A practical outcome of this approach is the annual *Human Development Report* of the United Nations (UNDP, 1990). This provides indices of human development that incorporate data including life expectancy at birth, adult literacy rates and GDP, thereby challenging traditional practice that assumed national income statistics convey all the essential information on standards of living.

Doyal and Gough (1991), in this tradition, set a wider agenda, tackling directly the nature of the relativist debate in social science and its impact upon ideas of human need. They begin by rejecting the view that ‘only individuals can decide goals to which they are going to attach enough priority to deem them needs’ (1991: 9). Integral to their thesis is the argument that implicit in the position of several schools in the social sciences is an appeal to some external and objective concept of human need. Doyal and Gough’s proposition is argued through critiques of orthodox economics, the New Right, Marxism, critiques of cultural imperialism, radical democrats and phenomenological arguments—the
central thesis being that in different ways each makes some appeal to an external and objective conception of human need (Chs 1 and 2 passim). Parallels to their critique are found in Wainwright’s (1994) challenge to the ‘free-market right’ in which postmodernism’s apparent rejection of the ‘very possibility of objectivity’ is challenged:

... some kind of objective reality, posited without any presumption that language or the present state of our knowledge can ever directly reflect it in the way that positivism imagined, is a necessary condition for any collective effort to resist the injustices and oppressions in which postmodernists have shown language and culture to be actively complicit.

(1994: 9)

In their own challenge to relativism, Doyal and Gough argue:

All of the examples of relativism which we have examined thus far have attempted both to denounce universal standards of evaluation with one hand only to employ them to endorse some favoured view of the world with the other.

(1991: 33)

The consistent relativist

... must not chop and change in this way. But the consistent relativist—one who regards the whole of social life as a ‘construction’, each aspect of which has no more or less veracity than any other—enters a moral wasteland into which few have feared to tread.

(p. 33)

In such a wasteland, ‘Objectively, there is not much to choose between anti-Semitism and humanitarianism. Racism will appear vicious to a humanitarian while humanitarianism will appear vapid to a racist’ (Feyerabend, 1978: 8–9). Doyal and Gough argue that we are able objectively to choose between these conditions:

A wide range of concepts concerning the evaluation of the human condition seems inextricably linked to the view that universal and objective human needs do exist. . . Human needs, we argue, are neither subjective preferences best understood by each individual, nor static essences best understood by planners or party officials. They are universal and knowable, but our knowledge of them, and of the satisfiers necessary to meet them, is dynamic and open-ended.

(1991: 2–4)
Writing in the context of educational policy and administration, Chapman states this theoretical position:

The position from which I am working might be called pragmatist and anti-essentialist. . . . Having rejected absolutism and eschewed relativism, I am seeking to arrive at some set of provisional theory-constructs, that will pro tem resist falsification, and to work out and operate with a set of ad hoc agreements that will constitute a pragmatic consensus we can then apply to the solution of problems that are in principle amenable to treatment.

(1993: 4)

Chapman recognizes the influence of Evers and Lakomski (1991) on her position. They argue that ‘moral reasoning is embedded in theory laden reasoning in general, and develops most readily along with our overall theory of the world (p. 189). In illustrating their argument, they suggest that the quality of the social rules in Rawls’s Theory of Justice owe something to the existence of a de facto model of society (p. 182):

. . . the reasonableness of maximin depends on making assumptions about the distribution of probabilities for social positions. So the ‘veil of ignorance’ condition for generating impartiality imposes de facto a model of society for generating moral rules. They argue that if the model was sharply divergent from the circumstances in our own society, the theory of rationality upon which it depends ‘comes apart from the best theories we might use to describe our society’.

(p. 182)

Sen’s analysis and that of Evers and Lakomski provide a basis for a more open and participatory process of value selection and administrative decision-making. In Sen’s case this arises obliquely from the idea of ‘Basic capability equality’ (1980). A development of Rawls’s expression of equality in terms of an entitlement to certain ‘primary goods’, it shifts attention ‘from goods to what goods do to human beings’ (p. 368), but shares with Rawls the view that ‘primary goods’ include liberty and opportunity, an emphasis on a more equal distribution of income and wealth, and self-respect. These rights point to notions of participatory decision-making in organizations and not elitism. Evers and Lakomski, writing about educational administration, are more direct; their argument centres upon the contention that ‘maintaining the social relations of inquiry is as relevant to moral theory as it is to empirical theory. . . . The common theoretical virtues of problem-solving and promoting the growth of knowledge are used to adjudicate rules or principles of social and administrative practice’ (p. 186). Preliminary work on its application to education generally is developed by Doyal and Gough.
Defining educational need

Education has a key role in contributing to an individual’s need for autonomy of agency and critical autonomy. As a means for leading to autonomy of agency it implies

... a core curriculum of subjects, more or less the same for all cultures, including basic numeracy, general social skills, physical and biological processes, general and local history and vocational abilities which are relevant to further employment. Ideally, learning of this kind readies students for active participation in the entire spectrum of practices/choices on which the continuation and, hopefully, the improvement of their well-being depend.

(Doyal and Gough, 1991: 215)

If we are to monitor factors which contribute to these outcomes, there is a requirement to monitor access to inputs of teaching. Doyal and Gough recognize the limited quality of such information and suggest data on access to formal schooling:

... number of years of completed study, the school/higher education occupational qualification obtained, the educational level reached (as indicated by the International Standard Classification of Education), the number of years at different levels of the education system, age on completion of study, and participation in adult education.

(p. 216)

They acknowledge these as limited too, and also note the absence of data on the quality of teaching—an issue to which I will return. More demanding conditions are set when they move to the concept of critical autonomy:

To criticise and to make choices between the current rules of one’s own culture and the rules of others requires a broader transcultural knowledge. However proficient someone is in knowledge of her own culture she will be unable to subject it to searching scrutiny without a knowledge of other social systems and an understanding of the rules of comparative method ... a curriculum ... must include the teaching of different cultural traditions and provide a forum for these to be discussed and debated openly.

(p. 216)

Further and higher education is seen as a means for developing this wider consciousness, and access to higher education is suggested as a proxy indicator of critical autonomy. That critical autonomy must await further and higher educa-
tion is, I would argue, remarkably cautious about the capacities of younger learners.

Setting aside the problems of international comparisons, for which some evidence is available (OECD, 1993), how might this approach be made operational in England and Wales? It is a task with at least four distinct components: first, the need to formulate more precise criteria by which we measure the level of attainment of personal autonomy and critical autonomy; second, issues about specifying the level at which data are collected, analysed and reported; third, the choice of agency for undertaking the task; and, fourth, issues about the role of government and governors, national, local and institutional, in responding to the reported data.

**Measuring educational need in England and Wales**

A beginning has been made on devising a framework against which we can assess the extent by which English and Welsh schools are meeting educational needs. Whatever its weaknesses, the post-Dearing national curriculum does provide the foundation for a framework by which we can monitor performance against the core curriculum suggested by Doyal and Gough. However, to this I would add a comment from *Learning to Succeed* (National Commission on Education, 1993):

> It is clear that children at school should learn about the society in which they live and how they can contribute to it. They should come to understand how decisions are made in a democratic society and how they can learn to take part in them through discussion and the ballot box. They need to know how Parliament and other democratic institutions work, and the place of the law in safeguarding our rights and freedoms. They need to understand how wealth is created. They need also to learn how they themselves can become active members of society. They must know what rights they have, but also what responsibilities they must bear as good citizens.

*(p. 39)*

These would seem to be essential characteristics in developing an individual’s critical autonomy.1 Yet, unless a school in England and Wales is particularly alert to non-statutory guidance on cross-curricular themes it could easily fail to address several of them, despite a general statutory requirement upon them to do so. Only with an explicit framework for defining educational need can we begin to assess the extent to which we meet those needs. This example is cited as indicative of the work required to specify the content of a framework and, *pari passu*, the criteria by which achievement is measured.

The second part of the task is determining the level at which data are collected, analysed and reported. National data are essential for some overall view of
performance and much could be added to the existing league tables on examinations and attendance; for example, spending levels on comparable schools in different LEAs could be added with relative ease.\textsuperscript{4} The Scottish Office has already begun publishing these data and it is certainly within the administrative capacity of the DfE (Department for Education) to do so (Scottish Office, 1994a).\textsuperscript{5} Within LEAs, data on schools should be reported by LEAs, whose potential role in a decentralized system has yet to be clarified. Since they already have a clear function as purchasers in a system where schools are providers, an obvious role is performance monitoring and quality assurance, although few LEAs appear to have developed this role. Is this because they are inhibited by their history and culture from such a development, or is it the spectre of schools opting-out if the LEAs were to develop better performance reporting?

At present the extent of data analysis is inadequate. If the system is seriously to address issues of equity, for example, there is a need to have annual, large-scale, national and regional analyses of pupil and student performance by, at least, gender and race. Whilst some of these data are already being collected, they would have greater utility if some additional information were sought, facilitating analysis by gender and ethnicity, for example.

The third party of the task is the choice of agency for undertaking some of the work. If we define the first task as specifying a framework, might this be part of a continuing role for the National Commission? This stage would not be expensive, but could contribute to shaping a debate about how best to specify our educational needs and monitor our performance in meeting them. Beyond that, the responsibility for monitoring and reporting is one that properly should fall to government, but it may be necessary for a non-governmental body to take on the role as an independent rapporteur.

As things stand at present, however, we have a rudimentary approach to assessing our nation’s educational performance. Published examination results, unauthorized absence data and the 4-year cycle of school inspection reports do give some information, but, more important, are indicative of what modern information systems could provide. Some of these data need to be improved upon but it is also necessary to extend the range and form of the data to be collected. Already, more information on provision could be extracted from the OFSTED (Office for Standards in Education) database and the Form 7 data provided by schools and held by the DfE. Formula allocations to schools could be obtained from the Section 42 returns made to the DfE by LEAs—the source of the funding data reported earlier in this article; some process and performance data can also be obtained from some of these sources. There are also examples of schemes for collecting the views of teachers, parents and pupils and reporting them in comparative form (Scottish Office, 1992a; 1992b).

A framework for reporting upon the achievement of national, regional and institutional goals can provide a means for reviewing and reporting upon the efficiency/cost-effectiveness and equity of the school system. It can provide a
source of information which by being more open, brings greater equality in debates which are otherwise heavily skewed in the direction of the professionals. Information provided by the LEA about the quality of school processes and performance can, for example, assist governors in undertaking management responsibilities in a more equal relationship with their head teachers. Within schools, within LEAs and at the national level there is a potential for creating a framework and an information system by which a dialogue of accountability can be encouraged between the range of stakeholders in the system. Consistent with Judith Chapman’s comment cited earlier, there is scope for a pragmatic consensus against which the achievements of the school system can be assessed annually and systematically.

Conclusion

In this article, I have argued that the school system operates in a mixed economy of exchange relations and suggested that is desirable that it does so. I have also sought to illustrate the applicability of the concepts of efficiency and equity to schools and provide some perspective on how they can inform judgements about the appropriate balance in the mixed economy. My discussion of efficiency and equity concluded by asking whether any framework is available against which we can judge the system’s general direction, and whether it is becoming more or less efficient and more or less equitable. This led into a theoretical treatment of the concept of educational need and a subsequent sketch of how it may be possible to operationalize a framework for defining need and the criteria against which achievement can be assessed. This concluded with the view that contemporary information systems could be harnessed to this task and that a key outcome would be information that was not owned by specific stakeholders but available to all. As such, it could be the basis for a better and more open dialogue of accountability, informing decisions about appropriate levels of provision and, in that context, appropriate expectations about process and performance.

For too many years in England and Wales, we have managed the school system—and the education and training system as whole—where there has been a quest for some efficiency, some effectiveness but—overwhelmingly—economy. Out of this, I suggest, have come many changes for the better but, associated with real concerns about genuine efficiency, too little concern with equity and a danger that the limited range of published performance information will lead to an over-emphasis upon a basic curriculum—a contemporary version of the 3Rs. I hope I have illustrated that there are ways and means for careful development of exchange relations in the school system which can improve efficiency and enhance equity. Doing so also requires attention to and the specification of a theory of educational needs, and from this could emerge a different 3Rs—a resourced, redistributive and relevant school system for all our children.
Notes

1 The absence of the ‘market’ in the curriculum was aptly put by Sir Keith Joseph: ‘The best “national curriculum” is that resulting from the exercise of true parental choice by parents and children acting collectively, and being provided collectively by governors and teachers in response to that choice. The substitution . . . of a government-imposed curriculum is poor second best’ (cited in Chitty, 1989: 217).

2 This is not to suggest that valuable work cannot be done on efficiency in learning. A recent doctoral study is a rare example of an attempt at examining the ‘personal time and effort given by a learner to achieve some desired learning’ (Hewitt, 1994). Yet, a focus on the use of time in learning—not time on task but economy of (non-linear) steps to achieving desired learning—may have a potential in efficiency gains that far outweighs those obtained through decentralized resource management.

3 In this respect, the forms of democracy and how they might be measured (Beetham, 1994) cannot overlook the role of the school system in preparing its citizens for that democracy.

4 Approaches in developing more persuasive value-added data, contextualized for schools, have been commissioned by OFSTED and reported (Sammons et al., 1994). SCAA (1994) has also completed its own review for the Secretary of State.

5 In the same series of Information for Parents, the Scottish Office reports on leaver destinations (Scottish Office, 1994b).

MANAGEMENT OF SCHOOLS

Part 7

FURTHER EDUCATION
As governments worldwide articulate the rhetoric of a ‘knowledge economy’ traditional cultures of education management and leadership are found to be wanting. At the same time, growing recognition that market and managerial reforms have not improved levels of educational performance has increased government interest in the transformative powers of business and charismatic leadership. This paper considers this phenomenon with reference to the changing conditions of corporate leadership taking place in the further education (FE) sector. Whilst ostensibly a ‘very English’ case study, the paper draws attention to the wider implications of managing and socializing others in the self-surveillance rules of corporate education culture. Drawing on data from an Economic and Social Research Council (ESRC) funded project the paper analyses the shifting discourse of leadership as it is experienced by principals and senior managers involved in the study. In so doing the paper seeks to examine how principals and senior managers mediate changing education policy agendas in a sector recovering from an intense period of financial crisis, industrial action and low staff morale.

Introduction

This paper examines shifting discourses of leadership in the changing policy context of the English further education (FE) sector. In contrast to a strong research and policy interest in school-based leadership and management (DfEE 1998), this area remains largely neglected territory in further education. This is surprising given that FE has been the subject of intense market experimentation and has experienced the worst industrial relations record in the public sector.
since the miners’ strike in the early 1980s (Burchill 1998). As the sector slowly recovers from highly publicized episodes of industrial action, mis-management and financial crisis, this paper questions the extent to which changing leadership styles challenge or reinforce prevailing forms of managerialism in FE. In addressing this issue the first half of the paper briefly examines the changing corporate context of FE that provides the backdrop to changes in senior managers’ work. This section draws on narrative evidence from a recently completed ESRC project looking at the impact of FE reforms on changing professional and managerial cultures at college level.1 In the second part of the paper, such evidence is analysed in the broader context of policy – practice related change in the FE sector and beyond. The third and final section critically explores the apparent transition from a hard edged managerialist approach to a more inclusive style of leadership, and questions its likely impact on re-fashioning education policy at the micro policy level of the college.

Managing the meaning of work in FE

The context of this paper is framed by the impact of the Further and Higher Education Act (1992) which led to the incorporation of colleges in 1993 (Gleeson 1993). The term ‘incorporation’ refers, among other things, to the introduction of local management of colleges, institutional self-governance and independence from local authority control. As Lucas (1999) has argued, the grounds for the quasi-market reform of further education had been laid earlier in school reforms associated with the Education Reform Act (1988). If, at one level, incorporation introduced greater autonomy to colleges, allowing them freedom to compete as business in the VET market, it also laid the foundations for even greater central control of FE via market and managerial forces. At college level pressures on FE lecturers to be more accountable, in terms of increased student participation, achievement and retention while, at the same time, experiencing harsh management strategies and new contracts of employment, took their toll (Elliott 2000). Following the initial euphoria of independence from local education authorities in 1993 the funding reality of ‘more for less’ soon became a major cause of concern for principals and senior managers, many of whom had no experience of business or corporate management. As financial pressures intensified, many colleges became preoccupied with entrepreneurial activities, while others entered into ill-advised franchising and commercial ventures which had little to do with the further education needs of their local communities.

In the period 1997/99 numerous colleges were investigated by the Further Education Funding Council (FEFC) for financial and management irregularity precipitating a House of Commons Select Committee of Enquiry into Standards of Probit in the Sector (Hodge 1998). Such irregularity represents the tip of an iceberg in which many colleges have been driven to desperate measures in seeking to reduce their debts and maintain competitive advantage. Of deeper significance is the financial fragility that has underlined the bullish marketing
front of many colleges. Behind the marketing images and new foyer facades a serious funding crisis has characterized the institutional reality of this fast growing £4 billion sector. In the period 1993–97, the FEFC reported that more than 50% of colleges were in the red with 63 projecting negative resources, 156 financially vulnerable and 93 financially weak FEFC (1997a/b). As the FE sector has sought to recover from such pressures, there has been a 30% turnover of lecturing and senior staff and a significant increase in casual and contract employment (Williams 1998, Lucas 2000). At a time when industrial action and financial uncertainty has dogged FE the issue of management and leadership has been high on the policy and political agenda (Kennedy 1997). According to the General Secretary of NATFHE (National Association of Teachers in Further & Higher Education) the fascination with market and managerial reform has had dramatic effects in terms of how the new breed of principal and senior manager interpreted their changing corporate role:

You had all these Principals walking around with ‘Thriving on Chaos’ by Tom Peters in their briefcases, and what it said to Principals was: ‘and you are God’. That was a disaster. The process took reasonable people and turned them into monsters.

(Mackney, quoted in Beckett 1998)

Evidence in this paper suggests, however, that principals and senior managers do not necessarily constitute such a neat or homogeneous group. Their responses and perceptions of leadership vary in relation to institutional effects, context, experience and gender. At the time of interviewing and undertaking fieldwork for this research, there had been considerable change in senior personnel across the five colleges involved in the study, with four principals appointed between 1995–97, two of whom were women. Moreover, a majority of senior managers were also appointed in this period following major restructuring and a wave of early retirements. Apart from curriculum managers appointed mainly through the ranks, the majority of senior managers (in marketing, personnel, estates and finance) were recruited from business, industry and commerce. One might expect, therefore, that this weighting of business experience would inevitably identify them with the corporate aims of their new employers. Many, however, were appointed during the period between 1993–97, when industrial action in colleges was at its height. Much of the unpopular restructuring had been instigated by and conveniently blamed on previous principals and senior managers who, with little business experience, had taken their colleges through the first phase of institutional independence. Thus, the majority of the 30 senior managers interviewed in this study, were relatively new and circumspect about their role. Appointed at the point or near aftermath of major conflict, budget deficit and redundancies, the ‘new guard’ of principals and senior managers adopted a more strategic and inclusive view of management, as a means of uniting a beleaguered and often hostile workforce. Though much of the day-to-day activity of
principals and senior managers is taken up with managing staff budgets and planning strategy, it also involves interpreting shifting national policy agendas at college level and making these meaningful to staff on the ground. This is how a recently appointed senior manager from industry and an advocate of market managerial reforms in FE, sums up her view of the new ‘reality’ being communicated to staff in her college:

Eastward College is a corporation: we are the employer and we are totally responsible for our employees in terms of employment legislation . . . The employer in the past was **** County Council – a body far removed . . . The college has got a strong identity, although having said that, some people have taken quite a while to adjust to it – some people perhaps won’t ever adjust – and it has brought with it . . . a sort of commercialisation, a sense of reality that we have to win.

(Sally, senior manager)

This account suggests that senior managers such as Sally see an important aspect of their role as one of persuading staff in the college to accept this new reality. It is a strategy increasingly connected with transparency, a term associated with openness (opening the books for all to see), designed to ensure participation, teamwork and compliance among those all in the same boat. This apparent spirit of inclusivity is, however, not always reciprocated. There are, in Sally’s view, a few isolated individuals who do not like change and who will not adjust. Implicit in her account is the characterization of the previous organizational order, based on a public sector model of professionalism as bureaucratic, complacent and wasteful. By comparison the new managerial order stresses responsibility on the part of staff and, above all, responsiveness to change in terms of flexibility.

New managerial values, stressing efficiency, compliance and flexibility, pose a challenge to the perceived ‘easy-life’ that existed for lecturers prior to market reform in the early 1990s (Randle and Brady 1997, Elliot 1996). The management of consent which guides change towards such ‘new realism’ also requires a different set of organizational values to those previously associated with public sector professionalism and are made explicit by senior managers through a variety of means. These include: college mission statements and corporate plans issued to staff; training courses aimed at the professional development of staff; and meetings intended to identify targets and values with which staff are expected to identify. The approach is increasingly, though not exclusively, expressed in progressive terms, often disguising managerialist ambitions in core values associated with inclusivity, teamwork and communication (Casey 1995). The following extract from a senior management group interview, provides an example of this approach:

. . . we’ve got quite a sophisticated communication system to start with and I think that staff know what is going on and that may be a con-
tributing factor. We don’t have any secrets. That is also very helpful, and also staff have copies of the strategic plan. They know about the mission, the vision, the values etc. and we do reinforce the successes in terms of telling people how well we are doing on a regular basis so people know we are doing well; we have always underlined DON’T GET COMPLACENT.

(Group Interview, senior manager)

In this account what comes across clearly is the requirement that staff, as individuals, must take responsibility for ensuring that success is internalized and maintained. Thus, while staff may be rewarded for their successes, they are reminded that they must not ‘get complacent’. The communication of such values, often associated with an intensification of work performance, requires senior managers to manage the meaning of work for staff so that it is appropriately internalized. In the wider organizational literature the management of such meaning in the workplace is identified as a major management priority and responsibility for increased work performance (Collinson 1994, Salaman 1997). For FE, this is particularly important since the new contracts of employment introduced since 1993 have, in many cases, led to an increase in teaching and contact hours coupled with, in real terms, a decrease in pay requiring a difficult leadership job for principals and senior managers. Managing the corporate FE culture in such circumstances involves deliberate attempts to structure the meanings employees attribute to the organization and their work (Flynn 1999). In an increasingly competitive environment this approach is presented by management gurus (Peters 1992, Handy 1994) as a key method of achieving institutional participation and allegiance designed to produce economic benefits through human and organizational performance (du Guy 1996). Successful attempts by senior managers to redefine the work culture of their staff through charismatic leadership are contingent on staff internalizing realism and regulation.

Part of the emerging corporate culture of FE involves senior management representing the college as a unified body through the expression of a corporate or unified voice. In the account presented below the college is represented through a discourse of unity that transcends different identities and often competing professional cultures that exist within the college. Though the rhetoric often does not match the experiences of many lecturers at the sharp end of the system (Shain and Gleeson 1999), the following account is illustrative of the authority that is invested in senior managers speaking on behalf of the organization, in defining its inclusive culture.

The culture is one of an open style of management . . . we are looking at leadership rather than management of staff and no doubt you have seen the college’s ‘organizational values’ which I think sum up the fact that we are all working together, we are all part of the college. I don’t see it as an ‘us and them’ or ‘management and staff’ . . . I think every-
body knows what we are about, or they should know. We spend a lot of
time communicating with staff and staff understanding what our stra-
tegic aims are: what our vision and mission is; we should all be
working together. Now, no doubt some people don’t feel part of it as
much as others; some people will choose to opt out anyway, but I think
in terms of the ethos, it is one of all participating as much as possible at
all levels in decisions which affect the staff and students.

(Sally, senior manager)

Here the culture of the organization is defined by a senior manager through a
discourse of unity. Management and staff are apparently unified in working
towards common goals and purposes for the organization. The discourse of
openness and inclusivity associated with this account draws on the notion of the
college as a community in which senior managers have different but
complementary roles in working together with staff to produce organizational
harmony and consensus. This visionary model is, elsewhere, seen to contribute
to a ‘happy’ atmosphere at work. The image of the corporate college as a
community also defines the role of principals and senior managers as community
builders and representatives of core values of tradition and continuity. It is an
approach that involves an inclusive style of management that is embodied in
managers’ vision, presence and approachability. As Salaman has argued, it is an
approach that requires the manager:

. . . to move modestly among the people, disclaiming the panoplies of
rank . . . a leader in touch with the people, who manages by ‘walking
the talk’, by being accessible and working with subordinates. Through
this consensual approach employees are both free to make their
empowered decisions and can safely be relied upon to execute their
new authority judiciously.

(Salaman 1997: 255)

At a time when the FE sector is seeking to establish greater stability after a
period of unprecedented change, this charismatic style of inclusive leadership is
increasingly in evidence as the account from a recently appointed principal illus-
trates:

It is about having to read, to think quickly, to use some part of your
experience and a lot of intuition and to walk around calmly and posi-
tively . . . that is no different from any other leadership role; it is to
demonstrate that you are in control and that you are comfortable. What
I have fed back to me is that everybody sees that I am actually quite
excited about the job. I am not walking around cynically, which would
have been the other option, saying, ‘oh no, more problems’: I think it is
very important to actually spread that excitement about FE now,
however difficult it is and actually pick up and say what the opportunities are.

(Maria, principal)

In talking about her vision of leadership Maria highlights the importance of spreading excitement around the place and instilling this into employees by her own example. This approach is, however, more than just a morale boosting exercise for staff. It is also a communicative technology that goes hand in hand with the internalization of regulation and self-discipline (Ball 1990).

We have spelt out the culture of this college; we have actually spelt out organizational values, which we put out to the staff and the desirable features of the college structure. Now we put these out not for consultation but for people to add to so we said (to staff), ‘there are ten things we think are our values . . . Everyone is responsible for striving for continuous improvement: there is openness and respect, which is important because people have different views; it is welcoming and supportive; promoting equality of opportunity; recognizing contributions . . . it is open rather than explicit.

(Maria, principal)

For Maria it is important that staff adopt a self-critical approach that connects with the corporate vision. This involves self-motivated staff taking more responsibility for the success of the college without constant supervision. However, for staff to internalize the new rules of the organization principals and senior managers must play a central role in communicating these values to staff. This process of unifying staff around an institutional mission and core values takes a variety of forms, including displaying posters, issuing leaflets, meetings, memos, workshops, training days and appraisals. The culture of the college is, as Maria illustrates, literally spelt out to staff. Such is the speed of change in FE that spelling it out is seen as a necessary precursor to inclusivity. In order to achieve this, however, senior managers may also adopt a more direct role that involves the policing of people to make sure it happens.

I went though a stage last year where I felt like a police lady, policing people. [I was saying] ‘you can’t do that, you have to use a corporate image’ and I don’t like that at all but . . . having developed a good corporate style then I couldn’t then allow people in a way to do their own thing and so it has to be controlled, but in a nice way. I don’t like controlling people; you get the best out of people by letting them all do their own thing but then you can get chaos and when you are dealing with the public you obviously have got to instil in staff that there are rules to this.

(Gina, senior manager)
Again we see the adoption of the community metaphor, but here the senior manager takes on the policing role that is deemed necessary in order to prevent the kind of chaos that might ensue if newly established rules are not adhered to. In other instances, an approach of coaching may be necessary in order to encourage middle managers to take responsibility for their staff and, at the same time, to accept their ‘right to manage’:

I think to get managers to actually manage and to see that they are responsible for staff . . . sometimes it [involves] coaching managers on the job. We had a disciplinary meeting a couple of years ago. I hadn’t been here very long and I was almost rehearsing the managers saying, ‘right, this is how you are going to run the meeting and what you are going to say and if I think you’re going way off I will call an adjournment’. I am not here to do the manager’s job, [I am] just here to help them to manage their staff. I could make a decision in five minutes but I spend an hour with the manager looking at all the options and hopefully he or she will come to the decision I think is right but it is their decision at the end of the day.

(Sally, senior manager)

Here, not telling middle managers what to do (in ways which allows them to reach the right decision) is the trick of managing and socializing others in the self-surveillance rules of corporate culture (Ball 1990). But is this process so neat and clear-cut in practice? As Collinson (1994) notes, despite insisting on the essential reality of consensus and community within the organization, leadership campaigns are often at odds with the existing conceptions and experiences of employees. This suggests, as others have noted, that corporate culture is not automatically accepted by FE lecturers or by senior managers themselves (Ainley and Bailey 1997).

For Brian, who came through the ranks from lecturer to director of studies (and now vice-principal), there is a sense of frustration with the overt rebranding of FE’s image which compromises his sense of professionalism. His feeling of unease, for example, with the ‘business speak’ of FE draws attention to the ethos and language of the corporate college.

There is a kind of business speak about FE. Directors, managers, clientele, finance, efficiency gains. What I can understand about it is the new ethos and you have to live with it. It’s not just us, it’s the National Health Service, and others. A lot of the former public sectors have now got this ‘post-Thatcherite’ language and rationality. I understand where it comes from but I’m not entirely comfortable with it, at least not all the time. I suppose, yes, I still see myself as a teacher.

For others, such ‘business speak’ is also reflective of wider reforms in the
public sector associated with growing divisions between professionals and man-
agers (Flynn 1999). According to Richard, a senior manager recruited from
industry, there is a link between iconoclasm and de-professionalization in public
sector reform.

There is a kind of iconoclasm built into incorporation in the same way
as there is for all sorts of other government initiatives such as those
which have taken place in the health service, which is a de-profession-
alization. There is actually restructuring of the system in a way that
doesn’t give the primacy of view to the educator in the classroom – that
says ‘well I think that in order to achieve these students should receive
X’. In the same way that doctors don’t run the health service any more,
it’s to say well in effect that professional argument, as a basis for
running the system, is broken.

(Richard, senior manager)

The iconoclasm referred to by this senior manager connects the market frac-
turing of professional and managerial knowledge in FE with wider changes in
the public sector. If, in theory, professionals are now expected to get on with
their jobs supported by principals and senior managers running the operational
side of ‘the business’, that division in practice is not clear cut or without contro-
versy. The main frustration felt by some senior managers is that the business
environment to which they have been recruited is not businesslike enough.
Rather, it is seen to be more determined by funding and bureaucratic systems
associated with government, than by the college itself. While many senior man-
agers in the study agreed that college independence and new funding arrange-
ments gave FE more status and flexibility, the means to achieve this were seen
to be contentious. A key concern is the displacement of time and energy which
goes into data gathering, market research and ‘bidding’ for funds, resulting in a
culture change more linked to funding requirements than the learning needs of
students:

It’s meant staff having to go through a culture change, which they are
still going through to get to grips with the way in which we are funded
and to understand the importance of finance. I personally believe that a
lot of decisions that we ought to take within the college ought to be
driven by educational philosophy and what we want to do for students
and what is good for students. Whether we get it right or not is what we
ought to consider, and we try to do that, but the funding methodology
drives us more and more to take decisions which we have at the fore-
front of our minds, i.e. finance . . . as well as education and possibly
even instead of . . . and that is bad I think and staff who might want for
very good reasons to run a class in a minority subject with two or three
students . . . which we would have supported and still try to support, are
now having to understand that funding is numbers related and they
can’t do what they might have done five years ago. We have tried very
hard to get the message across to staff and I think it’s getting across.
but the culture is changing.

(James, vice-principal)

The nature of such culture change is closely associated with new ways of
working that are linked with how successful senior managers are in making bids
to the European Union and government agencies for funding. Essentially, the
difference between ‘winners and losers’ in this bidding process is tied to the
quality of information and evidence provided by institutions to the Further Edu-
cation Funding Council in order to obtain funds. Thus, not only is a high degree
of investment in information systems and data retrieval required, but also per-
sonnel, time and resources which can detract from investment elsewhere,
notably in relation to the curriculum, teaching and learning. For Emma this
process is seen to have had a detrimental effect on senior management’s rela-
tions with rank and file lecturers. For her there is a close connection between the
speed of change and the funding and management of that change on FE lecturers
working in the sector.

I think the way it has impacted upon staff is that, to some extent, it has
constrained their opportunity to develop their curriculum, their subject,
the things that they are interested in because of methodology and
funding. It has also de-professionalized their role because of things like
the Student Centered Learning Approach etc. The models that have
been driven in from a more financial basis have meant that staff have
been threatened by that whole approach. We can have a demonstrator
now and not a teacher. Well if the machine does it where does that
leave me? Does it mean that I am a software developer? That has very
much been an attitude of staff. I think Incorporation has been very
threatening for them but it has de-professionalized staff. It has been
heavily dependent upon the type of management we have had. If you
were able to have supportive management in the process of post-incor-
poration then the de-professionalization and the challenges would not
have not been quite so threatening whereas, if you have had a very
aggressive management, then the challenges have been so threatening
that lots of people have just turned off and felt that they are no longer
of any value or that they have any professional worth.

(Emma, senior manager)

The notion, therefore, that senior managers are necessarily distant and lack
empathy with their lecturer colleagues can be challenged. Many such senior man-
gagers as Emma acutely recognize how cultures of managerialism affect them too,
particularly in their management relations with disillusioned colleagues. This
‘reading’ of the tension finds further expression in the often contradictory education and business ambitions of the institutions in which senior managers work as a corporate team as, again, Emma points out.

There is a real tension between being told that you are a business and getting your funding from public funds for 90% of what you do, being told how you must spend it or how you may acquire it, or not. You either get on and run yourself as a business or you don’t and I would much prefer to be part of a public sector and I do consider myself a public servant and consider that is part of my job. It is to serve the community. To have a level of provision which meets the needs of the community, not because it meets my business needs but because it meets the community needs . . . but not necessarily without having an eye to the finances of that.

(Emma, senior manager)

Given the funding crisis in the FE sector (FEFC 1997a), reconciling such ambitions has proved elusive to more than 50% of institutions in the sector. Thus, despite recognition that the education and business interests of FE are connected the issue, according to Hilary, is one of remembering what kind of business FE is in.

As long as it is always remembered that our business is about people. We are not making iron bars. We are not trying to make thousands of students exactly the same. Everybody that comes in is different, comes in different, goes out different. What they need, and their capability of achievement is different so everybody is unique and an individual . . . and it is important to remember that. Yes, we do need a business model. We also need a strategic plan and we do need to run ourselves as a business. We have to make sure that we make a surplus. We need to actually manage the budgets properly. . . . All of those kinds of things. We do need our own functions, finance and human resources but we must not forget what our business is all about and sometimes I think people have forgotten it is all about people.

(Hilary, senior manager)

Both Emma and Hilary’s accounts reveal tensions in ‘the business of learning’, and that no amount of corporate newspeak is likely to bridge the two (Ainley and Bailey 1997). The assumption, therefore, that senior managers passively accept the corporate line, despite working within it, ignores their experience and interpretation of educational reform as it affects their working relations with staff. Narratives in this study indicate that principals and senior managers resist and feel morally uncomfortable with hitting targets that do not conform with educational reasoning and rationale. Brian, for example, talks of
some of the ‘dodgy tricks’ which can compromise senior managers and lecturers in FE.

I think the targets we were set and the financial penalties incurred if you didn’t reach them is really getting more for less, it’s really put a lot of strain on the colleges and it has made a lot of colleges do some chancy and risky things that have not always been done for educational reasons. You do it for maximizing units. You get more students in and some colleges are going for some very dodgy franchises.

(Brian, senior manager)

Here, Brian draws attention to pressures which, for financial reasons, have drawn institutions into risky activities – some of which have been induced by funding mechanisms – and which nationally have attracted critical attention (Kennedy 1997, Hodge 1998). Again, as with other participants in this study, principals and senior managers often strongly resist pressures which they see as dodgy or compromising, though not always successfully. Elsewhere, Linda points to some of the ethical and professional dilemmas of matching image with reality when marketing new programmes and courses in her college.

The equal opportunities group and the multicultural forum produced a little leaflet and we got somebody to translate it into Urdu and possibly another language as well. It was translated into Urdu and distributed through the local community and I said ‘this is all right but what happens when somebody who speaks Urdu rings up? Who is going to speak to them? That is fine provided they are there. I do find that particularly difficult and I suppose that is one of the biggest challenges really, matching what we do to the image that we project and trying to live up to people’s expectations that we have created. There is always a danger in marketing, where you go out to get as many people as you can . . . and when people come we let them down. It is trying to get that balance.

(Linda, senior manager)

The balance between marketing, provision and expectation, to which Linda refers, captures both the excitement and risk associated with a more dynamic and enterprising FE system. However, extreme financial pressure on colleges to attract students from a wide range of backgrounds, in this case ethnic minorities, tempts many institutions to test the market as a means of signalling inclusivity and drumming up business. The downside of this is, as Linda notes, that marketing strategies can often precede the promise to deliver on provision (Avis et al. 1996). For some senior managers such tensions between the corporate rhetoric of inclusivity and the reality, in which they work with staff, are not one and the same thing. This, coupled with ongoing conflict in colleges over performance related pay, redundancy and casualization, is increasingly challenging the belief
among some principals and senior managers of the efficacy of managerial and funding-led reform in the sector. In a system acknowledged to be slowly recovering from crisis how do principals and senior managers view the future, and what has gender got to do with it?

**Gender, touch and leadership**

Despite the overt and less obvious trappings of FE corporate culture so far discussed, there are signs that extreme forms of managerialism, described earlier by Mackney (1998), are now taking a different shape. Two factors explain this. The first connects with the growing realization that FE has been an industrial relations disaster with lecturing staff at the limits of what can be expected of them, in terms of pay, conditions, institutional change and morale (Burchill 1998). The second relates to the unprecedented turnover of principals and senior staff in which 32% of 431 colleges (139 colleges) have appointed a new principal since September 1996. Of the ‘old guard’ of principals and senior managers in post before or just after incorporation many have since been replaced by a ‘second wave’ of new appointments, more versed in the ways of market and managerial reform. Though the evidence for this is speculative the ‘old guard’ fell into one of two groups: those who willingly embraced college restructuring and the industrial relations battles which followed and those, more circumspect, who sought a middle way between public sector professionalism and market-led managerialism. With little experience of business, information, human resource or management systems, the initial excitement of college independence soon wore off for ‘first wave’ principals and senior managers. Many such pioneers retired early as the funding and political ratchet of industrial disputes over lecturers’ pay, conditions and contracts increased. Not surprisingly there has been great variation in the management and leadership responses of colleges in the post-incorporation period (Green and Lucas 1999). As the FE sector grapples with the aftermath of such rapid change, a new breed of principals and senior manager is discernible. There is, for example, recognition among recently appointed senior staff that stress levels throughout FE are counter-productive to achieving a more inclusive learning culture and that more flexible and inclusive teaching and management approaches are called for.

Some of them [lecturers] feel that the management’s external accountability has meant a further rift between teachers and management. Some of them are conscious they are working harder and harder. Greater stress, more and more bureaucracy. Some of that has come from the awarding bodies. They are having to work very very hard. The stress builds up. Some of them go off sick, they then have to cover for sick colleagues and they become sick. The volume of change and the speed of change has meant some people have got left behind. . . .

(Maria, principal)

391
For Maria, there is a close association between the management skills that she advocates and issues of gender. Paradoxically, the need for a ‘second wave’ of restructuring in the face of near collapse in the sector has opened up new appointments and opportunities for women managers in senior posts, with a slightly increased proportion of women Principals rising from 14% to 20% in 1999. If jobs in estates and finance remain predominantly male orientated, colonization of ‘softer’ more feminized areas of senior management, in curriculum, personnel and marketing, has occurred partly as an antidote to rifts and divisions generated by macho management and partly in response to women’s professional experience in those areas (FEDA 1997a and b). Here, Maria connects what she sees as the ‘woman’s touch’ to a management style characterised by inclusivity.

. . . the issue of gender is important whether you want it or not. It isn’t the only factor but it is an important ingredient and it goes from walking around and saying ‘this place is dirty’ and I have been told, ‘we can see already there is a woman at the helm because it is much cleaner’. The other thing is about touch. Women have less difficulty touching whilst they are talking and I know that I touch. I don’t necessarily do it consciously but I have been told I do. The other thing is the ability to operate it through four different levels simultaneously because I have brought three children up and prepared the evening meal and prepared classes simultaneously and, therefore, the awareness of the skills that you pick up of having been a housewife and mother. I think that is mixed in with the human concern.

(Maria, principal)

Such apparent accommodation or privileging of gender is not, however, straightforward or uncontested in FE or the wider workplace. Neither does it signal the onset of the widespread ‘feminization’ of FE (Hughes 2000). The promotion and accommodation of women in senior positions in FE is still not the norm and remains as much a combination of legitimate ambition, (self) exploitation and stereotyping as in the past. Brenda, for example, sees both sides of this issue, in terms of what ‘being a woman’ means in senior management terms.

I have these views that women can juggle more things in the air and be more flexible. It’s never been proven has it, but it’s a question that is continually asked. Women tend to be more adaptable. Women have to be adaptable . . . it could be why there are a lot more women Principals and a lot more senior managers now . . . the communication of team working that is necessary for Incorporation. Would I call it exploitation? I think sometimes it is exploitation and sometimes it is just a matter of management and personality.

(Brenda, vice-principal and recently promoted to principal of another college)
As noted elsewhere (Gleeson and Shain 1999), while there is evidence that some women middle managers feel exploited by such experience others, at more senior level such as Brenda and Maria, view their gender, knowledge and skills as integral. It is also the case that adaptability, teamwork and communication skills in the current FE climate have as much to do with strategy and pragmatism than with ‘feminization’ or apparent feminine attributes. According to Limb (2000), there is a need to go beyond ‘monochromatic stereotyping’. She argues that a more appropriate familial model of leadership, based on the role of ‘containing parent’, is called for: ‘... holding back the demonising and idealisation of leadership in creative tension’ (Limb 2000). While the apparent ethos of leadership emerging here suggests a familial and perhaps less confrontational management style, it may be no less managerialist or macho in practice. In a sector riven with debt, casualization and low morale more participative rather than distant or overtly managerialist approaches, represent a highly pragmatic response for both men and women senior managers. In the case of Jim, recently appointed principal following major financial difficulties in his college, an altogether different participative approach to management is seen to be a high priority. In an atmosphere described by one of his senior management colleagues as previously ‘like living in Stalinist Russia’, Jim talks of rebuilding the relationship with staff:

I have spent quite a lot of time around the college speaking to groups of staff either in formal situations but more often informally, getting around staff rooms, getting around classrooms. Being seen around the institution. Again that is a difference from the previous world that we were in and I think that helps. People know that they can talk to me and that I do listen and I try and do something about it. I can’t always give them the answer they want but I would be sympathetic, understanding and I would look into it and try and do something if I possibly can and I think staff do appreciate that.

(Jim, principal)

In such circumstances ‘being seen around the institution’ is an essential ingredient of management wisdom. The importance of ‘walking and talking’ the job is also perceived by Maria as an antidote to a previous distant management regime. In the following account, for example, she views consultation as an integral feature of her preferred management style.

The first thing is to get to know the staff and the college. That means walking around, attending meetings, talking to people and nipping into staff rooms. Calling meetings, walking the job and picking up what is going on and so that the decisions I take in this office have got some relevance to what happens outside and that is also my style.

(Maria, principal)
If Jim and Maria’s accounts say much about the need for a more tactile ‘hands on’ leadership approach, in circumstances where trust and morale has to be rebuilt, they also connect with the mantra of visionary management thinking associated with presence, visibility and touch. (Peters 1992, Handy 1994). Although few principals and senior managers in this study acknowledge being influenced by such discourse their references to ‘walking and talking’ the college would seem to suggest otherwise.

One consequence of the FE system being in crisis is that it is requires new thinking about changing conditions of leadership, management and professionalism (Hodge 1998). Endless exhortations by government to greater flexibility and smarter working practices do not, however, cut much ice with principals and senior managers, many of whom have experienced the demoralizing effects of funding cuts and industrial action. As early advocates and forerunners of incorporation have fallen victim to their own constructions of managerialism, more participative or inclusive leadership responses have since emerged. Though most ‘new guard’ principals and senior managers in this study spoke of being heavily pressurized by funding, staffing and managerial constraints, they were not consumed or overtaken by such pressures. While operating in a highly competitive and cash strapped environment three of the five principals working in neighbouring colleges met regularly to discuss joint cooperative ventures with schools, HE, community and other bodies regarding student participation, course rationalization and recruitment.

I think there was always competition with private training providers and fine, why shouldn’t there be. I haven’t got a problem with that. I do have a problem with competing with other FE colleagues and certainly if you have spoken to [other Principals in this area, you will know that] we have made a decision that we are going to work together and we will. We will all say ‘our college has got to survive and our college is the best at X, Y and Z’, but there are certain things where we are doing, a lot of collaboration.

(Wendy, principal)

Here, Wendy points to how FE institutions are able to operate more effectively through co-operation in a competitive market situation, in ways that make sense to all those involved. Jim, a principal and a close neighbour of Wendy’s college endorses this view, pointing to the ways in which colleges themselves can ‘grow the market’.

We are more concerned about growing the market in total than we are in taking shares from each other. It is much more important that more people participate than we win some students from X or Y College wins some students from us. To some extent the Y College and us are really quite complimentary. Our big emphasis is Post 19, sort of 80%
odd of our students are over the age of 19 and 80% odd of their stu-
dents are 16–19 so there is that issue. We are not in head on competi-
tion. They are recognized as the main A-level centres for example in
the area but we have all sorts of specialist provision, which nobody else
locally has. So it is partly complimentary.

(Jim, principal)

In the absence of any coherent national policy for FE, principals such as Jim
and Wendy have initiated partnership links for themselves. If this is partly to do
with market share, protection and growth the question arises whether emerging
forms of partnership and inclusive management style represent just another
version of managerialism, or support more democratic forms of leadership and
professionality in the sector? Certainly the rhetoric would seem to confirm that
FE ‘under new management’ is less obsessed with macho images, and more
concerned with learning, staffing and leadership matters, if only for strategic and
pragmatic reasons.

This issue of ‘rhetoric and reality’ returns me to the central focus of the
paper. If at one level market and managerial reform is seen to have undermined
professionalism and collegiality in FE, at another, it has paradoxically exposed
various anomalies, policies and myths surrounding a ‘golden age’ of FE
(Gleeson and Shain 1999). Between the old guard of senior managers who have
since departed FE and the ‘new wave’ of recently appointed Principals and
senior managers, how is corporate culture in FE best understood? In addressing
this question wider research in public sector management is split between those
who discern a growing interchangeability between professional and managerial
roles in the education workplace (Menter and Muschamp 1999), and those who
see an increasing separation between them in response to market and managerial
reform (Gamble 1988, du Guy 1996, Flynn 1999). If, ironically, both views
acknowledge the inevitability of post-structural change in the public sector
workplace, the former tends to talk up the possibilities of professional recon-
struction arising from market dislocation while the latter tends to exaggerate the
de-professionalizing tendencies experienced by workers at the sharp end.

The narratives considered so far suggest that the effects of deregulation, mar-
ketization and managerialism have impacted on FE in intense fashion. Such
effects have, however, gone largely unnoticed by the wider education commu-
nity, partly due to FE’s historical invisibility and partly due to a lack of public
understanding of a sector marginalized between school, work and higher educa-
tion. This, coupled with FE’s voluntaristic and entrepreneurial legacy has ren-
dered it accessible to ‘market capture’ in response to various government and
business agendas, designed to both realign FE with the economy and increase
patterns of student participation at relatively low cost (DfEE 1995; 1998). Yet, if
FE has been restructured along quasi-market and managerial lines – essentially
on a ‘more for less’ model – it shares much in common with public sector
reforms in the UK and elsewhere (Exworthy and Halford 1999). What
distinguishes FE is multiple restructuring resulting in the unprecedented exodus (and recruitment) of principals, senior managers and lecturers. Since the introduction of the Further and Higher Education Act 1992, FE has experienced continuous professional, managerial and industrial disruption coinciding with belated public interest in the probity and effectiveness of leadership, management and governance in the sector (Hodge 1998).

One way of interpreting such contingency in FE leadership and management is to see it as part of a postmodernizing tendency, linked with greater social and economic diversity at institutional level (Hargreaves 1994). This points to new ways of understanding how institutional and professional leadership can arise in conditions of crisis and chaos. Whether, of course, the transition from government to market governance in FE heralds the introduction of such a postmodern awakening in FE is debatable. Arguably, much depends on how one views the type of leadership shift considered so far, as either a progressive response to pluralism or as a means of managing and controlling it. Thus, while inclusive leadership may appear to offer a strategic response to rapid social and economic change it is not clear whether it represents a new way of dealing with a differentiated polity or is ‘part of the problem’ in perpetuating the kind of chaos that has been experienced in FE and the wider public sector to date. The danger of uncritically accepting the mantra of charismatic leadership is that it promotes naive personality ‘trait’ solutions to market problems, ‘… with no sense of the structural, the political and historical as constraints’ (Grace 1994; 1995).

While the narratives in this study suggest that principals and senior managers are strongly influenced by the shifting FE policy agenda, they are not necessarily taken over by its various facets. There is, nevertheless, a noticeable shift in leadership style from the ‘old to the new guard’, following a second wave of restructuring soon after the onset of college independence in 1993. If the first wave of senior managers both initiated and ‘ran the gauntlet’ of market reform, often as perpetrators or victims of the new managerialism, their replacement by a new breed of corporate principal, more versed ‘in the business of FE’ (Ainley and Bailey 1997) has passed by virtually unnoticed. Less compliant and overtly managerialist than their predecessors, the new corporate senior management team are more strategic in their thinking about policy-practice related issues. At the same time, as Avis (1996) notes, these possibilities are constrained by wider government and Business agendas as well as the forms of governance and surveillance in which they operate at college level. The nature of these constraints range from auditing methodologies, linked to the previous Conservative Government’s low trust model of professional accountability, through to New Labour’s consensual ‘Third Way’ which, though high on the rhetoric of inclusivity and social justice, maintains a largely fiscally driven FE reform agenda tied to targets, delivery and qualifications (Skelcher 1998). In the immediate context of their work principals and senior managers often have to balance these parallel and contradictory processes in two ways. The first concerns working within ever declining funding levels while, at the same time, responding to national demand
for widening patterns of participation and learning provision (Dearing 1996, Kennedy 1997). The second concerns one of how to match New Labour’s agenda of inclusion with the job of motivating an often under-trained and demoralized lecturing workforce, stalked by a legacy of market experimentation and policy neglect. The wider parallels here with public sector reform, in health, social and welfare services, and transport, are compelling (Esland 1999).

Seven years down the line from incorporation there is now less euphoria about college independence, funding and management-led reform following a protracted period of industrial dispute and casualization. While the partial evidence presented in this paper indicates that principals and senior managers have absorbed the contradictory discourse of corporate culture they do not necessarily readily identify with the aggressive managerialist agendas which underpin it. One way of interpreting the emerging culture of ‘collaboration within competition’ is to view it as yet another variation of ‘light touch’ managerialism: as a more feminized or inclusive form of social control. Another possibility is to see it as a basis for rethinking professionality in the FE sector and for raising new questions about how professionality, gender and leadership can be critically reworked around pedagogy and community. There is, however, little evidence of that to date (Hughes 2000). On the surface it would seem an impossible task to reconcile such contradictory positions given the degree of organized anarchy that the FE sector has experienced in recent years. The danger is one of treating principals and senior managers as victims of funding led or managerialist reform, rather than as strategic interpreters of policy in the reconstruction of FE practice at college level.

**Conclusion**

Despite widespread evidence of managerialism in the FE sector this paper has sought to draw attention to competing forms of senior management response which both promote and challenge the hegemony of managerialism from within. As principals and senior managers become more aware of various alternative interpretations and re-workings of democratic professionalism (sharing, co-operation, inclusivity) this may, in the absence of a consistent national policy for FE, encourage new ways of thinking about leadership and management within the sector. This will require, as Whitty (1997) argues, ‘. . . new forms of association in the public sphere, within which citizens’ rights in education policy can be reasserted against restricted visions of the State and a marketised society’. From this viewpoint more inclusive management styles alone are unlikely to succeed in the absence of changes in the broader distributive policies adopted by government and the state. It also requires new solutions in transforming the market machinery of managerialism in favour of a more public vision of pedagogy and leadership in further education, which resonates with changing professional and learning cultures ‘on the ground’ (Ball 1994). What this paper demonstrates is that devolved forms of managerialism both negate and draw attention to a wide
variety of leadership and management responses at organizational level. Its principle argument is that corporate managerialism is neither as complete or uncontested as it is sometimes portrayed. In discerning a cultural shift toward more inclusive leadership styles in FE much depends on whether principals and senior managers believe this shift to be real or simply a reworking of old managerialist imperatives. It may be that belief is too risky a concept to rely on. Yet, depending on which interpretation one takes it may have a significant bearing on the future outcome of leadership at the micro-policy level of FE, as the sector responds to wider principles of learning and social inclusion. If leadership in this volatile sector is to be more than just a trick of managing and socializing others in the self-surveillance rules of corporate culture, a more critical understanding of learning and professional development is called for.

Notes

1 This paper draws on evidence derived from the ESRC project Changing Teaching and Managerial Cultures in Further Education (ESRC Award No. R000236713, 1997–99), directed by Professor Denis Gleeson, Research Fellow Dr. Farzana Shain. I am grateful to Dr. Shain for allowing me, in this paper, to draw on collaborative work connected with this project. The fieldwork for the project was conducted over an eighteen month period from January 1997 to March 1999 in five colleges across three counties in the Midlands. In each institution, semi-structured interviews were conducted with a cross-section of 20 to 25 individuals, including principals, governors, senior and middle managers, lecturers, support staff and union representatives. In all, over 150 interviews took place that included some follow up individual and group interviews. In addition, documentary data (inspection reports, strategic plans, policy documents and internal memorandums) from colleges was analysed and observations were recorded where possible of key meetings (e.g. strategic planning, management and sector meetings).

2 The evidence base of this paper is drawn mainly from the interview accounts of 30 senior managers (a majority of whom were appointed since 1993). Interviews covered a range of issues regarding role, position, experience and perceptions of work including the impact of national policy on senior management roles at college level. Though each institution was subject to different geographical, educational, business, labour market and funding conditions, the research sought to illuminate different narratives that express recurring themes among senior managers across the colleges. The research on which this paper draws attempts to make sense of FE policy through the experience of a small group of senior managers, as they manage and mediate FE reform in the professional field in which they work (Bourdieu and Wacquant 1992).

FURTHER EDUCATION

STRATEGIC PLANNING IN FURTHER EDUCATION

The business of values

Jacky Lumby

Introduction

Managers within further education have been subject to criticism both from those working in the sector and those observing from outside (Ainley and Bailey, 1977; Elliott and Hall, 1994), and stand accused of ‘managerialism’—an ill-defined concept which seems to imply the inappropriate adoption of business values and practice. Strategic planning can be seen as exemplary of the adoption of managerialism, deriving as it does from corporate practice. Prior to 1993, colleges participated in a planning process which was led by the local education authorities (LEAs), intended to produce some coherence in the provision of post-compulsory education and training. Since incorporation in 1993, colleges of further education have been required to undertake strategic planning as independent institutions, encompassing not only curriculum issues but also aspects of planning such as human resources and premises which had previously been the formal responsibility of the LEA. In attempting a strategic view, harmonizing all assets and activity within a long-term plan, colleges have moved to a planning process much closer to that undertaken by independent businesses. A second aspect of the greater similarity to commercial strategic planning is the degree to which the absence of local coordination has resulted in a competitive environment which may be detrimental to current and potential students and may be of national concern (Kennedy, 1997).

Crisp (1991: 3) defines the process: ‘Strategic planning is the set of activities designed to identify the appropriate future direction of a college, and includes specifying the steps necessary to move in that direction.’ The generic literature abounds with reminders that strategic planning is a very complex and contested theoretical area. Both the Further Education Development Agency (FEDA, 1995) and the National Audit Office (1994) by inference adopt a rational approach in the guidance they offer colleges, and detail the failure of colleges to
match the assumed features of this model, that is the achievement of a mission-derived hierarchy of precise and measurable objectives with clear timescales and responsibilities. This criticism has been balanced by the recognition that colleges have survived in a period of successive financial cuts (FEFC, 1996a) and expanded their student numbers (FEFC, 1996b), indicating some success with their planning process. The Kennedy Report (Kennedy, 1997) discriminates between increased student numbers and widening participation, arguing that the current deregulated context may be leading to colleges increasing numbers in ways which still do not address the non-participation of the disadvantaged, implying criticism of the value base and methods of colleges.

This article reports on interviews with principals in the context of analysis of a sample of college strategic plans, with the aim of further understanding how the process of strategic management has been experienced and understood in colleges, and to explore the relationship between college’s experience and generic models of strategic planning. It also investigates the values colleges bring to strategic planning, exploring whether there is evidence to support Kennedy’s concerns.

Research method

As Ainley and Bailey (1997) point out, further education is undertheorized, and although there is a body of literature on applying corporate strategic planning concepts to the public services (Bryson, 1988; Wilkinson and Pedler, 1994), the parallel literature on further education is very sparse. An answer to the question posed by Wilkinson and Pedler (1994: 188), ‘Is the strategic managerial task inherently different in public service?’ and more specifically, inherently different in further education, requires an answer urgently, both to enrich the pool of theory from which managers in the sector can draw to guide practice, and also to act as a touchstone against which to judge the justification of those who criticize strategic planning in further education for not conforming, or for conforming too strongly, to business models.

Bogden and Biklen (1992), in discussing the nature of qualitative research, emphasize the goal of better understanding human behaviour, and the use of ‘participant perspectives’ to this end. The research reported in this article was concerned not just with the products of strategic management, the strategic plans themselves, but also with how those concerned created meaning within the process. To achieve this ‘empathic’ perspective (Bogden and Biklen, 1992) interviews were conducted with four principals and one second-tier manager with particular responsibilities for strategic planning in colleges in five counties in the Midlands and eastern regions of England. Three colleges were in cities and two in smaller towns in more rural areas. Given the reluctance of many colleges to speak about what they perceive as a very sensitive area, the interview respondents were a convenience sample of those who offered help to further the research. As such they cannot be taken as representative, if indeed representation
is achievable in such a diverse sector, but the conformity or divergence of their views may offer clues as to how strategic planning has been experienced by those charged with leading the process. For convenience, this group will be referred to as ‘the principals’ throughout the article.

To balance this personal perspective, the author requested copies of the strategic plans of the 222 general further education colleges in England. There were 53 responses: 29 full strategic plans and 24 partial plans. It was therefore possible to analyse the content of full or partial plans of 24 percent of all general further education colleges in England. The scrutiny of plans was designed to offer an insight into the process of planning and the stated intentions of colleges which could be related to generic theory of strategic management and form a context for the interviews with principals.

The national framework

College strategic plans must be negotiated with both the FEFC and the local Training and Enterprise Council (TEC). The FEFC (1992) has offered guidelines on the structure it expects in college strategic plans. Analysis undertaken centrally indicates that most colleges conform to the expectations (FEFC, 1996b). The FEFC’s suggested approach is based on classical Taylorist ideas of management (Taylor, 1911), with carefully identified aims and objectives and the allocation of responsibility and resources against numerically specified outcomes, but the technical inclusiveness veils a strategic vacuum. The FEFC is charged with ensuring the adequacy and sufficiency of further education, so they have responsibility for the overarching mission. However, all of the principals felt that this was more evident in rhetoric than in fact. As one explained: ‘They are charged with providing adequacy and sufficiency. When you say to them what does this mean they do not know. I know they do not know because I have asked the question.’

The principals perceived the procedure of the FEFC to be to spot where a college was withdrawing provision in a curriculum area and then to consider if a response was needed:

The only approach of the Funding Council is to wait until people say they are getting out and then say, oh that is a problem. Could we talk to you about perhaps staying in? It’s not a pro-active approach. It’s not sitting down and saying what is adequacy and sufficiency. Have we got provision to match demand? Where do we need to be? The situation at the moment is for them to ask, well who’s giving up? Do we need to patch the hole?

Generic theory (Ansoff and McDonnell, 1990) suggests that the responsibility for the overall mission or vision is properly placed with the top level of the organization, and that subunits must plan within the overall strategic aims which
relate to mission. Within further education, the national mission is not defined in a way which is meaningful, and the absence of such direction leaves colleges de facto with the task of achieving a national strategy in a context where there is no well-defined and agreed mission and where they have little power to shape resources. Kennedy’s (1997) concern about a lack of coherence seems borne out, but the suggested response of a greater degree of collaboration and partnership will not address the lack of a national mission defining adequacy and sufficiency of further education provision.

If the FEFC framework was not seen as much positive help at a strategic level, none of the principals felt it to be a constraint on their strategic thinking. Fitting the thinking into the planning framework was a secondary process:

> You have what you might call a technical constraint of having to try and think back and turning what you would do in terms of responding to need into a numerical format, putting so many students into each programme area, so there is a sort of constraint there but it is not a constraint on the way you think strategically. It is a constraint in terms of interpreting the strategic plan into something which satisfies the Funding Council.

Similarly the TECs were not seen as a constraint on strategic thinking. As one principal explained, he did not believe that his local TEC had the quality of information which would allow it to challenge any of the college’s plans:

> From our point of view, I tried to involve the TEC from very early on this year, sent them an early draft, but I hadn’t had a discussion with any one of them about it. They have simply written back saying we think it is lovely and here’s your letter (of endorsement) and that has been the extent of negotiations with them.

All of the principals felt that they would wish to take account of the FEFC and TEC as important players, and some had helpful and supportive relationships, but ultimately, they felt free to shape their college’s objectives.

**The content of the plans**

The plans themselves were analysed to identify the range of terminology, how far the different levels of the plans related logically to each other, and the range of aims and objectives. This uncovered a semantic minefield. At the level of expressing the overall corporate aims and objectives, colleges referred to vision, mission, values, strategic aims, corporate aims, objectives, targets, strategic tasks, key commitments, key themes, crucial objectives, critical success factors, outcomes for students, motto, significant factors. There was no common usage of these words.
In many plans there was a loose relationship between the different sections. Johnson and Scholes present a neat, logical sequence of planning in which each level relates to the previous one (see Figure 1, adapted from Johnson and Scholes, 1993: 13). This model assumes that the first level of planning is a visualization or concept of where the organization wants to be which is strategy neutral—i.e. the means to reach the desired state are not chosen. As the hierarchy descends, the means to reach the overall aims are chosen and become ever more specific, each dependent on the previous level. Whether this figure fully represents what happens outside education is contested elsewhere, but it certainly does not describe the majority of further education college plans that were analysed.

First, the means chosen to achieve the ends were apparent in many primary statements of aims: overarching vision, mission and aims were not necessarily strategy neutral. Additionally the sections which came in sequence and had titles relating to the generic concept of a hierarchy of specificity, often were simple restatements of the same general aims. In other words the ‘vision’ would give some general aims which might be restated in the ‘values’ or ‘mission’ or ‘corporate aims’. Whatever sections were called, they were not necessarily a further refinement or specification of the previous section. They were more focused on rewording, finding new words to restate the same content as the previous sections.

The plans often incorporated sections on quality, accommodation, etc., as suggested by the FEFC and also sometimes sections which related to the units into which the college was organized, such as faculty or programme areas. Cross-referencing was used by some colleges to try to retain strong connecting links between different parts of the plan, but there were many examples where the multiplicity of sections were not clearly linked. It was often as if each individual or group of individuals, from governors through to programme area teams, had reworked the sections into statements which were all their own and which bore no strong connection to other parts of the plan.

![Figure 1](image-url)
It would be easy to hold this up as a failure to achieve the logic and precision required by rational planning models, and indeed colleges new to the process may have struggled to keep control of the coherence of the overall plan. However, it may be that the contrast with a strictly rational approach points to a different need and a different way of working. All of the principals referred to the unimportance of the strategic planning document and the importance of the process. For four of the five, the fundamental purpose of the strategic planning process was to identify the purpose of the college: ‘It is actually about galvanising yourself into some conscious thought about what you are there to do. You have to say things to yourself and to each other if you are to be able to act purposefully.’ The key phrase in this statement is in italics (my emphasis). Strategic planning to this principal is not just about arriving at crisp rational aims, objectives and costed action plans, but about speaking to each other. The use of words is not to achieve unambiguous targets for action, but primarily to explore the values and understandings of those who are involved. This may involve a limited group, such as the senior management team, or the entire college community, but it is essentially a conversation, an exchange which is only secondarily designed to delineate action. Primarily, it is an act of union, designed to reinforce commitment and motivation.

Although the language and structure of plans varied, the actual aims and objectives were very general and very similar from college to college. All of the corporate aims could be categorized under four headings:

- the product or curriculum
- market
- resources/costs
- capability building

The majority of plans had strategic aims of all four types and a generic list of college aims could be deducted (see Table 1).

Of course, at a high enough level of generality, the strategic aims of all organizations would appear similar. ‘Surviving long term’ is just such an aim. However, the wording of the college plans retained this level of generality often not just in the primary strategic aims but further into the plan, at those levels where one would expect specificity to distinguish one college from another in the way that one company might be distinguished from another in business. This raised another point of comparison with generic theory. In the latter, companies seek to acquire a competitive edge by differentiating themselves from others, particularly rivals within their market. As Peters (1989: 137) puts it: ‘Don’t just stand there, be something!’ Peters’s argument is further developed to suggest that companies must strive to be not just different from others, but significantly different. Colleges are clearly following the route of attempting to focus on product, costs and market, but this is not necessarily leading all of them to a significantly differentiated position.
Making strategic choices

To explore further this indication that colleges were not necessarily seeking to distinguish themselves from each other, the principals were asked what strategic choices they felt their colleges had. There were apparent differences in opinion. One felt ‘We have absolute freedom’. Another explained that he did not feel that there were any true strategic choices at all: a hundred years before someone had sat in his office making decisions about the curriculum and probably someone would be undertaking the same task in a century’s time. The decisions were tactical. He argued that the only strategic decision was whether the college continued or not, and in this there was less choice than might be imagined, as he felt that if the college closed, the community itself would set up a college of further education, as it had set up the colleges a century before. The college would continue to exist as a service to the community whatever managers might deliberate. The only decisions were small ones concerning minor changes in the curriculum. Another principal echoed this strongly, arguing that the inheritance of a college shaped the choices it could make. All felt that other colleges might have greater choices, but the principals emphasized a primary commitment to the college’s local community. Where work was undertaken elsewhere, it was to access resources which could be brought back to that community.

Our strategy is based on what we perceive to be our communities’ needs. We define our catchment and we are primarily here to serve...
those with a 25 mile radius of any of our sites but we go beyond that for a reason, and again this is written in our policy, that if we deliver beyond that catchment area we are doing so to make money to bring back to our catchment area . . . We do not need a big competitive edge against our nearest college. Most of the people will come to us anyway.

Where choices were made to work outside the college’s local area, they might be value and not just finance driven. For one rural college, the choice to engage with several national and overseas market niches was partly to put money back locally, but also to ensure that students were not trained in a parochial environment.

Colleges which had a large local population were able to make choices within their local community, again, at least at the moment, based on values. One college, faced with costs of £12 million to offer the 16–19 curriculum, and income of around £8 million, had chosen nevertheless to continue to provide for this group:

Sticking with it would be a value driven decision. Sticking with it would be to say that the market is 16–19 year olds and this college is about educating 16–19 year olds and that is the service that we wish to continue providing, even though we do so at some financial cost. However I don’t know how much longer I can continue to do this and let the buildings crumble around me.

Market choices were possible, whether to adopt specialist areas with national or international recruitment, whether to concentrate on training the 16–19 years olds or local employed people, or returning adults or to offer higher education, but all this was within the parameters of a primary commitment to local people. For some colleges, the need is to provide for as many of the local groups as possible: ‘In the particular geographical location in which we operate i.e. largely a rural location, we have a particular responsibility to the communities in this rural area to provide the broadest curriculum portfolio.’

Underpinning the ability to achieve a sense of choice was the position in relation to resources. All of the colleges were engaged in activities which were designed to generate income to plough back into provision for the local community, but the difficult financial position of some undermined strategic choice. The necessity to generate sufficient income to continue to survive may in effect dictate choice.

The business of values

The colleges then were engaged in choices, but not all of them in the sense which might be recognized in the commercial world. The drivers of strategy were fundamental commitments to the value of education and training and to the
people of the local community. These factors would be followed even at financial cost as long as the college could survive. The comment quoted earlier ‘You have to say things to yourself and to each other’ is relevant in that the people working in further education colleges may not have recourse to developing a strategy of competitive edge or differentiated markets-and-products. They are a public service and, as such, work within different parameters, and may need to reinvent continually their basic commitment to an unglamorous and low-status world. One principal said the real challenge lay with colleges like his own, which had historically grown up by meeting the range of local needs not covered by schools or universities:

The worst thing to be is a general purpose further education college . . . because almost certainly, the really distinctive things belong to some other institution . . . I look at this college and we are transparent. The worst thing you can be is in the middle ground with nothing distinctive. . . . Lots of tiny little niches, that is where the strategic choices are, let us try a bit of this, let us not do that. Actually, in a big sense there is nothing particular, just lots of little tiny moves.

How can the generic theory of strategic planning, with the need to achieve distinctiveness, be linked to this understanding, where the planning process is ‘lots of tiny little moves’ in an organization which is ‘transparent’? Clearly, some general further education colleges are working in a context which is too different to business to find such a theory either a helpful description of their experience or an appropriate basis to analyse the possibilities for further action. Compared to the logic and competitive drive of the theory, many of the college strategic plans appeared to be a muddle and lacking individuality. However, a minority of plans had a driving sense of direction with clear connections between sections, a logical development of a hierarchy of objectives and a strong sense of developing a distinctive market position.

A hypothesis which emerged is that the difference in the nature of the plans may relate to the geographical and historical context within which each college worked. Where the inheritance of geographical position allowed, the college had a real sense of strategic choices. For example, colleges located in an east coast port were able to offer a very distinctive vision of supporting a European market and global exporting industries. Colleges in a declining rural area, with a thin population and little concentration of industry or similar challenging environments, may feel that they are constrained by the imperative to meet as wide as possible a range of needs, particularly of those in the local community who are often the ‘socially excluded’. Despite an acute awareness of financial realities, values, not a competitive position, lay at the root of the choices or lack of them, and may also explain the language and structure of the strategic plans themselves.

A college’s plan could therefore be based on the need to achieve a distinctive
niche and the ability to drive forward hard in a logical and focused way, or on the need to use the strategic planning process to reaffirm values and commitment to the needs of local people, a position which was not distinguished from other colleges, and where the creation of commitment overrides all other possible aims of strategic planning. Despite the accusations of managerialism, the principals interviewed gave a strong sense of a value-driven process:

This is the difference between a college and a company. A company can make a strategic decision to get involved in a different area of activity, and to employ resources in different areas so that they will creep away from what their founders initiated to some other area. A college can flavour education, but it can’t strategically step away from it. . . . Why? What is the fundamental drive? It’s because people want to learn, want to change.

Viewed from this perspective, the purpose of strategic planning in further education may differ fundamentally from that in business.

The process of planning

The process of strategic planning was seen as difficult by all the principals. One described calculating the years of experience in education of those involved in formulating the strategic plan. It added up to a huge number and yet ‘we can’t get the projections right. Every year we get them wrong . . . We are asking the impossible.’ Two major issues were the difficulty of securing adequate information and the most effective way of involving staff. Local information was universally seen as problematic and may remain a stumbling block for some time to come.

The involvement of staff was a more complex problem. Ainley and Bailey (1997: 60) state: ‘Strategic decisions are taken at the centre and these are passed for local implementation to middle managers in their specialist curriculum areas. This is one of the sources of the new managerialism in further education.’ Interviews were only conducted with senior managers and therefore the perspective of middle managers and lecturers was not included. However, it was quite clear that the practice was, at least in intention, more varied than indicated by Ainley and Bailey and that the simple equation of involvement good, imposition bad, was not seen as unequivocal. The plans themselves sometimes indicated that the process had not been top–down. Some college plans were produced by a synthesis of plans written by programme area teams. One plan noted that contributions had been sought from the whole community and 120 staff had contributed ideas. The whole issue was fraught with problems, as one principal explained:

How do you get an organisation of 400 people who are all working in different ways, in different sets of people within the organisation, and
don’t appreciate each others’ culture and values, to own something that is called a strategic plan? That is what all the models say you are supposed to do.

He went on to define his own position as disbelieving this as an absolute. He did not believe that all wished to make a contribution, nor that all could achieve an overview of the college. Speaking of the IT technicians as an example, he explained:

I don’t think they would ever say that they want ownership of the strategic plan. They want leadership and they want to make some contribution. They want to feel that their views are important even if they have no views to make and often they will have no views to make. So I am a bit confused about exactly what ownership is.

The concept of ‘ownership’, if this meant everyone agreeing on aims and objectives and being fully committed to the plan, was seen as unrealistic. All of those interviewed had tried to involve staff to differing degrees. One had established a framework for every group from governors to programme area teams to be part of the process which was consensual not consultative. It was not a question of writing a plan and then sending it to people to comment. The plan was evolved through a collaborative process, each stage being agreed before the next was initiated. Other principals did use a consultation process, where the plan was written by senior staff, sometimes incorporating the ideas from a number of staff and other stakeholders, and then circulated for comment. Of the five principals interviewed, one was committed to a collaborative approach. The others were attempting a consultative process:

I am not advocating total involvement. We are not a democracy. We are an organisation in which some people will have more influence in strategic planning than others, but we do want as much ownership as we can achieve and as much contribution as possible from different staff in formulating the plan.

Implementing the plan

The difficulties of involving staff in the formulation of the plan shade into the difficulties of motivating them to implement it once formulated. The problem is widely acknowledged. Quinn (1993: 83) comments on executives who ‘rely on the awesome rationality of their formally derived strategies and the inherent power of their positions to cause their organisations to respond. When this does not occur, they become bewildered, if not frustrated and angry.’ The plan itself was seen by the principals as of limited value, partly because if it encompasses targets that can
be reached they may be too unambitious, and also because things change so fast that it is in a sense redundant from the moment it is completed. Nevertheless, the possibility of using it was a benchmark to guide and discuss progress emerged, though with some caution as to how far targets could be delegated in an endless succession like ripples emanating from the centre. While the use of objectives and targets was seen as helpful, the process of changing attitudes and behaviour as a result was seen as much more difficult. One principal described the challenge:

Of course having a plan on its own does not mean anybody will do anything. . . . At some point during the working week the caretaker in this institution has to think that what he or she is doing is making some sort of contribution to the college plan. That may sound grand, but if I don’t get them to the point where they think about their attitude to students. . . . if they don’t at some point in their working week realise that they are not putting a brick in a wall they are building a cathedral, then the strategic planning has failed. It must touch people’s lives.

In attempting to achieve this principals were building ownership processes, but also micropolitical tactics and coercion. The power base of players resulted in agendas which were not always perceived as in the best interest of the students or of the strategic management process. Some people just did not want to change. One principal described a programme area which was convinced it had as many students as it could possibly teach and was already a centre of excellence. He told them that they needed to teach more students and that they were not yet a centre of excellence: ‘I had to tell them to do this. I listened to all their views as to why they could not and then I had to tell them to do it anyway.’ Questioned on how the staff had reacted, the principal answered: ‘The nice answer would be that they were convinced by the arguments. The unpleasant answer is that they saw the need to do it or else. I think it was both.’ The staff had gone on to succeed in recruiting more students and improving quality. The means of achieving this were a mixture of coercion and reason, with a reorganization so that some individuals had new roles dependent on achieving what was planned. Not all agreed and it was acknowledged that they probably never would. Achieving a ‘dominant view’, in the words of the principal, was the aim:

All the time I am after a dominant view and sometimes it can be through the force of argument, sometimes it will be through putting people who are supporting in positions of power. It sounds hard but it is one way of doing it and also making people’s career dependent upon their supporting the direction of the institution and making it clear that if they don’t, they are along for the ride, but they are not moving anywhere in their own career. I don’t believe I just said that, but it is true.

Perhaps this could be seen as an example of the ‘new managerialism’ cited by
Ainley and Bailey (1997). The problem is that this is certainly not a new type of behaviour. The use of micropolitical activity was recognized for at least two decades before incorporation (Ball, 1987; Bolman and Deal, 1984). Consequently, whatever type of managerial behaviour it may be, it is certainly not new. The assumption that it is in some sense wrong is open to question. It is still not acceptable to openly admit to micropolitical behaviour, hence the final sentence of the comment above, where the principal surprised himself at the openness of what had been said. There has been relatively little research in any phase of education into micropolitical behaviour, partly because of the inherent difficulty of researching behaviour which is by definition hidden. The use of career prospects as a lever to create loyalty or direct behaviour is indisputably present in many institutions. It is therefore more likely that when college leaders are exhorted to achieve a consensual approach, they may need to consider how far the prevailing models of collegiality are a normative mythology and how far they may need to be modified into a more realistic approach, including a wider range of tactics.

The need for all staff to be fully aware of and committed to the strategic plan was also questioned. One principal pointed out that, in wandering round the college, unless a senior manager was encountered, the staff met at random would probably disclaim all knowledge of the strategic plan: ‘I think people are aware that changes are happening but they would not package it up and say oh that’s because of the strategic plan. They would describe it as managers cutting budgets or attribute it to something else.’ The real need, as he saw it, was for managers at all levels to be able to interpret and draw out the important points and motivate people in the direction of the plan. The strategic plan was a failure if the behaviour of teachers with students was not touched by it, but the behaviour would not be touched only by every member of staff being fully conversant with the plan and having fully contributed. The latter was certainly one way, and an important way to all of the principals, but it was not the only way. If a teacher changed what he or she did without realizing that it was as an indirect result of actions set in motion by the strategic plan, that was fine.

**Conclusions**

All of the principals agreed that engaging with strategic planning had brought benefits to their college. They felt that the process had resulted in:

- a greater sense of purpose
- an increased feeling of independence
- a benchmark against which all decisions could be measured
- better systems and efficiency
- better communication as there was something important to communicate

To use their words it had ‘taken away the adhocery’ and provided ‘a peg to hang everything on’. There was admiration from one principal that the FEFC had
forced colleges ‘kicking and screaming’ into better practice. The picture that emerged did not support Kennedy’s criticism ‘that the new ethos has encouraged colleges not just to be businesslike but to perform as if they were businesses’ (Kennedy, 1997: 3). Colleges had become more business-like, but not in any simplistic sense of being profit or competition centred. They were more sure and more committed to what their business was:

Business-like means recognising who we exist for, who we are serving, who our clients are and measuring ourselves against the satisfaction of those customers/clients . . . so by business-like, I am not meaning that you have got to measure every success in terms of profit.

In a public sector environment, as Wilkinson and Pedler (1994) point out, what may be required from strategic planning is a broad rather than detailed direction, so when writers analysing public sector plans from the perspective of private sector thinking criticize them as ‘travesties’ (Argenti, 1992) because of their lack of detailed verifiable objectives, it may reflect misunderstanding. Equally, those who have criticized senior managers in the sector for ‘managerialism’ may need to research further how far the behaviours in question are new or detrimental to the organization or the students.

The planning context of a perceived strategic vacuum at national and regional level concerned the principals, and it may be that the new emphasis on developing regional partnerships (Department for Education and Employment, 1998) will address this problem to some degree. Such a development was cautiously welcomed:

As resources get tighter we have to work in more partnerships, employers, the TEC, government bodies, other colleges, whoever, and it is getting understanding with them at a stage which could influence our own planning. What tends to happen is that you issue plans to people which outlines this is what we are going to do instead of developing plans with people. There will be a bigger emphasis on that in the future.

However the move from a free market towards a partnership model may be difficult as colleges balance their own desire to retain autonomy with the desire to achieve regional coherence and widen participation (Lumby, 1998).

The process of strategic planning has provided a vehicle for colleges to engage in discussion as to what they are about and how they are to achieve it. For some, the purpose may be to identify ways of surviving in the face of aggressive competition, but for many general further education colleges, the process is different. There are certainly strategic choices, but they are small ones about shifts in how to meet the vocational education and training needs of their local people. The process of planning allows them to commit to this business and to become more business-like, that is more centred on how better to meet
the needs of their students. The range of behaviours to achieve the plans may include micropolitical manipulation, but this has always been the case. Perhaps the real point is that there is now more chance of the purpose of such tactics being clearly understood and related to student need.

Strategic planning in further education therefore differs greatly from that undertaken by private sector organizations in that the process is used to position not only, or in some cases not primarily, against competitors but against, in the words of one principal, ‘governmental drift’. Government has policies for schools and for higher education. Whatever is left over is further education, and against this grim scenario strategic planning had helped to maintain some sense of the worth and value of the work of the sector. Criticizing managers in further education for not conforming to private sector rational models or for implementing a business-derived inappropriate coercive regime is to underestimate the diversity of practice and to miss the opportunity to better understand and support those engaged in an almost impossible task.

Acknowledgements

Acknowledgement is made of the generosity of many colleges which provided their strategic plans, and of the principals who gave their time to share their experience.

EDUCATIONAL REFORM AND MANAGERIALISM
Comparing the experience of schools and colleges

Tim Simkins

This paper explores the organizational and management consequences of the changing policy environment facing public sector education in England and Wales over the past 10 years. In particular it considers how far arguments about the replacement of older ‘bureau-professional’ forms of organizational order by more ‘managerialist’ forms in the public sector in general can be applied to the specific case of education. The paper begins by reviewing the major policy changes that have affected schools and colleges since 1988. Drawing on published studies from these sectors, it then considers a number of themes: changing roles of senior and middle managers; changes in managerial and organizational culture; and changes in specific aspects of management. Emphasizing the tentative nature of the evidence, the paper identifies some common trends which imply a movement towards managerialism in many institutions. However, it also identifies areas where the position is less clear and suggests a number of factors which may explain differences of experience. It emphasizes the importance of not reifying a previous ‘golden age’ of collegiality and concludes that what is being experienced is a complex and dynamic process of adjustment between old and new organizational and managerial forms.

Introduction
Since the late 1980s the British educational system has experienced a roller-coaster of policy changes. The focus and content of these changes have varied over time and among different parts of the educational system. Yet they have all been driven by a clear underlying rationale: to create a policy framework that
will provide an imperative for schools and colleges to respond to the improvement agenda of both Labour and Conservative Governments.

The purpose of this paper is to examine the evidence on the organizational and management consequences for schools and colleges of this changing policy environment and, in particular, to explore how far and for what reasons patterns of change may be differentiated among organizational contexts. The paper begins by outlining the similarities and differences between the policy contexts facing schools and colleges as a result of the reforms introduced by the present Labour Government and its Conservative predecessor. These changes are then related to the concept of ‘managerialism’, which is becoming an increasingly important part of the discourse about public sector reform in the UK. The paper then proceeds to review some of the changes which appear to be taking place in the management of schools and colleges as a result of the reforms, before drawing some general conclusions about the factors which may have affected the different experiences of institutions as those within them have attempted to respond to the new pressures which they face.

The policy context for schools and colleges: variations on a theme

The policy framework for schools was established initially by the Education Reform Act of 1988 and modified by later legislation. Under these arrangements governing bodies of schools have been granted considerable powers to manage their own affairs, including the management of block budgets out of which the great majority of their resources must be funded. These budgets are determined by pupil number-led formulae that local education authorities (LEAs) determine within government guidelines. The funding mechanism, therefore, is designed to provide schools with incentives to maintain and enhance their enrolment, within a context of enhanced parental choice.

These aspects of government policy – developed governance, formula funding and enhanced parental choice – have, despite some changes in detail, been the constants of the policy environment facing schools since the late 1980s. However, for most schools, at least as important as these aspects of policy have been other powerful non-financial control mechanisms which have been designed to constrain the nature of the choices which schools make in the deployment of their resources. These policies have focused directly on the curriculum, the means by which it is delivered and the results achieved. A constant theme has been the requirement that test and examination results be published to enable the performance of schools to be judged and, it is argued, to inform parental choice. Beyond this, the relative emphasis that has been given to particular aspects of policy has varied over the period since 1988. Initially the focus was on the National Curriculum so that for a number of years thinking in the majority of schools was dominated by the twin imperatives of delivering the National Curriculum and implementing devolution. From around 1992,
however, a new policy pressure emerged: a regime of regular inspection with the requirement for schools to produce action plans following such inspections (and the monitoring of their implementation in the case of schools deemed to be failing). Since then, the prospect and the experience of inspection has emerged as a dominant pressure for many schools, placing stress on senior managers and staff alike as they have prepared for and responded to inspection visits.

Since the May 1998 general election, further themes have emerged. First, the focus on the publication of test and examination results has been developed into a regime of institutional performance management through the requirement for schools (and LEAs) to set targets for the improvement of student achievements as the focus for planning (DfEE 1997, 1998a). Secondly, more interventionist policies on input management have been established through centrally-driven recommendations on the organization of teaching and, more recently, proposals for potentially radical changes in the ways in which teachers are managed within schools (DfEE 1998b). Such developments suggest that the new Labour Government is placing less emphasis on incentives derived from the quasi-market of decentralization and parental choice and relying much more on placing demanding expectations directly on institutions with the possibility of intervention when they are deemed not to be achieving them. There would seem to be two reasons for this: first, impatience with the assumed imprecision and unpredictability of mechanisms which attempt to affect performance primarily through the quasi-market; and, second, concern about some of the equity effects of quasi-market solutions to the ‘problem’ of school quality.

The policy framework for colleges was established by the Further and Higher Education Act of 1992. Under this, colleges were granted full legal autonomy as corporations, with responsibility for staff, assets and financial management, with their core funding provided on a formula basis. However, compared with the schools sector, the funding mechanism for colleges has been used more directly, more centrally and more ambitiously as a policy tool. Unlike the schools sector where, despite strong central government steers, responsibility for funding is distributed among, currently, more than 170 local education authorities, all institutions in the colleges sector receive substantial parts of their funding directly from one of two national funding councils (one for England and one for Wales). Furthermore, again unlike the schools sector, this funding is provided on the basis of contracts which colleges make with the councils to deliver specified levels of provision at specified unit costs, with colleges bidding for resources in relation to criteria established on an annual basis by the funding councils. This means that the councils can, and do, use their funding mechanisms explicitly to achieve particular policy goals that are derived in substantial part from government policy. The Further Education Funding Council (FEFC) in its early years has sought to achieve the following through the mechanism of formula funding:

- to encourage growth through enabling colleges to bid for additional funding for student numbers beyond a core level;
to encourage efficiency (or, more specifically, to encourage high cost colleges to reduce their unit costs) by seeking a convergence of the level of unit funding across the sector;
• to reduce wastage and increase achievement by tying some funding to successful learning outcomes;
• more recently, to widen the participation of under-represented groups in further education.

Thus while all parts of the educational system have been subject to significant resource constraints, the pressures for increases in resource efficiency have been much greater for colleges than for schools as the Government has pursued a policy of substantially increasing participation while constraining expenditure.

As in the schools sector, these funding mechanisms have been complemented by other policy tools, which focus more explicitly on the internal management of colleges. These include inspection and requirements for a range of formal management provisions, such as strategic plans, college charters, disability statements and learner agreements for each individual student. However, these had not yet, at the time of writing, significantly qualified the enormous power of the funding mechanism as an influential policy driver (Bradley 1996), although plans had been announced to introduce into the sector approaches to the management of outcomes based on benchmarking and target-setting similar to those in the schools sector (FEFC 1999).

In summary, all parts of the education system have been subject over the last ten years or so to a number of major policy pressures, but the ways in which these have been applied have differed in detail. Thus, each sector has experienced:

• decentralization of major powers from local education authorities to institutional level and the empowerment to varying degrees of clients as ‘customers’;
• outcome-based management through the specification of performance criteria and the establishment of target-setting and associated planning processes in relation to these. For schools these have focused primarily on outcomes measured in terms of test and examination results; for colleges the emphasis has been primarily on enrolment patterns and unit costs, although this emphasis is now to be supplemented by a focus on student achievement;
• more detailed interventions concerning organizational processes and decisions, relating for example to curriculum provision in schools and to planning and management processes in colleges;
• on-going processes of surveillance through regimes of inspection.

The rest of this paper examines the consequences of these changes for school and college organization and management.
The rise of managerialism in education?

In a seminal paper, Kouzes and Mico (1979) argued that ‘human service organizations’ in the public sector operate simultaneously in a number of ‘domains’, each of which has a rather different set of legitimizing norms which generate particular kinds of governing principles, success measures, structural arrangements and work modes. These domains are: the ‘policy domain’ of representative government; the ‘management domain’ of hierarchical authority; and the ‘service domain’ of professional support for clients. Kouzes and Mico argue that the natural condition of such organizations is a state of tension as each domain struggles to maintain its own integrity and reinforce its own standards within the organization. I have argued elsewhere (Simkins 1997) that this kind of analysis is particularly fruitful in analysing the underlying changes in power distribution sought by the educational reforms of the last decade. In particular, these reforms have sought to introduce new forms of accountability which: redistribute power in the policy domain from local representative government towards central government and its agencies and newly constituted governing bodies of institutions; disempower the service (professional) domain within institutions in favour of a reconstituted management domain; and empower ‘consumers’ directly through marketization and, in the schools sector, enhanced ‘voice’ within governing bodies.

The public policy literature suggests that such developments in education are part of a wider trend in forms of control in the public sector. For example, Hoggett argues that:

> The restructuring of the public sector in Britain illustrates several elements of hands-off control systems (e.g., the development of structured markets, the linking of resource allocation to performativity, the new forms of operational decentralisation), but these have to some extent been dwarfed by visible elements of centralisation (e.g. the destruction of the autonomy of local government, the development of the quango state) and the extended use of hands-on systems of performance management creating a form of ‘evaluative state’...

(Hoggett 1996: 29)

It is further argued that these developments are changing patterns of organization and management within those institutions which are subject to them through the development of new forms of organizational control which can be characterized as ‘managerialism’ (Pollitt 1993, Clarke and Newman 1997). For example, Clarke and Newman (1997) argue that such forms of control are replacing an ‘organizational settlement’ between two modes of co-ordination or ‘organizational orders’ – bureaucratic administration and professionalism (which they link as ‘bureau-professionalism’) – which dominated the public sector for much of the post-war period. Gewirtz et al. (1995) have argued
similarly in relation to schooling. These analyses suggest that bureau-professionalism and managerialism can be distinguished along a number of dimensions.

First, bureau-professionalism is characterized by a series of cross-cutting attachments to client-centred, professional and public service values, such as equity and care, whereas managerialism is characterized by commitment to the over-riding values and mission of the specific organization. Such attachments are derived from different forms of socialization: those with management responsibilities within bureau-professional systems are socialized within the specific professional field in which their organization is located, for example education or health, whereas managers within more managerialist systems are socialized directly into the values of ‘management’ as a generic discipline. Second, bureau-professionalism is characterised by decision-making through a combination of bureaucratic rules and professional discretion and judgement, whereas managerial decision-making is characterized by discretion entrusted to those who hold clearly identified managerial roles and authority and who use specialist management techniques to help them make choices. It is assumed that such techniques for achieving better management are knowable; indeed that they are known and generally applicable – they can often be found in best practice in the private sector. Thirdly, bureau-professional agendas are based on the needs of individual clients and client groups as interpreted or formulated by professionals. Those of managerialism, in contrast, derive from concerns focusing around organizational objectives and outcomes and the deployment of resources as defined by managers in response to their interpretations of the environmental forces with which the organization is faced. Finally, the norms of bureau-professionalism are defined in terms of the well-being, needs and rights of clients while those of managerialism are based on concepts of efficiency, organizational performance and customer-orientation.

The bureau-professional and managerial orders may be conceived in both normative and descriptive terms. In their normative or ideological form they represent sets of values and ideals which provide competing discourses to justify and explain particular policy and management regimes. In so doing they also embody contrasting assumptions about power and legitimacy. Thus bureau-professionalism gives primacy to the roles of the professional and the public service bureaucrat; managerialism, in contrast, justifies and legitimates managerial power and challenges the values and power bases embodied in the ‘traditional’ bureau-professional settlement. It requires that managers be given the ‘freedom to manage’, which in turn implies delegation of power within managerial hierarchies and may also imply the disempowerment of other groups such as political representatives and workers, including professional workers.

Alongside their normative content, however, these ideas have considerable potential for describing and analysing change in public service organizations, including those in the education sector. Viewed from this perspective, managerialism provides a framework, not just for analysing the discourses which justify and legitimate change, but also for exploring the particular arrangements which are developed to translate policy agendas and goals into practical organizational
consequences in particular situations. The rest of this paper will consider the ways in which the policy changes described earlier have impacted on the management of schools and colleges. It will explore in particular the degree to which the kinds of policy changes which education has experienced over recent years have indeed led to increased managerialism in schools and colleges and whether such an impact, if any, has varied across organizational contexts.

**Changes in organization and management**

* A focus on the organization and its leadership

There can be little doubt that the reforms in both the schools and the colleges sectors have altered thinking about the purposes and outcomes of education to place the primary focus on the performance of the individual school or college. This does not mean that the dimensions of the individual pupil or student or of the wider local and national system have been lost. Indeed, in both sectors, greater emphasis is being given to the development of sophisticated tracking systems to monitor the performance of individual students, and in the schools sector LEAs as well as individual institutions are being required to achieve ambitious targets in relation to pupil performance. Rather, the new emphasis sees effective management at the level of the school or college as the primary means by which policy goals are to be achieved and the place where the educational ‘buck’ stops. A major consequence is a reframing of the roles of senior managers.

It seems clear from all the literature on the consequences of reform that, despite *de jure* empowering of governing bodies, one of the major consequences of devolution has, in fact, been to reinforce the pivotal position of heads and principals as organizational leaders (Jephcote *et al.* 1996, Hall and Southworth 1997). This has been a natural consequence of two related facets of the new policy world: centrally-driven attachments and agendas which emphasize the overall performance of the institution above all other measures of success and the unprecedented degree to which individual leaders are now held responsible for that performance. Thus Hall and Southworth (1997) suggest that:

> heads have become more overtly aware of their schools’ levels of success. Several factors have contributed to this move . . . All these have caused heads to monitor and evaluate trends in the school’s performance. They are apparently taking a stronger interest in outcomes and the school’s ‘product’.

(p. 166)

Similarly in further education, a more robust approach to the quantitative measurement of performance has powerful effects on those aspects of the institution to which senior management attention is addressed (Elliott and Crossley 1994).
The idea of strong and effective leadership seems to have attained a pre-eminent position in the discourse of school management in England and Wales. It is quintessentially embodied in the priority given by the Government to national leadership qualifications for headteachers and the planned National College for School Leadership. In part, no doubt, this emphasis reflects the current attention given to leadership within the wider management discourse. However, it also reflects the emphasis which, for example, the school effectiveness literature and the work of Office for Standards in Education (OFSTED) and the Teacher Training Agency have given to the role of the headteacher. In further education, similar trends can be identified. The pressures created by incorporation for principals of colleges have been enormous, but the position of those who have survived seems to have been significantly enhanced by their typical designation as ‘chief executives’ of ‘corporations’.

Complementing this development are two sub-themes relating to senior managers. Firstly, despite the continuing pre-eminence of the head/principal, there seems to be a trend towards greater sharing of responsibility at the top within, sometimes smaller, senior management teams (SMTs). Hall and Southworth (1997) make this point about secondary schools, while Menter et al. (1995) note the development of SMTs or analogous structural forms in some primary schools. In further education Ainley and Bailey (1997) found that, in both the colleges they studied, the SMT is ‘a small and cohesive group of people very different from the old hierarchy of Principal, Deputy and the Heads of Department’ (p. 40).

Secondly, the nature of the work of senior managers seems to have changed. It has certainly become more intense (Jephcote et al. 1996, Webb and Vulliamy 1996), but its emphasis has also altered. For many writers this change can be related to Hughes’ seminal distinction, in relation to headteachers, between the roles of ‘leading professional’ and ‘chief executive’ (Hughes 1985). Indeed, managerialism might be argued to be virtually synonymous with the predominance of the chief executive role. Thus Raab et al. report growing ‘tensions between [heads’] traditional role as educational leaders concerned with curriculum development, teaching and learning, and their new role as financial managers’ (1997: 151), while Jephcote et al., note similarly that the focus of principals has become ‘the organization and financial management of the corporation . . . [C]urriculum matters have generally not been amongst the main current concerns of principals and boards of governors’ (1996: 44).

**Cultural change**

One of the major consequences of the reinforced role of heads and principals, the ‘drawing in’ of senior management teams and the increasing focus of their work on the broad policy of the institution and its place in the wider world seems to have been an increasing distancing of senior managers from other staff. For example, some writers on the consequences of local management of schools,
particularly those writing about secondary education, have identified an increasing ‘division of values and purposes’ (Bowe and Ball 1992: 58) between the ‘corporatist’ views of senior managers whose prime concern is with the school as a whole and its relationship with its external environment, and the more ‘individualist’ orientation of teachers whose prime concern is with the needs of individual pupils (Simkins 1994). Some have gone so far as to suggest the development of ‘schizoid organizations’ (Broadbent et al. 1992). A similar distancing has been widely commented on in the colleges sector. As Ainley and Bailey argue: ‘While integration amongst the [senior management] team increases . . . there is a danger for them to cut themselves off from other areas of college’ (1997: 42). For example, one study contrasts the perspectives of senior managers, ‘who were very concerned with the survival of their colleges’, with those of lecturers, among whom ‘there appeared to be little awareness or concern for the substantial financial pressures that were motivating the senior management’ (Hewitt and Crawford 1997: 118–19, 125). Another study in one college found that 85% of those interviewed believed that college management did not share the same educational values as staff (Randle and Brady 1997: 233).

When this idea of ‘cultural distancing’ is explored further a number of issues arise. First, the structural implications of ‘distance’ itself are interesting. For example, there appear to be contrasts in the ways in which organizational ‘layering’ is being managed in schools and colleges. In many primary schools new management layers are being created with clearer roles for deputy heads and curriculum co-ordinators where previously there was only ‘the traditional two-tier model’ of head and classroom teachers. This may be having the effect of reducing the direct influence of classroom teachers on school policy (Webb and Vulliamy 1996: 447). In contrast, in the college sector ‘delayering’ has been common, partly to establish clearer lines of accountability but also as a source of financial savings. However, it has been argued that this, too, has been accompanied by an increase in the distance between managerial layers, with less emphasis on management through face-to-face communication and greater use of new technologies (Ainley and Bailey 1997: 52–53).

Such changes in structures and communication patterns raise important questions about the ways in which organizational cultures are evolving. There is a good deal of debate about the degree to which the management of schools and colleges is becoming more or less participative as the consequences of the reform process work through. In the primary sector, for example, some studies claim to have found ‘a small shift to towards a top-down directive approach to management and a larger shift towards “managed participation” and away from a fuller form of collaborative collegiality’ (Menter et al. 1995: 303). Others, in contrast, argue that, their research shows ‘no evidence to support the view that, as primary schools become more autonomous, there is a shift away from collective decision-making towards a more top-down or directive approach to management’ (Bell et al. 1996: 259). Similarly, while Gewirtz et al. identify ‘a tendency towards speedier and non-consultative or pseudo-consultative decision-making
by management’ in secondary schools (1995: 97), Hall and Southworth (1997) suggest that ‘[t]he belief in heads monopolising leadership is at the very least softening . . . [T]here is an increasing reliance on shared leadership’ (p. 165). The situation in further education also seems far from clear-cut. For example, Jephcote et al. note ‘how different principals sought to either increase or decrease [the] sense of alienation’ resulting from incorporation. ‘Several principals described how they went to great lengths to involve staff in the changes and to keep them informed . . . Others, however, deliberately engineered a situation where staff were excluded’ (1996: 39).

At this stage, therefore, while cultural distancing seems a widespread phenomenon, it is difficult to discern clear common patterns of change in managerial cultures and styles more generally within sectors, let alone between them. In part this may be because of lack of comparability between studies. Differences may arise from the sample of institutions chosen in particular studies, from the methods used (for example, interviewing heads/principals only or a wider variety of staff) or from the ways in which evidence is actually interpreted. The difficulties are well-illustrated by a paper, which sees simultaneous pressures in the primary sector both ‘to break down the private individualistic culture of schools and replace it with one characterised by openness, trust and collaboration’ and ‘to promote . . . managerialism and the directive styles of headteachers associated with it’ (Webb and Vulliamy 1996: 455). This is clearly an area that needs further systematic investigation.

**Middle management roles**

With changing roles for senior managers and their increasing distancing from other staff, it is to be expected that the roles of those holding other leadership and management positions would also change. The evidence here is rather less clear, but a trend can be identified towards the establishment of more clearly defined ‘middle management’ roles within tighter managerial structures. The term ‘middle manager’ means different things in the secondary and primary school contexts. In the former it increasingly means heads of subject departments with line responsibility for groups of staff (Harris et al. 1995), whereas in the latter it means deputy heads and co-ordinators who typically have school-wide responsibility for areas of the curriculum (Webb and Vulliamy 1996). In both cases however, such roles are being more clearly defined and clearer lines of accountability established, although the process has inevitably gone further in secondary schools. This trend is likely to increase as a result of current developments such as the Government’s proposals for the management of the teaching profession (DfEE 1998b).

The much greater complexity and variety of work of the typical college compared to that of schools, and the greater financial pressures to which many colleges have been subjected, has raised particular issues in relation to the role of middle managers in that sector. Resource accountability in particular seems to
be being pushed lower and lower. For example, Carroll (1996) suggests that ‘caseloading’ is being explored as a method through which individual lecturers and teams might be given responsibility for using the flexibility associated with a high degree of delegation of the staffing resource to deliver targets for recruitment, retention and student achievement derived from college’s FEFC contracts. Such developments suggest that the increased distancing of senior managers and other staff described in the previous section may, paradoxically, be accompanied by approaches to management which significantly reduce the degree of ‘loose coupling’ which has often been claimed as a key characteristic of many educational organizations. In such circumstances it is perhaps not surprising, as one study finds, that a very strong tension has emerged for many middle managers ‘between a sense of being impelled by finance and a real struggle to retain student need as a basis for decisions’ (Lumby 1996: 336).

One general issue concerning middle managers which cuts across sectors is that increasing numbers of staff are now expected to come to terms with the fact that they are middle managers, whatever this may mean. As one Head of School in a college is quoted as saying: ‘[O]ver the last five or six years my role has changed from being a teacher and doing some management to being a manager and doing some teaching’ (quoted in Ainley and Bailey 1997: 57). In schools, too, even where an individual’s teaching load has not changed, similar changes in role understanding are expected.

Managing staff

In both the schools and further education sectors, legislation has given governing bodies greater powers to establish personnel policies to meet the needs of their institutions. Such freedoms have been considerably less in the schools sector – basic salary scales and conditions of service continue to be determined nationally for most schools. Nevertheless, within these, governing bodies may award additional salary points for excellent performance as well as defined responsibilities and they are required to review the performance of the headteacher annually and to determine his or her salary accordingly. Evidence suggests that most governing bodies are using these powers minimally or not at all as a means of managing staff (DfEE 1998b, paras 42 and 67, School Teachers’ Review Body 1999), and personnel management issues do not seem to have been as significant at an institutional level for many schools as they have been for many colleges.

In contrast to the situation in the schools sector to date, perhaps the major issue in the college sector since incorporation has been that of staff management. Pressures on costs, much more severe than in the schools sector, have focused attention on the staff resource in particular. The experiences of ‘downsizing’ and ‘delayering’ have been common, while major pressures have been exerted on teaching staff to increase the intensification of their work through the renegotiation of contracts. This has been a major factor in the distancing of
senior managers described earlier and has undoubtedly made it more difficult to maintain more open management styles. Nevertheless, differences have been observed among colleges in their approaches to this issue. Thus Bassett-Jones and Brewer (1997) link strategies of human resource management to broader college strategies. They contrast strategies which focus on cost leadership with those based on differentiation of quality, arguing that the former are associated with human resource strategies based on a core-periphery model with increasing reliance on part-time and contract staff, while the latter favour strategies based around the levels of commitment which having a high proportion of full-time staff provides.

Organizational planning

How have the ways in which decisions are taken and control established changed as a result of the reforms? One common feature in all sectors has been the institutionalization of planning – school development planning in the schools sector and strategic planning in colleges.

Although it is not a statutory requirement in the schools sector, strong government advice supported by the expectations generated by the inspection framework make it difficult for schools to avoid at least creating the appearance of planning. Indeed, as a minimum all schools are legally required to produce an action plan in response to inspection recommendations. It is clear, however, that the idea of development planning can be interpreted in many ways. Thus studies in the primary sector have found ‘different approaches to authorship, involvement and consultation from those [heads] who felt that it was simplest to prepare the plan themselves and then to persuade the staff and governors that it was right to those who sought a more interactive, developmental approach’ (Menter et al. 1995: 308). A major study of primary school planning (MacGilchrist et al. 1995) identifies four types of planning ranging from the ‘rhetorical’ to the ‘corporate’. Similar differences have been found in secondary schools (Sutton 1994, Glover et al. 1996b). However, while MacGilchrist et al. (1995) suggest that ‘corporate planning’ – which could be described as the most ‘managerial’ of the types they identify – is likely to be the most effective, Glover et al. (1996a, b) find that schools which are deemed to be effective differ in the degree to which they adopt centralized and systematized approaches or retain more open and organic models. In other words, approaches to planning can be consistent with a number of effective leadership and management styles.

In the colleges sector, strategic plans and planning appear to be both major expressions of organizational culture and an important means of influencing it. The funding councils require the production of strategic plans and have imposed specific requirements, both for the content of plans and for the outline planning process which colleges should adopt. Nevertheless, it is probably much more broadly true of colleges than of schools that ‘from a senior and middle management perception, adopting the FEFC planning framework is not just lip service
but [leads] to the creation of a better structured, more consistent planning process and thus a more effective service’ (Drodge and Cooper 1997: 47). There is some evidence that such planning is typically driven by ‘a broadly top-down approach to the mission of the college’ (Drodge and Cooper 1997: 38). However, as with schools, there is evidence of more variation in the planning process itself and in the types of strategies which colleges embody in their plans. Thus Drodge and Cooper (1997), for example, found contrasts between, ‘on the one hand, an approach in which strategic management realises the mission by fostering individual and collective learning and, on the other, a managerially directive approach in which the role of strategic management is to define college purpose and direction and then secure commitment to it’ (1997: 46).

Managerialism in schools and colleges: similarities and differences

In summary, the evidence, limited and sometimes ambiguous as it is, seems to suggest that policy developments in both the schools and colleges sectors have, indeed, been accompanied by a move towards a greater degree of managerialism within institutions. Figure 1 summarizes some of the main aspects of this change that are suggested by the empirical literature. Given the limitations of some studies and the complexity of the issues involved, these might more appropriately be treated as hypotheses for further testing rather than firm conclusions. Indeed, even allowing for these limitations, the evidence in not easy to interpret. On one hand, a number of ‘managerialist’ trends in the formal dimension of organizations and their management – tighter senior management teams, clearer middle management roles, more formal planning, agendas more dominated by measurable performance – seem fairly widespread. On the other hand the evidence in relation to the ‘softer’ aspects of management – levels and modes of participation, styles of planning – seem more ambiguous. Thus, while the managerial would seem to be challenging the bureau-professional order in both schools and colleges, it also seems to be the case that both the nature of the accommodation that is occurring between the orders and the form that the managerialist component is taking varies between and within sectors.

In part this divergence arises because, as was described earlier, there are significant differences among policy environments in different sectors despite superficial appearances of convergence. These different policy environments have potentially significant implications for the organizational and managerial responses which schools and colleges make to policy pressures. Thus, there seems little doubt that the severe funding pressures which have been placed on further education colleges have caused the efficiency objective to dominate over almost all others (Lumby 1996, Elliott and Crossley 1997) and a ‘hard’ approach being taken frequently to human resource management (Elliott and Hall 1994). In contrast, the government is establishing a climate in the schools sector which is essentially ‘effectiveness-focussed’, albeit on the basis of an agenda which is tightly
controlled from the centre and defines effectiveness in quite narrow ways (Gewirtz et al. 1995). Thus for many heads over the last few years inspection has been seen as ‘a major, possibly the most significant, test of their professional credibility’ (Hall and Southworth 1997: 158). Now the agenda seems likely to switch further to nationally-imposed processes of target-setting in relation to pupil performance.

Internal factors are probably at work as well in the schools and colleges sectors (as well as in different phases of the schools sector). Each sector has significantly different cultural characteristics, and these have no doubt caused or allowed many institutions to respond to external pressures in different ways. Size, too, may be a factor – a small primary school is a very different organization from an FE college. Nevertheless, consideration of the complexity of the

Figure 1 Evidence of a shift towards managerialism.
change process which schools and colleges have gone through should lead us to be cautious about making easy generalisations about patterns of change. While sector differences seem to be important, a number of other points need to be made.

First, it is important not to idealize the situation before the reforms, as some of the more radical critiques of managerialism seem to do. For example, even before the 1988 Act, the ‘pivotal, proprietorial and paternalistic’ role of primary headteachers (Hall and Southworth 1997: 153) and the ‘extraordinary centrality of the Headteacher in British [secondary] schools’ (Torrington and Weightman 1989: 135) were noted. Similarly, while some writers on primary schools have found greater degrees of collaboration at an organizational level than would typically be found in secondary schools or colleges (Nias et al. 1989), it is also true that a culture of teacher autonomy and independence, certainly in relation to professional matters, was probably just as common. In this context, it would appear that, while in some schools the reforms may have threatened pre-existing collaborative relationships, in others they have encouraged the replacement of a culture of autonomy by more collegial relationships, albeit primarily of the ‘contrived’ rather than the truly collaborative type (Hargreaves 1994). Similarly in further education, it has been argued that the new managerialism often presented itself as a modernizing alternative, offering new opportunities for coherence and efficiency in college policies in contrast to the perpetual ‘Wars of Roses’ which arose from departmentally-based ‘feudal’ college structures (Ainley and Bailey 1997: 40).

Second, although the reform process began in 1988, the process of radical policy development and implementation is still continuing as was noted at the beginning of this paper. Thus the position at any point in time is likely to be an unstable one. For example, the findings about growing cultural distance between senior staff and others may be associated with the pressures of devolution which placed major new resource management responsibilities on schools at the end of the 1980s. These pressures have now been superseded in part by pressures that are much more tightly targeted on the quality of teaching and learning and educational outcomes. This may lead to further changes in school cultures, and it is far from certain that cultural distancing will be a permanent phenomenon. Similarly in the colleges sector, it is possible that the proposed introduction of benchmarking and target-setting approaches will shift the emphasis of institutional policies from cost-efficiency to educational effectiveness. As a final example, it remains to be seen how far the relative ‘softness’ of personnel management in schools continues when the Government implements its performance management proposals, including more structured appraisal and performance-related components in the pay structure (DfEE 1998b).

Third, it is extremely important to note that significant differences in responses to policy pressures have been observed within sectors as well as between sectors. Some examples have been noted earlier. One reason for this lies in the widely differing positions that institutions found themselves in with the introduction of devolution and marketization. For example, the experiences of individual colleges have been heavily influenced by their relative unit costs
and hence the scale of their required efficiency savings (Bassett-Jones and Brewer 1997). Individual school experiences, in contrast, have depended strongly on the relative competitiveness of the local market arenas in which they have found themselves (Simkins 1994, Bullock and Thomas 1997).

Finally, it seems clear that the response of individual managers to the situation with which they are faced can and does vary. For example, Grace (1995) distinguishes between categories of secondary school heads who have differed markedly in their responses to policy changes: ‘headteacher-managers’, ‘headteacher-professionals’ and ‘headteacher-resistors’. Such a distinction perhaps explains in part the finding by Gewirtz et al. (1995) that some secondary heads have ‘enthusiastically embraced the new language and culture of management’ while others – the majority – have been ‘reluctantly implicated’ and have maintained ‘[a] strong adherence to comprehensivism or bureau-professional modes of operation combined with a grudging acceptance of market imperatives’ (pp. 99, 101). In further education, the pre-existing culture is likely to have created fewer difficulties for many principals, although there, too, reservations about the new market-oriented culture have been noted (Jephcote et al. 1996).

Conclusion

The evolving policy environment which educational institutions have faced over the past 10 years in the United Kingdom has exerted a number of common pressures on those who lead and manage them. These pressures include:

• the need to ‘perform’ in the quasi-market and take a more ‘customer-focused’ approach to those whom they serve;
• the need to set and meet demanding targets in terms of measurable performance indicators which are set by central government or its agents;
• the need to exhibit ‘appropriate’ forms of management and organization which can be inspected and for which institutions can be held to account.

The argument that such developments are leading to increasingly ‘managerialist’ patterns of control in the public sector generally (Pollitt 1993, Clarke and Newman, 1997) have been echoed by those writing about primary schools (Webb and Vulliamy 1996), secondary schools (Power et al. 1997), and institutions of further (Elliott and Hall 1994) and higher education (Dearlove 1997). A review of recent studies in the schools and colleges sectors suggests that a number of managerialist trends are indeed discernible, especially in the more ‘formal’ dimensions of organization and management, and that these can be traced to changes in the policy environment. However, it also clear that the picture is a complex and evolving one, with considerable differences identifiable both between and within sectors, especially in relation to aspects of organizational culture and management and leadership style. This supports evidence from other parts of the public sector that suggests, not only that managerialism
can take many forms, but also that it can interact with existing organizational orders in a variety of ways to produce different outcomes in different contexts (Clarke and Newman 1997). The nature of these interactions and their outcomes are likely to be affected by a variety of variables including:

- the detailed policy framework which affects the sector within which the institution is located;
- the ‘relative positioning’ of the institution within the sector in relation to the specific market and policy pressures with which it is faced;
- the ‘cultural starting points’ of particular sectors and of individual institutions within them; and
- the preferences and styles of organizational leaders and managers.

It is dangerous, therefore, to draw sweeping conclusions about the replacement of the traditional bureau-professional organizational order in education by a managerial one. Rather, it is better to view the process as a dynamic one in which growing tensions between the ‘old’ and the ‘new’ are worked out within particular policy and management arenas as different values systems and interests compete for influence. However, while there is clear evidence to support some differentiation in the impact of managerialist trends on particular schools and colleges, it is not possible to draw clear conclusions about the relative importance of the variables listed above in influencing such differences, let alone about the mechanisms through which such differentiation occurs. The ways in which sectoral, organizational and personal leadership factors interact to produce new cultural, organizational and managerial forms in particular contexts should be a major question for research and policy debate over the coming years.3

Notes
1 This paper is concerned with schools and with colleges in the further education sector. The latter, in England and Wales, broadly comprises all those institutions in the post-school sector whose primary purpose is not degree and postgraduate education (although they may offer some courses at that level). Higher (i.e. university) education is not the subject of this paper.
2 It should be noted that the Government, while increasing directive pressure in these ways, is also reducing the degree of prescription in the National Curriculum, and plans to increase the proportion of funding devolved to schools.
3 The research implications of the analysis in this paper are explored in Simkins (1999).

A COUNTER-POLICY TO SUBVERT EDUCATIONAL REFORM?

Collaboration among schools and colleges in a competitive climate

Mike Wallace

The concept of a ‘counter-policy’ is articulated as a heuristic device for grasping the process of mediation whereby implementation of national policies may stimulate resistance and co-optation at other education system levels. The discussion is illustrated through exploratory research into initiatives promoting collaboration among English schools and colleges, some enjoying local education authority (LEA) support. The term counter-policy is defined and located within a local perspective on national policy implementation; the scope of the investigation is summarised; the national policy context stimulating counter-policies is sketched; how far the collaborative groups studied had developed a counter-policy is discussed; interaction between key players at different system levels impacting on these counter-policies is outlined, including reference to related counter-policies developed in some LEAs; and conclusions are drawn about application of the counter-policy concept to collaborative initiatives, utility of the conceptual orientation, an agenda for further research, and the potential of collaborative initiatives to subvert central government reform.

Introduction

The image of schooling underpinning the education reform policies and discourse of the recently overturned Conservative central government in the UK was that of the individual, largely autonomous—or self-managing—institution competing in the local market place, where parents as education consumers could choose amongst a diversity of state and private schools and colleges (Department for Education [DfE], 1992). To break the
mould of the post-war consensus between the main political parties over state education, an unprecedented range of powers was created to drive home these reforms.

All four ‘policy instruments’ in the typology of implementation strategies developed by McDonnell & Elmore (1991) were employed by central government. The major instrument was a comprehensive effort at system changing: shifting the balance of authority between teachers and headteachers, governors for each institution, local education authorities (LEAs), and central government. Other policy instruments were used to support this effort: from mandates, mostly in the form of legislation; through financial inducements to take up the opportunity for schools to be freed from LEA control; to capacity building where finance for staff development support was targeted on giving teachers and headteachers the knowledge and skills needed to implement reforms.

Yet enduring voluntary collaborative initiatives existed across the country where the schools and colleges belonging to these groups were close enough to compete for students (Lunt et al., 1994; Ranson & Tomlinson, 1994; Lomax & Darley, 1995; Macbeth et al., 1995; Bridges & Husbands, 1996). A defining characteristic of such initiatives was the promotion of collaboration—joint work for joint purposes—in one or more areas of shared concern, promoting mutual survival of member institutions with variable effort to reduce or avoid competition inside the group (Wallace & Hall, 1994a). Moreover, despite the central government thrust to reduce LEA powers so as to increase school and college autonomy, some LEAs where collaborative initiatives were situated responded by shifting from an educational leadership to a service role. Supporting collaborative groups offered LEA staff a means of promoting their survival as contributors to state schooling in the face of ministers’ declared intentions.

Central government reforms were met in these cases by a response at other levels of the education system which reflected neither the practices envisaged by ministers nor the spirit of their reforms. The image projected by these collaborating schools and colleges was more that of the interdependent and mutually supportive institution than the individual, aggressively competitive, autonomous organisation beloved of reformers. Explanations of this apparent anomaly are thin on the ground. Most investigations and practitioner accounts of collaboration have been descriptive, though a start is being made on modelling forms of collaboration (e.g. Husbands, 1996) and relationships between collaboration and competition (e.g. Glatter, 1995). These models have limited potential to answer generic questions to which this phenomenon gives rise: how was it possible for old or new practices antithetical to those envisaged by the architects of education reform either to continue or to spring up and flourish despite the use of such a battery of policy instruments to secure faithful implementation? How may we explain such unintended consequences of policy changes?

This article is concerned with exploring complexities of education policy implementation in a large, multilevel system. Its main purpose is to explore how
implementation may be affected by interaction between education policies reflecting contradictory values held among actors at central government and other system levels. The notion of a ‘counter-policy’ will be put forward as a heuristic device for analysing the mediation of national policies where their implementation may stimulate resistance and co-optation in target institutions at other system levels, leading to subversion of these policies (Hall & Wallace, 1993). A subsidiary aim is to ground the discussion through an illustrative account of exploratory research into initiatives to promote collaboration among schools and colleges in England, some with LEA support.

Attention is increasingly being paid to the complexity and contested nature of education policy (Boyd, 1988; Ball, 1994a), highlighting the importance of policy-related rhetoric in ‘manufacturing consent’ through influencing the discourse which shapes perceptions amongst those involved in implementation. Work remains to be done, however, on refining the conceptualisation of action and response both within and between system levels which commonly leads to emergence of some form of ‘implementation gap’ (Wallace, 1991a) between policy-makers’ stated vision of the impact of new practices and what happens in target institutions. It is now more widely recognised that policies vary in the leeway offered for reinterpretation during implementation, not merely in terms of discourse, but in terms of practice (Ball, 1994b; Hatcher & Troyna, 1994).

A theme common to the complementary education policy implementation (e.g. Odden, 1991; Weatherly & Lipsky, 1977); and the management of planned educational change (e.g. Fullan, 1991) traditions is the idea that policies and associated innovations are subject to a process of ‘mutual adaptation’ (Berman & McLaughlin, 1978). The intentions of initiators at one level in the education system are reinterpreted to a greater or lesser extent by those who are supposed to put them into practice, often resulting in a change in designers’ expectations. The explanatory power of this conceptual orientation is nevertheless restricted by its emphasis on single changes, neglecting the context for implementation (Bolam, 1982). The response of actors who are the target of an externally initiated policy tends to be viewed in terms of ‘strategic resistance’ (Corwin, 1965) to it. The possibility exists, however, that such actions could represent more than merely an attempt to block the imposition of an undesired policy. They could contribute towards the implementation of a proactive local policy agenda bearing only an oblique relationship to the initiative under scrutiny.

Second, focusing on single changes underplays the fact that, in a context of large-scale education reform, policies do not exist in isolation. A major reform effort generally involves the introduction of a bundle of interrelated policies which interact both within and across system levels, often in contrary ways (Coulby & Bash, 1991; Ball, 1994a; Wallace, 1996). Schools and colleges are likely to be faced with a multiplicity of externally initiated innovations at any time (Fullan et al., 1986), alongside and often squeezing out any originating within. Research indicates how reforms produce a flow of policies at different
levels which are frequently adjusted during their implementation, resulting in an evolving profile of innovations to be addressed by school and college staff (Wallace & McMahon, 1994). There is considerable interaction between powerful individuals and groups within and between central, local, inter-institution and individual institution levels of the education system, according to partisan interests which may reflect contradictory values. In a large system, this interaction also reflects the limited awareness that actors at one level may have of their impact on others at different system levels (Wallace, 1991b).

To embrace the complexity of the change process in a context of reform, Fullan (1993) has advocated a new paradigm for understanding educational change which embraces its ‘dynamic complexity’. Following Senge (1990), change is viewed as involving more factors than we can take into account whose interaction we cannot fully predict. Therefore only limited control is feasible at any system level. A major contributor to dynamic complexity is the interaction between policies created at different levels beyond schools or colleges and policies developed within them, affecting the profile of innovations being addressed at any time. In the spirit of this new paradigm, the present study is aimed at conceptualising one aspect of the interplay of policies across system levels, where powerful actors at these diverse levels hold contradictory values and subversive local practices emerge.

In the remaining sections, the counter-policy concept is elaborated as part of a local perspective on policy implementation, itself underpinned by a combined cultural and political perspective on interaction; the scope of the exploratory study is summarised; evolution of the national policy context stimulating development of counter-policies is briefly sketched; the extent to which the collaborative groups investigated may be conceived as having developed a counter-policy is discussed; interaction between key players at different system levels impacting on these counter-policies is outlined, including reference to related counter-policies developed in several LEAs; and conclusions are drawn about application of the counter-policy concept to the collaborative initiatives, the utility of the conceptual orientation, an agenda for further research, and the potential of collaborative initiatives to subvert central government policies.

**National policy and local counter-policy**

A counter-policy may be defined as:

> a proactive response by powerful actors in a locality to a policy initiated elsewhere that they perceive to threaten their beliefs and values, where they harness their institutional resources in a coordinated manner to mediate implementation of this external policy in ways that challenge or subvert its initiators’ stated aims.

A counter-policy may vary between the formal and explicit, perhaps enshrined in a public written statement, and the informal and implicit, articulated only in
private conversation. A counter-policy may be oriented primarily towards active resistance to the external policy, especially at first, by persisting with present practice expressing existing values in the face of external pressure for change. The research into collaborative initiatives portrayed efforts to ensure continuation of those which had been launched before the reforms. A counter-policy may become more subversive through co-optation: hijacking the external policy by adapting its implementation in such a way as to express contradictory values. An example of co-optation, to be discussed more fully later, was an external evaluation programme superficially in line with the central government emphasis on increasing external accountability of individual institutions, yet designed to enhance a local image of high quality education provided by all institutions in the collaborative group.

The notion of a counter-policy is located within a conception of policy-making and implementation as a continuous process, where official policy statements and the associated discourses are both created and reinterpreted during implementation as a result of interplay between individuals and groups within and between system levels (Bowe et al., 1992). At the heart of the policy process lies interaction, which may range between the deeply conflictual and the strongly synergistic. Interaction is interpreted, through a combined cultural and political perspective, as reflecting the differential use of resources by actors to achieve their desired goals according to beliefs and values which they share to a varying degree (Wallace & Hall, 1994b).

Within a pluralistic society subcultures are likely to exist, each reflecting allegiance to beliefs and values that may be only partially compatible with those of others. The pro-market competitive values underpinning central government reforms do not square well with the long-standing dominant professional culture in British schools whose discourse has conceived education as a public service for local communities rather than a marketable product. Activities reflecting contradictory beliefs and values may coexist without necessarily producing conflict if they are kept separate (Wallace, 1991b), as where actors collaborate to compete against a third party, or collaborate on some activities while competing in respect of others (see Levacic & Woods, 1994).

Following Giddens (1984), power is taken as ‘transformative capacity’: the capability to intervene in events so as to alter their course. It does not necessarily imply conflict: parties to interaction who work together synergistically have power to make things happen. Equally, each protagonist in a conflict situation may use transformative capacity to achieve contradictory goals. We may distinguish two forms of power (Bacharach & Lawler, 1980). Authority means use of resources legitimated by individuals’ beliefs and values associated with status, including the right to apply sanctions. System changing, as a policy instrument, therefore implies altering the distribution of legitimation to use resources and apply sanctions among people of different status: LEA staff have lost some authority to school governors and headteachers; these groups have lost some authority to central government. By contrast, influence refers to informal use of
resources where there is no recourse to sanctions linked to authority, although other sanctions (such as withdrawal of commitment or minimal compliance) may be available.

All individuals have access to some resources, however asymmetrical their relationship. Each party to interaction is implicated in a multidirectional ‘dialectic of control’ (Giddens, 1984) consisting of a flow of action and response. Conversely nobody has a monopoly on power: it is distributed throughout the system, albeit unequally. There is no sense in which central government ministers, despite having exclusive authority to alter the education system, have complete control over what others do or refrain from doing in response, let alone what they believe or value. Control is dialectical in the sense that it is shared among actors, each able variably to delimit—rather than simply direct—the actions of others.

This local orientation towards national policy implementation takes as its starting point those elements of the system-wide pattern of interaction most directly affecting individuals and groups in and around the institution level, where both central government and LEA policies constitute external influences on the use of power in these institutions according to particular beliefs and values. A model of implementation at this level is depicted in Figure 1. Since policies are never introduced into a vacuum, analysis begins with the situation into which an external policy is introduced. Here practice will probably reflect the beliefs and values of powerful actors, especially headteachers and principals who have substantial authority as institution managers.

The values reflected by the external policy, as articulated by its initiators, may vary along the dimension whose extreme positions are portrayed in the diagram: between contradicting and being congruent with dominant institutional values. (My present concern is primarily with the former case, as indicated by the solid arrows.) In the light of their reading of this policy, powerful actors will seek ‘room to manoeuvre’ (Wallace, 1991a), whether to protect practice expressing their existing values where the policy contradicts them, or to engage in activities which express, synergistically, the values of the external policy where there is congruence. The policy thrust in this study has the added spice of posing the threat of closure, should a school or college staff fail to attract a viable number of students. Here the search for room to manoeuvre may include a newly surfaced value placed on promoting the very institutional survival which was taken for granted until now. The outcome of this search is a response which varies similarly along a continuum: from counter-policy activity expressing values running counter to those underpinning the external policy; through acceptance of the policy, either where there appears to be little power to express contradictory values or where there is congruence of values; to synergistic activity which may even outstrip expectations of external policy initiators.

Subsequent evolution of a counter-policy could take various courses. It might wither in the face of enduring pressure from the external policy or successor policies, as consent is manufactured, reflected by a shift in dominant values. A sub-
sequent change in central government or its policy orientation might bring the values underlying what was a counter-policy into line with the new central government policy thrust, as might be the case if the newly elected Labour central government were to adopt policies fostering local collaboration. Whatever happens, the process cannot be regarded as simply cyclic: as past actions inform present practice, no actor can ever be in quite the same experiential place twice. In sum, the concept of a counter-policy addresses active and coherent bottom-up and lateral uses of power, where opportunities are sought to reinforce practices or develop new ones that reflect beliefs and values belying those promoted by initiators of an unwelcome external policy.

**Investigating inter-institutional collaboration**

The exploratory research was designed to assess the applicability of the counter-policy construct to an instance of education reform policy. Collaborative initiatives were identified through a national survey by letter of LEA officials and representatives of professional agencies and unions, complemented by a search through the education press for relevant articles. The criterion for inclusion in this opportunity sample was evidence of working together for mutual benefit despite being in a position where proximity between member institutions catering for the same age range of students meant they could have competed.
inter-institutional collaboration was operationalised in different ways, all activities meeting this criterion lay within the definition adopted of collaboration as joint work for joint purposes. The activities were reportedly designed to benefit all schools or colleges involved, so helping to create conditions fostering their mutual survival within the increasingly hostile environment engendered by reforms.

From this set, seven initiatives were selected, offering diversity according to:

- their origin before or after the advent of relevant central government reforms from 1988;
- the coverage of different compulsory and post-compulsory phases of state education, from primary to further education sectors; and
- the form of linkage between the group and the local LEA.

Qualitative methods were used to conduct focused, interpretive case studies (Merriam, 1988) informed by analytical techniques developed by Miles & Huberman (1994). Fourteen semi-structured interviews with headteachers or principals and initiative coordinators were conducted during spring 1995, supplemented by a document archive including press articles, position statements, bulletins and the handbook for a shared project.

These collaborative initiatives could all be interpreted as a counter-policy because they constituted, at least in part, a reaction against an external policy shift promoting competition between institutions. For many years, state schooling in the UK had constituted a ‘national service, locally administered’, where competition between schools was largely limited to situations where falling student numbers due to a decline in the birth rate left institutions with substantial spare capacity (Audit Commission, 1986). The organisation of state education as a public service, with LEAs enjoying a substantial measure of control over allocation of students, staff and finance, provided conditions for a stance of indifference or cooperation between the majority of neighbouring institutions.

The 1970s and early 1980s witnessed sporadic emergence of diverse grass roots and LEA initiatives promoting inter-institutional collaboration whose content varied. They included cluster groups of small primary schools, pyramid groups of secondary schools with their feeder primary institutions, and arrangements for liaison between phases of schooling. From the early 1980s, these initiatives were supplemented by congruent central government policies. Financial inducements were offered to LEAs for projects promoting clusters of rural primary schools through the Education Support Grants scheme (Wallace, 1988; Galton et al., 1991), and to secondary schools and colleges for consortia participating in the Technical and Vocational Education Initiative (TVEI) and its extension (Bridgwood, 1989). The General Certificate of Secondary Education examination was widely introduced through secondary school consortia. In so far as central government and LEA policies promoted inter-institutional collaboration, they were consistent with the dominant (but not uni-
versal) belief in state education as a local service, where neighbouring schools in the same phase were regarded more as partners than as competitors.

Central government reforms, heralded by legislation in 1980 and 1986, represented a policy U-turn from 1988. They reflected values of increasingly influential right wing advisers (Ball, 1990) contradicting those expressed in the earlier emphasis on collaboration. Interrelated policies were designed to create supply and demand sides of an education market and so foster competition between individual institutions. A reduction in LEA authority was required to free up schools and colleges to form this market. Policies to build the supply of a greater diversity of institutions with enhanced autonomy included:

- more open enrolment of students to facilitate greater parental choice, requiring school staff to accept students up to the limits of physical capacity, and removal of LEA authority to plan local provision through limiting schools’ intake to a level below capacity;
- delegation of finance to each institution through a local management scheme according to a formula based on the number of students, removing LEA jurisdiction over this money and the staffing level. The tighter link between student numbers and finance, with direct implications for staff jobs, provided an incentive to expand or at least avoid any decline in the number of students on roll;
- ‘incorporation’ of sixth form and further education colleges, removing them from LEA control;
- diversification of types of school and maintenance of surplus capacity. Financial inducements encouraged secondary schools to specialise in certain subjects such as technology, and primary or secondary schools to escape LEA control by becoming grant-maintained where they were now funded directly by central government, frequently to avoid LEA proposals for closure where student numbers were low (Halpin et al., 1993). City Technology Colleges were created with generous central government funding and industrial sponsorship, located in urban areas where there were already enough schools to serve the community; and
- an increase in the proportion of parents and local community representatives on school and college governing bodies, coupled with greater authority for oversight of individual institutions, giving governors more power over decisions affecting the market niche occupied by their school or college, including the hiring of staff.

Complementary policies informed parental demand for student places through:

- nationally imposed arrangements for assessing the teaching of the National Curriculum and publishing results, along with truancy rates, as league tables ranked according to raw scores, facilitating comparison between outcomes achieved by different institutions; and
In the teeth of such a policy shift, collaborative initiatives represented a local counter-policy where they impeded the development of a market based on competition between individual institutions by acting in concert.

**Inter-institutional collaboration as a counter-policy**

Each of the seven collaborative initiatives displayed counter-policy characteristics. Composition of the groups and content of their counter-policies are summarised in Table 1. Member institutions included schools within LEA jurisdiction, grant-maintained schools, sixth form colleges and colleges of further education. The groups engaged in diverse shared activities which contributed not only to resisting external pressure to compete but also to co-opting aspects of the reforms to serve collaborative ends. Such activities were designed to empower all participating institutions, placing a high value on synergy to be gained from mutual support (in line with central government policy before the reforms). The vision statement for Group D was ‘to present a model for a group of LEA schools acting voluntarily within a consortium to enhance the educational effectiveness of each member school for the benefit of all pupils in the area’. Several informants signified their awareness that engaging in collaborative activities reduced any competitive advantage their institution might have retained over others where, say, particular curriculum or management expertise was located in that school or college.

The first column of counter-policy content in Table 1 lists the main activities involved. The most common joint venture was curriculum and staff development work where funds allocated to individual institutions and expertise within them were deployed for mutual benefit. Next came collaboration over finances, from sharing of ideas and experience to joint purchasing agreements made possible under the local management scheme. In the latter instances a central government reform policy designed to forge conditions for individual competition was co-opted through its formal adaptation to advantage the entire group.

These activities were incorporated in a more comprehensive formal arrangement in Group D, where a group of primary and secondary sector schools was established in the same town to share financial advantages and greater autonomy accruing to grant-maintained schools, without losing support of the LEA or other group members. LEA officials agreed to explore how far finances withheld for services such as library provision could be delegated to these schools, and an LEA official was appointed as coordinator. Within the dialectic of control between headteachers and LEA officials, the initiative empowered LEA staff to use influence to support schools in a novel service role. The headteachers concerned found room to manoeuvre to exploit the opportunity reforms inadvertently allowed for co-optation through a joint enterprise which contradicted the

values behind policies enhancing school autonomy at LEA expense. When several schools in the group subsequently did become grant-maintained, they continued to be accepted as part of the initiative, enjoying informal support of the LEA despite severing formal ties.

Another co-optative activity was collaboration to develop a joint institutional evaluation scheme developed amongst a group of sixth form colleges (Group E). Staff from one college were invited to review areas of provision in another and to give a confidential report, in order to assist in improving provision in each member institution and also help prepare for external inspection under the new central government scheme. Curriculum expertise shared in this way contributed both to synergy in enhancing provision across the group and to all members making a good showing when externally inspected. The more inspection results turned out positive, the more their publication would help give prospective parents and students the impression that sixth form colleges generally provided high quality education.

Valuing collaboration was tempered by the contradictory value accorded to individual institutional autonomy. A balance was struck between commitment to joint ventures for the communal good of the group, accompanied by loss of some individual autonomy, and retaining the authority of governors and headteachers or principals to do what they perceived to be in the best interests of their own institution. The aim of collaboration in Group D was stated as being ‘to offset the element of competition and to allow closer cooperation between schools whilst allowing each establishment to maintain their own individuality and autonomy’.

In a climate where finance now followed students and empty institutions would face closure, individual institutional survival had become the bottom line

value. As one head in Group B put it: ‘You need as much support as you can get, especially in our situation as a small school . . . it’s going to be the only way that we will survive’. Commitment to the joint work of collaboration was therefore frequently instrumental, contingent on joint purposes being achieved in such a way as to continue yielding benefit to the individual institution. The present synergistic use of power within the dialectic of control between group members might be replaced by something more conflictual. Should a decline in student numbers mean that survival depended on competing against erstwhile collaborators, this alternative strategy might be adopted. A minority of respondents, however, indicated that collaboration was of intrinsic moral value. A headteacher from Group C stated:

I’ve always felt that there’s been great value, not just in collaboration, but in a friendship group. That’s the very basic bottom line of what should happen. It should happen between heads who are under tremendous pressure all the time from forces that are trying to make them cut-throat all the time . . . I’ve thought right from the beginning that this was the way to do it: corporate response rather than individuals trying to get extra money.

Internal collaboration for external competition

The collaborative initiatives did not empower their members to buck the education market, but did ameliorate its impact. Depending on the stance adopted in other local institutions, the joint purposes of collaborative activities could include strengthening group members’ ability as a cartel to compete against aggressive outsiders. Here the contradictory values underlying collaboration and competition could be entertained without tension because collaboration was directed inside the group while competition was directed outside. Cornering the market through a collaborative cartel was co-optative to the extent that, though group members might be forced to engage in external competition, their predicament as comrades in adversity could serve to reinforce their collaborative values while inhibiting parental choice and working to keep all member institutions in business. A headteacher from Group G referred to adopting a ‘siege mentality’ where the motivation for extending the scope of collaboration was driven by the need to resist an external threat.

Conditions favouring competition depend in part on a surplus of student places coupled with a push by parents to exercise choice. In four instances, there was little environmental pressure because either schools were full, few parents wished to move students between institutions catering for the same age range, or headteachers abstained from competing. In the remainder, collaboration within was a basis for resisting competition from without. Group C, near the centre of a large city, faced a haemorrhage of students to suburban schools around the city limits.
This threat prompted expansion of the group, as staff in nearby schools sought strength in neighbourly support, and the formulation of a joint position statement articulating this concern as a basis for negotiation with the LEA over its policy of accepting movement of students. One headteacher indicated how she seized opportunities to reverse the trend and bring in students from outside the group: ‘I’ve actually rung colleagues in other schools and said, “So and so are on the lookout for another school. It should be yours; chase them!”’

The schools in group D were in an area where a significant proportion of parents expressed interest in exercising choice and, by forming a group encompassing all the schools in one town, its headteachers hoped to minimise the impact of parental pressure. One indicated awareness of an emerging discourse of competition to be resisted:

I don’t know where it could have come from, this pressure [to compete]. I don’t think it could have come from the LEA. To get those pupils in there because they mean money—I think it must have been this postmodernism, in the water, in the air, at a national level. More pupils would mean more money and your school would be more viable, and you would have the best resources and the best teachers. This was very much the culture of the early 90s when we got our delegated budget.

The sixth form colleges (Group E) had closed ranks because of their principals’ mutual self interest in withstanding increasing competition from further education colleges inside the area occupied by the group.

**Collaboration to avoid internal competition**

Collaborative activities in five groups specifically designed to pre-empt internal competition are summarised in the second column of counter-policy content in Table 1. There was an informal, unwritten, ‘no poaching’ agreement between headteachers in three groups, where each would refrain from attempting to attract students from other member institutions. A headteacher from Group C pointed to undesirable consequences of successful competition where the supply of students was finite: ‘If you take pupils in here and appoint new staff, other people are losing their jobs. And you mustn’t do that; it’s a moral issue’. They would also try to dissuade any parent wishing to transfer a student to their school from another in the group.

In Groups D and G, identification of headteachers with the group was regarded as a buffer against the temptation to compete. One headteacher in Group D reported how, to sustain support of governors for the collaborative initiative, she claimed that her collaboration was a means of keeping informed about her competitors. A governors’ forum was set up to encourage governors
from all member institutions to identify with the group, rather than just their school.

Only in Group E was a measure of competition for students accepted, with the safeguard that most member institutions were located far enough apart for its impact to remain within manageable limits. Collaborative activities were separated from competitive activities like marketing, allowing the contradiction to endure without conflict. Under Group E’s joint evaluation scheme, arrangements for matching reviewers to the college commissioning the review acknowledged the need to keep collaboration and competition apart. The handbook stated:

the coordinator will need to be aware of possible sensitivities if a reviewer is drawn from a neighbouring, possibly competitor, college. It will be important to ensure that there is no actual or perceived conflict of interest. The college which is being reviewed should have the opportunity to reject a reviewer where they consider there is a conflict of interest, and they should be encouraged to do so rather than jeopardise the review itself.

Implementation of counter-policies

The final column of counter-policy content in Table 1 shows how implementation was achieved through the introduction of roles, structures and procedures for developing and sustaining collaboration. The existence of coordinated management activity underlines the status of the collaborative initiatives as counter-policies, since the intention to collaborate had been backed by resources to make it happen and to make it last. In all cases, headteachers or principals held regular meetings to orchestrate collaborative activities and group development. These meetings were extended in Group F to include representatives from the companies and support agencies which were also members. Most initiatives were administered by a part- or full-time coordinator, drawn from the staff or from outside. Their responsibilities for promoting collaboration varied from organising occasional staff development activities (Group A and B), through liaising with the LEA (Group D), to recruiting new members (Group F). In Group D, staff from each institution could opt in or out of any activity. A headteacher noted: ‘I think it’s amoebic really . . . groups form and then others take part in other things; all the time there are changing groups’. Here about half the group members had elected to participate in a school-based initial teacher training scheme.

Closest coordination was achieved in the smallest group (G), consisting of two adjacent grant-maintained secondary schools in a small town. Shared decisions connected with the joint sixth form were made by paired staff with the same management responsibility in each school, to ensure that staff from neither could dominate. In the words of one headteacher:
If you appoint somebody from inside [the group] then clearly he (sic) is one of them or one of us, and as soon as he makes a decision that happens to go against our school then we know he’s biased. We’ve always had two people who have done everything. The joint sixth form timetable is constructed by two timetabling officers, examination entries are supervised by two examination officers. The sixth form has two directors, and at the top of it you have two heads—and we have lunch together once a week . . .

**Action and response in the genesis of counter-policies**

As noted earlier, implementation of central government reforms also entailed a complex series of interactions across individual school or college, inter-institution and LEA levels. In this sense counter-policies, which could emerge at any level where the dominant culture of powerful actors was threatened, represented just one (possibly temporary) component of a perpetually unfolding policy process. Having illustrated how activity inside inter-institutional collaborative initiatives met the criteria of a counter-policy, we now consider how a flow of interactions gave rise to these counter-policies and related LEA activity, as portrayed in Table 2.

The columns in this table list key interactions and contextual factors that variably affected initiatives and responses among the collaborative groups and LEA staff, the first two of which summarise the origin of initiatives and the institution level response to central government reforms. Three groups (A–C) pre-dated the recent reforms and none of them had originally constituted a counter-policy. Group A was formed through an LEA initiative, where exchange of curriculum expertise in the primary sector was fostered by setting up a primary school development group in each locality. Traditionally relationships between schools and the LEA had been very positive. Group B was a grass roots initiative, where the secondary school headteacher had been the prime mover in developing a partnership with feeder primary schools. An LEA initiative promoting school self-evaluation had encouraged headteachers to work together for their mutual benefit, and LEA staff had supported development of the partnership. Schools making up the majority of the present Group C had previously been formed by their LEA into a TVEI consortium.

The 1988 central government reforms altered the climate for collaboration in these groups both as a result of the system changing redistribution of authority and because the potential threat to institutional survival was increased under local management. The main response was to reinforce the group, taking account of the reforms while rejecting their underlying values. An audit of resources was carried out in Group B schools to determine what their combined resources could offer. The LEA agreed to give financial support to this or any other partnership if member institutions matched it with funds from their individual delegated budgets under the local management policy.
The other initiatives (D–G) were created as a by-product of reforms, capitalising on the new room to manoeuvre they offered to support mutual survival of member institutions. Group D was set up with LEA support to explore a consortium approach to making best use of delegated and hitherto undelegated funding for LEA schools; Group E was formalised to share expertise needed to manage the novelty of incorporation where previously many management tasks had been the LEA’s responsibility; and Group F was formed to secure better value for money for participating institutions over purchase of materials and services that the LEA had been carrying out on an individual basis.

Looking along the columns of Table 2 relating to Group G, we can see how its formation provides a stark contrast to the other three post-reform initiatives,
underlining the importance of adopting a local perspective on interaction, here encompassing a negative response to an LEA operating in sympathy with central government. The reaction at LEA level to central government reforms had been strongly to endorse them, even to the tune of relinquishing control over state education in the area. According to the headteacher of one of the two grant-maintained schools in Group G:

There are a large number of grant-maintained schools because of self-protection. The Authority made themselves perfectly clear that they would encourage people to opt out on the one hand, and they were quite prepared to take a totally non-education line . . . [The LEA] would have been perfectly happy to see a school flounder and go down as a result of the application of market forces economics. You’ve got some fairly ultra right wing Thatcherites—or you did have—calling the shots, and getting out from under was a safe policy. With the exception of one school in [the LEA] we are all grant-maintained. Not because we have this burning desire to be grant-maintained; not because we accepted the philosophy; not because we believe in grant-maintained schools particularly. We genuinely did opt out to say goodbye to [the LEA].

The headteachers of these schools had engineered becoming grant-maintained together—ironically—as a pragmatic escape route from what they perceived to be a hostile, pro-central government LEA. They used resources made available by reforms to hijack the grant-maintained policy so as to facilitate collaboration, and continued to resist LEA efforts to promote competition. When an LEA proposal was announced to create a new school in the area, which would have competed for students, these headteachers successfully launched a campaign to prevent it being built. Their collaborative initiative represented a counter-policy directed against the unwelcome synergistic external policies introduced by the LEA and central government. They shared a common, institution-level professional culture which evaluated the LEA negatively. Accordingly, within the dialectic of control between these system levels, the two headteachers had grasped the opportunity central government reforms provided to increase their authority relative to the LEA so as to enhance their joint autonomy and chances of mutual institutional survival.

There had reportedly been strong congruence between dominant values in this LEA and those reflected in central government reforms. Room to manoeuvre was found to express these values at LEA level through a response of active endorsement to implement the central government policy (one option for response to an external policy which was highlighted in Figure 1).

The reaction was different in other LEAs. The third column in Table 2 indicates how the LEAs associated with Groups C and F were subject to a subsequent central government policy. A review of local government was carried out in the early
A COUNTER-POLICY TO SUBVERT EDUCATIONAL REFORM?

1990s and some LEAs either had boundary changes imposed or were abolished and new LEAs created to serve the region. The impending changes in two LEAs appear to have inhibited any effort to work with the collaborative groups concerned. Officials from the new LEA for Group C were reported as having expressed interest, but fieldwork was conducted before the LEA was firmly established.

**Action and response in the genesis of LEA counter-policies**

As the fourth and fifth columns in Table 2 reveal, staff in two other LEAs had developed new ways of supporting the pre-reform collaborative groups (A and B) within parameters imposed by central government reforms. As discussed above, the LEA for Group D was integral to the development of the initiative, even providing the coordinator. Establishing positive links with collaborative groups of schools through these supportive activities amounted to an LEA counter-policy connected with Groups A, B and D. Room to manoeuvre was found within the dialectic of control between LEA and central government to resist the potential loss of LEA power under central government reform policies. Influence was employed to promote LEA survival by finding a group service role valued by the headteachers concerned. These counter-policies were co-optative in that LEA staff were assisting the kind of mutually supportive group that had no place in the central government rhetoric about state schooling.

The LEA for Group E had little room to manoeuvre since central government legislation had cut all ties with sixth form colleges. Officials had apparently accepted the loss of these institutions and directed their attention elsewhere. In seeking to understand how proclaimed central government policy changes turn out in practice, as mentioned earlier, it is necessary to take into account how much leeway they may allow for those on the receiving end. Incorporation of sixth form colleges left LEAs with no formal link, whereas local management of schools could enable LEAs to develop a service role. In the LEA for Group F, similarly, there appeared to be acceptance of a diminished role, as prescribed by central government reforms, limited to servicing individual institutions.

**Mapping the flow of interaction affecting counter-policies**

On the basis of this detailed account of counter-policies, we can now build up a more comprehensive picture of the part they played in the policy process connected with implementation of central government reforms. The sequence of interaction within and between system levels resulting in the emergence of the different collaborative group and LEA counter-policies is summarised in Figure 2. Activity spanned four system levels where collaborative groups formed an intermediate tier between the individual institution and the LEA. Policies at these levels with implications for inter-institutional collaboration changed and interacted over the previous decade. Policies prior to 1988 at all four levels variably promoted collaboration at other levels. The central government reform
programme from 1988 impacted on and led to divergent reactions in the other three levels, as depicted by the long cross-level arrow:

- at LEA level, the response to central government reforms in some cases had been to develop a counter-policy of servicing collaborative groups whereas, by contrast, one LEA in this study even promoted opting out of LEA control;
- at collaborative group level, existing groups reinforced their activities and identity, several groups collaborated to compete against other local institutions, and one group tolerated a measure of internal competition;
- at individual institution level, schools or colleges in this study joined old or created new collaborative groups, while staff in other schools elsewhere had complied with reform policies by engaging in competition or opting for grant-maintained status, and college staff had capitalised on the opportunity for competition accompanying incorporation.

The subsequent piecemeal central government change in LEA boundaries had also, by 1995, made a cross-level impact on collaborative groups. A key outcome of this four level interaction, at the time of the fieldwork, was that the education system now contained both collaborative groups and LEAs supporting them despite a sustained central government reform effort with a rather different outcome in mind. Within the system-wide dialectic of control, actors continued to wield considerable influence on the local stage.

**Conclusion**

The collaborative initiatives presented in the case studies show how, despite the formidable array of policy instruments used by policy-makers at one level to secure compliance, faithful implementation across other levels, nationwide, was not a foregone conclusion. A central government effort to offer parents increased choice amongst a greater diversity of educational provision with LEAs taken largely out of the frame gave rise to the irony that powerful actors in the study schools, colleges and LEAs, subscribing to subcultures whose values were out of kilter with this shift, were still empowered to exercise negative choice in response. Their collaborative approaches to aspects of educational provision lay beyond the limits of diversity promoted within central government.

Despite variation in the content and context of collaborative activities, they shared two key characteristics which enabled them to develop and endure. First, they were all substantial and sustained efforts where considerable energy was put into coordination and they all featured ongoing negotiation among key players. Second, they represented more than mere resistance to central government reform policies. Rather, they constituted a counter-policy which was the foundation for synergistic responsive action by participants in collaborative initiatives and, in some instances, LEA staff in reinterpreting central government
A COUNTER-POLICY TO SUBVERT EDUCATIONAL REFORM?

Policy and moving to co-optation in achieving the contradictory interest either of looking after the group of schools or colleges, or of finding a new niche for the LEA.

Yet it would be naive to overestimate the degree of subversion achieved or the prevalence of these counter-policies. Even if they enabled such leeway to be fully exploited as reform policies promoting autonomous and competitive self-managing institutions and reducing the power of LEAs allowed, pressure to comply with the requirements of other polices in the reform package remained. The combination of policy instruments may not have secured universal implementation in line with ministers expectations, but it does appear to have delimited the range of local responses. Collaborative initiatives certainly did not leave their members untouched by reforms. Moreover, while the exploratory research was not designed to establish the spread of such counter-policies, the initial postal enquiry suggested that they represent a minority response.

The idea of a counter-policy appears to have wider potential as a heuristic device for exploring the policy process. It may be dynamically complex, but patterns can be found if analytical tools are developed for the job. The local perspective on policy implementation and the concept of a counter-policy can help answer questions of the kind posed earlier: they show just how practices may endure in
target institutions within a large multilevel system which run counter to the thrust of central government reform policies, even where a system changing instrument is employed over several years. If room to manoeuvre can be found to resist or co-opt an unwelcome external policy, it will be. Counter-policies come into play in those situations where reinterpretation is a possibility at the level of practice.

The counter-policy idea fits the purpose of analysing local mediation of education policies, but more detailed conceptual mapping is required to refine the notion so that different forms of counter-policy may be distinguished, and conditions under which they may emerge, endure or decline may be understood. The possibility of transition from a counter-policy to the more generally accepted norm requires conceptualisation, attending to local uses of power to produce the cultural shifts that may be engendered where co-optation catches on system-wide. The research also indicated how the combined cultural and political perspective on interaction could highlight the centrality of contradiction and congruence in beliefs and values in affecting the conflictual or synergistic use of power between actors at different system levels.

A substantial research agenda is suggested. Promising directions for investigating the policy process from a local perspective include:

- longitudinal studies, tracking the policy process contemporaneously over a period of years, whether focusing on a single policy and its associated innovations or an overall policy thrust;
- multilevel investigations focusing simultaneously on two or more system levels and tracking the interaction between them as it happens;
- projects exploring a variety of settings inside and outside education; and
- comparative research, in, say, centralised and decentralised systems, or large and small states where the number of system levels and the degree of interaction between them varies (see Jones, 1996).

Finally, we have seen how voluntary local collaborative initiatives constitute counter-policies that subvert, on a small scale, a national policy thrust promoting competition between individual educational institutions. As for the future, who knows? We have witnessed one policy U-turn away from inter-institutional collaboration towards competition. The dynamic complexity of the policy process suggests we might yet see another, where collaborative initiatives in UK schools and colleges become cutting edge exemplars of policies launched by the new central government, and new counter-policies emerge within the aggressively competitive autonomous institutions whose managers actively endorsed the past reforms.

Part 8

LEADERSHIP AND HEADTEACHERS
Restructuring in schools has become one strategy for making significant changes in education. This article takes a preliminary empirical look at role transitions and role strain resulting from restructuring initiatives in schools in four districts. General support was found for role transition theory. The interview data provided evidence that these twenty principals had learned to deal with role transitions and the effects of role strain. Cognitive restructuring and environmental factors were important factors which moderated the effects of role strain. Experience, tenure in position, traditions of trust among staff, congruence of personal leadership style with role changes, school-level autonomy, and leadership and support from the superintendent and school board affected role strain intensity. The data also revealed that restructuring had resulted in a change in how these principals viewed their own leadership in schools: from managers in charge to facilitators on call.

Amid the flurry of educational reform activities aimed at improving education in general and student outcomes in particular, efforts are currently under way in schools and districts across the nation to make substantial changes in traditional structures and patterns of social organization in schools. There is a wide range in the scope and magnitude of change in experiments and practices representing this latest reform wave. Changes in structures and in the social organization of schools will have a major impact on the roles of individuals within those settings.

The traditional roles of principals and other educators in schools are changing and will continue to be reshaped, redefined, and renegotiated as restructuring
occurs. Timar (1989) notes that the ultimate success of educational reform efforts under the rubric of restructuring is fundamentally tied to changes in school cultures and social organization requiring dramatic changes in “the rules of behavior that define both the roles of individuals and their interaction” (p. 266). “Restructuring involves alterations in a school district’s patterns of rules, roles, relationships, and results. Anything less is not restructuring” (Corbett, 1990).

Substantial changes in identity with and understandings of tasks, behaviors, norms, and cultural values by principals in schools require a period of role adjustment. Shedd (1988) reported, “There are good reasons to believe that school managers and teachers’ unions are in fact, creating a new set of rules to govern their relationship—a set of rules uniquely tailored to their particular environment” (p. 407). Hart and Murphy (in press) conclude that as changes in role occur the principalship can be expected to change and principals “will be placed in transition, required to make sense of their new work lives” (p. 7). Chapman and Boyd (1986) reported that changes in decision processes and traditional notions of power and authority in Australian schools have resulted in altered social relationships, thereby forcing them to play new roles. Given the milieu of change in social role patterns, rules, values, and expectations, Duttweiler and Mutchler (1990) reported that educators in restructured schools are “having difficulty accepting changing roles and responsibilities, fearing the loss of power, lacking skills, lacking trust, and being afraid of the risks.” Allen and van de Vliert (1984) describe this period of change as role transition. In the transition process as principals and others in schools attempt to redefine and make sense of new role identities in restructured schools, they experience role strain. Role strain is intrapsychic—cognitive and affective disturbance manifested in varying levels of intensity of personal and professional tension.

**Purpose of the study**

A critical factor in role transition is role strain. Using interview data, this article takes a preliminary empirical look at role transition, role strain and reactions to it, and the impact of those reactions on principals themselves, on the role(s) of principal and others, and on the restructuring initiatives within those schools. The following questions guided the research and analysis of data. To what degree is role strain evidenced in the role transitions of these principals? How is role strain manifested in the lives of these principals? Are there identifiable individual and environmental factors that moderate the intensity of role strain and subsequent reactions to it? What are the reactions to role strain? What are the consequences of role strain and reactions to it for individuals, for the role of principal, for interrelationships among principals and various role senders, and for restructuring and reform efforts in schools?
Framework

Social role theory

Role transition as a social process is grounded in social role theory which argues that social behaviors are not simply random or meaningless events but that these social behaviors tend to be patterned, predictable, and have meaning for the actors and those with whom they interact. Social role theory is well-documented in sociological literature (see, e.g., Biddle, 1979; Biddle & Thomas, 1966; Mead, 1934; Merton, 1957; Sarbin, 1954; H. Turner & Colomy, 1988; R. Turner, 1962). The concept of role includes the related concepts of position, that is, “a designated location in the structure of a social system,” normative expectations, which are likely behaviors of persons in particular situations, and role enactment, that is, what a person in a particular position actually does given a set of role expectations (Biddle & Thomas, 1966, p. 11). Within complex social systems, individuals often occupy several positions and their individual behaviors are affected by role expectations and norms. Thus, in everyday life, an individual holds multiple roles, which are affected by role expectations from multiple role senders, and carries out many acts and behaviors given these complementary roles. Merton (1957) describes the totality of relationships among these complementary roles as “role set.”

Within the large body of literature on role theory, two basic perspectives have been dominant—structuralism and social interactionism. A structuralist defines role as a set of behavioral expectations associated with given social positions in the social structure. To structuralists, individuals are involved in the process of “role taking, which connotes the fact that expectations exist in the normative system and that an individual takes on and internalizes those expectations” (Ebaugh, 1988, p. 18). In contrast, social interactionists “focus on the way individuals negotiate emergent meanings in order to discover and enact new roles” (p. 18). Individuals in roles are in a dynamic process of “role making” in which they are constantly creating, redefining, and interpreting the roles they assume. Rather than choosing between these two approaches, the current study uses each of these perspectives to examine and describe role strain within the process of role transition.

Role transition

Embedded in social role theory, whether from a structuralist or an interactionist perspective, is the notion that social roles and their defining dimensions are mutable. A major assumption in this study is that the change process affecting the role set of the school principal can be examined as a social process much the same as investigators might study role socialization or role exit. “Role transition is used to refer to the process of changing from one set of expected positional behaviors in a social system to another” (Allen & van de Vliert, 1984, p. 3). This definition
suggests significant changes in tasks, behaviors, norms, and values for a given role holder. This often is the case when an individual moves from one position to another position (change in position set), say, from teacher to principal, from player to coach, or from educator to insurance broker. However, the role transition process described in this article differs in that individuals (principals) continue to occupy the same position, but role expectations, relationships, norms, and values associated with their position have changed substantially (change in role set).

Allen and van de Vliert (1984) offer a useful conceptual framework for understanding the role transition process (see Figure 1). The model depicts a dynamic and interactive social process encompassing the following components. Antecedent conditions are defined as potential causes of the transition. Role transition includes those change events for individuals and roles they occupy, which are affected by three conditions: the amount of discontinuity between two sets of role expectations, the degree to which the position (role) holder has control over the transition, and the extent to which the role transition is normatively governed, such as in ceremonial rites of passage. Role strain is a subjective state experienced by the role holder characterized by acute cognitive and affective disturbance such as discomfort, anxiety, perplexity, and uneasiness. Moderators are those “numerous individual (personality) and environmental (social context) variables which intervene between the initiation of the role transition process and subsequent reactions by an individual” (p. 14). Reactions to role strain are behaviors and activities an individual will engage in to reduce the intensity of role strain. Consequences include the totality of effects and impact of role holders’ reactions to role strain.

Several other authors have made valuable contributions to a general understanding of role transition processes and subsequent outcomes for individuals and for the roles they hold. Nicholson (1984) developed a theory of work role transition that links characteristics of people and organizations and modes of adjustment to role transitions (by replication, absorption, determination, and exploration) to varying sets of consequences for individuals and the role(s) they hold. The degree to which the modes of adjustment required by the organization (role dimension) and by the individual (personal dimension) match is moderated by various constraints and opportunities. As modes of adjustment between the two dimensions diverge, such mismatches become important sources of affective responses, such as anxiety and discomfort. According to Nicholson, role transitions also result in identity changes “in which new values, skills, and dispositions emerge in the search for new personal meanings to match new situational demands and behavioral outcomes in people as they make adaptations in their behaviors to new realities in their work life that are reinforced or transformed elements of the organizational culture” (p. 174).

Role theory has a rich history supported by dramaturgical metaphors. Fein (1990), examining role transition from a resocialization perspective, describes how changes in role require changes in “social role scripts,” those rules and
Figure 1. A model of the role transition process (source: From Role Transitions: Explorations and Explanations (p. 11) by V. L. Allen and E. van de Vliert, 1984, New York: Plenum. Copyright 1984 by Plenum Press. Used by permission).
structures that guide people during the performance of their behavior patterns and their interactions with others. He argues that as changes in role occur concomitant modifications are made in the external and internal components of “social role scripts” requiring negotiation between role holders and others because the “behaviors of one role are always integrated with those of others” (p. 21). The relinquishing of one social role script for another results in a variety of affective and cognitive responses by individuals and can be likened to the normal loss process. One needs first to recognize the dysfunctionalities of a current role, next, to let go of those role elements that impede change to new roles with new realities, and finally, to negotiate new and more satisfying roles to replace old ones.

Another useful process model for analyzing the social process of role transition is role exit. Ebaugh (1988) describes various properties of this transition process. Because role exit involves tension between an individual’s past, present, and future, it is an important dimension of the total role transition process. Ebaugh states,

In order to develop a comprehensive and adequate explanation of social roles, the notion of role exit must be as pressing and central as the traditional concept of socialization into new roles. Only then will we understand the process whereby we both learn and unlearn, engage and disengage, from the social roles that define who we are, especially in this rapidly changing world in which role exit is becoming commonplace.

(p. 206)

The dimensions of role identity and engagement are central whether one is entrying or exiting a role.

**Methods**

**Interview study**

Although there are limitations to interview data, one of the best ways to uncover evidence of individual role strain resulting from role transition processes affecting school principals is simply to ask them. Given the focus of the study on role strain, a subjective state experienced by a role holder typically characterized by acute cognitive and affective disturbances (e.g., discomfort, anxiety, perplexity, and/or uneasiness, manifest in varying levels of intensity), I chose the elite, structured interview as the research strategy.

A structured interview protocol was developed to query respondents about changes in their professional work life that, from their perspectives, were associated with restructuring efforts in their schools and districts. Open-ended questions were designed to permit each principal to interpret change processes taking
place under the rubric of restructuring. Throughout the inquiry, the investigator was careful not to impose his definition of restructuring and empowerment initiatives on respondents. Corbett’s (1990) notion of restructuring, that is, basic changes in school/district patterns of rules, roles relationships, and results, provided the initial definitional lens for examining these 20 principals and their schools. Given the lack of an agreed-on definition of restructuring in the literature and in practice, this understanding provided a useful preliminary framework, for investigating restructuring and role transition processes in these four school districts.

For the most part, restructuring in these schools was characterized by wider application of shared decision making, decentralized, school-based management processes, and greater professional autonomy expressed in redefined roles, rules, relationships, and responsibilities. In addition to these similarities, it is important to point out that each school and district had a unique biography that framed environments for, and definitions of, restructuring and empowerment.

When using the interview as the primary data source, there are always concerns about the reliability and validity of interview findings. Given the focus of the study, it would be difficult to find more reliable data than the principals’ own words on what they were experiencing in their professional work lives. Consistency checks were embedded in the study. Because these were self-report data, I employed structural corroboration using multiple interview items, each worded differently so as not to be obviously redundant but substantially asking for similar information from respondents. These multiple items were especially useful during stages of analysis. They permitted me to cross-check responses for consistency in how each principal articulated individual perceptions of work role changes and resulting role strains.

**Selection of principals**

The general purpose of this investigation was to examine the role transition process of principals in restructured schools. Theoretical sampling was used to guide the selection of school districts and principals in this large northeastern state. The selection of the four districts and 20 principals included in the study was based on the relevance of these sites and administrators to the dynamics of restructuring and work role transitions affecting principals. Principals were identified through a colleague nomination process. State department of education administrators, intermediate unit administrators, superintendents, and university professors who frequently worked with local school districts were asked to identify districts in which significant restructuring efforts were under way. The nomination process was facilitated by a recently enacted piece of legislation that mandated the development of local district plans for professional development and school improvement and that needed state department of education approval. The state mandate required each district to appoint a professional development team composed of teachers and administrators in relatively equal
numbers. These teams then proceeded to develop comprehensive ongoing professional development and school improvement plans that became expressions of, and vehicles for, restructuring in these schools.

Based on the list of nominees from these professional educators, four school districts were identified (see appendix). One district, Centremont, used a structured, problem-solving model developed in the private sector to address in a systematic way team-identified problem areas. The parameters of problem/opportunity finding, however, were limited to solvable school-based issues, not issues of school governance or policy-making. The second, Hillview School District, used a state-mandated curriculum review process as an opportunity to pilot and experiment with shared decision-making processes among teachers and administrators. Successful experiences in the districtwide curriculum review project using shared decision making processes were built upon as members of this original team fanned out to their schools to work on other critical issues at the building level. A third district, Westby, tapping into the visionary strengths of the superintendent, built its restructuring initiatives on trust, good morale, and significant changes in responsibilities and roles articulated clearly in practice and in contract language. The superintendent, school board, and teachers put shared governance up front. Together they worked to free up principals and teachers from organizational and structural shackles to move them to think and act for themselves professionally. Elk Mountain, the fourth district, had strong traditions of building-level autonomy, especially in curriculum planning and decision making. Professional autonomy, however, had very limited extension to district-level decision arenas.

Although not the only source of influence affecting restructuring efforts across these four districts, the superintendent was a major player and facilitator. Regardless of the framework or vehicle used to move ahead with school restructuring and empowerment initiatives, each of the respondents talked about the influence of the superintendent’s support and ideas. In addition, the superintendents used coaching and modeling of desired leadership skills and behaviors in administrative cabinet meetings with principals that were consistent with emerging understandings of shared decision making, empowerment, and professional autonomy. The leadership behaviors of superintendents were power mechanisms that helped to create and maintain cultures in which these experiments in restructuring could develop and flourish.

Sixteen of the respondents were principals and 4 were assistant principals. Two assistant principals carried out many of the traditional duties commonly associated with the role of assistant principal. The other 2 assistants described their role as that of coprincipal, dividing major functional responsibilities with the building principal. (For narrative convenience, all respondents will be referred to as principals.) The principals represented all levels of schools. There were 5 female and 6 male elementary, 5 male middle school, and 4 male high school principals. Although the four districts in which these principals worked were not completely representative of school district size and type in this state,
the interview data did provide evidence of how role transition processes were
being played out by principals and others in two medium-sized cities, a small
college town, and a rural/small town comprehensive school district.

**Data collection**

Interviews lasting from 45 to 90 minutes were conducted with principals and
assistant principals in their schools. Using conventional field study notations, the
researcher recorded all responses in field notes using a combination of symbols
and researcher-developed shorthand. All responses were transcribed onto the
interview schedule. To check for accuracy of recorded responses and to develop
transitions between questions, the investigator frequently repeated recorded
responses to the interviewee. After each interview, the researcher spent time
recording additional information in his field notes and checking for accuracy of
recorded responses. At the end of each day, the researcher transcribed all hand-
written field notes onto text files. These computer text files, with responses
recorded by item and by respondent, formed the data set that was amenable to
various analytical strategies including cross-checking for consistency of
responses within respondent sets, patternmaking across all response sets, iterat-
tive processes of theme identification, and analytical frameworks that provided
support for work role transition process models.

**Data analysis**

The research questions called for both deductive and inductive processes in the
analysis of interview data. The initial stage of data analysis was deductive in that
the researcher examined responses vis-à-vis Allen and van de Vliert’s (1984)
role transition process model. This model as well as that of Nicholson (1984)
were particularly useful for purposes of identification and description of work
role transition factors, processes, and outcomes. In the second stage of analysis,
the researcher examined the data set employing a constant comparative method
of analysis (Glaser & Strauss, 1967). Patterns and themes were then developed,
based on interview materials detailing role transition events and their effects on
individuals and schools in which they worked. The simultaneous deductive
processes, finding support for role transition theory, and the inductive processes
of systematic theme analysis enabled the investigator to develop themes from
the words of principals who were experiencing work role transitions with
varying levels of role strain intensity and who were employing various strategies
to cope with personal and professional doubts, fears, and anxieties.

**Presentation and discussion of findings**

A major assumption at the outset of this investigation was that significant
changes brought about by restructuring activities in schools would likely have a
major impact on individuals and the roles they held. The interviews focused on how principals currently involved in restructuring in their schools perceived those changes and the impact of various adjustments in their work life on their role as principals. The role transition process developed by Allen and van de Vliert (1984) serves as an organizer for the presentation of findings.

Antecedent conditions: environments of change
Role transitions for these principals were most often the result of social and political forces, unanticipated events, changes in role senders’ expectations, and/or changes in the characteristics, capabilities and motivations of the individual role holders. Helping to create environments for restructuring with a sense of ideological and political correctness were: the educational reform movement in general, calls for school improvement and higher student outcomes, the movement toward decentralized organization and decision-making structures in schools, the popularity of Theory Z (Ouchi, 1981) and Japanese management styles, and state legislation mandating school districts to prepare professional development and school improvement plans using teams of teachers and administrators. Changing expectations for principals by school boards, state departments of education, central office personnel, teachers, and parents also contributed to conditions fostering role transitions. To varying degrees, these antecedent conditions in general, as well as others which were unique to each district and school, were important causal factors of role transition for these principals.

Role transition: changes in role set
In this investigation, role transition is defined as the process in which an individual changes from one set of expected role-related behaviors in a social system to another set. The model of the role transition process depicted in Figure 1 illustrates a dynamic and interactive process of the major dimensions which underlie, occur and result from role changes. The degree to which expectations, norms, and values differed between old and new role sets greatly affected role transitions. Clearly, some changes in role expectations for principals had rather minor consequences for individuals and did little to affect their understanding of, behaviors in, or identity with a particular role. In any dynamic social system with complex role sets, such as those found in schools, there are always some alterations and adaptations of individual roles. These minor incremental adjustments were not the focus of this particular investigation. In this study, the changes that resulted from restructuring initiatives in 18 different schools were substantial and resulted in significant changes in expected patterns of behavior for principals and the people with whom they worked.

As noted in the appendix, role transition processes were driven primarily by initiatives from superintendents in each of the four districts. Teacher union
leaders in Westby and Centremont and teachers in Westby and Hillview were also identified as important forces in restructuring initiatives. Examples of significant changes in roles, rules, relationships, and responsibilities included reassignment of responsibility for budget allocations and spending, new decision-making configurations of teachers, principals, and other staff to identify and address important work-related issues, new patterns of collective bargaining between the local teachers’ association and the school board, petitions to the state department of education to seek release from rigid state curriculum mandates to enable greater professional autonomy at building and classroom levels and relinquishing of control by principals in professional work groups.

A second characteristic of role strain was the degree to which these principals controlled role transition events in their settings. The interview data revealed that individual principals were located along a continuum of control moderated by length of time in their positions, levels of trust established among their professional colleagues, personal leadership styles, school-level autonomy, supportive collegial environments, and leadership from the superintendent. As will be argued later in the article, the amount of control each principal exercised over role transition events and their timing was inversely related to role strain intensity.

To what extent were individual role changes normatively governed? For these principals there was little evidence to suggest that the transitions they experienced were part of established norms of passage. An elementary principal in Westby stated, “We’re making it up as we go.” An example of a normatively governed role change would be a classroom teacher moving into an assistant principalship. There is a typical pattern of socialization to new administrative roles, and thus it is likely that past experiences, existing expectations, and group norms would be more dominant in the socialization process. No such transitional or bridging positions were available to the 20 principals interviewed in this study. To be sure, organizational norms affected the role transition processes of each, but each role transition process could be best described as idiosyncratic, formative, and governed by emerging shared values rather than by established norms.

**Role strain: expressions of anxiety and disturbance**

Some role transition events occurred smoothly with minimal amounts of stress on role holders. Nevertheless, even under optimal conditions, shifts in role and in role expectations produced varying degrees of role strain, defined in this study as acute affective/cognitive disturbance for an individual role holder manifested as anxiety, discomfort, uneasiness, perplexity, and/or general distress. Role strain was distinguished from stress in that role strain was identified as individual subjective responses to causes of stress. Through stressors were noted, the focus of the investigation was on role strain and how it was evidenced in the worklife of principals.
The responses to interview questions revealed that each of these principals was experiencing many feelings. These included varying states and levels of anxiety manifested in feelings of having lost control, fear of failure, self-doubts about personal competence and ability to be successful, impatience and frustration, concerns about loss of professional identity, and increased feelings of uncertainty brought about by significant changes in their professional worklife. The notion of letting go of one set of professional functions and identities while learning others was described as risky, wearisome, and frustrating.

Loss of control

Loss of control due to role accretion was a major source of anxiety for these principals. A decade of education reform initiatives coupled with current efforts to restructure schools and the work of professionals in them left these respondents feeling as though they had been “dumped on.” Across the four districts and 18 schools, principals reported that their responsibilities as administrators had grown exponentially. Contributing to the feeling of being “spread too thin” were new responsibilities at district and community levels, increasingly specific demands from parents and other community stakeholders, the addition of countless programs to meet student needs in the areas of drug and alcohol abuse, child abuse, truancy, dropouts, and sundry other well-meaning projects to address specific societal ills affecting students. As one respondent noted, “The principal’s job is much more complex. We just keep adding to it, but never take anything out.” Loss of control also appeared in comments about no longer having to maintain the myth of principal omniscience. Role overload and increasing role complexity contributed to the belief that as principals they were no longer able to “keep a handle on what’s going on” in their schools. In Centremont and Westby, where restructuring activities included district-level committees and work teams, principals were further strained by requirements demanding time for teachers and for themselves away from their students and buildings.

As teachers assumed greater responsibility in decision arenas traditionally held by principals, such as in curriculum decisions, professional development programs, and community outreach efforts, the effect on principals was a mixed blessing. “It’s kind of interesting. The more you involve people, the more you can accomplish but the less you as principal can stay on top of things.” As teachers moved into decision arenas that principals once considered their personal forte, one principal captured the feeling of his administrative colleagues: “Sometimes teachers can do it better than me and that hurts.” One respondent described another problem: “Occasionally people outside the organization don’t understand the process of shared governance. For example, I might get a call from outside. A parent wants to know what’s going on. I’ll say I need to talk with the teachers about what they’re doing. They think, ‘Why the hell don’t you know what’s going on in your school?’ They think I’m not doing my job.” In part, the empowerment of others relieved some of the strain caused by role over-
load and helped to dispel the myth of principal omniscience while at the same time it resulted in other sources of strain.

Fear of failure

Fear of failure also resulted from role transitions. Anxieties about personal failure, mistakes, and misjudgment by others and nagging doubts about the long-term success of restructuring in their schools and districts characterized this source of role strain. Fear of failure was also tied to individual self-doubts about personal competence and ability to deal with newly empowered, professional colleagues. Many of these principals had misgivings about whether or not they could keep quiet and not intervene prematurely when teacher groups were experiencing difficulty in problem-solving sessions. They worried about being able to trust others to carry out newly assumed roles and responsibilities successfully. Principals were worried about their own capacity to be patient and to trust in others and in shared governance processes, to let things happen, and to permit others to go through growth processes. One principal stated, “That’s the one that kills me. It takes for me a lot of patience. I’m a Type A personality. I want for the committee to get something done. I have a tendency to overlead.” This is not to suggest that principals were completely out of the decision-making loop. However, they were well aware that even constructive, negative feedback to teachers and others during the nascent stages of shared governance might be misconstrued as heavy-handedness and reassertions of traditional authority. Concerns that teachers would inevitably make decisions that principals themselves would not have made raised the spectre of having to be supportive of people and restructuring processes through mistakes and misjudgments as well as in their successes. Finally, it was clear that not all teachers were enlisted in restructuring and shared governance processes. Not wanting restructuring initiatives to go the way of many perennial education fads, principals were also concerned about having adequate time, resources, and staff commitment over time. To allay some of their fears related to the long-term success of restructuring efforts, there were attempts to solidify gains achieved through empowerment and restructuring. In Centremont and Westby, restructuring was institutionalized in building- and district-level bodies (Alliance of Centremont Educators ACE, Building Liaison Committee BLC, and a Professional Issues Committee PIC). Ad hoc committees and less formal groupings of teachers and principals in Hillview and Elk Mountain entrusted restructuring energies and hopes in individuals who would carry out specific initiatives.

Loss of identity

Another aspect of role transition that created role strain was the process of disidentification, the process of ceasing to think of oneself in a former role. Role transitions required principals to unlearn normative expectations of previous
roles. At the same time they had to learn an emerging, ambiguous role. The shift to new role identities for principals was forged from past, present, and future role expectations and identities. Attempts to shift to new roles required incorporation of vestiges and residual aspects of former roles. Letting go of particular professional identities varied across respondents. For these 20 respondents, their self-identities had been built up gradually over the years by internalizing the meanings and expectations of the many roles they had played. Some roles were more important to self-identity than others. The greater the centrality of a previous role to individual self-identity the higher the amount of role strain experienced. Each principal was in the process of negotiating and reintegrating previous roles and expectations into new self-concepts of the principal’s role in a restructured school. The following responses are examples of role strain regarding identity of self in emergent principalship roles:

I am a member of the team. However, I sense there is still a differentiation on their [teachers'] part.

There is an expectation among many teachers that I should tell people what to do because of my role as principal. That I should be the final arbiter when they can’t reach consensus. That I should decide. The principal has real difficulty being a member of the group.

I was everything before. I did it all. Now, district professional development administration does a lot of what I used to do. Now I play a role in programs with new teachers, but I’m not responsible for it. I’m one of the committee in terms of empowerment.

Some principals are getting defensive [and they are] not really clear as to what their role is.

I tried to do everything at first. However, I quickly learned what I was most effective at.

A few respondents also talked about the difficulties of divesting themselves of residual roles while they negotiated a new role set for the principalship and reconciled an emerging sense of role with their own self-identity. More often, however, the principals, especially elementary principals, indicated that their own leadership style and working relationships with professional colleagues, which were quite compatible with restructuring and shared governance, predated current role shifts, and thus the transitions for them personally were not difficult. However, role shifts and self-identity were problematic for other principals they knew.

**Moderators of role strain**

The intensity of role strain produced by role transition varied from one role holder to another depending on the impact of individual and/or environmental
moderators. These moderators intervened at one or more locations between initia-
tion of role transition to reactions by the affected role holder. The effects of
individual attributional style, self-esteem, social identity, and emotional stability
were important personal moderators. Environmental factors included the struc-
ture of social networks, organizational culture, time and money, and existing
levels of trust.

**Personal moderators: leadership style**

Each respondent experienced role strain as a result of role transitions they
experienced in their unique setting. The intensity of role strain was moderated
by personal factors and environmental/structural influences. Personal factors
included the compatibility of personal leadership style with role changes, indi-
vidual tolerance for change processes, the principal’s capacity for growth during
role transition, strength of interpersonal communications skills, and facility with
group process. As predicted in role transition theory, the less role discontinuity
between old and new roles accompanied by greater individual control over role
transition events, the more likely role strain would be diminished. This was
clearly the case for these principals.

The following responses suggest a continuum for role discontinuity and
control over transition events among these administrators: “My role isn’t chang-
ing”; “As a leader I’ve always been working with teachers”; “This has been my
particular leadership style.” At the other end of the continuum, several com-
ments reflected recognition by principals that significant changes had occurred
in their leadership roles: “I’ve come a long way”; “Ten, 15 years ago, I wasn’t
like that”; “I don’t think 10 years ago principals worried about how teachers felt
about themselves, their work place.” Another respondent described the tension
between identification with old roles and emerging roles for the principal: “You
can no longer operate in an autocratic fashion. But you don’t just open the doors
and let others run it.” What the range of these comments suggests is that for a
few of these principals there was little role discontinuity and they felt as though
current restructuring initiatives (characterized primarily by wider applications of
shared decision making, site-based management strategies, and greater profes-
sional autonomy) were simply districtwide legitimation of their personal leader-
ship styles and long-standing professional practices in their buildings. However,
a number of respondents, especially female and elementary principals, noted that
some principals they knew, who had been used to acting as dictators or building
bosses, were feeling much greater role strain. Referring to her male counter-
parts, one principal commented, “I see the other guys’ role changing. I hear
comments from the fellows that reflect insecurity. It’s kind of hard for them to
swing over to new ways of looking at things.”
**Patience and tolerance**

Other moderators of role strain for principals were tolerance and patience. Individual tolerance for the slowness of shared governance processes, for the mistakes and limitations of colleagues, for role ambiguities, and for situational uncertainty tempered role strain and its effects. Thus exhibits of patience such as relinquishing control to others, avoiding unnecessary or premature intervention in group processes, and seeing the outcomes of restructuring in terms of long-term gains were moderators of cognitive and affective arousability, or role strain. The relationship was clear: Higher levels of tolerance and patience contributed to lower levels of role strain. Differences among these 20 principals were attributable more to individual leadership styles than to organizational characteristics and restructuring activities.

**Capacity for growth**

Each principal’s capacity for personal and professional growth also affected role strain intensity. One respondent stated, “I think principals go through growth phases just like teachers. I think initially I viewed things as ‘we-they’—not necessarily adversarial but differently. I’m not sure how much I’ve changed as a principal versus how much schools have changed. I’m much more process-oriented than 6 years ago.” The issue appeared to be one of perspective. For principals who viewed role transitions as opportunities for growth, role strain remained at fairly low levels of intensity. Another respondent added, “Some of the principals are getting defensive. Some principals are not really clear as to what their role is.” In Hillview and Elk Mountain, where superintendents coached and modeled behaviors supporting restructuring and where there were strong traditions of professional autonomy, principals saw more possibilities than problems in restructured roles and relationships. In Westby, a respondent noted, “Some principals are worried about losing control. If you’re still in charge, there’s no problem because you’re still pulling the strings.” Principals who perceived role transitions brought about by restructuring as threats to professional identity and to position security experienced greater role strain. However, only one principal, with most of his administrative experience in parochial schools, expressed concern about role changes. Individual growth was apparent in the responses of each principal. For a few, this growth required rather dramatic changes, such as breaking out of the seed hulls of traditional roles, rules, and relationships. For others, growth was less transformational and more developmental. The notion of growth supports the earlier discussion of strain brought about by role discontinuity. Dramatic spurts in growth for principals caused greater strain than did incremental maturation in nurturing, supportive environments.
Communications and group process skills

Individual strengths in interpersonal communications, delegation of responsibilities, facilitation of the work of others, and small group process skills also accounted for variance in role strain among these administrators. Across the districts, as changes occurred in their professional work life, highly developed communication skills were viewed as the most important leadership qualities for success in the principalship (Bredeson, 1989). As principals moved from more traditional, hierarchical school leadership to group-centered leadership, the capacity to listen, to deal with conflict, and to facilitate small and large group processes were these principals’ most important competencies for success.

Environmental moderators: traditions of trust

Environmental factors at school and district levels also moderated role strain. Primary among these factors was trust. As roles were being redefined for principals and other professionals, trust in one another, in restructuring processes themselves, and in the likelihood of positive effects on desired student and organizational outcomes was essential. Trust among principals, other administrators, and teachers had been established over months and years of these educators working together to accomplish mutually shared goals. High levels of trust at the building level permitted principals to more easily relinquish control, delegate responsibilities, take risks, share frustrations, and rethink their leadership roles without feeling threatened in terms of job security or their self-identity as principals. However, high levels of trust were not simply a function of years or experience in a school, although those principals with only a few years in their buildings had less history to connect them with their staffs. And in a few schools, the number of years the principal had been in the school appeared to have engendered more caution than trust. In schools where trust levels were high, traditions of trust were products of ongoing professional dialogues among principals and their staffs. Trust helped to build confidence in evolving processes, to suspend premature judgments, and to sustain enthusiasm for change, even when things went wrong. One principal noted,

> Initially everyone has a messianic complex that comes from a compulsion to do everything. One grows out of that because of necessity, one can’t do everything. You can’t be everything to all people. One’s success depends on the success of others. The only way to be successful is to help others be successful. I felt this at first, but now I know it’s so. I’m becoming more and more trusting of groups.

Trust necessarily had to be pervasive across all levels of the school system: “It [trust] continues not only here, but all the way to the school board level. It’s not we-they. It’s us.” The ability of teachers and other professionals to assume
facets of role and decision domains traditionally held by principals also affected role strain intensity and reactions to it. As rules, roles, and responsibilities were readjusted, collegial support was critical in moderating role strain anxieties.

*Time and money as moderators*

Two resources, time and money, were key environmental factors affecting the intensity of role strain. Having enough time to see change processes through, time to make adjustments to new role expectations, time for trust and comfort levels to be established, and control of the timing of role transition events greatly affected individual role strain. Time often translated directly into money. The data strongly suggest an inverse relationship between the amount of time and money and role strain. In Hillview and Elk Mountain, where substantial fiscal resources had been set aside to facilitate restructuring processes, role strain for principals and others was diminished: “I think the superintendent and the board set the tone. Other administrators in the district picked up on it.” The district, “is in good financial shape and this has allowed us to do some things. Finances are important because they enabled us to do things with facilities, with places for teachers to plan. For years they’ve not had space to work in and plan. All these things have turned things around. When teachers are involved, they have ideas. We can pay for those ideas.” In Centremont, time and money had been allocated primarily to train “opportunity finding teams” and to provide time for teams of professionals to work beyond the school day and year.

*System support*

There was evidence of general social system support across buildings and districts that moderated the intensity of role strain. In Westby, support was evidenced in the flexibility in interpreting and adjusting collective bargaining agreements between the school district and the teachers’ union without abdication of responsibilities and accountability. The other three districts were cognizant of the implications of restructuring on collective bargaining agreements, but they emphasized informal strategies for implementing changes in roles. In Westby, teachers and administrators confronted contract language and any other possible threats to local restructuring efforts directly. During the last two contract periods, contracts were reopened early to deal with problems. They would not permit collective bargaining calendars to interfere with significant progress in restructuring.

*Reactions to and consequences of role strain*

As described previously, the intensity of role strain was a product of antecedent conditions and characteristics of role transition, both of which were moderated by personal and environmental factors. Lower levels of intensity required only mar-
ginal adjustments by individuals. If high-intensity role strain existed, each principal reacted in particular ways to reduce the amount of anxiety and discomfort associated with work role transitions. Various reactions to role strain were evident in one or more domains. Reactions occurred in cognitive, affective, and behavioral domains: cognitive reactions—such as reinterpretations of events (the principal was pleased that teachers now called faculty meetings because this freed him up to attend to other priorities) and selective monitoring of the environment (cases where it was obvious that the principal could not know about every initiative in the school); affective reactions—fear of failure and fear of being overwhelmed by the pace of change or fears about loss of professional identity; and behavioral reactions—such as simply ignoring the stressors and the strain or acting to change one or more factors in the role transition processes. Role transition theory suggests that these types of reactions can be directed toward self (an internal reaction) or toward the environment (an external reaction). How did these respondents attempt to cope with role strain?

There was a great deal of similarity between moderating factors to role strain and reactions to role strain itself. Both consisted of environmental and personal dimensions that either moderated the intensity of role strain or were individual mechanisms for coping with existing role strain. Using the conceptual model of role transition processes, it was clear that feedback from reactions to role strain contributed to moderating dimensions of strain in subsequent role transitions. Reactions, however, were distinct from moderating factors in that the individual adjustments were resulting actions of strain, not factors that affected the intensity of role strain. Once role strain existed, each person dealt with it at one or more levels (cognitive, affective, and behavioral) and attempted to reduce discomfort and anxiety by altering aspects of self or conditions in the transition environment. Internal reactions (those directed toward oneself) and external reactions (those directed toward factors in the role transition environment) are briefly described.

Internal reactions to role strain

In general, these 20 principals primarily reacted to many of the pressures of role strain by looking inwardly. They listed a number of individual adjustments (cognitive, affective, and behavioral) related to changes in their sense of role and self-identity. The notion of locus of control is salient here. As these administrators attempted to deal with ambiguities and strains of role transition in restructured schools, it was clear to them that they could alter aspects of self more directly and with more impact than many of the broader, social system/environmental factors that most often appeared completely beyond their control or only indirectly mutable in their roles as principals.

Cognitive restructuring, redefining one’s understanding of and meanings ascribed to one’s role in the school community, was a common internally directed reaction to role strain. Within the context of highly publicized school
reform initiatives, these respondents were not resisting changes in their principalship role but were welcoming role transitions as opportunities to enhance leadership by tapping into the power and richness of human resources and dynamic processes in their buildings. Active resistance to changes brought about by restructuring was not reported. These respondents were seasoned professionals who knew the rhetoric and realities of change occurring in their settings. They had dealt successfully with organizational change before and would do so again. Given the fact that these are self-report interview data, one needs to be cautious. However, there was no evidence to suggest that these principals as a group were threatened by the role transitions or that any one was simply accommodating the rhetoric of reform by riding out this latest wave of educational reform. The credo “change is the name of the game,” as cited by one principal, appeared to be an operative situational reaction to role changes brought about by restructuring. Cognitive restructuring was also useful in ridding many of these principals of the burden of the “superprincipal myth,” that is, feeling as though they as principals had to be, know, and do everything. Changes in these schools were providing legitimated role-making opportunities in which principals could reassess their leadership roles, reflect on them, make choices among them, and set new role priorities.

Another internal reaction was the relinquishing of control over particular leadership responsibilities. Given the expansion of responsibilities for principals over the past two decades, role strain forced the issue of leadership priorities. To be successful, principals had to learn to delegate responsibilities and to rely on others. Relinquishing control over, and responsibility for, planning and organizing of staff development programs, special projects, and various tasks of professional work groups helped to reduce the intensity of strain from role transition and role overload. Most principals reported that relinquishing control was not easy even when they believed it to be imperative to successful restructuring efforts. They found themselves having to stifle their natural enthusiasm and tendency to intervene, to keep quiet as others puzzled through problems and assumed responsibility for outcomes, and on occasion they even purposely missed team meetings so that others could assume control and take responsibility.

Individual growth and changes in leadership behaviors were other reactions to role strain. Restructuring and empowerment of staff required these principals to enhance communication skills, especially the capacity to listen, to provide better feedback to professional colleagues, to be more sensitive and trusting, to model leadership behaviors for others, and to act more as facilitators than as doers.

External reactions: adjustments in roles and relationships

As principals made adjustments in their roles and responsibilities in school, they were also altering social relationships with teachers and others, that is, externally directed reactions. Many of the internally directed reactions occurred simultaneously with alterations in the school’s social system. As each principal
reexamined his or her understanding of role and created new meanings for principal leadership in the school, other role senders were affected. In an earlier report on these data, Bredeson (in press) described how these principals, to varying degrees, were readjusting sources of power in their schools as they moved from more traditional manager-oriented leadership behaviors to group-centered leadership behaviors. These adjustments included increasing attention to group needs, relinquishing control and responsibility for task completion to others, becoming consultants and facilitators, providing a climate of support, modeling leadership behaviors, and entrusting group maintenance and process problems to members of the group. These alterations in role and social relationships were not easily accomplished nor automatically accepted by others. Each principal was negotiating new roles, rules, and relationships within a particular school setting. Some principals felt uncomfortable with these changes as did some teachers. A few teachers even wanted their principal to simply make the decisions, set the direction, and “tell me what to do.” The data also indicated that in many situations teachers did not have the skills to assume particular responsibilities and therefore needed time to learn and refine requisite knowledge and leadership behaviors. Thus role changes and alterations in rules and responsibilities required incremental approaches in nonthreatening, supportive environments for both teachers and principals.

Conclusions

A major assumption at the outset of this article was that role transitions for principals were pivotal change events in organizations. Current initiatives in school restructuring and the empowerment of others in the school community were antecedent factors that contributed to work role transitions and role strain. Based on the data in this exploratory investigation, there are a number of implications for theory, research, practice, preparation of school administrators, and current educational reform initiatives.

Support for role transition theory

The role transition process model has utility as a conceptual, theoretical, and analytical guide in the examination of work role transitions for principals and others in schools. The model assumes a sequential, systems notion of role transitions focused primarily on intrapersonal psychological dimensions. These interview data provide preliminary evidence to support factors in the role transition process depicted by Allen and van de Vliert (see Figure 1). A key difference in work role transitions described in this study is that the changes were not in role position but in role set, namely, substantial changes in role expectations, relationships, norms, and values for individual holders. Although the interview questions did not focus on role transitions for other role senders and holders in schools, the responses from these principals suggest that role transition, role
strain, and individual modes of adjustment to social role change processes have important psychological, social, and political implications for teachers, students, and other professional staff in restructured schools.

The data indicated that not all role facets involved in work role transitions were equally important to professional role identity—what Stryker (1980) referred to as “identity salience.” Principals performed multiple roles in schools, some of which were more central to their sense of professional and personal identity than others. Blau (1973) noted that with each significant role change the integrity of self is jeopardized to some degree. These interview data provided evidence to support the hypothesis that the greater the role change, the higher the intensity of individual role strain. The ability of these principals to control specific facets of role transitions in their schools was moderated by their experience and length of time in their current position, traditions of trust among staff, congruence of personal leadership style with role changes, school-level autonomy, and leadership and support from their superintendent and school board.

Given the variability of moderating effects in role transitions for each principal, no one pattern of work role transition was discernible. Role transitions were idiosyncratic and not guided by normative organizational or professional processes. Some support for Nicholson’s (1984) theory of work role transition was evident in that each principal made adjustments to role changes through personal development (altering individual frames of reference, values, and relationships) and role development (proactive attempts by role holders to bring about a better match between individual needs, abilities and identities and their new role demands). Role innovation was affected by constraints and opportunities for discretionary behavior in the emergent role, novelty of role demands, reward systems, collegial support, and feedback from other role senders.

The variability of role transitions for these principals was matched by wide ranges of role strain intensity. The focus in this study was on the psychological dimensions of work role transition processes, defined as acute cognitive/affective intrapsychic disturbance. The analysis focused on role strain and its impact on individual social actors as they carried out and worked to redefine their social roles. Role strain was evidenced in feelings of having lost control over particular position responsibilities, fear of failure for restructuring processes and for their leadership efforts, self-doubts about personal competence and ability to be successful, impatience, frustration, loss of identity, and increased feelings of uncertainty about significant changes in professional work life. These manifestations of role strain are consistent with Ebaugh’s (1988) findings related to the process of becoming an “ex”: “Self-identity is built up gradually over the years by internalizing the meanings and expectations of the roles we play. Elements of the new or previous role have to be negotiated and reintegrated into one’s self concept before stability and security can be re-established” (p. 22). For some principals, reconciling past leadership identities, such as leader as boss, with newly configured ones created substantial role identity strain. For a few female
elementary principals, restructuring had resulted in the legitimation of long held beliefs about effective school leadership and practice rather than new identities.

The phenomenon of role strain resulting from role transition is not unique to school restructuring. Role strain can also result from factors such as role conflict, role overload, and role ambiguity. The very nature of the work life of school principals, as described by Kmetz and Willower (1982) and Martin and Willower (1981) provide ample evidence that role strain is a constant companion of principals. The degree to which work role transitions for principals resulting from restructuring efforts in schools can be understood in terms of their impact on individuals, on those with whom they interact, and on schools themselves provides role holders and role senders opportunities to employ personal and environmental factors as mechanisms to moderate and reduce role strain and concomitant dysfunctional reactions and consequences. Because there are many interactive dimensions to changes in work roles, it may not be possible to tease out just which aspects of role strain result from role transitions. The findings from this study do contribute to a better understanding of the psychological impact of work role transitions in restructured schools. As individuals and organizations come to understand more clearly the impact of role transition processes in schools, the more likely they will be to intervene effectively to influence the intensity of role strain and to minimize any dysfunctional reactions to role strain and its consequences.

From individual and organizational perspectives, moderators of role strain were key factors in role transitions. The ways in which individual role holders made adjustments to changes in role greatly affected the outcomes of transitions. Personal factors were the most powerful moderators of role strain for these 20 administrators. The notion of locus of control is relevant. Leadership style, capacity for growth, tolerance, patience, and interpersonal communication skills were personal factors under the direct control of principals. This is not to suggest, however, that these were easy to learn or to exercise consistently. In terms of personal moderators for reducing adverse effects of role transition strains, these respondents appeared to follow Blanton’s (1991) recommendation for successful leadership in restructured schools: “The essence of leadership is not to manage or change others; it is to manage and change oneself” (p. 9).

Principals reacted to role strain at cognitive, affective, and behavioral levels. Two categories of reactions were identified: internally directed reactions (directed at oneself) and environmentally directed reactions (directed at others, roles, and social relationships). Cognitive restructuring directed toward oneself and toward others was an important mechanism for reducing role strain. The ways in which principals perceived transition events in their work life greatly affected their reactions to those changes. None of the principals saw restructuring and the changes that came with it as threats to their leadership role in the school. Transition events were transformational, not threatening. Because “change was the name of the game,” the notion of active resistance to restructuring and role transitions was not a politically acceptable nor appropriate professional stance. These are self-report
data, so it should not be surprising that these seasoned administrators were adroit at dealing with external forces and events affecting their work life.

Environmental factors, which included traditions of trust, time, money, district support, and flexibility in collective bargaining processes, though equally important were less amenable to the individual principal’s direct control. The ability of the principal to provide time and money, two important sources to sustain restructuring efforts in these schools, was a key environmental factor. Many teachers and principals were reported as getting tired. Volunteerism was important but even the most altruistic of professionals were beginning to weary in environments of rapid social and organizational change. These principals saw the need to institutionalize mechanisms to moderate and facilitate role transition processes as they occurred. Institutionalization appeared to be accomplished in two distinct ways. In the two city districts, institutionalizing restructuring meant creation and formalization of structural components to solidify changes in roles, rules, relationships, and responsibilities. In Hillview and Elk Mountain, institutionalization was vested in individuals and their experiences and successes as empowered professionals rather than in formalized organizational structures.

Each principal listed many advantages to empowering others and restructuring roles and relationships in the school. Individual ability to reinterpret the nature and meaning of professional work roles and to embrace transition processes brought about by local restructuring efforts helped to ameliorate levels of discomfort and anxiety. In many cases, role transition events fostered individual professional growth, permitted long awaited redefinition of what principal leadership meant, helped some principals shed worn out images of the “super principal,” provided opportunities for adjustments in sources of power, and legitimated opportunities to experiment and model appropriate leadership behaviors for autonomous, self-managing, professional educators. Cognitive restructuring resulted in a fundamental shift in the way that principals defined, identified with, and carried out their leadership responsibilities.

The responses from these principals revealed that they were moving away from the image of principal as manager in charge to that of facilitator on call. Thus the reactions identified in this study support Nicholson’s (1984) theory of work role transition in terms of individual modes of adjustment to, and conditions for, significant changes in work roles. There was also ample evidence to support Zurcher’s (1977) and Ebaugh’s (1988) notion of the “mutable self,” which “represents a significant shift for the individual from orientation toward stability of self (self as object) to orientation toward change of self (self as process).” The mutable self develops as a response to the centrality and frequency of role change in the course of an individual’s lifetime” (pp. 22–23, emphasis in original). These principals were resilient social actors who were both role takers and role makers and who viewed their own professional identity as being integrally tied to an emergent self.

The role transition process model developed by Allen and van de Vliert (1984) is a very useful theoretical and analytical framework for examining pivotal role transition events for individuals and for organizations. Whether or
not such transitions are predictably linear and sequential is problematic and open
to debate. Nevertheless, it is clear that the model is comprehensive and has great
explanatory power. The model is also useful for generating hypotheses for future
investigations of work role transitions and their impact on social role processes.

Implications for further research

The findings from this investigation suggest important directions for future
research. These preliminary data indicate that personal/internally directed factors
are the most powerful moderators and strategies for lowering role strain intens-
ity and its effects. What are the differential effects of various moderators? In
what ways are moderators of role strain linked to organizational structures and
situational context? The psychological dimensions of work role transitions for
individuals as revealed in these interview data are critical factors to be addressed
as schools and districts across the nation experiment with decentralized
decision-making processes and restructuring. In what ways does role salience
vary across school settings and individuals? What meaningful relationship are
there among role salience, role transition processes, and role strain?

It is important to recognize that there are other equally salient units for exam-
ination of work role transition processes. The impact of role changes on social
networks, work groups, work flow patterns and norms, political systems, and
school, district, and organizational outcomes, such as student achievement, are
important dimensions that need to be addressed in future research. Given the
four districts with unique interpretations and enactments of restructuring, it is
important to address directly the relationship between structural dimensions of
restructuring and their effect on individual role strain. These findings strongly
indicate that both internal and external factors are important moderators of role
strain. Are there differences in the effects of these two sets of role strain modera-
tors based on unique characteristics of school/district setting and history?
Throughout the article I have reported a number of similarities of experiences
across schools and districts. Yet how restructuring was defined and enacted
locally was important to an understanding of role transition and role strain.
Research that examines restructuring and role transition processes from local
knowledge perspectives (Huberman, 1987) needs to be conducted.

Some limitations

There are a number of methodological implications from the findings in this
investigation. The self-perceptions of individual role holders are important data
to gather in an explanation of role strain anxieties and their impact on principals,
schools, and educational reform initiatives. Nevertheless, self-report data are
always limited in that they can be biased in ways that make the respondents look
and sound better than they actually are. It is possible for respondents to mask
role strain and consequently appear less perturbed and less resistant to work role
changes and their effects than they might actually be. These principals were seasoned professionals and clearly were steeped in the literature and political rhetoric of school improvement through restructuring. Even with the built-in checks for consistency of perception using multiple interview items, it is likely that role strain, reactions to it, and consequences have been underestimated due to socialized response sets. It is possible that these principals are so used to perennial educational reforms that their responses and behaviours simply reflect professional survival strategies more than substantive changes in work role identification and behavior. To address these issues, a follow-up study is currently under way. In this study, teacher perception data gathered at the school level on periodic statewide assessments instruments will be played against the interview responses of these principals.

Another limitation is that the data represent role transition processes in four districts in one state. There is a need to expand the data set for comprehensiveness and representativeness. Attention must also be given to interactive role transition processes. The primary focus of this study has been on the psychological dimensions of transition events. The effects of role strain on other dimensions of organizational life also need to be addressed. Finally, these data are temporally fixed and thus lack the advantages of a longitudinal perspective. Longitudinal studies or cross-sectional studies of work role transitions have the potential to contribute valuable insights into role change events for individuals, for schools, and for organizational goal achievement.

Implications for preparation programs and practice

There are also important implications for practice, for the preparation and professional development of school administrators, and for educational reform. Understanding work role transitions and their outcomes is beneficial to principals and to other educators in schools. Awareness of the potential negative consequences of role transitions is a fundamental step in planning for and acting to reduce role strain and to limit any deleterious effects on individual role holders and on organizational goals. Role holders who are aware and able to employ effective strategies to deal with multiple dimensions and implications of work role transitions are more likely to grow professionally and to foster healthy modes of adjustment to change and organizational adaptations to it as opposed to being resistant and calculating professional survivors who intend to ride out yet another wave of educational reform. Relinquishing traditional mechanisms for control and letting go of outlived professional identities are never easy. Thus understanding work role transitions can be helpful to individuals and to organizations as they think about and examine role exit and role transition as important psychological, social, and political dimensions in professional work life. As principals disengage and disidentify with former role expectations and role sets, the data suggest that school environments that are nurturing and supportive are important to principals and others as they attempt to redefine, negotiate, and internalize new meanings in their leadership roles in schools.
The findings from this study have implications for the preparation of school administrators and for their ongoing professional development. Work role transition theory grounded in social/psychological theories is an important preservice knowledge component for aspiring school leaders. The evidence presented in this study indicates that preparation for educational leadership should emphasize a blend of the two dominant traditions in social role theory development—role taking and role making. Preparation programs that view these perspectives as complementary and interactive provide learning experiences for principals and others to be active participants in learning and exercising organizational leadership roles. These learning experiences differ from the traditional administrator preparation curriculum that emphasizes proficiency in basic managerial competencies. Curriculum content incorporating the social/psychological dimensions of work role transition would highlight the importance of role definition and identity as interactive and dynamic processes of work role socialization, development, and professional expertise. Aspiring administrators would be trained to understand and deal with role transition and role exit processes. Professional craft knowledge needed to work effectively in rapidly changing organizational environments would include role learning, role taking, and role making.

The perspectives of these principals also suggest that preservice and ongoing professional development activities for principals could focus on helping administrators develop situationally appropriate responses and modes of adjustment to work role transitions in dynamic professional work environments. Training programs and activities would be designed to help individuals understand the processes of role transition and role evolution, both of which necessarily include letting go of particular residual role facets. However, the notion of loss might be framed as contributing to individual growth and role evolution and not as a threat to professional survival.

Finally, there are implications for restructuring initiatives at local school levels and for educational reform in general. Regardless of the definition or scope of school restructuring, work role transition is an important organizational change dimension that needs attention. The findings in this investigation help to inform educational stakeholders both inside and outside the school. As principals redefine and shape their leadership roles, they are at the same time informing others of changes brought about by restructuring efforts in schools. The notion of restructuring residuals in terms of outlived professional expectations and identities is salient for principals, other professional educators, students, and many other stakeholders in the school community. Failure to address the psychological, social, and political dimensions of role transition processes will likely negate improvements in educators’ work lives and in desired cognitive, affective, and behavioral outcomes for students. Given the central role of principals and teachers in bringing about educational reform with demonstrable measures of student achievement gains, attention to work role transition factors affecting those educators’ professional lives is critical to the future success of school restructuring initiatives.

GROUNDING KNOWLEDGE OF SCHOOLS IN STAKEHOLDER REALITIES

A multi-perspective study of effective school leaders

Christopher Day, Alma Harris and Mark Hadfield

Abstract

Leadership provided by the headteacher is widely acknowledged to be a crucial variable in determining the effectiveness of schools. However, the majority of leadership studies consist of either surveys or interviews which the researcher has conducted with head teachers or case studies written by the head teachers which draw heavily upon their own experience, and as such are essentially ‘autobiographical’ in the perspective they provide on leadership in schools (Ribbins & Sherratt, 1992). The objectives of this article are to: set out a new model of effective school leadership based on recently completed empirical research; demonstrate how the multi-perspective methodology adopted contributed to a critique of existing models of leadership and the development of a new grounded model and discuss the analytical issues raised by the multi-perspective methodology which involved all the stakeholders in a school community.

Theoretical framework

The emerging picture of school leadership in the late 1990s in all countries has become increasingly complex. In the UK the pace of change shows no sign of slackening as the Government continues to impose new demands upon schools and to expect results within relatively short time-scales. Much of the impetus for implementing successive national reforms rests primarily with the leaders
of individual institutions. It has been argued that the particular view of leadership which the nature, direction and pace of reform implicitly endorses as effective, has become increasingly managerialist (Gunter 1997; Slee et al., 1998). Ball (1987) suggests that the dominant discourse of leadership embodies direct control (‘old managerialism’) and people-centred management (‘new managerialism’). However, it has been claimed that the emphasis upon the ‘monitorial’ role of ‘managing directors’ has given headteachers less time to perform the role of ‘leading professional’ (Pollard et al. 1994). This claim directly contradicts the popular academic research view that the headteacher’s main role is to influence the quality of teaching and learning in the school through purposeful ‘transformative leadership’ (Leithwood & Jantzi 1990; Fullan, 1992), to articulate a vision and to promote shared ownership (Louis & Miles 1990; Blase & Anderson 1995; Starratt 1991). In this literature the search continues for a model of effective leadership which is suited to a postmodern context.

Recently, leadership studies have focused upon values—the ‘moral purposes’ and moral craft of leadership (Sergiovanni 1992; Tom 1984); the roles of leaders in creating a ‘community of learners’ (Barth 1990; Senge 1990); and the capacities of leaders to ‘make a difference’ through their ability to ‘transform’ (Sergiovanni 1995; Leithwood et al., 1999) or ‘liberate’ (Tampoe 1998) rather than simply ‘transact’. The most popular theories are located in the ‘transactional’ and ‘transformational’ models identified more than twenty years ago (Burns 1978) and lately reinvented through such terms as ‘liberation’ (Tampoe 1998), ‘educative’ (Duignan & Mcpheardson 1992), ‘invitational’ (Stoll & Fink 1996) and ‘moral’ leadership (Sergiovanni 1992). What is clear from these, and the effective schools literature, is that successful leaders not only set direction, organise and monitor, build relationships with the school community and are people-centred but they also model values and practices consistent with those of the school (Sergiovanni 1995: 119).

This research study (commissioned by the National Association of Headteachers) is one of the most recent studies of leadership in the United Kingdom. When work commenced on the project, few recent studies were in existence that had attempted to identify the key components of effective school leadership through the eyes of those who experience and witness it, whilst also relating analyses of multi-perspective grounded data to existing theoretical and empirical literature.

**Research methodology**

On the evidence of the literature it would appear that previous research has relied too heavily on headteachers to be the primary source of data on leadership in schools. However, there is evidence to suggest that when researchers turn their attention to alternative perspectives they prove to be rich sources of data. For example, studies of pupils’ views about school (Babad et al. 1991; SooHoo...
1993; Rudduck et al. 1996; Smees & Thomas 1998), reveal that they ‘can be both astute and articulate observers of the school environment’ (Smees & Thomas 1998). By failing to draw upon the different ‘perspectives’ provided by students, teachers and others, previous research has clearly ignored a plethora of evidence about both the ‘production’ and the ‘consumption’ of leadership in schools. Few studies have sought information from heads recognised as effective; fewer still have sought educated opinion from those who know most about them and who have experienced the realities of their leadership in times of change i.e., their students, staff, governors and parents. As a response to this, this research study was designed to consider effective leadership from multiple perspectives within the school organisation.

The project adopted the view that since the workings of the real world (even at the scale of a very small primary school) can be bewilderingly complex hence, no single observer, not even the most perceptive of head teachers, is restricted to viewing from a particular perspective or ‘angle of observation’ (Schatzman & Strauss 1973). The opinions of any individual, therefore, are inherently ‘biased’ by the position from which they have observed events in what Shimahara (1990) has called ‘contexts in process’. The research on which this report is based, therefore, was designed to capture the ‘silent voices’ (SooHoo 1993) of authentic sources of data about leadership in the case study schools on the assumption that new insights would inevitably arise if all too familiar situations were viewed afresh from ‘new angles’ (Schatzman and Strauss 1973; Morgan 1993). In addition to enabling the project to draw upon hitherto untapped and highly fruitful sources of evidence, the adoption of this multiple perspectives approach made it possible to compare data collected from different perspectives and sources for the purposes of triangulation (Hammersley & Atkinson 1983; Gill & Johnson 1991). The main objectives of the research were to:

- collect data in schools from a multiplicity of perspectives including those of head teachers, deputy head teachers, governors, parents, students, support staff and teachers;
- compare effective leadership in contexts ranging from small rural primary schools to large urban secondary schools;
- identify the personal qualities and professional competencies which are generic to effective leadership in schools;
- re-examine existing theoretical perspectives on school leadership through insights derived from new empirical research; and
- contribute to the wider educational debate on the relationship between leadership and school effectiveness and improvement.

It was acknowledged that the term ‘effectiveness’ when applied to the leadership provided by headteachers is both a contextualised and relational construct. Consequently, it was decided to investigate effective leadership by reference to a wide range of contexts and leadership challenges. This was achieved by the
selection of theory-generating case studies based upon three dimensions (Yin 1989; Maykut & Morehouse 1994). These dimensions were:

• schools of different sizes operating within different phases of education (i.e., the early years of primary schooling through to upper secondary and including special schools);
• schools located within a range of economic and socio-cultural settings (i.e., including rural, suburban and inner-urban schools as well as those with mixed catchment areas); and
• schools in which head teachers who were widely acknowledged as being ‘effective’ leaders had spent different amounts of time (i.e. ranging from relatively new to well-established head teachers with many years of experience).

Given the goals of the research, the most critical and problematic of these dimensions concerned the selection of schools in which the head teacher met the criterion of providing ‘effective’ leadership. The research team adopted a working definition of ‘effectiveness’ which enabled schools to be chosen on the basis of the following criteria:

• schools which had received a ‘positive’ Inspection Report by Ofsted, particularly with regard to the leadership provided by the head teacher;
• schools which, on the basis of test scores and examination results, could be shown to be performing better than local and national means; and
• schools in which their head teachers were widely acknowledged by their professional peers (through the local, regional and national networks of the NAHT) as being ‘effective’ leaders.

Once schools meeting all of the above criteria had been identified it was then necessary through a process of negotiation (in which the NAHT acted as an intermediary) for the research team to gain access to schools in which the head teachers were prepared to:

• subject themselves to intensive questioning during three interviews, each lasting for at least an hour;
• give the researchers access to deputy head teachers, governors, parents, students, support staff and teachers in order to conduct one-to-one and group interviews which would focus (perhaps critically) on the leadership which they had experienced; and
• organise and manage a programme of interviews and group meetings over a period of three days at a busy time in the school year (February–June).

The main methods used to collect data in the twelve case study schools were a short fact-finding questionnaire, one-to-one interviews and group interviews. Information about each of the schools appears in Appendix A and further details
of the research methodology can be found in Day et al. (2000). In addition to the collection of primary data, documentary evidence was obtained from such secondary sources as school development plans, school prospectuses, OfSTED Inspection Reports, newsletters and examples of media coverage. These sources were used to contextualise the empirical data as research has shown the importance of context in understanding approaches to school leadership (Leithwood et al. 1999).

The analysis

The analysis of 12 case studies by the team of five researchers followed a complex pattern of theory development and testing (Yin 1989). As a process it revealed the possibilities and problems inherent in combining researchers who felt more comfortable with a ‘grounded approach’ (Glaser & Strauss 1967) and those who wish to apply existing theoretical frameworks during the initial analysis of the data. This tension between researchers with fundamentally different approaches to data analysis was evident in each of the five-phase analysis of the interviews. It was inevitable that thirty six days of qualitative fieldwork in the case study schools which included e.g., a total of thirty six one-to-one interviews of a minimum of one hour’s duration with their head teachers would yield a rich abundance of data in the form of field notes, audio-cassette recordings and the researchers’ own recollections and impressions of their experiences. The principles and procedures of qualitative research as derived from ethnomethodology and phenomenology (Tesch 1990) were used in the analysis of this plethora of evidence.

Consequently, the analysis of the field evidence was not deferred until the end of the project. It began early and proceeded concurrently with the collection of data in schools so that the two became closely integrated (Glaser & Strauss 1967) to the extent that they began to inform each other (Miles & Huberman 1984). The simultaneous collection and analysis of data was a reflective activity, both individually and for the team as a whole. This process of reflection took a number of forms including periodic meetings of the project team at which progress was reviewed and ideas and opinions were discussed usually as a result of analytical notes (or ‘memos’) based on the reflections of individuals. These reflective documents and the discussions they prompted furthered the process of analysis by helping the team to move between concrete field data and conceptualisation. They also provide an accountable record or ‘audit trail’ (Lincoln & Guba 1985) which showed that the process of reflection and inductive data analysis not only occurred, but proceeded in a manner which, while being flexible and eclectic, was nevertheless orderly and systematic.

The sheer volume and diversity of the data collected by the team made it necessary to organise it into smaller homogeneous units of information in order to begin to make sense of it. Consequently, the project, by means of the reflective process described above, arranged the data into ‘segments’ of material based on an organising system derived from the data themselves. The process, therefore, was essentially one of inductive cross-case analysis (Miles & Huber-
man 1994), the main outcome of which was a two dimensional matrix with
issues and themes related to school leadership on one axis and the different
sources of evidence (i.e., head teachers, governors, parents etc.) on the other. In
the early stages of this process the organising categories, especially the issue and
themes, were regarded as being tentative and provisional and were subsequently
modified in the search for a more satisfactory system—though it would be diffi-
cult to disagree with Lofland (1971) who concluded that ‘no order fits perfectly’.
Manipulating the field work data in this way proved to be a time-consuming but
intellectually-exacting activity.

Having arranged the data for purposes of analysis in such a way, it was pos-
sible to compare what the different sources of evidence (i.e., head teachers,
deputies, governors etc.) had revealed about leadership in their schools, or what
a particular category of stakeholder had to say about different aspects of leader-
ship. In the event it was decided that the richness of the insights provided by the
analysis of the different perspectives of the various stakeholders interviewed
should be reflected in the way in which the research was reported. The aim was
to go beyond what Hyoner (1985) called a ‘composite summary’ and what
Patton (1980) has referred to as a descriptive account of ‘patterns and themes’.
Instead the final goal was to offer a critique of existing theories of effective
leadership in schools in the light of the project’s empirical findings and to
suggest some ‘provisional’ hypotheses (Turner 1981), new concepts or ‘theo-
retical categories’ (Lazarsfeld 1972) and some tentative thoughts on ‘substantive
theory’ (Glaser & Strauss 1967).

The analysis eventually developed along two distinct strands. Firstly, the
process of thematic induction began to build into a picture of the characteristics
and behaviours associated with effective leadership as viewed from the perspec-
tives of the key stakeholders. At the same time, the research team was searching
for ways of encapsulating the perspective provided by the headteachers them-

Dilemmas are not merely accidental and temporary difficulties which
arise in particular situations. Rather, social life itself is essentially
dilemmatic since it involves choosing between courses of action which
are to a greater or lesser extent mutually exclusive. Education is therefore characterised by a series of dilemmas which are endemic, though they may surface in different forms at different times and places.

(p. 170)

Tensions on the other hand reflected specific sets of pressures experienced by leaders which in certain contexts. Although different sets of tensions may ‘pull’ headteachers in different directions these did not necessarily involve leaders in having to choose between mutually exclusive courses of actions or decisions. Our attempts to uncover tensions and dilemmas which were endemic, and to a degree perennial, was driven by our desire to identify those which shaped or limited the leadership approaches of the headteachers we researched. Dilemmas and tensions, therefore, offered the prospect of gaining new insights into the difficulties which headteachers have in navigating their way through a complex matrix of expectations while maintaining their personal integrity.

In addition, the adoption of this approach allowed the team to bring together aspects of several of the case studies in a holistic format. No one headteacher encountered all of the chosen dilemmas but the field evidence showed that they had all experienced aspects of each dilemma. The analysis allowed these fragments to be drawn together around shared incidents, values and expectations, and in so doing it began to reveal how the headteachers were being positioned by those around them and were positioning themselves.

By presenting the analysis in the form of dilemmas, it was hoped that they would aid further reflection, not just on the nature of leadership, but on the experience of leadership. It’s impossible to adequately capture that experience in its totality and the dilemmas do not attempt to do so. Rather they provide a structure for considering how the experience of being a leader arises from the complex interaction of personal ideologies, relationships with staff and students, and the demands of the school situation.

However, given the insights which the interviews with headteachers gave into the impact which their professional work has on their personal lives it would have been worthwhile, on reflection, to have pursued this matter further by questioning those people who are closest to them personally—their partners and friends who know them well. The original research design did not anticipate that this particular perspective might be a valid and potentially-fruitful source of evidence.

**The leadership construct**

The methodology recognised that ‘effective’ leadership is both a highly contextualised and relational construct. Therefore not only did it need to be investigated by reference to schools selected on the basis of providing a wide range of contexts and leadership challenges but also with reference to multiple perspectives within the broader school community. This allows for a critical analysis of people-centred models of leadership in real ‘leadership contexts’ within which
school headteachers both establish themselves as leaders and in which they are judged by others. By viewing these relationships from the perspectives of those whose knowledge was based upon close or indirect and direct experience of them it was possible to identify not only the felt tensions and dilemmas of leaders but also the demands and aspirations of key stakeholders in the school community. These perspectives were investigated by individual and group interviews of key stakeholders. This was an attempt to develop a perspective on leadership which Ribbins & Gronn (1996) describes as 'post-positivist' approach to the role of contextual influences in defining and shaping personal agency, an approach which moves beyond a singular focus on the headteacher's self construction of themselves as a leader. It allows for a consideration of the interaction between the headteacher’s self construction, the shared social construction of leadership by the various stakeholders, and those aspects of leadership which are valued and demonstrated in their interactions.

The presence of a shared social construction of effective leadership amongst very different stakeholders is significant for three reasons. Firstly it helped us realise the extent to which what we were gleaning from the various stakeholders were not just characteristics of their headteachers that they had observed, but were also beliefs about how ‘good’ leaders should act. Such beliefs have their roots within shared social construction of what leadership is about and the way in which leaders should act. These formed a complex matrix of demands and expectations around the headteachers which they partially assimilated, always had to manage and occasionally challenged. Secondly, the analysis had begun to reveal patterns within the expectations of different groups of stakeholders who gave greater significance to certain characteristics because of their position within the school and its broader community. For example, honesty and openness in decision making was seen as particularly significant by teachers whose careers and working conditions were directly affected by them; parents placed particular value on their headteacher’s ability to communicate and draw them into the community of the school; and governors emphasised the strategic and micro-political skills of head teachers. Each headteacher’s work was, therefore, set within a matrix of needs and expectations which had to be navigated. Thirdly, this 360° matrix of expectations and demands placed on the headteachers by the broader school community formed the backdrop to a number of tensions and dilemmas. Not only did it play a part in their construction, but it also represented a number of critical audiences as the headteachers attempted to lead and manage them.

The results

(1) Beyond transformational leadership

The evidence is sufficient to suggest that existing theories of leadership do not adequately reflect or explain the current practice of effective leaders. Rather, they suggest a people-centred model of leadership we have termed ‘values led
contingency leadership’. They adhered to a ‘person centred’ philosophy that placed emphasis upon improving teaching and learning via high expectations of others. For them, the primary task of leadership concerned building and monitoring the conditions for professional, institutional and broader community growth (Leithwood et al. 1999). They were constantly engaged with the daily business of simultaneously managing inter-personal relations and challenging others to give of their best in the context of policy-driven imperatives which were not always universally welcomed.

(2) Values led—achievement orientated—people-centred

The findings from the research study demonstrate that effective leadership is defined and driven by individual value systems, rather than instrumental managerial concerns. Management and leadership were essential components of these headteachers’ roles and heads were able to do both successfully. They engaged in people-centred leadership, constantly creating, maintaining, reviewing and renewing the learning and achievement cultures for students, staff and the close communities of parents and governors whom they served; and they modelled this in the many thousands of daily interactions through which common visions, expectations, standards, relationships and definitions of effectiveness were formed, framed, supported and tested. Of equal importance was their ability to create and monitor organisational structures appropriate to the fulfilment of the legitimate interests and aspirations of both internal and external stakeholders. It follows that effective heads have a major responsibility both for the ongoing, evolutionary development of the schools in which they work and, within this, the more formal accelerated learning opportunities and challenges collectively known as ‘school improvement’ and ‘teacher development’. The headteachers communicated their vision and values through their leadership relationships. They had been able to raise the self-confidence, morale and sense of achievement of staff by using these relationships to develop a climate of collaboration and by applying within them high standards to themselves and others. Their focus was always upon the betterment of the children, young people and staff who worked in their schools. In this respect, they exercised ‘educative leadership’ (Duignan & Macpherson 1992). They were empathetic, warm, genuine in their love for children and concerned for their well being and achievement (Mintzberg 1994; Jackson et al. 1993; Noddings 1992). All valued and encouraged collegiality, a feature of ‘moving’ schools (Rosenholtz 1989; Hargreaves 1991), and all fostered climates of openness in their schools between students, staff and community, encouraging staff to participate in discussions about values and beliefs as well as in decision-making processes, emphasising mutual respect and providing supportive leadership for all their staff.

The heads in this study operated on the basis of both internally and externally determined measures of quality control so that their quality assurance criteria had a broader agenda in keeping with a holistic broader moral vision of a good school.
and good teachers, it involved everyone in the organisation seeking systematically, with evidence, to ensure that standards were constantly improving. It was contingent but within a framework of unshakeable core values. All the heads:

- were clear in their vision for the school and communicated it to all its constituents;
- focused upon care and achievement simultaneously;
- created maintained and constantly monitored relationships recognising them as key to the cultures of learning;
- were reflective in a variety of internal and external social and organisational contexts, using a variety of problem-solving approaches;
- sought, synthesised, and evaluated internal and external data, applying these to the school within their values framework;
- persisted with apparently intractable issues in their drive for higher standards;
- were prepared to take risks in order to achieve these;
- were not afraid to ask difficult questions of themselves and others;
- were entrepreneurial;
- were ‘networkers’ inside and outside the school;
- were not afraid to acknowledge failure but did not give up and learnt from it;
- were aware of a range of sources to help solve problems; and
- managed ongoing tensions and dilemmas through principled, values-led contingency leadership.

A number of writers (Shakeshaft 1989; Blackmore 1989) have argued for a paradigm shift in conceptions of leadership which start not from the basis of power and control but from the ability to act with others and to enable others to act. The heads in the study rarely used their personal rather than positional power to obtain the results they wanted. Yet at the core of their personal power resided a particular vision for the school shaped by a particular set of values. These effective headteachers saw themselves as the source of a vision for their institutions, working through their relationships with members of the school community. Centrally important in this new model of leadership is the co-operation and alignment of others to the leaders’ values and vision with those of the leader. The heads in the study communicated their personal vision and belief systems by direction, words and deeds. Through a variety of symbolic gestures and action, they were successful at realigning the school community to their particular vision.

In short, they led both the cognitive and the affective lives of the school, combining structural (developing clear goals), political (building alliances) and educational leadership (professional development and teaching improvement) with symbolic leadership (presence, inspiration) and human ‘principle-centred’ leadership (demonstrating care and support) (Bolman & Deal 1984; Covey 1990). It was the human resource management which occupied most of their
daily time and which created the most tensions and celebration. In this respect, their leadership approaches were heavily people-centred. They were both transactional—ensuring that systems were maintained and developed, targets were formulated and met and that their schools ran smoothly—and transformative—building on esteem, competence, autonomy and achievement, raising, ‘the level of human conduct and ethical aspiration of both the leader and the led’ (Sergiovanni 1992); and bonding, ‘by inspiring extraordinary commitment and performance’ (Sergiovanni 1992: 25).

Contingency driven: managing tensions and dilemmas

What seemed to really make the difference for the stakeholders was not only the persistence of vision and values with the simultaneous focus of the headteachers upon process and achievement (product) but also their ability to manage a number of tensions and dilemmas which characterised the human imperfections school contexts which, like classrooms, were by their nature, dynamic, complex and unpredictable.

In this section use is made of two linked concepts—tensions and dilemmas—which are grounded in the data as ‘lenses’ (Berlak & Berlak 1981) through which to focus in on leadership. The main distinction between tensions and dilemmas concerns the possibilities of choice and influence. The tensions identified in this study tended to be those over which headteachers had little choice or influence. In the case of the dilemmas, possibilities of choice and influence did exist, but the degree to which the heads exercised such possibilities varied considerably. A dilemma, in this sense, is a situation which presents at least two contradictory propositions. Whichever is chosen, however, will not be entirely satisfactory. Together these constructs of ‘tensions’ and ‘dilemmas’ capture the immediacy of the continuing conflicts faced by many of the heads in the study. They underscore the continuing dynamic between their core personal values, management functions and leadership demands. They capture their past, present and future pressures, challenges, and concerns and aspirations with which they are daily faced and which reflect the multi-faceted demands of the role. Heads are constantly juggling competing demands upon their time, energy and resources.

The data revealed seven key tensions and three dilemmas of ‘effective’ head teachers which focus upon their roles not only in maintaining and consolidating what they have already achieved, but also in managing the challenges associated with moving their individual schools forward. The tensions focus broadly on issues of leadership, personal time and professional tasks, personal and institutional values, maintaining presence, improving quality and developing staff, internal and external change, autocracy and autonomy and leadership in small schools. They reflect the concerns of a group of headteachers who are primarily concerned with achieving success for the teachers and pupils in their schools, for whom improvement is a permanent part of their personal and professional agendas.
(1) Leadership versus management

Leadership is essentially the process of building and maintaining a sense of vision, culture and interpersonal relationships, whereas management is the co-ordination, support and monitoring of organisational activities. To enact both roles successfully requires a careful balancing act.

Leadership is about having vision and articulating, ordering priorities, getting others to go with you, constantly reviewing what you are doing and holding on to things you value. Management is about the functions, procedures and systems by which you realise the vision.

(Infant School Deputy)

(2) Development versus maintenance

If I don’t develop others, the school won’t develop. So that’s my priority. Other jobs can be delegated but not this one.

(Primary Head)

There is a tension between the amount of time and energy devoted to system maintenance and that devoted to ensuring that staff were always more than competent and were challenged and supported actively in seeking higher standards.

(3) Internal versus external change

The pressure is from outside, but I have to manage the pressure inside . . .

(Secondary Head)

The growth in external scrutiny of schools creates its own tensions. Headteachers found themselves positioned uneasily between those forces outside schools instigating and promoting changes and their own staff who, ultimately, had to implement them. They demonstrated their leadership by the selection of which initiatives to take on; the relative support which they provide for their implementation; their knowledge of how others were tackling new initiatives and by the ways they adapted initiatives to their particular values and circumstances.

(4) Autocracy versus autonomy

Although we can work closely, there has to be a time when decisions are taken and she has to say whether we can or cannot do this . . .

(Primary Deputy)
In school cultures of collaboration in which decision making is no longer the exclusive preserve of headteachers, and yet heads remain responsible and accountable for the schools’ success (or otherwise), a key leadership skill that these heads displayed was their ability to manage the boundaries of autocratic and democratic decision making.

(5) Personal time versus professional tasks

Increasing external requirements upon schools had led many heads to commit more and more of their personal time to school-related business:

I work at least 60 hours a week . . . it worries me because I don’t know how long I can go on putting in the amount of energy.

(Primary Head)

Although most heads in the study had found ways of managing the demands of intensification the personal opportunity costs were universally high and, long term, potentially damaging.

(6) Personal values versus institutional imperatives

Whilst there was little evidence in the study of opposing sets of values within the schools, tensions did arise from externally generated pressures of rationalism, and definitions of efficiency and effectiveness which were perceived as challenging strongly held people-centred values.

He holds traditional human values—care for people and community and giving back to society the benefits of what you have been given at school. You are a better person if you achieve academically, but that is only part of being a balanced person.

(Primary Teacher)

(7) Leadership in small versus large schools

Heads in small primary schools were disadvantaged on two main counts. Because they had regular, significant class teaching responsibilities, they were unable to fulfil their strategic leadership roles satisfactorily:

. . . it’s all the stress of planning and preparing and co-ordinating as a class teacher which is too much . . .

(Primary Head)

The breadth of the curriculum which needed to be addressed also provided additional demands upon the small number of staff.
(8) Development or dismissal

For headteachers who have to make decisions about teaching standards, continuing poor teaching by a member of staff creates a leadership dilemma, cutting across the headteachers’ personal framework of values and beliefs, their ideological and educative commitments to the development of everyone in the school community.

You can support somebody who is incompetent for as long as you like, but there comes a point where you know that it is not going to make any difference, particularly if they have been doing it for a long time.

(Infant Head)

Engaging in dismissal procedures touches upon the culture of the school, staff morale, and the nature of the relationship between leader and led. The headteachers in the study, however, had not shrunk from taking such ‘tough decisions’, illustrating the clear if painful boundary that must be drawn at key times between the personal and professional relationships which are at the heart of the educational health of school communities.

(9) Power with or power over

The basis of this dilemma is the extent to which similar and dissimilar values can be reconciled. The headteachers in this study sought to achieve a balance between consulting and involving staff in their decisions whilst still providing a clear direction forward, but were aware that such involvement might well lead to demands for a bigger say in the direction and that this might well challenge their right always to make the final decision.

We are leaders in our own little domain and sometimes it’s hard to accept the overall leadership . . . because you think you have got a better way of doing it . . .

(Primary Teacher)

(10) Sub-contracting or mediation?

This final dilemma reflects the position of most heads in the study as they found themselves legally responsible for the implementation of externally imposed change some of which challenged their own moral purposes, sets of core values and practices, and analysis of the needs of their particular school.

At the end of the day the head has to have integrity and to stick to core
values and beliefs. It is important that the head can demonstrate integrity in the face of adversity . . .

(Infant Head)

The heads had not become ‘sub-contractors’, unthinking links in a chain leading from those who developed policy to those who received it. Nor were they subversives, attempting to undermine the authority of policy imperatives. Rather, they managed changes with integrity and skill, integrating them into the vision, values and practices of their schools.

Discussion

**A values-led contingency model: post-transformational leadership**

We in ‘mainstream’ educational management have become to preoccupied with what might be called the institutional side of leadership and management to the extent of disregarding, or at least under-emphasising policy and contextual factors. In doing so we may be playing into the hands of those who accuse educational management of being too technocratic and mechanistic and of paying insufficient regard to values.

(Glatter et al., 1996: 3)

The findings from the research study have demonstrated that effective leadership is defined and driven by individual value systems, rather than instrumental managerial concerns. They demonstrate also the important influences of socio, political, economic and personal and professional contexts on effective leadership. Moreover, they illustrate that there are alternative models to the bureaucratic, rational and entrepreneurial forms of leadership espoused in government policy and documentation which are more appropriate to leaders in the third millennium and more likely to lead to success. Thus, they pose a direct challenge to the current orthodoxy of such forms of leadership theory and leadership training which are based upon them.

Within the study, there was ample evidence that people were trusted to work as autonomous professionals, within clear collegial value frameworks which were common to all. There was a strong emphasis upon teamwork and participation in decision-making (though heads reserved the right to be autocratic). Goals were clear and agreed, communications were good and everyone had high expectations of themselves and others. These collegial cultures were maintained, however, within contexts of organisational and individual accountability set by external policy demands and internal aspirations. These created ongoing tensions and dilemmas which had to be managed and mediated as part of the establishment and maintenance of effective leadership cultures. These heads, for example, were able to live with the dilemmas of ‘development or dismissal’,
‘sub-contracting or mediation’ or ‘power over or power with’. They were not part of, nor did they encourage a ‘dependency’ culture (Fullan 1998). They were constantly engaged with the daily business of simultaneously managing interpersonal relations and challenging others to give of their best in the context of policy-driven imperatives which were not always universally welcomed. In these schools, a new kind of hierarchy had emerged:

... one that places purposes, values and commitments at the apex and teachers, headteachers, parents and students below in service to these purposes...

(Sergiovanni 1992: 27)

It seems that morality, emotion and social bonds provide far more powerful stimulants to motivation and commitment than the extrinsic concerns of transactional leadership in which leaders and followers exchange needs and services to achieve independent objectives. Sergiovanni’s (1995) concepts of ‘servant leadership’ and ‘stewardship’ and the ‘flexibility’ and ‘resiliency’ which he sees as key characteristics of effective leaders relate closely to the findings in this study, as does the work in England by Grace (1995), and Bottery (1992) which focuses upon the ethics of leadership:

Leadership in general must maintain an ethical focus which is oriented towards democratic values within a community. This has to do with the meaning of ethics historically—as a search for the good life of a community... Ethics here refers to a more comprehensive construct than just individual behaviour; rather it implicates us and how we as a moral community live our communal lives.

(Grace, 1995: 55)

The heads in the study were centrally concerned with developing their organisation through developing others. In Sergiovanni’s (1998) analysis they developed social capital by encouraging collegiality and collaboration. The data provided by teachers, pupils, parents and governors emphasised ‘building community’ as an important dimension of the leadership role. Furthermore, it was evident that within the various school communities there was a strong and clear commitment to academic achievement as evidenced by the heads’ high expectations of their staff. This academic capital was developed through a commitment to the success of all pupils and a shared belief in rewarding and praising pupils.

This new model of leadership which we are proposing takes leadership and management to be mutually reinforcing within a conception of leadership that is diffuse rather than hierarchical. The knowledge and skills that are required are both generic and specific, within and between phases and sectors. The kind of moral leadership that Hodgkinson advocates for example, is a generic feature of
effective leaders. Similarly, effective leaders must have the ability to read and adjust to the particular context or set of circumstances they face. In this respect, their leadership behaviour is contingent on context and situation. The choices that they make relate directly to their own beliefs, values and leadership style. Different contexts will present different challenges and will require different responses. In the turbulent and unpredictable climate of uncertain and changing challenges which characterise schools of today and tomorrow the room for manoeuvre is constrained and inevitable tensions arise. Consequently, effective leadership in the 1990s and beyond is essentially concerned with adapting strategies and tactics (but not values) to address unanticipated events and new demands.

The capacity of leaders to make a difference will, then, depend upon their interpretation of and responses to the constraints, demands and choices that they face. Goldring (1997) argues that effective leaders, like those in this study, must know how to span boundaries in order to promote information and resource control. At the same time as they negotiate the constraints of internal and external environments, they must capitalise on the many opportunities for making choices.

The concept of leadership proposed here, then, has a number of different dimensions which combine to represent the complexity of leadership. It includes a range of features, or characteristics that are not mutually exclusive.

Values and vision

Centrally important in this new model of leadership is the co-operation and alignment of others to the leaders’ values and vision with those of the leader. The heads in the study communicated their personal vision and belief systems by direction, words and deeds. Through a variety of symbolic gestures and action, they were successful at realigning both staff and pupils to their particular vision of the school. As Bhindi and Duignan (1996) have proposed in their visionary paradigm for leadership in 2020:

Organisations are not solely concerned with outcomes, processes and resources. They are also concerned with the human spirit and their values and relationships. Authentic leaders breathe the life force into the workplace and keep the people feeling energised and focused. As stewards and guides they build people and their self esteem. They derive their credibility from personal integrity and ‘walking’ their values.

(p.29)

Integrity

In many respects, the heads in the study did ‘walk the talk’. Through the consistency and integrity of their actions, they modelled behaviour that they con-
sidered desirable to achieve the school goals. This dimension of values-led contingency leadership incorporates, but is more than, what has been termed by Stoll and Fink (1996) as invitational leadership. This emphasises the way in which positive and negative interactions shape one’s concept of self. Invitations are messages communicated to people which inform them that they are able, responsible and worthwhile. Such messages are communicated through interpersonal action, but also through institutional policies, programmes, practices and physical environments. Invitational leadership is built upon four basic premises:

- **Optimism**—the belief that people have untapped potential for growth and development;
- **Respect**—the recognition that each person is an individual;
- **Trust**—the need to trust others to behave in concert and in turn, as leaders, to behave with integrity; and
- **Intention**—the need to be actively supportive caring and encouraging.

All of these were perceived characteristics of the heads in the study which has provided the basis for this book. The heads in the study did display invitational leadership in their day to day dealings with individuals. Their behaviour with others was premised upon respect and trust and their belief in developing the potential of staff and students commonly held. Their ability to invite others to share and develop their vision was frequently commented upon by staff and students alike. Alongside these qualities, however, were examples of heads being firm (in relation to values, expectations and standards), and, on occasion, ruthless. In many respects, the way they interacted with others was the common denominator of their success. The human qualities they possessed enabled them to lead others effectively and to establish confidence in others that their vision was worth sharing.

**Context**

Another important dimension of effective leadership is the power of context. The heads in the study were highly responsive to the demands and challenges within and beyond their own school context. In managing people and cultural change they managed external as well as internal environments. They had skills in communicating, in supporting colleagues’ development so that they felt confident in fulfilling expectations of their contribution to the achievement of strategic goals and in the management of conflict and negotiating positive outcomes. In this sense, they were ‘adaptive’ (Heifetz 1994). In adaptive leadership, first developed in a medical context, it is recognised that the leader’s task is to advance the goals of the organisation by designing appropriate strategies which others must carry out. However, ‘resolving problems’ and ‘tackling and tough decisions’ is seen as a context-related collective responsibility. Thus the role of
the leader is to engage in activities designed to raise awareness, ‘ripen the issues’ in order to mobilise groups to tackle the issues and to take responsibility for consequences of their decisions (Edwards 1999). The heads in the study were adaptive and through these processes were able to manage conflict in a way that achieved positive outcomes. They were also adept at keeping the balance between involving others and taking individual action. It is clear, then, that effective leaders are able, within competing values frameworks, to combine a moral purpose with a willingness to be collaborative and to promote collaboration amongst colleagues, whether through teamwork, or extending the boundaries of participation in decision making.

**Continuing professional development: power with and through**

The heads in this study adopted highly creative approaches to tackling the complex demands of implementing multiple change. The decision to work with and through teams as well as individuals was a common response to the management of change. Telford (1996) argues that collaborative leadership is the most certain way of ensuring the vision of the school is realised. Her model of collaborative leadership identifies ‘artistry’ as an additional key ingredient of successful school leadership. Such artistry is required to read the idiosyncrasies of each leadership context and to know how to exploit the situation to maximum advantage. Within the study the heads did operate a form of collaborative leadership and saw staff and students as central to achieving the school’s purpose. The heads used a number of strategies for bringing out the best in staff. In addition to formal development opportunities, these strategies included: the power of praise; involving others in decision making; giving professional autonomy; leading by standing behind, alongside and in front. Although the heads tended to concentrate on teaching staff in the first instance, they used similar approaches when dealing with governors, parents and, to some extent, students. All the heads invested in others in order to lead the school. From the perspectives of governors, deputies, teachers, parents and pupils the overarching message was one of the head building the community of the school in its widest sense i.e., through developing and involving others.

**Implications for leadership training and development**

The characteristics of successful leaders and their ability to be simultaneously people-centred whilst managing a number of tensions and dilemmas highlight the complexity of the kinds of **values-led contingency** leadership exercised by these successful heads. The study illustrates that there are no neat solutions to situations which hold within them so many variables; that successful leadership is defined and driven by individual and collective value systems rather than instrumental, bureaucratic, managerial concerns. Leaders in this study were
identified as being reflective, caring and highly principled people who emphasised the human dimension of the management enterprise. They placed a high premium upon personal values and were concerned more with cultural than structural change. They had all moved beyond a narrow rational, managerial view of their role to a more holistic, values-led approach guided by personal experience and preference. What, then, are the implications for the leadership training and development of aspiring and serving school leaders? Nations across the world are extending their provision of training and development programmes. In England, the establishment by the Teacher Training Agency of such programmes for aspiring and serving headteachers as Headteachers Leadership and Management Programme (HEADLAMP), National Professional Qualification for Headship (NPQH) and Leadership Programme for Serving Headteachers (LPSH) provide a testimony of the importance attached by government to effective leadership, and this has been further underlined by the establishment of a high profile, innovative National College for School Leadership.

Currently, even the most recent training programmes fail to address the key themes which have emerged from the study. Since values, it seems, are central to successful leadership, reflection upon these must be central to training. Alongside this must be a focus upon critical thinking, emotional and cognitive (echoing Roland Barth’s wise dictum that heads must be the ‘leading learners’ in their schools), and intra as well as inter personal skill development. Recognition of the intimate link in successful leadership between the personal and the professional, between the development of the individual and the organisation is paramount. Finally, problem solving and the management of ‘competing forces’ must be key components of leadership training for school improvement if schools are to become the high achieving learning communities espoused by government. The seven tensions and three dilemmas presented here highlight the complex and fraught nature of headship. They illustrate that effective heads, like others, must manage these whilst engaging in the central tasks of building cultures and promoting learning and achievement. Indeed, they are an inherent part of the context in which these occur. There are no easy or perfect answers. The worlds of schools, like those of classrooms, hold too many variables and few neat solutions. The concepts are useful because they reveal that effective leaders are not always successful at all times with all people and that a key characteristic is their determination and ability to continue to try to reconcile the irreconcilable.

Within governments’ overall strategic vision for education, in all countries the training, re-skilling, and certification of heads occupies a central place. The problem is that many of the training models focus upon managerial rather than leadership functions. In doing so they fail to build capacities of heads to reflect upon their own values and those of the whole school community and do not provide sufficient emphasis upon building the range of interpersonal qualities and skills necessary and appropriate to effective leadership. For governments’
rhetoric of lifelong learning, high teaching standards, pupil achievement and school improvement to become a reality, schools need to be led by headteachers who are not only knowledgeable and skilled in managerial techniques but also, like those in this study, people-centred leaders who are able to combine the management of internal and external change with a strong development and achievement orientation. Their practices need to be based upon clear and communicated values to which all in their community subscribe.

If schools are to become ‘knowledge creating’ in which ‘the knowledge of all the school’s members and partners is recognised’ and shared (Hargreaves 1998: 29), if teachers are to continue to be committed to making a difference in the learning lives of their students through skilful teaching combined with the ethics of ‘care, justice and inclusiveness’ (Hargreaves & Fullan 1998: 35), then effective headteachers may themselves be justifiably expected to demonstrate these qualities through the kinds of leadership which they exercise.

Power and politics will continue to provide the context and daily realities for life in all schools and it is the management of the tensions and dilemmas that these create which, within a strong values framework, is a distinguishing feature of effective leadership. The heads in this study were effective because they held and communicated clear vision and values. They empowered staff by developing a climate of collaboration, by applying high standards to themselves and others and monitoring these, by seeking the support of various influential groups within the school community, by keeping ‘ahead of the game’ through ensuring that they had a national strategic view of forthcoming changes and by managing their own personal and professional selves. They managed tensions between dependency and autonomy, between caution and courage, between maintenance and development. Their focus was always upon the betterment of the young people and staff who worked in their schools. They remained also, often against all the odds, enthusiastic and committed to learning.

HEADTEACHERS’ KNOWLEDGE, PRACTICE AND MODE OF COGNITION

Michael Eraut

Introduction

The term ‘knowledge’ carries several meanings in professional discourse, but for our purposes these can be reduced to two. Type A, which I shall call public knowledge,

is defined in terms of propositional knowledge, codified and stored in publications, libraries, databases and so on, subject to quality control by editors and peer review, and given foundational status by incorporation into examinations and qualifications. Under this definition, skills are regarded as separate from knowledge (although some of them, such as reading and reporting, are essential for acquiring knowledge and passing it on to others). Hence there is a potential problem when an educational system, which has evolved with propositional knowledge as its main focus, is also expected to deliver certain skills and competences.

(Eraut, 1997b)

Type B knowledge, which I call personal knowledge is defined as

what people bring to practical situations that enables them to think and perform. Such personal knowledge is not only acquired through the use of public knowledge but also constructed from personal experience and reflection. It includes propositional knowledge along with procedural and process knowledge, tacit knowledge, and memories of images, episodes, incidents and events. Under this definition, skills are treated as part of knowledge rather than as separate from it. This allows for
representations of competence, capability or expertise in which the use of skills and propositional knowledge are closely integrated.

(Eraut, 1997b)

I define the terms ‘professional knowledge’ and ‘management knowledge’ as forms of Type B knowledge. Thus, the personal knowledge of a headteacher includes both professional knowledge developed as a teacher and management knowledge, as well as knowledge acquired outside school contexts but still relevant to them, e.g. from living in the local community or through experience of being a parent, not to mention several years of experience as a pupil. To explore the nature of headteachers’ knowledge more deeply, let us consider three diverse examples.

1. The relationship with governors

Every headteacher and governing body have to develop or negotiate their own interpretation of their respective roles. This will be influenced by some members’ prior experience of governing bodies or similar kinds of group and by other members’ lack of such experience. Governors’ prior expectations may not match those of the headteacher; and the development of the group will also depend on the interests and personalities of its members. What knowledge, then, do headteachers bring to this situation? Their public knowledge will come from statutes, inspectors’ reports, books and articles. More private knowledge may be gained from their own experience and from hearing about other headteachers’ experiences. In addition they bring with them a range of relevant skills in listening, presenting oral and written reports and getting to know people and understand their viewpoints both as individuals and group members. Most of the skills of communication and acquiring situational understanding will have been acquired in a wide range of contexts, many of them unconnected with schools; but some newly appointed heads may not be well prepared in all these areas. This whole gamut of knowledge, personal experience and skills for communication and developing understanding is likely to be used by experienced headteachers in some integrated form, both reflectively in preparation and intuitively in response to unexpected events.

2. Relationships with individual teachers

In order to manage teachers appropriately, heads need to make judgements about their individual performance and potential, to understand their social and political situation in school, to have some understanding of relevant aspects of their life outside school and to relate to each teacher in a way that suits them both. How do heads acquire sufficient valid knowledge of individual teachers to do this? Their files will include job applications, appraisal reports and correspondence – all compiled for specific purposes. Any evidence of their students’
performance will rarely be of a value-added kind. Heads receive oral comments about a teacher from a range of sources, but usually as incidental comments rather than considered reports. Otherwise the information comes from a series of incidents: one-to-one conversations; group meetings; observations of the teacher interacting with pupils and colleagues in various settings. Apart from formal interviews for appraisal or appointment, few of these incidents will have had the intention to learn about the teacher concerned. Even incidental knowledge from direct contact tends to be regarded as more authentic. What is remembered will be determined by what was perceived at the time and stored in episodic memory as a series of impressions. Though not sufficiently processed by reflection to yield propositions, these observations and encounters will nevertheless contribute to heads’ knowledge of the teacher but without them being aware of how the selection, integration and reorganisation of knowledge in episodic memory had occurred.

These remembered episodes are likely to be a highly atypical sample of a teacher’s behaviour, partly because the head was present and partly because the most typical incidents are often the least memorable. Salient and recent incidents are the most likely to be remembered, and there will also be other sources of bias (Nisbett and Ross, 1980). For example:

a In order to sustain human interaction, rapid interpretations of the other person have to be made early in order to make a response: but this response itself affects the ongoing interaction and affects later interpretations, often in ways which tend to confirm the original and possibly inaccurate interpretation.

b Headteachers’ personal constructs, developed by experiences before they even met the teacher, will affect how that teacher is perceived.

c Preconceptions, gathered from earlier incidents, affect the interpretation of later incidents, so that the sample is not constructed from genuinely independent events.

In general, we may conclude that headteachers’ construction of their knowledge of individual teachers is often a mainly intuitive process, which is significantly affected by potentially biasing factors of which they are unlikely to be aware. Both a head’s current communication with each teacher and those past interactions which have constructed their relationship (including occasions when the teacher has not been a specific recipient but one of a larger group of staff) will depend on interpersonal skills developed over a lifetime as well as their ability to make appropriate use of their knowledge and prior experience of that teacher. Thus informally acquired skills are integrated in performance with knowledge of people which has been mainly acquired by informal and implicit learning. Without such knowledge, the skill dimension of a headteacher’s performance is likely to be of only limited effectiveness.
3. Understanding schools as organisations

This example has been chosen as an area of personal knowledge where theory makes a particularly significant contribution. The experience of myself and my colleagues in teaching masters level courses to mid-career teachers and public service managers has been that many theoretical concepts link easily with people’s experiences of working in organisations and provide frameworks which enable them to make sense of that experience and transform it into useful knowledge for decision-making. When combined with training in qualitative research, they acquire a capability to investigate the nature of organisations more quickly and at greater depth, using other people’s experiences as evidence as well as their own. Their own experience is likely to have been acquired informally and incidentally as in the previous example; but becomes far more useful when set alongside that of other people and when theoretical frameworks are available to help develop more considered and generally recognised analyses. Given the complexity of organisations, different theoretical perspectives are needed as well as multiple sources of evidence. My research on learning at work found strong support for mid-career management qualifications in the finance, engineering and healthcare sectors (Eraut et al., 1998) and several respondents noted without prompting that modules on organisational behaviour had been particularly useful.

We need to recognise, however, that acquiring this useful knowledge is not a simple process. Having relevant prior experience enables managers to quickly appreciate that theories of this kind may help them in their current work and future careers. They then need the time and opportunity to think and talk about it, and gradually expand their personal cognitive framework to accommodate it. They may note that others have interpreted the same theories in different ways and argued about their relative significance. After a while, those theories they find particularly convincing become part of their normal way of looking at organisations, a platform for their future learning. The total learning time involved will ultimately be much greater than that allocated to that particular course module.

Transfer, change and learning

This last example involved the transfer and personalisation of public knowledge about organisational behaviour from an academic to a school context. This was not an event in which managers applied (or failed to apply) a piece of recently learned public knowledge, but a lengthy learning process during which that knowledge was transformed through use. Transfer might also occur when a head of department becomes a deputy headteacher in another secondary school in a different part of the country. Given the change of role, school and location, how much knowledge of schools as organisations would be relevant to the new context and what would be involved in learning to use it? Research indicates
that a theoretical framework would help by suggesting ways of sorting out the similarities and differences between the two schools and reducing the risk of imprudent transfer (i.e. overgeneralisation). The new deputy will need to be aware of the challenge and prepared to learn a lot about the new school before making strategic decisions, then to reinterpret their prior knowledge – both theoretical and practical – in ways that suit the new organisational context. Similar considerations will apply to changes in the community context, pupil culture, individual colleagues and so on. When the contexts are very similar, for example from one governors’ or staff meeting to the next, little further learning may be necessary; but even then circumstances may have been changed by external events. Interpersonal skills, in particular, have to be resituated for every new encounter in the light of one’s best knowledge of the people and circumstances involved. Any performance or management process involves the integration of skill with knowledge of people and situations and often with conceptual knowledge. This knowledge has to be constantly updated, the skills retuned and the action sensitively monitored in case a change of direction is needed. Such integration is rarely recognised in the literature about headteachers’ knowledge, competence and expertise.

Another neglected aspect of change is the amount of unlearning which has to occur. We have already mentioned the inevitable acquisition of unbalanced perspectives of people and situations, as a result of the uncritical way in which informal information is collected, selected and aggregated. Unless this is periodically checked against more carefully collected evidence, inappropriate decisions and behaviour will result; and relationships and understandings will gradually become more difficult to adjust or modify. Routines and habits are even more difficult to change. They are needed to avoid information overload and to cope with busy contexts, so one comes to depend on them. As circumstances change, routines become dysfunctional; and people take shortcuts which save effort but reduce effectiveness, often without being aware of it. Yet abandoning them leads to disorientation and an inability to cope until new routines have been developed to replace them. The problem for headteachers is not only to evaluate and, where necessary, change their own practice but also to facilitate this learning process for all their staff.

The recently introduced National Standards for Headteachers uses the word ‘effective’ nearly 40 times in order to emphasise a commitment to improving pupils’ achievement. But having the will, contrary to popular belief, does not ensure finding the way. What expertise do headteachers need in order to be able to improve their schools? Evidence suggests that there is both a sociopsychological dimension, generic to all organisations, and a technical dimension specific to schools. The implication of my earlier discussion is that expertise is a dynamic capability which constantly changes and develops. Hence school improvement depends on all staff being committed to continuing learning focused on this purpose. My own research (Eraut et al., 1998) suggests that workplace learning arises mainly from the challenge of the work itself and
through interacting with other people (colleagues, customers and clients). Such learning depends on confidence, motivation and capability (knowledge and skills previously acquired), which in turn depend on how they are managed and on the microculture of their immediate work environment.

The key person is the local manager whose management of people and role in establishing a climate favourable to learning, in which people seek advice and help each other to learn quite naturally, is critical for those who are managed.

(Erout, 1998a)

Few schools are organised to support and facilitate this kind of teachers’ learning.

The technical dimension is highly dependent on theories of what constitutes effective teaching, an area where the Standards are not entirely consistent. Sometimes effectiveness appears to be treated as an absolute unproblematic judgement, as when heads are expected to have knowledge and understanding of ‘effective teaching and assessment methods’ (Section 3d) and to ‘secure and sustain effective teaching and learning throughout a school’ (Section 5b). Sometimes effective teaching is more contextualised as, for example, when teachers are expected ‘to employ the most effective approach(es) for any given context and group of pupils’ (Section 2b). In this latter case, the head could not reasonably be expected to know the group of pupils that well nor even the context of the lesson; and would not therefore be in a position to judge the most effective approach, although bad teaching might be more obvious. This distinction is important because the first interpretation implies that knowledge of effective teaching is public propositional knowledge, while the second suggests that it is mainly personal process knowledge. Significantly the contextual interpretation is accompanied by process criteria which could be applied to almost any teaching method: pacing lessons appropriately, using time and resources effectively, extending pupils’ learning and achievement through setting consistent and challenging homework.

The notion of ‘effective methods’ has great political appeal, especially when linked to ideas of evidence-based practice imported from the field of medicine. But not more than 20 per cent of medical decisions and virtually no teaching decisions can be made on the basis of ‘gold standard’ evidence from meta-analyses and randomised control trials. Educational ‘diagnoses’ and ‘treatments’ show so much natural variation that the construct of an ‘effective method’ is highly questionable. Elsewhere the Standards accompany statements about effective practice by discussion of standards of achievement, the use of benchmarks and setting targets; which suggests that effectiveness is to be judged only by the outcomes and not by the method employed. But it is difficult to tell whether it is the method or its application that is effective, which brings us back to a contextual interpretation of effectiveness. This depends more on teacher
expertise than prescribed methods, so heads have to work with teachers to continually develop that expertise. Agreed targets between headteacher and teacher or teacher and pupil may signify rising expectations and confidence in their ability; imposed targets may be perceived as threats and lower their sense of self-efficacy.

Headteachers’ practice and mode of cognition

During the last decade the nature of professional expertise has become increasingly an issue for debate. The traditional academic stance, by no means as dominant as often presented, defines the professional knowledge base in terms of Type A knowledge – public, propositional and grounded in established research traditions. In so far as it is theoretical, the relevant expertise lies with the academicians; in so far as it is empirical, the relevant expertise lies with researchers. The modernist stance, often described as hyper-rational, focuses on competences and achievements. Expertise is attributed to those who achieve good results even though the attribution of such success to individual merit may be highly questionable. Neither approach tells us much about how experts actually do their job. To do that we have to identify and deconstruct the various processes which constitute their practice, then find out what enables them to conduct these processes with (or without) quality and expertise.

Those processes which constitute a manager’s or a professional’s practice can be usefully analysed in terms of four types of sub-process, linked in a variety of sequences and combinations:

i Acquiring situational understanding through collecting and interpreting information about people and situations.

ii Deciding how to respond to this current representation of the situation, both immediately and over a longer period.

iii Activities required for implementing one’s own or other people’s decisions: routine actions, special techniques, giving advice, referral, delegation, further inquiry etc.

iv Meta-processes concerned with directing and controlling one’s own behaviour in accordance with one’s main purpose, whilst also monitoring one’s clients and their environment

(vide Eraut, 1999)

These sub-processes are most often described in the context of a deliberative process in which professionals assess a situation, think of alternative options and their implications, plan an appropriate course of action then modify it in the light of information from ongoing monitoring. This model of practice gives prominence to analytic reasoning; and is favoured both by academics, who see it as an essential framework for research-based practice, and by government who recognise that public defence of policy requires a reasoned approach which is difficult
to criticise. However, this approach is limited by the amount and quality of evidence available.

In a seminal paper, the McMaster University Working Group (1992) on evidence-based medicine argued that: evidence of all kinds should be gathered more systematically and interpreted more critically; the balance between patient evidence, personal experience, theoretical reasoning, research evidence and advice from local experts should be altered to give more weight to systematically gathered patient evidence and research evidence. More systematic observation and recording of patients is needed to construct a valid personal knowledge-base, alongside regular consultation and critical appraisal of the literature. Advice from local experts should be sought (rather than rejected) but used more critically. They also argue that clinicians must be ready to accept and live with uncertainty and to acknowledge that management decisions are often made in the face of relative ignorance of their true impact.

The Government and TTA now advocate this approach for teaching. However, as noted above, the research evidence on the respective merits of different classroom ‘treatment’ is neither available nor likely to become available in the future. While it is clearly desirable to attend to as much classroom-generated evidence as possible, the absence of valid and relevant research imperatives significantly changes the decision-making context from that found in medicine. There are also practical difficulties. Hospital doctors can concentrate on diagnosis and decision-making while relying on healthcare teams to look after their patients and imaging and pathology departments to provide scientific evidence. General Practitioners can refer more complex, urgent or critical cases to hospitals. Teachers are the equivalent of the whole healthcare team (doctors, nurses, scientist, therapists, porters); and there is nobody to mind their classes while they make individual diagnoses of pupils’ learning. Even at school level, where there are strong arguments for collecting evidence about critical issues before making decisions, the allocation of staff time has to be carefully considered when making pre-decisions about the scope and scale of such inquiries.

The alternative for professionals, but not necessarily for managers, is to locate prime authority with acknowledged expert practitioners. Such people become experts as a result of years of experience in a particular domain of professional practice, usually quite specialised. In some professions such experts may need to be very familiar with research, but it is their use of research knowledge rather than their creation of it, that characterises the expert practitioner. It would be wrong to suggest that experts do not use analytic reasoning; but their superior performance will have been primarily constructed through learning from experience and being able to call upon that experience quickly and appropriately. This perspective receives considerable backing from psychological research contrasting novices with experts. A particularly attractive model for many professional practitioners is that of Dreyfus and Dreyfus (1986). They define skill as an integrative overarching
approach to professional action and identify five stages of skill acquisition: novice, advanced beginner, competent, proficient and expert. Their model’s early and middle stages involve:

- the development of situational recognition and understanding;
- the development of standard routines which enable one to cope with crowded busy contexts;
- the later abandonment of explicit rules and guidelines as behaviour becomes more automatic; and
- a peaking of the deliberative mode of cognition (not usually very analytic) at the competence stage.

Progression beyond competence is then associated with the gradual replacement of analysis by more intuitive forms of cognition. Their claim that experts make considerable use of rapid decision-making is well substantiated by research (Eraut, 1999); but they do not establish their claim that deliberation has become virtually redundant. Benner (1984) recognises two situations where analytic approaches by experts might be required: when confronted with a situation of which they have no previous experience or when they misdiagnose a situation and then find that events and behaviours are not occurring as expected. Thus it can be argued that the Dreyfus model neglects the self-evaluative dimension of professional work. The gradual development of experience-based intuition may enable a person to become an expert, but without a more explicit evaluative dimension it can become so self-confirming that it slips into decline. Is there not a danger that an almost wholly intuitive model of professional expertise will perpetuate the myth of an almost infallible expert? The problems of sharing intuitive expertise with colleagues or explaining the basis for their ‘expert opinions’ will severely constrain participation in collaborative endeavours, thus minimising their exposure to different, possibly critical, perspectives.

The term deliberation has been used hitherto in the sense of taking time to think about a situation, decision or problem. As Aristotle observed over 2,000 year ago, many practical problems in society require thought but cannot be resolved by logical argument and evidence alone. The ‘real world’ is too complex. Managers need to mull over problems, consult and discuss, then judge the probable best course of action; more likely, they settle for an option good enough for the purpose, even if it might not turn out to have been the best. According to the context, deliberative decision-making may vary from ‘just sorting something out’ to making ‘high stakes’ decisions after a period of careful consideration, consultation, predicting consequences then finally deciding. In this latter context headteachers would normally aspire to that maturity of judgement we sometimes call wisdom. Wisdom implies experience in making difficult decisions, access to multiple perspectives, a balanced viewpoint and an ability to situate the expertise of others in a broader social context. It conveys neither the analytic reasoning of the researcher, nor the confident, intuitive grasp of the expert practitioner, but an ability to deliberate about
issues and problems, to see how different people might be affected and to put them into longer term perspective. Part of the skill of a manager is to recognise which problems can be dealt with fairly quickly by satisficing strategies and which require prolonged attention and more evidence.

The most important variables affecting the time devoted to decision-making are likely to be the significance and complexity of the decision, the timespan during which it has to be made and other demands on the decision-maker’s time. The less the time available, the more headteachers will have to rely on more rapid, intuitive approaches. Figure 1 depicts the effect of time (and indirectly also complexity and busyness) on three of the four types of sub-process identified earlier (Eraut, 1995). Since thinking time is the focus, action itself has been omitted and the thought accompanying action treated as interpretation, decision-making or reflection.

The relationship between time and mode of cognition is probably interactive: shortage of time forces people to adopt a more intuitive approach, while the intuitive routines developed by experience enable people to do things more quickly. Crowded contexts also force people to be more selective with their attention and to process their incoming information more rapidly. Under conditions of rapid interpretation and decision-making, reflectiveness is necessarily intuitive, in accordance with Schon’s (1983) concept of reflection-in-action. But as the time scale expands, the role of meta-processes becomes more complex, expanding beyond self-awareness and monitoring to include the framing of problems, thinking about the deliberative process itself and how it is being handled, searching for relevant knowledge, introducing value considerations, etc.

Headteachers do not start as novices in quite the same way as beginning teachers; but neither, especially at primary level, do they have experience of the headteacher role before their first headship. Many important relationships will have been constructed and major decisions made before significant expertise has
been developed. By then, patterns of work will have been formed which may be considerably less effective than they might have wished, and changing them will require a significant amount of determination and effort. For headteachers to maintain critical control over their own practice they will need to be aware of their habits and routines and their ways of thinking about people and situations, even if they cannot easily explain them (Eraut, 1994). Otherwise they are, in effect, abdicating their responsibility for the outcomes that follow. This is why the self-evaluation dimension of headship is extremely important, as well as being a strong argument for facilitating constructive criticism within the senior management team and governors rather than seeking to avoid uncomfortable or time-consuming debate.

The relationship between capability and performance in a changing context

Another important consideration is the problem for new headteachers in both converting their current capability into competence in a new role and context and converting that competence into performance. When the expected level of performance does not result, there is a natural tendency to look for dispositional factors, such as drive and motivation. But often closer inspection reveals significant factors in the work context which constrain performance. Capacity to perform is affected by the total demands of the job, emotional as well as physical. Headteachers’ performance will depend not only on their expertise but also on their overall workload and the expectations of governors, senior managers, teachers and parents about access to them and about what they ought to be doing. It is easy to forget when formulating standards that the ‘whole job’ role is the most important of all.

This ‘whole job’ role, however, still needs to be seen in the context of the whole management function of the school. Ultimately it is the performance of the school’s management which counts. Some headteachers are much better supported by governors and their management team than others. This is partly their own responsibility but they normally inherit both groups and working conventions, and have little control over the loss of valued people through illness or promotion. Developing the capability of the management team as a whole has to be a major priority, even though it may be periodically upset by changes. Thus, depending on the senior management team’s expertise, the head’s personal role in many of the activities listed in the Standards may vary from ‘do it yourself’ to monitoring and occasionally advising capable colleagues, thus affecting their priorities for time management and professional development.

This emphasis on the ‘whole job’ role of the headteacher and the ‘whole team’ approach to the management function emphasises the over-riding importance of prioritisation and the deployment and development of management expertise. Thus the key requirements for a headteacher are to:

- make an accurate and balanced assessment of the school’s current state and of trends, risks and opportunities;
formulate, through consultation, short- and long-term priorities for action;
ascertain how staff can best attend to the priorities without causing negative
side-effects.

This may entail some staff, including the headteacher, developing new cap-
abilities; and this overall management development plan should determine the
head’s own professional development priorities.

Finally, it should be recognised that government and school policy and prac-
tice change. Views about the relative merits of different types of learning out-
comes will change. So also will views about the teacher’s role and how schools
should be managed. Staff will also have to change their roles or practices
because of internal reorganisation, promotion or new external mandates. What
constitutes competence or expertise today will not be the same tomorrow. Hence
it is important for people to have capabilities which extend beyond the confines
of their current job but may be valuable in future.

Conceptually it is important to distinguish between a head’s capability,
which is individually defined in terms of what that particular person can think
and do, given the appropriate context and opportunity, and the competence
required to be the headteacher of a particular school, which is socially defined
in terms of the performance expected from the holder of that post (Eraut,
1998b). That definition of competence will also change; and in responding to
that change the headteacher will need to call upon or develop additional capa-
bility. Equally important for headteachers in the modern world will be their
ability to redesign their own job in accordance with the changing needs of their
school; and this of course will change what counts as being competent in that
job. Should they not also expect such proactive innovation from others?
Rapidly changing organisations are not only dependent on the current compe-
tence of their staff but also on their additional capabilities and understandings.
These need to be continually developed in the interests of the school’s mission;
but they also need to be properly appreciated and used. Individual capabilities
and understandings relevant to group or whole school issues have to be incorp-
orated into the capabilities and understandings of the school as a whole and its
constituent sub-groups (Eraut, 1997b). Where there is synergy, the potential of
groups will be greater than that of their members; where there is division, strati-
fication or mutual isolation, the group potential will be less. That is what trans-
forms learning professionals into learning groups and learning organisations;
and what headteachers in rapidly changing contexts need to develop in their
schools.

Conclusion

My conclusions from the above analysis of headteachers’ knowledge, practice,
mode of cognition, job priorities and leadership role are that training for new
headteachers should concentrate on:
LEADERSHIP AND HEADTEACHERS

1. Aspects of the management role which can be undertaken only by the headteacher.
4. Understanding the school’s culture and sub-cultures and the symbolic impact of their behaviour and thinking about the promotion (if desired) of cultural change over a period of time.
5. Leadership of the senior management team and sharing duties among them.
6. Their own self-evaluation and continuing professional learning.
7. Supporting and developing managers, groups of staff and learning throughout the school.
8. Organising the administration of the school to give its professional staff thinking time.
9. Strategies for school improvement which take the above into account, and avoiding pressures from documents like the Standards to try to do too much.

HEADSHIP

Valerie Hall and Geoff Southworth

Introduction

In common with education systems in other parts of the world, school leadership in Britain has gone through a quantum change in the last 10 years. This has been in response to the radical reforms embodied in central government education policies, from the 1988 Education Act onwards. The focus of this paper will be on school leaders in primary and secondary school in Britain. Our intention is to review the literature, particularly that which reports research, deriving mainly from Britain, but making reference to other contexts where appropriate. We will therefore use the terms ‘headteacher’ and ‘headship’ to describe the phenomenon with which we are concerned.

A review of the ‘state-of-the-art’ of headship in the 1990s in Britain has to take the 1988 Education Act as a watershed. In the 1990s, the scale of change throughout the education system makes a review of both primary and secondary headship crucial to our understanding of contemporary school leadership. They can or should no longer be considered in isolation from each other. If in the 1970s the expression of the transformation of the head’s role was in terms of ‘autocrat’ and ‘chief executive’ (Morgan & Hall, 1982), the issue now is, as we shall see, around the extent to which headteachers must choose to be or not to be entrepreneurs; and the extent to which a positive choice inevitably compromises their identity and activity as leading professionals, as well as their ability to be critical of the system of which they are a part. For those who question the desirability of entrepreneurialism in education (e.g. Smyth, 1989; Grace, 1995) an issue for school leaders now is whether they interpret their role as managerialist or emancipatory and how they can most effectively contribute to successful schooling.

The other striking feature in reviewing school leadership in Britain is the continuing absence of research-based analyses of headship in primary and secondary schools. Practitioner accounts and informed commentaries abound, but the empirical base is limited. We have ourselves had the privilege of carrying out extensive research into headship, allowing us the comfort of knowing that
many of our own conclusions are data based (Southworth, 1995a; Hall, 1996). Our intention in this paper is to allow our own and others’ research to lead the identification of issues and findings that can point towards future directions for school leadership as we approach the millennium. These will be considered alongside the continuing debate between academics, practitioners and others about the nature of headship now and in the future.

Although we will focus strongly on research and literature from the past decade, some historical perspective is necessary, not least because most headteachers today were nurtured in yesterday’s schools. Yet our review will show how one of the main challenges to headteachers and aspiring headteachers is in developing the capacity to adapt to an ever-changing scenario without compromising their own and others’ professional and educational values. In other words, they need to be ready for the future but draw on foundations established in their own personal and professional pasts.

The accounts which inform our own version of headship towards the year 2000 fall into three types: research inquiries, mainly using qualitative data collection methods, with a specific focus on school leadership; structured accounts either by or in dialogue with headteachers; research enquiries that include headship but did not have that as the main focus. Our discussion is framed by the radically changing context of schooling leading to a re-conceptualisation of the headship role and the tensions this creates for school heads. Our purpose is to present what can be learned from the accounts that will help us understand what is needed in school leadership come the Millennium. The focus will be first on primary headship, then on secondary headship, enabling us to consider how headship in both phases was conceptualised before and since the national reforms of 1988 were placed on the statute book and implemented.

**Studies of primary headship pre-1988**

The literature and research focusing on primary headteachers is almost entirely made up of small scale studies. The observation that ‘writing and research on the topic remains the province of individuals’ (Coulson, 1990, p. 101) remains as true for the 1990s as for the 1970s and 1980s, because no major funded investigations or national surveys have been conducted.

Prior to 1988, Coulson’s (1976) work on the role of primary heads was among the most important because he developed his ideas over time (Coulson, 1978, 1985, 1986, 1990) and his conceptualisations underpinned the ideas of others who took an interest in leadership in primary schools (e.g. Alexander, 1984; Campbell, 1985).

In the 1970s Coulson drew upon his experience as a deputy head in a large primary school, where he worked with three heads, and his simultaneous research into headship and deputy headship. He argued that the job title of headteacher signalled that they were to be thought of as teachers rather than administrators and that heads had a freedom to set the school’s aims and underlying
philosophy (Coulson, 1976, p. 275). Coulson saw headship as a blend of personal control and moral authority, derived largely from a Victorian conception of headship and which was implicitly gendered. Heads were the pivot and focus of the school and were expected to mould the school ‘in accordance with their own views’ (p. 276). While they acknowledged the teacher’s ‘zone of autonomy inside the class-room’, heads exercised ‘hegemony over matters of general school policy’ (p. 278). Furthermore, since heads often determined the shape of the curriculum, they were responsible for creating other posts of responsibility in the school and for the appointment of staff, heads were often able to determine singlehandedly the structure of the school.

Coulson accepted that heads affected a more benevolent image in the 1970s than they had in the 1950s and 1960s and were more consultative on some matters than formerly, but, nevertheless, the centralised pattern persisted:

At the root of the primary head’s paternalism lies the ego-identification which he normally has with the school. He tends to think of it as ‘his’ in a very special way and therefore to feel a deep sense of personal responsibility for everything and everyone in it.

(p. 285)

According to this interpretation primary heads were pivotal, proprietorial and paternalistic.

In his later work Coulson elaborated on these themes. He argued that in primary schools power and influence were generally seen as personal and individual. Consequently, schools were ‘particularly vulnerable to the vagaries of individuals’ and that the ‘head’s dominance in the school is inimical to the personal growth and professional development of individual teachers’ (Coulson, 1978, pp. 80–81). The issues of development and personal growth became strong themes in his subsequent work, where Coulson suggested ways of modifying the paternal model of headship by advocating a collegial approach to school management (Coulson, 1985) and by attending to the personal and professional development needs of headteachers (Coulson, 1990).

The centrality of headteachers within ‘their’ schools was also noted by Nias (1980). Her longitudinal research into a group of graduate teachers’ views on teaching as a career revealed that many ‘were often frustrated by what they perceived as inefficient management or alienated by dictatorial leadership’ (p. 256). Nias’ study offers a followers’ view of headship and shows that for many teachers, heads are positive or negative significant others. Nias analysed her data in a three-fold typology of leadership and found her teacher respondents favoured a head who set high standards, was involved in the school to high degree, was readily available for discussion, interested in teacher development, gave a lead on school aims and encouraged participation in goal setting and decision making. Such heads Nias classified as initiating in-school structures, being considerate to teacher colleagues and providing a measure of decision decentralisation (p. 260).
Lloyd (1985) used similar categories to investigate the role perceptions of 50 heads and concluded his data showed a move away from a ‘head-centred’ approach. While Lloyd acknowledged that primary heads remained influential and powerful figures in their schools, he reported that over half the heads in his sample saw this as no longer desirable. Yet he also noted that many found it difficult to combine high levels of decision decentralisation with high levels of initiating structure. Lloyd’s study, therefore, may only have shown heads becoming more aware of the need to soften their dominance, but finding it a challenge to achieve in practice. The rhetoric of heads had changed, but the reality of power relations in schools remained unaltered.

This theme of heads sustaining high levels of both staff participation and overall control of the school was evident in the writings of others who prescribed how headship should be conceived (e.g. Whitaker, 1983; Dean, 1987; Bell, 1988). However, what these texts most clearly revealed was the continuing lack of descriptive analyses of primary heads at work.

During the 1980s some studies were published which offered partial descriptions of headship and heads in action. Clerkin (1985) analysed heads’ time diaries and concluded that headship was:

more often about tackling a high intensity of tasks with frequent interruptions rather than a systematic ordering of curricular or organisational programmes based on agreed policies or clearly understood management structures.

(p. 298)

Harvey (1986) examined 32 heads’ intended and actual use of time and concluded that heads need to develop coping strategies to deal with the unexpected (p. 66). Davies (1987) used open-ended observation and diary methods to study four primary heads. He found that each head was at the centre of the school’s information network and that their work days were characterised by brevity, variety and fragmentation, with nearly one quarter of activities undertaken being interrupted (pp. 44–45).

Coulson (1986) also presented a narrative account ‘built firstly upon close knowledge and observation of how a number of heads conduct their work and secondly on what they and their closest colleagues say about what they believe they are doing’ (p. 5). Coulson developed a category analysis of headship, drawing upon Mintzberg (1973) and Hughes’ (1976) ideas. In the light of his analysis Coulson argued that heads and teachers believe that a head’s managerial behaviour should be integrated with and help to realise his or her particular educational and organisational vision (p. 84). Here Coulson applied Bennis’ (1984) notion that vision meant the capacity to create and communicates view of a desired state which induces commitment among organisational workers.

Coulson (1986) also presented his views on the characteristics of successful heads. Successful heads are: goal-oriented; personally secure; proactive; sensi-
tive to the dynamics of power inside and outside their schools; analytic; in charge of the job; tolerant of ambiguity (pp. 85–86).

The move to observational studies was also evident in the Primary Schools Staff Relationships project (Nias et al., 1989). This ethnographic study used the concept of organisational culture to analyse how heads and teachers in five schools worked together. The findings on leadership showed the heads to be central, proprietorial figures. The researchers characterised the heads as the ‘owners’ of their institutions because of their close association with the school and the ways they established a sense of mission for them (pp. 98–99). The heads were described as the founders of the schools’ cultures, since they exemplified and promoted particular educational, social and moral beliefs. Although these heads often behaved in ways similar to those depicted in the time studies and in Coulson’s (1976) work, the significance of the heads’ work lay not only in what they did, but also in the meaning of their behaviour.

In the follow-up research Nias et al. (1992) examined curriculum development in a different set of schools and noted that the heads ‘all worked hard in a variety of ways to secure their staff’s allegiance to their particular visions’ (p. 148). Subsequently, Southworth (1993), reflecting on these two studies, suggested that heads are often motivated to work hard because they are pursuing their own visions. Headship is the licensed promotion of an individual’s professional values (pp. 23–24). For heads this is personally empowering and, along with their positional authority, legitimates their exercise of power in the school.

Mortimore and associates’ (1988) findings on effective junior schools and departments largely support the picture presented so far. The research identified 12 key characteristics of effective schools, the first of which is purposeful leadership of the staff by the headteacher (p. 250). This means the head understanding the school’s needs and being actively involved in the school’s work without exerting total control. Effective heads influenced the teaching strategies of teachers and monitored pupils’ progress and teachers’ records. They ensured pupil records were maintained and were knowledgeable about what went on in classrooms (pp. 250–251). In other words, effective heads are centrally involved in the school.

This outline was congruent with several ‘official’ prescriptions for headship [e.g. Department of Education and Science (DES), 1978, 1985; Inner London Education Authority, 1985]. It also continues the pattern that headship involves two potentially opposed dimensions. On the one hand, heads are powerful and controlling figures. On the other, they need to involve colleagues and create a measure of organisational unity (Southworth, 1987). While the duality of participation and control was promoted, the fact that for some heads it can be a dilemma—pulling them in opposing directions or difficult to reconcile—was barely recognised.

Taken together these studies show four things. First, that headship was strongly concerned with organisational power, with heads being key players in their schools’ power relations. Second, apart from some limited attention to the
personal aspects of headship, the work was largely conceived in terms of functions and tasks. In large measure an instrumental view of headship prevailed which relied upon a bureaucratic and managerial rationality. Third, the great majority of the writing and research was conducted by males, so that a gendered construction of headship was sometimes implied or remained unexamined. Acker’s (1988) study of a female head at work is the only antidote to this trend. Nevertheless, Acker notes the centrality of this headteacher and how she performed ‘a key role in shaping the values of the school’ (p. 32). Fourth, in research terms, while some observational studies were beginning to be presented, no close-up, sustained studies of headteachers at work were conducted and published.

**Studies of primary headship post-1988**

Southworth’s (1995a) year-long ethnographic case study of a male headteacher at work during the 1988–1989 school year used data collected by participant observation and interviews. The study showed the head ‘at the centre of the school, personally involved and closely associated with almost every aspect of it’ (p. 148). The head was pivotal and powerful. Although he was considerate to others and consulted and encouraged staff participation, this was not at the expense of his control. Indeed, ‘his control pervaded the school’ (p. 150) and he dominated the school.

Southworth explains this head’s domination not in terms of role theory, or because of positional authority alone, but because power and domination were part of his professional identity (p. 150). At length (pp. 157–181) Southworth argues that organisational norms about power relations and decision centralisation become sedimented in teachers’ and heads’ professional practices and understandings and so become part of their occupational selves.

This case study is especially pertinent here because one of the reasons Southworth focused on identity was because the national reforms, which began to be introduced during the year of the fieldwork, were seen as threatening the head’s occupational self. This head saw his work as the transmission of his educational beliefs to the staff and he feared the arrival of the National Curriculum would cause him to lose control of his curricular vision, while Local Management of Schools would diminish his professional leadership and increase his administrative role (pp. 119–125). In short, the national reforms were a major challenge to this head’s approach to headship and a profound threat to his sense of self.

Other studies noted how the national reforms increased the tension between the head-as-teacher and the head-as-manager. Mortimore & Mortimore (1991) reported that primary headteachers were having to spend much more time on management (p. 125) and noted in the Chief Inspector’s annual report (1991), that Her Majesty’s Inspectorate (HMI) detected signs that management and administrative duties were beginning ‘to take their toll’ (p. 8, para 48) on the curricular leadership of primary heads.

Alexander et al. (1992) also acknowledged the changing nature of headship, but argued that heads should take a lead in ensuring high quality provision, mon-
itoring teaching and learning and providing ‘a vision of what their schools should become’ (p. 47).

Webb’s (1994) survey of 50 schools across 13 Local Education Authorities (LEAs), showed that headship had altered in some ways, but not others. While there was more to manage and administer (see also Bolam et al., 1993), the long standing ‘expectation at the level of national policy that heads should be curriculum leaders’ continued unaltered (see Webb & Vulliamy, 1996, p. 139).

The notion of continuity and change in the role is evident in two other studies. Southworth (1995b) interviewed 10 heads about their work in the 1990s. He used these experienced heads’ first hand knowledge of headship before 1988 to compare and contrast with their work in the mid 1990s. Three major role continuities were identified.

- The persistence of work patterns. The heads continued to deal with many things at once, interruptions, variety and fragmentation (p. 25).
- Ego-identification. These heads felt personally responsible for ‘their’ schools. If anything the increased accountabilities (through publication of results and inspection reports) had strengthened the heads’ sense of responsibility (p. 25).
- Power. The heads readily spoke about their influence, authority and control, clearly recognising they were powerful and describing themselves as resident inspectors of their schools’ performance (p. 27).

The role changes included:

- an intensification of the work;
- more management and school maintenance tasks;
- more politics and diplomacy because they were networking and liaising with parents and governors and dealing with more ‘players’ and stakeholders;
- more of a public role (pp. 25–27).

Overall the changes had altered the balance between being a head and being a headteacher, because the increase in management was apparently accompanied by a decrease in teaching. The changes generally took the form of quantitative shifts in the work. There was more to do: more players to liaise and consult with (e.g. parents, governors, agencies); more meetings; more administration because of increased site management and budgeting being devolved to the school.

However, one exception to this pattern was the introduction of a national system of school inspections. The 1992 Education Act established the Office for Standards in Education (OFSTED) to manage the inspection of every school in England and Wales over a 4 year time scale. Schools are inspected by a team of external inspectors who produce a public report for parents, governors and the staff on the quality of the school’s work and the pupils’ achievements. For the
heads in this study (and in our view for most heads whether primary or secondary phase headteachers) school inspections were the contemporary issue and change. They were the major preoccupation of these heads, whether they had been inspected or were preparing for one.

There are many reasons why inspections were the predominant issue for these heads. They were concerned about the validity of the inspectors’ judgements and how these would impact on the school’s reputation. Some were critical of the inspection process, regarding it as only a ‘snapshot’ of the school. However, it was also, the case that being closely associated with their schools these heads were acutely sensitive to how the school’s report would reflect on them individually. In other words, the inspection was not only an external audit of the school’s strengths and weaknesses, it was also, because of the head’s strong identification with the school, a professional and personal assessment of themselves. The school’s inspection was tacitly understood as a public examination of themselves as headteachers (pp. 22–23).

A major change in headship, therefore, is that in the 1990s heads are guaranteed that their schools will be inspected and the report published. The meaning of this exercise for primary heads is that directly and indirectly their school leadership, their ways of doing headship are now being judged and made public. Moreover, some heads see the inspection process as a major, possibly the most significant, test of their professional credibility. Furthermore, it is a test both in terms of how other colleagues and stakeholders see them and, most sensitive of all, how a head comes to regard her/his self. For many primary heads when the school is inspected it is not so much that there is a lot at stake as that the head sees her/himself as going to the stake. Accountability for heads has altered dramatically.

Menter et al. (1995) used data from 12 heads and also perceived headship in the 1990s to be a blend of old and new approaches (p. 309). Most noticeably, while there have been significant changes in working practices, the centrality of the head remained as clear as ever. Their conclusion that it is ‘heads who are still carrying the can’ (p. 311) echoes much of the foregoing.

While Webb’s (1994) research was among the first to highlight the theme of continuity and change, latterly Webb & Vulliamy (1996) have challenged the appropriateness of such a duality. They see it as unreasonable to expect heads to take on more and more executive tasks while simultaneously sustaining high levels of curriculum leadership (p. 139). Moreover:

Given this unrealistic and unmanageable workload, headteachers have to make choices about their priorities based on the size, staffing levels and expertise in their schools. An enormous variety in these contextual factors was revealed in our sample schools, suggesting the need for management advice to develop a range of approaches which recognise that the work of primary headteachers should differ in contrasting circumstances.

(pp. 139–140)
This call for a more differentiated awareness of headship is significant. Little account is made of the diversity of school contexts and circumstances in large sections of the literature focusing on headship. This is especially true of advice and prescription emanating from central government and its agencies. The differences which can exist because of variation in school size, type and location need to be emphasised and their implications more thoroughly examined, otherwise writing about headship may remain too general and become unconvincing to practitioners because it does not recognise nor reflect the individual contextual factors they face.

Another reason why headship research remains undifferentiated is the lack of attention paid to gender differences. Although awareness has been signalled in some studies, only Hall’s (1996) study of three women primary heads, alongside her enquiries into three women secondary heads, has begun to explore how they approached headship. Her research raises important questions about leadership, collaboration, entrepreneurship and ethics:

A picture emerges of women heads enacting strong leadership within a collaborative framework. In spite of this, the women heads (in common with men and women in the studies by Southworth and Grace) were firmly committed to the belief that sharing leadership still required them to take the lead when appropriate, including having a personal vision for the school. They saw themselves (and were seen) as key players co-ordinating, developing and using others’ efforts to the benefit of the school’s purpose.

Hall’s research suggests that we are at a relatively early point in understanding the subtleties of headship. Analysis through the lens of gender may help us to identify some of these differences and so too will other ways of looking at headship. While an outline of primary headship has now been drawn, the pattern and textures of headship need to be further explored and a richer set of portraits developed which capture the range of approaches with greater perspicacity than at present.

What we can say at this juncture is that primary headship in the 1990s has become more complex and challenging than formerly. There has been an increase in the number of tasks, the network of stakeholders and communications with them and others have expanded, while the responsibilities and accountabilities have sharpened. Heads appear to have responded to the changes by taking on more and more, hence their work has intensified and their work hours increased. Yet, while they are doing more, and in some respects doing some new things, there does not appear to have been a wholesale change of approach to headship, since they remain powerful figures in their schools. Although aspects of primary headship have changed, one of its strongest and most notable features endures.
Studies of secondary headship pre-1988

Writing in the early 1970s and drawing on his doctoral study of the role of the secondary head, Hughes kicks off the debate about school headship in transition by quoting suggestions that school headship is an obsolete institution which should be transformed, dismembered or abolished (Hughes, 1972, p. 34). Twenty five years on, headship is still centre stage, neither dismembered nor abolished but definitely transformed. Reviewing the research and debate over the past 25 years enables us to track the nature of that transformation and identify what headship looks like as the century draws to a close. Hughes concluded from his research that, however strong the push for more democratic, participative procedures, the head would continue to be ‘in a very real sense, the focus and pivot of his (sic) school’ (p. 40). Later Hughes elaborated his dual role model for leadership in professionally staffed organisations, in which the ‘chief executive’ is also considered the ‘leading professional’ (Hughes, 1976). Closely interdependent, the head as chief executive is primarily concerned with allocative and coordinating functions within the school and relationships with the governing body and others external to the school. As leading professional, the head’s concern is predominantly with the professional guidance of staff, teaching and counselling within the school and acting as spokesperson, with involvement in professional activities outside the school (Hughes, 1985, p. 279). Hughes saw the distinction between these two roles and the need for their integration as fundamental to a coherent, situated model of headship that took account of the tensions between the ‘instrumental’ (task) and ‘expressive’ (consideration) dimensions of the job.

In spite of the strong lead offered by Hughes, neither of these sets of tensions was fully addressed in the research projects that emerged in the 1970s and 1980s. Instead, research was concerned to establish the empirical base for understanding the tasks of headship, particularly as these informed first the selection of secondary heads, then their development as school managers. Lyons’ (1974) research into the administrative tasks of heads and senior staff in large secondary schools resulted in Heads’ Tasks: a handbook of secondary school administration (Lyons, 1976), which subsequently informed many of the management training programmes set up by the Department of Education and Science in the 1980s. From this point on, research into secondary headship in the 1980s had a conspicuously instrumental purpose. Simultaneously the boundaries between management in education and management elsewhere became increasingly blurred and the role of secondary headship increasingly defined in terms of the management competencies that are seen to characterise other leadership roles (Mintzberg, 1973; Boyatzis, 1982). Subsequent research by Early (1992) and Esp (1993) contributed towards the legitimation of competency-based approaches to headship, in spite of the narrowing vision of school leadership that these represented.

Continuing this theme, Jirasinghe & Lyons’ (1996) research-based analysis
of heads’ tasks and personality factors is the most recent attempt to use job analysis techniques to document the skills and qualities associated with effective headship, to enable an objective and accurate assessment to be made of a head’s job performance. Their sample of 255 heads across England and Wales, representing a variety of types of schools, phases of education and experience of headship, results in a profile of ‘the competent head’ as she or he needs to be at the end of the century (Jirasinghe & Lyons, 1996). The starting and finishing point for the authors is that school heads must develop the use of a range of management skills and behaviours if they are to deal effectively with current reforms. Challenging earlier views such as Hughes’, they claim:

the latter may be far removed from those headteacher attributes and skills that have emerged from much previous research into school management, e.g. the head’s functions polarized into professional and administrative leadership.

(p. 7)

Their research enables them to draw up a list of competencies, based on the use of two major questionnaires (Work Profiling System and Occupational Personality Questionnaire) and heads’ self-reports. They found as many differences within groups (e.g. of men) as between groups (e.g. of men and women), but at least their research embodied a specific gender focus and allowed them to make substantiated claims about similarities and differences between men and woman heads. They also found few differences between primary and secondary heads, leading them to conclude:

Thus the majority of dissimilarities observed are likely to be a reflection of gender differences between male and female heads and their preferred ways of managing rather than attributable to a fundamental distinction in the way primary and secondary schools are organized and run.

(p. 65)

Their findings reflect the continuing tensions embodied in the head’s role, which they express as dualities of being ‘strongly affiliative and not affiliative’, ‘strongly democratic and strongly controlling’, ‘caring and not caring’, ‘change oriented and not change oriented’, ‘relaxed and not relaxed’, ‘critical and not critical’ and ‘having emotional control and not having emotional control’. Such nebulous conclusions sit uncomfortably in a study that claims a positivistic approach to data collection.

However, both the focus of Jirasinghe and Lyons’ research and its conclusions show how far the understanding of heads’ tasks has come since 1983. Then the POST Project, funded by the DES to look at the selection of secondary headteachers, was forced to construct a theoretical job description in the absence
of job descriptions in all but one LEA. At that time there was no demonstrable relationship between the theoretical view of headship and secondary headship as practised. A subsequent study of Headteachers at Work (Hall et al., 1986) confirmed many of Lyons’ earlier findings about the brevity, discontinuity and people intensive character of heads’ tasks. Drawing on Mintzberg’s analyses of managerial work (Mintzberg, 1973) the intention of Headteachers at Work was to describe the head’s role based on what heads do rather than what they or theories say they do. Fifteen heads were observed at their daily work, four of them in depth on a regular basis for a year. The findings were reported in terms of commonalities in headship performance, contrasting interpretations of headship, LEAs and headship practice, secondary headship and public policy expectations and headship theory and practice. Referring to an earlier (single case) study of headship by Richardson (1973), the authors confirmed the continuing uncertainty about the boundaries of the head’s role and subsequent difficulties in the exercise of authority by those in leadership positions. By the 1990s, as we shall see, the demands of educational reforms led by the need for schools to become self-managing have forced heads to clarify the division of duties between themselves, their senior and middle manager colleagues and other staff.

Other research in the 1980s reflected the interest in tasks and competencies, which was itself a mirror of the increasing concern (backed by funding) with heads as managers as well as leaders and leading professionals. Jenkins’ (1985) study of the job perceptions of senior managers in schools and manufacturing industry also drew heavily on Mintzberg’s ideas and informed his later commentary on headship, Getting It Right: a handbook for successful school leadership (Jenkins, 1991). The fact that the majority of the research projects on headship before 1988 led to prescriptive handbooks indicates the predominantly instrumental purpose of the research, particularly where government funding was involved. Critical perspectives on secondary headship, examining its relationship to the policy framework within which heads operate were, in the UK at least, still to come.

Two other research projects which demonstrated a primary concern with the ‘reality’ of secondary headship, were completed before the 1988 watershed. Weindling & Earley’s (1987) study of newly appointed secondary heads had two components: large scale national surveys of new heads, more experienced heads and LEAs and 16 case studies in which a large number of interviews were conducted with the heads and their staff, over the heads’ first 2 years in post. In common with other studies at the time the conclusions were accompanied by recommendations, focusing on four groups: deputies wishing to become heads; INSET providers; new and experienced heads; and LEAs. Many of those recommendations are now part of the Teacher Training Agency’s rhetoric (improve preparation for headship, tailor training to management development needs, provide planned induction for new heads). Others, such as recognising the value of Senior Management Teams, have become part of most secondary heads’ repertoires, albeit with different manifestations. Recent research by Wallace &
Hall (1994) shows how secondary heads have as much to lose as gain when they commit themselves and colleagues to a team approach to managing the school. The Senior Management Teams in the study were the brainchild of the heads, who played a critical role in creating them and promoting a shared culture of teamwork. Inevitably there were clashes between this culture and the heads’ decisions at times to take over the leadership role.

Torrington & Weightman’s (1989) *The Reality of School Management* is based on the findings of a research project in 24 maintained secondary schools in eight local authorities. They interpreted the surprise they encountered at their intention to study managers other than the head as an indication of the ‘extraordinary centrality of the Headteacher in British schools’ (p. 135). Rather than reducing their puzzlement about this centrality, their research confirmed their belief about the head’s role as a main impediment to improving school organization (p. 136). Providing examples of heads’ power and good practices, they use the research to make prescriptions for school management that echo the management gurus so influential in the 1980s, such as Peters & Waterman (1982). These include the head as ‘the mover of the mission’ and ‘manager of the boundary’ (p. 143).

**Studies of secondary headship post-1988**

These attempts by researchers to clarify the role of the head in ways that would be useful to government and other paymasters were superseded after 1988 by the government’s own prescriptions for the role and functions of headteachers and the clear policy framework in which they and others were expected to operate (Hall, 1997b). Most of the studies appearing after 1988 have been undertaken in the spirit of collegiality and intellectual curiosity, their format justified by changing views of what is methodologically appropriate. Ribbins & Marland (1994) capture these changes well in *Headship Matters*, in which they report conversations with seven secondary school headteachers. In their view, what we know of headship from current accounts ‘relates to a bygone age’ and that knowledge is based on accounts that present headteachers as ‘one-dimensional creatures’ (p. 4). They conclude that to answer current questions about the role of the contemporary headteacher needs not just more research, but new methods of research. Most importantly, it needs to be contextualised in three main ways: as a situated perspective, i.e. give full access to the views and actions of the headteachers involved across a representative range of issues and events; as a contextualised perspective, i.e. within the context of the views of heads’ significant others and the community of the school; as a contextualised perspective in action, i.e. explore what heads say in the context of what they do (p. 6). Ribbins’ own research looking at the personal, professional and managerial attitudes of more than 30 secondary heads has involved him in all three levels described here. Working closely with the head of the largest comprehensive school in the UK, Ribbins has modelled an approach to understanding headship in which the
head becomes both the principal subject of the research and also a full partner within it (Ribbins, 1996, p. 258).

His is not the only study to emphasise the importance of the ‘meaning’ of heads’ behaviour for themselves and others, captured mainly through their own words. Mortimore & Mortimore (1991) allow eight secondary heads to present their account of their school and its community, how the school is managed and their unique and personal reflections on headship. Summing up the issues that arise from the heads’ accounts, they conclude on a positive note. These heads have survived the heat, developed their skills and are ready to take their schools into the new order (p. 172). They make a distinction between newer heads welcoming the freedom to use resources as they wish and established headteachers missing the security of an LEA taking care of financial and staffing aspects (p. 165). Similarly Hustler et al. (1995) have produced an edited volume of secondary heads and educational commentators in dialogue. Valuable though such inquiries are in representing individual heads’ views, their contribution to understanding headship is limited by the absence of theoretical perspectives and methodological rigour. The picture of headship that emerges is still predominantly first level. This shift in emphasis in our ways of knowing about headship from outside to inside or from characteristics to characters’, as Hodgkinson clearly quoted in Ribbins (1996, p. 260), echoes the organising principle in research in which we have ourselves been engaged. Hall’s in-depth study of six women heads and Southworth’s research-based account of a primary school head represent attempts to provide the kind of contextualised account in action that Ribbins has called for. The conclusions about headship in both studies are grounded in methodologies that involve the head as co-enquirer and theoretical frameworks that help both explain and challenge the findings. They are part of what Gronn (1996, p. 25) calls ‘a new world order in the study of headship’ which is about:

... more and better leader-watching or on-looking; longitudinal, naturalistic and biographical investigations, particularly the latter, to better enrich knowledge of where leadership comes from and to ascertain what leading and following look like when scrutinised in any depth.

Carried out between 1992 and 1995, Hall’s study represents the most recent attempt to research systematically the nature of heads’ responses to educational reforms. The description of headship that emerges shows how some heads are dealing with the constraints and demands of government policies and making choices about how these will be managed to ensure their schools are ‘successful’ by whatever criteria they decide are important.

A feature of Hall’s study was the attention paid to a wider range of factors than is usual, including life histories and gender, as well as the use of a wider range of methodologies including interviews and observation. A triple metaphor of power, culture and gender was used to frame the interpretation of research
findings. These were compared with those of Grace’s (1995) study based on interviews with 88 secondary and primary heads in England. Both studies found heads committed to the belief that sharing leadership still required them to take the lead when appropriate, including having a personal vision for the school. In Hall’s study, the women secondary heads’ actions for achieving these purposes were collaborative rather than directive, but within a conception of the head’s role that included clarifying the direction and ensuring people were reminded of where they had agreed to go. As women heads they shared most of the characteristics of Jenkins’ (1991, p. 164) ‘transforming post-heroic leaders’. Summing up in a word their own leadership styles, they talked of being ‘exemplars’, ‘motivators’, ‘interpreters’, ‘opportunists’, ‘reflectors’, ‘facilitators’. Like the heads in Evetts’ (1994) study of Becoming A Secondary Headteacher, the women heads’ formal careers are shown as intricately embedded in their private lives and earlier childhood and work experiences. Their ‘subjective’ careers are set alongside their symbolic leadership behaviour, approaches to managing staff, use of power generally and specifically with governors and senior colleagues.

Conclusions

In this section we shall highlight the major themes which are common to the studies of headship in the two school sectors we have reviewed. There are seven themes to note.

First, the central importance of the headteacher is a longstanding theme. It appears in a number of guises, but most compellingly in the school effectiveness research which claims to show that heads make a difference to the schools they lead. The idea that powerful and visionary heads enhance the school’s effectiveness (see Bolam et al., 1993) is thus a continuing belief in the research and the teacher profession generally. Yet beyond this assertion surprisingly little else is known. For example, it remains unclear in what ways heads actually influence and shape their schools. School effectiveness studies and more recently school improvement commentaries have offered some broad ideas about the nature of effective leadership, but these are relatively generalised and superficial. Longitudinal and observational studies of heads increasing the effectiveness of the schools they lead are presently lacking. Hence, we do not have a sophisticated understanding of how heads make a difference and how this might vary according to the school’s context, size, development needs and the head’s professional background, experience, skills and knowledge. Although the centrality of the head is widely acknowledged, it has not been examined in very much depth.

Second, while heads are central players, there are strong indicators that this is altering. The belief in heads monopolising leadership is at the very least softening. Heads now speak less of ‘my’ school and refer more commonly to ‘our’ school. Also, there is an increasing reliance on shared leadership, most evident in the rise in senior management teams, assistant headship, as against deputy headship, and with the promotion in some LEAs (e.g. Birmingham) of leadership at
all levels. This move to a more distributed pattern of leadership might also signal increased complexity in school leadership where the challenges are now so great no individual can meet the demands by her/himself. It might also imply that the volume of tasks has expanded so much that there has to be a corresponding growth in the number of leaders to deal with them. Furthermore, this trend might show that heads are now striving to develop more leaders in their schools. The use of management teams reflects heads’ attempts to improve the effectiveness of their schools by increasing the power of colleagues’ contributions. Such heads may be seeking to empower colleagues by transforming the nature of leadership in the school.

Notions of empowerment and transformational leadership suggest that heads and others interested in school leadership are still wrestling with the perennial challenge of establishing and sustaining a balance between, on the one hand, control of the organisation and, on the other, staff participation and involvement. It appears that there is presently a trend towards increased levels of participation, but whether this is because heads believe it is necessary for pragmatic reasons or because heads in the 1990s have increasingly strong principles about democratic organisation and wish to create schools which are communities is uncertain.

The value of the triple metaphor that informed Hall’s study was in raising issues that relate to the current pessimistic debate about the transformation of headship in response to government policies, into simple technical formulations for making schools effective as organisations (Grace, 1995, p. 26). For Grace, this transformation represents the reconstruction of headship over time from moral to market relation terms. Challenging Grace’s view that educational entrepreneurialism necessarily means managerialism, Hall proposes the possibility of heads being new educational entrepreneurs. As such, they demonstrate a model of educational entrepreneurialism that seeks to preserve the integrity of the educational enterprise by using rather than being used by government reforms. Whether this meets the demands of those who call for ‘critical leadership’ is still a matter of debate. Grundy (1993, p. 174) defines critical leadership in terms of ‘emancipatory praxis’. She says:

Emancipatory praxis is not a set of behaviours in which an educational leader can be trained. This form of praxis is grounded in a critical consciousness which will manifest itself in action that will always be becoming emancipatory. The question for the educational leader is not, ‘Am I emancipated and how can I emancipate my staff?’ but ‘How can I engage in forms of critical, self-reflective and collaborative work which will create conditions so that the people with whom I work can come to control their knowledge and practice?’

However headship is described from the perspective of critical theorists, the reality is that the task load has increased and the character of the work has
changed significantly in some respects. Heads have had to adapt to the ideology of an ‘educational market’. The increase in competition between schools for pupils has, in part, led to a concomitant need for heads to be entrepreneurial in promoting the school and securing resources for it. Without doubt, the ‘selling of schools’ has advanced.

At the same time, as this third theme shows, heads have become more overtly aware of their schools’ levels of success. Several factors have contributed to this move, including: the inspection of schools; the introduction of school league tables based upon test and exam results; value-added analyses of pupils’ learning gains; an upsurge in interest in using pupil achievement data and management information systems. All these have caused heads to monitor and evaluate trends in their schools’ performance.

Moreover, as heads begin to take a harder and increasingly evidence-based view of the school the character of their professional leadership changes. Some studies suggest that heads in the 1990s are finding it more difficult to teach, because of demands on their time. These heads do not see themselves as leading by classroom example, rather, they are now acting as the school’s resident inspector and leading school reviews. In effect, their professional leadership has been recast. They are apparently taking a stronger interest in outcomes and the school’s ‘product’.

These three themes combine and suggest a fourth, which is that heads are increasingly dealing with educational change. They are, of course, also responding to change in a wider sense, for example, the revolution represented by the explosion of information technology, the globalisation of corporations and markets and the influence of the European Union upon life and work in the UK. However, in terms of educational change heads have had to make quite considerable shifts in their assumptions. For instance, while many contemporary headteachers entered the profession and made their first career steps at a time when political intervention was relatively gentle and distant, over the last decade they have had to adjust to central government applying structural solutions through top-down regulations (Fullan, 1993, p. 2). In other words, educational change has changed. As Handy (1989, p. 5) says, change is not what it used to be. While change is now everpresent, in recent years it has, in education, become discontinuous. Discontinuous change means policy initiatives are unlikely to be ‘more of the same only better’ (p. 6). Thus, heads have become accustomed to policy developments disturbing established structures and creating turbulence in schools (e.g. the introduction of school performance league tables; the advent of school inspections). Moreover, such changes powerfully affect how teachers’ and headteachers’ work is organised.

Headship, therefore, is less to do with managing a steady-state school organisation and more to do with anticipating and responding to new initiatives, challenges and opportunities. Some regard such change as learning (Brighouse, 1996, p. 77) and connect it to notions of learning organisations and life-long learning for all (see also Fullan, 1993). Presently we are only on the brink of
exploring, let alone understanding, how leaders establish and sustain learning schools. However, the constancy of change in schools and society and the acceleration of educational developments means that headteachers need to be: future-oriented; capable and sophisticated managers of multiple changes; able to live with change in proactive and productive ways; aware of the professional learning needs of themselves and the school’s staff; active in orchestrating development activities which support staff and which advance the school’s capacity to improve.

Fifth, there is a lack of differentiation in the studies examining headship. Although there is some appreciation of differences between school sectors, there is little awareness of differentiation within them. Yet there are important issues to explore in terms of the effects of differences in school size and school type (e.g. country, denominational and grant maintained schools; nursery, infant, first, junior, primary, middle, comprehensive, high, upper, grammar) within the same phase of education.

The other important area of differentiation relates to gender. Understanding the ways in which women and men headteachers interpret and enact school leadership is not about highlighting differences and identifying the characteristics of one gender as superior to the other. As Hall (1997a) argues elsewhere, understanding the impact of gender on life in schools and colleges is an essential component of our ways of knowing about educational leadership. Using a gender perspective creates new possibilities for exploring the lives of men and women who teach, manage and lead in education. As researchers into headship we have both concluded that educational leadership is firmly rooted in professional identity. Gender, in turn, is a crucial component of that identity. Future research into headship that fails to take this and the gendered nature of schools and colleges into account is likely to be incomplete.

Sixth, we have yet to fully understand the development of headteachers. For example, what are the lessons to be learned from experienced heads? What are the key ingredients of the process of headteacher maturation? Longitudinal studies are needed to begin to uncover the changes that occur as heads move from their first headship into their second and third headships. We also need to map what are the critical incidents and epiphanies in their professional development and understanding. If it is true that heads are central players in their schools’ success, then we urgently need to embark on studies which illuminate how they can be supported, challenged and developed into highly effective headteachers.

These six themes in the literature add up to a seventh. While there has been some sustained interest and research into headship over the past 25 years, the research has been limited in both scale and scope. We have some interesting and insightful studies on which to draw, but the absence of larger surveys and longitudinal studies means that there is much more to investigate. Furthermore, as the character of headship changes, the earlier studies will become redundant. In terms of research into headship in the UK, we are probably, at best, only approaching the end of the beginning in our understanding of headship. We need more research.
into the topic, new methodologies and more sophisticated reflections and understandings.

THE EFFECTS OF TRANSFORMATIONAL LEADERSHIP ON ORGANIZATIONAL CONDITIONS AND STUDENT ENGAGEMENT WITH SCHOOL

Kenneth Leithwood and Doris Jantzi

Abstract

Most school restructuring initiatives assume significant capacity development on the part of individuals, as well as whole organizations; they also depend on high levels of motivation and commitment to solving the substantial problems associated with the implementation of restructuring initiatives. Transformational approaches to leadership have long been advocated as productive under these conditions, and evidence suggests that transformational practices do contribute to the development of capacity and commitment. Much less evidence is available, however, about whether these socio-psychological effects actually result in organizational change and enhanced organizational outcomes. Survey data from an achieved sample of 1,762 teachers and 9,941 students in one large school district were used to explore the relative effects of transformational leadership practices on selected organizational conditions and student engagement with school. Results demonstrated strong significant effects of such leadership on organizational conditions, and moderate but still significant total effects on student engagement.

Most school reform initiatives assume significant capacity development on the part of individuals, as well as whole organizations. Efforts to reform instruction encompassed in the “teaching for understanding” movement (e.g. Ball and Rundquist, 1993), for example, often require teachers to:
... think of subject-matter content in new ways ... [be] much more attentive and responsive to the thinking of students ... and [become] more adventurous in their thinking.

(Putnam and Borko, 1997, p. 1229)

Initiatives such as this one also depend on high levels of motivation and commitment on the part of school staffs to solving the often complex problems associated with their implementation. “Reform documents”, Putnam and Borko point out, “stop short of offering concrete images and prescriptions for what this new reformed teaching should be like”. This assertion could be made for most reform initiatives. As a consequence, whether a reform initiative actually improves the quality of education or simply becomes another “fatal remedy” (Seiber, 1981) hinges on the work of implementors. And the extent to which they do this work depends a great deal on their commitments and capacities.

Transformational approaches to leadership have long been advocated as productive under conditions fundamentally the same as those faced by schools targeted for reform (Yukl, 1994; Leithwood, 1994). Considerable evidence suggests that transformational practices do contribute to the development of capacity and commitment (e.g. Yammarino et al., 1998). Much less evidence is available, however, about whether these socio-psychological effects actually result in organizational change and enhanced organizational outcomes, especially in school contexts (for a recent review of this evidence, see Leithwood et al., 1996): exploring this question was our purpose in this study.

Framework

This is the third in a series of studies concerned with the effects of different forms and sources of leadership using two comparable, relatively large data bases (Leithwood and Jantzi, 1998, 1999). Each study in the series has been guided by a framework consisting of the same mediating and dependent variables but focused on a different independent (leadership) variable. According to this framework, the influence of leadership on student engagement with school is mediated by both school and classroom level conditions. School conditions influence student engagement directly, as well as indirectly through their influence on classroom conditions. Family educational culture is a variable which directly influences not only student engagement, but school conditions, as well.

Transformational leadership

Part of a cluster of related approaches termed “new leadership” by Bryman (1992), transformation leadership only recently has become the subject of systematic empirical inquiry in school contexts. As has been pointed out, this approach to leadership fundamentally aims to foster capacity development and higher levels of personal commitment to organizational goals on the part of
leaders’ colleagues. Increased capacities and commitment are assumed to result in extra effort and greater productivity (Burns, 1978; Bass, 1985).

Authority and influence associated with this form of leadership are not necessarily allocated to those occupying formal administrative positions, although much of the literature adopts their perspectives. Rather, power is attributed by organization members to whomever is able to inspire their commitments to collective aspirations, and the desire for personal and collective mastery over the capacities needed to accomplish such aspirations.

Current educational leadership literature offers no unitary concept of transformational leadership. Kowalski and Oates (1993), for instance, accept Burns’ (1978) original claim that transformational leadership represents the transcendence of self-interest by both leader and led. Dillard (1995, p. 560) prefers Bennis’ (1959) modified notion of “transformative leadership – the ability of a person to reach the souls of others in a fashion which raises human consciousness, builds meanings and inspires human intent that is the source of power”. Leithwood (1994) used another modification of Burns, this one based on Bass’ (1985) two-factor theory in which transactional and transformational leadership represent opposite ends of the leadership continuum. Bass maintained that the two actually can be complementary. Leithwood identified six factors that make up transformational leadership. Hipp and Bredeson (1995), however, reduced the factors to five in their analysis of the relationship between leadership behaviors and teacher efficacy. Gronn (1996) notes the close relationship, in much current writing, between views of transformational and charismatic leadership, as well as the explicit omission of charisma from some current conceptions of transformational leadership.

The model of transformational leadership developed from our own research in schools, including factor analytic studies, describes transformational leadership along six dimensions: building school vision and goals; providing intellectual stimulation; offering individualized support; symbolizing professional practices and values; demonstrating high performance expectations; and developing structures to foster participation in school decisions (Leithwood, 1994; Leithwood et al., 1999). Each dimension is associated with more specific leadership practices and the problem-solving processes used by transformational leaders also have been described (Leithwood and Steinbach, 1995).

Most models of transformational leadership are flawed by their underrepresentation of transactional practices (which we interpret to be “managerial” in nature). Such practices are fundamental to organizational stability. For this reason, we have recently added four management dimensions to our own model based on a review of relevant literature (Duke and Leithwood, 1994). These dimensions, also measured in this study, include: staffing, instructional support, monitoring school activities, and community focus.

There is a small but compelling body of empirical evidence concerning the effects of this form of leadership on a wide array of organizational and student outcomes when exercised by principals (Leithwood et al., 1996). Our study con-
tributes to this literature in two ways. First, the study examined the effects of transformational practices exercised by those not only in administrative roles, potentially a distributed form of transformational leadership. Second, the study focused on an especially important student outcome, student engagement, for which there is no prior evidence of leadership effects.

School conditions

Studies that inquire only about the direct effects of school leadership on student outcomes tend to report weak or inconclusive outcomes, whereas studies that include mediating and/or moderating variables in their designs tend to report significant effects (Hallinger and Heck, 1996a). Because the largest proportion of school leadership effects on students are mediated by school conditions, a significant challenge for leadership research is to identify those alterable conditions likely to have direct effects on students, and to inquire about the nature and strength of the relationship between them and leadership. In their 1996 review, Hallinger and Heck reported evidence of only one mediating variable, school goals, consistently interacting with principal leadership. One reason for such limited results may be insufficient importance attributed by researchers to their choices of mediating variables (Hosking and Morley, 1988).

Building directly on prior work by Leithwood (1994) and Ogawa and Bossert (1995), and using evidence from their two 1996 reviews, Hallinger and Heck (1998) have proposed four school conditions through which leadership may exercise its influence. These conditions include purposes and goals, school structure and social networks, people, and organizational culture. Our choice of school conditions for this study included three of these four variables along with several others not identified by Hallinger and Heck. In a factor analysis carried out as part of our previous study (Leithwood and Jantzi, 1998), all of these conditions loaded on the same factor.

“Purposes and goals”, one of the school conditions included in our framework, includes what members of the school understand to be both the explicit and implicit purposes and directions for the school. It also encompasses the extent to which such purposes and directions are believed to be a compelling and challenging target for one’s personal practices as well as the collective school improvement efforts of staff. Evidence from our reviews suggested that such purposes contribute to school effectiveness, for example, to the extent that members are aware of them, and to the extent they are perceived to be clear, meaningful, useful, current, congruent with district directions, and to reflect important educational values. This variable bears close similarity to what Stringfield and Slavin (1992) refer to as “meaningful goals” and what Reynolds et al. (1996) label “shared vision and goals”. It is the only mediating variable that Hallinger and Heck (1996b) found consistently interacting with principal leadership across the 40 empirical studies included in their review.

Although conceptually part of Hallinger and Heck’s (1998) purposes and
goals variable, we treated “school planning” as a separate school condition in our study. It includes the explicit means used for deciding on mission and goals, and on the actions to be taken for their accomplishment. Planning processes contribute to school effectiveness, for example, to the extent that they bring together local needs and district goals into a shared school vision (Mortimore, 1993; Hargreaves and Hopkins, 1991).

“Organizational culture” is a third school-level mediating variable included in our study. Hallinger and Heck (1998) suggest that this variable focuses on the importance of developing shared meanings and values. For purposes of our study, organizational culture was defined as the norms, values, beliefs, and assumptions that shape members’ decisions and practices. The contribution of culture to school effectiveness depends, for example, on the content of these norms, values, beliefs, and assumptions (e.g. student centred). It also depends on the extent to which they are shared, and whether they foster collaborative work. This variable shares elements of Reynolds et al. (1996) “learning environment” and the “consensus and cooperative planning” to which Scheerens (1997), and Creemers and Reetzig (1996) refer.

“Structure and organization”, the fourth school condition included in this study, was defined as the nature of the relationships established among people and groups in the school and between the school and its external constituents. As Hallinger and Heck (1998) argue:

... leadership is linked to organizational roles and the networks of relations among roles because it is this network that comprises the organizational system.

(Hallinger and Heck, 1998, p. 173)

Such relationships contribute to school effectiveness, for example, when they support the purposes of the curriculum, and the requirements for instruction. Structure and organization also contribute to school effectiveness when they facilitate staffs’ work, professional learning, and opportunities for collaboration. This variable includes elements of what Reynolds et al. (1996) include in “shared vision and goals”, as well as in school ethos or “learning environment”.

Information collection and decision making was the final variable included among the school conditions in the framework guiding our study. This variable includes the nature and quality of information collected for decision making in the school, the ways in which members of the school use that information and how they are involved in decisions. Schools benefit, for example, when information for decision making is systematically collected, varied, and widely available to most school members for decisions. This variable is reflected in the importance attached to “monitoring student progress” (Reynolds et al., 1996; Mortimore, 1993) as well as the extensive support now available for the contribution to organizational effectiveness of employee participation in decision making (Lawler, 1986; Conley, 1993).
Classroom conditions

The inclusion of classroom conditions in this study goes beyond the set of mediating variables suggested as important in principal leadership studies by Hallinger and Heck (1998). While there is considerable evidence that classroom conditions make a substantially greater contribution to student achievement than do school conditions (Bosker et al., 1990), the strength of the relationship between such conditions and student engagement is unknown. If student engagement is as important a variable as we argue it is below, a comprehensive understanding of the avenues through which leadership influences it is called for.

Two classroom conditions were included in this study, instructional services and policies and procedures. These conditions loaded on the same factor in our previous study (Leithwood and Jantzi, 1998). Instructional services were defined as interventions by teachers with students aimed at stimulating their educational growth. Practices associated with this variable included, for example, instructional planning, the consideration of learning principles, clarification of appropriate instructional goals, decisions about curricular content, selection of instructional strategies, and the uses of instructional time. A large literature supports the important contribution to student achievement of these and closely related variables (Reynolds et al., 1996; Creemers and Reetzig, 1996).

Policies and procedures, was defined as guidelines for decision making and action in the school. Although not referring directly to practices in the classroom, when policies in the school are student oriented, encourage continuous professional growth among staff, and encourage the allocation of resources to school priorities without stifling individual initiative, their contribution to classroom practice is expected to be significant. At least indirect support for this variable can be found in evidence concerning the influence on school effects of “high expectations”, “consistency” and “control” (Mortimore, 1993; Creemers, 1994).

Student engagement with school

Student engagement with school has both behavioral and affective components. Extent of students’ participation in school activities, both inside and outside of the classroom, is the behavioral component. The affective component is the extent to which students identify with school and feel they belong. As it was defined and measured in this study, student engagement is quite similar to the “social cohesion” variable used by Oxley (1997) as a dependent measure for her test of the effects of community-like school qualities on students.

Student engagement was chosen as the dependent measure in this study for several reasons. Expanding our understanding of leadership effects beyond basic math and language achievement was one of the reasons. Such achievement measures have served as dependent variables in the vast majority of school leadership studies, to date, not because they are the only, or always the most
suitable, measures but because they are available for research at little or no cost to the researcher. Since the research team had to collect any outcome measures to be used in this study themselves, a measure was chosen which would extend the knowledge base concerning the scope of leadership effects.

The choice of student engagement is warranted on four additional grounds, as well. First, for many students, dropping out of school is the final step in a long process of gradual disengagement and reduced participation in the formal curriculum of the school, as well as in the school’s co-curriculum and more informal social life. Reversing such disengagement is a necessary requirement for achieving the ambitious outcomes advocated by most current school reform initiatives. Variation in schools’ retention rates are likely to be predicted well from estimates of student participation and identification (Finn, 1989). Second, some factors giving rise to students becoming at risk are to be found very early in the child’s pre-school and school experiences. Patterns of student participation and identification are sensitive to the consequences of these factors as early as the primary grades. Change in a student’s participation and identification is a reliable symptom of problems which should be redressed as early as possible (Lloyd, 1978). Finally, at least a modest amount of evidence suggests that student engagement is a reliable predictor of variation in such typical student outcomes as social studies, math, and language achievement (Finn and Cox, 1992; Bredschneider, 1993; Dukelow, 1993).

Our orientation to understanding and measuring student participation and identification began with the work of Jeremy Finn. In his paper “Withdrawing from School” (1989), Finn offers a model explaining continuing engagement in school as a function of participation in school activities which, along with other influences, results in successful performance. Such performance is esteem building and fosters bonding or identification with the school. One central construct in the Finn model is identification with school. The terms “affiliation”, “involvement”, “attachment”, “commitment” and “bonding” encompass the two ideas which, Finn (1989) suggests, constitute a good working definition of identification:

First, students who identify with school have an internalized conception of belongingness – that they are discernibly part of the school environment and that school constitutes an important part of their own experience. And, second, these individuals value success in school-relevant goals.

(p. 123)

Such identification and engagement with school, an internal state, has been found to mediate a wide range of achievement and behavioral outcomes among students, as mentioned above.

The second construct central in the model is overt behavior – students’ actual participation in school activities. Finn identifies four levels of such par-
participation and suggests a strong positive relationship between these levels of participation and the extent of students’ identification with school. Level One participation involves acquiescence to the need to attend school, to be prepared for school tasks, and to respond to teachers’ instructions. At Level Two, students take initiative in the classroom, are enthusiastic, and may spend extra time on school work. Level Three involves participation in school activities outside of the formal curriculum – the social and co-curricular activities of the school, in addition to extensive participation in academic work. Participation in school governance is the fourth level of participation in Finn’s model. In the present study, the mean of these four levels was used as the measure of participation.

Finn conceptualized the participation-identification model in the form of a developmental cycle which included other variables. Participation in school is essential to successful school performance, although such performance is also influenced by students’ perceptions of the quality of their instruction and their own ability (perhaps better understood as academic self-efficacy). Quality of instruction is also an influence on participation. Successful performance influences the students’ sense of belonging and valuing of school-related goals. Such identification, in turn, has a position effect on participation. While evidence was collected about those variables in the model in addition to participation and identification, that evidence was not used in this study.

**Family educational culture**

In this study, family educational culture, a moderator variable, was used in place of more commonly used socio-economic status (SES) measures to represent contributions to student outcomes from home and family sources. Historically, SES has been the most powerful predictor of student success at school (e.g. Coleman, 1966; Bridge et al., 1979). It also has been shown to influence the form of leadership exercised by principals (Hallinger et al., 1996) – hence the arrow in Figure 1 signifying influence flowing from family educational culture to school leadership. But SES is a crude proxy, masking a host of family interactions which have powerful educational consequences. These interactions vary widely across families, often without much relation to family income, for example, and this is why we prefer family educational culture over SES as a moderator variable in this study.

The content of family educational culture includes the assumptions, norms, values, and beliefs held by the family about intellectual work, in general, school work in particular, and the conditions which foster both. Six literature reviews were used as the sources of eight dimensions of either the family’s educational culture or resulting behaviors and conditions demonstrably related to school success (Bloom, 1984; Walberg, 1984; Scott-Jones, 1984; Finn, 1989; Rumberger, 1983; 1987). Taken as a whole, these dimensions represent what Walberg (1984) referred to as the “alterable curriculum of the home”. This curriculum, twice as predictive of academic learning as SES according to
Walberg’s analysis, includes family work habits, academic guidance and support, and stimulation to think about issues in the larger environment. Family culture also includes the academic and occupational aspirations and expectations of parents/guardians, the provision of adequate health and nutritional conditions, and a physical setting conducive to academic work in the home (see Leithwood and Jantzi, 1998, for a more detailed description of these variables). Based on this framework, our intention in carrying out the study was to identify: the proportion of variation in school and classroom conditions explained by teachers’ perceptions of the extent of transformational leadership practices exercised in their schools; the total direct and indirect effects (explained variation) of transformational leadership on student engagement; the amount of variation in student engagement explained by school and classroom variables; whether transformational leadership explains comparable amounts of variation in each of the two dimensions of student engagement (participation, identification); and the proportion of variation in both transformational leadership and student engagement explained by family educational culture.

**Methods**

**Context**

Data about leadership, school and classroom conditions, student engagement, and family educational culture were collected through two surveys in one large
school district in a province in eastern Canada. The district served a population of approximately 58,000 urban, suburban, and rural elementary and secondary students. Data for this study focused on the 2,465 teachers, and 44,920 students in the district’s 123 elementary and junior high schools.

At the time of data collection, all schools in this district were confronted with expectations for change from both the district and the provincial government which clearly called out for the exercise of school-level leadership. For example, just two years prior to the study, the district had been newly formed through the amalgamation of three much smaller administrative jurisdictions. This gave rise to the need for considerable district-wide culture building, policy realignment, and structural reconfiguration. During this period, as well, the provincial government was proceeding with a host of other changes affecting schools – changes in curriculum, student assessment and funding formulae, for example. Comparable changes were being in many educational jurisdictions across Canada at the time of the study.

**Instruments**

Two survey instruments were developed, one to collect data from teachers on school and classroom (organizational) conditions, and transformational leadership, the other to collect evidence from students on their engagement with school and their families’ educational cultures.

The “Organizational Conditions and School Leadership Survey” contained 214 items measuring five sets of school conditions, two sets of classroom conditions, and the perceived influence of teacher and principal leadership in the school. Items measuring school and classroom conditions were stated in the form suggested by the research literature to be most desirable, and were rated on a five-point Likert scale (“strongly disagree” to “strongly agree”) that the statement was true for their school, with a “not applicable” response option available, as well.

The “Student Engagement and Family Culture Survey” contained 61 items measuring student participation in school activities (34), student identification with school (17), and students’ perceptions of their family educational culture (10). Students responded to each item on the same five-point scale used by teachers (“strongly disagree” to “strongly agree”) that the statement was true for them, with a “not applicable” response option also available.

**Sample**

All elementary and junior high school teachers in the school district \( n = 2,465 \) were asked to respond to the “Organizational Conditions and School Leadership Survey”. Because of the extensive number of items, however, two forms of the survey were developed. Each form collected data about at least three sets of organizational conditions and all leadership items. All schools with fewer than
ten teachers were asked to complete both forms of the survey, preferably at two different times to prevent fatigue. Each form required an average of 20 minutes to complete. In all other schools, each teacher was randomly assigned either Form A or Form B. A total of 888 teachers completed Form A of the survey and 874 teachers completed Form B for an overall response rate of 71 per cent.

The “Student Engagement and Family Educational Culture Survey” was administered to all students in one class in each of the three highest grades. In order to protect student anonymity, principals rather than teachers supervised the administration and subsequent collection of these surveys. A total of 8,805 students responded in the 110 schools in the sample.

Data for all variables in this study were complete for 110 of the 123 elementary and junior high schools in the district.

Data analysis

Responses of individual teachers and students to the surveys were aggregated to the school level. SPSS was used to aggregate individual responses by school and then to calculate means, standard deviations, and reliability coefficients (Cronbach’s alpha) for all the scales measuring the variables. As in our previous study (Leithwood and Jantzi, 1998), principal components extraction with varimax rotation was used to analyze the seven school and classroom conditions to estimate the number of factors measured by the specific conditions and assess the extent to which our conceptual distinctions among the seven organizational conditions could be verified empirically.

LISREL was used to assess the direct and indirect effects of leadership on student engagement. This path analytic technique allows for testing the validity of causal inferences for pairs of variables while controlling for the effects of other variables. Data were analyzed using the LISREL 8 analysis of covariance structure approach to path analysis and maximum likelihood estimates (Joreskog and Sorbom, 1993). Hierarchical linear modelling is the analytic technique of choice for some researchers exploring databases such as this one. For a variety of practical reasons, however, we were unable to collect our data in a way that allowed us to link the responses of individual student with their teachers, a prerequisite for HLM.

Results

Table 1 reports means and standard deviations, aggregated to the school level, of teachers’ ratings of transformational leadership and all school and classroom conditions. Comparable information about student responses to items included in the three scales of the Student Engagement and Family Culture Survey appear in the last three rows of this Table. The far right column indicates that the internal reliabilities of all scales were acceptable, ranging from 0.74 to 0.95.

Results of the factor analysis, reported in Table 2 indicate that only one factor
was extracted from the seven organizational conditions, rather than two factors (a school factor and a classroom factor) as in one of our previous studies using comparable data (Leithwood and Jantzi, 1998). Five of the conditions loaded at 0.83 or higher, whereas the relationship of structure and organization to the factor was somewhat weaker at 0.72. Instructional strategies had the weakest relationship at 0.70. Table 3 demonstrates a similar, single factor outcome of the

factor analysis of the ten leadership and management dimensions of our model of transformational leadership. Results of both these factor analyses are reflected in the path model tested below.

Table 4 reports correlation coefficients among all variables included in the path model. All relationships are statistically significant except the relationship between transformational leadership and family educational culture.

Figure 1 reports the results of testing (using LISREL) a version of the initial framework for the study adapted in response to the factor analyses, reported in Tables 2 and 3, in which all items measuring school and classroom conditions loaded on the same factor and all items measuring leadership and management loaded on the same factor. Although the model also tested relationships between
family educational culture and leadership as well as between conditions and participation, to facilitate interpretation only the significant paths are shown in Figure 1. The model is an acceptable fit with the data ($\chi^2 (2, N = 110) = 1.91, p = 0.38$; AGFI = 0.95, RMR = 0.01; NFI = 1.00, PGFI = 0.13) and, as a whole, explains 84 per cent of the variation in student participation, and 78 per cent of the variation in student indentification. Family educational culture has the strongest relationship with student engagement as reflected in its significant total effects on participation (0.88) and identification (0.87). Family educational culture has significant effects on organizational conditions, and these conditions have significant, although modest, total effects on both student participation (0.11) and identification (0.15).

Transformational leadership has strong, significant direct effects on organizational conditions and weak but significant indirect effects on student participation (0.07) and identification (0.10).

Discussion and conclusion

The purpose of this study was to inquire about the effects of transformational leadership practices on organizational conditions and student engagement with school, taking into account the potentially large effects of family educational culture. Results of this study are consistent, in many respects, with evidence provided by other large-scale, quantitative studies of principal leadership effects, as well as several of our own earlier studies of transformational leadership (Leithwood, 1994). With student engagement in school as the dependent variable, results of the study indicate that transformational leadership effects are significant although weak on the affective or psychological dimension (identification) and the behavioral dimension (participation) of student engagement. The size of these transformational leadership effects are approximately the same as those found for the effects of leadership provided specifically by principals in two of our previous studies (Leithwood and Jantzi, 1998, 1999) which also used student engagement as the dependent variable. It is possible, of course, that respondents in the present study primarily had principals in mind as they responded to questions about the extent to which they experienced transformational leadership in their schools.

Whether the focus is on leadership from principals, in particular, or on transformational leadership practices whatever their source, two quite different interpretations of these results are possible. The most obvious interpretation is that principals, in the case of our earlier study, and transformational leadership practices, in the present study, make a disappointing contribution to student engagement. Had the dependent variable in the study been basic math or language skills, this interpretation would be seen as fundamentally in contradiction with the assumptions of most school professionals, normative assertions about the role of leadership in schools (e.g. Hudson, 1997; Foster, 1989), and the results of many school effectiveness studies (e.g. Mortimore, 1993). In fact, student
engagement is an outcome not nearly so obviously tied to teachers’ classroom practices as are more conventional outcome measures, and so potentially more susceptible to influence by those outside the classroom. Our results, for this reason, might be considered doubly disappointing. This might be termed the “romance of leadership” interpretation, after Meindl’s (1995) argument that leadership is a convenient, phenomenologically legitimate, social construction which, nonetheless, masks a complex, multi-sourced bundle of influences on organizational outcomes.

A second interpretation of these results, after Hallinger and Heck’s (1996b) analysis of principal leadership effects, cautions against dismissing, as not meaningful, the admittedly small effects of leadership on, in this case, student engagement. Transformational school leadership practices, after all, do explain a large proportion of the variation in organizational conditions, those features of the school to which leaders have direct access and which are, conceptually, the means through which school effects are exercised.

To put this interpretation in a broader context, recent reviews of empirical research on school effectiveness suggest that educational factors for which data are available explain, in total, something less than 20 per cent of the variation in student cognitive outcomes; very little evidence is available concerning such non-cognitive outcomes as the one used in this study. Reynolds et al. (1996) suggest 8–12 per cent for research carried out in the UK, while Creemers and Reetzig suggest 10–20 per cent for studies carried out “in the Western Hemisphere . . . after correction for student intake measures such as aptitude or social class . . .” (1996, p. 203). Variation within this range across studies may be explained by such variables as school size, type of student outcome serving as the dependent measure, nature of students, and department and subject matter differences.

While these relatively small amounts of explained variation are now considered to be both meaningful, and practically significant, a school is not a single variable. It is an aggregate of variables, the “correlates” of effective schools, or the organizational conditions used as mediating variables in this study. Some of these variables most likely contribute more strongly than others to school’s effects, although they have yet to be unpacked empirically, except for distinguishing between classroom and school level factors (Creemers and Reetzig, 1996; Scheerens, 1997). Efforts to do the unpacking, however, realistically begin with very modest amounts of variation to be explained, especially if it is assumed, as seems reasonable, that at least a handful of factors contribute to explained variation. This was Ogawa and Hart’s (1985) argument in claiming importance for their finding that principal leadership explained 2–8 per cent of the variation in student performance, similar to the results of this study. Under such circumstances knowing the relative explanatory power of a variable will be at least as interesting as knowing the total amount of variation it explains.

Results of the study involving family educational culture are significant for three reasons. First, most school effects studies acknowledge a central role for
SES in accounting for variation in student achievement. In this study family educational culture replaced SES on the grounds that it more precisely targeted those elements subsumed by, typically, very global SES measures (e.g. percentage of students in school eligible for free lunches) contributing to student success at school. Our results support the validity of this concept and its measurement in future school and leadership effects studies. Family educational culture behaved statistically in a manner comparable to the behavior of SES in most previous school effects studies.

Second, the exceptionally large proportion of variation in student engagement explained by family educational culture raises the possibility that different student outcomes may range considerably in their sensitivity to family, as compared with school, variables. This is apparent already in studies attempting to explain variation in mathematics as compared with language achievement, for example (Thomas et al., 1997). It seems likely to become much more apparent as evidence from school and leadership effects studies accumulates across a wider array of student outcomes, especially across important but “non-standard” outcomes such as student engagement. These outcomes, while reflected hardly at all in current school effects research, are an important feature of most curriculum policy, and are central to many parents’ assessments of their local schools (Townsend, 1994). This suggests that future school and leadership effects studies ought to conceptualize family variables more centrally in their designs: they also might do well to reconceive themselves as “school and family effects” or “leadership and family effects” studies. Our understanding of school effects in general, and leadership effects in particular, is unlikely to progress much further without systematically inquiry about how schools and families co-produce the full array of outcomes for which schools are responsible.

Finally, effects on student engagement of transformational leadership practices were substantially weaker than those of family educational culture. This pattern of effects was especially strong for teacher leadership in one of our previous studies (Leithwood and Jantzi, 1998). A plausible implication of these findings is that high levels of student engagement reduce teachers’ perceived needs for either teacher or principal leadership. Student engagement could be conceived of as a substitute for leadership (Howell, 1997), as well as a student outcome.1

THE EFFECTS OF TRANSFORMATIONAL LEADERSHIP

Further reading

There has been much debate about the types of leaders needed in tomorrow’s schools and about the optimal forms of leadership preparation. This study examined the applicability of the Boundary-Breaking Leadership Development Model to a cross-cultural travel study programme for Canadian and New Zealand graduate students in educational leadership programmes at two universities. The Canada–New Zealand travel study exchange was designed to foster participant understandings of educational issues that are prevalent in education internationally. Grounded theory data analysis techniques were used in the study. The information contained in the journals, field notes, reflective commentaries, and surveys was sorted and re-sorted into related categories until four broad groups of findings emerged. The categories focused primarily on the effects of the cross-cultural exchange on the graduate students’ learning. The categories were the emotional experience of learning, the culture of critical enquiry, moving beyond self, and developing agency. The study of the use of the Boundary-Breaking Leadership Development Model demonstrated and reinforced several key points. Firstly, in-depth reflection by students on their personal educational contexts is enhanced through examination of other educational contexts, both locally and internationally. Secondly, the breaking of boundaries between theory and practice, between university professors and students, between two nations, and between self and others, can foster the development of critically enquiring leaders. Finally, the article concludes that these leaders are likely to be critically reflective about the quality of education in their schools and to demonstrate the belief that they are able to make a difference to the quality of education offered.
The need for cross-cultural leadership development

The nature of school reforms internationally, over the past decade, underscores the need for cross-cultural leadership development initiatives. Educational leaders now must respond proactively to a wide range of pressures. For example, governments in the Western world are looking increasingly to schools to promote the economic competitiveness of their nations. Clear links between levels of education, long-term employment, and income (Statistics Canada 1996) along with a variety of international comparisons of student achievement (Le Metais and Tabberer 1997) have led policy makers to promote educational reforms that include site-based management, increased accountability measures, charter schools, and school choice. Further, educational reforms have been accompanied in virtually all Western nations by budget cuts and various forms of privatization as governments strive to reduce their debt load, decrease taxes, promote investment by business, and create an entrepreneur-friendly environment. In fact, the almost ubiquitous move toward budget reductions and some variation of a market model for programme delivery led to the criticism that school reform has been more economic than educative in nature (Aronowitz and Giroux 1993, Barlow and Robertson 1994, Radnor et al. 1998).

Despite criticism, school reforms are perceived as successful in some ways by significant numbers of school community constituents. For example, studies of charter schools in the United States report that, along with good levels of satisfaction among students and parents, charter schools have forced greater accountability upon other public schools (Horn and Miron 1999). Also, higher levels of parent involvement in school decision making are apparent in Western Australia following government policies requiring schools to involve parents substantively in school matters (O’Donoghue and Dimmock 1998). As well, decentralization policies in New Zealand, in conjunction with a relevant programme of partnering of principals, have encouraged some principals to develop an increased sense of agency, or ability to change their practices (Robertson 1998). Clearly, there is a need to enhance the ability of principals in Western nations generally to change their professional practices constructively.

School reforms internationally have been accompanied by significant problems with which school leaders must be familiar. For instance, Cobb and Glass (1999) cautioned that charter schools in Arizona may be promoting ethnic segregation. Timperley and Robinson (1998) and Webber and Townsend (1998) highlighted the strong tensions that exist between educators’ accountability to public authorities and professionalism in New Zealand, Canada, and Australia. In addition, Apple (1998) articulated the dangers of schools spending energy on marketing rather than on ‘curricular substance’ (p. 25).

Finally, school reforms of the past decade have been primarily a Western phenomenon (O’Donoghue and Dimmock 1998, Whitty et al. 1998). Reforms in Western nations are characterized by their almost simultaneous occurrence, speed of attempted implementation, economic focus, and devolution of authority.
to school communities, which collectively led Webber and Robertson (1998) to call for strong leadership development programmes that include international perspectives.

This article describes an effort to use a specific leadership development framework, called the Boundary-Breaking Leadership Development Model (Webber and Robertson 1998), as the basis for providing graduate students in two universities in Canada and New Zealand, with learning opportunities through which to better understand school reforms common to their two nations.

**Framing the study**

The study that we had conducted the previous year with our graduate students examined the utility of an electronic mail discussion group called the *Change Agency*¹, in the context of university leadership courses at the University of Calgary in Canada and the University of Waikato in New Zealand. The electronic mail discussion group consisted of teachers, principals, superintendents, trustees, parents, Department of Education personnel, preservice teachers, graduate students, and professors. We studied the cross-cultural and cross-role dialogue that occurred on the *Change Agency* in terms of the listserver’s usefulness as a leadership development tool. The results of the exploratory study supported the tentative proposal of a leadership development framework called the Boundary-Breaking Leadership Development Model (Webber and Robertson 1998). We described the model as ‘boundary breaking’ because we believed the data gathered in our research demonstrated its capacity to move learning beyond the boundaries normally imposed by cultures, roles, institutions, economics, and nations. Further, we proposed that the framework moves some way towards closing the gaps between theories-in-action and espoused theories of the participants involved.

The study described here examined the applicability of the Boundary-Breaking Leadership Development Model to a cross-cultural travel study programme for Canadian and New Zealand graduate students in educational leadership programmes at two universities in the following year. The cross-cultural exchange was designed to fit closely with all the attributes of the Boundary-Breaking Leadership Development Model, a key component of which is the provision of international perspectives. Therefore, we designed the Canada–New Zealand travel study exchange to foster participant understandings of educational issues that are prevalent in education internationally, for example, parent and community involvement, self-managing schools, school choice, charter schools and accountability and the Boundary-Breaking Model was used as the framework of our pedagogy. We wanted to research whether this model did provide an effective pedagogical framework to enhance graduate student learning experiences.

In the first part of the study, three New Zealand and sixteen Canadian graduate students plus one researcher from the United Kingdom participated in a series of classes, meetings, seminars, and school visits in Calgary, Alberta. Then, ten
Canadian graduate students went to Hamilton, New Zealand, for a series of parallel activities. The graduate students in the study tour were either teachers or principals, with a depth of teaching experience. Other participants included over one hundred guest participants in public seminars and field trips in Canada and New Zealand; these participants comprised teachers, principals, superintendents, trustees, parents, Department of Education personnel, graduate students, and professors.

Study data were gathered from a variety of sources.

- Reflective journals kept by graduate students throughout the Canadian and New Zealand events.
- Field notes compiled by the two researchers, who also designed and facilitated the cross-cultural exchange.
- Evaluative and reflective notes written by the graduate students during their daily coursework.
- Survey instruments, based on field notes and observation data, administered to the Canadian and New Zealand graduate students.
- End-of-course evaluations (administered by an outside agent).

Findings

We used grounded theory data analysis techniques (Glaser and Strauss 1967) in this study. The information contained in the journals, field notes, reflective commentaries, and survey data was sorted and re-sorted into related categories until four broad groups of findings emerged. We were conscious of being in the role of researcher and professor and shared this with the students throughout the study. We told them when we were gathering particular information as ‘data’ and we openly declared our intentions and what we were studying and actively sought this reciprocity. The students carried out an activity for us where they filled in a blank Boundary-Breaking Model Rubric where they reflected on their learning experience in relation to the model and to our perceptions. We shared findings with them as they arose and the students were also given the article on the previous study as part of their coursework. The students knew that they were part of theory building during this study tour. This again was intentional to purposely model ways in which to ‘break the boundaries’ between theory and practice, and researcher, professor and learner.

The categories which emerged from the analysis focused primarily on the effects of the cross-cultural exchange on the graduate students’ learning. The categories were: the emotional experience of learning, the culture of critical enquiry, moving beyond self, and developing agency.
The emotional experience of learning

Four major propositions were evident in this category of findings.

• The construction of meaning requires active listening as reflection on own practices, beliefs and values takes place.

• The juxtaposition of self and others highlights and evokes different emotions—jealousy, humility, pride.

• Experience of public self-expression requires risk-taking and self-evaluation. This can be affirming and self-validating as well as disquieting.

• The asynchronous communication through electronic networks can complement face-to-face experiences and vice versa.

The type of experiences the students were involved in during their cross-cultural exchange facilitated the construction of their own learning. They began to realize the importance of listening to others and to understand that learning was not a passive process but one that required their active involvement. Through the classroom and cultural activities, students realized that there were many different practices, values and beliefs within a class that they first thought was relatively homogeneous. One student described her learning like this: ‘I understand the discomfort I put my students through . . . I have had to learn too—to listen.’ Another said, ‘I was very aware of how the participants in my group were struggling with constructing meaning. I was reminded of the importance of entry points to new learning and about the power of the group talk to help with personal construction of meaning.’

Students experienced a depth of emotion that, although apparent to the researchers during the travel study experience, was much more apparent through an analysis of narrative within the data. As Hargreaves (1998: 324) stated, ‘Professional development, where colleagues learn from one another’s differences, therefore necessarily involves moments of discomfort and anxiety, of challenges to the self.’ Here are examples of how students described the emotions associated with their learning:

They still amaze me at the things we still have not discussed . . . I am in awe . . . the work has been invigorating . . . My mind is muddled with wonderful levels of learning . . . Today’s class has been, as usual, mind-bending . . . I was mortified to realize . . . I am humbled by the . . . I have very much appreciated and enjoyed the . . . the richness and diversity of the course is amazing (and exhausting) . . . the depth of the dialogue has left me mentally drained . . . I worry that tomorrow’s session will be strenuous . . . My concern . . . It’s like a treasure hunt!

The intensity of ‘total immersion’ into the travel study learning community was mentioned by the majority of students. They felt that the experience provided
‘powerful insight’. For one, it seemed quite painful. She said, ‘You are squeezing my brain—it is now tapped out!’ For others, the study tour exchange was too intense and suggestions were given to adapt the assessment requirements for those billeting overseas visitors and providing cultural activities as they felt they could not fully do justice to either. Others felt that the programme was too rushed and that they did not get enough ‘down time’ for reflection. However, students commented that they also had experienced positive feelings of pride, of affirmation and of confidence. Students also felt more comfortable speaking about their values and beliefs. A student said, ‘At the end of the day my mind is muddled with wonderful levels of learning but I often have more questions, wishes and wants than knowledge. However, I do not feel alone.’ Another student said, ‘The activities used in class . . . allowed me to make sense of and affirm my learning of not just this course, but my entire grad experience.’

The Change Agency listserver supported the travel study experience in several ways. It provided the participants with an asynchronous forum for discussion where responses could be made at times that suited the respondent. The Change Agency listserver also helped to network the graduate students before the study tour began. About two months before the exchange started, one student started an online dialogue about the course topics with most of the New Zealand and Canadian graduate students. She later related how the participation of all exchange graduate students in the Change Agency discussions made her ‘feel connected to a learning group even though the classes had not started.’ Other students agreed that the face-to-face meeting of colleagues had given new meaning to their electronic community. A student said, ‘Having met, it will be easier to be direct and informal over the electronic links,’ and another said, ‘I will rely on this “community” again in future.’ Most students felt that ‘the face-to-face meetings and discussions gave greater depth to our interactions’ but that ‘the Change Agency postings [during the course] created a second forum for discussion with an even wider audience.’ Interestingly, some students preferred the asynchronous nature of the electronic forum: ‘I felt much more inclined to contribute to the Change Agency than to participate in large group discussions. With the Change Agency I had time to formulate my thoughts and do some research in the area.’ Another student reflected, ‘I now have the desire to develop my e-mail skills and to put my school on the web. Before, I got into e-mail because Jan said to. NOW I am empowered to continue my own personal/professional development.’

This empowerment and responsibility for learning was an important part of the Boundary-Breaking Leadership Development Model. The next category of findings explores this further.

Creating a culture of enquiry: developing a critical perspective

The following four propositions were developed from the data that formed the second category of findings:
The flexible course structure allowed for active involvement of the students in the directions the course of study took and, therefore, some responsibility for their own learning. This in turn required less intervention from instructors and a trust in the process.

A generative approach to learning allowed opportunities for shared leadership from within the group. Their leadership extended beyond the Canada–New Zealand experience to include additional professional activities that the students initiated at a later stage.

Facilitating generative learning increases the depth and scope of a course curriculum, but developing a culture of enquiry and critical perspectives takes place over time.

The critical analyses created dissonance at the international as well as national level as students actively explored their own practices, values and beliefs.

The flexible course structure, or ‘flexibility with an agenda’ as one student described it, was generally appreciated by the students. The fact that so many noted the flexibility suggested that students did not perceive this to be the usual style of graduate study. However, some students needed to work through the issue of ‘generative learning’. For example, one student pondered in this way:

Not sticking too much to readings, but OK, because as graduate students we should be able to make interpretations and connections to literature. But in two weeks we lose the ‘friendly resource’—at least in person, so best to maximise that resource now . . .

Another student commented that, ‘the flexibility and the variety in the sessions make this a special place to be,’ while another said, ‘I personally liked the fact that we were not “tied” to the text.’ Students also commented on the richness of this process for them: ‘I would say that this has been one of the most powerful courses that I’ve taken so far as collaboration and respect for others is concerned. I have come away with many thoughts and am anxious to implement ideas.’ Another said, ‘This class had a life of its own and it was allowed to live it.’

Although students perceived the summer institute and the travel study units as rich with dialogue and debate, the students also felt their study was rich in theory. They felt ‘It has put a “face” to the readings’ and that ‘It will broaden our understanding of education in tangible ways due to contextualizing others’ lived experiences.’ Students were also cognizant that they were ‘creating theory’ and ‘being researched’. One participant felt that ‘the opportunity to hear how policy “plays out” in the practice and lives of school leaders really made all the reading, writing, thinking I’ve been doing all year come alive, make sense.’

It was only natural that the students reflected on our facilitation roles as we had encouraged them to do so to gain their involvement in theory building in
this study. The most common observation was the ‘trust’ that was apparent: trust in the process, trust in the group, trust in the model. One student said, ‘I have been amazed at how generative this course has been given that it is such a short time line. It shows great trust on the part of the two instructors.’ Another said, ‘This model allows us to “take off” on areas of interest and yet there are gentle reminders and time lines which keep us focused towards a big picture.’

Many of the students referred to our ability to draw the class back on track to attain the course objectives; for example, ‘Many thanks for providing the situation which allowed me to learn. It all looked effortless and laid back—but I realize that the casual look takes a great deal of work.’

The opportunities for shared leadership and informal leadership added to the depth of the learning process. One student said, ‘I found myself learning and questioning more about our educational practices, by having to explain them to others.’ This leadership and ‘explaining to others’ also went beyond the cross-cultural experience. For example, one student (a principal) wrote two articles for professional magazines on her experiences, and another student (a teacher) combined with others to give a seminar on international perspectives on policy issues.

Some students worried about their ability to ‘deal’ adequately with all the topics that were raised. For instance, one student worried, ‘New information . . . have I understood correctly? . . . Am I trying to acquire too much data—should I just let some of it go and focus on key stimuli to exploring issues?’ Another said, ‘I know my course requirements will not reflect the true scope and dimension of this learning experience.’ A third student said, ‘At what point do lists of counter arguments make the work just unmanageable? Should I change jobs? My word, doesn’t this add to the burden, to the feeling of inadequacy!’ By day eight she was more accepting: ‘I realize even more what a luxury it is to have two weeks with informed, committed people when each answered question raises half a dozen more for which there is no time to get answers.’

Our style of teaching was generative in that it challenged students to question and critique within this course. This did not always sit comfortably with the students. One student explained this discomfort: ‘As a young person I was taught that “the experts knew” and [learners] only listen and perform. Even today I find it hard to look at articles and question . . . but I did see in chapter 10 . . . aren’t the “big issues” the students really or am I just too bottom line to see through the fog?’ However, students also understood the importance of questioning. One said, ‘I wonder whether we make basic assumptions so basic that we do not question them. They are almost innate . . . we do take things for granted.’ Another said, ‘Thank you to you both for helping me to open doors to questioning.’ As course professors, we often also experienced discomfort as the students struggled with their construction and generation of new knowledge.

Another comment was:

I was surprised that, considering how similar many of the reforms of
Alberta, NZ, and England are, there were significant differences in interpretations of policy, attitudes towards and practices (that is, the way we see the implications of accountability in different areas, such as curriculum).

The graduate students from both New Zealand and Canada began to examine more carefully their local contexts and the differences and similarities apparent within the same policy guidelines. One student said: ‘There were countless times throughout the discussions and readings where a process of reconfirming occurred in regards to the earth beneath my feet. It was reconfirmed that my beliefs and values are rooted deeply in the soils of learning.’ Another said, ‘Clearly bottom-up discovery maximizing contextual participation. Very much the entire experience challenged me to question my beliefs.’ As well, the variety of perspectives in the class was noted. One student on day two said ‘Today’s class was a wonderful opportunity to talk, learn, explore and listen to new perspectives and ideas.’ Another on day eight said, ‘So many different directions in people’s reading and areas of interest. I feel very privileged to be part of such a “culture of inquiry”.’

However, the exploration of personal and professional values and beliefs through the many forums for discussion, also created a level of dissonance within the group, particularly at the national context level where there had been the assumption of being more homogeneous than at the international level. A student described this process in this way: ‘I would agree heartily with today’s comment that we see our own system in a new light when in the company of others.’ Another said, ‘It has also been interesting to watch the local tensions play out in the group, e.g. Catholic/public in Alberta.’ Another reflection from a student who had been ‘on the other side’ of the debate about Catholic/public school systems said, ‘I was mortified to realize my strong negative feelings about the separate board versus public board . . . I had better get over this.’ Another ‘local’ student also was challenged to examine values and beliefs and said, ‘the visit [to a Canadian private school] forced me to face some preconceived ideas I have about private schools.’ Yet another stressed the ‘need to continue to explore my own prejudices and biases and how I have come to hold them . . . If my perspectives become the truth, then I cannot develop—I simply stagnate.’

A reflection in one researcher’s field diary captured growing explorations of ‘power’ and leads us into the next category of findings:

There is an amazing use of ‘we’ and ‘they’ that needs exploring further. When as educational leaders/citizens are we ‘we’ and when are we ‘they’?
Moving beyond self

The following italicized statements captured the propositions that developed from the data in the third category.

- Through a culture of enquiry, with multiple perspectives, the graduate students began to see the bigger picture of education. This required new learning for many who also felt that this was only a beginning of their journey of learning.

- The graduate students began to reconsider the politics of accountability within their local contexts which led to an analysis of power and the use of ‘we’ and ‘they’.

- The graduate students began to challenge ‘whose’ voice was being heard in education and asserted their right as leaders able to make a difference and be heard.

- The graduate students felt less opposed to change.

The multiple perspectives offered in the Canada–New Zealand exchange led students to see the bigger picture in education, something that they commented had not always been apparent to them. One student said, ‘Last night I went over the presentation material with my wife. Our discussion focused on the “big picture”—this view often eludes us as educators and citizens.’ Often this ‘big picture’ focus left students feeling somewhat overwhelmed. For example, one student reflected on day two:

Perhaps my biggest challenge is that I have been focused for so much of my teaching career on my own ‘school context’ that I feel somewhat ‘BEHIND’ or ‘IGNORANT’ on issues that are discussed from a broader perspective. The international perspectives, discussions, presence of international educators, reading, etc. is helping me to learn a lot in a very short period.

A few days later the same student said, ‘Again today I feel as though I acquired a couple more pieces of the puzzle in my understanding of the BIGGER PICTURE.’ Another said, ‘I find the complexity of the topic of accountability somewhat overwhelming! It is excellent for me to gain awareness of the broad issues on accountability.’ Many other students realized that they were only just beginning their learning on an international level:

I believe that this course is only the beginning to provide opportunities to create an international bridge/link. When will there be another course that can link Britain, the United States and others?

Power and who holds it was an interesting issue for debate when the graduate
students explored the politics of accountability. One student said, ‘Through my listening I found myself thinking about “power” . . . and the exasperating need for it in certain political levels all around the world . . . I have always felt that those truly with the most “power” are the ones who do not even know they have it.’ The graduate students argued about the ‘ownership’ for the reforms and made comments such as, ‘When are we “we” and when are we “they”?’ Another said ‘We (oops, pronoun) meaning “all those involved in education” have to share the most common purpose—“the students”—what is going to be best for the children.’ Another explored why we categorize people into ‘we and they’ and how it won’t get us anywhere. She said:

We can’t be afraid of stakeholders. We can talk among ourselves forever, and put every other stakeholder on the ‘other’ side but we will never grow and develop. We can’t stay with our own truths—we have to listen to everyone. Still, with perspectives from the international visitors, it makes me truly value what I have and what I have to fight for.

Further, students began to see that perhaps change was inevitable: ‘The international perspective had led me to be less oppositional towards change. Change and reform are happening—so if I don’t want to be left behind I may as well embrace it.’

The graduate students began to challenge whose voice was being heard in educational reform, and to experience a ‘lack of their teacher-voice’ nationally and internationally. They also recognized the dissent at the local level among different stakeholders:

There is so much division amongst teachers and administrators, schools and business, government and educators, public and Catholic teachers that is based on misinformation, innuendo, rumour, hearsay—that it becomes apparent why we as educators become deprofessionalised. We don’t (or maybe I don’t) understand and know or internalize the facts.

Another student mentioned the division between teachers’ views even within schools. She asked,

Why are people distrustful of the teaching profession . . . But this distrust seems to be there and in fact grows within individual schools: Staff worry that one class would outdo another/schools [would] outdo each other. Where does our collaboration fit in? How can we ‘just get at’ the work we have to do?

Finally, a willingness to act as educational advocates, even activists, was apparent by the end of the course:
We need to look at articulating what is important in our schools in ways that our communities really understood and can buy into... A positive outcome of reform is that we are much more willing to share exactly what we are doing in our school... We need to have a serious look at what we value as a society of Albertans and Canadians, global persons, because we have come through an I/me situation to a community situation—and who decides on the agenda and values?

This developing sense of agency, or the belief that one can make a difference (Robertson 1998), is explored further in the next section.

**Developing agency**

The following six propositions summarize the general content of the fourth data category.

- Scrutiny of students’ prior assumptions led them to realize that differences are possible and that they had the ability to make a difference—they shared increased feelings of efficacy and confidence.
- A study of ‘counter culture’ was important to the development of possibilizing and recognition that things could be different.
- The graduate study helped these graduate students to lift their heads from their classrooms and schools to global political issues and back again to the purpose of education.
- The students always contextualized their learning with reflection and anecdotal examples.
- A critical examination of values and beliefs led to some affirmation of their beliefs as well as an alleviation of concerns they held. Hence some students experienced greater confidence.
- There was also much evidence of changes in and challenges to values and beliefs over the period of the travel study exchange.

Scrutiny of the graduate students’ prior assumptions within this international framework led the students to examine what was meant by ‘counter culture’. They came to the conclusion that perhaps what was counter, or thought to be counter, was not, and what was homogeneous, was not. A student said, ‘Does our same skin colour and language mean we initially judge ourselves to be homogeneous?’ Another student pondered this and wrote:

What is ‘counter culture’? As soon as you think you are a part of one, aren’t you part of a culture? Perhaps the only true counter culture is what we rest with each day inside our own minds, which is truly unique, individual and maybe ‘counter’.
Students found it interesting that ‘we are all following along the same path of accountability’ and felt perhaps that ‘the politicians are all reading from similar sources. Is it a package?!’ They found the similarities between countries frightening. For example, they stated, ‘We are going down your road and it’s scary’. They questioned each other: ‘I’m interested in the assumption that change in NZ has had very little effect on teaching and learning. What does this really mean?’ ‘There is no question that authentic assessment pushes teachers into more creative teaching, greater use of materials, experiments . . . [but] accountable to whom and for what purpose?’

A study of differences in international trends took the students to the bigger questions such as: What are the purposes of schooling? Who decides? What should accountability be? This led them to perhaps the most important questions, to asking, ‘What should the purposes of schooling be? What could the purposes be?’ As one student said, ‘Our educational tinkering is not enough. Somehow we have got to be prepared to shed what is no longer working.’

This imaging of alternatives or ‘possibilizing’ became an important part of the learning process, for example ‘So then what could it, should it be like?’ A student reflected,

Why do we need ‘either this or that’ conversations in education. There may not be a need to approach educational problems as if there is always a paradox present. There are two agendas operating—a pedagogical agenda and a political agenda that are not always the same. Important to have discussions from both pedagogical and political agendas.

As the graduate students discussed professionalism in their respective countries, one student said,

We need to reflect on the percentage of teachers who leave early in their careers. Why aren’t we critiquing that problem? Perhaps we need to make teaching a profession. It’s lost a lot of its professionalism. Society’s perception of educators must take some of the blame.

While students examined the larger picture for education, they found that their thoughts always brought them back to the school or classroom level, or, as one student described it, to their ‘heartwork’. A student said, ‘I constantly want to put what I am learning back into my own context . . . by asking . . . What does that mean to me as a teacher in a high school with 80 students per day?’ Another said, ‘Is it time for teachers to stop resisting assessment and get on the boat and influence that assessment so that it is fair to everyone?’

One student described their abilities to refocus on students’ learning:

I am finding it interesting how often emergent patterns continue to
spiral out of our informative discussions . . . almost as if the branches of these patterns are ‘rooted’ in the soils of our common foundation . . . yet we travelled a full circle back to our main purpose as educators . . . that being, the meaningful and purposeful learning opportunities we create with students.

Students were challenged on a number of leadership issues throughout the exchange. Some of the issues were appraisal, accountability, self-managing and charter schools, public and private education, and the purpose of education. One student demonstrated how the multiple perspectives and experiences had changed her thinking when she said in the second week:

Today I am thinking about how much my thinking has evolved since the beginning of this experience. I began by considering the idea of competing forces, or dilemmas or paradoxical situations . . . I think that my idea of democratic accountability and professional accountability has moved from an ‘or’ to an ‘and’. I am feeling more comfortable with the idea of democratic accountability now, as we have had time to talk about our varied experiences.

The graduate students found that the experiences during the course with other educational stakeholders gave them ideas that alleviated some of their concerns and dissonance. One said, ‘My cognitive dissonance was as follows . . . I was impressed by some of the strategies used by administrators in our group.’ Another said, ‘Administrators are “stuck” with policies they often must do their best to “deal” with. It is these administrators who effective “deal” with these reforms maintaining “healthy positive” school communities who have lessons we can learn from.’ They also worried that they, as teachers, did not always understand the bigger picture: ‘Someone needs to reframe the issue so that teachers understand that their knowledge of assessment has a direct impact on their professional autonomy and interactions with students.’

**Discussion**

On one level, the study data provided valuable guidance for the management of future cross-cultural exchanges. For example, we learned to keep in the mind the intensity of the experience for both graduate students and professors. That is, expectations for student assignments should be realistic within the time available to students in the exchange, particularly in the light of the high value the graduate students placed on the informal aspects of the experience. As well, students need to be allowed some flexibility in terms of when they are able to do the reading and written assignments associated with the exchange. For instance, it is important to allow students to do presession independent study for partial course credit and to extend deadlines for final assignments. As planners of such experi-
ences, we also need to allow exchange participants sufficient time to debrief their experiences. Also, reciprocal billeting arrangements need to be flexible enough to allow some students to make their own arrangements for local accommodation and transportation. It needs to be safe for students to decline the opportunity to host visiting colleagues because of family, work, or personal needs. It is important to structure extended travel time between sessions in each country to allow the graduate students to recover from the intensity of the work and to adjust to local time zones. Equally important is the need for visiting students and professors to have opportunities to participate in social and sightseeing events that provide valuable opportunities for collegial dialogue and participant bonding. Finally, as the professors who were delivering the travel study units, we had to grapple with university semesters in opposite hemispheres that overlapped only slightly. Thus, university registrars and office staff had to allow the two professors wide latitude in terms of when marks were submitted, while one of the professors had to arrange for colleagues to cover her teaching assignment during the out-of-country component of the exchange.

On a second level, the data that were collected reinforced the validity of the Boundary-Breaking Leadership Development Model as a pedagogical framework for the provision of graduate learning. According to the graduate students from both countries, the cross-cultural exchange was a pivotal experience in their graduate programmes in educational leadership. Certainly, various components of the model played a larger role in the Canada–New Zealand exchange than they did in the earlier study that suggested the leadership development model. For example, the international nature of the model was much more powerful in the present study than in the earlier online study. As well, it could be argued that the model could be collapsed from eight components to six. That is, others may find the model less cumbersome if two of the components—construction of meaning and generative approach to learning—were collapsed into one category. Further, the model might be as useful if two other categories were integrated—provision of a forum for discussion and sense of community. However, the overall differences among the model components, although at times relatively subtle, certainly merit consideration by those responsible for leadership development programmes. For this reason, the results of this study do not argue convincingly for substantive changes to the descriptions of the attributes of the Boundary-Breaking Leadership Development Model.

What the data do suggest, which was perhaps at best implicit in the previous study, is that the leadership development model has an additional dimension. Certainly the model should include its eight attributes and descriptors for learner and facilitator practices. However, the present study also highlights the fact that Boundary-Breaking Leadership Development seems to have a clear set of desired outcomes:

- emotional engagement with learning,
- development of a critical perspective,
The eight model attributes and the degree to which they are implemented appear to have a direct influence on the learning outcomes. These four outcomes and their relationship to the original Boundary-Breaking Leadership Development Model are portrayed in Figure 1. Increasingly, it is these very outcomes of our pedagogy and work with students which are the focus for ongoing critique and discussion.

**Conclusion**

There has been much debate about the types of leaders needed in tomorrow’s schools and about the optimal forms of leadership preparation. Although this study does not purport to settle the debate, it does go some way toward challenging planners of leadership development programmes to think about their pedagogy, why they teach the way they do, and what the impact of their teaching is on learners.

In addition, this study of the use of the Boundary-Breaking Leadership Development Model of teaching in a cross-cultural exchange demonstrated and reinforced several key points. First, in-depth reflection by students on their personal educational contexts is enhanced through examination of other educational contexts, both locally and internationally. Second, the breaking of boundaries between theory and practice, between university professors and students, between two nations, and between self and others, can foster the development of critically inquiring leaders who may not only have more questions than answers, but, more importantly, know that there are still more questions to ask.

![Diagram of Boundary-Breaking Leadership Development Model](image.png)

*Figure 1* Dimensions of Boundary-Breaking Leadership Development.
Finally, perhaps these leaders are likely to be critically reflective about the quality of education in their schools and to demonstrate the belief that they are able to make a difference to the quality of education offered in their settings. Certainly, the wide scope of school reforms in Western nations requires leaders who can respond proactively and effectively to change. The Boundary-Breaking Leadership Development Model could be a powerful leadership development tool that contributes to clear and desirable learning outcomes.

CONTEXT AND PRAXIS IN THE STUDY OF SCHOOL LEADERSHIP

A case of three?

Peter Ribbins

First thoughts

At a key point in Educational Leadership: The Moral Art, Hodgkinson ‘having considered at length the general theory of value’ and the relationship of theory to practice concludes ‘we can proceed to examine their workings in the practice, or, more correctly, praxis of educational administration and leadership’ (1991, p. 110). His analysis of ‘value praxis’ and account of ‘prescriptions and practicalities’, offers much leaders will find thought provoking. However, as he is the first to acknowledge, his approach is essentially abstract. I am aware that there is nothing so practical as a good theory, but my interests have been rather more concrete. As such, my research over the last 25 years has focused mainly on trying to understand how a number of educational leaders at a variety of levels within the educational systems of the United Kingdom and elsewhere describe, justify and enact their leadership. Much of this has been, and continues to be, ethnographic in character, but I have come to supplement this with life and career history based approaches. In doing so with Ron Best, Peter Gronn, Christine Pascal, Steve Rayner and Brian Sherratt, I have tried to work out the theoretical implications of doing so. In what follows I will say something about this approach and its implications for context and value in the study of administrative praxis. I will seek to illustrate the possibilities of the approach drawing on a case study of three successive regimes of headship enacted at a comprehensive school in England.

Appreciating context

I believe that studies of leaders, leading and leadership need to be contextualized. What does this mean? I begin from the idea that the world of the institution
is a complex one in which, in an important sense, there are as many ‘realities’ as individuals. To accept this is to be committed to an approach which makes the study of the person and his or her subjective interpretation of reality a ‘foundations block’ of any satisfactory account of social life (Ribbins, 1986). In taking this view, I have been influenced by Greenfield’s subjectivist critique of educational administration (Greenfield and Ribbins, 1993). Greenfield acknowledges the influence of Weber on his thinking but, unlike his mentor, concentrates on human agency to the virtual neglect of social structure. I take Weber’s view (Best, Ribbins, Jarvis and Oddy, 1983). Accordingly, Gronn and I, following Seddon (1994) and others, propose a ‘contextualized perspective’ for the study of leaders (Gronn and Ribbins, 1996). In doing so, we advocate the need for approaches which have a concern for both agency and structure viewed within a context seen to be shaped by the interaction of one or more of macro (the societal), meso (the institutional) and micro (the individual) levels of relationship. Reconceptualized as the sum of the situational, cultural and historical circumstances that constrain leadership and give it meaning, context can be regarded as a vehicle through which the agency of particular leaders in specific situations may be empirically understood. Amongst other things, this would have the advantage of refocusing attention away from an overconcentration on leadership, characteristic of traditional approaches, and towards leaders and leading. Applied to education what might such an approach look like?

**Regarding context: a three-level approach**

I have developed a framework with five propositions which taken together comprise a prolegomenon (a preliminary and tentative sketch for a yet to be produced fully worked out theory) for the study of leadership during periods of radical reform (relevant to steady-state conditions) which has yet to be produced. Applied to the case of the headteacher, such an approach would need data on:

1. the reforms in their specific historical, social, economic, cultural and values framework;
2. the contemporary scope, dimensions and character of the reforms;
3. the interpretations of, and responses to, the reforms of key national/local stakeholders;
4. the interpretations of, and responses to, the reforms by key institutional stakeholders as seen from the perspective of particular schools;
5. the interpretations of, and responses to, the reforms by individual headteachers within the schools identified in 4 above.

Propositions 1 and 2 constitute macro-level, longitudinal and comparative elements of the relational context; 3, 4 and 5 cover actors operating in a variety of interpretive contexts and at a variety of levels. In what follows, I focus on
propositions 4 and 5 and will argue for meso- and micro-level ethnographies of educational leaders. Three main elements of interpretive contexts are implicit: I have termed these situated, individual portrayals; multi-actor perspectives; and multi-actor perspectives in action.

A situated portrayal

Such an approach would present the reader with sets of portraits of individual heads, and of their views across a representative range of issues, each reported in some depth (Mortimer and Mortimer, 1991a, 1991b; Ribbins and Marland, 1994). It can take various forms. I know of no study which replicates for headteachers the kind of approach Gardner (1995) has used. His portraits of leaders are his, and presented in his words, rather than theirs and in their words. In contrast, the studies listed above are largely in the words of the heads involved. Even so, they differ in important ways.

The Mortimers, for example, invited seven primary and eight secondary heads, to respond in writing to issues specified by the researchers. My work on headship has emphasized the need for greater spontaneity and a more open process of agenda negotiation. As such I have derived my various accounts from face-to-face interviews and have used the same broad format. A group of heads/other educational leaders are invited to take part. Those who agree are sent a list of topics and asked to indicate any they would not wish to discuss and/or to add any they felt might be helpful. In an interview it is usually possible to renegotiate the agenda as the conversation progresses. Interview schedules have varied between projects in terms of agenda and the level of detail set out for individual themes. All were interviewed once, some twice, for about two hours. They knew the discussion was ‘on the record’. The interviews were recorded, transcribed and edited. The editing sought to create a text which was authentic and readable. Censorship was restricted to the deletion of likely libels. Each respondent was sent a full transcript of the edited interview and invited to propose such additions and amendments as he or she wished to see included. The original letter of contact usually made clear they could pull out at any time and that should their interview be published there would be regard to their wishes for revision. Some have made considerable use of the right to propose revisions, others very little. It is possible that the advantage of allowing respondents to have sight of the interview schedule and enabling them to propose revisions to the draft text might entail some loss of spontaneity or authenticity. This was a risk worth taking and in any case was the price of an on-the-record interview. I do not believe the published texts lack colour or authenticity.

Multi-perspective

Traditional reports of headship decontextualize in the way described above but also insofar as they do not attempt to locate what headteachers say within a
context of the views of significant others (staff, pupils, parents, governors) in the community of the school. A multi-perspective gives the reader some access to such information.

**Multi-perspective in action**

Relatively few studies explore what heads say in the context of what they do. To achieve this the researcher must do five things: collect relevant documentary evidence which touches upon the role of a specific headteacher in a particular school; observe such a head as he or she enacts his or her role in practice in relevant situations; discuss with the head what he or she is trying to do and why; set this account against the views of significant others; and, compare and contrast the available evidence. Ethnographic research of this kind can offer an enhanced understanding of the headteacher and headship in a variety of settings. The following examples are classified into three categories according to the extent to which the headteacher is the principal focus and his or her status in undertaking the research.

**Category 1** research treats the head as one among a number of actors at the school to be studied. Since the case study reported in the latter part of this paper is just such a case in point, I will not discuss the issues which this category raises until then.

**Category 2** studies are characterized by their concentration on the perceptions and actions of particular headteachers. Insofar as Elizabeth Richardson’s on-the-record study of Nailsea Secondary School focuses on the views and actions of Denys John, its headteacher, it is an exemplary case (Richardson, 1973).

Southworth has recently published an interesting ethnography of a primary school. In it he studies ‘a headteacher by observing him at work inside the school . . . I investigated the idea of producing a portrait of the subject and saw parallels with biography’ (1995, p. 1). The book is a ‘case study of Ron Lacey, head of Orchard Community Junior School’ (p. 2). He is described as ‘the informant’ and Southworth emphasizes that ‘Ron was the native I was studying and the research was aimed to elicit his vision of his world’ (p. 38). Lacey is the subject of the research, not a partner in it. As such it is a Category 2 study of headship, albeit a full and interesting one.

**Category 3** studies identify the headteacher as co-researcher. Since 1989 I have been involved in third level research at Great Barr GM School in Birmingham. At first, this study was informed by ideas developed at Rivendell and refined elsewhere. It was planned to investigate how a large urban comprehensive school was responding to the reform agenda initiated by the 1988 Education Act and, in this form, was Category 1 research. As the work progressed I became increasingly interested in the role of the head as an interpreter and enactor of change. As a portrait of Brian Sherratt at Great Barr, during this phase, it had much in common with Southworth’s study of Ron Lacey at Orchard and could be classified as Category 2 research.
Since 1992, however, with Sherratt’s active involvement, I have been trying to develop a novel third level approach to the study of headship. In this version the head is both the principal subject of the research and a full partner within it. As such the research in which we are jointly engaged is autobiographical, insofar as it enables the head, as internal researcher, to reflect systematically and critically on his praxis during a period of intense reform. The study is also biographical insofar as I, as external researcher, have talked to him and many others at Great Barr and have observed a wide variety of events related to the exercise of his leadership in practice. We have recently called a halt to the field research and have begun to think about writing it up. This is not proving straightforward; we know of no close precedents upon which to draw in resolving some of the difficult theoretical and methodological problems entailed.

What has been fully written up is the kind of Level 3, Category 1 research which has been discussed above. To an example of this, I will now turn. In doing so, I will focus in particular upon the issue of leadership praxis in action.

**A case of Level 3, Category 1 research: three heads for Rivendell**

*Values, power and the administrator*

In a conversation I once had with Thomas Greenfield, he talked movingly about Boethius:

> a Christian who stood at the hinge between the Roman World and the Middle Ages. He is an administrator, one caught between the Emperor and the Pope, or as it turned out, the wrong Pope. He is condemned, and as he awaits his death he thinks back on his career and writes, thus bringing us new insights into the administrative task. Few of us will face the horror that Boethius did, but I am convinced that potentially there is that same dimension in all administrative rule, a kind of horror. The wielding of power is terrible, and the more power, the more terrible it becomes. If there is to be a kind of humanizing of that power a contemplative, philosophical dimension must and should be brought to it.

(Greenfield and Ribbins, 1993, p. 262)

Acton has said ‘all power corrupts, absolute power corrupts absolutely’. Less famously, and in less politically correct times, he went on to claim that ‘almost all great men are bad men’. I have met many fine educational leaders who I could not describe as bad. Even so, I have long been interested in the potential which leadership can have for corrupting those who seek to exercise it and of the ways in which its horrors can be humanized.

Applied to the study of leaders, leading and leadership in education this can
entail many different things. In this chapter, I will restrict myself, among other things, to a comparative examination of the more or less coherent and consistent framework of educational and managerial values of each of three successive headteachers at one school, ‘Rivendell’, and of the ways in which this shaped their actions in terms of the strategies and tactics of management they sought to apply.

**Contextualizing the case**

Rivendell, at the time of our research, was a fairly large, coeducational, comprehensive located within the south-east of England. Our intention had been to engage in an ethnographic study of pastoral care at the school (reported fully in *Education and Care* – see Best et al., (1983). We soon found it was necessary to engage in a wide ranging examination of education, order and welfare at the school if we were to hope to understand pastoral care in context. Thus our ‘three year study’ took almost six years from start to finish, but that is another story. However, we were fortunate enough to encounter three headteachers at Rivendell and this encouraged us to attempt an account of the characteristics of three successive regimes of headship over a 25-year period at the school. In undertaking our research we drew upon a model which postulated that individuals within social settings of all kinds can be located along a continua of power and authority and in terms of their policies by the degree of their attachment to, or rejection of, the status quo. This means that the extent to which headteachers can manage either continuity or change along lines which they prefer, is to an important extent dependent upon the accuracy of their appreciation of these configurations and on their ability to mobilize support and minimize opposition. In analyzing these three regimes of headteacher we wished to explore the educational and managerial values espoused by ‘Mr Barber’, ‘Mrs Sewell’ and ‘Mr Lucas’; the extent to which and how they sought to enact these in practice and with what outcome; and, the responses which this engendered in other members of the school community.

**Mr Barber**

At the time of Barber’s appointment, Rivendell did not exist. What was to become its site was occupied by two schools, one for boys and the other for girls. His first task was to put them together into a secondary modern. Ten years later he presided over its comprehensivization. At the time of his retirement, ten years later still, Barber’s period of tenure tended to be described by himself and staff as characterized by its commitment to egalitarian, democratic and curriculum-centred reform. In fact these policies were associated with his second, and not his first, decade in office. Shortly after comprehensivization, Barber’s philosophy of education underwent a major transformation. Why this happened need not trouble us here, but a consequence was that under his driving influence
Rivendell came to have a coherent policy which underlay a set of largely consistent policies on key features of its provision.

Teachers’ accounts demonstrated the depth and breadth of this philosophy and of its effective implementation in practice. As a deputy head put it, ‘It is unusual to find a school with a cohesive philosophy across the whole spectrum of its work. Barber’s philosophy underlay everything that went on in the school. The philosophy went back to the 60s and the provision of a well-rounded person.’ The policies which flowed from his conversion represented a radical reform agenda which was generally believed by staff and others to have fundamentally altered the whole ethos and practice of the school. At the time, other schools were also attempting to introduce similar reforms. Usually with much less success. Why was Barber successful?

There were several factors which worked in his favour. First, since his policies were broadly in tune with the drift of educational thinking towards more informal-progressive, open, egalitarian and child-centred methods, some staff would have been receptive. Second, his initial attempts to achieve change coincided with comprehensive reorganization and the increase in resources which this made available to the school. This made staffing and resourcing his innovations practicable. Third, the very fact that in his early years he had been seen as an effective and successful conservative helped when he wanted to implement change. Fourth, some teachers who did not favour aspects of his reform agenda nevertheless felt, as they told us, it would have been unprofessional to have opposed him. Even so not all staff, initially at least, were willing accomplices. What strategies did he use to secure at least their acquiescence? Some he seems to have won over by securing their commitment to his educational values. How he did this was not always clear, but several commented on his ability to articulate and justify his policies in terms of a coherent and watertight philosophy. Attempts to better him in debate rarely succeeded. He came to be seen by staff as far-sighted, even visionary. Many attested to the power of his argument. By good and determined argument and appeals to certain normative values, Barber, it seems, re-educated his staff to see their work in a new light and in doing so to accept the policies entailed in such a redefinition. By fostering the same kind of enthusiasm he felt himself, he gradually gained the support of more and more staff. For some this ‘was very exciting. It was just like being back at college. The atmosphere was one of continual debate and discussion’. For others, ‘You could almost describe some (teachers) as brainwashed.’

This last comment hints that there was a darker side to Barber’s strategies of reform and to his values as a manager. There is evidence that there was some more-or-less blatant coercion of staff who did not easily accept his policies. According to one ‘If you did not toe the line, Barber would come round and thump the table and boot you in the pants’, although another suggested ‘he tended to ask opponents to go elsewhere’.

Conversely, he was good at assembling allies through appointment. He was also skilful in giving potential allies a stake in the innovations as they
progressed and in doing so promoting them to positions of greater authority within the school. How he did this can be seen from the way in which he implemented mixed ability and integrated humanities throughout the school. A member of the humanities team described it as follows

Barber set up the system year by year. He, the deputy and head of humanities began with the first year, when they had worked through the year left ‘Jane Rayner’ in charge and moved to the second year. When they had devised the 2nd year work and worked through that they left ‘Roslyn Parker’ in charge and moved on to the 3rd year...

By such a process converts were systematically and gradually located in key positions.

This seems to have been a feature of his approach generally to the system of meetings and teams he established to make key decisions within the school. Here he used powerful allies to instigate and defend the changes dictated by his broad philosophy, and through his personal membership of almost all these groups, he was able to monitor progress and if necessary to veto proposals which ran counter to his policies and values. Many staff considered the deliberations of these groups and committees to have been systematically rigged. It would have been possible to offer numerous examples of this view but I must be content with two or three:

In Barber’s day he had a ‘Cabinet’ meeting... of between 15 and 20 people... It did not work formally through agendas, resolutions and minutes, rather through the discussion of issues brought to it, an informal agenda under the control of the head and deputy.

The School Council met monthly, chaired by the head... it was meant as a vehicle for children to influence democratically the working of the school, but he was an authoritarian not a democrat so it didn’t work in practice. There was a lot of verbiage from him which meant that he restricted the questions...

Barber was good at manipulating people to get them to do what he wanted.

Not surprisingly, Barber was widely described as a ‘totalitarian’, an ‘autocrat’ and a ‘ruthless manipulator’. Yet, overwhelmingly, staff also spoke highly, if grudgingly, of his qualities. They commented on his ‘visionary powers’, his impressive ability to articulate and defend his values and philosophy, and his powers of leadership. Even those who did not prosper under his regime acknowledged his immense ability to work and his dedication and involvement in the work of the school. As one put it ‘he was always around the school, he attended
pretty well every team meeting and there were a lot of team meetings’. Barber was seen as devoting his working hours to the real work of the school, only beginning his administration after school and always working late. We met no teacher who believed that he or she or any other member of staff worked as hard as Barber. Moreover, several acknowledged that ‘With Barber, if you agreed with his philosophy, or at least attempted to apply it, he would back you to the end.’ Finally, as time went on, the visible success of his policies in the public arena, expressed in growing numbers of visitors to the school and increasing and often flattering media attention, made it more and more difficult to stand against him. However, all good things come to an end and after 20 years in office Barber finally, and reluctantly, reached an age when he was required to retire.

Mrs Sewell

By the time of his retirement in the late 1970s, the circumstances of the school had changed substantially. Public expressions of a conservative backlash on many of the developments he had fostered such as mixed-ability teaching, ‘soft-option’ integrated studies course, liberal exam methods were becoming more frequent and trenchant. In addition, there were those within the school for whom discretion had been the better part of valour during the Barber years, who began to express disenchantment with aspects of the existing regime. The new head therefore took up her appointment in a situation which had a strong and established pattern of policy and practice, but which was also moving out of a period potentially ripe for change. As it turned out, her values, policies and strategies differed in a number of important ways from her illustrious predecessor. We, and many staff, found it difficult to decide if her overall policy either in general or in terms of Rivendell was conservative or radical. Sewell seemed to approve of the overall philosophy of education which Barber had tried to implement, and she seemed to have wanted to conserve much of the best of his era. Yet she also seemed to believe that some structural change was necessary to make their implementation more effective. One thing was clear. She recognized the potential difficulties of succession. As she put it:

I knew it was going to be a hard act to follow . . . the very fact that he had made such an outstanding and such a morale-boosting success of the school’s recognition to comprehensive education by his avowed policy – which I thought was absolutely the right one of not imitating the grammar school but of becoming a different kind of school – this seemed to be absolutely the right thing to have done.

However, on specific issues, notably attempting to raise the profile of science and technology and diminishing the overwhelmingly privileged position of the humanities, she clearly wished to encourage some change. In attempting these and other innovations she seems to have tried to employ a strategy of
assembling allies in a way substantially similar to that used with such success by her predecessor. As she told us, ‘It was very much with the sort of object I had in mind that one of the deputy head appointments was made.’ Again, she used a similar approach in appointing staff to new positions in the revised pastoral structure of the school. For whatever reason, these strategies were not effective in strengthening her position within the school. Those she chose as allies and sought to promote by no means always reciprocated. This was recognized by a senior member of staff who quickly became an important opponent. As he put it, ‘It is worth remembering that some staff gained from her coming. Some of them reneged on her afterwards. They had no right to do so.’

This is an interesting comment in various ways, not least because it demonstrates that this member of staff recognized the ‘rules of the game’ of these appointments and promotions for what they were: a strategy for gaining loyalty and support. If this is what they were, too many were unsuccessful. This was notably the case with the appointment of two relatively young teachers to deputy headships within the school. Both found the struggle to make their own position within the school too demanding to have much time for lending support to the person who had appointed them. In addition, some members of the old guard felt they had been passed over for unacceptable reasons for inexperienced people which the new head had known and brought in from outside the school. However, as she recognized, some, at least, of the resistance which she encountered owed something to rather less rational reasons: ‘I think there was bound to be ... an element of suspicion and a little bit of antagonism in that a relatively inexperienced teacher was appointed to what was obviously a very coveted headship ...’ How, then, did she try to exercise this coveted headship?

Reflecting in retrospect, she described her values and management style in the following terms:

I tended to be a consultative head ... and probably in the upshot found that there were certain decisions which everybody expected a head to take and that if you spend too much time consulting about them you just end up offending everybody ... If you didn’t make the consensus of opinion type decisions ...

Certainly, she fostered discussion on a number of highly contentious issues and established working parties of various aspects of organization and management of the school. In doing so she sought to involve as many staff as possible on these groups and committed herself to having their reports being presented to the governors. In the early days of her regime, quite unlike her predecessor, she even tried to make full staff meetings opportunities for full, free and open discussion. As far as we could tell from our conversations with her and our observations, her policies on decision making, the committee structure, and her role as a consultative head did not seem to have been conceived or employed as a means of manipulation and control. However that may be, they were not well received.
Within a few months of her appointment, a growing number of staff became highly critical. Some argued that her management was undirected by any clear philosophy of her own. As one senior teacher put it to us, ‘She had no real philosophy of the comprehensive school and saw her job as dealing with day-to-day things.’ Others shared this view and concluded that as a result, the school lacked leadership: ‘the school is falling into the trap of too many people doing what they want without any real direction . . .’ Yet others criticized her policy and practice on all aspects of staffing, including establishment, appointment and promotion, suggesting that decisions were made on inappropriate grounds and this had led to the institutionalization of unhelpful bureaucracies. There were certainly some grounds for the latter claim. During her term of office Rivendell developed a pastoral structure of such impenetrable complexity that it was commonly described by staff as a ‘bureaucratic nightmare’. Finally, there was also much censuring of her alleged failure to support the teachers she had appointed and her use of these appointments as a means of evading her responsibilities. I can only illustrate the vigour with which these and other criticisms were made:

She made an absolute mess-up of things. She had a thoroughly bad effect on the school. Despite all you hear about how good she was, she didn’t back her teachers . . . She gave rapid promotion to people she knew outside the school. All this had a very bad effect on the school.

Mrs Sewell has introduced a series of faculty, year and house meetings partly in order that she can farm out responsibility to the people involved. If a criticism came she could say, for example, I am sorry, I have to consult my head of faculty, house, etc. She would not let the ‘can’ come back to her.

There was also a good deal of resentment over the distinction which she was purported to make between administrative and other posts, and, especially worrying for those of us who teach the subject, her enthusiasm for the jargon of educational management:

Under Barber there was no talk of administration, you did your administration in an odd minute here and there. Barber didn’t start his administration until after 5 o’clock. During the day he was always around the school. So when ‘Madam’ came, she was talking ‘a language that nobody understood’ . . . Of course, now I have been on courses and heard people talking about ‘top management’ and ‘middle management’ and realize that I have been in a backwater.

A few staff did speak with approval about what she was trying to do and compared her favourably with her predecessor but they were very much in the minority. Most saw her brief term of office as a bad thing for the school. Yet, as
I have tried to show, she claimed to have approved of much of her predecessor’s values and philosophy, she sought to conserve the best features of the school as she had found it and, in particular, she encouraged consultation and attempted to replace manipulation and coercion with more open and democratic methods. But she failed to carry staff with her. She came to be seen as a head who lacked clear values and a discernible philosophy, who gave little leadership and shuffled off responsibility whenever she could, and who had presided over a sharp decline in the quality of life and schooling at Rivendell. Where did she go wrong?

Several possible explanations are possible. We did consider if gender was a significant issue and did find some limited evidence in support of this. But Sewell herself did not seem to regard this as important. Rather it was her youth and relative lack of experience and, therefore, of understanding of how to proceed which seems to have been much more critical. That both she and others understood this is evident in some of the quotations presented earlier. In conversation with us she talked about the kind of head that she would like to have become in time, rather than the kind of head she actually was. This led to a lack of certainty on how to handle difficult matters. As she says, ‘It’s very difficult, I think, to know just how properly to manage such things . . . I hope I would have had the wisdom and insight to have done (what her predecessor did) had I been, you know, that much older . . .’

In the face of such inexperience and uncertainty, a policy of consultative and democratic decision making might seem a logical response, but in practice it led to a mixture of ad hoc management on the one hand, and a large measure of laissez faire on the other. In retrospect she believed she did have significant policies on a number of matters, but these were not given coherence by the kind of overall philosophy which Rivendell had enjoyed under the previous regime, or if they were, this was not clear to the staff. In seeing her predecessor as a hard act to follow, she was more correct than she knew. First, because at a macro-level the climate of opinion which had supported Barber’s core innovations was becoming more hostile. Insofar as she sought to preserve key aspects of his legacy she did so in markedly less favourable circumstances. Second, not only did she seem to lack a philosophy as coherent as her predecessor, she also lacked his capacity to win and strengthen allies and to lose and neutralize enemies. Third, she was unwilling or unable to press home the kind of strategies of manipulation and control which Barber had used so ruthlessly and effectively. She soon came to see herself as a failure and this view was shared at Rivendell. In little more than two years she left headship and moved to another post.

Mr Lucas

Perceived failures of the previous administration meant staff morale was generally thought to be low, with many hoping that the new head would give some sort of lead to fill the vacuum left by Barber’s retirement. But there were also
misgivings. Some were concerned that the new head might ‘initiate even more changes from the Barber philosophy’. Others feared the prospect of some dismantling of the structures of posts which had mushroomed during Sewell’s brief period in office and from which they had benefited. One even threatened to resign if this took place. In the event some restructuring did take place but he proved to be a major beneficiary. No more was heard of this threat.

Sewell had been 34 when she took up the headship at Rivendell. She had been a teacher for some 10 years. Her first and only prior post had been as a Deputy Head to which she had been appointed directly from a managerial post in publishing. On appointment Lucas was in his early fifties, had spent his working life as a school teacher and, before he came to Rivendell, had been for many years the head of another, if smaller, comprehensive school within the same local authority. He had some knowledge of what had happened at Rivendell under his predecessor and came determined to achieve rapid change. He saw the innovations he wished to make as a rational response to change in the light of perceived constraints. He was also clear about the potential advantages of the new systems that he wished to put in place; we at the time, as researchers, saw these as being primarily to do with achieving a smoother and more streamlined administration in which better use might be made of the resources invested in various positions of responsibility.

The changes were driven through very rapidly and with little general consultation. Lucas once told us he believed that ‘any meeting for more than 20 minutes is useless’. He tended to be as good as his word on this. Staff meetings became 10-minute weekly meetings ‘for the dissemination of information’, mainly in a top down format. When major meetings took place they were usually carefully stage managed. At the key meeting at which staff had the ‘opportunity to discuss’ the structural changes he was intending to implement, they found themselves filing in faced by a semicircle of people seated at the front of the room who represented the new order and who had most to benefit from the reforms. Lucas opened his remarks by making it clear that he did not welcome debate on the broader principles and concluded that, ‘I will be happy to end this meeting at 10:20 but would definitely want to finish by 12:00; I don’t want to dwell on the reasons for these changes’. He used much the same approach when introducing the proposed changes to a meeting of the Parent–Teacher Association.

Although there was a good deal of support, along with some opposition, to the structural and other reforms Lucas proposed, there was strong objection to the way in which these changes were being introduced. There were numerous references to the fait accompli, to inadequate or non-existent consultation, and to the various discussion documents which were being produced at the times as the pronouncements or the edicts. Perhaps because of all this, a number of staff quickly concluded that, like his predecessor and unlike Barber, Lucas had no educational policy and was not much interested in trying to develop one. Yet for us it seemed that there was a clear, if implicit, philosophy behind the quite
radical educational changes he sought to implement at Rivendell. Conversely, there was a widely shared understanding that a major change in the rules of the game had taken place in terms of the values which underpinned management and decision making at the school. Everyone was clear, including Lucas, that the authority resides in the head and, by their inclusion in policy formulation, in his deputies. The new system was at best hierarchical and at worst overtly autocratic.

However one evaluates the changes Lucas introduced, or the methods he used to achieve them, there can be no doubt that within his first year at the school sweeping educational and managerial changes were made and more were on their way. It is also beyond doubt that these changes were by no means welcomed by all. Yet the actual level of resistance, despite the heated rhetoric sometimes heard within the school’s staff rooms and elsewhere, was relatively small. Why was this?

In part, this was because Lucas was skilful in buying or squaring off those who might have been most disaffected. He was also successful in ‘building in’ senior and influential staff into key positions within the new structures and in making them clearly accountable for key aspects of the work these entailed. This gave the structures an aura of power and officially-legitimated authority in the eyes of most staff. In some respects, for example, in his attempts to restrict the scope of staff meetings, Lucas might be thought to have been using an approach which reflected the kind of more-or-less manipulation which had characterized the Barber regime. On balance we felt that this was not an appropriate interpretation since given the overtness of his autocratic style of management, Lucas did not seem to require manipulation of any subtlety. Conversely, given the absence of opportunities for debate, discussion and consultation, he left himself little room to employ some of the strategies that Barber had used with such telling effect. The opportunities for advocating the normative grounds for the changes he wished to make were simply not there, and without them the kinds of attachment to his philosophy that Barber secured from many of his staff through strong moral appeals were almost impossible to achieve. If Barber surrounded himself with disciples at all levels amongst his teachers, the best Lucas could hope for were loyal line managers and an acquiescent staff. Insofar as this is what he wanted, the evidence suggests that he was successful both during an initial brief period of intense reform and in the many years of his regime that followed.

Conclusions on a case
As an illustration of the praxis of three educational leaders some may find the case of Rivendell makes for uncomfortable reading. It tells us of Mr Barber, who espoused a coherent and comprehensive set of egalitarian and democratic egalitarian philosophies that were at variance with the often calculating and manipulative managerial strategies which he employed with such telling effect.
to achieve his purposes. It also tells us of Mrs Sewell, who had no coherent educational philosophy or was unable to make clear what this was, lacked the will or the ability to be manipulative. Thus, while Barber merely espoused democratic managerial ideals, Sewell made a real effort to introduce democratic structures and processes, only to be accused of a lack of leadership and a poverty of philosophy. Seen as unsuccessful, she came to share this view and gave up headship. Rivendell teachers, it seemed, preferred strong leadership and a semblance of democracy, even when they knew this to be largely a sham. From their third head, Mr Lucas, they got strong and honest leadership without much manipulation and little attempt at even a facade of democracy. Again, they were not satisfied. Lucas was in a hurry and successfully drove through many major changes during his first year at the school yet, despite much passionate talk of opposition, very little came of any of this.

**Final thoughts**

In this chapter I have outlined a three level approach to the study of leaders, leading and leadership. I have sought to illustrate the merits of this approach in one of its third level ethnographic forms with reference to three successive, and very different, regimes of headship at a secondary school in the United Kingdom. I believe that this approach can be applied to good effect to research into the praxis of leaders and led within a wide variety of educational and other contexts and would wish to take this opportunity to call for more such studies. Those who are mad enough (Wragg, 1995) to want to be leaders, but who have no desire to be corrupted by the exercise of this ‘moral art’, need them. Hodgkinson (1991) notes that one of the functions of his book is to ‘ground action on better theory, on the best theory available’ (1991, 111). I believe it is also necessary to attempt to ground theory in action.

EMBEDDING LEADERSHIP IN TASK PERFORMANCE

Viviane M. J. Robinson

In his recent review of research on leadership in the Handbook of Organization Studies, Alan Bryman (1996) writes that ‘Leadership theory and research have been remarkably and surprisingly uncoupled from the more general field [organization studies] in which they are located’ (p. 259). Much leadership research floats ethereally above the humdrum of organizational life, abstracted from the tasks that leaders are alleged to help others accomplish. When leadership is disconnected from tasks we pay too little attention to their structure and to the resources required to progress them. We may also misunderstand the skills and capacities involved in leadership, focusing too much on decontextualized processes of interpersonal influence and too little on substantive task-related expertise.

These are the themes I explore in this chapter. I begin with a brief review of leadership research, and show how it disconnects task performance from leadership. I then propose a way of reconnecting the two by describing leadership as exercised when ideas or acts are recognized by followers as capable of progressing tasks or problems that are important to them. The argument involves describing what it is to progress a task or problem, through an account of problems and problem-solving. Since most educational problems are solved by interacting actors and not isolated individuals, I then show how this account constrains the type of interpersonal influence process involved in leadership. Finally, I contrast this view of leadership with the recent emphasis on leadership as visionary and transformational.

The disconnection of task and leadership performance

The following definition of leadership is typical of those which dominated the field until the mid-1980s: ‘Leadership may be considered as the process (act) of influencing the activities of an organized group in its efforts toward goal setting and goal achievement’ (Stogdill, 1950, p. 3). The inclusion of goals and goal
achievement in this definition suggests that task performance is an important aspect of leadership, but despite this acknowledgment little of the research within this rational tradition has theorized the processes that contribute to task performance. For example, in the search for the holy grail of leadership effectiveness, hundreds of studies have correlated leaders’ traits and styles with task outcomes, but there is doubt about even whether the results reflect the causal impact of leaders on task performance, or the inclination of followers to attribute task outcomes to their leaders (Lakomski, 1998).

The contribution of leadership to task performance has also been clouded by the assumption that leadership is adequately studied by the study of leaders, that is, those who occupy formal leadership positions. By contrast, when leaders are identified by the effects of their acts on others, rather than by the fact of their appointment, attention is drawn to the processes by which influence is exercised, the emergence of leadership in the course of interaction, and the way different individuals exert varying influence across situations (Hosking, 1988). Furthermore, when acts of leadership are distributed across individuals, studies of leaders will capture but a small percentage of the contributions that advance the relevant tasks.

When rational approaches to leadership were overtaken by New Leadership in the mid-1980s, there was even less focus on task accomplishment. The term New Leadership, which embraces a variety of approaches including transformational, charismatic and visionary leadership, treats leaders as ‘managing meaning’ rather than goal achievement, and motivating followers through a variety of symbolic activities. Alan Bryman (1996) describes the common ground between the various New Leadership approaches as follows:

Together these labels revealed a conception of the leader as someone who defines organizational reality through the articulation of a vision which is a reflection of how he or she defines an organization’s mission and the values which will support it. Thus the New Leadership approach is underpinned by a depiction of leaders as managers of meaning.

(p. 280)

Leaders in this approach need to be charismatic and inspirational and they need to know how to motivate followers. What knowledge they need of the work of the organization is unclear. The disconnection between task and leadership is seen in the following definition of James MacGregor Burns whose study of political leaders produced the distinction between transactional and transforming leadership – a distinction that has been very influential in educational administration literature. For Burns (1978), ‘Leadership over human beings is exercised when persons with certain motives and purposes mobilize, in competition or conflict with others, institutional, political, psychological, and other resources so as to arouse, engage and satisfy the motives of followers’ (p. 18).
On this account, leaders access resources to satisfy the motives of followers, which in the case of transactional leadership is achieved through rewards and sanctions, and in the case of transforming leadership is achieved through the articulation of vision and values. The requisite leadership skills include the accurate reading of follower psychology, so that one knows how to motivate and inspire. Task-relevant knowledge and skill play little role in this conception, so that one gains the impression that leaders can motivate, engage and inspire regardless of task demands. If followers are motivated by task demands, then leadership through satisfaction of motives will be compatible with task performance – if not, then leadership and task performance will be disconnected. These themes remain influential, for in his 1996 review of ‘New Leadership’, Peter Gronn (1996) proposes that ‘leading’ is best defined as ‘the framing of meaning and the mobilization of support for a meaningful course of action’ (p. 8). While Gronn’s reference to a ‘course of action’ implies a task dimension, his review makes clear that what is problematic is the mobilization of support, not framing the meaningful course of action. Leadership is analysed as an influence process that is disconnected from, rather than embedded in, task accomplishment.

**Embedded performance**

While leadership research, or at least large portions of it, have ignored the task contexts in which leadership is exercised, the practice of leadership is inextricably woven into the fabric of task performance. The following scenario provides a typical enough picture of how school staff go about accomplishing tasks together. The question I raise about the scenario is ‘What, if anything, does the scenario have to do with leadership?’

*Mei, the Head of Science, is chairing a meeting in which her staff are reviewing the results of the assessment of the last unit of work. She circulated the results in advance, with notes about how to interpret them, and asked the team to think about their implications for next year’s teaching of the unit. The team identifies common misunderstandings and agrees they need to develop resources which help students to overcome them. Jushan, a second year teacher, was pretty unhappy with the assessment protocol used this year, and suggests revisions which he thinks will give more recognition to students who have made an extra effort. Most of his suggestions are adopted. Lee, who teaches information technology as well as science, shows the group how the results have been processed on the computer so they can be combined with other assessments, and incorporated in reports to parents and to the Board. Several team members express nervousness about reporting to the Board so they decide to review a draft report at the next meeting.*

If we were to believe some of the more popular accounts of leadership, the above
scenario would not be recognised as relevant to the topic. Mei is not in the driver’s seat, articulating a vision, motivating the troops or satisfying their needs. What she is doing is structuring the task, doing it, revising how it will be done next time and simultaneously completing related tasks. Her contributions articulate with those of others, whom she influences through her talk or actions, but Jushan and Lee also influence her. In this scenario leadership has gone underground because it is embedded in the task rather than floating above it as a meta-level commentary. I try to capture the way leadership is embedded in organizational action in the following definition:

- Leadership is exercised when ideas expressed in talk or action are recognized by others as capable of progressing tasks or problems which are important to them.

The recognition does not require a verbal endorsement from followers. Leadership is detected by its effects, that is by identifying those contributions around which other contributions are coordinated. Mei structures the task of reviewing the science results by providing guides to their interpretation and suggesting an agenda. Her staff indicate agreement with this influence attempt, by simply doing as she has suggested. Jushan makes a similar contribution, and so we see that leadership occurs wherever and whenever such contributions arise, whether or not the contributors hold formally designated leadership roles. The notion of leadership as distributed across work groups contributes to the democratization of leadership by decoupling leadership from rank and focusing attention on who is doing the work and how it gets done.

If leadership is about making contributions through actions and words that are accepted by others as progressing an important task, then we need to focus on the nature of tasks and what it is to progress them. Clarification of these issues will enable us to make progress on understanding the skills, knowledge and attitudes that might be associated with making leadership contributions. Our research will then be grounded in the detail of task contribution rather than in assessments of the personal qualities of those who are designated as leaders and who may or may not make such contributions to any given task.

**Task performance as problem-solving**

In previous writing I have proposed an account of problems and problem-solving that I believe is useful in understanding what it is to progress a task (Robinson, 1993, 1998). It draws on the work of Thomas Nickles (1981), a philosopher of science who defines a problem as ‘the demand that a goal be achieved, plus constraints on the manner in which it is achieved’ (p. 111).

Nickles argues that problems arise through demands that they be solved and that such demands arise within particular historical and cultural traditions. What counts as a problem changes over time and across social and cultural contexts.
The shift to school self-management, with its associated emphasis on accountability, has increased the demand that schools address a number of problems of finance, property, personnel and curriculum, that were either not previously seen as problems, or were the responsibility of central agencies. Whether these particular problems ought to be on schools’ agenda raises more general questions about the political processes creating the demand that particular problems be solved. Precisely because these processes are political, the problems through which leadership is exercised are not uncontested, both in the sense of how a particular problem is formulated and in the sense of whether any particular problem ought to be on the agenda at all. It is important, therefore, that the above definition of leadership can be developed into an account that demonstrates how leadership contributes to task performance through both the emergence of particular issues as problems, and through the resolution of contested formulations of those problems that are on the agenda.

In the following, I explain Nickles’s somewhat abstract account through the example of a hypothetical school trying to solve the problem of how to monitor and report on the collective achievement of students. Let us imagine that some staff in this school do not accept the problem demand, which has largely come from regulatory agencies, and other staff accept that the problem should be on the agenda, but are wary of how it may be formulated.

The problem of how to monitor collective achievement in the context of an individual school, like many problems in education, can be described as ill-structured because there is uncertainty about the information and methods needed to solve it, and about what counts as a solution (Simon, 1973). In education, such problems are controversial as well as uncertain because people develop emotional and value-based commitments to different understandings of the problem, and it is unclear whether they can be adequately reconciled. Ill-structured problems are solved by making them more well-structured, that is, in Nickles’s terms, by specifying the constraints on the solution. Constraints narrow the solution alternatives by specifying the conditions that are to be satisfied. Constraints could include relevant values and beliefs, regulatory requirements, material conditions such as available financial and human resources, and other school practices with which any proposed solution must articulate. The more constraints that are specified, the more well-structured the problem, which means that there are fewer degrees of freedom available about how it may be solved, and a narrower problem space in which to search for the solution.

This account can now be applied to the example of collective assessment as follows. Imagine that the comments in Table 1 are a summary of the main concerns that have been raised in staff’s preliminary discussions about the type of collective assessment they wish to develop. On the right hand side of the table are the positive and negative constraints on any proposed solution that are implicit in the associated staff comment. For example, the comment that the information will be used against teachers implies opposition to any assessment practices which may be used punitively; advocates of this constraint may not
accept any solution if they believe that it is not possible to solve the problem without violating this constraint to an unacceptable degree. If sufficient staff shared such a view, the problem of collective assessment would remain irresolvable until this constraint was formulated in a more flexible manner. Alternatively, the demand for its solution could be dropped until a more trusting political climate emerged – this amounts to taking the problem off the agenda, at least for the time being.

Problems are solved by discovering or designing practices which adequately integrate the proposed constraints. For our assessment problem, this involves developing procedures which, as far as possible, provide reliable information, have utility for both classroom teaching and programme evaluation, satisfy external accountabilities, protect teachers from possible misuse of the information and are efficient.

It will be obvious to anyone familiar with current debates on collective assessment that there is considerable tension between staff’s various solution requirements – indeed, some would argue that the constraints in Table 1 are irreconcilable. The tension inherent in this example can be appreciated by evaluating various assessment practices against the listed constraints. Achievement data that are easily aggregated and reported to external stakeholders may tell teachers that improvement is needed, but provide little diagnostic information about students’ difficulties. If more detailed diagnostic data are collected, the requirement to assist classroom teachers will be better satisfied, but the efficiency constraint may then be violated to an unacceptable level. While this example may be extreme, tension between constraints is precisely what makes so many educational problems intractable, and subject to repeated reform attempts, as different stakeholders advocate new solutions which give greater weight to their preferred constraints.

Table 1 Implied constraints on collective assessment

<table>
<thead>
<tr>
<th>Staff comments</th>
<th>Implied constraints</th>
</tr>
</thead>
<tbody>
<tr>
<td>‘The Board will misinterpret the information’</td>
<td>Accuracy of interpretation</td>

</table>

LEADERSHIP AND HEADTEACHERS
The degree of tension between constraints is a function of both their formulation and the objective relationships between them. For example, if the comment that ‘the Board will misinterpret the information’ implies that it should not receive the information, then the problem may be irresolvable, for this constraint contradicts any legal requirement to provide such information. If, on the other hand, it represents a plea for accurate interpretation, then these two constraints are not incompatible, because certain sorts of reporting to the Board could reduce the risk of misinterpretation to acceptably low levels.

The process of constraint specification and integration are concurrent rather than sequential, for in attempting to integrate constraints, problem-solvers adjust their meaning, their relative weighting and their proposed solutions until they are satisfied with the degree to which they have been integrated. Satisfaction does not, of course, indicate an absolute level of integration, only that problem-solvers see the solution as good enough for now. For example, staff who are concerned that individual teachers will be held accountable for their students’ results might accept a system which aggregated results across a whole year level, but not one which aggregated and reported results by class. The latter system would make it too easy, they would argue, to target allegedly under-performing teachers.

In summary, problems do not arise until there is a demand that they be solved and both the demand itself, i.e. the claim that there is a problem, and its formulation may be uncertain and contested. Problems are solved, however inadequately, when problem-solvers adopt practices which sufficiently integrate their proposed constraints on the problem. When I say ‘their’ constraints, I mean those they take into account, whether they reflect their own preferences or not. In other words, the constraint set proposed for a particular problem is likely to originate in both the preferences of the problem-solvers and in features of the environment controlled by others which they believe must be taken into account. Practices which solve problems have short- and long-term, intended and unintended, and positive and negative consequences. Since many such consequences are neither predicted nor predictable, the solution may subsequently be judged inadequate and trigger a new demand that the problem be re-solved (Nickles, 1981).

From task structure to leadership

Most educational problems are formulated and resolved not by isolated actors, but through the coordinated understanding and action of multiple actors. Earlier, I defined leadership as exercised when ideas or actions are recognized by followers as capable of progressing tasks or problems that are important to them. Now that we have an account of what it is to progress a task, we can turn to the influence processes that promote the collective accomplishment of problem-solving. In turning to social considerations at this point, I am not outlining a two-stage theory of leadership in which problems are solved in the heads of
leaders who then engage with followers in order to convince them of his or her solution. What I am doing is exploring how problem-solving constrains the social dimension of leadership activity.

Problem-solving constrains leadership by suggesting the relevant aspects of social interaction. The word ‘social’ rather than ‘interpersonal’ is deliberately chosen, for the latter implies influence through face-to-face interaction which is only one of various ways in which influence over others may be exercised. For example, followers may value ideas that are conveyed through written descriptions, demonstrations, or that are implicit in the observed actions of others. A teacher may notice how a curriculum leader is able to use individual assessment records to give teachers useful feedback about particular students, and to use those same records, along with those of the remaining children at that level, to evaluate the teaching programme. Leadership is exercised in this case, not because the teacher holds the position of curriculum leader, but because her assessment practice shifts her colleague’s belief that information collected for the purpose of programme evaluation cannot provide useful information about individual students.

Some clues to the nature of the influence processes that constitute leadership are found in the earlier definition of leadership as ‘exercised when ideas expressed in talk or action are recognized by others as capable of progressing tasks or problems which are important to them’. First, leadership is identified by the reaction of followers, not, in the first instance, by the position, character or style of particular individuals. The latter type of investigation becomes useful when it focuses on those who have been independently identified, through the reaction of others, as making more than the usual number of contributions. Second, the influence is accepted because the ideas and actions are attractive, not because of coercion, fear or a sense of duty or obligation (Fay, 1987). The basis of the attraction is the belief, which may or may not turn out to be true, that the contribution will progress the task or problem in a manner consistent with one’s own understanding of it. This means that others sense an alignment between the values and interests through which they understand the problem, and those implicit in the contribution. Or, to put it more technically, the contribution is accepted, because it incorporates and gives appropriate weighting to those constraints which are important to followers.

The processes of leadership

What knowledge and skills are involved in influencing others through making contributions that are recognized as progressing relevant tasks or problems?

Gaining and utilizing knowledge relevant to the task or problem

Experience with similar problems and tasks provides information about the constraints that may be relevant, their inter-relationships, and the possibilities for
their integration. The deeper one’s knowledge of a problem’s constraints, the more possibilities open up about how they may be integrated because they are understood at the level of underlying principle rather than surface detail. To return to our former assessment example, whether or not school-wide assessment practices can be informative for teaching as well as management purposes, and still be efficient, depends on the subtle detail of their design. Staff who have a superficial rather than a detailed knowledge of assessment are unlikely to recognize or make the distinctions needed to craft practices that can satisfy all three requirements.

People with prior relevant experience are more likely to anticipate unintended consequences of certain patterns of constraint satisfaction, to accept more complex constraint sets because they are more confident of their integration, and to avoid crafting constraints in ways that set up opposition between them. Like expert problem-solvers, their experience with similar tasks enables them to perceive a possible structure through the detail of the initially ill-structured problem (Chi, et al., 1982).

**Skills in constraint integration**

Whilst this process is closely related to that of gaining and utilizing task-specific knowledge, it is treated separately, for it is possible to influence others’ understanding of specific constraints without contributing to the process of their integration. Indeed, partisan leadership achieves just that, by emphasizing the importance of one aspect of a problem while neglecting, if not opposing, other dimensions or perspectives. Integrating constraints requires relevant knowledge, attitudes and skill. Dewey’s (1922) notion of imaginative deliberation captures what is involved:

> The aim in deliberation should be to devise an action in which all [competing tendencies] are fulfilled, not indeed in their original form but in a ‘sublimated’ fashion, that is, in a way which modified the original direction of each by reducing it to a component along with others in an action of transformed quality.

(p. 194)

The competing tendencies, or constraints, are fulfilled, not by crass compromise or trade-offs between them, but by understanding their underlying principles and values so that more possibilities are revealed about how they may be satisfied. Inseparable from this knowledge is an attitude of commitment to the whole problem, which motivates problem-solvers to search for solutions that as far as possible satisfy the whole constraint set rather than maximize those they initially favoured. Such integrative contributions are more likely to be made by those who are skilled at recognizing and creating common ground, than by those who more readily perceive conflict and opposition.
Gaining and utilizing knowledge of actual or potential followers

When actors know what is important to potential followers, they are more likely to craft ideas and actions in ways that are recognized as contributions, not simply because they are trying to ‘win them over’, but because they have learned more about what the problem involves. Because this knowledge is contextualized in terms of particular tasks or issues, it is not necessarily gained by what is sometimes described as ‘getting to know’, or ‘getting alongside’ others. Someone in a formal leadership position may not have such knowledge, despite friendships and years of shared experience, because they have assumed that they know what is important, or because they have not had an opportunity to learn how others understand a particular problem.

Hosking (1988) describes how knowledge of others’ interests is gained through networking – the process of making contacts and building social relationships. Networking promotes collective problem-solving through learning what is important to others and building relationships which can be channels for influence.

Ideas and actions may gain recognition from groups that have had no contact with their originator because understandings gained from engagement with similar groups are widely applicable. Leadership is thus always social (confirmed by the response of a follower) without being necessarily interpersonal (it does not always occur in a face-to-face context).

Like all of the processes described in this section, utilizing knowledge of followers implies both cognitive and attitudinal dimensions. Gaining knowledge of how others frame problems implies that one cares about others, especially when their beliefs and values differ from one’s own. Respect for difference produces ideas and acts that take into account the interests and values that others bring to the problem, so, as a result, more people with initially different positions will identify with the resulting problem formulation. Thus gaining knowledge of followers increases the likelihood of being influential through negotiating a problem formulation that is sufficiently shared to allow a solution to be reached.

In summary, I have suggested three leadership processes that increase the likelihood of making contributions that others recognize as progressing problems that are important to them. Two of those processes, gaining relevant knowledge and integrating constraints, emphasize the role of task expertise in leadership, and the role of experience in gaining such expertise. The remaining one, gaining knowledge of followers, recognizes the contested and political nature of educational problem-solving and the value of an empathic and respectful understanding of the differing interests and values that inform alternative problem formulations.

Leadership, vision and task performance

When leadership is embedded in task performance, it becomes more mundane and less dramatic than portrayed by those authors who write of leaders as inspir-
ing and transforming followers through their vision for the organization (Peters and Waterman, 1982; Senge, 1990). What are we to make of this popular conception of what it is to lead? Do these leadership attributions bear any relationship to the actual work of leadership as we have described it here?

The articulation of a vision draws attention to what is important and what is important ought to shape the way ill-structured problems are formulated. A vision expresses those constraints that are intended to guide all organizational problem-solving and if this is achieved, there will be overlaps between the constraint structures of many organizational problems. Let us say that ‘serving its community’ is part of the vision articulated by a school leader. This espoused constraint shapes the school’s theory-in-use to the extent that it is incorporated within the constraint structure that informs relevant school practices (Argyris, 1982; Argyris and Schön, 1996). In the assessment example referred to earlier, this ‘vision’ would require dialogue with parents about the type of assessment information they seek, and sufficient weighting of their preferences to influence the eventual problem solution. Vision becomes meaningful when it makes a difference by ruling in some alternative actions and ruling out others.

Vision gets a bad name when it is represented in words, rather than in words and deeds. Some words cannot be represented in deeds, because the words do not recognize the constraints that will determine the deeds regardless of what the new words are. That is why Karl Weick (1993), who has made a brilliant career out of turning things on their head, advises leaders that rather than learn how to ‘walk the talk’ they should learn to ‘talk the walk’. Workable visions are developed by those whose intimate knowledge of the past makes them wise about what can be accomplished in the future, rather than by those who engage in elaborate planning disconnected from evaluation of current practice.

Discussion and conclusions

If task-relevant expertise is critical to the resolution of complex educational problems, then leadership that accesses expertise, wherever it lies, makes sense. The phrase ‘wherever it lies’ requires careful consideration, however, for expertise lies in the tools and resources that are the products of previous problem-solving efforts, as well as in the heads of individuals. These resources lie both within individual self-managing schools and in the wider educational environment. One of the mistakes that may be made in the move to school self-management is to misunderstand how the problem-solving capacity of individual schools is partly dependent on the capacity of the system as a whole (Hutchins, 1995). For example, the capacity of a school to grapple with the problem of designing school-wide assessment policies and procedures is dependent on the resources available in the wider educational environment. While each school must solve the problem for itself, this does not mean that each one should start afresh. The state has a leadership role in supporting school self-management, not just by increasing the demand that certain problems be solved, as it has done in
the case of school-wide assessment in numerous OECD countries, but also by offering a menu of resources, including a variety of solution possibilities. Such solution possibilities increase confidence that the problem is soluble, provide a concrete reference point against which envisaged threats and opportunities can be assessed, and provide a basis from which schools can formulate their own solutions.

If leadership is linked to task-relevant expertise, then is there such a thing as generic leadership? When leadership is disconnected from task performance it is reduced to a decontextualized interpersonal influence process which lends itself to generic analysis. It may be the case that some people make contributions which are recognized as progressing a wide range of tasks, but the basis of their apparently generic leadership is their wide ranging substantive expertise. If I am right about this, we should be wary of claims that there is little difference between managing a school and a supermarket. My proposal of a theory of a problem and problem-solving should not provide comfort to advocates of generic leadership, for while that theory identifies a generic problem structure, it makes clear that fleshing out the structure to formulate and solve any particular problem requires task-specific knowledge.

The more one embeds leadership in task performance the more it disappears from view – which raises the question of whether the concept is needed at all (Mintzberg, 1998; Ogawa and Bossert, 1995). Is it possible that leadership research is marginal to the wider field of organization studies because organizational action can be explained without appealing to the concept? This question deserves a paper in itself, but here are some initial thoughts. Leadership disappears when tasks are well-structured, because the knowledge that progresses the task has been structured into the technologies and routines that are involved in its completion. When tasks are well-structured, their solutions are known, so the problem is solved automatically rather than through conscious deliberation. It is the conversion of ill-structured to well-structured problems that requires leadership, because the routines that would otherwise coordinate action have not yet been devised. Over time, well-structured problems may return to being ill-structured as changed circumstances create a demand that the problem be re-solved. As discussed in the earlier example, the science staff had solved the problem of how to assess the science unit, but became dissatisfied with their solution as they learned more about the pattern of grades it generated. The assessment problem then became more ill-structured, and leadership more visible, as team members contributed to its reformulation.

As schools become more self-managing, they encounter dozens of ill-structured problems, ranging from property maintenance to personnel management. The resolution of these problems provides countless opportunities for leadership from administrators, parents, teachers and students themselves. One of the jobs of leaders is to make such leadership opportunities accessible to all those who have or would wish to develop expertise which is relevant to the formulation and resolution of these problems.
EMBEDDING LEADERSHIP IN TASK PERFORMANCE

References

This article proposes pedagogical leadership as a more effective alternative to bureaucratic, visionary and entrepreneurial leadership in improving schools. Pedagogical leadership invests in capacity building by developing social and academic capital for students, and intellectual and professional capital for teachers. This emphasis on human capital development provides the conditions necessary to improve levels of student learning and development. Pedagogical leadership develops human capital by helping schools become caring, focused and inquiring communities within which teachers work together as members of a community of practice. To understand pedagogical leadership one must understand the story of community. This story includes unique ways of thinking about connections and human nature that run against the grain of conventional thought. In traditional schools connections are understood using the narrative of social contracts and human nature is understood using the constrained narrative. In schools that are striving to become communities, connections are understood using the narrative of social covenants and human nature is understood using the unconstrained narrative. Examples are provided that show how these narratives are embodied in leadership practice.

How can we bring about change that will result in higher levels of student performance, enhanced social development and improved levels of civility in schools? This question, uppermost in the minds of policy makers and school leaders throughout the world, is usually answered by advocating one or more of the following strategies:

- Provide bureaucratic leadership that mandates certain things for schools to
do and mandates certain outcomes for schools to achieve. Support this leadership by providing management systems that emphasize supervision, evaluation and incentives.

- Provide corporate style *visionary leadership* that provides a powerfully spoken sense of what must be done. Support this leadership by motivating and inspiring schools to change.
- Provide *entrepreneurial leadership* that applies market principles to schools. Support this leadership by encouraging competition, providing incentives for winning and disincentives for losing.

Despite their widespread use bureaucratic leadership, visionary leadership and entrepreneurial leadership have not improved schools in ways hoped for. Unfortunately, if we continue to do what we are now doing – even if we do it better – we will continue to get what we are now getting. Better results for all students, I argue in this article, will not be achieved until we emphasize a new conception of leadership and a different set of school improvement strategies. Instead of continuing to place bureaucratic, visionary and entrepreneurial leadership at the centre, I propose the following alternative for this centre position:

- Provide *pedagogical leadership* that invests in capacity building by developing social and academic capital for students and intellectual and professional capital for teachers. Support this leadership by making capital available to enhance student learning and development, teacher learning and classroom effectiveness.

Pedagogical leadership differs from bureaucratic, visionary and entrepreneurial leadership in that it is capital intensive but not in an economics sense. Instead of increasing material value, pedagogical leadership adds value by developing various forms of human capital.

Capital refers to the value of something that when properly invested produces more of that thing which then increases overall value. This emphasis on capital development provides the conditions necessary to improve the level of student learning and development. Capital expansion is, therefore, the key mediating variable that stands between pedagogical leadership and school results. These relationships can be depicted as follows:

\[
\text{Pedagogical Capital \rightarrow Development \rightarrow Students}
\]

Critics can point to numerous instances where students are learning and developing at high levels even though the schools they attend pay scant attention to capital development. Chances are these students are bringing to school the capital they need from home and other places. But society is changing. For many students, families are less stable and supportive. Neighbourhoods are
disarray. And traditional institutions such as the extended family, the YMCA and YWCA, the church, the social club and the community itself are not able to provide the support they once did. These students experience a society that is capital poor.

Community building is a powerful way for school leaders to develop capital. The value of capital generated as schools become communities is more important in determining a school’s success than are its physical and financial assets. Pedagogical leadership develops capital by helping schools become caring, focused and inquiring communities within which teachers work together as members of communities of practice (Sergiovanni 1997).

**Developing social capital**

Schools develop social capital by becoming caring communities (see for example, Bryk and Driscoll 1988, Battistich et al. 1989, Sergiovanni 1994). Social capital consists of norms, obligations and trust that are generated by relationships among people in community, neighbourhood or society (Coleman 1988, 1990, Gamoran 1996).

When students have access to social capital they find the support needed for learning. But when social capital is not available, students generate it for themselves by turning more and more to the student subculture for support. The result, too often, is the development of norms and codes of behaviour that work against what schools are trying to do. This seeking of support elsewhere often takes its toll on both academic performance and social behaviour.

**Developing academic capital**

Schools develop academic capital by becoming focused communities that cultivate a deep culture of teaching and learning. The rituals, norms, commitments and traditions of this culture become the academic capital that motivates and supports student learning and development. Teaching and learning, for example, provide the basis for making school decisions. Leaders in focused communities are committed to the principle that ‘form should follow function’. They strive to embody this principle as decisions are made about organization, staff, time, money, space and other resources; curriculum focus, content, implementation and assessment; teacher development, supervision and evaluation; and other matters that impact the quality of teaching and learning (Sergiovanni 1996).

In a focused community there is a strong and clear commitment to academic achievement as evidenced by rigorous academic work, teachers’ personal concern for student success, and the expectation that students will work hard, come to class prepared and complete assignments (see for example Sebring and Bryk 1996). This commitment to academic success is more likely to be achieved when the curriculum is narrowly focused and common for all; assessment is
authentic and linked to purposes; standards of achievement are explicit and public; and students are encouraged to do their best.

Teaching and learning in focused communities are characterized by assignments and teaching strategies that encourage students to create knowledge for themselves; to anchor what they learn in frameworks, theories and disciplinary structures; and to link this learning to real world problems (Newman et al. 1995). Schools with a strong and deep culture of teaching and learning know what they are about and communicate this to students in a way that increases their academic engagement and performance.

**Developing intellectual capital**

Schools develop intellectual capital by becoming inquiring communities. Intellectual capital is the sum of what everyone in the school knows and shares that can help the school be more effective in enhancing the learning and development of students. As the amount of intellectual capital increases, the school’s capacity to add value to the lives of students increases. The school gets smarter as a result.

Pedagogical leaders realize that the link between what happens to teachers and what happens to students is direct (see for example Elmore 1996). They know that inquiry in classrooms is not likely to flourish where inquiry among teachers is discouraged. A commitment to problem-solving is difficult to instil in students who are taught by teachers for whom problem-solving is rarely observed. Where there is little discourse among teachers, discourse among students will be harder to promote and maintain. Aspirations to transform classrooms into learning communities for students will remain more rhetoric than real unless schools become learning communities for teachers too.

Getting students academically engaged at higher levels and improving student performance in today’s world requires teachers to develop new capacities for understanding the subjects they teach and the pedagogical decisions that must be made to teach effectively. The practices of effective leaders reflect the belief that teachers learn best when learning is focused on the issues they consider to be important; is situated in their classrooms; is supported by adequate resources; is continuous; and is valued. Further, this learning emphasizes not just the development of new knowledge and understandings but the skills and dispositions needed to actually practice differently. And finally, learning occurs in a social context that enables teachers to learn from each other, support each other and care for each other.

**Developing professional capital**

Good schools take collegiality seriously – so seriously that they strive to create a single practice of teaching in the school that is shared by many. They cultivate communities of practice as a way to generate professional capital. One hallmark
of an established profession is the willingness of its members to be concerned not only with their own practices but with the practice itself. Professional capital is created as a fabric of reciprocal responsibilities, and support is woven among the faculty that adds value to teachers and students alike.

Though membership in a community of practice can be a powerful source of expanding professional capital for teachers and the school, it is still under-valued and under-developed in most schools. Communities of practice, for example, are more likely to emerge in small schools, schools within schools, family-grouped schools, teams that stay together for more than one year and other configurations found in learning communities that provide for continuity and that promote sharing. But policy makers and school leaders, particularly in North America, remain committed to larger scale schooling and the formally organized management systems needed to ensure that schools run properly.

Leadership in school communities

In communities, leadership and learning go together. So does leadership and sense-making. Leaders and followers reflect together, learn together and inquire together as they care together to construct a reality that helps them to navigate through a complex world. This process of reciprocal influence is guided by shared purposes and involves accepting roles that are connected to moral obligations. Just as teachers, parents and students have roles linked to moral obligations, principals too are expected to meet the obligations that come from their role responsibilities as leaders.

It is through morally held role responsibilities that the principalship becomes a profession in the more traditional sense of what a profession is and means. Principals are bound not just to standards of technical competence (I know how to do it well) but to standards of public obligation (I know what is good to do) as well (Bellah et al. 1995). Standards of public obligation always override technical standards when the two are in conflict. It is in the principal’s role responsibilities that we find the roots of pedagogical leadership – a commitment to administer to the needs of the school as an institution by serving its purposes, by serving those who struggle to embody these purposes, and by acting as a guardian to protect the institutional integrity of the school.

Pedagogical leaders take their ministerial roles seriously. But how do they embody these roles? What are the tasks that they emphasize in their practice? The following ten tasks are central (Sergiovanni 1996):

**Purposing** – Pedagogical leaders bring together shared visions into a convenant that speaks compellingly and with a moral voice to principals, teachers, parents, and students.

**Maintaining harmony** – Pedagogical leaders build a consensual understanding of school purposes, of how the school should function, and of the moral connec-
tions between roles and responsibilities while respecting individual conscience and individual style difference.

**Institutionalizing values** – Pedagogical leaders translate the school’s convenant into a workable set of procedures and structures that facilitates the accomplishment of school purposes, and that provides norm systems for directing and guiding behaviour.

**Motivating** – Pedagogical leaders provide for the basic psychological needs of members on the one hand, and for the basic cultural needs of members to experience sensible and meaningful school lives on the other.

**Problem solving** – Pedagogical leaders mobilize others to tackle tough problems and help them to understand the problems they face.

**Managing** – Pedagogical leaders ensure the necessary day-to-day support (ie. planning, organizing, agenda setting, mobilizing resources, providing procedures, record keeping) that keeps the school running effectively and efficiently.

**Explaining** – Pedagogical leaders give reasons for asking members to do certain things, and give explanations that link what members are doing to the larger picture.

**Enabling** – Pedagogical leaders remove obstacles that prevent members from meeting their commitments, and provide resources and support to help members to meet their commitments.

**Modelling** – Pedagogical leaders accept responsibility as head follower of the school’s convenant by modelling purposes and values in thought, word and action.

**Supervising** – Pedagogical leaders provide the necessary oversight to ensure the school is meeting its commitments, and when it is not, to find out why, and to help everyone do something about it.

Most of these tasks are straightforward. The ‘supervising’ task, however, may need some explaining. The word *supervision* has a negative tinge that conjures up factory images of ‘snoopervising’ foremen checking up on workers. But supervision was originally a virtuous word that referred to the carrying out of one’s stewardship responsibilities. Traditionally, stewardship meant the overseeing and caring for an institution such as a university, church or school.

As supervisors, principals act *in loco parentis* in relationship to students, ensuring that all is well for them. As supervisors, principals act as trustees in relationship to parents ensuring that all is well for them too. And as supervisors, principals act as stewards, guarding and protecting the school’s purposes and structures.

With supervision as an expression of stewardship at the core, the tasks of leadership are brought together when school leaders practise leadership as a
form of pedagogy. The term pedagogy has deep historical roots and meanings. As Max van Manen (1991: 37) explains,

The term *pedagogue* derives from the Greek, and refers not to the teacher, but to the watchful ... guardian whose responsibility it was to lead (*agogos*) the young boy (*paides*) to school ... The adult had the task of accompanying the child, of being with the child, of caring for the child. This is a kind of ‘leading’ that often walks *behind* the one who is led. The ... pedagogue was there *in loco parentis*.

Teachers practise pedagogical leadership directly since in schools they stand first and closest in a caring relationship to children. They have the major responsibility for guiding children academically, socially and spiritually through the world of childhood to adulthood.

Principals practise pedagogical leadership by facilitating this process, and by ensuring that the interests of children are served well. A key part of this practice is the ability of the leader to mobilize people and community to face their problems, and to make progress in solving them (Heifetz 1994). In this sense, the pedagogy they practise is understood as a form of authority. Pedagogical authority ensures that people make good decisions and face up to their responsibilities, and that things work right for children. Its legitimacy comes in part from the virtuous responsibilities associated with the principal’s role, and in part from the principal’s obligation to function as the ‘head follower’ of the school’s shared purposes, ideals and commitments. This followership represents a moral compact that transforms the school into a moral community.

Moral communities generate leadership capital. Leadership in moral communities is idea-based. The source of authority for leadership is found neither in bureaucratic rules and procedures nor in the personalities and styles of leaders but in shared values, ideas and commitments. Those who identify with this idea structure are members of a community of mind. This membership both empowers them and requires them to accept responsibility for providing leadership and for helping the leadership provided by others to work. As leadership capital expands, leadership density in the school increases. Leadership density increases the likelihood that social, academic, intellectual and professional capital will all expand.

**The story of community**

Why do many policy makers and school leaders have doubts about the efficacy of pedagogical leadership, preferring to improve schools by sticking exclusively with bureaucratic, visionary or entrepreneurial leadership? The answer, I believe, is that pedagogical leadership requires them to accept the story of community as a valid theory to guide policy and practice.

The story of community includes unique ways of thinking about connections
and human nature that run against the grain of conventional thought (Sergiovanni forthcoming). In schools that are traditionally organized, connections are understood using the narrative of social contracts and human nature is understood using the constrained narrative. In schools that are striving to become communities connections are understood using the narrative of social covenants and, human nature is understood using the unconstrained narrative.

The narrative of social contracts guides the practice of the principal of the Locke Elementary School. He promised the student body that if 2,000 books were read during the month of October, on Hallowe’en night he would dress up like a witch and kiss a pig on the roof of the school building. This goal was achieved and, to the apparent delight of the students, the deed was done. The Locke principal believes that contracts are important motivational devices and that unless students get something tangible for their efforts they will not be motivated. You can’t expect a manager to manage well, a worker to be diligent, or a football player to play hard unless there is something in it for them. So, he asks, how can we expect teachers to teach well, students to learn well and schools to reform themselves without incentives? How can we expect them to display proper behaviours without providing long lists of rules and regulations or long lists of outcome requirements that are linked to clear consequences for non-compliance?

This narrative is about calculations involving trades that offer incentives in exchange for compliance. Self-interest is presumed to be paramount and ‘let’s make a deal’ is the order of the day. Social contracts, however, are maintained only as long as each of the parties gets what it wants. When teachers no longer receive the contracted amount of money, health benefits, fulfilment and security they are less willing to hand over to the school time, muscle and brains. And when students no longer get gold stars, attention and grades, they are less willing to endure the rituals of schooling.

The narrative of social covenants guides the practice of the principal of the Rousseau Elementary School. She encourages teachers and students to develop together a description of how everyone in the school should lead their lives together. Connected to a larger vision of school purposes, critical values and pedagogical beliefs, this ‘covenant’ provides the basis for an ongoing discussion about how teachers, administrators, parents and students can meet their commitments to each other and to the school. Students at Rousseau, for example, expect teachers to work hard, to be caring and to teach well. Since relationships are reciprocal, teachers expect students to respond similarly. Students are given considerable latitude in deciding important things at Rousseau. They help decide how learning goals will be achieved and help make decisions about how they will spend their time. But decisions must be responsible ones that embody and advance the school’s covenant. Both teachers and students work hard to make reading fun and useful while also increasing mastery.

The Rousseau principal believes that when given the opportunity to make important decisions about school goals, purposes, values and other important school matters, teachers and students will respond by being morally obliged to
embody these decisions in their actions. Further, the bonding of school members and their binding to shared ideas and ideals provides a normative environment that encourages moral responsiveness. Social contracts, the principal reasons, have important roles to play in the real world. But so do social covenants. The school is the place, she argues, to learn about social covenants, to practise developing them, and to use them in a practical way to govern affairs.

In comparing the two narratives, Sacks (1997) argues that a social contract is maintained by the promise of gain or the threat of external force. A social covenant is maintained by loyalty, fidelity, kinship, sense of identity, obligation, duty, responsibility and reciprocity. A social contract, he points out, ‘gives rise to the instrumentalities of the state’ both corporate and political. ‘A covenant gives rise to quite different institutions – families, communities, traditional and voluntary associations. It is the basis of civil society’ (Sacks 1997: 16). Social contracts are at the core of what connects people in communities and social covenants are at the core of what connects people in more formally organized traditional schools. The former are rule-based and the latter are norm-based (Sergiovanni 1994).

The nature of human nature

Related to the social contract and social covenant narratives are two narratives about the nature of human capacity and will – constrained and unconstrained (Sowell 1987, Etzioni 1988, Hertzberg 1996). The constrained narrative is aligned with the selfish side of human nature, rooted in physical needs satisfaction and psychological egoism. The unconstrained narrative is aligned to the altruistic side of human nature rooted in moral conceptions of goodness. The altruistic side includes our capacity to practice such virtues as moral bearing, self-sacrifice and cooperation aimed at the enhancement of the common good. The selfish side includes our propensity to put self-interest first, to compete to win, and to strive to accumulate advantages such as wealth and power aimed at enhancing our individual pleasure and position.

The major story line in the constrained narrative emphasizes controlling the impulses of self-interest thought by Hobbes (1950) and others to dominate human nature. According to this narrative, people are self-centred, competitive, devious, addicted to gratification and even unscrupulous as they seek to maximize their own gains with little regard for the common good. The constrained story avers, that principals, teachers and students must be ‘constrained’ if they are to overcome these brutish impulses and instincts. Without constraints they will not be inclined to do the right thing. Society therefore must use rewards and punishments to provide the necessary constraints that will channel human behaviour in the right direction – be it paying taxes, communing with God, providing leadership, preparing lessons, being collegial, or studying and behaving at school.

The major story line in the unconstrained narrative emphasizes the capacity
of people to embody such virtues as altruism, moral bearing and cooperation aimed at enhancing the common good, even if doing so occasionally requires sacrificing one’s self-interest. Instead of viewing people as being cost-benefit machines who make individual choices rationally in an effort to win, the unconstrained narrative includes the emotive, normative and altruistic side of people. Motivation, in this story, is not only a result of the complex interaction between our emotions, values and beliefs, but between these and our ties to others (Etzioni 1988). Connections, in the unconstrained narrative, are normatively derived and have moral overtones (Sergiovanni 1992).

Policy makers and school leaders who subscribe to the unconstrained narrative believe that principals and teachers can be trusted to act morally, and therefore should be provided with the freedom to optimize their moral propensity to do what is right. Principals and teachers, for example, have both the capacity and the need to sacrifice their self-interest for causes they believe in and for conceptions of the common good that they value. As professionals, they willingly accept responsibility for their own practice and they commit themselves to the learning needs of their students above other concerns. A similar tale is told for students.

Within the constrained narrative, by contrast, it is believed that principals and teachers will act selfishly if given the chance. Their primary concern is to maximize their self-interest. Thus constraints in the form of incentives and penalties must be provided to force them to do the right thing. Principals and teachers may have the capacity to do the right thing, this narrative concedes, but this capacity will only be motivated if constraints are provided. A similar tale is told for students.

Undoubtedly the truth lies somewhere in between the extremes of social contracts versus social covenants and constrained versus unconstrained views. The intent of this article is not to argue for the replacement of bureaucratic, visionary or entrepreneurial leadership with pedagogical leadership. It is, instead, threefold: to recognize the importance of pedagogical leadership to the development of social, academic, intellectual and professional capital; to recognize the importance of capital development in improving schools; and to move pedagogical leadership to the centre position as the primary basis for developing school improvement strategies, policies and practices.

INSTRUCTIONAL LEADERSHIP IN SCHOOLS
Reflections and empirical evidence

Geoff Southworth

Abstract
This paper examines the notion of instructional leadership. The paper opens with a review of current work on school leadership, arguing that more inclusive, differentiated, holistic and learning-centred accounts are needed. Next the paper examines definitions of ‘instructional leadership’. In the third section the discussion looks at the empirical evidence we have about such leadership, drawing upon work in the USA and England. The latter study was conducted into leadership in small primary schools. Parallels between the studies are drawn and links made with the definitions of instructional leadership. The concluding section highlights the importance of leaders being learners, the implications for leadership development and the importance of creating and sustaining certain organisational conditions which facilitate instructional leadership. The paper ends with the point that instructional leadership is becoming more significant with the growing emphasis on organisational learning.

Introduction
In this article I examine the notion of instructional leadership. Instructional leadership has become increasingly popular in North America and is attracting interest in Britain. However, writers and researchers in the UK have usually preferred to talk about ‘educational leadership’ or ‘pedagogic leadership’. None of these three labels—instructional, educational or pedagogic—seems very satisfactory to me, but rather than try to find a better one, I will use ‘instructional’ for this article.

My discussion is organised into four sections. In the first section I will set out some of my reflections on the current state of our knowledge and understanding of school leadership. In the second section I will review definitions of instructional
leadership. In the third I will examine two empirical studies and relate them to the literature reviewed in section two. In section four I will set out my conclusions. Here I will argue that we need to create ‘learning and teaching schools’ as environments most amenable for instructional leadership and for the development of instructional leaders.

1. Reflections on school leadership

I want to raise four overlapping and interrelated points in this section. The first is that leadership is socially constructed. When I interview practitioners or discuss with scholars their ideas about leadership it is obvious that each is using a set of concepts they have adopted or created to portray the phenomenon they call ‘leadership’. These constructions vary in many and subtle ways. For example, there is presently a growing interest in how leadership is influenced by cultural values (Dimmock & Walker 2000), while contingency theories of leadership have for some time explained how leadership varies from organisation to organisation or system to system. The importance of leadership being a social construction is that it suggests that it will vary from setting to setting. Therefore, instead of searching for an over-arching theory we may need a more pluralistic approach to take account of the inherently variegated nature of leadership.

Furthermore, it is important that we take a more generous view of leadership than has been the case until very recently. Much of the empirical data on school leadership has explored what headteachers have to say about school leadership, particularly in primary schools. I do not doubt the importance of this work, but it also needs to be accompanied by studies into deputy headship and other leaders. Sadly, there has been too little empirical work on school leadership at other levels (although heads of department in secondary schools seem to be now attracting some attention). For example, as Ribbins (1997) says, it seems ‘heads are interesting and deputies are not’ (p. 295). This fascination with headship means that we have, generally speaking, developed a leaders’ view of leadership. We have not explored enough the followers’ perspectives and expectations of their leaders, although the study of Bolam et al. (1994) into effective school management surveyed teachers’ perceptions and Day et al.’s (2000) recent study of effective leadership provides one of the most comprehensive enquiries because it included the perspectives of teachers, students, ancillary staff, parents and governors, as well as head teachers. As Leithwood states in his introduction to Day et al.:

Data collected from teachers about effective heads’ leadership tells us something about how well the heads’ practices conform to teachers’ mental models of what leaders do: their leader prototypes.

(p. xiii)
We cannot know what effective leadership means unless and until we include the stakeholders’ perspectives and their constructions of leadership. If leadership is a social construct then we need to make it truly social and not a singular construction. Recent developments such as Day’s study are therefore most welcome.

Second, school leadership theorising has suffered from a lack of differentiation. It seems to me that we need more differentiated accounts of leaders working in different ways and contexts and over time. Currently, we have concentrated on how poor performing schools, and schools in disadvantaged circumstances improve. We have yet to consider leadership in other settings, or how differences in school size influence the nature and character of educational leadership. We also know too little about how leaders and leadership changes over time as individuals mature and increase their experience (Weindling 1999).

Neither should we forget that the field of leadership and management study has been dominated by male writers. Nor that we need to know more about how gender influences school leadership, particularly as there are increasing numbers of women in leadership positions and because many schools are almost or entirely staffed by women. Recent work in England by Hall (1996) and Coleman (2001) has contributed to our understanding of women’s experience and conceptions of leadership and builds on the work of other researchers outside the UK (e.g. Shakeshaft 1989; Blackmore 1989; Acker 1994).

In my own work I have always made it plain that I have (largely) studied leadership in primary schools. This is not to be sectarian about the work, but to acknowledge that I have focused on some school leaders and not all. Generalisation in educational research is difficult enough without conflating leadership, or indiscriminately extrapolating findings from a sample of leaders in one type of school to all schools. Instead of striving for generalisations that homogenise leadership, we might be better advised to work towards more heterogeneity.

Third, writing and research about ‘leadership’ in education has often concentrated on what leadership entails. Scholars have been very good at producing lists of what leaders do or should do, but we are far from the creation of a taxonomy of school leadership and management because leadership is a contested notion. Moreover, these lists are usually lengthy and atomised because they particularise and fragment the work of leaders into categories and elements.

Lists, of course, have useful analytic and heuristic purposes. However, too many list-producers fail to distinguish between theory for understanding and theory for action (Hoyle 1986). Lists may help develop understanding, but that does not mean they are theories for action. Moreover, the utility of listing characteristics is reduced when they become over long. National standards for head teachers can be useful to help develop, train, recruit and assess colleagues, but few head teachers or deputies when talking about her/his work refer to the national standards, probably because they see them as ‘lifeless lists’ (Bredeson 2000).

Another difficulty with ‘list logic’ is that the work of school leaders, particularly
heads, is polyphonic. Leaders do many things at once, often at rapid speed so that their work is characterised by simultaneity, inter-connection and holism. It seems that leaders are often trying to develop and sustain a view of their work and the school which is a ‘gestalt’ and not a set of particularities. A challenge to researchers then is to portray leadership in a more inter-related and sophisticated way than has so far been achieved.

Fourth, school leaders commonly regard their work as involving tensions, dilemmas and dualities (Southworth 1995; Dimmock 1996; MacBeath & Myers 1999; Day et al. 2000). According to these researchers the dilemmas take many forms and include the exercise of power, ethical issues, conflicting expectations of stakeholders and satisfying internal and external demands. The interest in the dilemmas of school leadership supports the argument that there is unlikely to be a ‘golden rule-book or recipe for effective leadership’ (MacBeath & Myers 1999, p. 67).

One of the major dilemmas of school leadership centres on the fact that heads in England are expected to be both organisational managers and leaders of effective teaching and learning. This duality has been most clearly articulated in Hughes’ (1975) classification of secondary headship which he saw as consisting of two roles: the chief executive role and the leading professional role. Coulson (1986) has applied this classification to primary heads and demonstrated its relevance across the sector boundaries. The chief executive role includes liaison and communication, resource handling and entrepreneurial activity, while the leading professional role covers goal setting, supervision, evaluation and the exemplification of professional values and beliefs. Both roles are important and following a period in the early 1990s, when the chief executive role was enhanced as a result of devolution of resources to the school (site-based management), the leading professional role has latterly been placed at the very heart of school leadership:

There is now much more clarity and agreement about the core tasks of teaching and schooling and, therefore, about the tasks of school management. As we have seen, this has come about because of the introduction of such major policy changes as the National Curriculum and assessment and the national inspection system. One does not have to agree with every aspect of these reforms to recognise that they, together with the research and development work on effective schools and improvement, all place increasing emphasis on effective teaching and learning . . .

(Bolam 1997, p. 277)

In short, despite leadership and management involving a diverse number of activities and processes and although it is differentiated in its character, instructional leadership is central to successful school leadership. Hence it becomes important for researchers and scholars to focus on the concept and to describe what it looks like in action. The latter is particularly necessary because the
contemporary literature appears to be far stronger in prescribing such leadership than in describing it.

Given these concerns and criticisms of our current knowledge base, I now want to examine definitions of instructional leadership before moving on to consider the empirical evidence about instructional leadership. Moreover, I want to look at instructional leadership in the light of the reflections I have discussed in this section. For example, how is it socially constructed? Has it been and can it be differentiated by context, gender or school size? Does contemporary theorising embrace both theories for understanding and theories for action? What are the dilemmas and tensions of this approach to leadership? However, before addressing these questions it is necessary to develop some clarity about instructional leadership and that is the purpose of the next section.

2. Instructional leadership

To find definitions of instructional leadership it is necessary to turn to the North American literature. I will discuss three relatively recent reviews of instructional leadership by Leithwood et al. (1999), Hallinger and Heck (1997) and Blasé and Blasé (1998).

Leithwood and his colleagues (Leithwood et al. 1999) recently reviewed six approaches to school leadership. They searched four representative English-language educational administration journals (two from North America, one UK-based journal and one reflecting perspectives from Australia and New Zealand). Given the reputations of these journals it was assumed that it was ‘likely that most significant contemporary conceptions of leadership in the English-speaking world would find some expression in their contents’ (p. 7).

One of the six approaches to school leadership this review identified was instructional leadership which:

Assumes that the critical focus for attention by leaders is the behaviours of teachers as they engage in activities directly affecting the growth of students.

(p. 8)

The emphasis on teacher behaviours which affect the growth of students is clearly the key issue, as Leithwood’s italics demonstrate. It was also noted that some versions of instructional leadership focus, additionally, on other organisational variables such as school culture because these are believed to influence teacher behaviours as well. Therefore, it is possible to distinguish between ‘narrow’ and ‘broad’ views of instructional leadership (Sheppard 1996). Broad forms encompass organisational and teacher culture issues, whereas narrow forms restrict themselves to leadership which focuses only on teacher behaviours which enhance pupils’ learning. This distinction between broad and narrow forms also implies that it is possible to differentiate between ‘direct’ and
‘indirect’ instructional leadership (Kliene-Kracht 1993). Leithwood et al. also note that principals alone cannot fulfil all of a school’s need for instructional leadership.

Instructional leadership is portrayed as occurring along multiple dimensions and incorporating a number of practices. Leithwood believes that the most fully tested model of instructional leadership is the one developed by Hallinger and his associates and consists of three broad categories of leadership practice (p. 8):

- Defining the school mission
- Managing the instructional programme
- Promoting the school climate

Hallinger has subsequently developed these ideas (Hallinger & Heck 1997). They review research between 1980 and 1995 exploring the relationship between principal leadership and pupil achievement and developed a three-fold classification of principal (headteacher) effects:

1. **Direct effects**—Where the principal’s actions influence school outcomes.
2. **Mediated effects**—Where principal actions affect outcomes indirectly through other variables.
3. **Reciprocal effects**—Where the principal affects teachers and teachers affect the principal and through these processes outcomes are affected.

(Hallinger & Heck 1997, pp. 162–163)

Reviewing this classification Hallinger and Heck are critical of the first insofar as those researchers who use it do not typically seek to control for the effects of other in-school variables such as teacher commitment, or curricular organisation (p. 163). The lack of attention to other factors creates a simplistic view of headteacher action and effects. The mediated effects model hypothesises that leaders achieve their effects on outcomes through ‘indirect paths’:

Leadership practices contribute to the outcomes desired by schools but the contribution is always mediated by other people, events and organisational factors such as teacher commitment, instructional practices or school culture. This conceptualisation is consistent with the proposition that leaders achieve their results primarily through other people.

(p. 167)

The reciprocal effects model presents heads as ‘enacting leadership through a stream of interactions’ (p. 168) through which they address the salient features of the school, such as pupil outcomes, staff morale or commitment. However, in so doing they adapt to the organisation in which they work and change their thinking and behaviour over time. As Hallinger and Heck argue, this model regards leadership as an ‘adaptive process rather than a unitary independent
force’ and allows for the possibility that ‘causal relationships may be multi-
directional, change over time and even be non-linear’ (p. 168).

Hallinger and Heck conclude that mediated effects studies yielded more con-
sistent findings than did the direct effects studies. They argue that the general
pattern of results drawn from their review supports the belief that principals
exercise a measurable, though indirect effect on school effectiveness and pupil
achievement (p. 186). They also note that researchers in the early years of
research in this domain focused on answering the question: ‘Do principals make
a difference?’ More recently they have transcended the bounds of this question
to try to understand ‘not only if principals have effects on school outcomes, but
more particularly the paths through which such effects are achieved’ (p. 187). In
their review Hallinger and Heck conclude that a primary avenue of influence
appears to be in shaping the school’s direction through vision, mission and
goals.

This work suggests that instructional leadership is likely to be more effective
when it is conceptualised as ‘broad’, rather than ‘narrow’ because the former
includes both direct and mediated (indirect) effects and increases the scope for
other leaders to play a role as well as the principal or headteacher. Moreover, the
broad approach implicitly recognises how social organisations operate (e.g.
interpersonal and group dynamics, micro-politics, cultural norms, values and
beliefs). By contrast the narrow approach relies heavily on the individual
leader’s influence and may sustain more heroic notions of leadership.

Blasé and Blasé (1998) start from the idea that instructional leadership has
long been viewed by practitioners as a blend of supervision, staff development
and curriculum development. They draw on Sheppard’s (1996) synthesis of the
research on instructional leadership behaviours, ‘especially those linked to
student achievement outcomes’ (p. 11), which take a broad perspective wherein
both leaders’ and followers’ beliefs are regarded as important. Sheppard
itemises the following principal behaviours as being connected to teachers’ pro-
fessional growth and performance:

- framing school goals†
- communicating school goals
- supervising and evaluating instruction
- co-ordinating the curriculum
- monitoring student progress
- protecting instructional time
- maintaining high visibility*
- providing incentives for teachers
- promoting professional development†*
- providing incentives for learning

(Key: * = most influential behaviours, elementary school; † = most influential behaviours, high
school (Sheppard 1996: 327, 339)) (see Blasé & Blasé 1998: 11)
Blasé and Blasé emphasise that promoting teachers’ professional development was the most influential instructional leadership practice at both elementary (primary) and high (secondary) school levels (p. 11).

These three reviews outline the nature and character of instructional leadership. They show, unsurprisingly, that it is strongly concerned with teaching and learning, including the professional learning of teachers as well as student growth. While distinctions can be made between broad and narrow formulations and between direct and indirect influence, all three favour a broad configuration which includes the use of direct and indirect effects. However, as both Blasé and Blasé and Leithwood et al. recognise, there is a dearth of description which ‘makes it difficult to assess the extent to which such leadership means the same thing to all those writing about it’ (Leithwood et al. 1999: 8). The lack of descriptive and empirical evidence is compounded by the reliance of these reviews on lists of characteristics and behaviours because, as argued in the previous section, lists tend to facilitate theoretical understanding, but not necessarily theories for action. In other words, we need to look at the empirical evidence we have concerning instructional leadership, then compare and contrast the two sets of ideas and try to develop some theories for action.

3. Empirical evidence

There are two sources of evidence I shall draw upon in this section. The first is work on ‘how really good principals promote teaching and learning’ (Blasé & Blasé 1998). The second is a study I conducted into successful leadership in small primary schools (Southworth 1999a).

Blasé and Blasé (1998) are aware that until recently, we had little knowledge about the behaviours of effective instructional leaders in the literature (p. 11). They therefore conducted a survey of:

Over 800 teachers working in elementary, middle and high schools in the South-eastern, Midwestern and Northwestern United States. Teachers completed open-ended questionnaires on which they wrote detailed descriptions of principals’ positive and negative characteristics and exactly how such characteristics affected them and their performance in the classroom.

(p. 5)

The Blasés’ (1998) findings suggest there are three interrelated aspects to effective instructional leadership behaviour. These findings are valuable, although given the cross sectional design of their research, they do not make it clear whether these findings applied equally to elementary, middle and high schools, or whether there were contextual differences. The three aspects of effective instructional leadership are:
Talking with teachers (conferencing)
Promoting teachers’ professional growth
Fostering teacher reflection

These three aspects are tied to three other head teacher behaviours that can have positive or negative effects:

- Being visible—versus interrupting and abandoning
- Praising results—versus criticising
- Extending autonomy—versus maintaining control (see p. 18 for summary)

Positive effects were associated with the use of visibility, praise and autonomy, while ineffective principals use abandonment, criticism and control (p. 156).

Conferencing is regarded as lying at the ‘heart of instructional supervision’:

Principals who are good instructional leaders develop a deep appreciation for the potential artistry of an instructional conference with a teacher . . . Such principals realise that most teachers expand their teaching range only with carefully designed support and assistance. (p. 19)

The latter point is important because the Blasés believe that some principals assume that when given minimal information and assistance, most teachers can analyse their own teaching and formulate and act on it to develop their pedagogy (p. 20). Such an assumption is over optimistic and many teachers can benefit from formal, explicit support structures and systems such as conferencing.

Conferencing is described as involving knowledge and skill in the following areas:

- Classroom observation and data-gathering methods
- Teaching methods, skills and repertoires
- Understanding of the relationship between teaching and learning Data analysis
- Knowing how to make the conference reflective and non-threatening
- Communication skills (e.g. acknowledging, paraphrasing, summarising, clarifying and elaborating on information)
- Awareness of the stage of development, career state, levels of abstraction and commitment, learning style, concerns about innovation and background of the teacher (p. 20)

This list alone suggests that instructional leadership requires high levels of professional knowledge, skill and understanding about pedagogy, pupil learning, adult learning and human interaction. These skill and knowledge demands
become even more evident when the processes of conferencing are identified. The Blasés set out five conference strategies:

- Making suggestions
- Giving feedback
- Modelling
- Using enquiry
- Soliciting advice and opinions (pp. 28–43)

Blasé and Blasé go on to analyse staff development and teacher reflection in similar ways. Staff development includes the study of teaching and learning, support for teacher collaboration, peer coaching, action research and the ‘application of the principles of adult growth and development to all phases of the staff development programme’ (p. 156). The development of teacher reflection included behaviours such as:

Modelling, classroom observation, dialogue, suggestion and praise. The essence of reflection, as we found, was associated with collegial enquiry, critical thinking and expanding teacher repertoires.

(p. 156)

Three points emerge from the Blasés’ study. First, instructional leadership is complex and demanding. It requires high levels of professional knowledge, skill and understanding which we cannot assume all headteachers or other leaders will possess. As other studies show, developing evidence-informed approaches to leadership, management and school improvement require concomitant developments in leaders’ skills in handling data, colleagues (Dudley 1999; Southworth & Conner 1999; Saunders 2000) and teaching and learning (Hill 2001). Second, because this study is based on teachers’ perspectives, the findings are especially potent since they provide not only insights into what helps teachers to grow, but also, what followers want and find helpful from their leaders. This construction of instructional leadership is based on what teachers say works for them. Third, it appears that such leadership needs to be designed as part of the school’s organisational structures and processes rather than left to chance. This last point becomes apparent when the Blasés conclude their study by arguing for schools to become learning communities (pp. 155–167).

The second study was an investigation I recently conducted into successful leadership in small primary schools in England. The study focused on a sample of ten primary heads (8 women 2 men) working in schools with less than 150 pupils on roll and used qualitative methods. The research used a purposive sample drawing upon heads nominated by their local education authorities (LEAs) and validated by school inspection data. Data were collected through semi-structured interviews with the head, two teachers and one school governor in each of the schools about the head’s leadership. I adopted a multiple perspect-
ive approach for reasons discussed in section one and because the collection of evidence from three sources was intended to reduce any bias and widen the ‘angle of observation’ (Schatzman & Strauss 1973). The interviews focused on several issues, including: interviewees’ views about the characteristics of successful headteachers; how the heads led the schools’ improvement efforts; and whether and how the heads’ influenced the quality of teaching and pupils’ learning.

The study has been reported in a number of ways (Southworth 1999a,b; Southworth 2002) and forms part of a larger project that I have been working on over the last four years. This larger project aims to develop a more differentiated view of primary school leadership by examining leadership in schools of varying size. Hence following studies of leadership in small and medium sized schools I am presently investigating leadership in large and very large primary schools to complete the research triology.

The small school study found a high level of agreement among the heads, teachers and governors as to the nature of successful headship and the findings trace the outlines of the heads’ instructional leadership. From my analysis of the three data sets (heads, teachers, & governors) I identified a number of common themes, six of which are pertinent to this discussion:

1. Working hard
2. Determination
3. Positive dispositions
4. Approachability
5. Teamwork
6. School improvers

Working hard concerns the nature of headship in small schools today. It is clear from the testimonies of the heads, their teacher colleagues and the governors that headship is very demanding. Respondents from all three groups made this point time and again. The heads acknowledged they worked hard, but did so in an uncomplaining way. They regarded it as a fact of headship, rather than something they might be able to avoid or change. As the House of Commons Education and Employment Committee of Inquiry into the role of headteachers reports, the average working week for primary heads is 55.7 hours and heads in small schools, have a teaching commitment in excess of 80 per cent of the week (House of Commons 1998, paras. 24–25). The ten heads in my study of small schools estimated they put in similar hours and sometimes much more.

However, it seems that hard work is not only unavoidable but necessary because of what the teachers and governors said. These respondents regarded their heads as having the capacity to deal with a lot of work and that this was a symbol of the headteachers’ care, concern and commitment. Hard work is not simply about being prepared to put in the hours, it is also an emblem that the leader is devoted to the school.
Second, these heads were determined individuals. They were resolute about the schools doing well, and appeared to work tenaciously towards increased levels of success. When the heads gave me a tour of the school it was apparent they had developed the quality of the school as a learning environment for the children. Their efforts were noted by the governors and mentioned by many of the teachers. Sometimes their ability to secure additional learning resources was seen as another sign of their commitment to the school. Certainly the governors and teachers recognised that their heads were ‘fighters’ because they had battled for new or better buildings and the governors and teachers valued their heads’ perseverance and courage.

Moreover, improving the schools’ physical environments demonstrated that the heads were not prepared to tolerate poor teaching and learning conditions and this too had symbolic significance. Their wish to improve the learning environments conveyed their unwillingness to accept second best. Many teacher colleagues took this to mean their head had a low threshold of tolerance for poor quality provision.

Third, all ten heads were positive people. Each believed the school could improve and achieve more because the children and the staff deserved to be successful. They were quick to acknowledge successes in the school and usually described them as resulting from the children’s or the staff’s efforts. The heads were also remarkably optimistic about the future and their schools’ prospects.

Fourth, the teachers and the governors valued the fact that their heads were approachable and accessible to them. The frequency with which this attribute was mentioned suggests that teachers in small primary schools approve of heads who are not remote, are willing to talk and listen to them and who share their ideas and plans with staff.

Fifth, the heads knew that their schools’ successes were dependent on everyone pulling their weight, supporting one another and working together. This applied to all staff, including office and classroom support colleagues, but more than anything, improving the performance of the school rested on the teaching staff functioning as a combined teaching unit. Developing a team of teachers who were characterised by professional openness, a unity of purpose, clear and shared goals and educational values, consistency in teaching and planning, continuity in the curriculum and agreed and implemented classroom practices were both the means and the ends of teamwork in these schools.

Consequently the heads were keen to involve deputy heads, if there was one, and/or senior teachers. The teachers too saw benefits from participating and acknowledged how effective their heads were in orchestrating teacher and staff collaboration. The heads believed that positive inter-professional relations were critical to the school’s success and that dealing with staff, parents and others were the key skill areas of leadership. In short, teamwork was a vital ingredient in improving the school.

Sixth, all of these heads were improving their schools. For some it was because the school was under-performing. For others it was a case of enhancing
already high levels of success. Whatever the context, none of the heads were satisfied for the school’s performance levels to remain as they were. Hence they spoke about wanting to avoid complacency within the school, of pupil results rising, of under-achievement being eliminated, the children’s attitudes to learning becoming more positive and of the schools’ ethos changing for the better. All of the heads wanted to improve on their previous best.

Although each head used a number of strategies to improve the quality of teaching and learning in the school, three stand out from what the heads, teachers and governors said:

• Modelling
• Monitoring
• Professional dialogue and discussion

Modelling meant the heads used their teaching as an example of what and how to do things, worked alongside staff in their classrooms, coaching staff and consciously used assemblies as occasions when they could promote and reinforce educational values and practices. As the National Primary Headteachers’ Association (NPHA) said in their evidence to the House of Commons Education and Employment Committee (1998) ‘headteachers must set standards of performance by their personal example’ (para. 21). All the heads in this study understood this and to judge from their own and colleagues’ statements, plus their school’s Ofsted inspection reports, they all did it.

Monitoring involved the heads looking at teachers’ weekly plans, visiting classrooms, examining samples of pupils’ work, observing the implementation of school policies, reviewing test and assessment information and evaluating pupil, class and school levels of performance and progress.

Professional dialogue was developed through staff meetings, preparing curricular policies together, reviewing practice, looking at pupil learning data, joint planning meetings and general teamwork. The heads also followed up visits to classrooms with informal discussions with individuals, or used questions to probe teachers’ assumptions and to promote ideas and ways forward. Sustaining teacher talk and using it as a vehicle for teacher and staff development underscored these heads’ efforts.

Complementing these three strategies were a number of school structures and systems the heads had put in place. For example, all the schools had development plans which provided direction and a focus for staff efforts. School policies and schemes of work were used as reference points for curriculum and lesson planning. Similarly, policies for teaching and learning were common and appeared to be actively used by staff. These structures and systems were both support mechanisms and different forms of media that conveyed the educational messages the heads wanted to see adopted in the schools.

Together, the leadership strategies, organisational and curricular structures and systems were the processes by which shared educational goals were
developed, high expectations established and the means by which improvements in pupils’ learning outcomes and progress were realised. They were major ingredients of the heads’ instructional leadership because all of them understood headship to be about developing the quality of the pupils’ learning and enhancing pupils’ progress.

These findings complement those reported by Blasé and Blasé (1998). There is a high degree of consistency between the two studies even though they were entirely independent of one another. Professional dialogue figures prominently in both since the Blasés stress the centrality of conferencing, while within conferencing they note the importance of monitoring and modelling. The significance of organisational structures and systems is also identified in each study. Instructional leadership can occur informally, but heads and principals also supported it with formal organisational processes. Another common thread is that there was a broad approach to instructional leadership because each study portrays leaders influencing teachers directly and indirectly.

In the case of small schools it is reasonable to assume that heads will have stronger direct influence than those in much larger schools, where mediated effects are more likely to be at work. However, the ten heads I studied also seem to have been very effective in how they indirectly influenced pupil outcomes. For example, it was noted that these heads were approachable, skilled in talking and listening to staff, monitored classrooms, teaching and pupils’ learning, and evaluated pupils’ achievements and progress. Given they applied these skills consistently and continuously they may have been able, perhaps to an unusually high degree, to bring their influence to bear on those who had to implement and carry out planned changes and desired improvements. Expressed another way, these heads worked directly on the indirect pathways to effectiveness. They deployed both forms of influence knowing that when applied in combination they were more powerful. They also ensured that in their detail they promoted the same values, goals and end results and by co-ordinating their influencing strategies they increased their impact in the school.

Therefore, it is possible to argue that this particular study, alongside the work of Blasé and Blasé (1998) points to a theory of leadership effects whereby a school leader’s success is to some degree, and possibly a significant degree, attributable to the heads’ direct effects but particularly their mediated effects. Also, because the heads engaged with the mediating factors, and often in a direct and personal way, they were particularly powerful in making a difference inside their schools. The force, frequency and effectiveness of their encounters with staff made their influence pervasive. Their dealings with staff were regarded as warm, fair and open and they valued individuals and groups, praised them and worked in teams themselves. In these ways they tempered what may, in some other circumstances, become oppressive conditions. Nevertheless, over time, these heads appeared to be irresistible in moving, directly and indirectly, the schools along paths they and the staff and governors wanted.

The effect of their direct and indirect effects also creates a teacher culture
characterised by professional collaboration and professional learning. Such a
culture has long been associated with school improvement (Nias et al. 1989,
1992; Rosenholtz 1989; Fullan & Hargreaves 1992) and has led many
researchers and scholars to regard such a culture as enabling schools to become
learning organisations (e.g. Fullan 1993; MacBeath & Myers 1999; Southworth
2000; Silins & Mulford 2002).
Lastly, both studies point to instructional leadership requiring individuals to
be highly competent in a number of knowledge and skill areas. These include
knowledge of curricula, pedagogy, student and adult learning and skills in
change management, group dynamics and interpersonal relations and communi-
cations. Also, certain personal qualities and individual attributes may be import-
ant, such as high energy levels, resilience, determination, empathy and
optimism. These all have implications for the development of instructional
leaders.

4. Conclusions
The two empirical studies reviewed do not constitute a robust evidence-base for
developing instructional leadership. We therefore need many more studies of
instructional leaders to meet the demands of differentiation, as discussed in
section one, as well as those of sample size and generalisation.
In terms of the questions raised by my reflections on leadership, one was: has
instructional leadership been differentiated by context, gender or school size?
The two empirical studies show that some work has been done in this realm, but
by no means enough. Yet they do make a contribution to understanding how
instructional leadership is socially constructed by teachers in American elemen-
tary and high schools and by heads, teachers and governors in small, English
primary schools. Furthermore, the studies suggest that there are many simil-
arities despite cultural and other contextual differences.
Beyond these observations there are three other conclusions I want to high-
light. One of these centres on how instructional leadership is developed. When I
asked the 10 primary heads how they had developed their leadership and man-
agement practices they all said, in line with other heads, that they learned most
by doing the job. Such role learning on-the-job raises two implications.
First, it may be important that anyone appointed to a headship needs to be able
to demonstrate they are a continuing professional learner. That is, someone who is
able to solve the myriad ‘problems’ they encounter, is sufficiently flexible to think
their way round difficulties and can work things out for themselves, as well as
with others. Heads need to be reflective learners who can independently work out
how to deal with all the problems, issues and challenges they encounter in the
course of their work. In this way, their work is a ‘course of study’ and they need to
be students of their work.
Second, if leaders’ professional development is characterised by on-the-job,
osmotic learning, then new heads may benefit from activities which deepen their
knowledge and understanding of their context specific learning. Instead of trying
to train new knowledge into them, it may be better for them to reflect on and
analyse their implicit, even tacit professional knowledge and make their work
experiences the content of their professional learning. Such a way of creating
new knowledge might be facilitated less through content driven courses and
more through group and one-to-one activities which invite participants to share
and to develop key ideas and insights from the work they presently do and the
tasks which currently are a puzzle to them.

During the heads’ discussion of their professional development it emerged
that at least half of them had found being a deputy headteacher a frustrating role.
This is consistent with Ribbins’ research in this area (1997). Part of their frustra-
tion stemmed from the lack of opportunities to exercise leadership or to develop
their skills within the school. Such feelings points toward the need for prospective
heads to be mentored and coached by skilled and successful leaders and for
those who are about to take up their first headship to be offered an internship
with able, instructional leaders. We can neither assume individuals are well pre-
pared for their first headship, nor believe they know how to be instructional
leaders simply because they were deputy heads.

There is one other aspect of leadership development I want to highlight.
Instructional leadership requires individuals to have high levels of knowledge
and understanding of curricula, pedagogy, student and adult learning. This
observation has implications for the nature of leadership programmes and sug-
gests that they include such material, alongside whatever technical knowledge
they provide about management and leadership processes.

Hill (2001) has also focused on this topic stating that the ‘instructional
leadership orthodoxy implies that principals should have very specific know-
ledge related to teaching and learning’ (p. 2). He also states that, for a variety
of reasons, school leaders may lack sufficient knowledge of teaching and learning
to provide adequate, let alone successful instructional leadership. Despite prin-
cipals and headteachers being recruited from the teaching profession, their know-
ledge of teaching and learning is:

> Often tacit or dated knowledge, based on increasingly distant memories
> of a former life in the classroom. As a consequence, it is possible that
> the knowledge of teaching and learning possessed by many principals
> is more a hindrance than a help in informing the role of modern school
> leader.

(Hill 2001: 1–2)

Also, leaders’ professional learning has frequently been directed towards a range
of other management tasks. These include: managing change and generic skills
in goal setting, planning, budgeting, marketing and human resource management
and development in order to exercise operational responsibility for tasks govern-
mental reforms have devolved to schools. Hill concludes that:
The last 15 years have thus been times of great change in which more and more has been expected of principals as leaders of complex organisations, but as leaders who may be less, rather than more, connected to core business of schools, namely teaching and learning.

(p. 3)

However, Hill believes this cannot continue for two reasons. First, as educators and school leaders respond to the emerging demands of knowledge societies and learning organisations they will need to re-focus on learning. Second, as educators accept and fully internalise socially constructivist views of learning, and aim to develop in-depth learning and the acquisition of high-level, thinking skills and problem solving abilities, new conceptions of teaching and learning will be needed:

The principal and other key members of the leadership team will need to disseminate this new knowledge and become intimately involved in rethinking the curriculum, in creating larger blocks of time for in-depth learning, in reducing the emphasis on content coverage but increasing the amount of time given to thinking skills, in promoting inter-disciplinary studies of issues and problems and in exploring ways in which new information and communication technologies can be integrated into regular classroom practices.

(p. 5)

It is now imperative that school leaders develop and sustain high levels of knowledge and understanding about teaching and learning. The implications of this for leaders’ professional learning and development are profound. At first sight it appears to mean that even more is expected of leaders. Whether this turns out to be true will unfold over time. What is quite clear, is that leaders’ professional development needs to be very carefully examined and possibly re-conceptualised. In part, this will in England, be a major task for the National College for School Leadership, not least because the college will have to play a leading role in reviewing and, if necessary, re-shaping leadership development.

The second conclusion I want to note is that instructional leadership looks to occur when certain organisational conditions are present. These are characterised by Blasé and Blasé (1998) as those associated with learning communities. I also came to the same view in my study of heads in small primary schools. Elsewhere (Southworth 2000), I have begun to articulate what a ‘learning primary school’ involves, drawing upon research in primary schools over the last 20 years. This work has convinced me that learning schools must facilitate teachers’ pedagogic growth, since the development of their teaching skills and repertoires seems to me to be the major content area. The curriculum of learning schools should be pedagogy (Southworth 1996; 2000).

However, schools which are learning organisations are relatively advanced
institutions because of the kind of teacher culture they need to flourish. They require a teacher ‘culture of collaboration’ (Nias et al. 1989; Fullan & Hargreaves 1992) in which formal and informal professional dialogue is the norm and which includes challenge, debate and a willingness among all staff to address their professional differences in a calm and mature manner (Nias et al. 1992). Also, learning schools enquire into pupils’ perspectives on their learning and use these data to guide development in pedagogy and learning (Fielding et al. 1999). Such schools will also provide many opportunities for teacher mentoring, coaching and school-based professional development. There will be explicit efforts to manage professional knowledge in the school through audits of teacher strengths, skills and needs (Hargreaves 1996). The development of pedagogy will feature strongly in this and it will be both an individual and collective responsibility to enhance everyone’s teaching knowledge, skill and understanding.

Such a culture not only creates the organisational conditions for schools to become ‘teaching and learning schools’ (Southworth 2000), it should also provide the most hospitable environment for the exercise of instructional leadership. Culture formation has to be led (Schein 1985; Nias et al. 1989, 1992). When school leaders work towards establishing a collaborative, learning culture they simultaneously create the climatic conditions for instructional leadership because professional cultures characterised by openness, trust and security appear to be the ones where teachers feel confident to become learners (Southworth 2000). Instructional leadership is, as the empirical studies show, about leading teachers’ professional learning.

Finally, I want to argue that instructional leadership needs to be given even greater emphasis than previously. Given the global interest in learning organisations, school leaders as educators and leaders are uniquely placed and qualified to contribute to this development. Heads could undoubtedly teach business leaders a thing or two about running a social organisation in which staff learning is a major priority and investment. Moreover, such leadership is possibly what makes school leadership a distinctive branch of leadership practice and theorising. Far from educators being the recipients of expertise from elsewhere, now may be the time to reverse the flow and instead of being importers of expertise from outside education, we can become exporters of it as well. However, such a development will need researchers and practitioners to forge new partnerships and alliances and for researchers to learn with and from practitioners, rather than treating schools as sites for our studies and the individuals as the objects of our enquiries. Thus, the promotion of instructional leadership has implications for practitioners, researchers and policy-makers alike and for each group to use it as an opportunity to develop and enhance their understanding, knowledge and leadership actions.

LESSONS FROM SUCCESSFUL LEADERSHIP IN SMALL SCHOOLS

Geoff Southworth

Introduction

One of the most robust findings from leadership research is that context matters. Situational theories demonstrate that leaders’ actions are often contingent upon environmental and contextual factors. As Leithwood, et al. (1999) say, ‘outstanding leadership is exquisitely sensitive to the context in which it is exercised’ (p. 4).

Yet, despite this knowledge, empirical research into school leadership lacks similar levels of sensitivity to context. Writing about educational leadership too often describes or prescribes what leaders do, or should do, in a general manner without acknowledging contextual differences. Thus, some of the literature about school leadership is undifferentiated and indiscriminate. If we accept that context matters, then research must begin to develop a more fastidious and refined appreciation of the relationships between actors and their theatres of operation.

I am not saying that we cannot generalise about school leadership, nor am I arguing for uniqueness and particularity. I am, though, counselling against universality and suggesting that researchers need to take greater account of context than has so far been the case. Indeed, in my own work I have always made it plain that I have studied primary school leaders (e.g. Southworth, 1987; 1995; 1998) in order to respect school sector differences and to avoid what might otherwise be an imprecise discussion of school leadership. More recently I have embarked on a series of three empirical studies which aim to compare and contrast leadership in small, medium and large primary schools. These studies are intended to refine our understanding of school leadership by examining differences within the primary sector.

This chapter focuses on the first of these three studies, an investigation into headship in small primary schools in England. Small schools in England (and usually elsewhere too) are largely found in rural settings and given policymakers’
LEADERSHIP AND HEADTEACHERS

pre-occupation with the challenges associated with urban schooling, small rural schools are not given a high priority. Consequently, many staff in small schools feel overlooked and under-valued. The same is probably true in other school systems such as in the USA and South Africa. Perhaps it is only where there are very large numbers of small schools, as in New Zealand and Wales, or where recruitment to small and isolated schools is a challenge, as in parts of Australia and Scandinavia, that they are afforded a higher profile. The research had two main aims: to explore how headteachers led their schools’ improvement efforts; and to identify the characteristics and strategies the heads associated with effective school leadership.

This research was necessary for six reasons. First, no major study has been conducted into primary school headship in England and Wales. Although there are approximately 18,300 primary schools in England and Wales, no substantial investigation has been mounted to examine the work and skills of those who lead them. Moreover, not only do primary schools comprise the largest number of schools, but they are also the most diverse in nature. However, the educational leadership research literature does not reflect this diversity. Thus, in line with my opening remarks, there is a real need to examine leadership in different settings and contexts.

Second, in the absence of any large-scale studies, our understanding of primary headship relies on two types of study. First, there have been a number of descriptive studies usually investigating how heads use time in school (Clerkin, 1985; Harvey, 1986). Yet, there is only one, close-up, observational study of a primary head at work in his school for an academic year (Southworth, 1995). Second, there are numerous prescriptive commentaries focusing on how heads should approach headship (Whitaker, 1983; Dean, 1987; Day, et al., 1998). Both types of accounts have yielded limited perspectives on headship. The first type looks at only one aspect of the role, while the second often does not differentiate between school contexts.

Third, such studies as have been conducted into primary headship are now dated (e.g., Coulson, 1986; Mortimore & Mortimore, 1991). Likewise, the insights into school leadership gleaned from school effectiveness research are rapidly ageing. Moreover, studies conducted during the 1990s (e.g., Southworth, 1995a; Webb & Vulliamy, 1996) tended to focus on how heads responded to implementing national reforms (e.g., the National Curriculum and the introduction of self-managing schools), but less on how heads were improving their schools. Also, these studies are based upon heads’ perceptions of their roles and while they provide valuable insights into their practical theories and experiential knowledge, they do not focus on the leadership of school improvement, nor on what this looks like to those headteachers who are accomplishing it with success.

Fourth, it is widely recognised that school leadership matters. One of the most robust findings of school effectiveness research is that purposeful leadership by the headteacher is crucial to the school’s high performance. This finding is now
LESSONS FROM SUCCESSFUL LEADERSHIP IN SMALL SCHOOLS

supported in England by the Office for Standards in Education (Ofsted, 1999) inspection data. In England all schools are inspected by external teams of accredited inspectors who judge the quality of the school and the effectiveness of the leadership and management. Inspection evidence influences national policy making and has played a part in guiding central government’s work on identifying and preparing aspiring heads, the development of experienced headteachers and the establishment of a national college for school leadership. However, although school leadership is now accepted as centrally important, we lack contemporary insights into what successful primary headship involves. Nor have we investigated with any rigour what effective practitioners have to say about their leadership, or analysed the key characteristics these leaders associate with improving their schools. In short, although leadership matters, we have yet to learn from those who are effective leaders of improving or high performing primary schools how they actually conceptualise their work.

Fifth, because we have not studied primary headteachers in much depth we do not know how some heads have become successful leaders. We urgently need to know how their leadership skills were acquired and developed and which professional learning experiences were of critical importance to them. Insights into these areas would enable two dimensions of leadership preparation to be developed. In the first instance, it is very likely that the accounts of successful heads’ professional development will enable the identification of leadership potential to become clearer. In terms of the second dimension, leadership training could identify the workplace, on-the-job, professional learning experiences prospective heads should be offered and outline how they might be mentored, coached and their leadership repertoires extended and enhanced. Furthermore, given the diversity of primary schools, attention to headteachers’ professional development needs to be related to the effects of context.

Sixth, only when we have undertaken and reported detailed, close-up studies of heads and principals, which are developed cumulatively, synthesised and related to the findings of large scale surveys, will we have robust national perspectives. Once we have articulated national studies, conducted in the light of research in other countries, we can then orchestrate sensible and sensitive international comparative projects. Such a systematic project is necessary because too much of the current interest in educational leadership is based on too little evidence. The evidence-base needs to grow, building on previous work in order to create valid national images of leadership which can then be compared and contrasted internationally.

Given these reasons and with funding from the Teacher Training Agency, which at the time had responsibility for headteacher training and preparation, I embarked on a study of successful leaders in small primary schools. In this chapter I will report my findings and discuss the significance of them to our understanding of school leadership. However, it is not my intention simply to make this chapter a report of this research. Rather, I want to use this particular enquiry into leadership in small schools to produce an evidence-based picture
from which emerging issues can be identified and grounded theories about school leadership developed.

**Literature review**

A literature search of both national and international databases was conducted. The national search used the British Educational Index (BEI) and the international survey concentrated on ERIC and the international ERIC since the latter included coverage of Canadian and Australian sources. There were two major predetermined search parameters: the phase of schooling (primary/elementary); and school size. The time scale for the search was set at 10 years. However, the latter parameter was breached because the initial searches yielded so little material. I extended the time scale by a further ten years to see if there was earlier relevant work. Once sources were identified I also scanned reference lists of relevant articles. This tactic helped to identify further studies for consideration and can suggest new keywords and authors (Evans & Benefield, 2001). Key journals were also manually searched to identify articles that might have been missed in the database searches.

These searches produced studies which reported on small schools in a number of countries, including: Australia, Canada, England, Greece, Iceland, New Zealand, Scotland, Sri Lanka, Sweden, the USA (Appalachia, Alaska, Nebraska, Texas) and Wales. Other studies referred less specifically to areas of South America, the Caribbean countries and rural Africa. The searches showed that the literature on small schools is largely concerned with two sets of related issues:

- viability;
- educational effectiveness.

*Viability* concerns were demonstrated by articles focusing on the following topics: sustainability; school closures and survival issues; cost-effectiveness and value for money; the impact of national and/or local policies on small schools; overcoming perceived disadvantages of remoteness and isolation (e.g., twinning, clustering, federations, networking). *Educational effectiveness* concerns largely covered: curricular provision (manageability, coverage, breadth, implementing national reforms), and school size effects on achievement; and dealing with mixed-age classes of pupils.

These two themes are constant in the literature and continue today. For example, following the completion of the first four year cycle of inspections of schools in England (1994–98) by Ofsted, inspectors have used the data to compare the achievements and quality of education of small schools with larger ones. Small schools were defined as those with fewer than 100 pupils on roll. The inspectors are aware that bald comparisons are problematic since the majority of small schools are in relatively affluent areas, with above average socio-economic indicators. They note that small schools are strongly represented in the
top 100 performing schools (in English, mathematics and science tests) between 1996 and 1998:

A significantly greater number than might have been expected on purely statistical terms have been in the top 100 each year . . . By contrast, there was also a higher than expected proportion of very small schools in the lowest scoring schools between 1996 and 1998.

(HMI, 1999, p. 14)

Small schools were judged to provide the full range of knowledge, skills and understanding required by every subject in the National Curriculum. Also, with the exception of the provision for under-fives, the curriculum of small schools is generally at least as broad and balanced as that of larger schools (HMI, 1999, p. 14). As inspectors state elsewhere:

Pupils in small schools are not disadvantaged in comparison with those in larger schools simply because of the size of school. Small schools are capable of providing an effective education and many are among the most successful schools in the country.

(OfSTED, 1999, p. 81)

This finding is consistent with earlier research which showed that small schools are not significantly different from their larger counterparts in the content of their curriculum, nor in how they teach it (Galton & Patrick, 1993).

Inspectors also report on the quality of leadership and management in schools. Of these matters the inspectors said that headteachers of small schools provided clear educational direction for their schools, although in line with schools in general “there are weaknesses in the leadership in about one school in seven” (HMI, 1999). Furthermore:

Good management and good teaching are, understandably, the two most significant characteristics of successful small schools. These two characteristics are uniquely combined in the role of the small school head so that his or her influence is a more than usually important factor in determining the quality of the school.

Where the head is effective in both the teaching and the management roles, a virtuous circle of benefits accrues to the school: change and development can be achieved more quickly, the head is able to lead by example with any new initiative and is well placed, from first hand knowledge, to assess priorities for training and spending. This circle can easily be broken, however; a weak or absent head can quickly trigger a downward spiral with consequent loss of morale and reduced quality of education.

(HMI, 1999, p. 16)
The inspectors conclude that the head of a small school is of paramount importance to the success of the school because of her/his more than usual direct influence on the quality of teaching and standards achieved. Overall, the inspectors say of small schools that higher unit costs notwithstanding, “a good case emerges for the place of small schools in the education system as a whole when the quality of their educational performance is added to the broader contribution they make to their communities” (p. 16).

The English school inspectors’ comments are congruent with research in North America. Cotton’s (1997) review of US research into school size, school climate and student performance deals with whether small schools are better than larger ones. Although the review is complicated by the fact that researchers in the US have not agreed what constitutes a small or large school, Cotton’s summary of findings suggests that:

- academic achievement in small schools is at least equal – and often superior – to that of large schools;
- student attitudes toward school are more positive than in larger schools;
- student social behaviour is more positive in small schools;
- levels of extra-curricular participation are much higher in small schools;
- students have a greater sense of belonging in small schools;
- teacher attitudes to their work and their administrators are more positive in small schools;
- students and staff generally have a stronger sense of personal efficacy in small schools.

(Cotton, 1997, p. 12–14)

Interesting and important as these findings are, they do not explicitly tell us whether and how principals of small schools influence such outcomes. Indeed, there were relatively few articles that directly and strongly focused on school leadership in small schools. Moreover, those studies I found which focused on school leadership tended to dwell on the challenges of being a leader of a small school and not what makes them, or their schools, ‘successful’. For instance, Dunning (1993) focused on the ‘double load’ problem of the teaching head. The concept of heads of small schools carrying a ‘double load’ was first expressed by the Gittins Report (CACE, 1967) which focused on primary schooling in Wales, where a third of all primary schools have less than 100 pupils on roll. Dunning examined how educational reforms had impacted on the double load. He observed that, as a consequence of national reforms in the 1980s and 1990s, teaching heads in small schools had experienced an expansion of their responsibilities. Teaching heads now have to demonstrate a much more sophisticated technical competence in their teaching, while dealing with the same teaching load and new management commitments which are as demanding as those of non-teaching heads in larger schools (p. 82).

Dunning essentially makes two points. First, that neither the special
circumstances of small school heads, nor those of the schools they manage have usually attracted much sympathetic attention on the part of reforming politicians or central administrators (p. 79). Second, despite the early identification of the problem of the ‘doubly loaded’ teaching head, 30 years later the bipartite role remains a characteristic phenomenon of most small primaries and little has been done to alleviate the ‘demanding task’ which Gittins (CACE, 1967) recognised teaching headship to be (p. 80). Given all the educational reforms which have occurred since then, Dunning (1993) concludes that it is questionable whether heads of small schools should still be expected to work under many of the ‘double load’ factors which were recognised as major encumbrances so many years ago (p. 87).

These points are echoed in two other studies. Hayes (1996) interviewed six primary heads in England and found that they were attracted to small school headship because it offered the opportunity: to go on teaching; to be their own boss; to fulfil a vision; and to ‘make a mark’ (pp. 381–3). However, the realities of headship were that the pressure of work threatened even the job satisfaction gained through continued interaction with children. After a time in post, each head accepted that it was impossible to maintain high standards in every area of the job (p. 386). Despite their common belief about what a small school headship could offer, they had to concede that they were sometimes unable to cope with its many demands.

Hayes then explored what this meant for the heads and argued that while trying to achieve success, they also had to hide their shortcomings from parents and other stakeholders outside the school, in order to avoid harming the school’s, and their own, reputations. In fact, these heads appeared to work so hard to conceal their shortcomings that they sometimes became exhausted. In turn, this exhaustion created dissatisfaction, due to fatigue and a diminished ability to cope. They then worked even harder to restore their elusive sense of success, until they were unable to offer anything more to the job (p. 387). According to Hayes, they felt good about themselves only when they did everything well, but the strain of doing everything well reduced the extent to which they experienced a sense of self-esteem. Feeling positive about themselves as teachers became increasingly difficult; the heavy demands of being a teaching head meant they sometimes had to sacrifice a central aspect of their professional identity – being an effective teacher – in order to cope with the managerial side of the job (p. 388).

In short, teaching heads sometimes have the worst of both worlds. In trying to do both aspects of the role well, they sometimes do neither and thus experience a profound sense of dissatisfaction with their efforts. Thus, Hayes’ analysis transcends previous thinking about the ‘doubly loaded’ head. He argues that the workload pressures and expectations can be so acute that they become a source of professional strain and personal dissatisfaction with one’s professional self.

Waugh’s (1999) study of 11 headteachers aimed to examine how heads in primary schools of different sizes responded to educational changes. All of the heads experienced a conflict between their desire to teach and the need to under-
LEADERSHIP AND HEADTEACHERS

take administrative duties (p. 22). Yet, this was experienced more strongly by
the small school heads than those in larger schools. The heads of small schools
tended to maintain that they did not have sufficient time to manage their schools
properly, given their heavy teaching loads. As one respondent said:

‘When I grow up I want to be a headteacher’

This person did not think he was a headteacher at the moment, but rather a ‘class
teacher and an administrator’ (p. 30).

In common with the Ofsted inspection evidence cited above, Waugh states
that heads of small schools have certain advantages over large schools when
implementing change, notably:

* the fact that the head is responsible for teaching a large proportion of the
children means that s/he can implement curricular change directly;
* the limited size of staff means that few people need to be persuaded of the
need for change and all can easily be involved (p. 32).

Waugh also acknowledges that heads of larger schools have certain advantages,
for example, they can share their workloads and delegate responsibilities and are
better able to monitor change in the school because they do not have class teach-
ing responsibilities (p. 32).

Together these studies suggest that although heads of small primary schools
may have no unique management tasks to perform, nevertheless, their manage-
ment and class teaching tasks are generally affected by factors which in combi-
nation may be unique to small primary schools (Wallace, 1988, pp. 16–17). The
job of headship in a small primary school seems to be distinctive insofar as the
context in which management tasks have to be carried out is specific to small
schools (p. 18). This context creates the organisational conditions whereby ten-
sions exist between heads’ teaching commitments and leading the school (Day,
et al., 2000, p. 162) and these tensions can often be acute and corrosive to an
individual’s sense of professional efficacy.

While these are significant findings, it should not mask the fact that remark-
ably little work appears to have been conducted into school leadership in small,
primary/elementary schools. When this material is categorised into articles,
which are research-based, and those which are commentary oriented, the amount
of empirical work into leadership in small primary schools becomes very
meagre indeed. Clearly, there is a lack of research into the role and work of
heads and principals, particularly in terms of leading school improvements and
the systematic reporting of leaders’ perceptions and concerns.

Furthermore, as I argued in the introduction, unless and until the data on
school leadership, and in this case headship and principalship, expands then we
will have only a limited, if not impoverished base on which to draw comparisons
between schools of different sizes within any school system, let alone between
systems on an international scale. Indeed, the growing interest in comparative studies in educational leadership (e.g., MacBeath, 1998; Dimmock & Walker, 2000; Hallinger & Kantamara, 2000; Cheng, 2000; Bredeson, 2000) argues for more painstaking and careful studies, while also revealing how much differences matter. For example, Riley and MacBeath (1998) state that it was because of the international nature of their project that differences in context and culture came to the surface (p. 140). These differences sharpened their awareness of how leadership is shaped by socio-economic and political forces and explains why they are critical of the notion of leadership ‘recipes’ because there is “no one package for school leadership, no one model to be learned and applied in unrefined forms for all schools, in all contexts” (p. 141).

If there are grounds for rejecting a formulaic approach to leadership, then policy-makers and practitioners alike should find it useful to look at teaching principals in several countries and compare how their different organisational contexts influence their role conceptions and actions. For instance, do principals in, say, rural Australia, Canada, New Zealand or Norway have similar or different amounts of non-contact time with pupils? How do they use their discretionary time when not required to teach? These are obvious questions, but they may reveal significant resource issues.

However, international comparisons need to be treated with care. Dimmock and Walker (2000) argue that while internationalism in education is desirable, caution needs to be exercised to avoid superficial comparisons being drawn. As they say: “such comparisons can be fatuous and misleading without thorough understanding of the contexts, histories and cultures within which they have developed” (p. 144). They make a good case for comparative studies, noting that educational leadership lags behind conceptual and epistemological trends and events already taking place in business management and cross-cultural psychology. Also, comparative studies should reduce the “ethnocentricity underlying theory development, empirical research and prescriptive argument” in educational leadership because “Anglo-American scholars continue to exert a disproportionate influence on theory, policy and practice” (p. 145). Yet they also warn about the dangers of “cultural borrowing” (p. 147). Policy-makers are increasingly adopting policy blueprints fashioned in different countries without giving consideration to their cultural origins or fit with their intended implementation context. In other words, we need to go “beneath the veneer of similitude” (Bredeson, 2000, p. 3) and consider differences as well.

Much the same arguments are advanced by comparativists themselves. Watson (1998) in his presidential address to the British Comparative and International Education Society sets out his view of the field, describing it as a form of “social cartography” (p. 20) and concludes that truly international studies will not simply compare nation states with one another, but might introduce:

Other categories for grouping countries and societies, for example, Buddhist, Christian (Protestant, Roman Catholic and Orthodox), Hindu,
Watson notes that what is happening at the grass roots in educational systems is often overlooked because many comparative and international studies really only deal with macro-level issues. Watson believes one should undertake contextualised research at the lowest possible level by observing schools and individuals within those schools in relationship to the local community (p. 24).

It seems, then, that comparativists and leadership researchers alike are arguing for greater differentiation and more sophisticated awareness of contexts and cultures. Furthermore, increased sensitivity to these concerns needs to take place at the macro and micro levels. These lines of thinking not only justify qualitative studies of leadership in different settings and types of schools, but they also provide a rationale for developing portraits of leadership which can then be contrasted nationally and compared internationally.

Therefore, in addition to establishing in this section that there is a shallow pool of knowledge about leadership in small primary schools and thus a case for conducting further empirical work, such studies should not only enhance the knowledge-base within the country of origin, but also across national borders. Globalisation of education and of educational leadership should increase not diminish understanding of contexts and local settings.

Given these ideas, I now turn to my study. In the next section I outline the research methods and sample, then I will present the main findings and follow this up with a section discussing the emerging issues, before offering my conclusions.

Research methods and sample

This particular study focused on a sample of ten primary heads (8 women, 2 men) working in schools with less than 150 pupils on roll and used qualitative methods. The research used a purposive sample drawing upon heads nominated by their local education authorities (LEAs) because they were seen as successful school leaders. This was validated by school inspection data. Nominated heads were invited to participate and, given their agreement, I spent one day in each of their schools conducting the fieldwork.

Fieldwork consisted of an initial tour of the school with the head so s/he could highlight any context specific issues they wished to be noted and for me to familiarise myself with the school as a setting for their leadership. The tour was followed-up by a semi-structured interview with the head lasting approximately one and a half-hours. I next interviewed two teachers and one school governor in each of the schools. Following these interviews I met with the head again to see if s/he had anything further to add, or to follow-up lines of enquiry which had emerged during the day. I adopted a multiple perspective approach because too
much of existing research has relied too heavily on heads as the primary source of data (Day, et al., 2000). Collecting evidence from three sources was intended to reduce any bias and widen the ‘angle of observation’ (Schatzman & Strauss, 1973).

Immediately after each visit I made detailed field notes about the school, my impressions of the head, staff and governors, the points they had made, the tone of their comments and the emphases they had stressed. As the fieldwork progressed I also drafted research memos to myself setting out my reflections and ideas. When all the data were collated I proceeded to formally analyse them. The questions provided one framework for analysing the data and I sorted the comments accordingly. Emerging themes were identified, re-analysed and validated. In the following section I will report the major findings.

Main findings

When we toured the school site and buildings the heads described the school as a context for their work and explained past and present challenges and successes. Each school was different. For example, one was located in a very isolated rural area; one was a ‘listed’ (i.e., historical) building dating from the 15th century; another was surrounded by high rise apartments in a densely populated urban area characterised by unemployment and poverty; while others were in suburban settings, or village locations. The sample of schools also reflected a range of socio-economic circumstances.

As the heads showed me around I saw new or refurbished entrance areas, halls, and classrooms they had created. Their attention to the physical state of the schools revealed that they wanted the best possible learning environments for the pupils. Hence I was shown alterations to teaching areas, new libraries, computer suites, playground facilities and told about imaginative uses of teaching spaces. The heads also made it plain they were keenly aware of the school as a setting for their leadership. They told me about the school’s history and how it had come to be what it was today. Each described in detail what the school was like when they started their headship. All of them demonstrated that their priorities and actions depended on the school’s circumstances. In other words, the heads tacitly recognised that leadership was contingent upon where you are and who you are working with.

During the tours the heads showed how aware they were of colleagues’ and helpers since everyone was noticed and acknowledged. Interpersonal relationships were a major feature of their work and they executed them with a transparent sense of care and consideration for others. Also, every school relied on extra contributions from voluntary helpers and the heads were plainly able at enlisting and orchestrating this additional support. This was recognised in the schools’ Ofsted inspection reports, which stated that leadership and management in the schools were good, very good or excellent, that professional relationships were positive and that there was much evidence of teamwork. Also, the heads had
LEADERSHIP AND HEADTEACHERS

well-founded views about learning, clear visions for the schools’ futures and a good grasp of the critical actions necessary to improve the schools.

_Becoming a headteacher_

Asked why they became heads most acknowledged that they wanted the responsibility headship offered. In common with the heads Hayes’ (1996) studied, they typically liked the idea of ‘running their own school’. They wanted to see for themselves if they could meet the challenge of being a successful school leader and whether they could implement and achieve their educational beliefs.

They saw the role as both empowering and a personal challenge. Empowering because they had the authority and power to determine what their schools should be like and the direction they should be heading in. Challenging because now the responsibility was theirs and they must prove to the schools’ stakeholders that they really could make a difference. Equally, they also had to prove this to themselves and now operationalise what they believed in.

_What is headship like?_

When asked about their experience of headship each mentioned at some point that headship was very hard work. On occasion they found the role tiring because of dealing with so many people and tasks. However, the most demanding feature of their work were the simultaneous and dual demands of being head and teacher:

> It is exhausting teaching and headteachering.

(HT 10)

Also, given their reasons for wanting to become heads, they were striving to meet their own goals, to their own standards and on two counts – when teaching and when leading the school. They had high expectations of all teachers, including themselves and wanted to be successful as heads. Given what they said and the passion with which they spoke, they were driven by their own high expectations of themselves and their strong needs to succeed. Therefore, the role may be demanding for three related reasons:

- they had to meet the expectations of all they served and led;
- they were doubly loaded, being both heads and having teaching duties to perform, which for some were very substantial class teaching responsibilities;
- they had to meet their own high expectations and ambitions.

Thus they were under pressure from a series of sources – the dual situation of head and teaching, from stakeholders and themselves.

202
LESSONS FROM SUCCESSFUL LEADERSHIP IN SMALL SCHOOLS

The best features of headship – the job satisfiers – were seeing the children achieve and make progress, plus working with adults and teamwork:

The best bits (of headship) are the children . . . Seeing children’s progress and also seeing the staff’s satisfaction.

(ht 4)

The best bits are going into classrooms, sharing the children’s successes.

(ht 5)

It is all about the children, the growth of the school and the collegiate feel in the school.

(ht 6)

The job dissatisfiers were:

The long hours and continuous nature of headship – there is a never-endingness to headship. There used to be a time when there were ‘busy periods’ during the year, but now it is all year long.

(ht 1)

Not enough time, not enough money and the external agenda. Dealing with someone else’s agenda is difficult.

(ht 8)

The fact that there is never enough time to do things properly – you have to run to keep up – shifting the paperwork.

(ht 9)

When asked to characterise headship each offered a few key words which graphically summarised what it felt like to be a headteacher:

Diverse – rich, varied, fragmented.

(ht 1)

You are in the middle of things – at the heart of things – there is an immediacy about it.

(ht 2)

Juggling time, money, and loyalties – between home and school.

(ht 3)

It’s way of life.

(ht 6)
LEADERSHIP AND HEADTEACHERS

It’s a living process . . . headship is constantly developing.

(ht 7)

These comments are consistent with other studies into primary headship and, indeed, headship in general. For example, another recent qualitative study into headship in primary, secondary and special schools found that heads characterised the role as:

Highly variable, involving them in covering a wide range of issues and topics, which they often dealt with in rapid order and they had become accustomed to switching from one thing to another . . . They also understood that the work was never-ending and required dedication and commitment. The role was stressful and sometimes exhausting.

(Southworth, Pocklington & Weindling, 1998, p. 105)

Professional development

Asked about their professional development six stated that over their time in headship they had grown in confidence. Five of them had been provided with formal mentors, but this process was not rated as highly beneficial. Instead benefits arose from ‘informal’ mentors or professional friends, while five spoke about the value of belonging to local headteacher support groups, school clusters and membership of LEA headteacher networks.

Although all of the heads had one or more colleagues to whom they could turn for advice, or use as a ‘sounding board’, they acknowledged that most of their professional and role learning was done on the job:

Most of my learning has been doing the job, living it. Meeting problems and working through them.

(ht 5)

I learned on my own.

(ht 9)

All of them had an implicit belief in self-development. They saw themselves as developing and valued professional learning. Many valued off-site courses and in-service programmes, but mostly their development as headteachers was through experiential learning. What characterised their growth as school leaders was how much they had learned from doing the job, meeting the challenges thrown up by their schools’ circumstances and dealing with whatever they encountered. Learning the role was very largely an osmotic process.

Perhaps then it is not surprising that for at least half of these heads, one of the significant developments that had occurred was the growth in their confidence
and sense of self. The ability to cope and survive the trials and challenges of being a leader developed their self-esteem and self-image as a headteacher.

**School improvement**

All the heads believed their schools were improving and they employed a range of strategies to achieve this growth. All spoke about using their teaching as an example:

> Throughout I have drawn heavily on my teaching and that has been hugely important with the staff. They know I have done in my teaching what they are being asked to do.  

(ht 2)

Another strategy common to all was monitoring. This took a number of forms including formal and informal approaches, headteacher and peer observation of classrooms, examining pupils’ work and learning outcomes and scrutinising teacher plans:

> I go around nearly every single day. I’m monitoring a lot – informally mostly, but sometimes formally. I’m looking at what the pupils are doing. I make lots of mental notes and follow these up. For instance, today I saw an SEN group without assistance. I’ll see if that happens again on Monday. I teach on Fridays and the staff like that, they see I am still a teacher colleague. Every week I take in teachers’ plans, I check these are being implemented, or find out why not. We look at pupils’ reading ages twice a year.  

(ht 5)

I do a lot of classroom observation. At least once a week I observe a classroom. I also get formative feedback from the teachers’ weekly plans and summative information from tests. All this helps us to detect trends and concerns. My role is listening, watching, identifying issues and taking these to the staff and deciding together what to do.  

(ht 10)

From much that was said it was clear the heads prized professional dialogue. Staff discussions were viewed as valuable ways in which teacher expectations could be raised, pedagogic assumptions challenged, greater consistency between classrooms developed and a common vision for improvement in teaching and learning established and sustained. However, while professional talk was understood to be necessary to improve the school, it was not seen as sufficient. These heads claimed to have devoted a lot of time and effort to putting in place and
developing a series of organisational and curricular structures and systems to support improvement efforts and to ensure quality in teaching and learning, including:

- School development planning
- Target setting
- Analysis of pupil learning data
- Evaluation of pupil, cohort, key stage and school performance levels
- School policies for learning and teaching
- Curriculum policies
- Assessment and marking policies
- Monitoring of policies
- Weekly planning by teachers who set out clear, explicit learning objectives for the pupils
- Staff meetings
- Curriculum managers'/leaders’ roles

All the heads during their interviews mentioned teamwork. They were keenly aware of the importance of teacher collaboration, of the staff becoming a cooperative group in which individuals supported one another and of them acting as a combined teaching unit. As one said:

> Relations are critical.

(ht 7)

Their comments about school improvement illuminated a number of themes. All regarded school improvement as the major part of their role. As each interview drew to a close no one suggested that the emphasis placed on school improvement during the interviews was an inappropriate one, or one which misrepresented the role. Tacitly all of these heads understood that first and foremost headship was about developing the quality of the pupils' learning and enhancing pupils’ progress.

No head relied on a single approach to school improvement, rather they adopted a variety of strategies to influence the practice of teachers and classroom support staff. Most commonly they monitored what was happening in the classrooms and across the school. They were very keen to gather information about what was happening inside classrooms and concentrated on the received curriculum, as well as the planned and the taught curriculum. In other words, all of the heads were using an evidence-informed approach to improvement.

They had also put in place a range of other structures and systems to support school improvement. Most telling, however, seemed to be the introduction and adoption of policies for teaching and/or learning. These took on central importance in most of the schools. Some of the heads had used them as the foundation for improving their schools and others had made them their touchstones for eval-
Evaluating quality since the policies established criteria for effective teaching and learning.

Integral to policy development and planning processes were staff discussions. Sustaining teacher talk and using it as a vehicle for teacher and staff development underscored almost everything these heads were doing. Talk enabled shared understandings to be developed, levels of awareness and expectations raised and common approaches to become established. The heads presented themselves as skilful at questioning colleagues’ assumptions and in probing complacency if they encountered it.

As far as the heads were concerned much of the policy and planning work undertaken in each school was intended to help staff. What the heads described can be interpreted as putting in place a series of support systems for teachers. Moreover, several had obtained additional teaching resources for staff, be it new classrooms, materials, or equipment, such as computers. Undoubtedly, they were very concerned to ensure that the teachers had the necessary tools to do the job well.

**Leadership**

Their responses to being asked what lessons they had learned about school leadership fell into four categories. Overwhelmingly the most important set, in terms of the number of times the heads mentioned it was working with others, teamwork and sharing leadership. Second, was the need for heads to be forward looking. Third, was being knowledgeable and leading by example. The fourth set was composed of a diverse range of points made just once or twice by respondents (e.g., there are various ways to lead, headship is lonely).

As far as their strengths as leaders they emphasised the need to work hard, to be resilient and committed. They also spoke about their communication skills, including listening, as well as dealing diplomatically and patiently with adults and children. Invited to say what they saw as the key characteristics of successful leaders they said:

- Relationships [4]
- You have to be a good teacher and lead by example [4]
- Having a vision [3]
- Respected [2]
- Determination and strength [2]
- Committed [2]
- Positive [2]
- Knowing what is going on across the school
- Reliable
- Adaptable and flexible
- Good communicator
- Know where you are going
LEADERSHIP AND HEADTEACHERS

- Must think of the children
- Deal with and manage change
- Willingness to work “bloody hard”

Taken together, these points show that the respondents regarded headship as a role in which you needed to be enthusiastic, positive, determined and hard working. Yet, because they worked with colleagues and regarded teamwork as vital to the school’s success and organisational health, they were alert to staff needs. Therefore, they had learned that leaders must be sensitive to others, value and involve them, as well as encourage them to take a lead. Consequently, leadership was understood as multi-faceted because the role covered many professional and organisational issues.

What also emerged was a range of leadership ‘orientations’ which portrayed headship as being concerned with maintenance, relations, change, and survival:

- **Maintenance** relates to the heads’ comments about being organised, using time wisely and establishing common practices, systems and structures in the school. They clearly recognised that things had to be managed and that transactional leadership mattered.

- They were acutely aware that leadership was relational – it was about working with people. Creating and sustaining productive, professional relations within a small group of staff who worked in close proximity alongside one another was always uppermost in their minds. In small schools no one could be detached from anyone else and everyone was reliant on others. Professional interdependence was vital to establish and sustain because it created organisational resilience, vitality and growth.

- Yet while positive relations had to be sustained, staff also needed to change and hone their practices. Sometimes this had involved major changes; more commonly it involved incremental development. Nevertheless, continuity was less acceptable than change because the heads knew that successful schools were both moving and improving ones.

- The survival image originates from headship being hard work. Words such as determination, strength, struggle, fight and battle were used by several interviewees. There was a general recognition that you had to be tenacious, as well as sometimes direct and frank with colleagues. Moreover, given that these schools did not have lavish funds, many of the heads had fought for additional resources for the school. All this effort took its toll on them and all, at some stage, acknowledged they became fatigued and needed to pace themselves. The survival image is both about the school struggling through to success and the heads personally coping with the many and varied challenges they encountered. Thus, there are some echoes of Hayes’ (1996) research findings about dealing with the demands of the job.

- Leadership itself was largely understood as involving three interlocking aspects. First, it is about looking forward as the heads’ comments on vision demonstrate. Leaders provide a sense of direction for the school. Second, leaders...
manage change; they are school developers. They saw themselves and their schools as moving forward, recognised that this process had to be led and managed, and wanted the children and staff to achieve as much as they could. They knew they needed to maintain the school and manage it, but they were mostly concerned with developing and improving the schools. Third, the process of leading rested on the power of example. Leading through one’s professional example, be it as a class teacher, drawing on their knowledge of the curriculum and children, or through their attitudes to change, improvement and leadership, lay at the core of their work.

The lists of characteristics also show that leadership according to these headteachers was neither mono-dimensional nor monochrome. Leadership involved many qualities and skills and no single style was favoured by the heads, nor thought to be appropriate.

Many were aware that their leadership had to suit the circumstances they faced at any one time. Also, leadership was not only varied, but richly so. It was about working with others, which could be fun, frustrating, challenging and rewarding. It involved dealing with teachers, support staff, governors, parents and community representatives. Yet the heads were most strongly anchored by their responsibilities for the pupils. At the very heart of so much that they said was a relentless concern for the children and their progress.

**Teacher data**

No teacher dissented from the view that their headteachers were successful school leaders. They attributed much of the schools’ success to their heads’ stewardship. They described their heads as hardworking, approachable, collaborative, determined, knew what was going on, were good listeners, organised, dedicated and led by example. The teachers’ comments also showed that they believed their heads to have influenced their own classroom practices through a combination of:

- the heads’ monitoring and knowledge of what was happening around the school and inside classrooms;
- the heads’ own teaching practice, behaviour and attitudes towards the children, which were seen as a model of what to do;
- discussion and talk with colleagues, including the head, since this developed ideas and teaching knowledge.

**Governor data**

The governors also believed their heads’ were doing a good job. They spoke warmly and positively about the heads throughout the interviews. They appreciated their efforts, their appetite for hard work and their achievements. While the
LEADERSHIP AND HEADTEACHERS

general tenor of their comments was consistent with what the teachers said, the
governors laid greater stress than the teachers on two specific aspects of the
heads’ work:

• how the heads had enhanced the schools’ reputations and standing with
  parents;
• how well the heads worked with the governors.

Therefore, the governors were aware that external and community relations were
important elements of running a successful school.

When asked why they thought the heads were successful leaders four gover-
nors emphasised that it was because they never lost sight of the children, others
mentioned the heads’ care and concern for the pupils and how the heads put the
children first. The governors also believed that the heads’ capacity to work hard
was an important factor. More than the teachers, the chairs of governors were
aware of the administrative load headteachers had to shoulder. The volume of
paperwork – forms, documentation, finances, correspondence etc. – was men-
tioned by several governors, along with their appreciation of the heads’ abilities
to deal with all of this and everything else as well.

Discussion

This section is divided in two. First I identify and discuss the emerging themes.
Second, I contrast and compare these themes with the literature and current the-
orising about school leadership.

Emerging themes

There are five interrelated themes that I will focus on in this section:

1. Working hard

The first theme concerns the nature of headship in small schools today. Respon-
dents from all three groups made this point time and again. The heads acknow-
ledged they worked hard, but did so in an uncomplaining way. They appeared to
regard it as a fact of headship, rather than something they might be able to avoid
or change. As evidence presented to the House of Commons Education and
Employment Committee of inquiry into the role of headteachers shows, the
average working week for primary heads is 55.7 hours and many heads, espe-
cially in small schools, have a teaching commitment in excess of 80 per cent of
the week (House of Commons, 1998, paras. 24–25).

Indeed, it is also clear that these ten heads had an appetite for hard work.
They plainly enjoyed the responsibilities of headship. More than this, though, it
seems that hard work is necessary if heads are to be successful. For one thing, in
small schools, which by definition have fewer staff (in particular support staff covering administration and finances) heads do not have many colleagues they can turn to. They did not have personal assistants, nor many of the other trappings of executive life in commerce and industry. Rather, each school employed a ‘secretary’, who often worked on a part time basis and who managed most aspects of school administration and finance. However, what was not done by the secretary was left for the heads to do.

The other reason why hard work is necessary centres on what the teachers and governors said. It was very clear from their comments that when they acknowledged the time and the effort the heads put in, they understood this to mean not only that the heads had a capacity to deal with a lot of work, but that the heads were committed to the schools. Dealing with all the demands and not shrinking from all the requirements of the role were indicators, indeed, symbols of the headteachers’ care, concern and dedication. Therefore, hard work is not simply about being prepared to put in the hours, it is also a powerful emblem that the leader is committed, dedicated even, to the school.

2. Positive people

All of the heads shared one characteristic – they were strongly positive individuals. Their optimistic outlooks were particularly apparent in terms of their beliefs about the school, the staff and the pupils. All believed that their schools would improve and become more and more successful. Although they knew they had challenges to face and resolve, more than anything they viewed the schools’ prospects with hopefulness.

Throughout the time I was in the school it was clear that these heads were positive forces in their schools. There was no sense of despondency or pessimism, even though some were stern critics of the national educational reform process and several believed small schools were under-valued. Rather, the heads were enthusiastic about their schools and the future.

3. Team builders and players

Teamwork was frequently mentioned by the heads and noted by the teachers, governors and in many cases by the Ofsted inspectors in their reports. This emphasis is no surprise given that in recent times teacher collaboration has become a norm in primary schools, along with collaborative staff cultures and ‘whole school’ policy-making (Nias, et al., 1989, 1992; Fullan & Hargreaves, 1993). Ensuring that the school is a cohesive organisation, that there is staff cooperation, that plans are co-ordinated, communications work well and staff share ideas, resources and support one another, are now common expectations of heads and those who inspect schools.

However, in small primary schools the emphasis on teamwork may be particularly important. Many respondents believed that if the school was to be
LEADERSHIP AND HEADTEACHERS

successful, then staff had to work together. Collaboration was not an option in small schools, it was a professional obligation. The teachers too saw benefits from participating and acknowledged how effective their heads were in orchestrating staff collaboration. The heads viewed positive inter-professional relations as critical to the health of the school. Interpersonal relationships – dealing with staff, parents and governors – were the key leadership skills.

The heads’ contribution to teamwork followed two paths. First, the heads were team builders. Second, they were team players. All demonstrated that they had been active in creating teams in their respective schools. Their comments showed that they recognised and valued individuals and encouraged participation in planning, policy-making and school decisions. The governors valued heads who were accessible to them and it appears that staff did too. The frequency with which this attribute was mentioned suggests that teachers approve of heads who are not remote, are willing to talk and listen to them and who share their ideas and plans with staff. Therefore, the notion of the heads being approachable is probably a shorthand for heads being expected to be communicative and receptive leaders, who acknowledge others and interact on a personal and professional level with them. The emphasis they placed on professional dialogue is another hallmark of their concern to develop and sustain collaboration. They also, however, valued the staff as a group. They were quick to attribute success to the group’s efforts, rather than their own. In this way they suggested that they were also team players; success was not ‘mine’, but ‘ours’. The heads knew that while they played a leading part in the school, they could not achieve very much single-handedly and whatever success the schools had made was the result of everyone’s efforts.

The heads believed that their schools’ successes were dependent on everyone supporting one another and working together. While this outlook was an inclusive one and applied to all staff, improving the performance of the school rested on the teaching staff functioning as a combined teaching unit. Developing a team of teachers who were characterised by a unity of purpose, shared educational values and goals, consistency in teaching and classroom practices, continuity in the curriculum and professional openness were both the means and the ends of teamwork in these schools. In short, teamwork was a key ingredient in improving the school.

4. School improvers

All of these heads were improving their schools. For some it was because they had been appointed to move the schools forward because they were under-performing organisations or in decline. For others it was more a case of enhancing already high levels of success. Whatever the context, none of the heads were satisfied for the schools to remain as they were. Hence the heads spoke about wanting to avoid complacency, of under-achievement being eliminated, pupils’ rates of progress accelerating, children’s attitudes to learning becoming more
positive and of the school’s ethos changing for the better. All of the heads wanted to improve on their previous best.

Each head used a number of strategies to improve the quality of teaching and learning in the school, but three strategies in particular stand out from what the heads, teachers and governors said:

- Modelling
- Monitoring
- Professional dialogue

Each of these strategies relied on a range of tactics. For example, modelling involved the heads using their teaching as an example of what and how to do things, working alongside staff in their classrooms, coaching staff through demonstrating how they taught or approached issues and consciously using school assemblies as occasions when they could promote and reinforce educational values and practice across the school. As the National Primary Headteachers’ Association (NPHA) said in their evidence to the House of Commons Education and Employment Committee (1998): “headteachers must set standards of performance by their personal example” (para. 21). All of the heads in this study understood this and given the evidence of their own and colleagues’ statements they all did it.

Monitoring involved the heads looking at teachers’ weekly plans and the learning objectives teachers were working towards, examining samples of pupils’ work, visiting classrooms, observing the implementation of teaching, learning and curricula policies, reviewing pupil assessment information and evaluating pupil, class and school levels of performance and progress.

Professional dialogue was developed through staff meetings, reviewing practice, looking at pupil learning data, joint planning meetings and policy formation. The heads also followed up visits to classrooms with informal discussions with individuals, or used questions to probe teachers’ assumptions and to promote ideas and ways forward.

Complementing these three strategies were a number of school structures and systems that the heads had put in place. Together, the leadership strategies and the organisational and curricular structures and systems were the processes by which shared educational goals were created, the ways in which consistency in teaching and high expectations were put in place and the means by which improvements in pupils’ learning outcomes and progress were realised. They were the practical ways in which these heads enacted their educational and instructional leadership. As such, they are anatomical features of successful leadership in small primary schools.

5. Educational leaders

These headteachers were first and foremost educational leaders. In common with previous research studies (Alexander, 1984; Nias, et al., 1989; Nias, et al., 1992;
Southworth, 1995a & 1998), longstanding traditions in primary headship (Alexander, 1992) and contemporary thinking (House of Commons, 1998) educational leadership has long been favoured. Yet despite consistent advocacy for it, the 'street realities' of headship can inhibit or thwart such leadership because heads can be caught up in administration and management at the expense of exercising professional leadership. These heads knew that while effective management and efficient administration were necessary, they were not sufficient for the success of the school. Certainly they would have welcomed more administrative support to free them from some of the bureaucratic tasks they dealt with. Yet despite many other calls on their time, they were most strongly focused on leading the schools' educational development. All that they did was concentrated on enhancing pupils' learning provision, progress and outcomes and they did this in an educative way. In developing the quality of learning the heads often enabled staff to learn from them and from one another. Thus the process of improvement was a learning process for the staff.

The heads focused strongly and directly on improving the quality of teaching. To this end these heads were ‘instructional leaders’, that is they looked hard at how children were being taught and how such practice might be improved and shared so that every teacher could teach to the same standard as the best. Much of this development in pedagogy occurred through modelling, monitoring and discussion. However, all of these strategies were predicated on teachers being able to learn from one another. Thus improving teaching was based on professional learning and this required the heads to be both educational and educative leaders. What this interpretation of headship, leadership and improvement suggests is that leaders in small primary schools need to be able teachers of young children and good at enabling the professional learning of adults as well.

Currently, ‘best practice’ in management outside education is pointing towards ‘liberating leadership’ with a focus on trust, integrity, fairness and belief in self and others (Turner, 1998). As Glatter (1998) has suggested, effective human resource management practices contribute far more, in statistical terms, to company performance than do strategy, quality, technology and research and development combined. Also:

The increasing emphasis on people management is reflected in the growing literature on the significance in modern conditions of the ‘intellectual capital’ of organisations (e.g., Allday, 1998; Stewart, 1998), with its implications for valuing, motivating and developing staff.

(Glatter, 1998, p. 11)

Judged by these criteria these heads provided effective leadership because it was educational. They helped staff to feel involved and valued their ‘intellectual capital’ – their professional knowledge – by treating them as colleagues and valued partners.
Relationship with existing literature and theory

The first point to make is that this study is broadly consistent with other studies into headship and school leadership. Previous studies conducted into primary headship have identified how the role is demanding, tiring and hard work (Southworth, 1995a, pp. 13–15). There are also parallels with other studies which have invited heads to identify from their experience the personal qualities and professional skills required to be an effective school leader (Bolam, et al., 1993; Southworth, 1995a; Day et al., 2000). The National Commission on Education (NCE) study (1996) found that leaders of effective schools in disadvantaged areas used similar organisational and curricular structures and systems, monitored pupil learning and teaching and paid attention to the physical environment in order to create a context ‘optimally fit for learning’ (p. 320).

The NCE study noted that the heads had ‘an abundance of energy and commitment’ and that ‘an unusually high level of human effort’ was expended ‘in a very focused way’ (p. 335). These leaders believed their schools had the potential to succeed. The heads were omnipresent in their schools, having a high profile with pupils and their progress and observing teaching and learning. They took a lead in monitoring the quality of teaching and the progress of pupils and provided feedback. The key elements of these heads’ leadership styles were: accessibility; willingness to build expertise and experience of others into the management of the school; and a desire to get the best from every member of staff (p. 339). Also:

There is a clear sense in which the headteachers have an impact by setting an example to the rest of the school, providing powerful role models.

(PP. 338–9)

Team building was also highlighted as important, as was developing the team. In the case of the latter, collaborative cultures and participative approaches were developed (p. 343) along with positive reinforcement of individual’s efforts. The development of cohesive and professional relations among staff was regarded as essential.

Given the parallels between these studies it seems safe to claim that these successful heads in small primary schools are not unusual from other headteachers whose work has been investigated. However, this is not to say that they are the same in all respects. There are similarities, but also some important nuances of difference.

For one thing, the study of small schools suggests that recent thinking about effective school leadership needs to be examined with the variable of context in mind. Hallinger and Heck’s (1998) review of research between 1980 and 1995 explored the relationship between principal leadership and pupil achievement and developed a three-fold classification of principal (headteacher) effects:
LEADERSHIP AND HEADTEACHERS

1 Direct effects
   Where the principal’s actions influence school outcomes

2 Mediated effects
   Where principal actions affect outcomes indirectly through other variables

3 Reciprocal effects
   Where the principal affects teachers and teachers affect the principal and through these processes outcomes are affected.

(Hallinger & Heck, 1998, pp. 162–3)

Reviewing these three models Hallinger and Heck are critical of the first insofar as those researchers who use it do not typically seek to control for the effects of other in-school variables such as teacher commitment, or curricular organisation (p. 163). The lack of attention to other factors creates a simplistic view of headteacher action and effects. Indeed, in my view, it may develop the idea of headteacher causation. That is, there is an assumed one-to-one correspondence between what a head does and the school improving. On occasions this may happen, for example, where the head has a direct input into teaching. As one of the heads in the small schools’ study said: “In this school I represent 25 per cent of the teaching” (ht 1). Hence it is reasonable to expect that given s/he is an effective teacher their practice will enhance pupil outcomes, but so too will the other 75 per cent of the teaching!

The mediated effects model hypothesises that leaders achieve their effects on outcomes through ‘indirect paths.’ The model recognises that:

Leadership practices contribute to the outcomes desired by schools but the contribution is always mediated by other people, events and organisational factors such as teacher commitment, instructional practices or school culture. This conceptualisation is consistent with the proposition that leaders achieve their results primarily through other people.

(p. 167)

The reciprocal effects model presents heads as ‘enacting leadership through a stream of interactions’ (p. 168) through which they address the salient features of the school, such as pupil outcomes, staff morale or commitment. However, in so doing they adapt to the organisation in which they work and change their thinking and behaviour over time. As Hallinger and Heck argue, this model regards leadership as an ‘adaptive process rather than a unitary independent force’ and allows for the possibility that ‘causal relationships may be multidirectional, change over time and even be non-linear’ (p. 168)

Hallinger and Heck conclude from their detailed analysis of the literature that mediated effects studies yielded more consistent findings than did the direct effects studies that were popular earlier in the decade. They argue that the general pattern of results drawn from their review supports the belief that princi-
pals exercise a measurable, though indirect effect on school effectiveness and pupil achievement (p. 186). As Hallinger and Heck also note, researchers in the early years of research in this domain focused on answering the question: ‘Do principals make a difference?’ More recently they have transcended the bounds of this question to try to understand ‘not only if principals have effects on school outcomes, but more particularly the paths through which such effects are achieved’ (p. 187). In their review Hallinger and Heck conclude that a primary avenue of influence appears to be in shaping the school’s direction through vision, mission and goals.

Of course, there is much to debate about these ideas and there are obvious difficulties in adopting the findings of research about principals in North America for headteachers in England. One particular difficulty I have with their ideas is in discriminating between direct effects and mediated effects. I can appreciate their co-existence, but it becomes difficult to attribute some headteachers’ actions as ‘direct’ effects and others as ‘indirect’. Nevertheless, Hallinger and Heck’s analysis is insightful and implies that context does matter, since contextual factors will mediate leaders’ actions. Furthermore, when the three models of principal effects are applied to this sample of headteachers they offer a valuable analytic tool and lead me to make four points.

First, all three models of effect can be detected somewhere across the headteacher, teacher and governor data. Teaching heads would have certainly have had some direct effect in their schools because of their class teaching responsibilities. Mediated effects stem from the ways the heads had influenced goals, expectations, instructional and curricular practices and so on. For those who had been in the school for some time there were also indications that, over time, there were reciprocal effects. Not only had they influenced the school, but as staff changed, as trust was developed with staff and governors, as circumstances changed and developed so too had the heads adapted some of their practices.

Second, because these are relatively small schools, it seems reasonable to assume that these heads will have stronger direct effects than heads in larger schools, where mediated effects are more likely to be at work. Such an outlook is plainly an assumption in the inspectors review of small schools (HMI, 1999) and in Waugh’s (1999) study which were both reported in the literature review above. However, what emerges from this study is the suggestion that not only did these heads have some direct effects, but they were also very active in terms of mediated effects. Their behaviour was typified by a keen awareness that they were working with and through others. They knew that to improve the school they had to influence others and did so with tenacity, determination and a clarity of purpose.

Third, it is especially interesting that these heads appear to have been effective in how they indirectly influenced pupil outcomes. Perhaps because they worked in close proximity and interacted face-to-face with staff they could ensure there was much personal contact. Communication and professional
interaction between head and staff was processual. Such patterns of interaction connect with Fullan’s (1991) ideas about managing change and developing meaning. The data suggest that these heads were skilled in negotiating and developing teachers’ understandings and subjective meanings about desired changes for the school.

Fourth, while the impact of heads in small schools included some direct effects and reciprocal effects, the ability and dispositions of these heads to engage strongly with and act on the mediating factors as well, may, in part, account for why they were so successful. Expressed another way, these heads worked directly – through their interactions and interventions – on the indirect pathways to effectiveness.

Therefore, this study points to a theory of leadership effects whereby these heads’ success was to a significant degree, attributable both to the heads’ direct effects and especially their mediated effects. Because the heads engaged with the mediating factors, and often in a direct and personal way, they were particularly powerful in making a difference in their schools. The strength, frequency and effectiveness of their encounters with staff made their influence pervasive or, as the NCE (1996) stated, omnipresent. Their dealings with staff were regarded as warm and open and they valued individuals and groups, praised them and worked in teams themselves. In these ways they undoubtedly tempered what may in some other circumstances become oppressive conditions. Nevertheless, over time, these heads appeared to be irresistible in moving – directly and indirectly – the schools along paths they and the staff and governors wanted.

Thus, while heads in small schools are likely to exercise greater direct influence than colleagues in larger schools, they have the potential and opportunity, because of their smaller organisational contexts, to make their indirect effects very powerful too. When both effects are used positively, these doubly loaded heads can be doubly influential.

Central to leading school improvement was the assumption that leadership itself involved a social influence process whereby “intentional influence” was exerted by the head over the staff to “structure the activities and relationships in a group or organisation” (Yukl, 1994, p. 3). As Leithwood et al. (1999) say:

Influence . . . seems to be a necessary part of most conceptions of leadership. This suggests that most of the variation in leadership concepts, types or models can be accounted for by differences in who exerts influence, the nature of that influence, the purpose for the exercise of influence and its outcomes.

(p. 6)

For heads of small schools their influence was achieved by the power of their professional and personal example and their implicit belief in the ‘primacy of personal contact’ (Fullan, 1991, p. 53). They used copious amounts of effort and
energy, and while each was willing to exert influence ‘over’ others, more usually it seems they exercised their influence through ‘positive politics’ (Block, 1987, p. 97). Positive politics refers to changing organisational cultures through personal behaviour because it is our actions which are our political statements. These heads, with their belief in the power of example, knew that the truth of what you say lies in what you do.

It also needs to be emphasised that these heads were emotionally intelligent leaders. They were empathetic, used positive reinforcement to value staff and to steer them towards common goals. They were also able talkers and listeners and used a dialogic approach to setting targets and expectations (see Goleman, 2000). Working in such close and continuous proximity to their colleagues and reliant upon them and their goodwill to go beyond the boundaries of the basic job requirements, they needed to create and sustain a workplace climate which was conductive to collegiality. This they appear to have achieved by being interpersonally skilful and emotionally sensitive as well as professionally knowledgeable and effective.

It remains to be seen whether this approach is similar or different to leadership in other contexts. Research is now needed to see how heads in larger schools use direct and indirect effects and how they blend and mix the two. What seems likely from this examination of heads in small schools is that these heads took advantage of their close, personal proximity with their staff groups, in settings characterised by first-hand, oral communications and collegial interactions. Nor should it be forgotten that these heads were also teachers. They remained active members of the teaching fraternity. Thus, the power of their example was based not only on the perspicacity of their knowledge and understanding, but also on the fact that they provided concrete evidence of these ideas in action. In other words, they were neither remote figures, nor leaders who had left the classroom. The combination of both qualities may have made them particularly potent leaders.

The outline I have sketched here begins to provide an analytic description of a sample of heads’ leadership. While this picture shows that successful heads’ roles are polyphonic and their actions subtle and intricately woven, it also suggests that these heads broadly followed patterns common to other leaders. Here I have in mind Bolman and Deal’s (1991; 1992) views about there being four frames of leadership:

The structural frame emphasises rationality, efficiency, structure and policies. Structural leaders value analysis and data, keep their eye on the bottom line, set clear directions, hold people accountable for results and try to solve organisational problems with new policies and rules – or through restructuring. The human resource frame focuses on the interaction between individual and organisational needs. Human resource leaders value relationships and feelings and seek to lead through facilitation and empowerment. The political frame emphasises
conflict among different groups and interests for scarce resources. Political leaders are advocates and negotiators who spend much of their time networking, creating coalitions, building a power base and negotiating compromises. The *symbolic* frame sees a chaotic world in which meaning and predictability are socially constructed and facts are interpretive rather than objective. Symbolic leaders pay diligent attention to myth, ritual, ceremony, stories and other symbolic forms.

(Bolam & Deal, 1992, pp. 314–5)

These frames have been researched by Bolman and Deal who conclude that, while all four frames are important for success as both a manager and leader, their results suggest that school leaders rarely use more than two frames and almost never use all four (p. 316). Furthermore, research with principals from Florida and Singapore showed that the human resource frame was dominant in principals’ critical incidents, while structural themes were the second most common (pp. 317–8).

Day et al.’s (2000) study of school leadership in England also utilised these four frames and they argued that, while there was evidence of the use of all four frames by the leaders they case studied, “it was the human resource frame which occupied most of their daily time and which created the most tensions and celebration” (p. 165). Much the same conclusion can be drawn from these heads of small schools. Their concern for teamwork, positive and productive social and professional relations, collegiality and collaboration are equivalents for Bolman and Deal’s lexicon for the human resource frame. Thus, it seems that headteachers and principals share a common concern for leading and managing staff, or as Riley and MacBeath (1998) refer to it, “the school’s inner life” (p. 148). That is, the emotional, personal and interpersonal dimensions of organisational life and growth, as well as the professional.

In line with Day et al.’s (2000) study I would also argue that this sample of heads of small schools used the other three frames, but not with as much emphasis. There were signs of structural, symbolic and political frames being used, but without each individual completing Bolman and Deal’s inventories it is impossible to say whether this is a composite view or something common to each individual. Thus further work is needed to advance this line of enquiry.

However, what can be said is that the human resource frame appears to be a constant emphasis and the highest priority for heads and principals. This could have implications for their professional development. Heads who experience difficulties may need to hone their interpersonal skills, while others may need to attend to their structural, symbolic and/or political frames.

**Conclusions**

Although this chapter is predicated on the idea that we need a more discriminatory appreciation of context and situational leadership in schools, there is also a
good case for studying leadership in small schools in greater depth. The study reviewed here is, at best, an introductory analysis of the issues. Notwithstanding the small sample and other limitations of the research, there is more than a suggestion here that if we want to look at instructional leadership, then leaders in small schools offer a particularly rich source of knowledge that has hitherto not been developed. Perhaps too much of the educational leadership literature has been willing to advocate particular approaches without providing detailed analytic descriptions of what such leadership actually looks like in action.

These heads were emotionally intelligent leaders because they were able to handle the intense interpersonal dynamics that come with working in small groups. Undoubtedly they were able instrumental leaders, but equally, they were also highly skilled expressive leaders. From all accounts they appeared to manage the affective domain of life in schools and were able to deal productively with the emotional costs of teaching and working with teachers. Clearly, there is more to explore here which should benefit our understanding of organisational context and teacher cultures. Indeed, it can be argued that unless the emotional and psychological dimensions of teaching are acknowledged and dealt with in an empathetic way, then developing knowledge creating schools (Hargreaves, 1998), where the intellectual capital of teachers is valued and utilised for the good of the school, may not advance very far or very fast.

This latter point relates to two others. First, what emerged from looking at leadership in small schools was the extent to which these leaders were able to multi-task. They could switch from one issue to another and keep many things in their minds simultaneously. Such polyphonic behaviour is common to teachers and headteachers in my experience, but not to the extent suggested by these heads and their witnesses. Second, eight of the ten heads were women and all of them led female staff groups. Therefore, the issue of gender should not be discounted. I am not saying that what is presented here is a feminine model of leadership, but I do think that the presence of so many women in the studied schools was a contextual feature and that this in itself warrants further analysis.

The case for women leaders to be studied has long been recognised and advanced. Hall (1997) in reviewing 25 years’ worth of articles in the journal of British educational management and administration says that “gender only began to emerge as a discrete topic after 1980 and since then, has hovered in the wings like a wallflower at a party” (p. 309). Since Shakeshaft’s (1987) influential review which raised issues about the different world of women administrators, the literature has broadly focused on two sets of issues: why women were under-represented in senior positions in educational administration; and differences between male and female managers (Hall, 1997, p. 310). It is the latter set of issues which is of relevance here. Some studies suggest there are differences between male and female leaders, while others suggest that there are no significant differences (McGhee Banks, 2000). In recent years the favoured view seems to be that gender does make a difference in how administrators behave (Hall, 1999; Shakeshaft, Nowell & Perry, 2000; Coleman, 2001). I was not able
LEADERSHIP AND HEADTEACHERS

to detect any such differences, but that may only reflect a weakness in the analytic frame and my interpretation.

However, some current thinking is advising against taking a single issue approach to leadership. Hall (1999) questions the appropriateness of seeing gender as a single determining factor (p. 155) and advocates that researchers adopt a wider viewpoint. Likewise, McGhee Banks (2000), in her review of gender and race in educational leadership, is critical of the limited scope of studies of educational leaders and their attention to just one key variable such as gender, ethnicity, leadership style, or career patterns. Such studies:

Do not usually examine several variables or attempt to identify the intersections among them. Future research needs to have a broader scope and to reflect the dynamics of race and gender within the changing nature of our society. As a socially constructed phenomenon, leadership must also be examined within the changing meanings of race and gender.

(p. 245)

I did not include either perspective in this study and that was clearly a weakness. However, this study of leadership in small schools certainly points to the need to examine in greater depth how women lead staff groups composed entirely of women.

This observation paves the way for another conclusion. In the introduction I argued that small schools are relatively low status institutions. In schooling size matters and bigger schools are usually seen as more important than small ones. This position is further compounded by the fact that small schools are almost entirely staffed by women. Yet, the picture of leadership which emerges from this study shows a sample of leaders who were highly effective, extremely hard working and capable of dealing with multiple issues simultaneously. Their capacity to use skills in combinations was impressive, as was their ability to be energy creators, enablers and empowering. These heads were perhaps the closest I have seen to transformational leaders in action. Far from according them low esteem and paying them little attention because they lead ‘small’ schools, they may well be potentially rich subjects for learning about instructional and educational leadership.

Finally, given all that I have said about context, I now want to end with one further observation. Within the primary school sector in England, at least, but possibly in elementary schools in other countries too, many of the differences which might be detected in leaders’ interests, actions and behaviours and which are associated with contextual variables, are likely to be more about matters of degree than of kind. For example, it may be that there are substantially more indirect and mediated effects used in very large schools. In small schools heads may have to be more directly involved in expressive and affective leadership than in larger ones, where other leaders may be involved and the headteacher
LESSONS FROM SUCCESSFUL LEADERSHIP IN SMALL SCHOOLS

more remote. Likewise, the effects of shared and distributed leadership will figure in larger schools and these will need to be taken into account alongside the headteachers’ effects. Clearly there is much to discover, explore and record before we can feel we have an adequate understanding of school contexts and their influence on the nature and texture of leadership.

LEADERSHIP AND HEADTEACHERS

LESSONS FROM SUCCESSFUL LEADERSHIP IN SMALL SCHOOLS

STAGES OF HEADSHIP

Dick Weindling

1. Introduction

This chapter uses socialisation theory to re-examine the NFER longitudinal study of headteachers (Weindling and Earley, 1987; Earley et al., 1990 and 1994/5) in order to study the stages of headship transition. Previous models of leadership transition and succession in both business and schools are outlined. Finally, the NFER findings are integrated with the earlier work to produce a stage theory of headship which can be used as a research tool and to assist the development of heads and prospective heads.

2. Stage theories of socialisation

A useful approach to understanding leadership and headship development derives from Merton’s (1963) socialisation theory. The stress here is on the two-way interaction between the new leader and the school situation (with each trying to change and influence the other). In this view of socialisation, which is prevalent in the North American research, there are two main overlapping phases:

- professional socialisation which involves learning what it is to be a headteacher, prior to taking up the role, from personal experience of schooling and teaching and from formal courses;
- organisational socialisation which involves learning the knowledge, values, and behaviours required to perform a specific role within a particular organisation (Schein, 1968), after appointment.

A large body of work exists, drawn largely from the non-educational field, where previous writers have suggested stage theories to explain the transition phases experienced by leaders. Although various labels are used by different authors, they commonly identify three periods of organisational socialisation. Hart (1993) provides the most detailed synthesis and critical analysis of the field and the following is adapted from her book.
STAGES OF HEADSHIP

Stage 1. Encounter, anticipation, or confrontation
The initial arrival stage requires considerable learning on the part of new heads as they encounter the people and the organisation. Cognitive approaches focus on rational interpretations and the understandings that new heads construct, what Louis (1980) called the *sense making* process in an unfamiliar situation.

Stage 2. Adjustment, accommodation, clarity
This involves the task of attempting to fit in. New leaders must reach accommodation with the work role, the people with whom they interact and the school culture. They look for role clarity in this new setting and may face resistance from established group members.

Stage 3. Stabilisation
In this stage, stable patterns emerge but this is only visible in data from longitudinal studies. Nicholson and West (1988), using a cyclic model, treat the stages of stabilisation and preparation (for the next change) together, because they found that stabilisation did not occur for some managers who had moved on to their next post.

3. Previous research
A few studies have looked at the period as a deputy as preparation for headship. Ribbins (1997), for example, interviewed 34 heads and found that, while some enjoyed the experience as an appropriate preparation for headship, relatively few remembered it with enthusiasm or their former heads with unqualified warmth. Although most felt that their heads had not positively prepared them for headship, they believed that they had learned from the negative experiences, often vowing never to act like that themselves.

Gender issues and headship were explored in two important, life history studies by Evetts (1994) and Hall (1996) who found that women heads’ career paths, and the way they approached management, differed from that of men, but these authors did not use stage theory.

Parkay and Hall (1992) conducted a US project modelled on the NFER research. They surveyed 113 new high school principals and carried out case studies of 12 throughout their first year in post. A return visit was made after three years. The authors derived a five-stage developmental model to describe the career patterns of new principals:

1. Survival
2. Control
3. Stability
4. Educational leadership
5. Professional actualisation.

Four basic assumptions underlie the model:

- principals begin at different stages and not all start at Stage 1;
- principals develop through the stages at different rates;
- no single factor determines a principal’s stage of development. Personal characteristics, the school context and the previous principal all play a part;
- principals may operate at more than one stage simultaneously, i.e. the stage is their predominant orientation.

In this country, Day and Bakioglu (1996) questionnaired 196 headteachers and interviewed a sample of 34, and derived a four-phase, developmental model:

1. Initiation: idealism, uncertainty and adjustment.
   This lasted about three years and involved two key processes: learning on the job and accommodating to the existing framework and structure of the school.
2. Development: consolidation and extension.
   Heads with four to eight years’ experience were still enthusiastic, saw this as more satisfactory and rewarding with fewer difficulties than the other phases, built new management teams as inherited senior staff left, and delegated more.
3. Autonomy.
   Here heads continued to be self-confident, felt they had management expertise but had less energy, a nostalgia for the past, and saw externally imposed national initiatives as causing lack of enthusiasm. ‘Autonomy’ was positive in that they felt in control of the school, but negative because this was threatened by external change and pressure to work with governors.
4. Disenchantment.
   A decline in confidence, enthusiasm and fatigue were the characteristics here. Heads started to ease off and their health (physical and mental) deteriorated as they approached retirement. The Education Reform Act had a major impact on many of them.

Ribbins (1998) adapted Day and Bakioglu’s phases and a stage model developed by Gronn (1993, 1999) to produce a model of typical pathways for school leaders:

- Formation – the early socialisation influences from agencies such as the family, school and other reference groups which shape the personality of a future head.
- Accession – career advancement and preparation for headship.
STAGES OF HEADSHIP

- Incumbency – the total period of headship, from appointment to leaving, sub-divided into Day and Bakioglu’s four phases, to which Ribbins adds enchantment as an alternative to disenchantment for some long-serving heads.
- Moving on – leaving headship which may involve divestiture for the disen-chanted or reinvention for the enchanted.

Gabarro (1987) conducted research on 17 senior management successions in business and industry in the US and Europe (including three case studies in the UK), pointing out that while there has been research on management succession, very little work has examined the activities and problems facing a new manager after they take up their post. He calls this process ‘taking charge’:

... I do not mean just orienting oneself to a new assignment. Taking charge, as I use the term, refers to the process by which a manager establishes mastery and influence in a new assignment. By mastery, I mean acquiring a grounded understanding of the organisation, its tasks, people, environment, and problems. By influence, I mean having an impact on the organisation, its structure, practices, and performance. The process begins when a manager starts a new assignment and ends when he or she has mastered it in sufficient depth to be managing the organisation as efficiently as the resources, constraints, and the manager’s own ability allow.

(Gabarro, 1987)

He characterised the process as a series of five predictable, chronological stages of learning and action. The timings are approximate:

- Taking hold (the first six months).
  This period involves intense learning as the manager develops a cognitive map of the organisation using processes of orientation, evaluation (an assessment of staff, understanding where the problems lie) and establishing priorities. ‘Corrective’ actions are taken to address emerging problems and ‘turnaround’ actions to deal with urgent problems.
- Immersion (six to 12 months).
  This very important period of deeper learning and diagnosis involves relatively little organisational change activity. Managers develop a much better understanding of the basic issues and underlying problems. They often question more sharply if they have the right people in place as they understand their strengths and weaknesses.
- Reshaping (12 to 21 months).
  This is a time of major change, organisational reconfiguration and implementation. The transition to reshaping often involves the use of task groups and external consultants.
LEADERSHIP AND HEADTEACHERS

- Consolidation (21 to 27 months).
  Earlier changes are consolidated. Learning and diagnosis tend to be evaluative. The manager and key colleagues assess the consequences and the unanticipated problems of earlier changes and take corrective actions.

- Refinement (27 to 36 months).
  A period of fine-tuning with relatively little major additional learning. The managers had ‘taken charge’, were no longer ‘new’ and had either established their credibility and power base, or not. This relative calm could be disturbed by changes in the external world.

Gabarro found that the organisational changes managers made as they worked through these stages characteristically occurred in three waves: the first wave occurs during the Taking-Hold stage, the second, and typically largest, during the Reshaping stage, and the last and smallest during the Consolidation stage. These stage and wave patterns are found in successful transitions regardless of the kind of succession (insider versus outsider; turn-around versus non-turnaround cases), the industry of the organisation involved, or the manager’s prior functional background.

4. The NFER secondary heads project

This unique project, which followed a cohort of headteachers for over ten years, falls into three stages:

1. Stage 1 began in 1982 with everybody who took up their first post as a head of a secondary school in England and Wales. Questionnaire data were obtained from 188 heads. Forty-seven new heads were interviewed towards the end of their first term in post and 16 of them were then chosen for detailed case studies covering the first two years of headship. A total of three visits were made to each of the schools in this part of the project and individual interviews conducted with the heads, each of the senior management team, a cross-section of teachers, the chair of governors and a senior LEA adviser. A total of over 300 interviews was conducted.

2. In 1988, the cohort of 188 heads was surveyed after they had been in post for five to six years and the 16 heads were re-interviewed.

3. In 1993, survey data were collected from 100 heads who were still in post some ten-11 years after they began their headships.

This chapter concentrates on the problems the heads experienced and the changes they made in this ten year period.

a. The first years

The key point to make is that new heads do not start with a clean slate (as some seem to think). The shadow of ‘headteachers past’ hangs over them for longer
than they expect. The previous head had often retired, having been in post for 15 to 20 years. They had ‘shaped the school in their image’ and while this might be apparent in the form of structure, it was harder to see the school culture. New heads were often surprised, when they confronted existing routines, to be told, ‘That’s the way we have always done it’. They soon found that their approach differed from that of their predecessor and this affected the period of settling in and the kind of changes they made. Many teachers said the new heads and their predecessor differed considerably – they were like ‘chalk and cheese’.

The main problems reported by new heads were: difficulties caused by the style and practice of the previous head, the school buildings, communication and consultation with staff, creating a better public image of the school, coping with a weak member of the SMT, dealing with incompetent staff, and low staff morale.

The heads differed in their approaches to change. Some deliberately chose to make early changes, others to move cautiously, while some were delayed and hindered by a poor SMT.

Almost all the changes made in the first year were organisational. Curricular changes began in the second year and continued into the third year and beyond. A few of the changes to the pastoral system occurred in the first year, but these were mainly introduced in years two and three.

The organisational changes made soon after the new head’s arrival were frequently concerned with communication and consultation. Another group of early changes was concerned with promoting a positive image for the school, something of particular concern to the new heads especially where the community held it in low esteem or student numbers were falling.

Today it is hard to remember the pre-National Curriculum and OFSTED inspection period when these heads first took up their posts. They had to initiate curricular changes. Timetable changes could not be implemented until the beginning of their second year, but much preparatory work was undertaken in the first year. This usually took the form of a curriculum review, where each department was required to set out its aims, objectives, schemes of work and, in some cases, methods of assessment.

Of the 200-plus changes introduced in the first three years in the 16 case study schools, it was noticeable that only a handful did not originate with the new heads themselves. Once the decision to adopt a change had been made, day-to-day responsibility was usually delegated either to a deputy head or a head of department.

b. Ten years on

The external changes produced by the Educational Reform Act and other legislation had only just begun when we conducted the second phase of the research in 1988. The following five years saw the heads attempting to cope with substantial changes imposed from outside.
One hundred of the original cohort 1982/83 returned a completed questionnaire in 1993. Seventy-seven were still in their first school, while 23 had moved to a second headship. We were not able to track down the fate of those (104) who did not return a questionnaire, but we believe that most had retired.

To gauge their feelings after ten years the heads were asked a set of questions about their current level of enthusiasm. Two-thirds said they had the same enthusiasm as when they started as heads but there were noticeable differences between those who were still at their first school compared with those who had moved to second headships. For example, 40 per cent of those still in their original school said they did not have the same enthusiasm as when they started, compared with only 14 per cent of those in second headships. This may not be an unexpected result, but it is difficult to tell whether those who moved to a second school were more highly motivated people, or whether the challenge of a new school boosted their enthusiasm. It is most likely to be an interaction of the two.

In order to explore how the problems changed over time a set of core questions was used in the first and last surveys. Table 1 shows heads’ perceptions in 1984 and 1993 on the core questions where a direct comparison is possible.

Most problems were perceived to lessen over time, e.g. getting staff to accept new ideas; creating a good public image of the school; dealing with poor staff morale; improving communication and consultation; managing staff development and INSET; establishing discipline; dealing with finance; and issues concerning non-teaching staff. However, a few problems seemed to have increased, e.g. managing time and priorities; working with the governors. Dealing with

</table>
incompetent staff appeared to have continued over time. Working with LEA officers and advisers remained a very minor problem for most heads.

These findings are likely to be due to the interaction of several complex factors. With time, heads and staff get to know each others’ strengths and weaknesses; the heads have made some key staff appointments; they have gained a deeper understanding of the school and have introduced most of their intended changes. But the world outside has also changed. During the ten-year period a large number of external changes occurred, such as: the role of governors, LMS, GM, NC, league tables, and OFSTED inspection.

The 100 heads were also asked to outline how they thought the school had improved in the five years since the previous survey. It is interesting to compare these results with the heads’ replies to the same question in 1988 when they had been in post about five years.

Half the heads reported improved exam results in their first five years, while 29 per cent said the results had improved in the last five years. It seems possible that some sort of ‘levelling off’ may have occurred. However, without more detailed information it is not possible to say exactly what has happened over the total ten-year period.

Similarly, in the 1988 study, half the heads mentioned improvements in the curriculum. Not surprisingly, this again emerged as a focal area. In fact, the comments were very similar, usually describing a more relevant curriculum, but after ten years just over a quarter of the heads mentioned the curriculum.

Approximately the same number – about a quarter – talked about physical improvements in the buildings and facilities in 1988 and 1993. At each point in the study very similar comments were also made about improvements in the main areas of staff, students, parents and the community.

School improvement, in all its forms, is obviously the major quest for all heads. From our longitudinal research it seems that most of the groundwork is put in place during the first five years or so, and then further refinements are made. This involves setting up a number of working parties, curriculum and organisational restructuring, modelling appropriate behaviour, and most crucially, appointing key staff (particularly at senior and middle management).

5. Transition to headship: stages of socialisation

A problem with much of the previous research in schools or businesses is the lack of a sufficiently long time-frame to see all the phases of development. Hence the value of the NFER ten-year study.

Gabarro’s work shows interesting parallels with the NFER study where the new heads attempt to ‘take charge’. But heads are more constrained than business managers in their ability to hire and fire, and the school year and timetable delay major curricular changes. Nevertheless, the waves of changes described by Gabarro have great similarity to the way that the heads introduced change.
Another common finding was that internally appointed heads/managers appear to make fewer changes and to move slowly than external appointees.

Day and Bakioglu’s final phase of disenchantment produces a new perspective, while Ribbins offers the alternative of enchantment for some long-serving heads. The NFER data shows that, as Ribbins believes, some heads are enchanted and others disenchanted by their experience of headship.

The NFER results and the work of Hart, Gabarro, Day and Bakioglu, and Ribbins and Gronn, have been used to produce the following model which maps out the stages of transition through headship. The timings are approximate.

**Stage 0 – Preparation prior to headship**

Throughout their career people develop a conception of headship during their professional socialisation which is learned through both formal and informal processes. As the NFER and other studies (e.g. Ribbins, 1997) show, they learn from both good and bad headteacher role models.

The NFER heads said they learned about headship throughout their career but they particularly stressed the value of the following experiences prior to appointment: the need for a wide variety of experience, especially as a deputy head; the value of a period as acting head; the importance of delegation by the head; the rotation of deputies’ responsibilities; and the need to work with heads who saw deputy headship as a preparation for headship. Some heads spoke highly of management courses that they had attended as deputies, but most agreed that off-the-job training and development complemented experiences gained as a deputy working with ‘a good practitioner’. The gulf from deputy to head was, nevertheless, seen as enormous: ‘no course or reading matter can really prepare you for the job’. It will be interesting to see to what extent the National Professional Qualification for Headship (NPQH) improves the preparation for headship.

**Stage 1 – Entry and encounter (first months)**

The first few days and weeks are a critical period when the new head’s notions of headship meet the reality of a particular school. It is a time of ‘surprise’ and the importance of sense-making is highlighted as organisational socialisation begins and the new head attempts to develop a cognitive map of the complexities of the situation, the people, the problems and the school culture.

**Stage 2 – Taking hold (three to 12 months)**

The newcomer strives to ‘take hold’ in Gabarro’s terms, and the new heads begin to challenge the ‘taken for granted’ nature of the school. The NFER heads introduced a number of organisational changes. They develop a deeper understanding and their diagnosis of key issues during this stage was used to decide priorities.
STAGES OF HEADSHIP

This is also part of the ‘honeymoon period’, when staff are more lenient and open to change. In the NFER study we found that all new heads had such a period, though some did not realise it! The length of time varied, from about a term to possibly a year. It was often ended suddenly by negative staff reaction to an action of the new head e.g. an internal appointment whom the majority of the staff considered the wrong person for the job.

**Stage 3 – Reshaping (second year)**

After a year in post most heads felt more confident and were beginning to feel that they could take off their ‘L’ plates! They had experienced a complete annual cycle of school events and learned about the strengths and weaknesses of the staff. Conversely, the staff had also learned about their strengths and weaknesses, and their mutual expectations had become more realistic. The seeds planted in the previous stage now produced the implementation of major changes to reshape the school. This was the period of major change.

**Stage 4 – Refinement (years three to four)**

After two years many of the structural changes were in place. But during this stage further curriculum changes were introduced and a number of refinements made. Previous innovations were fine-tuned and heads felt they were ‘hitting their stride’.

**Stage 5 – Consolidation (years five to seven)**

After about five years a period of consolidation seems to occur after the heads have introduced most of their planned changes. However, in the NFER study this was affected by the introduction of legislative and external changes. These, as Gabarro found, required attention as their impact may hit the school during any of the stages.

**Stage 6 – Plateau (years eight and onwards)**

The NFER heads suggested that about seven years in one school was sufficient to see through a cohort of pupils and to have initiated most of the changes they wanted. This period corresponds with Day and Bakioglu’s phase of disenchantment or Ribbins’ enchantment. The NFER data showed that about a third of the cohort felt they had reached a plateau after ten years but that this was far less likely if they had moved to a second headship. Motivating heads who stay in one school until the end of their career can be a problem. However, many of the NFER heads said they still enjoyed their work and, despite the changes to the role, considered it to be the ‘best job in education’.

The model is in the form of an ideal type and some caveats are necessary.
Clearly the time periods attached to each stage must be treated as approximations. It is also likely that different heads may move at different speeds, as Parkay and Hall suggest. Also, the situation in the UK has changed considerably due to ERA and other legislation. Whereas the NFER heads were able to introduce almost all the changes internally, today’s headteacher has to manage multiple initiatives which originate externally, and attempt to integrate themselves and shape the culture of the school. Unfortunately, the NFER study of secondary heads had too few women heads to make a comparison. This means that it is not possible to say how gender differences might affect the stages of headship.

The model is offered as a means of helping headteachers and prospective heads to understand the likely phases they will experience during headship. Although the particular circumstances in each school make it unique there are common patterns, knowledge of which can be used to improve the preparation and support for heads.

Part 9

LEARNING LEADERSHIP
ENHANCING SCHOOL LEADERSHIP

Evaluating the use of virtual learning communities

Megan Crawford

Introduction

The growth of the virtual learning community, both in the UK and globally, has been rapid in recent years, especially for those in positions of leadership in schools. This is part of a global trend to ‘online anything’ (Stephenson, 2001), where governments, educators and companies are keen to exploit the potentials of the Internet and Web-based online learning. Stephenson argues that it is a powerful trend that education is part of, and asks whether it amounts to anything more than doing what was previously done, but on a larger scale, and for more people.

At first glance, it would seem that much of the development in England has been driven by perceived governmental need to disseminate policies, share ‘good’ practice among heads, and allow direct communication to the leadership community, bypassing LEAs (local education authorities). However, by the very nature of their role, leaders can be isolated from those they lead. Developing online networks would seem to be an excellent strategy for relieving isolation, providing space for educational leaders not only to reflect, but also to share the affective side of leadership. The purpose and structure of online communities within the greater policy context may well be a subject for debate for some time.

This article draws on Wenger’s concept (1999) of a community of practice, and Salmon’s model of e-moderation (Salmon, 2000). Drawing on an evaluation of one such online community, the article will look at the influencing factors in such an online conferencing facility, the part played by group interaction and participation, and the distinctive role of moderation in such leadership discussions. It will also draw on established adult learning concepts such as situated learning (Lave and Wenger, 1990). To this author, online conferencing is all about community—creating new social forms at a time where communities everywhere are being eroded, and the possibility that you can have deep, warm personal relationships electronically in this medium (Farson, 1997). This article
will argue that these forms of discussion are organizationally, socially and intellectually challenging, and discuss a developing conceptual framework. It aims to begin to shape our thinking about the ways in which school leaders can be supported through online conferencing, and how such discussions could play a key part in encouraging and sustaining leadership in schools, perhaps through more formal online mentoring arrangements. It also highlights the need for more research into this area.

The discussion will be shaped around the following questions:

- What value do educational leaders place on using online conferencing?
- What is it about working online that changes the environment and the experience for those that take part?
- What is the role of the facilitator/moderator in working and learning online?
- How can we define both online groups and ‘participation’?
- Are there any key implications for leadership and management in using such environments?

**Context of the original research**

Developed by the Teacher Training Agency (TTA) in partnership with Hay/McBer Management Consultants, and in association with the National Association of Headteachers (NAHT) and the Open University (OU), the Leadership Programme for Serving Headteachers (LPSH) became nationally available in the United Kingdom in November 1998. The OU supported the Information and Communication Technology (ICT) component of the programme until Easter 2001. Responsibility for the LPSH passed from the TTA to the Department for Education and Employment (DfEE) in June 1999 and then the National College for School Leadership (NCSL) in April 2001. The college now runs ‘Talking Heads’ a follow-up online community.

The programme was aimed at all serving headteachers in England and Wales and had four key elements: pre-workshop preparation; a four-day residential workshop; post-workshop support; and a follow-up day. During the residential workshop it was intended that trainers introduce the dedicated LPSH website. This was developed and managed by the Open University, and incorporated a range of features including:

- a conferencing facility which enables participants to share ideas and expertise;
- a ‘Good Ideas’ database submitted by headteachers;
- resources providing guidance on analysing school performance data and target setting; and
- SWISH—(Selected Websites Indexed for Serving Headteachers) providing an A to Z index of websites covering management, education and professional topics.
The research concentrated on the online conferencing part of the ICT component.

Each LPSH workshop was given a conference facility, using First Class conferencing software in its web access format, so that in theory participants could keep in touch electronically after the residential element of their programme. Where appropriate they were moderated by colleagues with experience at a senior level in the field. Access to all conference areas was controlled centrally and each LPSH participant was given a unique user name and password. A published code of practice set out the etiquette for all online conferencing.

Up to January 2001, 5388 headteachers had been given user names and passwords entitling them to full LPSH website access. Thirty-eight per cent of the entire LPSH population, 2067 people, logged on in the period January 2000–January 2001. Thirty-six per cent had never logged on by password, though this figure does include a small number who had yet to attend their LPSH workshop; a further 26 per cent had not logged on in the calendar year in which the research was carried out.

From January to September 2000, there were 63,338 successful hits for the entire LPSH website. The number of sessions peaked in March and dropped to their lowest in August, when most schools are on vacation. If the August figure is discounted, the average figure per month is 7659 hits. Extrapolated across the year these figures suggest over 85,000 hits. However, care is required in extrapolating figures because the number of LPSH workshops varied from month to month.

The programme itself did not insist upon participants using or demonstrating a competence in ICT. It was for participants to choose whether to use the ICT component. They were neither contracted to do so nor provided with the necessary ICT equipment. The follow-up project, ‘Talking Heads’ using Think.com software, provided participants with a laptop and insisted upon regular logging in as a component of participation in the pilot phase. Laptops are also given to new headteachers in England every year, if they join the project. The rollout phase is currently being evaluated and should provide more information on the role of online communities.

**Method**

For the evaluation, a variety of research instruments and techniques were used and both quantitative and qualitative evidence was collected. This created a mixed method study (Caracelli and Greene, 1993). The sources comprised technical records from the OU servers, a telephone survey, an online questionnaire and a specific online conference. Technical records generated by the OU servers provided a range of valuable background material. The telephone survey was conducted in late November 2000. Four separate categories of participant were targeted and 72 successful interviews conducted. The four participant categories were as follows and the bracketed figure shows the number interviewed:
LEARNING LEADERSHIP

- the most active users in October 2000 (24);
- occasional users (6);
- non-users who went to a workshop in June and July 2000 (21); and
- participants from two parallel LPSH workshops in January 2000 (21).

Separate but linked question sheets were designed for each category. The questionnaire was first made available as a downloadable file and subsequently as a document that could be completed ‘live’ online. It was designed to elicit information about:

- respondents and the schools they work in;
- their use of the LPSH website;
- their views on the current LPSH website; and
- their views as to how it should develop.

Questions in the first two areas were primarily designed to yield quantitative objective data; those in the remaining areas to provide opportunities for qualitative judgements. Additionally, once the initial findings were analysed, an online, moderated conference was set up, drawn from a random sample of participants who logged on regularly. This offered a forum to discuss and interpret the results, as well as an opportunity to probe further into the answers.

The research

Telephone survey

The 72 respondents to the telephone survey were almost evenly divided by gender. Exactly half were heads of primary age children; 57 respondents had served as a headteacher for six or more years, and 35 had 10 years’ or more experience.

In the survey, active and occasional users of the LPSH website were invited to make qualitative judgements about it. Of the 30 active and occasional users of the LPSH website surveyed, 26 regarded the conference facility as its most useful feature. The ability to keep in touch with course participants was also mentioned several times and clearly, for many, conferencing was the key strength. Both groups were also asked to indicate their strength of feeling in relation to a series of statements about the LPSH conferencing facility. Using a five-point scale they were able to express opinions from strong agreement (5) to strong disagreement (1). Taken together, active and occasional users believed that the conferencing was easy to use (mean score 4.1) and promoted useful discussion (mean score 4.0). They also thought, though with less strength, that the conference facility was relevant to their needs (mean score 3.7), reduced their isolation (mean score 3.5) and enabled them to get rapid responses (3.3). Active users were slightly more certain that it was easy to use and promoted useful discussion; occasional users that it reduced their isolation.
Headteachers felt that not enough people used the conferencing facility. The reason for this given in the responses was often believed to rest within the LPSH training, and is outside the remit of this article. However, we will return to the discussion of the importance or otherwise of numbers of participants in conferencing.

Non-users were also asked about their reasons for not subsequently logging onto the website. When offered a list of five possible reasons just over half said they had too little time to do so and, in setting out other relevant factors, several more pointed to other priorities, including preparing for an OFSTED visit and inspecting a leaking roof. None of the respondents identified a lack of ICT skills as an issue, though four touched on a lack of suitable ICT equipment and one reported not being able to gain access despite trying. While a small number were not sure about the website’s relevance and felt that they needed some sort of stimulus, just one person did not like the content. Although no one reported lost passwords as a factor preventing them from using the website, two-thirds of those contacted asked to be sent access details in one form or another.

As well as targeting groups of headteachers by their usage of the website, a sample was taken of two workshops picked at random. These two groups contained 24 participants and all but three could be contacted for the telephone survey. Over two-thirds of the respondents were female; exactly two-thirds were headteachers at schools involved with Key Stage 1 and/or Key Stage 2; and all bar two had served at least six years as a headteacher. Of these headteachers 16 said that they had had the opportunity to look at the website on their LPSH workshop. However, of these, three commented on their disappointment that they had only done so briefly and two noted that there had been significant problems with the computers. Furthermore, the two headteachers who said they had not had the opportunity to look at the website during the workshop explained that this was due to difficulty logging on and the tutor’s inability to overcome the problems. Seven headteachers said that they have had subsequent opportunities to explore the website, but of these only three felt able to express views on it. The 14 who had not logged on responded to a list of factors and were given the chance to include others; 11 (and therefore half of the entire group actually sampled) said they had too little time and several more reported other priorities. Five noted lack of suitable ICT skills or equipment and two said that they had tried but been unable to get onto the site. While only two had lost their passwords, 10 asked to be sent their access details again. Just three of the entire sample had gone on to become more regular users. Where they expressed preferences and exercised clear judgements this small group felt conferencing to be the most useful feature.

One headteacher expressed concern about conferencing (in general) being used as a chat line instead of a business tool, while another had suspicions about the web and what happened to comments once people had expressed them. This may be a personal opinion reflecting a normative view about how communication between professionals should be structured. However, there was frequently
recognition that the website could be a means of keeping in touch and exchanging ideas, as well as providing links to other sites and resources.

**Online questionnaire**

As well as the telephone survey, an online questionnaire was trialed. Although the online questionnaire used a very small sample the results obtained were very detailed. Most of the 12 respondents to the online questionnaire were headteachers working in the primary sector, mostly in community and voluntary-aided schools. Five were in their first headship and eight had served for over 10 years as a headteacher. School size varied from 93 to 513 pupils and nearly all were within 5 miles of an institution similar in status, type and the number on roll. Analysis of respondents’ use of the LPSH website revealed that nearly all logged on from home in the evening, even though they could take advantage of confidential access at school if they wished. Most logged on at least weekly, but three visited the site monthly and one person just once a term. The length of user sessions was rarely less than 10 minutes or over one hour. Ten headteachers used the website during school vacations. Conferencing was the most frequently accessed area; it was also regarded as the most useful.

Respondents were invited to comment on the strengths and weaknesses of the conferencing facility. Keeping in touch with former course participants and the ability to share and discuss ideas were frequently noted strengths. One headteacher described it as: ‘a rare opportunity to share thoughts and concerns with colleagues across the country’. Another valued the opportunity to: ‘break away from the local culture’. For one person the opportunity to get a rapid response to issues of concern or interest was important. ‘Comprehensive debate’ was also mentioned and the site was described as ‘a valuable opportunity for the exchange of idea, with real potential’.

More generally, other respondents noted that it was easy to use, getting broader and covering more issues. It was ‘an excellent resource’ in which the main strength was the ‘support structure’. These thoughts were taken up in the Online Conference on the initial research.

**Why do educational leaders use online conferencing?**

To probe deeper into why headteachers used the site, the online conference discussion was set up. Its aim was to focus more specifically on why headteachers who used the conferencing frequently did so, and what were the barriers, if any, for them in building up an effective online community. The strongest reason for using it was summed up by the following headteacher: ‘As heads, we have relatively few people with whom we can traditionally confer on an emotional level and more generally, conferencing does provide opportunities for informed discussion.’

Another said: ‘This form of communication fits in with my time schedule. I
can use it whenever I have time.’ There was an interesting paradox that began to emerge from the comments. Those who use the conferencing said that it fitted in with their time schedule, and was a welcome treat in a school day: ‘If I’m word-processing some document or other for school or governors or church, it’s a welcome diversion to pop into LPSH.’

Less active users, as reported above, were more likely to make comments focusing on lack of time, such as: ‘I wish I had more time to use it. It could do with being bigger and quicker so that people like me, when I am busy and need it most, can get on line quickly.’ This strongly suggests, as a participant noted, that ‘time and tradition influence our use’.

A strong feeling to emerge early on was that, as in any social arena, people feel more comfortable when social conventions that would apply in face to face discussion, are observed:

People need a bridge into electronic communications.

We feel more comfortable if there has been some sort of introduction.

There is the opportunity for one to one engagement, but at a level of intimacy that is less than that face to face. It is in some ways less spontaneous than speech and may appeal to those who prefer writing to talking.

These findings replicate other studies of online forums (Anderson and Kanuka, 1997). They have suggested that professional discourse needs to develop new social skills to cope with socializing electronically. Others (Rafaeli and Sudweeks, 1997) suggest that face-to-face communication should not be used as a standard of comparison because, if communication is to be fully interactive, preceding messages must be taken into account and the manner in which previous messages were reacted to.

Newcomers to conferencing reported a sense of moving into an established group of people who had physically met, despite any online evidence of this:

It felt strange contributing to something when you didn’t know any of the other names. In fact for a while I just read everyone’s contributions. I felt as if they must all know each other personally from the way the contributions read.

This emphasises how a feeling of ‘knowing others’ can develop, despite the lack of physical or verbal clues. In some ways it is akin to the art of 19th-century letter writing, but with more opportunities to interact with the ongoing community commentary. The headteachers’ comments echo those comments reported by Beatty. Her study of the emotions of leadership online is one of the fullest currently available.
Their enjoyment of the process of sharing real feelings, is itself an important finding. This experience has been described variously as follows: ‘compelling,’ ‘a real high,’ ‘I really enjoy reading this stuff,’ ‘I feel this dialogue has provided both personal and professional growth.’ (2000: 13)

These comments and the replication in this research suggest that online conferencing for headteachers actually taps into the affective, emotional side of leadership, rather than being a ‘professional’ discussion arena. The topics, e.g. stress, bereavement, difficult colleagues, that participants have themselves suggested over the time period of the research suggest strongly that this is the case.

Last year I was experiencing a very traumatic time with a governor. I used the steam room and boy was it good. The comment about needing to unload with peers is very true and colleagues in nearby schools are not always the ones.

**What is it about working and learning online that changes the learning environment and the experience for those that take part?**

Brochet (1989) suggests that some conferences have an energy that encourages active participation, while others, apparently designed to facilitate discussion of equally relevant and interesting topics, seem to offer little of value to the contributor. The ICT component of LPSH was predicated on the assumption that the implementation of networked technology to online conferencing would be easy, and require little extra from the trainers, if the headteachers had access to the appropriate equipment. Somehow, they would both know how to use it, and what its value to them was as leaders. This has not been the case. Very quickly, the leaders using the site moved the discussions away from the initial workshop stimulus (leadership in a more theoretical sense) to issues of daily concern. But providing the facility was not enough, the community had to be nurtured and developed. This research has shown that those who took up the opportunity of conferencing, and used it regularly, found it very valuable. It not only linked in to their daily lives as headteachers, but also enabled them to share emotions about the dynamics of working in schools. There have been major pressures in England over the last few years, coupled with increased and increasing accountability to central government. Conferencing has provided opportunities for leaders both to acquire knowledge from a professional community and also develop shared meanings as the group learning processes have been developed.

As heads have relatively few people with whom they can traditionally confer on an emotional level and more generally, conferencing does provide opportunities for informed discussion.
I find purpose—apart from fun—and I have a much-enhanced respect for heads, their skills and problems (just like mine).

The benefits they have felt are derived from the paradox described by Beatty (2000: 15):

The paradox of emotion and educational leadership, is the dichotomy between the way leaders, and teachers, believe they are required to seem, and the way, as highly functioning, multi-dimensional human beings, they need to be. In order to accomplish the emotional labour of being emotionally controlled in difficult, threatening and angering situations, the emotions may become subverted to the cause. Even so, deep emotional understanding requires access to what oneself and others are really feeling, something that has been professionally hidden in the traditional models of teaching and leading.

Gradually, a community of practice had developed, a living context that, as Wenger argues, invites a personal experience of engagement. Identity is about deep connections with others through shared histories and experiences, reciprocity, affection and mutual commitment (Wenger, 2000).

The LPSH research detailed in this article showed how the community could help other members manage the multi-dimensions of leadership. Building such a community of practice through the medium of online conferencing meant that participants could explore aspects of leadership within a safe virtual space. To engage with the community across various levels, because so many became involved, it was necessary to structure it in layers. The NCSL has also structured ‘Talking Heads’ into more accessible layers, as navigation can provide a bar to access and participation. I will return to the meaning of ‘participation’ in online communities. Wenger suggests that this layering into a fractal structure means that you can belong to your own subcommunity and yet experience in a local and direct way your belonging to a much broader community. This can be further illustrated by using Wenger’s three elements of community as identifiers.

Members are held together by their collective understanding of what their community is about . . . (they) hold each other accountable to this sense of joint enterprise.

Members build their community through mutual engagement. They interact with each other, establishing norms and relationships of mutuality that reflect these interactions.

Communities of practice produce a shared repertoire of communal resources—language routines, stories, styles, etc. To be competent is to
have access to this repertoire and be able to access it appropriately. (2000: 229)

For newcomers to become full members of the community, they must gain new positions in that community’s economy of meaning. Participation in a community can therefore be seen as crucial. This dovetails with Lave’s concept of situated learning. If learning occurs, it is a function of the activity, culture and context in which it occurs, and social interaction is a critical component of situated learning.

Another key variable is the role of the facilitator, or e-moderator, in online conferencing.

**What is the role of the facilitator/moderator in working and learning online?**

There is a growing literature on the role of e-moderator in learning online, and on the competences that are required to be successful, both for moderators and participants:

Successful online learning depends on teachers and trainers acquiring new competencies, on their becoming aware of its potential and on their inspiring the learners, rather than on merely mastering the technology. In practice, networked applications should reflect the needs of teachers and learners (rather than the other way round!). Providers of online learning platforms are keen to respond to these needs, but currently, most teachers do not know enough about online learning to be able to articulate their needs effectively.

(Salmon, 2000)

Salmon has been at the forefront of work in the UK in this area. She describes a five-stage model of moderation.

This conceptualization is very relevant to this research, but with some significant differences. In the Salmon model, the participants go through certain defined stages as the online learning progresses. At stage 1, individual access and the ability of participants to use the online learning platform are essential prerequisites for conference participation.

The next stage involves individual participants establishing their online identities and then finding others with whom to interact. At stage 3, participants give information relevant to the course to each other. At stage 4, course-related group discussions occur and the interaction becomes more collaborative. The communication depends on the establishment of common understandings. At stage 5, participants look for more benefits from the system to help them achieve personal goals, explore how to integrate online learning into other forms of learning and reflect on the learning processes. She also describes (Salmon, 2000: 112–13)
three types of conference participant—swimmers (participants who can plunge right in), wavers (need quite a bit of help to get started, and often feel there is too little time) and drowners (find it very difficult to log on, and have little motivation to succeed). These evocative names sum up for this author some of the research findings. However, with the LPSH conferencing, there was no explicit course content to moderate. Explorations of issues chosen by the participants were the means that the moderators used to build community, and the participants built their online identities over time.

I have developed a model for this, drawing on the LPSH experience. The model assumes a certain kind of conference, which I initially called non-context based and professional. It seemed pertinent here to develop these models for such a professional online conference, and match them to the research. In the final section of this article, I will align this evidence with other typologies in the online field.
It would seem that the LPSH conferencing was more fluid and organic than the Salmon model described, and the participants, although similar to swimmers, wavers and drowners, differed in several ways. I have called them addicts, newcomers, thinkers, sceptics and dippers. Figure 2 attempts to explain the fluidity of this framework. By definition, everyone is a Newcomer at some stage! However, some heads never moved past this stage into the community proper. Addicts, like Salmon's swimmers, tend to be confident with ICT and able to integrate quickly into a known community. Their motivation may be quite altruistic in that they are willing to spend time in cyberspace with other professionals sharing both the day-to-day minutiae, as well as more profound issues. Thinkers
may eventually become addicts, but the research had many examples of heads who preferred to stay in this group: ‘I get support just reading the conversations.’

‘Thinker’ is a more user-friendly title than that of the ‘lurker’, but may well be seen in the same way as a pragmatic approach to information gathering, or at a further level what Lave and Wenger (1990) call ‘Legitimate peripheral participation’. Sceptics are newcomers who have often been subjected to some sort of technological breakdown on the way to using conferencing, of which the following quote is typical: ‘Recently had trouble logging on. Not been able to log on so not bothered.’

They may also be concerned about the audience for their comments or, having not interacted themselves with others significantly, may treat the whole idea dismissively as ‘chat’. Dippers, on the other hand, tend to be less altruistic than other users, and will only really become involved when they need some sort of response urgently from other leaders. This activity can also be described in online discussion groups as ‘illegitimate peripheral pilfering’. This is effectively summed up in the following comment: ‘On tap there are other educational professionals’.

Because the software used (FirstClass) gives the participant an overview on his/her screen of the whole conferencing arena, and access to the history of messages, they can feel a part of the whole process. This is more difficult to achieve in other conferencing systems where the pages displayed are very individualized. However, it also means that for those who choose not to participate fully, or become sceptics, they are unable to get a sense of what taking part and being part of a community actually means.

Effective facilitation engages participants in this process of becoming and adds and fosters the personal experience of engagement. The research has shown that this type of intervention by other leaders and professionals was clearly valued and part of the reason that they felt a part of the community. It also reinforced the idea that this sort of activity was a professional one to engage in:

The facilitator keeps the conversation going. They wind up if the topic is waning and bring forward other ideas. A bit like the needles on the knitting they’re holding onto the threads.

The facilitator is absolutely indispensable. There needs to be somebody ‘who knows’ and who has a role as leader to take participants gently into the community and make them feel welcome—part of the community. They need to be obviously keen on the system and dedicated to making it work. An enthusiast.

The facilitator provides continuity, encouragement and a sense of mediation/legitimation i.e. a sort of independent guarantor that the site is bona fide and therefore ‘proper’.
Through the facilitator, personal learning could take place. Facilitators, then, are key features of making such communities active and growing. The ‘Talking Heads’ community for example has full-time paid facilitators, seconded from their teaching posts. More work remains to be done both on what makes facilitation effective, and whether the outlay (in cost terms) is beneficial enough to leaders’ personal practice to justify it in the long term.

**How can we define online groups and the meaning of participation?**

Online communities are being used in many settings worldwide, for study as part of a course with assessment, as fluid chat groups around an issue decided by the group, and as educational discussion groups where the content is decided by the participants. Both the LPSH project and ‘Talking Heads’ would seem to fit naturally into the latter group. This differentiation between different types of online groups is important when discussing any kind of professional development. There is also an ongoing issue on how one judges participation in such online group settings.

Coomey and Stephenson (2001) have reviewed the information available in the literature on benefits and detriments of online learning for participants. Several of their conclusions are similar to the research I have outlined. Four key features of online learning were widely identified as essential to good practice, and they are summarized below:

- **Dialogue**: facilitators must not assume that people will get into debates online just because they are told to participate.
- **Involvement**: this is associated with challenge, clear feedback, learner control and concentration.
- **Support**: participants need to see participation as ‘congenial’ and view themselves as a community.
- **Control**: this is more relevant to course tuition, and concerned with debates over which learners have control over key learning activities. However, it may be applicable to the communities described in this article, because of the view expressed by some that it is the government, not educational leaders who are setting the agenda and exercising control. (Based on Coomey and Stephenson, 2001: 38–40)

Coomey and Stephenson have also proposed a framework that helps locate practice and helps construct appropriate programmes and systems for online learning. It would seem that this framework would be helpful if framing questions about both the LPSH/ICT and other developments such as ‘Talking Heads’. They suggest that current experience of online learning falls within four paradigms:
1 teacher-controlled, specific learning activities;
2 teacher-controlled, open-ended or strategic learning;
3 learner-managed specific learning activities; and
4 learner-managed, open-ended or strategic learning.

Professional online discussion groups would seem to be most aptly described within paradigm 4, and aligns with my characterization of non-context-based professional learning environments. Such groups are characterized by peer group discussion groups, relating the learning to their own personal or vocational needs, support from facilitators, and control of the goals and outcomes by the learner. The important aspect of learner-managed, open-ended or strategic learning, I would suggest, is what Coomey and Stephenson call personal goals or reasons for being there. Educational leaders using such facilities need to be convinced that there is a good reason for logging in, as was evidenced from the LPSH research. And when headteachers have logged in, we need to develop clearly what is meant by participation. As developers of such online dialogues, we may be pleased with a figure of, for example, 60 per cent logging in on a regular basis. However when the figures are examined, much of that may be characterized as ‘Lurking’, ‘Browsing’ or ‘Thinking’. Actual posting of messages may be done by as few as 20 per cent. What appears to be passivity on the part of the participant may be useful learning of the dialogue of a new community, but a problem must surely occur in professional development communities when there is a high ratio of ‘Browsers’ to people who post messages. As a participant suggested: ‘Lurker is too furtive and threatening a term to capture this thing that can be very positive, as long as everyone isn’t trying to do it at once.’ It is clearly very important to distinguish between different types of participation, using the framework I described in the previous section.

Another difficulty is the quality of the contributions that are made, and the checks on veracity. Once messages are posted in a public online space, they can remain for some considerable time. Headteachers may not wish to express key opinions in front of ‘unknown’ colleagues, and onlookers from the government. Even when private communities are used, there can still be a very public face to posting messages. Beatty’s work used pseudonyms for the headteachers who participated.

Developing online interaction of value to education leaders clearly introduces new and complex challenges for those involved both as participants and designers.

**The implications for leadership and management of using E-learning environments**

‘Leadership has its highs and lows, its successes and failures. Principals cry, laugh, dream and become suspicious’ (Loader, 1997). Loader’s book on the ‘inner’ principal conveys to the reader the affective side of leadership. He
LEARNING LEADERSHIP

shares, through the use of metaphor, the emotional journey that is leadership in schools today. Similarly, the one strong outcome of this research is a realization by school leaders that they need support, affirmation and direction in their leadership, and that a useful way of providing this is online. For example, the online discussion group that was created in this particular research example was not, in the end, to do with discussions of models of leadership effectiveness, as may have been envisaged by the programme’s originators. Instead, the climate created was one that enabled leaders to begin to explore some of the personal and emotional issues that impacted on their leadership, as well as giving access to a professional community with ready solutions for day-to-day management problems. More development could be done in the online environment to offer the kind of coaching/mentoring for educational leaders that is already available within the business community.

The overall question still remains. Is this move towards online discussion groups for educational leaders part of the move to ‘online anything’, or has it more to offer? The challenge in terms of community growth, for example, is to extend the number of participants, while still retaining quality facilitation to enable people to feel valued, and also to add more specific professional development opportunities to the e-learning environment. The proliferation of such online communities in education also means that research needs to be carried out to find out what works best, and how aspects of community online can be effectively assessed.

When designing online learning opportunities in general, Shaw (2001: 177–8) suggests that a practical set of questions can be very useful. To sum up the reflections in this article, I have adapted them to fit the learner-managed, open-ended model that many leadership online experiences seem to be offering.

• What works best for educational leaders?
• In what circumstances?
• Where is the evidence?
• What are the resource, development, validation, implementation and maintenance implications?
• How much will it cost?
• How can leaders progress within such communities in order to maximize professional learning?

This article has begun to address the first three questions, but more research is needed to build a model of the effective online community for leaders in schools. The challenge is enormous, but the development of the virtual learning community for leadership could also be invaluable in terms of wider issues such as motivation, morale and retention of staff in leadership posts.

LEARNING THROUGH LEADING OR LEADING THROUGH LEARNING?

Jennifer Kerr and Danny Murphy

Improving the learning experiences of pupils in schools through a work based learning approach to the development of school leaders – the experience of the Scottish Qualification for Headship

In the late 1980s and early 1990s a variety of management training initiatives were taken forward within Scottish local authorities and nationally across Scotland as a whole (SOEID 1988 MTHT). Recommendations from two published evaluations of the MTHT programme (Draper et al 1995, Kerr 1992) included the expressed wish of senior managers in schools for a move towards more use of self evaluation within a competence and school based approach along with a greater focus on joint training for school teams and on outcomes for pupils. At the same time, approaches to management training in the worlds of business and industry were being standardised around a ‘competence model’ within vocationally oriented training programmes and trialed in an education setting (Earley 1992). Meanwhile a critical literature was developing in relation to lack of fit between this technicist/managerialist model (Paterson and Fairley 1996) and both the broader models of professional learning emerging from the research literature (Eraut 1994, Kolb 1984, Schon 1987) and the broader models of professional practice written up in ‘critical leadership studies’ (Grace 1995).

The piecemeal character of previous training for Headship in Scotland, together with observation of experience and practice in other systems and the theoretical heat generated by discussion of competence models for training and development, made more likely the development of a consensus on the need for a more coherent, grounded pathway for leadership and management development towards Headship in Scottish schools. Development was rooted and professional consensus developed in typical Scottish fashion (Humes 1986, Humes and Mackenzie 1994) by widespread managed consultation, in this case on the purpose and
characteristics of Headship as defined in The Standard for Headship (SOEID 1998). The Standard provided a framework for describing the professional practice of Headship and consequently for developing potential Heads. The Standard avoided narrow competence-based approaches to practice, although drawing from them, by developing a model which required the successful development of Professional Values. Management Competence in four key areas and Intellectual and Interpersonal Abilities and was widely acclaimed within the profession after extensive national consultation.

Scottish funding was made available for a pilot and full-scale implementation of two approved programmes which could lead to the award of the Scottish Qualification for Headship – an Accelerated Route for those who were already competent school managers and a Standard Route for those seeking further development. Both routes were designed to lead participants to a level of professional practice equivalent to that described in The Standard and recognised by the award by the Scottish Minister for Education of The Scottish Qualification for Headship (Higher Education Institutions offering these programmes would also award a Postgraduate Diploma.)

The programmes can be summarised:

- All participants evaluate their current practice against the Standard and identify learning needs.
- The programme comprises four Units of study, designed to ensure progression in practice and reflective thinking by personalising and contextualising broader issues of leadership and management, as these emerge from current research and associated thinking, through constant direct reference to and application in the current workplace of those taking part.
- Learning takes place through the normal methods of academic coursework (reading, reflection written assignments, class meetings, workshops and tutorials) but just as importantly through successful experience of taking forward project(s) which make a difference to the learning lives of pupils. It is a central part of the programmes that participants should not just know about leadership and management but should be able to practise successfully in a contemporary school setting.
- To this end, work-based learning is supported by the compilation of a portfolio of evidence, assessed as a written document, but also verified through a field visit. Within the portfolio participants must demonstrate that their leadership has made a difference to the learning lives of pupils through successful management practice with and through staff.
- The portfolio is complemented by an analytical commentary in which participants reflect on their experience of management and their professional learning.
- Workplace learning is supported by the local authority employer and by the school Headteacher (who acts as the participant’s supporter through the programme) in partnership with HEIs.
LEARNING LEADERSHIP

• Quality is assured by the national programme descriptor, nationally set performance criteria, national training within the pilot phase and through University quality assurance procedures. The assessment criteria are designed to ensure that the Standard has been met in practice.
• There has been limited experimentation with using online learning support.

The commitment to experience-based professional development, set within a context of reflection on purposes and values and within a well structured Standard defining good practice, offers many new ways to assess the manner and extent of the impact of professional learning on the experience of pupils. One of the links between the ambitions of the programme and the improved experience of pupils is in the framework for school improvement adopted within the programme and based on current visions of effective improvement in schools and schooling experiences (Hargreaves and Hopkins 1994, Harris et al 1997, MacGilchrist et al 1997, MacBeath and Mortimore 2000). Indeed Unit 3 of the programme is entitled ‘Managing School Improvement’ and requires participants to begin their management activity with an analysis of the ‘capacity for change’ (Stoll 1999) of their school.

Four key characteristics of school improvement highlighted in current literature fit well with the SQH model and are used in the following discussion to illustrate and expand on this link. These are:

• Learning and teaching as the key focus for improvement
• A whole school approach
• The involvement of a range of stakeholders
• Contextual specificity of improvement factors linked to awareness and development of a school’s capacity for change

For each of these four characteristics there now follows a discussion and illustration, based on actual SQH school improvement projects.

1) Learning and teaching as the key focus

While the literature encourages practitioners to understand that there is no single model which will guarantee school improvement (Slee et al 1998) it has also led to the concept of the classroom as the main context for change in terms of the teacher as the agent of change and the pupil as the focus for change (Fullan and Hargreaves 1992, MacGilchrist et al 1997).

In the Standard for Headship in Scotland (SEED 1998) the stated key purpose of Headship is:

To provide the leadership and management which enables a school to give every pupil high quality education and which promotes the highest possible standards of achievement.
Through their work based projects and development of the interrelated competences of The Standard (see diagram) programme participants are expected to demonstrate that they are striving towards the above key purpose. The detail of the programme is designed in such a way as to encourage this in a range of ways including:

- In Unit 1 participants evaluate themselves as leaders and managers of learning and teaching using The Standard and an extensive audit tool. The links between a corporate style development plan (MacGilchrist et al 1995) and improving pupils’ achievement is explored.
- In preparation for Unit 2 participants prepare a detailed project plan for the management of learning and teaching and managing people, in which they are required to plan not only for the management tasks but also for the outcomes for pupils and for the involvement of all staff in the chosen initiative.
- Assessment criteria for the work based project on learning and teaching state clearly that participants should have successfully developed structures for the management and evaluation of effective learning and teaching. The expectation is that within the evaluation process participants are able to demonstrate successful outcomes for pupils.
- As participants progress to Unit 3 (see above) the focus on learning and teaching remains, but now within the context of understanding and demonstrating their increasing application of a wider range of factors affecting school improvement: the school’s capacity for change, strategic planning,
In Unit 4 in the final stages of the programme participants explore political and educational issues at local authority and national level in order to improve their understanding of and practice in strategic management, but still within the overarching purpose of The Standard for Headship.

Illustration 1

In common with many colleagues in other primary schools in Scotland, the focus for this participant in the first year of the programme was raising attainment in writing, linked to a national and local education department priority. From rationale through to evaluation, the participant emphasised commitment to improving outcomes for pupils. During the whole cycle of the project the participant also became the acknowledged school expert on aspects of learning and teaching in writing: policy, programmes, pedagogy, assessment, resources, staff development, management and evaluation. Nevertheless it was still a learning experience for her in terms of managing learning and teaching.

- Embarking on this project meant far more to me than simply meeting a school development necessity and using it as a vehicle to develop my leadership skills and demonstrate competency against The Standard. I am a passionate believer in the central importance of writing as being a liberating and life enhancing skill, and feel strongly that a lack of literacy has major implications for the rights of all children to receive an equal education.
- Having managed a collaboratively produced policy, programme, and assessment and recording procedures, the next task was to ensure its effective implementation . . . so that it was more than solely a curriculum development . . . but also an instrument in promoting a culture of achievement.
- Many staff changes in recent years have made it difficult to establish the kind of staff collaboration necessary to ensure consistency of approach and therefore continuity to ensure raised achievement. I had to learn how to establish collaborative working patterns. Feedback from staff about changes in methodology for teaching writing suggested that team teaching, and therefore smaller pupil/teacher ratios would be a supportive strategy for all staff. This involved me in confronting the dilemma of negotiation in order to convince senior managers that they should be timetabled and involved in the teaching of the writing programme. I now firmly believe that such ‘leading from the front’ provides a great impetus to whole school teamwork and collaboration, with clear outcomes for pupils’ learning.
• I introduced a number of strategies to support high expectations and to celebrate the success of the pupils’ writing, not only for the pupils’ self esteem but also for that of staff: the ‘star writer’ of the week, exchange of audiences across the school for pupils’ writing, personal gifts of books written by older children for infants, celebratory letters to parents. What I learned was that staff also needed to celebrate their success through open discussions together: displays of writing throughout the school were shared and enjoyed by staff; staff meetings discussed targets, progress and achievement, smaller groups of children have enabled better working relations with pupils and with other staff in the team as well as between pupils. These outcomes were not in my original plan.

• I began the project with a clear end-point in mind – the raising of attainment in writing – and thinking I had a fairly good idea of the best way to achieve that. I now know that working through the whole school team provided a richer and deeper approach, with more divergent ideas, than my possibly too rigid, clear, coherent vision did.

• Pupils’ attainment in writing has improved but real professional development has also taken place – collaborative working, improved knowledge about teaching, greater enthusiasm to engage in discussion, more positive attitude to change – school improvement factors which will have a long lasting effect.

• I do not have a clear end point as planned – the point where we are now is merely a current position.

2) A whole school approach

A whole school approach incorporates the concepts of professional leadership (Macbeath 1998, Grace 1995, Day et al 1993), shared vision and goals, (Fullan and Hargreaves 1992) and the learning organisation (Senge 1990) which together are inextricably linked with effective learning and teaching. These concepts are also fundamental for the developing practice of participants on the programme, particularly in order to demonstrate their competencies in managing people (see The Standard 2.2.1 to 2.2.4) and interpersonal abilities (see The Standard 3.1).

The requirement on programme participants to plan for and lead a whole school development priority for the first time is a challenging one. The structure and size of management teams in many primary schools is such that it is often only the Headteacher who does not have a teaching commitment and who therefore may be the person who leads all parts of the school development plan, with other staff having responsibility for a particular stage in the school. The other side of this coin is that in Scotland there are many small primary schools, where leading a whole school development may fall to a teaching Headteacher and a small band of class teachers who do everything together as an effective team.
In secondary schools, which normally have larger management teams, each member of that team may have a substantial remit, but still not have a whole school responsibility for any one part of that remit. For the first time in their professional lives many participants find themselves leading a team of colleagues through a whole school development priority, with the expectation that they will be able to make a difference on a whole school basis.

The programme supports participants towards this in a range of ways including:

- Ensuring that participants have the strength and legitimacy of the school development plan as the context for their leadership and management of their chosen project.
- Encouraging participants to research and become the school’s expert, or leading learner in relation to the focus of the chosen development project.
- A supporter (normally their Headteacher) who can facilitate access to the whole school context and provide personal, professional support.
- Taught days, study sessions and tutorials which are both knowledge and skills based, focusing on such topics as team roles and team working, delegation, motivation, conflict management, interpersonal abilities and emotional intelligence.
- Assessment criteria which require a reflective commentary on each of the two major school based projects. In the first of these, participants analyse key issues in managing people (within a context of managing learning and teaching) through examining critical incidents at a personal level in the management of people. In the second of these participants move on to analysing key issues in their management, often of people, through examining critical incidents relating to the wider strategic and political contexts which affect their school.

**Illustration 2**

One participant in the programme described critical learning points in managing a whole school approach to the development of learning and teaching in a large secondary school. A whole school policy had been agreed as a working document, a guide and a spur to assess learning and teaching and work for improvement.

- *This is a large organisation with a history of balkanised departments and little whole school activity. I knew I would need to initiate change in a step by step way, building on the strengths of a hard working staff, committed to their pupils’ achievements. However statistics told me there was significant potential for improvement in achievement.*
LEARNING THROUGH LEADING OR LEADING THROUGH LEARNING?

• To support an agreed focus on teaching and learning two experienced external consultants acted as critical friends to four departments, as the staff developed their own learning and teaching handbooks and identified and shared their successes and failures with the whole school. This was very successful and a learning point for me – I could not be all things to all people, the staff responded well to the professional attention from the critical friends and to the change in methodology used by the critical friends in an in-service day.

• Another aspect of the development was the use of staff mentors for under-achieving pupils. The first attempt at this had not been successful, due I believe to my strengths in initiating new ideas but my weakness in monitoring, supporting and evaluating the implementation. I am conscious of how very differently I have operated the process this year . . . by sharing a structured process for evaluating the mentoring I am also valuing the staff who are making it possible. There have been excellent ideas from those staff involved for improving the mentoring process. I hope to incorporate these next year – I may even delegate the mentoring process to another teacher next year as a staff development opportunity.

• The project has required me to reflect on and improve my interpersonal abilities: by giving all staff a regular newsletter and summary evaluations of all aspects of the project I believe I encouraged them to realise that the school was making good progress and they were part of that; I am aware that having built up strong relationships, I can trade on this to challenge pupils and teachers to achieve more, move into challenging areas and have a positive result; each critical learning point has brought me out of my own personal comfort zone and I am more aware of how the correct input will help our school grow and improve.

3) The involvement of a range of stakeholders

A recent on-line study session, using the University SQH web-site and a structured model of teaching and learning on-line (Salmon 2000), has been encouraging participants, who are just at the start of their Unit 2 project, to consider the views of pupils, parents and teachers as vital indicators of effectiveness and for improvement (McCall J et al 2001). Responses have ranged from How can pupils have a say in the school development plan? to Our parents trust us to get on with the job and I’m planning to do this but don’t quite know how. (Participants had been encouraged at the earlier project planning stage to include stakeholder involvement at one or more stages of their project).

Consultation with and involvement of pupils, parents and teachers is now enshrined in Scottish legislation (SEED 2000), and one must assume that this has
been influenced by the school improvement literature. More than twenty years ago a Scottish study (Gow and Macpherson 1980) raised the awareness of researchers and the education establishment of the importance of listening to the voices of our pupils, as the authentic evaluators of their classroom and school experience. More recently, pupils’ and parents’ voices were heard and listened to while planning for improvements in teaching and learning (SBC 2001) and schools were encouraged to identify a genuinely parental agenda and model partnership in action (Bastiani 1993).

Although stakeholder involvement is well documented as an important school improvement strategy, it is not universally acknowledged as such, seldom going beyond the involvement model to the model of effective partnership. How are the participants in the SQH programme supported to develop their knowledge and practice in this aspect of their work-based learning?

• As stated above, detailed project plans for both Unit 2 and Unit 3 are expected to show how the participant will recognise the importance of involving all stakeholders.
• Study sessions and tutorials are designed to include access to the literature and the opportunity to share strategies which work (with a health warning about different contexts).
• Participants have the opportunity to listen to and have discussions with expert, and generally inspirational, witnesses, who have been involved in research or who are headteachers of improving schools where partnership with stakeholders has been a key strategy.
• The Standard itself (see 1.3, 2.2.2, 2.3.1, 2.3.2) and associated assessment criteria for the two major projects require participants to demonstrate that they can establish, develop and use participative management structures and partnerships with the full range of stakeholders.

Illustration 3

In Unit 3 in the second year of the programme, participants are required to demonstrate competence in the core activity, develop and maintain partnerships with parents, pupils, school board, outside agencies and the community. Within a school priority on target-setting for senior pupils preparing for external examinations, one senior manager in a large secondary school successfully worked in partnership with an educational psychologist, whose specific role was to provide an objective evaluation of the initiative. The psychologist focused on teachers and pupils, while the participant focused on parents. The participant referred to a statement in a national document on school leadership. ‘Leadership involves looking beyond the school and working with others who can contribute to school improvement.’ (SEED 2000a: p5) Numerous self-evaluative comments appear in the participant’s commentary in relation to the involvement of stakeholders and experts beyond the school.
LEARNING THROUGH LEADING OR LEADING THROUGH LEARNING?

- I wanted staff to see that the status quo was not an option, that it was not bolt-on but part of the monitoring of progress and assessment procedures which students deserve to achieve their potential.
- Following the outcome of the psychologist’s evaluation it was apparent my communication of the target setting procedures (agreed by all staff – or so I thought) had not been as effective as I believed. One of the ten characteristics of effective leaders (SEED 2000a) is developing and sharing a vision; obviously I needed to do some work on this.
- The responses to my letter to parents about their views of target setting made it apparent that not all of them had been involved in the process. I now realise that parents should have been consulted on the process rather than being informed about it once the policy was in place. If parents back schools and we work with each other, there is more likelihood of success – a lesson I intend to remember:
- The value of this project for me lay in allowing me to plan strategically for change, to experience the difficulties I was likely to meet in the process of managing change, to learn from my mistakes and be up front about admitting them to colleagues and parents.
- The main findings of the psychologist’s extensive evaluation report give me an agenda for future action. It states that this has been a bold venture, that the committed school management team have planned and implemented carefully, that we have been open to outside evaluation and keen to take on advice about development. The findings will be shared with staff and students and a number of recommendations are already being worked on.

4) Contextual specificity of school improvement factors linked to awareness and development of a school’s capacity for change and improvement

Participants on the programme come from a wide variety of school contexts: depute headteachers in large urban schools, senior teachers in small town schools, headteachers of two or three teacher rural schools, a mix in any one cohort of secondary, primary, special and nursery school contexts, some from leafy suburbs, some from areas of social and economic deprivation. As well as a unique context, each school will also have its own mix of factors influencing its capacity for change.

All participants are required to meet The Standard in order to gain the SQH, but it follows that, just as there is no blueprint for school improvement (Harris 2001, Fullan 1993, Macbeath and Mortimore 2001, Lauder et al 1998) nor any consistent capacity for change and improvement, because schools are different (Hargreaves 1999, Macbeath 1999), there is also no blueprint for how a participant works towards the SQH, apart from a satisfactory performance in each of the assignments through meeting the given and transparent assessment criteria.

An issue for the programme providers then is how to ensure that all contexts are
catered for while also ensuring that those who gain the SQH do not simply gain a context specific qualification. Some of the ways in which this is managed are:

- Participants are deliberately mixed in terms of context for group sessions on taught days, in tutorials and local authority network seminars, to encourage both cross sector understanding of different contexts and also sharing of experience, expertise and knowledge.
- Through case studies and interaction with the literature, participants can consider a wider range of strategies than they might otherwise have done.
- By the second year of the programme, through analysing their own school’s capacity for change, participants are encouraged to develop their own unique package of improvement strategies within their Unit 3 project plan as well as reflect in their Unit 3 assignment on that package and its usefulness in moving their school forward.
- A comparative study placement in business or industry gives participants the opportunity to consider improvement strategies from a wider context and to consider how practice beyond their own world of education could be adapted to support change and improvement in their own or another context in which they might work.
- Participants themselves bring a wealth of experience to the programme if they have worked in different school contexts; some move schools during their time on the programme, giving current first hand knowledge of capacity for change and improvement in differing contexts. The programme provider can capitalise on such experience to support participants with developing their understanding of this issue.

Illustration 4

The opportunity to act as Headteacher in a different school gave one of the participants an ideal opportunity to gain first hand experience of a different school culture as well as develop an appropriate package of strategies to move the school forward.

In addition the school catered for children with special needs, each requiring special support from other professionals within the staff as well as appropriately designed teaching and learning strategies. Many aspects of the school were different from mainstream schools – the line management arrangements for the school as a whole and within the school, finance and resourcing, staffing requirements, expectations of parents.

The aim of the chosen development project was to develop partnership with parents, which involved discussion on target setting, support for the children’s work, involvement in decision making in the school and parental development in issues relating to their own children. An analysis of the school’s prevailing culture and the package of school improvement strategies developed gave the participant much opportunity for critical self-reflection and learning:
LEARNING THROUGH LEADING OR LEADING THROUGH LEARNING?

• The outcomes of the analysis were quite clear; but I found that I needed to explain aspects of the process clearly to staff, who felt confused about the purpose. I will think such a strategy through more fully in the future.

• Stoll and Fink’s (1996) steps, I got to know the culture as an objective outsider, without being part of any subcultures. I considered how the culture supported or inhibited pupil progress, concluding that talking with and involving the hard working, committed and knowledgeable staff, and involving them in decision making, was a powerful forum for sharing values. The introduction of inter professional meetings allowed the discussion and sharing of values.

• Although the staff were keen to move forward on a number of fronts, the analysis of the school’s capacity for change and a high staff turnover persuaded me that beginning the change process for three cultural norms would be enough of a challenge – shared goals, collegiality/collaboration and openness.

• This change process involved better communication with parents. From this I soon learned that we needed to do more than allow parents to share in the new ethos. We should have involved parents in how they perceived the school ethos and in assisting its self-evaluation. I will be guarded about getting carried away with organising ‘events’ just for their own sake.

• I am now more aware of the need for accurate baseline information against which improvement can be measured. A related area of personal development is how to design specific criteria, against which pupils’ achievement can be measured, especially in this fairly unique context.

• I have found it difficult, due to the nature of the pupils’ special needs, to be certain that parental involvement did help pupils’ learning, but I am convinced that building relationships between the range of professionals within the school and parents is the key to involving parents.

**Summary and discussion**

The experience of how professional learning relates to and supports school improvement has been illustrated through these descriptions of current experience within the Scottish Qualification for Headship. More structured but piecemeal evaluation of the overall characteristics of the Scottish Qualification for Headship experience has taken place and some of this has been published (Morris 1999, Simpson et al 2000, Malcolm and Wilson 2000). Although this does not allow a definitive assessment to be made of the impact on pupils’ learning experience of the SQH programme and of the professional learning it encourages, there are clear indications of areas where substantial contributions are being made and the summary discussion which follows is therefore based on the illustrations given above and the evaluation evidence currently available.
Using assessment criteria which require participants to produce evidence of improvements in children’s learning experience has acted as a powerful lever on practice. In tutorial discussion, tutors regularly comment on this set of criteria as the most powerful lever to take practice beyond ‘comfortable collegiality’ (Fullan and Hargreaves 1992). This contrasts with some previous models of professional development in which the main focus has been on the ‘inputs’ in terms of programme structure or those ‘outputs’ which could be assessed from written presentations by participants. The outputs of this work-based CPD are evidence based improvements for pupils in the school context.

There have however been difficulties with progression into and within the programme. As a new programme, and the only one of its kind on offer in Scotland, it has shown up the lack of a pathway for those aspiring to Headship from earlier in their career. Unit 2 of the programme was designed to develop operational management skills, Unit 3 is strategic management for school improvement, but this has not been an easy progression. As those delivering the programme identify the gaps and difficulties, they have continued to rewrite guidance and expectations of quality in participants’ work have increased.

The partnership characteristics of the programme ensure that it affects those involved in school development well beyond the participants themselves, for example Field Assessors (generally current serving Headteachers) and local authority staff developers. In local evaluations of the experience of Field Assessment conducted within the south and east of Scotland, field assessors considered that they had been developed professionally by the experience. In many cases, they considered that this development had been significant and cited as examples the contact with good practice in school improvement, the rigour of thinking associated with the assessment process and the encouragement to personal self-evaluation.

Local authority experience of SQH has been varied. This is in part due to the variety of personnel involved, the different resource bases and different approaches taken within Scotland’s local authorities. An evaluation of the role of local authorities in promoting work based learning (Draper et al forthcoming) highlights the significant role local authorities play in: selecting and supporting staff; ensuring equality of access; ensuring that work-based contexts for learning offer appropriate opportunities to learn and develop; providing pastoral support. The capacity of local authorities to develop and sustain a professional environment within which this kind of support can be offered varies greatly (Harris 2001). The clear link from this kind of work based learning to improved outcomes for pupils suggests that this is a capacity which all authorities should be aiming to develop and sustain.

Alongside the many positives for SQH as a new model for professional development which aims to make a difference in schools, there are issues to be addressed. Part-time context based learning is proving difficult for participants. All those involved in part-time postgraduate study alongside full time jobs might reasonably be expected to complain of workload difficulties or problems in managing their work-life balance. Some difficulties have been encountered also in finding a balance within portfolios. Candidates tend to produce far too much evidence
without sufficiently considering issues of quality and selection. Portfolios still do not comfortably sit with professional expectations of assessment. Additional problems emerging for participants in SQH derive from the wide variations in school context which can have a dramatic effect on the character of the learning opportunities. Sometimes this is to do with problems in finding suitable contexts within school to demonstrate competence at the level prescribed in the standard – this applies for example in relation to the management of budgets, for Headteachers may be reluctant to delegate the function or in recruitment and selection, for opportunities may not occur during the time the candidate is on the programme. This is most strikingly the case, for example, where the Headteacher is challenged or threatened by the SQH model and the programme design of collegial and systemic school improvement (with the Headteacher as supporter to the management of key school improvement priorities) is replaced by a reality where participants are managing the micropolitics to do what is possible. There are also different types of social profile for the programme in schools. Where it is known that a senior member of staff is pursuing SQH this can lead to staffroom chatter about motivation, or about relative success or failure. Previous relationships in school, the ethos of the staff and the culture of professional improvement in the school can all have a significant impact on whether or not these factors help or hinder participants in moving forward professionally (Reeves 2001).

The management of a complex site-based development model also makes logistical/infrastructural demands on people and institutions. The time involved in partnership working, in dual assessment (professional and academic), in establishing systems to support site-based learning, is substantial. The variations in context, from small two teacher rural primary to separate nursery school to 1800 inner city comprehensive demand sensitive customisation both in delivery and in assessment.

The profession is still guarded in its approach to the qualification. Early concern that this was a simplistic ‘competence’ model has given way as the programme has become embedded to worries about access and desirability of a ‘mandatory’ statement. School Boards and Local Authorities responsible for appointing Headteachers continue to see possession of SQH as only one, and not necessarily the most important of the criteria to determine who is best for a given Headteacher post.

A new legislative framework for school improvement in Scotland has been devised nationally (SEED 2000) in which evidence-based improvement strategies, analysed and delivered through effective development planning, are required of every local authority and every school. At the time of writing, a national Ministerial strategy group for continuous professional development has been established by Jack McConnell, until recently the Scottish Minister for Education. These logistical concerns will loom large in the proposals this group makes to develop the framework for Chartered Teacher in Scotland, since whatever professional development structure is built for Scotland’s teachers to meet the demands of the McCrone agreement on the continuous professional development of teachers (SEED 2001), it will have to work in the wide variety of situations that characterise the Scottish school system. A sub-group of that committee is currently developing
proposals for a career development pathway in leadership and management and SQH as it now stands will thereafter be absorbed into a broader framework for developing teachers for teaching and for leadership. In doing so, they will benefit from evaluation of the Leadership Programme for Serving Heads (LPSH), the new consultative framework for school leadership development (National College for School Leadership 2001) and the SQH in Scotland. Whatever that broader framework turns out to be, there is much to learn from the SQH experience, and its commitment to ensuring that professional development is measured in part by evidence of its impact on pupils, thus far.

In conclusion, the continuing development of SQH has offered many new and exciting possibilities for professional development in leadership and management for those who aspire to Headship in Scotland. The use of portfolio and commentary assessment, benchmarked against The Standard for Headship, has stimulated an exciting range of reflection and practice on the part of those on the programme – practice which demonstrates professional learning in new and exciting ways and has stimulated partnership to support this learning across schools, local authorities and HEIs. There are continuing areas for development – both logistical and in terms of the learning experiences offered and supported, but this is development building on an exciting and successful start.

PREPARATION FOR THE SCHOOL PRINCIPALSHIP
The United States’ story

Joseph Murphy

Abstract
In this paper, we trace the evolution of training programmes for educational leaders in the United States, focusing primarily on activity in the 20th century. The history of preparation is divided into four eras: The Ideological Era, 1820–1899; the Prescriptive Era, 1900–1946; The Scientific Era, 1947–1985; and the Dialectic Era, beginning around 1986. Key dimensions and central events are underscored in each time frame. Particular attention is devoted to the eras of ferment that characterize the shift from one era to another.

Introduction
The study of principal preparation in the USA is of interest for a variety of reasons. It is, of course, centrally important in its own right, i.e. to the extent to which it is linked to the development of more successful educational leaders and school managers. An analysis of preparation programmes also provides a window on the development of the field of school administration writ large. Our thoughts about relevant epistemological foundations of the field, about connections between the academic and practice arms of the professions and about appropriate anchoring values are all highlighted in the evolutionary tapestry of principal preparation. Because formal, university-based training for school leadership positions has been relatively rare outside the USA (Willower & Forsyth, 1998), lessons learned here over the last century may prove helpful to other nations exploring adoption of the US model of preparation. Regardless of the approach they are employing, unpacking principal preparation in the USA
may help others to avoid pitfalls that have been experienced here, so that they can concentrate on the more positive lessons.

In this paper, we trace the evolution of training programmes in the USA over the last century, relying heavily upon the efforts of others who have already begun to fill in some of the pieces of this historical puzzle. We review the development of the preparation of school leaders through four periods of time: the ideological era; the prescriptive era; the behavioural science era; the dialectic era. Table 1 and Figure 1 provide the frameworks that ground our discussion.

The Ideological Era, 1820–1899

Although the administration of schools in the USA enjoys a relatively long history, in its early days it ‘went largely unrecognized as an essential component of school operation’ (Guba 1960: 115) and the actual number of administrators was quite small until after the Civil War. For example, the development of the school superintendent, the first administrative position in education, occurred during the latter part of the 19th century (Gregg 1960). The Department of Superintendence, precursor of the American Association of School Administrators (AASA), was not organized until 1866 (Button 1966). Moreover, because early schools were simple organizations, their administration was not an arduous task. As Gregg (1969) notes:

Under such circumstances, the administrator could learn his profession effectively on the job by trial-and-error processes. Little, if any, formal specialized preparation was needed, and none was provided. The minimal formal education which was designed for teachers was deemed sufficient for those who would become administrators.

In 1875, William L. Payne, then a school superintendent in Michigan, wrote the first book in the USA dealing with school administration, *Chapters on School Supervision*. After receiving a faculty appointment in education at the University of Michigan in 1879, Payne also taught the first college level course in school administration (Callahan & Button 1964). Although other ‘departments of

education’ were also established in the 1870s, professors of educational leadership and programmes specific to school administration ‘were unknown until the early 1900s’ (Cooper & Boyd 1987: 16). Thus the earliest:

... formal training for administration included some basic pedagogy and a lifelong search for the ‘ideal’ education, but not much self-consciousness or thought about their own roles as leaders, statesmen, or administrators. Hence, they attended no courses, received no credits, and applied for no licenses in educational administration.

What broad education departments such as that at Michigan did offer students was subject matter ‘relating to school management as well as to philosophy’ (Moore 1964: 11) and pedagogy. The ‘first teachings to prospective administrators were “theories” about exemplary school leaders which were then rarefied into “great man” and “trait” theories’ (Cooper & Boyd 1987: 7).

Callahan & Button (1964) and Button (1966) have isolated two doctrines of school leadership before 1900 that, at least to some extent, exerted influence on thinking about the content to which administrators were exposed from 1870 to 1905 in these newly forming departments of education. Under the doctrine of administration as the teaching of teachers (1870–1885), ‘administration was very simple, really; administration was supervision’ (218). Because the proper role of education was instruction, much of the limited education administrators did receive was in the areas of curriculum and instruction.

The doctrine of administration as applied philosophy (1885–1905) asserted that truth, concerning all things and all matters, was eternal and to be discovered. As in all other fields, this was necessary in education. It therefore followed that the learned administrator, who could discover relevant truths, was the best authority on all matters concerning education, and that the problem of administration was the application of philosophical knowledge to schools.

This new doctrine, ‘with its emphasis on eternal wisdom and moral judgement, made the administrator into something like the clergyman and borrowed from him some of the clergyman’s status’ (219). It also reinforced the emphasis on philosophy and theories about outstanding school leaders in the rudimentary subject matter being offered to students of school administration.

The Prescriptive Era, 1900–1946

The 20th century ushered in the beginning of the prescriptive era in school administration (Campbell et al. 1987), a nearly 50 year period of expansion in
training programmes for school leaders. In 1900, no institutions were offering systematic study in the area of school management. By the end of World War II, 125 institutions were actively engaged in preparing school administrators (Silver 1982). A first generation of educational administration professors was actively engaged in laying the foundations of the field and in training a second generation of professors to take their place. Many states were requiring formal coursework in educational leadership for administrative positions and were certifying graduates of preparation programmes for employment (Moore 1964). As these elements of the profession began to find acceptance, more and more principals and superintendents embarked on their careers with university training in the practice of school administration.

This shift from an era of teaching, ideology, character and philosophy to one of prescription represents the first era of ferment in school administration, one marked by a number of trends that we see repeated during both the second (1947–1957) and third (1986–) periods of ferment in the profession (see Figure 1). All three periods witnessed much critical analysis about the health of educational administration in general and the status of preparation programmes in particular. There was considerable muckraking literature about the way practicing administrators were managing schools (Cooper & Boyd 1987). In addition, new views of leadership (the captain of commerce role from 1900 to 1930 and the social agent role from 1930 to 1950) that reflected dominant social and cultural forces in American society were held up as desirable alternatives for training educational administrators (Callahan 1962).

Information on the preparation of school leaders following the first era of ferment is limited and uneven, gaining in clarity as we approach World War II. Faculty of this era were drawn almost exclusively from the superintendency. They carried heavy teaching loads and showed little proclivity for research. A similar homogeneity characterized students of this period. Most were white males holding full-time positions as school administrators while attending school on a part-time basis (Campbell et al. 1987).

The education received by superintendents and principals was largely undifferentiated from that of teachers until the onslaught and widespread acceptance of the scientific management movement throughout the corporate world between 1910 and 1915. For the next 20 years, business was to exert considerable influence over preparation programmes for school administrators: ‘Program content was consistent with prevailing emphases of science on fact gathering, inductive reasoning, and empirical generalizations’ (Culbertson 1988: 9). During this time, ‘preservice education for school executives tended to stress: the technical and mechanical aspects of administration’ (Gregg 1969: 994); ‘specific and immediate tasks’ (Callahan & Button 1964: 87); the practical aspects of the job (Newton 1934). The objective was to train students to understand the job of administration as it was and to perform successfully in the roles they undertook, what Campbell et al. (1987) labelled preparation for the role, as opposed to
studying what might need to be done differently and preparing for roles as change agents, i.e. preparing the person.

While the Great Depression and World War II saw the incorporation of new material into training programmes—‘human relations in cooperative educational activities’ (Gregg 1969: 994), social foundations and the human factor in general—by the end of the prescriptive era, preparation was still highly technical in nature. Almost no attention was given to the theoretical underpinnings of the work of school leaders:

The scholarship that informed course content throughout this era was little more than ‘naked empiricism’ or ‘factualism’, resulting in the development of: ‘fuzzy concepts’; ‘inadequately field-tested principles’; and a mere ‘encyclopedia of facts’ that lacked ‘the power of unifying interpretive theories’. The knowledge base was comprised of: ‘folklore, testimonials of reputedly successful administrators, … the speculation of college professors’; ‘personal success stories and lively anecdotes’; ‘personal accounts or “war stories”’, and prescriptions offered by experienced practitioners’; ‘experiences of practicing administrators as they managed the various problem areas of school administration’; ‘maxims, exhortations, and several innocuous variations on the theme of the Golden Rule’; and ‘preachments to administrators about ways in which they should perform’.

(Cited in Murphy 1992: 31–32)

The Scientific Era, 1947–1985

Beginning in the late 1940s and continuing throughout the 1950s and 1960s, prescriptions drawn from practice came to be overshadowed in preparation programmes by theoretical and conceptual material drawn from the various social sciences. Like the prescriptive era before it, the scientific era, in its emergence, drew support because of its harsh attacks on the status quo in the area of administrative training, its critical analyses of the performance of existing school leaders and its lure of an alternative vision (science in this case) that held forth the promise of dramatically improving the education available to prospective school leaders.

At the onset of the scientific era, considerable criticism was levelled against the naked empiricism, personal success stories and maxims or untested principles that constituted the knowledge base of educational administration at the time. It was also argued by many that the explicit values framework of the latter half of the prescriptive era—the human relations era—was inappropriate in a scientific world. In the first period of ferment in school leadership (1900–1915), practicing administrators were chastised for their lack of grounding in the management principles of the corporate world, especially those developed by Frederick Taylor and his peers. In the second era of ferment (1947–1957), they came
under attack for their unscientific, non-theoretical approach to administration. Throughout this second era of ferment, training institutions were being exhorted to develop better preparation programmes ‘to protect the public against ill-prepared or indifferent practitioners’ (Goldhammer 1983: 253). In addition, as has been the case throughout the history of school management, professors began to reweave the fabric of preparation programmes to mirror the high status professions in the larger society, thereby creating an alternative vision of the role of school administrators (Callahan 1962; Callahan & Button 1964). Since scientists, not business people, held centre stage at this time (Halpin 1960), a quest for a science of school administration was undertaken (Culbertson 1965, 1988; Greenfield 1988; Griffiths 1988a).

This second period of ferment in school administration was characterized by considerable enthusiasm, activity and growth and by dramatic changes in the structure and content of training programmes (Wynn 1957; Willower, 1983; Crowson & McPherson 1987). It was a period which many believed would lead to the full professionalization of school administration (Farquhar 1977; Goldhammer 1983).

Four major events mark the second era of ferment. The first of these was the formation of the National Conference of Professors of Educational Administration (NCPEA) in 1947. By linking professors throughout the country for the first time, the NCPEA exercised considerable influence over emerging conceptions of the profession and over school administration training programmes (Gregg 1960; Campbell et al. 1987). The second defining event in the transition from the precriptive to the scientific era was the creation of the Cooperative Project in Educational Administration (CPEA), a consortium of eight universities funded by the Kellogg Foundation whose primary purpose was to institute changes in preparation programmes. Continuing initiatives charted at earlier NCPEA meetings, especially the ‘benchmark’ 1954 gathering in Denver (Getzels 1977: 8), the CPEA encouraged a multidisciplinary approach to analyses of administration and to the education of school leaders. As Gregg concludes in his 1969 review, the CPEA had a profound influence on preparation programmes and on the practice of school administration. The establishment of the Committee for the Advancement of School Administration (CASA) in 1955 and of the University Council for Educational Administration (UCEA) in 1956 are the third and fourth milestones that helped shape evolving conceptions of school administration during the second era of ferment (Griffiths 1959; Moore 1964). The CASA’s most important work focused on the development of professional standards of performance. The UCEA’s influence has been quite pervasive (Willower 1983). Throughout the 1960s and 1970s it ‘became the dominant force in shaping the study and teaching of educational administration . . . [and] a major force in the advancement of preparation programmes’ (Campbell et al. 1987: 182–183).

Under the pull of these forces, there was a considerable flurry of activity in preparation programmes throughout the USA during the scientific era, especially during the 1950s and 1960s. This was a period of rapid growth in educational administration. While approximately 125 institutions were in the business of
preparing school leaders in 1946, 40 years later over 500 were involved (National Commission on Excellence in Educational Administration 1987). The number of doctoral degrees doubled during each decade throughout this period (Farquhar 1977). The size, defined in terms of number of faculty, of the typical programme increased substantially during the heyday of the scientific era, doubling in size from five to 10 full-time faculty members (Farquhar 1977) before falling back to its original size by the mid 1980s (McCarthy et al. 1988).

The average faculty member in 1945 was most likely to be a generalist, drawn from the superintendency and oriented primarily toward the practice dimensions of the profession. By the mid 1980s that picture had changed considerably. The typical faculty member in educational administration at the end of the scientific era was likely to be a discipline-focused specialist with little or no practical experience, concerned primarily with the professorial (if not scholarly) aspects of the profession. While there was considerably more diversity among students in preparation programmes in 1985 than in 1945 in terms of gender and, to a lesser extent, ethnic background, there were still many commonalities. Most students continued to be drawn from the bottom quartile on national entrance exams, to have self-selected their programmes, attended local institutions on a part-time basis and exercised little control over their lives as students (Murphy 1990a, 1992).

Consistent with the guiding vision of the scientific era, the predominant trend during this 40 year period was the infusion of content from the social sciences into preparation programmes. The infrastructure for this activity was the expansion of the conceptual and theoretical knowledge base of the profession by the development of a science of administration. This was a movement intended ‘to produce a foundation of scientifically supported (hypothetico-deductive) knowledge in educational administration in place of the hortatory, seat-of-the-pants literature already in place’ (Crowson & McPherson 1987: 47–48) and a trend ‘away from technique-oriented substance based upon practical experience and toward theory-oriented substance based on disciplines “external” to education’ (Culbertson & Farquhar 1971: 9). The scientific movement led to: (a) a conception of educational administration as ‘an applied science within which theory and research are directly and linearly linked to professional practice [and in which] the former always determine the latter, and thus knowledge is superordinate to the principal and designed to prescribe practice’ (Sergiovanni 1991: 4); (b) the acceptance of a heavy reliance on social science content ‘as an indicator of a high quality program’ (Miklos 1983: 160); (c) ‘the borrowing and adopting of research techniques and instruments from the behavioural sciences’ (Culbertson 1965: 7); (d) a multidisciplinary (if not interdisciplinary) approach to preparation (Culbertson 1963; Hodgkinson 1975).

The Dialectic Era, 1986

Educational administration today is in the throes of a third era of ferment, one that appears to be accompanying the shift from a scientific to a post-scientific or
dialectic era in school administration (Murphy 1993; Murphy & Forsyth 1998). As was true in each of the preceding two eras, the present ferment is being fuelled by devastating attacks on the current state of preparation programmes, critical analyses of practicing school administrators and references to alternative visions of what programmes should become. If anything, the rhetoric in this third period of ferment seems both more strident and more comprehensive than that found in earlier eras of reform (Hallinger & Murphy 1991).

The most fruitful sources of support for current reform efforts are critiques of existing training programmes. While the current era of ferment was foreshadowed by scholars such as Harlow (1962) and Culbertson (1963) 35 years ago and began to pick up momentum starting with Greenfield’s (1975) insightful critique, it was not until the mid 1980s that the scale was tipped toward a critical analysis of educational administration in general and of preparation programmes in particular. Subsequently, every facet of the education of school administrators has come under serious scrutiny in the last decade. Almost every programme component has been found wanting: (a) few recruitment efforts are undertaken and selection standards are low; (b) programme content is irrelevant, connected neither to the central mission of schooling nor to the practice of leadership; (c) instruction is dull; (d) ‘faculty are only marginally more knowledgeable than their students’ (Hawley 1988: 85); (e) standards of performance are largely conspicuous by their absence (Murphy 1990a, 1992).

Also contributing to the current ferment is the increasingly voiced opinion that existing school leaders are responsible for the current crises in education and that they are incapable (or unwilling) of solving the array of problems that plague schools (Murphy 1990b). It is argued that school administrators are mere managers, nurturing a dysfunctional and costly bureaucracy (Murphy 1991). Concomitantly, their perceived inability to address fundamental educational (Evans 1991) and value issues (Greenfield 1988) in schooling is dissected with increasing frequency. In turn, the cry for leadership is being heard on all fronts (Murphy 1990c).

While there is an emerging consensus about the deficiencies of current preparation programmes and the leaders they anoint, there is less agreement about an alternative vision that might shape the existing ferment into a new model for preparing tomorrow’s leaders. Some of the most frequently heard suggestions these days include: (a) greater attention to matters of practice in the design and delivery of educational experiences (including enhanced cooperation between the two arms of the profession); (b) movement toward a professional school model; (c) recognition of the importance of craft knowledge (and the legitimacy of practice-based learning experiences); (d) additional emphases on values, social context, core technology, inquiry and new forms of leadership.

It is difficult to anticipate what future historians of educational administration will designate as the major events during the current era that helped form this ferment into strategies for improving preparation programmes—assuming, that is, that some consensus emerges about redefining the profession. One market
that will most likely be highlighted is the set of activities comprising the work of
the National Commission on Excellence in Educational Administration
(NCEEA). Growing out of the deliberations of the Executive Council of UCEA,
the Commission was formed in 1985 under the direction of Daniel E. Griffiths.
The NCEEA has produced three influential documents that have promoted con-
siderable discussion both within and outside educational administration: (a) their
1987 report *Leaders for America’s Schools*; (b) Griffiths’ highly influential
address to the American Educational Research Association (AERA), which was
subsequently published as a UCEA paper (Griffiths 1988b); (c) a UCEA-
sponsored, edited volume containing most of the background papers commis-
sioned by the NCEEA (Griffiths *et al.* 1988). These three documents have
helped crystallize the sense of what is wrong with the profession, extend discus-
sion about possible solutions and, to a lesser extent, provide signposts for those
engaged in redefining preparation programmes.

Following up on these activities, the UCEA Executive Director, Patrick
Forsyth, initiated discussions with foundations and set about mustering support
for one of the NCEEA recommendations, the creation of the National Policy
Board of Educational Administration (NPBEA). After considerable work on the
part of the UCEA to forge a union among the executive directors of 10 groups
with a deep-seated interest in school administration, the NPBEA was created in
1988. Its care was entrusted first to David L. Clark, then to Scott D. Thomson.
The NPBEA has undertaken a series of activities designed to provide direction
for the reconstruction of preparation programmes and for the institutions that
house them (see Thomson 1998 for a full review). After a year of work sup-
ported by the UCEA, chaired by the UCEA’s Executive Director, Patrick
Forsyth, and facilitated by the NPBEA’s Executive Secretary, David L. Clark,
the NPBEA released its first report (National Policy Board for Educational
Administration 1989). The report outlines an extensive overhaul and strengthen-
ing of preparation programmes. Its recommendations were later adopted in
slightly modified form by the 50-plus universities comprising the UCEA.
Following release of *The Reform Agenda*, the NPBEA published a series of
occasional papers that were designed to inform the reform debate in educational
administration. It also began to sponsor national conferences, in conjunction
with the Danforth Foundation, to help professors discover alternatives to deeply
ingrained practices in training programmes.

In the midst of this ferment, and building on earlier-noted documents, two
national efforts to redefine the knowledge base of the field have been completed.
In 1990, the National Commission for the Principalship (NCP), under the leader-
ship of Scott Thomson and funded by the National Association of Elementary
and Secondary Principals (NAESP), published a report entitled *Principals for
Our Changing Schools: Preparation and Certification* (National Commission
for the Principalship 1990). The document represented an attempt to unpack the
functional knowledge base required by principals. Subsequent to the release of
that report, the NCP assigned working teams to flesh out each of the 21 func-
tional domains listed in its report. The resulting document (National Commission for the Principalship 1993) was published in 1993. A year later, the UCEA authorized six writing teams under the overall direction of Wayne K. Hoy to update the knowledge bases in educational administration preparation programmes.

In addition to the reform reports described earlier, efforts to strengthen preparation programmes were shaped by a series of volumes devoted to the analysis and improvement of the profession. Each of these books helped focus attention on the problems of the field and provided alternative visions for a post-theory world as well as solution paths to guide programme reform. Some of the most important of these volumes are: the first handbook of research in the field, an AERA-sponsored volume edited by N. T. Boyan (1988); two volumes on the professoriate authored by Martha M. McCarthy and colleagues (McCarthy et al. 1988; McCarthy & Kuh 1997); the edited volume growing out of the NCEEA project (Griffiths et al. 1988); the 1990 National Society for the Study of Education Yearbook (Mitchell & Cunningham 1990); a volume resulting from the National Center for Educational Leadership conference on cognitive perspectives in school administration (Hallinger et al. 1993); a volume on school administration published by the Politics of Education Association and edited by Hannaway and Crowson (1989).

The initiatives of the Danforth Foundation will no doubt be seen as an important marker in this decade of programme reform (McCarthy, 1998). In addition to its sponsorship of the NCEEA and its core support for the NPBEA, Danforth has underwritten four significant efforts designed to assist self-analyses and improvement efforts in educational administration, all of which capture multiple elements from the various reform volumes and documents of the late 1980s: (a) a Principals’ Program to improve preparation programmes for prospective leaders; (b) a Professors’ Program to enhance the capability of departments to respond to needed reforms; (c) research and development efforts, such as the Problem-Based Learning Project under the direction of Philip Hallinger at Vanderbilt University, that are designing alternative approaches to understanding the profession and to educating tomorrow’s leaders; (d) a series of conferences and workshops created to help the professoriate grapple with important reform ideas in the area of preparing leaders for tomorrow’s schools.

Two standards-defining activities are also likely to be heavily referenced in future reports of events shaping the evolution, and perhaps the transformation, of preparation programmes as the profession moves into the 21st century. The first initiative was the development by the National Council for the Accreditation of Teacher Education of their curriculum guidelines for school administration. This work, completed under the aegis of the NPBEA over a 3-year period,
brought the best thinking of the Policy Board, via *Principals for Our Changing Schools: The Knowledge and Skill Base* (National Commission for the Principalship 1993), and the various professional associations into a comprehensive framework to reshape preparation programmes for school leaders (Thomson, 1998). A second initiative, the Interstate School Leaders Licensure Consortium (ISLLC), conducted under the auspices of the Council of Chief State School Officers (CCSSO) and in cooperation with the NPBEA, produced the first universal set of standards for school leaders. Approved in late 1996, *Standards for School Leaders* (Interstate School Leaders Licensure Consortium 1996) sets about strengthening preparation programmes primarily through the manipulation of state controls over areas such as licensure, relicensure and programme approval (McCarthy 1998; Thomson 1998).

Finally, it is likely that two additional triggering events from the AERA and UCEA during this last decade will stand the test of time when the history of preparation programme reform is written. For the AERA the important event was the establishment of the Special Interest Group on Teaching in Educational Administration (Willower & Forsyth 1998). For the UCEA it was the development of an annual convention (Forsyth 1998). Both of these catalysing initiatives have helped create sustained work in the service of reshaping the education of school administrators.

LEADERSHIP, LEARNING AND SYSTEMIC REFORM

Kathryn Riley

Abstract

For three consecutive years, opinion polls in the US have placed education as the top national issue (USA Today, 1999). ‘Education, Education, Education’ has been the personal mantra of UK Prime Minister Tony Blair. These responses are not unique, governments across the globe are engaged in the education reform business, motivated by a range of concerns. Drawing on the experience of a number of countries, this article explores the context for education reform, offering insights into the reform process and questioning some of the conventional orthodoxies about the nature of education change. The author argues that the structural reforms which have been the pre-occupation of governments over recent years have been limited in their impact because of their lack of connection to learning – teacher learning and student learning – and because of the ways in which policy-makers have embarked on the change voyage. She argues that governments need to move away from a compliance models of educational reform, towards an approach which reflects the aspirations of schools and communities, and which is supported by forms of leadership connected to learning.

Introduction

Education has always been a contested issue, and the extent to which the State should or could control it, the topic of debate, dispute and compromise (Riley, 1998). Two decades ago, education systems in most industrialised countries functioned in the belief that teachers were competent and needed to be left alone to teach (Leithwood & Montgomery, 1982). For good and ill, teachers are no longer left alone to teach. In many countries and contexts *what is to be taught, where, by whom, how, and with what outcomes* have become issues for politi-
cians to decide about, and teachers to act on. The professional voice is muted, the pupil voice silent and the parental voice limited.

Governments around the world are now engaged in the education reform business. Improving the micro-efficiency of the schools has come to be seen as a vehicle for addressing some of the macro-problems of the state and society. Rising national expectations about schools have been accompanied by reduced teacher autonomy and increasing demands for higher performance – by teachers, as well as by pupils (MacBeath, Moos & Riley, 1996).

There are no certainties, however, in the education reform business and the debate is bedevilled by controversy. There are claims and counter claims about the impact of reform: growing evidence that some education reforms are working, but a declining public confidence in education; claims that we know what works in education and counterclaims that the generic solutions which are being pedled simply do not work. There are perhaps even more claims and counter claims about the financing of education: a belief that there has been soaring spending in education and equally strong assertions that there has been little real increase in spending, except in specific areas; a view by some (including some leading economists) that governments are throwing money away in education – and yet a counter argument that we are now discovering ‘how money matters’; a focus on value for money but few evaluations of reform initiatives (Boyd, 1998). Despite these controversies, the arguments for investment in education are powerful. Investment can help reduce poverty; contribute to the accumulation of human capital; strengthen national capacity and good governance; and add to the well-being and development of individuals, but the gap between investing in education and achieving all, or some of these goals is wide for a number of reasons. Although arguments have been made about the need to provide coherence to the reform process (Fuhrman, 1993) reform initiatives are more likely to be characterised by disconnection than connection, and to be divided into two mental black boxes: one called structural reform and the other called cognition and learning. Typically, reform initiatives give insufficient weight to the perceptions and experiences of those caught out in the reform process – administrators, teachers, parents and pupils – who not infrequently feel pressurised and confused by reform.

Figure 1, The External Combustion Engine, was drawn by a Scottish headteacher (one of a cohort of headteachers and school principals in an international project on school leadership in which I have been involved). It depicts his experience of trying to manage the reform process. The headteacher is in the driving seat. The external ‘fuel’ which drives the engine is a mixture of national and regional policies and legislation, as well as pressures from trade unions and employers, but in his view, the ‘wheels’, the foundations of reform, are in teaching and learning (teacher learning, as well as student learning) and are reflected in the core ethos of the school. The wheels are lubricated by humour, integrity, trust and goodwill and maintained by good communications (MacBeath, Riley & Kruchov, 1995). The image reflects a crucial point: that educational reform is
as much about leadership and learning within the local context, as it is about national policy. Although the headteacher who drew the combustion engine put himself in the driving seat, as the image suggests, external forces are taking the vehicle to an unknown destination.

The reform imperative

The reform imperative is strong and emanates from a range of sources. For developing countries and countries in transition, the provision of basic education as a primary route to social transformation has been the pressing concern. For most industrialised countries, maintaining a competitive edge in the globalised economy has been the strong reform driver, even though the link between educational attainment and economic performance is a disputed one (Robinson, 1998).² Whilst the economic driver is common to many countries, national reforms give different weight to the parallel issues of social justice and equity.

I was serving as an elected member of the Inner London Education Authority when, in the summer of 1987, Margaret Thatcher’s third Conservative Administration turned its attention to education. The charge against education was that producer domination, combined with the pursuit of egalitarian goals, had created a poor performing system (Riley, 1994). The political solution was to introduce a range of market-orientated reforms which were characterised by choice, competition and accountability through a range of performance mechanisms. A
heavily prescriptive national agenda was introduced which co-existed uneasily with greater devolution to schools and governing bodies. These reforms created winners and losers (Riley, 1994, 1998). Although some aspects of these reforms have been tempered by the 1997 Labour Government, a standards-based agenda (with its emphasis on school accountability for student performance, and local education authority accountability for school performance) now stands centre-stage.

Although governments of many different persuasions are driven by the reform imperative, the focus of reform inevitably reflects national concerns, as in the UK example. In the US, reform has been a familiar part of the education landscape for over half a century, yet disillusionment with public education remains high (Mathews, 1996). The current phase of reforms, described by Murphy and Adams as the ‘excellence era, a generation of educational policies intended to enhance student learning’, encompasses a range of strategies, each of which reflects a different conceptualisation of the nature of the problem. According to their analysis:

- **Intensification reforms** ... target the problem of low expectations.
- **Restructuring** addresses the problem of outmoded school organization.
- **Systemic reforms** attack the problem of fragmentation and uncoordinated state policies. Similarly, **standard setting** confronts the problem of unspecified or inadequate student learning goals and measures of success, while privatization focuses on the problems of entrenched bureaucracy and weak incentives.

(Murphy & Adams, 1998, pp. 1, 7)

What these different strategies have in common is a belief that the US education system is not working.

Education is also a pressing issue for countries in transition. The United Arab Emirates, for example, is embarking on a comprehensive reform programme, *Education Vision 2020*, which aims to enhance the skills and capacities of the indigenous population, reducing reliance on external labour, whilst also sustaining economic development and affirming cultural and social values (UAE, 1996). Other countries in transition are focusing on specific aspects of reform. Vietnam, for example, is concerned about the quality, training and management of its teaching force and is developing a package of reforms aimed at enhancing the skills and competencies of teachers. Poland is seeking to address the relatively low levels of literacy of many of the 16–25 year olds who have completed formal schooling.

For many developing countries, the problems may appear to be intractable. In sub-Saharan Africa, for example, one out of three males, and one out of two females is illiterate. One out of three primary age children is out of school and in ten countries, less than half of the school age population is enrolled in primary school. In many parts of Africa, the spread of AIDS is having a profound impact
on education, depleting an already limited teaching force, undermining parents’ ability or willingness to pay for education, and generating social upheaval (World Bank, 1999). Enrolment and student drop-out have become critical reform issues.

The context for educational reform is a global one, adding to the complexities and creating a strong external imperative for change (Riley, 1998a). The emergence of the knowledge-based society, coupled with the technological revolution takes us into unchartered waters. ‘The free access to information on the scale offered by the Internet and inter-active technology promotes the flow of both information and disinformation, knowledge that is both educational and anti-educational: anti-social, as well as beneficial to society’ (MacBeath, Moos and Riley, op. cit., p. 225). Teenagers can buy cheap jeans on the net, research homework assignments, but they can also access pornographic images and engage in net vandalism, by sending viruses to unsuspecting recipients. Technology may also widen divisions: between the confident middle class net-surfers and the working-class children who do not have the access of their peers. Its impact is complex and messy. Within schools, many teachers are uncomfortable with interactive technology, and acknowledging the technological skills and capacities of many their students, as well as the potential power of interactive technology, challenges traditional notions of how teachers teach and pupils learn.

The external context is also shaped by the changes in social and public policy which have taken place over recent years in many countries, and by shifting international influences and power allegiances. The collapse of the Berlin Wall, the end of the Cold War, the global spread of capitalism and the emergence of new poverty in Western countries erode many previous distinctions between countries (Albrow, 1994). Societies are changing at a rapid pace. The reconfiguration of nation-states, increased inter-ethnic conflict and the emergence of the new ‘moral’ globalisation, reflected in the threat and actuality of intervention by external powers into these conflicts, add to the uncertainties.

**The change voyage**

The education challenges are considerable and the path to reform is neither an easy nor a uniform one. Educational reform, policy and practice are shaped by political, structural, individual and social dynamics (Murphy & Adams, op. cit.), many aspects of which are context and culturally specific. The legislative framework and the cultural context create the expectations and boundaries about what can and should be achieved – and how (Fitz, Firestone & Fairman, in press). How the reform ‘problem’ is identified and characterised, the political possibilities and policy options, and the final choices and priorities are a product of national circumstances and historical arrangements. The number and range of players who try and influence that framework continue to expand. Businesses are taking a larger role: trade unions are seeking to affect both the nature of educational reform, and how it is implemented on the ground.
Approaches, as well as priorities to reform differ significantly. Some governments have pursued the path of decentralisation, giving greater autonomy to schools, although often (as in the case of the UK) retaining significant degrees of central control, with both anticipated and unanticipated outcomes (Riley, 1998a; Whitty, 1997). Others have embraced privatisation, deregulation and choice. Others still have placed greater emphasis on quality control, evaluation and testing, as part of a general accountability thrust. Whatever the rationale for change, the question of how to introduce reform in ways that will maximise its impact is one which governments share.

From a national policy-maker’s perspective, the central task is to get the policy right, but whilst national or state polices are important, this is only a small part of the jigsaw. Reform initiatives are not received by schools in a uniform way. The national context may set the scene, but the local context – the municipality, school district, or local education authority, as well as schools themselves – influences how reform is interpreted and implemented. Key actors construct their own meanings about the nature of reform and their perceptions may resemble, or differ from those of policy-makers. A school’s history, leadership and community context will affect how a national reform initiative is perceived. School principals, teachers, parents and governors may have their own views about the nature of the reform or change initiative, about priorities, and about how the local and national agendas come together.

Managing change at the school and local system level is about responding to competing demands. It is about managing the political/professional interface within the locality, and between the locality and national and state governments. Roles and relationships have to be negotiated between schools, trade unions, local agencies, the business and local communities, as well as with governments. Boundaries have to be established. Schools have to manage competing sets of realities: not only the policy context set at the national or state level; but also the community location i.e. the neighbourhood context and the social needs in the locality; and the internal workings of the school itself (Silver, 1994). Characteristically, schools are in a state of flux as new staff, pupils or governors enter the school, or as the school responds to the latest crisis: fire, pestilence, or loss of funding. Rational and planned models of change fail to capture the realities and complexities of the school context, or to recognize that:

School development is a process that occurs as a result of the interacting influences of three sources of change – that which is deliberately planned; that which is naturally occurring in the life cycle of organisations; and that which is unforeseen or unknowable in advance.

(Riley & Louis, in press)

Embarking on education reform and creating and sustaining significant levels of improvement are not one and the same thing. School reform is about change. Change in its turn depends on the will, capacity and actions of many players at
different levels in an education system. The degree of alignment between any reform initiative and the personal goals and aspirations of individuals and organisations engaged in the reform process is a powerful force in school reform (Murphy & Adams, op. cit.). There have to be incentives for reform (Hanushek, 1994), although not necessarily financial ones. There has to be capacity building and opportunities for professional learning (Fullan, 1991).

However, much thinking and research about the change process is predicated on assumptions about certainty, yet change is not linear. It is unpredictable, stuttering and drawn out, requiring the identification of existing constraints and obstacles, as well the capacity to design new strategies and embed these within existing polices and practices (Riley, Docking & Rowles, in press). Change is an intractable beast and, as a number of researchers have argued, reform and school change is a never ending process (see for example, Sarason, 1990; Cuban, 1990).

For those embarking on the reform voyage, there is much preparation work needed before embarkation. The route and final destination will need to be planned. If all the different vessels are to arrive safely at port, then the lead ship will need to understand the capabilities of the different craft on the voyage, as well as the skills and enthusiasms of the captains and their crew. Much will have to happen during the journey itself to keep the flotilla together, but whilst there may be treacherous waters ahead, there are also some landmarks to guide the way.

Navigating the waters

*Identify what needs to be changed during the voyage*

Education systems across the globe will need to tackle the significant problems of failure, drop-out, under-performance and student disengagement. OECD studies have estimated that between 15–30% of school age children are susceptible to school failure (OECD, 1996a). Student performance varies by country, gender and location and, regardless of the source of difficulties experienced at school, there are large differences in the attainment levels of the weakest 25% of pupils and the strongest, generally, the equivalent of two years of schooling, but as much as five years in some countries (OECD, 1997).

Educational attainment at age 16 is the most important predictor of future participation in learning, and of labour market prospects (Pearce & Hillman, 1998). Young people without upper secondary qualifications are between 3–5 times more likely to become unemployed than their peers (OECD, 1996b). Those who leave school before the standard ‘graduation’ date in their country are at particular risk of unemployment and long-term social exclusion (OECD, 1996c). Annually in the UK, 8% of young people leave school without any qualifications (House of Commons, 1998). In some of the most difficult and deprived
areas in the US, as few as 1 in 16 students graduate from high school (Kozol, 1996).

The scale and level of student disaffection is considerable. A longitudinal Swedish research found that for 1 in 3 young people, school was a profoundly disappointing and largely unhappy experience, offering little creative or intellectual stimulation. If schooling was perceived as a negative experience, this perception tended to be carried through into adulthood, influencing views about future learning, as well as parental attitudes to schooling (Bengt-Andersson, 1997; Lindblad, 1997). The consequences of an unhappy school experience can be far reaching.

Take account of all the passengers and crew

School reform is an inherently political process. Notions of what constitute a ‘good’ school are bound in culture and context and, as Harold Silver has argued, change over time:

Good schools have been ones (in the past) which have trained girls to be good wives and mothers, or which trained boys to serve the commercial ethic of the Empire. ‘Good’ has been an infinitely adaptable epithet, used of schools of many kinds, by interested parties of many kinds.

(Silver, op. cit., p. 6)

To reach a consensus on issues which are profoundly value-laden is unlikely in a pluralist society. However, identifying the needs and aspirations of the major stakeholders in educational reform, and respecting their concerns is critical. Findings from a major study on the role and impact of local education authorities – intermediary systems – suggest that stake-holders in a typically diverse educational community, can come to respect even controversial policies (such as the inclusion of children with special educational needs into mainstream education), if decisions have been reached after genuine and wide consultation process, and if there is clarity about what is to be achieved, and how (Riley, Docking & Rowles, 1999).4 Respect is not the same as agreement but it is a key ingredient in making reforms work.

Teachers, of course, are key players in the reform process and government approaches to teachers and teaching can have a significant impact on teacher recruitment, teacher morale and teacher retention (Riley, 1998b). However, many governments seek compliance to their reforms and the ‘compliance mentality’ generated by large-scale reform (David & Goren, 1993) can foster institutional inertia and stifle professional creativity. Reforms will be limited in their impact if teachers are denigrated and disengaged from the process, seeing implementation as a hoop they must jump through, rather than as a central activity which will improve their professional practices.
Teachers are motivated to change their practices, if they can see the benefits for their pupils. Investing in the sustained professional development of teachers and providing them with a wide span of opportunities (such as work-shadowing, shared classroom observation, access to relevant web-sites and teacher networks which cross schools and localities) are key elements in the change process. Research evidence suggests that teachers who are part of professional development networks have higher standards, a stronger service ethic in their relations with students, and a greater commitment to the teaching profession than other colleagues (Talbert & McLaughlin, 1994). The strategy is a twofold one: engage the hearts and minds of teachers (Hargreaves, 1998).

Parents have to be brought on board and recognised as co-educators, and not viewed as hindrances to learning. Where the partnership between schools and parents is genuine, ‘parents play an active part in their children’s learning and are confident that problems will be dealt with and feedback given’, according to Scottish researcher John MacBeath, and ‘the school provides for the special, cultural and linguistic background of pupils. Parent-teacher meetings are useful and productive and pupil progress is shared with parents on a regular basis’ (MacBeath, 1999, p. 58).

The other key partners in learning are the pupils. Pupils’ perspectives give us fresh insights, not only into what schools are, but what they might be. Young people in Greenwich in South London helped set the local reform agenda by contributing to a video, which I coordinated, Young Voices of Greenwich. They describe what in their view, makes a good teacher:

- You can talk to the teacher and ask them questions and they won’t get the hump, and they have a sense of humour.
- Someone who listens to the children and knows what it is like.
- Someone who trusts us and knows our point of view.
- They try and understand that there are things going on in a child’s life outside school.

Young people thrive in a climate of mutual respect and trust. They attach great weight to school policies which help to maintain that climate and which tackle issues such as bullying and racism. They recognise the ways in which bullying, racism and name calling impede learning, or ‘cause depression’, as one young woman from Greenwich explained to me. They want an environment which is conducive to learning. ‘The school should have an anti-bullying policy, written by the pupils, for the pupils and which is followed carefully’, a member of the local Youth Council commented.

Whilst the young people from Greenwich had much to say that was positive about their school experience, they also identified what needed to change. In their view, schools do not give sufficient attention to pupils who are struggling. A young Somalian refugee, striving to make sense of a new country, culture and language, had felt this acutely. Greenwich students wanted access to the curricu-
lum for all young people and a recognition that a physical disability is not an impediment to learning. ‘I think that some schools believe because you are disabled you don’t need to learn’ a wheel-chair bound young woman argued. They wanted a broad curriculum which included technology, ‘to link us to the real world’, sports and the arts, personal relations and sexuality. They wanted a curriculum which offered enrichment through out of school experiences, such as opportunities for travel. ‘It’s great to have experience of foreign countries and so on, it helps the person to have more confidence’, explained a young man whose first experience of foreign travel was though a school trip. The young people who contributed to Young Voices of Greenwich, made it clear that they wanted to be considered as active partners in their own learning.

In our project on school leadership referred to earlier, we looked at the ways in which teachers, parents and pupils, as well as headteachers themselves, thought about leadership (note 1, Riley, 1998b). We found that perceptions differed between countries. English parents, for example, viewed ‘assertive or strong leadership’ as a key component of effective management of the school: a concept which was alien to Danish parents who valued ‘co-operative and collaborative’ leadership (Moos, in press). Pupils had very clear views about school leaders. Older students in our study valued an inclusive leadership style which demonstrated care and respect for students and which contributed to a school environment that was conducive to effective learning. Younger children emphasised safety, security and relationships. One group of nine-year-olds worked with me to construct a job description for a headteacher which powerfully demonstrates the importance which young people attach to trust and relationships (Riley, 1998a, p. 122).

We asked some of the young children in our study (5–6 year-olds) to answer some questions about school leadership by drawing pictures for us, with captions. The question ‘How do you become a headteacher’ elicited a range of responses, including, ‘You read a book about being a headteacher and you take an exam in kindness’. Some thought you become a headteacher by ‘buying a school’, by ‘reading a book about it’, by ‘going to a school and seeing whether you like children’ or, ‘by years of hard work and kindness’. With some pre-science in the UK context, one thought that, ‘the Government lets you’ become a head (ibid.).

In responding to the question ‘What does a headteacher do?’ the children captured many facets of the job. ‘The headteacher comes to see the children and says very good.’ ‘The headteacher sings and she tells you if you are naughty.’ Some of the complexities of the job are shown in Figure 2, the caption for which reads, ‘The headteacher writes letters about discos and she keeps old books. She teaches the children songs and she talks on the telephone.’ Most of the images were positive, although not all, as Figure 3 shows. Here the headteacher is a tall angry figure who looms over a small child who is crying. What the headteacher does on a daily basis can contribute in significant ways to both the immediate and overall school experience of children. The messages they
give as they ‘walk their vision’ (as one of the headteachers in our study described it) are profound. In one large secondary school in the UK, I asked a group of 12-year-olds, ‘what makes a good headteacher?’ One replied, ‘Mr X is really good, he queues up for his (school) dinner’. The others agreed. What they experienced from their headteacher was a simple but profound mark of respect for them.

**Be clear about the purpose of the voyage**

The call for a renewed focus on teaching and learning is becoming a familiar one. In a ‘blue print’ for reform, American educator Linda Darling-Hammond
quotes from Civil Right’s activist W.E.B. Du Bois, to remind us of the power of learning.

Of all the civil rights for which the world has struggled and fought, the right to learn is undoubtedly the most fundamental. . . . The freedom to learn has been bought by bitter sacrifice. . . . We should fight to the last ditch to keep open the right to learn, the right to have examined in our schools not only what we believe; not only what our leaders say, but what the leaders of other countries have said. We must insist on this to give our children the fairness of a start which will equip them with such an array of facts and such an attitude toward truth that they can have a real chance to judge what the world is and what greater minds have thought it might be.

(Du Bois, quoted in Darling-Hammond 1997, p. 1)

The notion of an entitlement to learning is a powerful one, but if classrooms are to become ‘intellectually rigorous and exciting’ places to be, schools will
need to put learning at the centre. The extent to which schools provide active support for learning can be assessed by the following indicators:

- pupils see themselves as independent learners;
- teachers believe that all pupils can learn and gain success;
- the main focus of school activity is related to making learning more effective;
- learning in and out of school is seen as a coherent whole;
- pupils are involved in reviewing progress, recording achievement and target-setting. (MacBeath, 1999, p. 136)

Radical changes will also need to be made in the organisation and delivery of education services. Avenues to learning will need to be accessible to a wide community, creating a stronger focus on distance and self-directed learning, with a much wider definition of who learners are (Duguet, 1995). If young people are to become autonomous and self-regulating learners’, able to cope with uncertainty and change, rather than ‘diligent’ workers who have a ‘sense of duty and discipline’ (Posch, 1996, pp. 6–8), a transformation from teaching to learning will need to take place.

Despite the growing research focus on learning, the evidence across many countries is that the structural reforms which have been the major preoccupation of many governments over recent years have had insufficient impact on the substantive core of teaching and learning, and what actually goes on in classrooms. The prevailing notion of teaching and learning remains one in which, according to an OECD study, knowledge, competencies and values are predefined and stored in curricula, tests and accredited textbooks (Posch, ibid.).

There are many reasons why this is the case. The pace and speed of change has often meant that headteachers or school principals have had to focus much of their time and energy on administration, rather than on pedagogical effectiveness, classroom innovation and improvement. Similarly, teachers have had limited time and opportunity to review the effectiveness of their practices, or to think about new modes of learning. A UK study found that 9 out 10 of primary school teachers felt that they had insufficient time to do their job as it should be done, and 8 out of 10, that their job did not make good use of their skills and ability (ATL, 1998). The pressures of testing (which have led to an overemphasis on examinations which test the ability of students to recall a body of knowledge, rather than assess whether they are able to understand the concepts which underpin that knowledge, or are capable of solving problems based on that knowledge) have compounded the problem.

In refocusing on teaching and learning, assessment clearly has to be addressed. British academic Caroline Gipps has argued that there is a need to move away from an ‘examination-as-hurdle’ model, to an assessment model in which ‘we try to give all the candidates a real opportunity to show what they know, understand and can do’ (Gipps, 1999, p. 1). As she goes on to argue, there are many demands on assessment systems:
Assessment is now required to achieve a range of purposes. It has to support teaching and learning; provide information about pupils, teachers and schools; act as a selection and certification device; as an accountability procedure; and drive curriculum and teaching. There are increased demands for testing at the national level which must offer some comparability but equally some recognition that we need assessment to map more directly onto the processes we wish to develop, including higher order skills.

(ibid.)

Assessment needs to be more closely aligned to learning, but in some countries and contexts assessment of student performance and evaluation of institutional effectiveness have become the drivers in the system. The UK national school inspection system, for example, has been criticised for its cost (estimated as being £26,020 for an average primary school, 4.5% of the school’s budget and £65,893 for an average secondary school, 3.2% of its budget); for its failure to focus sufficiently on pupil achievement and the ‘non-school’ factors which contribute to this; and for the punitive and adversarial culture which it has generated (Rowntree, 1999). The Chief Inspector of Schools, Chris Woodhead, has been criticised by a Parliamentary Select Committee for ‘his intemperate approach’ and his reliance on ‘conjecture rather than evidence’ (House of Commons, 1999). Although there have been some gains from the ‘culture of review’ which has been created (particularly in those schools which have been most resistant to change), the current system is flawed and is in serious need of revision (Riley, 1998a). A more developmental system which offers the opportunity for a more professional and reflective dialogue is needed.

Avoid the treacherous waters and the sirens

Once reform is on the agenda, politicians want results, but there is a fine line between maintaining momentum and generating reform overload. In June 1999, headteachers from England and Wales welcomed Prime Minister Tony Blair to their annual conference, but also complained vociferously about reform overload and were adamant in their opposition to Government proposals on performance related pay (TES, 1999b, p. 4). In the school year 1998–1999, schools and local authorities in England and Wales had to implement 29 new policies. In 1999–2000, a year in which government pledged to reduce the overload, they still had a further 19 polices to implement (TES, 1999c). If reform is experienced as a constant round of ‘flavour of the month’ initiatives, it will create cynicism and frustration amongst headteachers, teachers and administrators. We have ‘more pilots than Heathrow’, was how one teacher characterised her experience of the reform process in the UK (Riley, Docking & Rowles, 1998).

The context in which policy-makers make their choices about reform priorities is, of course, an international one. Ministers, researchers, civil servants,
trade union leaders meet to discuss developments in education. International projects (such as The Third International Mathematics and Science Study – TIMMS – which compares the performance of different countries) add a competitive edge to these discussions. A range of international organisations, such as the World Bank, the OECD, UNESCO and Education International provide fertile ground for the transmission of new ideas. Technology provides instant access to information, but there are no ‘quick-fix’ solutions, no uniform structural changes which will inevitably create specific changes, no reform panaceas. ‘Packages for Improvement’ do not arrive by mail order. Research traditions such as school effectiveness and school improvement, which have much to offer to the reform process, cannot be applied as ‘laws of science’, appropriate to all teachers and all schools (Glickman, 1987). Whilst much can be learned from the experience of others, what matters is clarity about goals, understanding of the context, and attention to the process of reform and change. Let us take the example of decentralisation.

*Timeo Danaos et dona ferentes (Beware Greeks bearing gifts)*

Decentralisation has been a popular policy option over recent years, stimulated as much by business trends and the collapse of large centralised states, as educational arguments (Fiske, 1996). To some countries, the appeal of decentralisation has been that it has offered the potential to improve the quality of services and maximise resources. Other countries have pursued decentralisation, primarily as a way of dispersing power and widening decision-making. In some cases, community financing has been an attraction, either because it offers the prospect of sharing the financial burden of education (by getting alternative financing from local communities, or private sector organisations), or because it emphasises the importance of partnership and joint responsibility in the education enterprise (Bray, 1996). Enthusiasm for community financing, however, has not always been accompanied by enthusiasm to relinquish control.

Too often, decentralisation is seen as a panacea for all the ills of an education system, rather than as a tool which if properly used can aid reform. There is no empirical or statistical evidence to suggest, for example, that school-based management (which is not of course synonymous with decentralisation) has increased student achievement (Summers & Johnson, 1994). Authors of a recent review of the impact of decentralisation in Nicaragua entitled, ‘What’s Decentralisation Got to do with Learning?’ argue that decentralisation on its own will not improve student performance (King & Ozler, 1999). As I have argued earlier, substantial changes are needed in teaching and learning, and in the culture of schools themselves.

Decentralisation can create fragmentation, loss of expertise (in areas such as support for pupils with special educational needs) and reduction in professional development opportunities and networks. School autonomy when linked to
choice is as likely to exacerbate differences, as lead to school improvement. In the UK for example, an analysis of ‘failing schools’ suggests that a combination of factors, including decentralisation, competition, reduction in the role of the local education authority (i.e. the municipality or school district) have combined to engender a climate of isolation and insularity, turning schools into themselves in ways that reduce professional reflection and challenge and contribute to failure (Riley & Rowles, 1997). On the other side, decentralisation can help to challenge inertia and unlock a frozen system.

Undoubtedly what matters is the approach and the focus. Nicaragua, for example, has embarked on a major programme of decentralisation, motivated by the twin objectives of extending democracy and widening the financial base for education. According to researchers in the field, how school-based actors have interpreted the new ‘school autonomy’ has had a significant impact on the degree, and success, of implementation. Responses have been ‘quite divergent, especially in schools that lack[ed] cohesion and a shared mission, prior to the onset of decentralization’ (Fuller & Rivarola, 1998, pp. 5–6). Teachers have tended to see the ‘new autonomy’ as being about increasing their pay and giving them a greater say in what happens within their school; headteachers, as enabling them to have more control over their school; parents, as offering them a greater voice in what is happening. Where perceptions differ radically – and are not reconciled in some way – then the impact of reform will be limited.

The Nicaragua experience is that school principals have been much more positive about the decentralisation programme than teachers (ibid.). The same has been true for the UK (Bullock, Thomas & Arnott, 1993). Much depends on how schools are led and managed. Decentralisation puts school principals centre stage and they can choose to adopt a more hierarchical and directive model of leadership, or a more inclusive model which brings teachers into the frame (Fuller & Rivarola, op. cit.). Where school principals in Nicaragua have adopted the latter model, and brought their staff into decision-making, then teachers have been more supportive of the reform initiative overall.

Decentralisation needs to be linked to learning: pupil learning and teacher learning. Key questions need to be asked. Have teachers been prepared for a decentralised context? Are schools able to think about the long-term, as well as the short-term development of teachers? In an overview of the literature on parental choice and school autonomy in Britain, New Zealand and America, Geoff Whitty has argued that attention needs to be given to developing ‘mechanisms of regulation, and to the most appropriate ways of deciding these’ (Whitty, op. cit., p. 36). In other words, in thinking about decentralisation, we need to consider what checks and balances are needed to ensure equity, and to support the achievement of other education goals.

A UK study on teachers’ professional development, found that devolution of budgets to schools, in the context of erosion of much of the provision previously offered by the local educational authority, had created unequal access to professional development, as well as inequities of funding between schools. Practices
and opportunities varied within schools, as well as between schools and the attitudes of individual heads of department and of senior management were key. Training and development opportunities tended to be targeted towards immediate school-based priorities at the expense of the longer-term development needs of teachers (McMahon, 1998).

Before embarking on decentralisation, policy-makers need to clarify their objectives. The decentralisation process needs to be regulated to reduce inequalities, as well as create opportunities, for teachers and pupils. As decentralisation usually includes a broadening of the base for school governance, then developing the capacities of school governors to be involved in decision-making is also key. The shift in the vertical partnership – the powers and responsibilities of central and local government and of school governors and headteachers themselves – will mean that the roles and responsibilities of each will need to be redefined and ways found to ensure that teachers, and teachers associations are involved. Finally, as Bruce Fuller and Magdalaegna Rivardo ask in the review of education in Nicaragua referred to earlier, if decentralisation creates greater parental involvement but does not raise pupil achievement is it a victory? (op. cit.).

**Think about the ships’ captains – and their crew**

Amongst other things, the discussion on decentralisation illustrates the importance of leadership in the change process. But as Chris Hodgkinson has asked, ‘Is leadership a matter of seduction, a bewitchment of the led?’ (Hodgkinson, 1999, p. 25). From a policy-maker’s perspective, school leaders can perhaps be seen as holding the key to resolving many of the ‘problems’ which appear to be facing schools. Increasingly, leadership is accepted as a key constituent in the ‘effective’ school (Sammons et al., 1995), but equating leadership with principalship, or headship creates a narrow definition of the term.

The conceptualisation of leadership which Karen Seashore Louis and I have begun to develop is much broader (Riley & Louis, op. cit.). It sees leadership as a network of relationships among people, structures and cultures (both within and across organisational boundaries), not just as a role-based function assigned to, or acquired by, a person in an organisation, who then uses his or her power to influence the actions of others. This notion of distributed leadership extends beyond the immediate school community, embracing other actors on the leadership stage – such as trade unions and school districts. Leadership is seen as an organic activity, dependent on interrelations and connections (Riley, Docking & Rowles, in press).

But how do school leaders contribute to leadership? Authors of a major compendium on leadership have argued that the search for a general theory of leadership is doomed to failure (Leithwood et al., 1996). However, there are a number of conceptual understandings about leadership which offer some relevant insights into the management of change. To explore these, I want again to
draw on the research project *Effective Leadership in a Time of Change* (note 1, Riley & MacBeath, 1998; MacBeath, 1998; Riley, 1998a and b). A number of core issues emerged from that study:

- That there is no one package for school leadership: no one model to be learned and applied, regardless of culture or context. However, leadership can be developed and nurtured.
- That school leadership is beyond the heroic undertakings of one individual.
- That school leadership is not static. School leaders do not learn how to ‘do’ leadership, polishing their style to perfection. Effective school leaders are often rule breakers and are willing to change in response to new sets of circumstances, and the differing needs of children, young people and teachers.

The paradigm of school leadership which we found is one of *mobility and fragility*. It is a model which rests on the assumption that schools are constantly changing and that the challenge for the school leader is to respond to the school’s inner life, as well as to the demanding and constantly changing external context. It is a paradigm which recognises that constructions of school leadership are profoundly value-laden and bound in national and local context. It acknowledges that schools have to serve internal and external constituencies which are often in uneasy coexistence with each other, and that school leaders have to manage contested notions about achievement, as well as multiple interests and demands, and complex ethical dilemmas. The headteacher or school principal of today is expected to be a significant player in a whole galaxy of sometimes separate, sometimes interlocking spheres: governing bodies, local authority, central government, parents, teacher unions and of course, teachers and students. This involves managing conflict and competing expectations.

Effective school leaders exercise both their professional and political leadership. Political leadership is about being able to recognise patterns, draw on past experience and note the unique elements of a situation (Riley, 1998b). To some extent, headteachers have always had to exercise political leadership, seeking alliances; deciding on courses of action about the fate of individuals; and drawing on their own beliefs and judgements to make decisions about the use of resources. What has changed in the UK and elsewhere, is the extent to which headteachers have to exercise those skills.

The evidence from an international review of research on the effectiveness of school principals is that they exercise a measurable, although *indirect* influence on the effectiveness of a school, and on school achievement, and whilst the effect is relatively small – it matters. The reviewers, Hallinger and Heck (1999), concluded that there were four areas in particular, in which the leadership of the principal, influenced the school. The most obvious was through establishing and conveying the *purposes and goals* of the school. This was achieved through the selection and motivation of teachers. A second area of leadership influence was through the interplay between the *school’s organisation and its social networks.*
Highly effective principals tended to promote participation in decision-making, networks and interactions between staff, and the involvement of parents. A third, and some would argue, the most critical area of influence was through people. Effective principals fostered group goals and modeled their desired behaviour for others, by providing intellectual stimulation and support for staff, both personally and through staff development. The fourth and final area was in relation to organisational culture. School leaders operate within an environment but also influence how others perceive that environment and interpret events.

Moving the reform process forward and working to influence the school community is difficult. Figure 4 depicts a headteacher who is trying to lay out a path for change. The path is steep. The headteacher sees her job as pulling people up the hill. The image has a number of other components. It depicts the ‘trailblazers’ who have already made it to the top, the ‘defeated’ who have lost their hold, and the ‘refuseniks’ who are turning back (MacBeath, Kruchov & Riley, op. cit.).

Leadership is about learning, yet many schools are structured in ways that are antithetical to teacher learning (West et al., ibid.). Successful school leaders model professional values and aspirations, supporting teachers in meeting professional challenges and in managing the change process. Good leaders are learners themselves. School teachers in Canada rated school principals as effective if they worked hard; had lots of energy; were genuine in their beliefs; modeled openness and had good people skills; and, most importantly showed evidence of learning by growing and changing themselves (Leithwood et al., 1997). Whether it is managing a decentralised reform process, or implementing specific aspects of reform, the evidence is that:

![Figure 4](image.png)
Teachers appear more willing to participate in all areas of decision-making if they perceive their relationship with their principals as being more open, collaborative, facilitative and supportive. They are less willing to participate . . . if they characterise their relationships . . . as being closed, exclusionary and controlling.

(Smylie, 1992, p. 23)

Trust is key. A UK study found that less than 50% of primary school teachers felt that they could usually believe what their headteacher told them (ATL, 1998).

**Was the voyage worth it?**

Education reform hinges on trust and a recognition of what each of the different partners in the process can contribute to the reform journey. There are many expert voices which need to be heard: children, parents, and teachers, as well as politicians, administrators and officials, but if this is to happen, then the reform process needs to be an open and inclusive one. Sergiovanni (1998)\(^\text{10}\) has argued that there are two discredited theories about how schools should be run: the *pyramid theory* (which assumes that the way to ensure that schools achieve their goals is to put one person in charge to control the others), and the *railroad theory* (which assumes that teachers can be controlled by standardising their work). The same two approaches seem to characterise many national and state approaches to reform. Such approaches are outmoded. As societies become more complex, education systems will need to move away from maintenance and control, towards quality and development, which in its turn will require new ways of monitoring and evaluating performance (Cassidy, 1999). Given the complexity, government ministers will need to recognise that they cannot direct what happens in individual schools and classrooms.

Successful reform initiatives are those which recognise that not everything may need to change – some things might actually be working – and that reforms have unintended, as well as intended consequences. Strong connections are made between the two black boxes of *structural reform* and *cognition and learning*, and the voices of the often overlooked stakeholders in the education community are heard. Such initiatives aim to develop education leaders (policy-makers, local systems and schools leaders) who are wisdom seekers, committed to developing their own thinking and capacity, as well as that of others. Pupils are recognised as co-learners, not as passive recipients of the reform process, parents as educators, and teachers as co-agents of change. Reform depends on three interlocking elements: the skills, capacity and commitment of educators within school and at the local system level; the enthusiasm and commitment of pupils and parents; and the ability of politicians to create the right legislative framework. In the last analysis, however, its success will be judged by the ways in which real changes in teaching and learning take place.
Notes

1 The project, *Effective Leadership in a Time of Change*, included school leaders from England, Scotland, Denmark and Australia. Members of the Research Team were: Associate Professors Chresten Kruchov, Lejf Moos and Johnny Thomassen (The Royal Danish School of Educational Studies, Copenhagen); Professors Kathryn Riley and Pat Mahoney (The Roehampton Institute, London, England); Professor John MacBeath, Joan Forrest and Jenny Reeves (University of Strathclyde, Scotland); Associate Professor Nell Dempster (Griffith University, Brisbane) and Lloyd Logan (Queensland University, Australia). Findings from the project are reported in MacBeath, Kruchov & Riley, 1995; MacBeath, Moos & Riley, 1996; MacBeath, 1998; Riley, 1998a and b; Riley & MacBeath, 1998.

2 Peter Robinson has argued that there is no evidence that boosting national attainment in maths will improve national economic performance. He derives this conclusion from an examination of the relationship between student attainment in international tests of literacy, numeracy and science and the economic performance of countries which have participated in the tests. Taking, for example, the scores for 13 year olds in 16 countries which took part in the Second International Mathematics Study in 1992–1993, he examines the economic growth in those countries over the subsequent decade, and concludes that the ‘impressive’ economic growth rates of countries such as Hong Kong and Thailand, in the decade up to 1997, are not a product of past superior attainment in mathematics. The relative improvement in the mathematical attainment of Hong Kong students, for example, followed economic growth, rather than precipitated it.

3 For example, the ‘opt out’ provision which allowed schools to vote (through a parental ballot) to become independent of the local education authority, and to be nationally funded as a grant-maintained school, has been rescinded by the 1997 Labour Government. The ‘assisted places scheme’ which provided state sponsorship for a small number of children to attend private education has also been withdrawn. However, the private sector now seems set to play an increasing role and the pace of education reform has accelerated. A swath of reforms have been introduced which Ministers argue offer ‘new’ solutions to old and intractable problems: a claim which, in the case of one particular initiative, Education Action Zones, has been disputed (Riley & Watling, 1999).

4 The Research team members for the project, *The Changing Role and Effectiveness of the LEA*, are Professor Kathryn Riley, David Rowles, Dr Jim Docking, Ron Letch, Elle Rustique-Forrester and Ian Monk from the Centre for Educational Management, the Roehampton Institute, London. Findings from the project are published in Riley, Docking & Rowles, 1998, 1999 and in press.

5 The video *Young Voices of Greenwich* was produced for the London Borough of Greenwich in 1998 by Susie Grant Productions, as part of a local education reform initiative. Professor Kathryn Riley from the Roehampton Institute, London was the lead adviser and co-ordinator of the project.

6 Cognitive psychologists in the UK have concluded, for example, that the General Certificate of Education (the external examination taken by the bulk of 16 year-olds) is largely a test of memory (TES, 1999a, p. 1).

7 That is, those schools which have failed the national inspection carried out by the Office for Standards in Education (Ofsted).

8 In 1997, grant-maintained secondary schools received an average of £32,000 for professional development, compared with £12,000 for locally maintained schools (McMahon, 1998). With a change of government in 1997, there has been a convergence of funding between grant-maintained and locally funded schools (note 3).

9 Paul Begley (1999) has argued that, as school principals increasingly encounter value
conflict, they need to develop a sophisticated understanding of the interaction between personal values and the collective valuation process.

10 Referred to in Ribbins (1999).

TECHNOLOGY-MEDIATED LEADERSHIP DEVELOPMENT NETWORKS

Expanding educative possibilities

Charles F. Webber

Abstract

This report describes the evolution of a technology-mediated leadership development network from its origin as a local e-mail discussion group to a loosely-coupled international leadership web. The report includes a description of the components of the network, which include face-to-face and online cross-role discussion groups, annual seminar series, graduate degree programming, an online refereed journal, summer institutes, university partnerships, and cross-cultural research. In addition, an explanation is offered of the challenges that the network poses for understandings of what counts as professional development, university regulations for planning and delivering instruction, communication of research, and teacher-student roles. Then the paper offers a profile of the leadership development network in terms of its professional, role, environmental, and emotional dimensions. Finally, a set of questions is offered for readers interested in planning leadership development networks.

Introduction

The use of technology in leadership development programs pervades university, school district, and professional organizations. Examples of technology-mediated leadership development initiatives abound online. For instance, see the University of Calgary distance-delivery graduate programs[1] the Association for Supervision and Curriculum Development online training opportunities[2] and the Australian Council for Educational Administration’s Educational Leaders
Online services. Significantly, these online leadership development programs are not stand-alone projects but parts of well-integrated networks. Further, online leadership development provides readily accessible information and networking opportunities for large numbers of school leaders worldwide.

What is the actual function of technology in these networks? It could be said, perhaps naively, that technology is but a tool that allows individuals and groups who share common interests to communicate and learn together. However, Macpherson (2000) cautioned that technology is not a neutral force but one that can fundamentally reshape how individuals interact and think. Bates (2002, p. 141) went further to say that “there is little doubt that innovations in technology are facilitating many of the processes of globalization” and pointed to what he claimed are associated challenges of privacy loss, distribution of misinformation, and even criminal behavior. Similarly, Winsboro (2002, p. 42) warned of potential problems associated with intellectual dishonesty, content compatibility with electronic formats, and ability to deal with sensitive issues such as race and multiculturalism.

Other perspectives suggest that we be wary of the “uncritical acceptance of the status quo” and consider that technology may provide opportunities for individuals and groups to envision new possibilities for how they might live their lives (Harris, 2002, p. 38). For instance, organizational structures that once supported traditional educational environments are being reengineered, because of technology, to facilitate student-centred learning that includes both synchronous

![Diagram](image)

Figure 1 Change Agency network linkages.
and asynchronous learning (Macpherson, 2000) that may allow learners to acquire deeper understandings and increased problem-solving capacity.

Glickman (1998) claimed that Western democracy is based on the idea that we all are capable of educating ourselves if we are able to participate actively with knowledge. This complements Harris’ (2002) suggestion that if technology is to benefit our communities then it “must enhance rather than reduce the public space in which people discuss, in an ethical manner, matters of communal interest.” In fact, the features of Glickman’s (1998) “pedagogy of democracy” suggests that leadership development networks, electronic or otherwise, might best be characterized by active engagement, choice, responsibility for others, public demonstration of learning, and both individual and group work.

In short, technology has emerged as a major factor in leadership development programs worldwide and this is reshaping how educational leaders learn, interact, and conceptualize their professional practices. Indeed, the traditional venue for formal educational leadership development programs – the university – is being challenged to reengineer both conceptual and physical infrastructures in order to cope with increasing demands from the field to become “dual-mode organizations” (Macpherson, 2000, p. 276) that provide both face-to-face and technology-based learning opportunities. Therefore, it is important that the impact of technology use in leadership development initiatives be examined carefully so that pitfalls can be avoided and benefits maximized.

Purpose of the report

The purpose of this report is to describe the evolution of one technology-mediated leadership development network from its origin as a localized e-mail discussion group based at a single Canadian university to a loosely-coupled international leadership web (see Figure 1). The components of the network are described, which include face-to-face and online cross-role discussion groups, ongoing seminar series, graduate degree programming, an online refereed journal published by a major academic press, summer institutes, university partnerships, and cross-cultural research. In addition, an attempt is made to explain the challenges that the network poses for understandings of what counts as professional development, university regulations for planning and delivering instruction, communication of research, and teacher-student roles. The paper closes by offering a profile of the leadership development network and by speculating on the broader educative possibilities for this and similar networks.

Limitations

The content of this report is subject to several limitations. First, it is written from the perspective of an active participant who may be too closely associated with the network to assess critically all of its dimensions. Second, this report is meant only to highlight possibilities and cautions for others who are interested in
technology-supported leadership networks, rather than to present a framework that could or even should be replicated in other contexts. In addition, the learning network exists primarily, though not exclusively, in Western nations and, therefore, its strengths and limitations may be specific to Western culture. Finally, limits to the length of this report demand that this report offer mainly an overview of the learning network and that a description of how and why the various network components emerged be offered elsewhere. Therefore, readers are directed to earlier and forthcoming descriptions, cited throughout this report, of specific network components.

The Change Agency Listserv: a catalyst for educative leadership

The electronic mail discussion group called the Change Agency Listserv[4] originated in 1994 with a request made by a small group of teachers and junior school administrators from a large Canadian urban school district for an online discussion group that would promote dialogue about their educational practices. Use of the resulting listserv quickly spread from the original group to members of other local educational organizations. Shortly afterwards graduate students were offered the opportunity to participate in the listserv for partial course credit. Over time the Change Agency evolved from a small listserv for teachers to a virtual discussion group for teachers, principals, graduate students, parents, school trustees, and department of education personnel. As well, some colleagues and their students from North America and abroad began to participate in the listserv.

Over the next few years, the Change Agency became a catalyst for several related local and international leadership development initiatives:

- Online academic refereed journal. As the Change Agency gained strength, several individuals associated with the listserv decided to create a free online academic refereed journal that focused on educational leadership. The journal was named the *International Electronic Journal for Leadership in Learning (IEJLL)*[5] and it began publication in 1997. Recently, the journal became the University of Calgary Press’ first online academic journal, after a rigorous cross-disciplinary review process. Significant numbers of the Change Agency Listserv’s international subscribers participate in editorial activities associated with the *IEJLL*, while the Change Agency occasionally is the forum for discussions among *IEJLL* readers.

- Centre for Leadership in Learning seminar series. Change Agency subscribers participate annually in an online needs assessment that is used to plan a face-to-face seminar series sponsored by the Centre for Leadership in Learning (CLL), an educational consortium housed at the University of Calgary. The same needs assessments also have been used successfully to plan and conduct international online seminars that parallel the face-to-face CLL seminars.
• Summer institutes. Participants in an annual University of Calgary summer institute use the Change Agency Listserv to conduct pre- and post-seminar online discussions that involve international participants in addition to summer institute registrants.

• Travel studies. Graduate students at the University of Calgary who participated in recent travel studies to New Zealand and to the United Kingdom used the Change Agency network prior to arriving at their destinations to dialogue with their hosts about the issues they were to discuss later in face-to-face formats. The information that was shared and the bonds that formed online meant that travel study participants and their international hosts were able subsequently to engage in face-to-face exchanges that were richer and more productive than they might otherwise have been. Indeed, the online and face-to-face academic activities resulted in professional relationships that continue to the present.

• Online graduate courses – In 1999 two online graduate courses in educational leadership were designed with the help of a colleague. One course provides an overview of school reform in Western nations and the other course addresses school-based management issues. Students in both courses use the Change Agency Listserv to gain insights from dialogue with individuals who represent several different educational roles. In fact, students in the school reform overview course plan and host an online seminar series that in the past has drawn over 300 participants from a wide variety of countries. As this paper is being written, a colleague and co-researcher from New Zealand is teaching the University of Calgary school reform course while still based at the University of Waikato.

Several of the leadership development initiatives described above have been the focus of on going studies that have informed the growth of the leadership development network linked by the Change Agency network. For instance, a four-week discussion on the Change Agency Listserv among graduate students in educational leadership from the University of Calgary in Canada and the University of Waikato in New Zealand led to the development of the Boundary-Breaking Leadership Development Model (Webber and Robertson, 1998). A CLL seminar series in 1998 led to a set of provocative questions and insights into public education garnered during a period of rapid change in education in Alberta (Spencer, 1999). An analysis of a Canada-New Zealand cross-cultural travel study program for graduate students allowed the Boundary-Breaking Leadership Development Model to be clarified and expanded (Robertson and Webber, 2000). These reports and others (Robertson and Webber, in press; Spencer and Webber, 2000; Webber, 1995a, 1995b, 1995c, 2000, in press; Webber and Robertson, in press) document the evolution of the virtual and face-to-face network components linked by the common thread of the Change Agency and they underscore the centrality of research in the evolution of the web of leadership development projects.
International influences have pervaded the leadership development activities described previously. Graduate students, professors, and other educators from a wide range of countries have been actively engaged in Change Agency discourse. In turn, some of the international participants have formalized their linkages to the Change Agency’s host university by updating or entering into official partnerships between the University of Calgary and others such as the University of Waikato in New Zealand, the University of South Australia, and the University of Amsterdam. Such partnerships allow for cross-institutional recognition of graduate programming for credit toward the attainment of degrees at students’ home universities. Less formal internationalization is clearly evident in the composition of the IEJLL editorial committees and the countries of origins for IEJLL authors[6], speakers’ lists for CLL programming[7], travel study destinations[8,9], emergent cross-university staffing and student registrations, and co-sponsorship of international summer institutes[10].

Network challenges

The challenges that students, colleagues, and the author himself faced as they created the leadership network framework fell into four interrelated areas: structure, procedure, access, and power.

Structure

The structural challenges were in many respects the least interesting parts of the work associated with developing the leadership network. However, ensuring a dependable structure was also perhaps the most critical work, at least on a practical level. Even the first phase of the network, which was the creation of a listserv for a small number of individuals, depended on our access to a stable server that was operational 24 hours a day. Dependable computer access grew increasingly important as the network expanded to include the international online journal and Web-based graduate courses. After a variety of possible servers were tried, we came to rely on the university’s computer network for reliable listserv software, e-mail accounts, and archival space.

Besides access to a computerized infrastructure, software and Web site maintenance quickly emerged as a significant issue. Graduate students, university technical staff, and contracted designers all have supported the network by coordinating listserv subscription lists, designing and updating Web sites, assisting with the creation of support materials such as CDs, and formatting online materials. In addition, enough had to be learnt about maintenance to be able to update Web sites and manage listserv software independently.

In the early phases of the network, the speed of Internet access was not an important issue. Telephone lines and computer modems provided satisfactory service for listserv subscribers using simple e-mail software to exchange text-based messages. However, as the network began to include, for example, Web-
based graphics and audiovisual components, high-speed Internet access became more important. Some network participants still rely, at least at home, on low-speed connections but it is expected that very soon network participants will find that high-speed access is a necessity.

The implications of the structural challenges of technology-mediated leadership networks for equity and social justice are clear. Simply because of cost, network access is extremely limited at this point for individuals in remote areas and in developing nations. Equally limited access is clearly the case for the poorer members of even wealthy societies.

Interestingly, women are well represented as Change Agency Listserv subscribers, *IEJLL* editorial committee members, *IEJLL* authors, and participants in both online and face-to-face seminars. The strong representation of women may be due in part to the demographics of the graduate student population at the university and others such as the University of Waikato in New Zealand whose students regularly participate in Change Agency-related programming.

Related to graduate student participation in online dialogue, summer institutes, seminar series, and travel studies, several additional structural challenges emerged that will be profiled in a forthcoming paper (Webber and Robertson, in press). These include, among others, registrar’s offices deadlines, immigration rules that restrict who universities can hire, course approval procedures, institutional “ownership” of students, legal requirements for cross-university partnership agreements, prolonged university governance procedures, and tuition fee regulations.

**Procedure**

As discussed earlier, the Change Agency Listserv linked a large number of related programs. Despite its connective capacity, however, several of its limitations should be noted. First, Change Agency conversations, for which students sometimes receive graduate credit, occasionally become pedantic as students strive to demonstrate their ability to cite academic references and to critically analyze broad issues. Interestingly, the more formal tone of Change Agency postings contrasts with the more informal, practice-oriented conversation on the Leaders’ Net[11] a parallel listserv for school leaders in New Zealand that was modeled on the Change Agency Listserv. Second, the online discussions are influenced heavily by the credential-driven interests of some student participants so readers should not assume that every posting is based on heartfelt interest in the discussion topics. Third, Change Agency participants are likely completely unaware of the unseen influence of, for instance, instructional designers whose technical backgrounds do not prepare them for the learning styles, information needs, or time limitations of current and emerging educational leaders. The result is that the assumptions guiding Web site design, for example, may conflict occasionally with the realities of users.

A continuing challenge arose in the form of the academic schedules of
educational institutions in the northern and southern hemispheres. School terms that overlapped in varying patterns, conflicting due dates for grade submission to registrars’ offices, asynchronous vacation and work schedules all mitigate against cross-hemispheric collaboration in technology-mediated learning networks. Even the loss of one shared workday a week because of the international date line reduces the ease with which North Americans and Australasians can collaborate online.

A surprising early challenge arose in relation to the widespread need for many teachers in Western nations to submit an annual professional development plan. When a Canadian teacher submitted to her principal a professional growth plan that included participation in online seminars, her principal returned it for revision noting that online dialogue was not acceptable as professional development. The teacher persevered with the online seminars but was required to participate in complementary face-to-face programs so that her school administrator could perceive her professional development plan as “real.”

In summary, the procedural challenges that we have faced to this point in the evolution of the Change Agency-related network demonstrated that only some professional development activities “count” for at least a few of our colleagues. Further, the cost of participation in technology-mediated programming, the university-driven dialogue, and the unseen influence of technicians on, for example Web design and interactive capacity, mean that there are limits to what we can expect of online networks as we currently know them.

**Access**

As stated earlier, access to participation in the Change Agency or other technology-supported vehicles for professional and academic discourse is limited for some. The reasons for limited access fall into several domains: cost, role responsibilities, urban and rural network inconsistencies, time, and culture.

First, the issue of cost is not insignificant. Although participation in an e-mail discussion group is not reliant on highly sophisticated equipment and a high-speed Internet access, some of the information that is discussed on the change does require this. For instance, postings regularly contain references to articles, news briefs, government policy documents and databases that are accessible only with the help of a relatively recent Web browser, a high-speed Internet service provider, and a computer with high-speed processing capacity. Participating in an online discussion with no access to the material that informs the conversation could not be particularly useful or gratifying for anyone. For many Change Agency participants the cost of access is borne by their employers while others are able to afford access costs on their own. Clearly, cost is a factor that excludes the voices of many both in Western and developing nations.

Role responsibilities reduce access for others to the dialogue associated with participation in the Change Agency and its associated seminar series, summer institutes, travel studies, and research projects. For instance, some women with
family responsibilities have little or no time outside of their workdays to engage in professional dialogue. Therefore, it is surprising that the majority of Change Agency subscribers, for example, is comprised of women, although it should be noted that most are relatively privileged women with at least middle-class incomes or, in the case of graduate students, the capacity to earn such incomes.

Another group that has reported a reluctance to participate is made up of senior educational leaders (Webber, 1995c). They attribute their online and face-to-face discretion to their fear that their leadership capacity could be limited if they are perceived to be less than articulate or informed. It should be noted that limited time to participate is also an access issue for senior educational leaders.

Inconsistent access to electronic networks for rural and urban dwellers influences whose voices are heard in the Change Agency. Initially at least, subscribers were mainly urban professionals who had Internet access through their work environments. As residents of rural communities in many countries gained access to at least telephone-based Internet access, their voices began to appear in the online dialogue. As a result, postings now regularly include reference to issues that are either specific to rural and isolated communities, or they are shared concerns.

Perhaps less conspicuous are the ways in which network conversations are culturally specific, to the extent that subscribers from non-Western countries tend to drop into the listserv only for short periods and to limit their participation. Offered explanations refer to astonishment at how Western participants can lament their access to resources when their counterparts in developing nations can only imagine some of the educational resources that are available in Western contexts. In contrast, cultural limitations seem not to apply to 416 subscribers (as of October 4, 2001) to the online journal affiliated with the Change Agency. Online subscribers to *IEJLL* represent an extremely wide array of nationalities and languages.

Despite the different ways that access to network dialogue can be limited for some, it is also important to note how the network has increased access for others. The layered participation in the Change Agency, seminar series, and summer institutes means that some educators participate for professional development purposes, some parents and community members participate in order to gain access to knowledge and opinions held by other educational stakeholders, and some graduate students participate because they can gain partial university course credit as a result. The result is an unconventional participatory mix that is not possible in many other formats.

**Power**

It has been informative to observe the ebb and flow of dialogue among network participants and to note that power is often an important part of what people say and how they say it. It has been observed that many components of the online discourse could be described as reactive rather than proactive. Examples include
participants who use the electronic context to lament the growth of technology-mediated learning environments at the perceived loss of meaningful human interactions, to argue that educators should not be subject to shared governance mandates, to suggest that public accountability mechanisms are meant to control teachers or students, and to decry the expansion of private, home, and charter school options for students and parents. Many of these arguably reactionary stances could be attributed to a defensiveness that arises from an apparent loss of control or status, while others could be seen as a normal human reaction to unsought educational change.

Less common but as powerful are the postings and presentations from individuals who wonder about possibilities, question current policies and practices, and pose challenging alternatives. Examples include the enterprising principal who markets her school to international students so that she can generate revenue to subsidize the rest of her school’s operations, and the international schoolteacher who challenged participants in North America to understand that there are numerous successful alternatives to traditional Canadian or American public schools. Similarly, an American home-schooling parent instigated a strong debate about the ways public schools deny voice, access, and success to disadvantaged students and their families.

Power or, more precisely, the desire to have more of it may have been a motivator for the occasional participant who has used the Change Agency, for example, as a vehicle to try to accumulate disciples of one kind or another. One example, was a Canadian school trustee who used the listserv to gather information and vocabulary to assist in her re-election bid. Another example was an American participant who seemed to be an itinerant sessional instructor who wrote from a postsecondary institution address that changed every few months. This person used the Change Agency to espouse his Marxist beliefs about education to all. Other power ploys have been less obvious and perhaps more acceptable: the teacher who wished to increase his visibility within the educational community while applying for leadership positions, and the teacher education student who thought that a Change Agency and seminar series presence would help her applications that had been submitted to some of the school superintendents who also participated in these activities.

Interestingly, the Change Agency has served to level the power often associated with role. For instance, a beginning graduate student unwittingly challenged a renowned American academic over the latter’s theoretical stance. The student was aghast when informed by her peers that she had just told someone they regularly cited in their papers that she was misled in her thinking. Importantly, the student-guru exchange that resulted was a dialogue between equals and the debate-limiting deference that graduate students too often give to senior academics was not evident (Webber and Robertson, 1998).
Educative possibilities

The challenges of the Change Agency notwithstanding, the network that it fostered has created numerous educative possibilities. The network offered increased participant diversity, the potential to promote alternative thinking, the identification of voices that are noticeably absent in most educational debates, and new understandings of professional growth.

Participant diversity

Perhaps the most useful insight gained from my participation in the Change Agency and its larger network is the power of so-called “low tech” software to connect individuals, groups, and institutions. The result is a “boundary-breaking” network (Webber and Robertson, 1998) that crosses the borders normally imposed by role, politics, and institutional regulations. Without the support of the Change Agency Listserv, much of the associated network activities could not happen. For instance, the seminar series’ needs assessment is conducted primarily on the listserv; summer institute participants grapple online with professional challenges before and after the institutes; and travel study registrants “bond” before and after their face-to-face meetings. Further, the international university partnerships that support the network are a direct result of individuals “meeting” on the Change Agency or through colleagues who are Change Agency subscribers. As well, most of the editorial board members associated with the International Electronic Journal for Leadership in Learning are current or occasional Change Agency subscribers or associates of subscribers.

A second important observation mentioned earlier and highlighted here is that, contrary to usual expectations, most of the participants in the network described in this paper are women. This network feature is worth closer examination. That is, what are the factors that led to this gender imbalance? Are the numbers of participants who are women and the voice of women in network activity proportional?

Another aspect of diversity that warrants further examination is the impact of cross-role participation. That is, what are the benefits and limitations of participation by teachers, principals, students, parents, community members, department of education staff, graduate students, and professors? Participants regularly report that they appreciate cross-role dialogue but the impact on practice and, importantly, on the lives of students is not entirely clear.

The promise of the network to promote discourse among diverse individuals and groups notwithstanding, there is no easy or obvious solution to the problem of socioeconomic limitations to participation in network activities. One possible solution may grow from the proliferation of cellular telephones in both developed and developing nations. That is, nations such as Kosovo, Romania, and China appear to have abbreviated the transition from limited access to telephone communication, to relatively widespread telephone access through the
installation of a nation-wide grid of overhead telephone lines, to heavy use of cellular telephones. Therefore, one wonders if Internet access will follow a similarly shortened transitional period as a result of advances in wireless technology and high-speed processors in hand-held and portable computers.

Alternative thinking

Further to the tendency noted earlier in this paper for network participants to voice conservative or even reactionary stances, it also is entirely possible that we are in the stage of the social change process where we lament the passing of the familiar and resist the effort required to engage change. Perhaps we need to go through the lamentation phase before we can begin to consider how familiar structures and organizational frameworks can be altered or discarded as new and more promising possibilities emerge.

Promising signs of a shift to engagement with possibilities are manifested in some network programming. For example, a recent online exchange among students taking the same graduate course while residing in several different nations suggests that there is increasing recognition of the utility of network activities for educators working in rural or remote communities, for professionals with young children whose study time during regular business hours is extremely limited, or for individuals who either cannot afford or will not tolerate long treks in urban or rural communities to participate in more typical evening graduate classes.

Absent voices

Students both in and out of school-sponsored activities constitute one group whose voice is seldom heard in educators’ professional growth activities. Therefore, the Change Agency network programming has provided some but insufficient opportunities for educators, policy makers, and community makers to talk directly with students who are currently in school and those who have elected to leave school early. These student-related events easily have been among the most powerful of all Change Agency network programs. For instance, a seminar several years ago featured a troupe of high school actors who, with the help of their teacher, had written a play that addressed the construct of teacher professionalism. Their powerful play moved the audience to levels of discussion that had not occurred in previous seminars. Due entirely to the profile they gained at the seminar, the student actors subsequently performed their play at several conferences for school principals, superintendents, and school trustees.

Besides the self-reported endorsement by network participants of cross-role dialogue, there are some groups that participants have not called on adequately to join the discourse. These include representatives of business and industry, the military, and church-affiliated organizations. The Change Agency and its network affords a unique opportunity for these previously unheard voices in conversations about education to become more actively engaged.
New understandings of professional growth

Until recently, professional growth was thought, at least by educators, to be their domain and to include traditional in-service activities such as professional development days, specialist conferences, and curriculum development committees. However, the Change Agency network has allowed for the acceptance of alternative activities, such as online professional growth, shared cross-role learning, and graduate studies to be considered equally legitimate. This type of “layered participation” is unique to the Change Agency network and merits additional study.

Similarly, technology-mediated programming has allowed network participants access to professional growth that is less dependent on space and time (Webber, 2000) than traditional professional development. Therefore, it now is possible and in fact extremely beneficial for participants to engage in joint discussion and research while living and working around the globe.

Finally, the ability of network participants to learn across roles, space, and time, suggests that the educative possibilities of technology-mediated programming are largely untapped. Therefore, it is important that we successfully engage, for example, with the cognitive dissonance that comes from talking with those who conduct their learning and lives differently.

Educative network profile

The preceding sections describe how a relatively unsophisticated communication tool – the Change Agency Listserv – was a catalyst for the formation of an international leadership development network. The network was informal in many respects, loosely-coupled, and fragile. Nonetheless, there was a discernible profile for the network that may evoke possibilities for readers (See Table 1).

Professional dimensions

Perhaps the most significant observation within this section of the network profile is the focus on learning possibilities rather than on technology per se. That is, although the network was supported by technology, learning and learners are the primary foci. Moreover, network activities focused on leadership issues such as accountability, globalization, governance, organizational frameworks, school reform, and instructional leadership, and not on technology concerns like bandwidth, processing capacity, or software upgrades. Obviously, technological capacity was necessary for the network activities to occur and, in fact, the network formed primarily because of technology; however, the technology tended to exist in the background with most network members either unaware of its impact or not particularly interested in discussing it.

Role flexibility emerged as a significant characteristic of the leadership network. That is, traditional leadership roles such as professor, superintendent,
and principal were less clearly defined than in participants’ previous experiences with leadership development. That is, teachers, school students, parents, and community members emerged as information providers and discussion facilitators in both face-to-face and online activities. This meant that participants representing traditional leadership roles were able to move in and out of the role of learner, information gatherer, and decision challenger. Further, the open access to many of the network programs, for example, the Change Agency Listserv and the seminar series, meant that individuals were able to dialogue about significant educational issues with other stakeholders with whom they do not normally interact. To a much lesser extent, participants were able to communicate and learn with individuals from both developing and Western societies.

It should be noted that although network initiatives allowed and in fact encouraged participants to draw on learning derived from their professional practices, theoretical and empirical reports were highly valued and used regularly, e.g. Hargreaves (1997), Levin (2001), and Macpherson et al. (1998). Moreover, the participants’ preferred literature suggested a strong inclination toward future-oriented leadership development rather than to past practices.

**Role dimensions**

The most pervasive and most productive feature of the leadership development network was that it challenged virtually every standardized policy and practice

326
of the individuals and organizations it served. For example, the awarding of
graduate credit for participation in various components of network program-
ming, the required collaboration across decision-making bodies in universities
and professional organizations, and even event timetabling to accommodate
participants from different time zones and hemispheres, all challenged how
leadership development has been done in the past. Successfully challenging
these and other standardizations meant that participants filled a large number of
roles at different times that could be characterized by these descriptors: scholar,
entrepreneur, politician, practitioner, and networker. Further, participants had to
translate network practices into a format that colleagues in their respective
organizations could understand and accept.

As expected, all network initiatives were not highly successful. Fortunately, pro-
gramming failures, such as a poorly attended conference that unfortunately coin-
cided with drastic budget cuts to schools and universities in Alberta, Canada, were
viewed as productive so long as reckless risks were not taken and if significant
lessons could be learned and applied to future planning. This network attribute
could be described as “responsible failure.”

Environmental dimensions

Network participants discovered that pervasive school reform over the past
decade in Western nations reduced in stature and utility much of their know-
ledge about how best to cope with educational change. Therefore, lessons from
the past were useful but only minimally so and a future-oriented perspective was
required, especially among program planners.

For example, network participants and planners resisted their tendency to
want to wait for a time when educational stakeholders from more demographic
groups and from developing nations could participate, for example, in online
seminars and travel studies. They resisted because they found that if they did not
gain experience in delivering online seminars for relatively privileged particip-
ants with high-speed Internet connections, then they would not be ready to make
the most of the online multimedia capacity of new software programs like
Centra[12] and vClass[13] that can be used to good effect with lower-speed
Internet connections.

The capacity of learning-related software, such as WebCT[14] and First-
Class[15], led to the discovery of the effectiveness of “layered” participation in
network programming. In addition, very powerful learning occurred when the
benefits of “layered” participation combined with the positive impact of indi-
viduals who were able to participate in learning groups regardless of their time
zone or geographic location.

Finally, network programmers learned to take advantage of serendipitous
opportunities. Some of the strongest and most productive network linkages to
date were the result of a misdirected telephone call, a brief introduction while
one of the network planners was on vacation in The Netherlands, and a response
to a general call for a North American contact that was sent from the United Kingdom to one of the listservs sponsored by the American Educational Research Association[16].

**Emotional dimensions**

The emotional dimension of the leadership development network was in evidence in all of its components. Passionate debates on the Change Agency Listserv and during summer institutes cemented ongoing professional exchanges between participants from Canada, the United Kingdom, New Zealand, Australia, and the United States of America. Also, a healthy competition between professional organizations was balanced by the need for them to collaborate in order to deliver high quality seminar series, online publications, Web-based courses, and travel study opportunities. Furthermore, the productive competition-collaboration tension was characterized by creativity, sensitivity, and trust. Indeed, it could be said that the emotional dimension of the leadership development network was one of its strongest features.

**Conclusion**

To close, the Change Agency network provides some evidence that technology-mediated learning has a large educative capacity. To realize that potential, practitioners and theorists alike might consider the following questions:

- How can the Change Agency network components – online dialogue, research studies, seminar series, travel studies, and electronic publication – be adapted to other contexts in useful, defensible ways?
- What are the benefits and disadvantages of participation in networks that are concurrently local, national, and international in scope?
- Is the apparent dominance of the privileged in technology-supported networks defensible?
- How can absent voices be recognized and invited to participate?
- Is there the will to change organizational structures and procedures to allow for technology-supported networking?
- Can educational institutions successfully and effectively incorporate technology-supported learning or will it simply occur without them?
- What is the future of a learning network that fails in the long term to involve both genders, at least the majority of community voices, and the less privileged among us?

All of these questions apply equally to more traditional learning institutions and networks. However, the incorporation of a technology-supported component changes the focus, magnitude, and audience for these important issues.

LEADERSHIP FOR LEARNING—
REENGINEERING ‘MIND SETS’

John West-Burnham

Abstract
This paper argues that for schools to be able to respond to fundamental changes in their environment a profound re-conceptualisation of leadership is necessary. Using Sergiovanni’s notion of a mindscape, the article argues that the current formulations influencing the language of leadership are archaic and inappropriate. Drawing on a range of sources, alternative models are proposed using concepts such as intellectualism, artistry, moral confidence, etc. The article argues for a closer linkage between the language of leadership and the language of learning, in contrast to the vocabularies of management and the curriculum. The overarching theme of the article is that it is only through changing language that we can change conceptualisations and so behaviour.

The purpose of this paper is to explore the extent to which the language that is used in talking about leadership in schools is compatible with the notion that learning is the core purpose of schools. The semantics of leadership are fundamental to the creation of meaning and so to perceptions, expectations and behaviour. For Sergiovanni (1992) this has to do with the mindsapes, or theories of practice, that leaders develop over time, and with their ability, in the light of these theories, to reflect on the situations they face.

(p. 7)

He quotes Diana Lam:

I believe leadership is an attitude which informs behaviour rather than a set of discrete skills or qualities, whether innate or acquired.

(p. 1)
Attitudes and ‘theories of practice’ are constructs derived from a prevailing culture and expressed, reinforced and elaborated into practice through language. The vocabulary, definitions and metaphors of leadership will be powerful forces in formulating attitudes, expressed, as they are, through the symbolism of schools, the content of training and development activities and the discourse that is employed in all the events that inform the culture of a school.

If schools are to respond to the fundamental changes that are taking place in social and economic terms then it is necessary to re-conceptualise leadership. In British society in particular much of the formulation of the concept of leadership is essentially 19th century in origin. People in Britain are subjects, not citizens, and this has a profound impact on how the language of leadership has developed and the way in which associated behaviour is accepted. In essence leadership is expressed in terms of individuality, hierarchy and essentially masculine language.

This has produced a culture of formal accountability, control and dependency. However much this is mitigated by personal characteristics, the fact remains that most schools are essentially archaic in organisational terms, resembling classic bureaucracies which, by definition, lack flexibility, adaptability and the potential to be transformed. If a school, or any organisation, is to be capable of transforming itself then it has to be led by people who are capable of personal transformation. If schools are to reengineer themselves, then one of the starting points has to be reengineering the perceptions of leadership.

One of the most powerful determinants of the mindscape or attitude of leadership is experience. The experience of leadership in many schools is expressed through a number of key concepts, e.g. Headteacher; Senior Management team; Line management; Head of department; etc. Although the practice can and does vary, the underlying mindscape is one of hierarchy, control and linearity. Somewhat paradoxically, this language is combined with that of professionalism. Saul (1992) characterises the situation thus:

The myth of salvation through efficient management is now so strong that no one pays much attention to the premise upon which the new elites are being educated.

Efficiency. Professionalism. A belief in ‘right’ answers, which can only be produced by professionals.

One of the results of this has been a tendency to express leadership as ‘super-management’; leaders are more competent at a wider range of tasks. Thus the model of headship is one of omnicompetence: the skilled classroom practitioner plus curriculum leader, plus technical expert, plus all the manifestations associated with being the figurehead. It is no wonder that so many headteachers seek early retirement or suffer a range of work-related illnesses. The job as historically constituted is almost impossible.
An implication of this view is the formulation of the role of the teacher and the status of the curriculum. Both in terms of content and delivery, the National Curriculum is predicated as a control culture based on the right answers. This is manifested in the often significant confusions between the functions of teaching and learning; the inference, for example, that there is a logical correlation between the two and that efficiency in the former will necessarily lead to the latter taking place. The consequence of a hierarchically based mindset for leadership has a number of implications for the implementation of learning in schools: automatic cohort related chronological progression; time constrained compartmentalisation; assessment based on ‘right’ answers; emphasis on the recording of information.

What emerges is a picture of uniformity, dependence and an implicit definition of learning that is generic and essentially passive. Of course, this is a stereotype and caricature, but the absence of appropriate definitions of leadership and learning, at the very least, allow the possibility of elements of what has been described to be found in schools. However, even if the reality is much softer than implied, there are still serious doubts that the underlying culture described is an appropriate one for the changing context in which schools will have to operate.

Schools are moving into an era which has the potential to challenge every existing premise on which current notions of leadership and learning are posited. Four key trends can be identified.

Firstly, as the self-managing school movement reaches maturity, notably in England and Wales, the level of significance attached to institutional leadership and management will increase. This is a direct function of prevailing models of accountability, which are both personal to the headteacher in terms of legal and contractual issues and specific to the institution in terms of inspections, league tables, etc. Schools are increasingly vulnerable in that the historic support mechanisms and limited public exposure have been replaced by direct answerability. The quality of decision making at school level is becoming increasingly important as mistakes and failures are visited directly on the institutions and its members. Errors or omissions in planning, budgeting, staff deployment, etc. have direct, immediate and specific consequences.

Secondly, and directly related to the first point, is the increasing emphasis being placed on performance at institutional and personal levels. The need to demonstrate value added, value for money, year-on-year improvement, target achievement, etc. has fundamentally altered the view of the school as one stage in a life long process where outcomes may not be manifested for many years. The growing importance being attached to results, usually in a quantitative form, calls into question the view of learning as an iterative process.

Thirdly, these first two trends are taking place in the context of exponential social, economic and technological change. Caldwell and Davies have explored the implications of these trends in more detail elsewhere in this volume; the issue for schools is the extent to which they can legitimatise the way in which they
function in the context of rapid environmental change. It may be that the current formulations of leadership and learning are correct and appropriate, but if education is a function of society and society is changing, then the a priori conditions on which schooling is based at the very least has to be visited and re-affirmed. There is the possibility that schools will become increasingly dysfunctional because they are working to mindscapes which owe more to 19th century maps of Africa (vast tracts of land labelled ‘unexplored’ and then turned into colonies with straight line boundaries totally ignoring local realities) than to the latest satellite images.

Fourthly, and perhaps most significantly, is the growing awareness that the world is not linear, but is rather complex and chaotic. Most prevailing orthodoxies in management and learning assume a linear and controllable universe,

But chaos theory has proved these assumptions false. The world is far more sensitive than we had ever thought. We may harbour the hope that we will regain predictability as soon as we can learn how to account for all variables, but in fact no level of detail can ever satisfy the desire. Iteration creates powerful and unpredictable effects in non-linear systems. In complex ways that no model will ever capture, the system feeds back on itself, enfolding all that has happened, magnifying slight variances, encoding it in the system’s memory—and prohibiting prediction, ever.

(Wheatley, 1992, p. 127)

Almost every teacher will recognise what Wheatley is describing—it is the dynamics of the classroom and staffroom, meetings and lessons, interviews and plans. Most importantly, Wheatley is describing the learning process, where each child in the class is a variable and each child is made up of a complex range of variables that determine how they might learn. Equally, every school leader spends most of her/his time managing unpredictability—yet this is rarely reflected in role descriptions, the deployment of time, organisational structures, etc. One of the reasons why schools can be such demanding places to work in (for children and adults) is that people have to live in a state of permanent tension between the superficial simplicity of management and the deep complexity of learning and leading.

If schools are not to become asynchronous, then the way that a school is led has to become a macrocosm of the learning process, in design terminology, form has to follow function. The language that is used to talk about leadership has to be changed to reflect the world in which leaders can lead and learners can learn. This is an incredibly complex task, but it is one that we regularly engage in; joining the staff of a new school, a club or even getting married all involve developing (or re-aligning) our vocabularies which determine our understanding of the way we are to function, to be together. As Sergiovanni (1996) puts it:

The heart and soul of school culture is what people believe, the assumptions they make about how schools work, and what they con-
sider to be true and real. These factors in turn provide a theory of acceptability that lets people know how they should behave. . . . Efforts to change school cultures inevitably involve changing theories of schooling and school life.

(p. 3)

Theories are mental constructs and as such are the products of our choice of formulations to describe the reality we wish to create. Much of our social understanding is created by ostensive definitions—relating a name to an object or process. The terms leadership and learning continue to be applied to processes which are no longer valid or appropriate. The process of creating meaning is described by St Augustine in the *Confessions* (quoted by Wittgenstein, 1968)

. . . Thus, as I heard words repeatedly used in their proper places in various sentences, I gradually learnt to understand what objects they signified; and after I had trained my mouth to these signs, I used them to express my own desires.

(p. 3)

The rest of this paper is concerned with identifying which words should be used, what are the ‘proper places’ and how everyone in the school can be helped to express their own desires. In the context of (a) the changing world that has already been described and (b) the need for leadership to be reformulated to make it logically consistent with the learning process, the following concepts are proposed:

- intellectualism;
- artistry;
- spirituality;
- moral confidence;
- subsidiarity;
- emotional intelligence.

There are two important points to be made about this list. Firstly there is a danger with any list that a hierarchy of significance will be imposed on it. This is not intended, indeed, the important thing is to see the six elements as interdependent and contributing to a holistic view of the nature of leadership. Secondly these are all elusive concepts, subject to a variety of interpretations and applications.

A helpful metaphor is provided by Valerie Stewart (1990) in *The David Solution*

When Michelangelo looked at the block of marble he was to carve, he looked beyond the outside and saw the shape of the statue he was to create. He could see the real beauty hidden within the waste.

(p. 1)
The process of personal growth, development and change has to start with a visualisation of how we want to be. David was a unique personal creation which can be understood by all who see it. A parallel metaphor for the school might be the building of a cathedral. The patron’s vision had to be interpreted by the architect whose drawings had in turn to be interpreted by a wide variety of skilled workers. The minutiae of specific tasks were held together and made meaningful by an overarching vision which had to be understood, interpreted and translated into action. In both cases, David and the cathedral, the vision had to be made meaningful through specific intent ‘you just chip away the bits that don’t look like David’ (p. IX); each mullion, gargoyle and piece of stained glass had to be put in place.

If the primary purpose of educational leadership is to facilitate learning, then what follows is an attempt to describe the appropriate components—even the most spectacular flying buttress is eventually rooted in the foundations and secured to the main body of the building. There is a danger in describing the six elements separately—they might be interpreted as being discontinuous whereas the argument here is that they are inter-related elements of a holistic model.

**Intellectualism**

One of the most depressing outcomes of the self-managing schools movement coupled with the introduction of a national curriculum and its associated testing regimes is the increasing emphasis on school leadership and management as a technical skill. Increasing levels of definition, specification and imposed goal setting have served to diminish the creative and critical components of leading and managing. Prescription of the right answers and associated models of accountability may have contributed to the creation of an accepting and conformist culture. Giroux (1988) argues for teachers as ‘transformative intellectuals’ because

> The category of intellectual is helpful in a number of ways. First, it provides a theoretical basis for examining teacher work as a form of intellectual labour, as opposed to defining it in purely instrumental or technical forms. Second, it clarifies the kinds of ideological and practical conditions necessary for teachers to function as intellectuals. Third, it helps to make clear the role teachers play in producing and legitimating various political, economic and social interests through the pedagogies they utilise. By viewing teachers as intellectuals, we can illuminate the important idea that all human activity involves some form of thinking.

(p. 125)

The assertion of the role of teacher as intellectual is essential if the educative and transformational role of schooling is to be refined and strengthened. At no point in the development of educational practice—whether at national policy
level or decisions about learning strategies in schools and classrooms—are there uncontroversial decisions. The process of being an educator is the process of making decisions, of choosing and interpreting the outcomes in ideological and practical terms. Policies may be prescribed at a variety of levels, but the implementation of those policies involves ‘forms of knowledge, language practices, social relations and values that are particular selections and exclusions from a wider culture’ (p. 126). Decisions as to modes of practice involve the conscious legitimisation of specific options; that legitimisation has to be an intellectual process if it is not to be reductionist, bureaucratic and a denial of the social purposes of education as opposed to training.

A further dimension to the concept of the ‘teacher-as-intellectual’ is that it is very difficult to see how the notion of the ‘reflective practitioner’ can be developed except in the context of an intellectual perspective. Reflective practice implies the ability to conceptualise, analyse, establish causal relationships, draw conclusions, etc. These qualities are at the heart of effective pedagogic practice, just as they are central to the learning process and therefore have to be axiomatic to any notion of leadership.

Said (1996) argues that one of the greatest barriers to the true functioning of the intellectual is the ‘attitude’ of professionalism:

> ... thinking of your work as an intellectual as something you do for a living, between the hours of nine and five with one eye on the clock, and another cocked at what is considered to be proper professional behaviour—not rocking the boat, not straying outside the accepted paradigms or limits, making yourself marketable and above all presentable, hence uncontroversial and unpolitical and ‘objective’.

(p. 74)

He goes on (pp. 76–83) to identify four characteristics which mark out the true intellectual:

- love for, and unquenchable interest in, the larger picture;
- making connections;
- refusing to specialise;
- caring for ideas and values.

Said argues that the most appropriate counter to the imperatives of specialisation, expertise, power and authority is that

The intellectual today ought to be an amateur, someone who considers that to be a thinking and concerned member of a society one is entitled to raise moral issues at the heart of even the most technical and professionalised activity . . .

(p. 82)
For leaders in schools Said’s four points offer a powerful parallel between the qualities of leadership and the overarching educative purpose of the school. If leaders function as intellectuals then they are more likely to create a culture in which others are able to function in the same way, even though this might be extremely uncomfortable at times. However, given the moral nature and social significance of the educational process, the development of a critical and creative perspective as an essential component of leadership seems axiomatic.

Artistry

Stewart’s (1990) metaphor of Michaelangelo’s David provides a helpful model of the distinctions to be drawn between aspects of leadership and management. What makes the statue so distinctive is the artistry that transforms the physical material into a powerful image. Management can only function within the context of the vision of the completed work. Equally, the traditional management skills are unable to cope with the complexity of the creative process, they are the tools to facilitate it. Schemes of work, school timetables, etc. are literally pointless if they are not set within the context of a vision of the school as a learning community.

The leader as artist is thus a central notion to the process of realisation—translating ideals into concrete outcomes. Leaders need three qualities that are found in artists—vision, creativity and the ability to communicate. Much has been written on the centrality of vision to quality, school improvement and school effectiveness. However, it is unlikely that any school can have a vision per se, it has to be a school understanding which is initially individually articulated.

The process that leads to the articulation of the vision is a complex one. In discussing the origins of the creative process Gardner (1993) argues

At first accepting the common language or symbol system of the domain, each creator finds soon enough that it proves inadequate in one or more respects . . .

. . . because the creative individual is dissatisfied with an ad hoc solution or because the particular problem can only be solved by a fundamental reorientation . . .

(p. 33)

Given the context that schools are increasingly having to function in and the complexity of creating a learning organisation, it is essential that leaders are capable of the ‘fundamental reorientation’; conceptualising a new paradigm. This process is well known in the arts and sciences—Michaelangelo, Beethoven, Darwin, Einstein, etc. Similar qualities may well be appropriate to respond to the changing demands on schools. Reference to the intellectual giants of Western culture may be intimidating, each is unique (and male) and there are
25,000 schools in Britain! However, it is possible to argue for artistry and creativity to be given higher significance in our understanding of what constitutes the elements of leadership. According to Henry (1991)

Change is occurring too fast for quantitative extrapolation, rather we will have to re-open the part of us that ‘knows’ in some other way; the sure judge with the courage to risk, the imagination to challenge, the sensitivity to know when to act and whom to involve.

(p. XI)

For Henry creativity is

... a thinking process associated with imagination, insight, invention, innovation, ingenuity, intuition, inspiration and illumination.

(p. 3)

What is highly significant about this listing is that it has much in common with what happens when people learn—the creative process is one of understanding a new phenomenon and this applies equally to student, teacher and headteacher. However, if the latter is managing rather than leading, the outcomes are more likely to be replication, reiteration, reinforcement and resignation.

There is an obvious tension between the creative individual and the needs of any organisation—the need for some stability in order to support innovation. Kao (1996) uses a musical analogy, jazz improvisation, to examine the potential conflict:

A well-managed enterprise can’t survive without some sheet music. It allows the management of complexity, without which the modern symphony orchestra... would degenerate into cacophony. Most large-scale human interactions require their specific blue-prints, rituals, road maps, scripts, whatever, but they also require improvisation.

A detailed examination of the process of creativity is outside the remit of this discussion. The essential points to make are its centrality to appropriate models of leadership for learning and reengineering and the fact that it can be developed in individuals.

The real reason why we have done so very little about creativity is very simple. We have not understood it at all. We have not understood the process of ideation. We have not understood creativity because it is impossible to do so in terms of the passive information universe... No matter how hard we try in the wrong universe, we shall not understand creativity.

(de Bono, 1991, p. 218)
If we are in the ‘wrong universe’ with regard to creativity then the chances are that we are inhabiting the wrong universe with regard to leadership and learning. A very high warp factor may be needed to bring about the paradigm shift required.

The final element of artistry is the ability to communicate the new insight or vision. This assumes a sophisticated level of competence in order to bridge the gap between vision and understanding. The first performance of Stravinsky’s *Rite of Spring* produced a riot in the audience. Stravinsky’s vision was not understood and so not accepted. Many innovators have experienced a similar response—although riots in staff meetings are mercifully rare. Any product of a creative process will challenge existing norms and force new ways of thinking. In an educational context the issue of effective communication cannot depend on the passage of time to gain acceptance. The leader as artist has to educate her/his audience, to help them learn and understand and in this respect is no different to the effective teacher.

**Spirituality**

One of the limitations of competence approaches to management is that they miss the holistic view of the ‘person’. Any discussion of the qualities of leadership has to address what is usually described as the ‘spiritual’, although this is an unsatisfactory word as it is not proposed to advocate a metaphysical or transcendental component *per se*. What is important is the recognition that many leaders possess what might be called ‘higher order’ perspectives. These may well be, and often are, represented by a specific religious affiliation. However, these perspectives may come from a range of sources—Covey (1992) refers to them as principles and characterises them thus:

> Principles are deep, fundamental truths, classic truths, generic common denominators. They are tightly interwoven threads running with exactness, consistency, beauty, and strength through the fabric of life.

> . . . we can be secure in the knowledge that principles are bigger than people or circumstances, and that thousands of years of history have seen them triumph, time and time again.

(p. 122)

Such principles are necessary for self-understanding, they are the means by which the individual is able to contextualise herself or himself in a chaotic, complex and often bizarrely contradictory world. A personal ‘world view’ is the basis of self-awareness, interpretation and an essential prerequisite to the process of reflection that is the key to personal learning and so to growth through transformation.

Most educational leaders will experience failure, disappointment, frustration, rejection and hostility at some time during their professional lives. The lack of a
set of fundamental principles makes such reverses almost impossible to bear and may actually give rise to acute dysfunction. When faced with personal rejection we can either seek to reaffirm the principles by which we work or become reactive, pragmatic and expedient. As Gardner (1995) puts it

The creator must in some sense embody his story, although he need not be saintly. . . . The individual who does not embody her messages will eventually be found out, even as the inarticulate individual who leads the exemplary life may eventually come to be appreciated.

(p. 293)

Terry (1993) affirms this emphasis

Faith in authenticity must undergird our actions. To be faithful, we must believe that any authentic act, no matter how small or seemingly insignificant is upheld by the universe as worthy and honourable. Leadership is spiritually grounded.

(p. 274)

In terms of leadership development this area has often been seen as too ‘personal’ or too elusive to be regarded as a significant factor. Yet this is not a matter of seeking to establish religious faith (although a significant number of schools do require that information), but rather ‘what do you believe in?’ and ‘how do you translate your beliefs into action?’.

This implies a degree of sophistication in being able to articulate a belief system and use it as a benchmark in a variety of personal and professional contexts. Given the sensitivity of personal beliefs systems this is an obvious area for development through reflection-in-action and mentoring.

**Moral confidence**

This quality is clearly closely related to spirituality in that a moral code is often the most overt manifestation of any personal belief system. However, because of its significance in the context of school leadership it requires specific discussion.

The term ‘moral confidence’ is used to stress the importance attached to the capacity to act in a way that is consistent with an ethical system and is consistent over time. This requires confidence in terms of acceptance and understanding of the ethical system and the ability to interpret it in a wide range of situations. Schools are highly complex communities—there are no value-free decisions where the learning of young people is involved. Equally, schools are understood through the actions of individuals—what in the Total Quality movement are known as ‘moments of truth’, actions which are the direct and immediate reflection of a moral code. As Etzioni (1995) expresses it, schools
... provide experiences that tend to have deep educational effects, either positive or negative. Thus the first step towards enhancing the moral educational role of schools is to increase the awareness and analysis of the school as a set of experiences.

(p. 104)

Two issues emerge from this assertion. Firstly the role of leaders in creating the ‘awareness and analysis’, i.e. a morally competent community. Secondly the importance of leaders being able to validate their own actions in explicit moral terms. Sergiovanni (1996) reinforces this when he tells of the need

... to accept as part of our role responsibilities the necessity to practice leadership as a form of pedagogy. Aristotle would suggest that nothing could be more natural for schools since he defined pedagogy as a good; as a virtue.

(p. 96)

‘Leadership as pedagogy’ (or practice what you preach) captures the essence of leadership for transformed schools. At a time of social and moral uncertainty the need for leaders to exemplify not so much a specific code but rather the existence and understanding of a personal ethical framework and the ability to translate it into validated and justified outcomes would seem to be essential. If the school *qua* organisation is going through turbulent times then its moral purpose needs to be clear so that it can be debated, understood and applied. There are numerous issues in schools (child protection, equity, health and safety, access, etc.) which do not permit ambiguity in terms of practice.

The morally confident leader is someone who can:

- demonstrate causal consistency between principle and practice;
- apply principles to new situations;
- create shared understanding and a common vocabulary;
- explain and justify decisions in moral terms;
- sustain principles over time;
- reinterpret and restate principles as necessary.

These attributes might appear to be a ‘counsel of perfection’ and they are undoubtedly demanding. However they relate very closely to the concept of the leader as intellectual discussed above. In essence, moral confidence is the product of a learning process which makes direct use of higher order cognitive skills. The process of becoming and developing as a leader is the process of learning to think and of learning to learn.
Subsidiarity

It is impossible to dance if every joint is locked rigid, it is impossible to have a conversation if those involved only talk in monologues, it is impossible to lead if control is seen as the necessary condition. One of the problems with hierarchies is that they are manifested through increasing accountability, which appears to require increasing capacity to control. At a time of complexity, chaos and rapid change, leadership through control will inevitably produce brittle organisations and brittle people.

The relationship between leadership, hierarchy, power and control is endemic to British organisations. If nothing else it is reflected in the symbols of status—in schools it is manifested in time and space. This apparently endemic view has been powerfully challenged by Charles Handy (1989), who quoted a papal encyclical:

> It is injustice, a grave evil and a disturbance of the right order for a large and higher organisation to abrogate to itself functions which can be performed efficiently by smaller and lower bodies.

(p. 100)

This statement is a fundamental and profound challenge to the semantics of leadership in education and in particular the mindscapes which inform the behaviour of headteachers and principals. Subsidiarity confronts the status of headship, the validity of hierarchy and the notion of delegation as the basis of effective leadership. Control and delegation, and the cultural manifestations of seniority, are inappropriate models for organisations that have to change rapidly and that are primarily concerned with learning. Central to the concept of subsidiarity is the notion of trust—willingly surrendering power rather than delegating it and structuring organisations to institutionalise and reinforce trust. As Fukuyama (1995) puts it

> If people who have to work together in an enterprise trust one another because they are all operating to a common set of ethical norms, doing business costs less. Such a society will be better able to innovate organisationally, since the high degree of trust will permit a wide variety of social relationships to emerge...

By contrast, people who do not trust one another will end up cooperating only under a system of formal rules and regulations, which have to be negotiated, agreed to, litigated and enforced, sometimes by coercive means.

(p. 27)

The purpose of leadership in the context of a culture of subsidiarity, or what Handy calls a federal organisation, is not to manage but rather to enable, facilitate, interpret, create meaning and to develop through trust.
**Emotional intelligence**

Emotional intelligence is a problematic concept—to many it is an oxymoron. Goleman (1996) has argued persuasively for the importance of emotional intelligence as a balance, if not an antidote, to the implicit supremacy of cognitive intelligence in the language that is used about individual and organisational life.

The concept is introduced in this paper because schools are places in which emotions play a highly significant role. Relationships between student and student, teacher and student, teacher and teacher, parent and teacher, senior manager and teacher, etc. are often expressed in emotional terms. For institutions so founded on cognition and rationality, most people’s experience of schools is in fact in terms of fear, joy, apprehension, worry, love, hate, grief, jealousy and resentment.

The process of transformation that we are arguing schools will have to go through is likely to increase the range and intensity of emotions. It therefore seems appropriate to argue for an understanding of the place of emotions in the repertoire of qualities desirable in a leader. Goleman quotes Gardner

Many people with IQ’s of 160 work for people with IQ’s of 100, if the former have poor intrapersonal intelligence and the latter a high one. And in the day-to-day world no intelligence is more important than interpersonal.

(p. 42)

Goleman (p. 43) argues that emotional intelligence is made up of five main domains:

1. knowing one’s emotions;
2. managing emotions;
3. motivating oneself;
4. recognising emotions in others;
5. handling relationships.

Developing capability in each of these domains is an intimidating prospect, but as Goleman argues

The underlying basis for our level of ability is, no doubt, neural, but as we will see, the brain is remarkably plastic, constantly learning. Lapses in emotional skills can be remedied.

(p. 44)

The development of emotional intelligence in leaders is perhaps the most complex of all the qualities raised in this paper, but

Imagine the benefits for work of being skilled in the basic emotional
competencies—being attuned to the feeling of those we deal with, being able to handle disagreements so they do not escalate, having the ability to get into flow states while doing our work. Leadership is not domination, but the act of persuading people to work towards a common goal.

(p. 149)

Conclusion

This paper has set out some of the possible variables in developing a new vocabulary for leadership in schools, so influencing the prevailing mindscapes and thus behaviour. If schools are to change in order to respond to a changing world, then a disjointed incremental approach is not appropriate, if for no other reason than the toll it takes. The response to profound externally imposed change (such as the 1988 Education Reform Act in England and Wales) has usually been based on piecemeal approaches derived from professional commitment, e.g. ‘working harder’. This is reflected in the level of demand for early retirement, levels of stress-related illness, etc. Profound and fundamental changes in what has to be done have to be replicated in an equally significant shift in how it is done—and this has to start with the conceptualisation of leadership.

There is, of course, a need for the technical managerial components of leadership to be addressed through appropriate training. However, that training has to be contextualised, set within a mindscape that is responsive to a complex and chaotic world, schools that are focused on learning, individuals that are capable of personal transformation and growth and so able to lead schools for the 21st century rather than the 19th century.

LEARNING LEADERSHIP

Part 10

MIDDLE LEADERSHIP
LEADERSHIP OF SCHOOL SUBJECT AREAS
Tensions and dimensions in managing in the middle

Hugh Busher and Alma Harris

ABSTRACT
There are an increasing number of research studies concerned with the realm of middle management in schools. However, few of these studies have adequately defined what might be considered middle management in schools, or have clarified which posts constitute those of middle managers. In addition, these studies have rarely considered the way in which different departmental cultures and structures affect leadership style and departmental performance. This article acknowledges the importance of the role of the head of department in secondary schools in school wide change and outlines some of the tensions and dilemmas facing those who manage from the middle. It considers the leadership tensions facing heads of department in secondary schools and points towards the variety of departmental contexts, structures and cultures in which heads of department, or subject leaders operate. The article offers an analysis of the dynamic between leadership and culture within the departmental context. It concludes by suggesting that heads of department have a major contribution to play in managing cultural change at both the department and whole school level.

Introduction
Research evidence concerning school improvement underlines the importance of focusing change efforts at different levels within the organisation (Fullan 1992; Hopkins et al. 1994; Hopkins et al. 1997). The largest study of differential school effectiveness in the UK highlighted the importance of differences between departments in explaining differences in school performance (Sammons
et al. 1997). It provided evidence that both schools and departments are differentially effective with pupils of different abilities and of different social and ethnic backgrounds. Furthermore, the study suggested a need to re-conceptualise school leadership more broadly to include leadership at middle management level. However, as Glover et al. (1998) have argued most recently, the distinction between middle and senior management remains blurred and leadership functions are still not adequately delineated, or defined. Yet, in view of the overwhelming evidence of the influence of departmental performance upon school performance such clarity concerning leadership at middle management level would seem imperative.

Leadership: tensions and dimensions of managing in the middle

One of the fundamental tenets of school effectiveness and school improvement research concerns the powerful impact of leadership. Research findings from diverse countries and school contexts draw similar conclusions (e.g. van Velzen et al. 1985; Ainscow et al. 1994; Hopkins et al. 1994; Stoll & Fink 1996). Essentially, schools that are effective and have the capacity to improve are led by headteachers who make a significant and measurable contribution to the effectiveness of their staff. Whatever else is disputed about this complex area of activity, the centrality of leadership in the achievement of school effectiveness and school improvement remains unequivocal.

This broadening of interest in, and understanding of, the leadership role parallels the pattern of development of leadership theory generally. There has been an increasing emphasis within school development upon the links between leadership and the culture of the organisation. This has led to a move away from the notion of leadership as a series of transactions within a given cultural context towards a view of leadership as transformational, having the potential to alter the cultural context in which people work. This transformational leadership perspective, as Duignan and Macpherson (1992) explain, focuses on the moral values and value-laden activities of a leader and how these are disclosed to other colleagues. Blase and Anderson (1995) argue that leaders acting in this mode try to use power with, or through other people, rather than exercising control over them. Implicit in this view is also notion of shared or devolved leadership activity where leadership activity is not chiefly the preserve of the headteacher.

UK research suggests that subject leaders can make a difference to departmental performance in much the same way as headteachers contribute to overall school performance (Sammons et al. 1996; Harris et al. 1996a & b; Harris 1998). This departmental sphere of influence has been termed the ‘realm of knowledge’ because of the importance of the subject boundary (Siskin 1994). Furthermore, it has been suggested that at the department level there is a major potential and possibility to influence whole school development. Huberman (1990: 5) states:
From the artisan’s logic, I would rather look to the department as the unit of collaborative planning and execution [since] in a secondary school this is where people have concrete things to tell one another and where the contexts of instruction actually overlap.

In hierarchical terms the head of department is a middle manager. He or she is not part of the senior management team, responsible for the overall strategic development of a school, but someone responsible for the operational work of others, namely classroom teachers. Site supervisors and senior office administrators might, along with heads of academic and pastoral departments in secondary schools, also be classed as middle managers, being operationally responsible for overseeing and developing the work of their colleagues.

In schools these organisational hierarchical distinctions are not neatly delineated. Many staff will be involved in a complex switching of roles and lines of accountability between different aspects of their work. For example, most teachers will be responsible to both academic and pastoral heads of department for different aspects of their work. The demands of these two arenas may conflict. Heads of academic departments will also be classroom teachers in their own or other subject areas. Heads of pastoral departments and senior staff will work in subject areas and be accountable for this aspect of their work to academic heads of department.

Within this complex matrix of leadership and accountability, heads of department are increasingly acknowledged to be key figures. Early research into the role of heads of department (Bailey 1973; Busher 1988; Earley & Fletcher-Campbell 1989) was concerned mainly with the responsibilities and time pressures upon heads of department. Most recently, attention has turned towards their leadership role and the relationship between departmental leadership and the differential performance of departments (Bennett 1995; Harris et al. 1995; Turner 1996; Sammons et al. 1997; Harris 1998).

This raises a number of important issues about the leadership role of subject leaders in schools and how they deal with the tensions between different functions of their role. Drawing upon the work of Glover et al. (1998) it is possible to identify four dimensions of the head of department’s work. The first dimension concerns the way in which heads of department translate the perspectives and policies of senior staff into the practices of individual classrooms. This bridging or brokering function, although only perceived by the Teacher Training Agency (TTA 1998) and the Office for Standards in Education (OfSTED) as one of the functions of subject leaders, remains a central responsibility. It implies a transactional leadership role, wherein heads of department make use of power—usually ‘power over’ others (Blase & Anderson 1995)—to attempt to secure working agreements with departmental colleagues about how to achieve school and departmental goals and practices. Part of this role is the managing and allocating of resources.

A second dimension focuses on how heads of department encourage a group
of staff to cohere and develop a group identity. The area, or areas, of subject knowledge that the department shares usually defines the boundaries of the group. An important role for the head of department therefore, is to foster collegiality within the group by shaping and establishing a shared vision. This necessarily implies a leadership style that empowers others and that involves subject leaders using ‘power with’ or ‘power through’ other people to generate collaborative departmental cultures (Blase & Anderson 1995). This style of leadership is people-oriented and requires a leadership approach that helps other people to transform their feelings, attitudes and beliefs. Transformational leaders not only manage structure but they purposefully impact upon the culture in order to change it. Hence an important dimension of the head of department’s work is to shape and manage departmental culture.

A third dimension concerns improving staff and student performance. At one level this implies a transactional leadership role for the head of department in monitoring the attainment of school goals and meeting particular prescribed levels of curriculum performance. On the other hand, as Glover et al. (1998) note, it suggests an important mentoring, or supervisory leadership role in supporting colleagues’ development and the development of pupils academically and socially. It also draws on the expert knowledge of heads of department and that of their referent power as sources of power to bring about improvement in practice (French & Raven 1968).

The final dimension of a head of department’s work is a liaison or representative role. This requires them to be in touch with a variety of actors and sources of information in the external environment of the school and to negotiate, where necessary, on behalf of the other members of the department (Bussher 1988, 1992). One aspect of this dimension is in helping departmental colleagues keep in touch with others in their subject area and with the views and needs of colleagues in other school departments. Part of this dimension of the role, then, is representing the views of departmental colleagues to senior staff and other middle managers within the school (Bussher 1992).

These four dimensions of the head of department’s leadership role create both complementary and potentially competing demands. They reflect the complexity of a management role within the middle of a hierarchy and reveal the tensions facing leaders in a middle management position. However, for individual heads of department this role is made even more challenging because of the wide variation in departmental structure and cultures. The very fact that departments vary in size, configuration, status, resource power and staff expertise make the job of each head of department contextually different from that experienced by other heads of department either within the same school, or in other schools. Consequently, to explore fully the tensions and dimensions within this role, we must consider how different departmental cultures affect potential leadership performance.

In analysing departmental cultures so as to understand the problems involved in managing different types of departments, there seem to be four main para-
meters. The first relates to the structural organisational configuration of a department, i.e. size, membership, institutional location and subject affiliation. The second relates to the degree of social cohesion and collegiality within a department. Writers such as Hargreaves (1995) and Hopkins et al. (1994) have demonstrated how the dimensions of ‘social cohesion’ and ‘social control’ can delineate different types of school culture. Consequently, these dimensions are used as tools for exploring the social relationships and processes within a department. The third parameter focuses on the status or esteem in which a department is held. It concerns those socio-political forces which shape the relationship of a department to its wider organisational contexts both within and outside a school. The fourth parameter which invisibly permeates all these other three is that of power: in terms of what constitutes power in social situations (French & Raven 1968; Foucault (in Ball 1990); Siskin 1994), the power imbalance between leaders and followers (Hofstede 1991) and the strategies through which leaders and followers exercise power (Busher 1992; Blase & Anderson 1995), be it formal authority or informal influence.

The following sections explore each parameter in depth. Each section considers a particular set of influences upon departmental culture and explores the implications that emerge for departmental leadership. Collectively, the three sections analyse the dynamic between departmental culture and departmental leadership.

**Departmental structure: implications for leadership**

The realm of academic departments in secondary schools presents a considerable range of organisational differentiation. Departments in secondary schools range from multidisciplinary departments such as design and technology departments, or science departments with many staff in them, to departments staffed by one or two people or even one person (the subject leader) and several part-time staff (e.g. a music department or history department). Furthermore, some larger departments may well have several subject leaders, each with a particular subject specialism, responsible for creating an inspiring vision in their area which fits within the overall vision of a faculty area. In such academic departments (e.g. a humanities, or science department), the head of faculty may supervise the work of a specialist subject area and also have responsibility for co-ordinating the work of the other subject leaders in the area (Kemp & Nathan 1989; Blease & Busher, in press). This suggests that not only do heads of department face competing leadership demands but that they also have widely differing arenas in which to exercise their power.

In secondary schools different departmental structures can be easily defined by size, configuration, staff-membership and subject expertise. Using these defining features, we can identify five departmental types. The first two, and largest, contain many staff and possess generous resources. The first type is the ‘federal’ department, such as science faculties, or humanities departments.
These are likely to contain and support the teaching of several subject areas. Yet these subject areas may work closely together because their subjects and pedagogies are perceived as cognate and their cultures are substantially homogeneous.

On the other hand some large multi-subject departments can be seen as primarily an administrative convenience, as in the case, perhaps, of some design and technology departments. These might be described as ‘confederate’ departments. Here, subject areas are allied together but share little in common. Confederate cultures are likely to be heterogeneous, with individual subject areas creating their own identities that may be in conflict.

A third type of large-scale department is the ‘unitary’ department, defined by a single subject area e.g. English or mathematics. Only one area of subject knowledge would be taught within the unitary department, and this is likely to have strong influence on its culture (Siskin 1994).

Smaller than unitary departments, ‘impacted’ departments also teach only a single subject area. These have very few staff, some of whom are part-time and/or teach other subjects too. They are likely only to have a few rooms in which to teach, and may have relatively small budgets. Although this type of department can be freestanding within a school’s organisational structure— including departments such as music, history and geography—it can also be part of a larger federal department—a biology department in a science faculty, for example.

The fifth type of departmental structure can be termed ‘diffuse’. For example, information technology may have no identifiable base in a school and may be taught by a wide variety of staff under the guidance of a school co-ordinator. It may be very difficult for the subject leader to create a sense of subject identity under these conditions. Consequently co-ordination may fall into a largely technical, instrumental process with the subject leader creating materials for the other staff to use. Such informal administrative processes are likely to be supplemented by infrequent team meetings focusing on predominantly instrumental matters.

These different departmental structures inevitably affect the leadership approaches of a head of department. The extent to which cognate subjects within a federal department actually work together in various strategic and operational ways will depend on the quality of leadership both of the whole faculty and of the semi-autonomous subject areas within it. Other factors likely to affect this process are the demands made upon it by school senior staff and the external environment. The historical development of the department and the formal and informal distribution of power and authority within it will also affect how it works. An implication, however, in the notion of a federal department is that the ‘centre’, held by the department or faculty leader, is sufficiently powerful organisationally to ensure that in key decisions, such as processes of change or resource allocation, the members of the department will work as a unit.

In confederate departments, however, the ‘centre’ is not sufficiently powerful.
to ensure the members of the department work together on key decisions. Consequently, leadership is likely to involve a great deal of micropolitical activity between the allied subject areas. Formal meetings might well be relatively formalised processes of statements of position by leaders of the subject areas, with the real negotiations taking place informally outside the meetings. The management of joint resources, including staff development, is likely to be a tense process, with each subject area making its own arrangements as far as possible.

In unitary departments, leadership is likely to display less obviously some of the more central characteristics of micropolitical activity found in the first two types of departments described. On the other hand, it will still include complementary formal and informal processes of interacting with and co-ordinating the work of staff and pupils. The more effective of these departments are likely to display a well-developed homogeneous culture.

In the smaller impacted departments, many of the dimensions of leadership may be constrained into a network of informal processes. There may be too few staff, or they may have other duties in other departments, to make formal processes worthwhile except as a gesture to the administrative demands of the school. Although the norms and procedures of the department are likely to be strongly upheld by the few full-time staff, they are likely to be held progressively more weakly by those with lesser organisational commitment to it. Leaders of such departments are likely to find themselves in weak positions when negotiating with senior staff.

As departmental structures vary in size, configuration and resource base, so they also differ in the cultural norms and values they establish. As departmental structures are enacted and create formal and publicly accepted rules, so cultures create informal and often implicit rules. Both represent forms of constraint upon the individual, and as such represent statements of power relationships between members of the organisation. However, just as structures are susceptible to both direct and organic change, so cultures are not fixed either. The possibility of creating a new set of norms to replace those of the existing culture is one potential form of departmental and whole school change.

Social cohesion and departments: implications for leadership

It has been consistently argued that unravelling the culture of a department will cast light on how teachers and support staff understand notions of collegiality and collaborative leadership (Ribbins 1992; Busher & Saran 1995; Sammons et al. 1997). Schein (1990: 5) suggests that ‘the only thing of real importance that leaders do is to create and manage culture’, and Siskin (1994) makes a similar claim for departmental leaders. In this respect, heads of department have points of reference and influence that, in some sense, transcend many of the formal structures within the school. Consequently, their leadership style is fundamentally important in shaping the direction and cohesiveness of subject departments.
Siskin maintains that ‘collaborative’, ‘administrative’, ‘dictatorial’ and ‘non-leader’ styles of leadership can be related to department cultures identified using the dimensions of ‘inclusion’ and ‘commitment’. These dimensions can be used to identify different departmental cultures. Hence, it is important to explore the dynamic between departmental structure, culture and leadership style.

Subject departments are not just smaller pieces of the same school social environment, or bureaucratic labels, as Bennett (1995) points out. They are separate worlds, with their own:

... ethnocentric way of looking at things. They are sites where distinct groups of people come together and together share in and reinforce the distinctive agreements on perspectives, rules and norms which make up subject cultures and communities.

(Siskin 1994: 81)

Departmental cultures, then, represent the enacted views, values and beliefs of teachers and support staff about what it means to teach students in particular subject areas within particular institutional contexts. These are moral relationships (Hodgkinson 1991) rather than instrumental ones which exist both between the people in, for example, a subject department, and between them and their surrounding institutional and socio-political contexts. Such cultures will be represented through a variety of cultural artefacts (Samier 1997), including rituals, ceremonies, language and other agreed educational practices which people undertake (Beare et al. 1989). Within given organisational structures, cultures may be collegial, or falsely collegial, termed ‘contrived collegiality’ by Hargreaves (1994); or autocratic, or corporate, or collegial, or fragmented (Busher & Saran 1995). Writers such as Huberman (1990) and Harris (1997) have used various terms and dimensions to produce cultural typologies of subject departments. The main dimensions of the last model are those of ‘departmental maintenance’ and ‘departmental development’ against which the quality of potential change in performance can be plotted.

Using such typologies of departmental culture, then, goes well beyond the Handy (1985) notion of cultural types into an exploration of the micro-ethnography of subject departments. A defining feature of departmental culture in secondary schools has been shown to be the nature and discourse of the academic subject knowledge (Siskin 1994), which provides the focus of identity to a department. This is not merely the structure of school curriculum content, texts and tests, but also includes the values, methodologies of study and foci of work. These elements of its epistemology play a fundamental part in shaping teachers’ individual approaches to teaching and learning and, hence, the departmental culture.

The development of this subject-oriented culture is of key importance in the creation of staff identities. To a teacher it is frequently the subject department, rather than the school, which is seen as the central and immediate unit of organi-
sation (Little 1995). Thus, subject departments often represent the primary point of reference or professional home for most teachers (Siskin & Little 1995), especially those who perceive themselves as subject specialists (Bennett 1995: 52). This process is helped by the subject department often being the most common organisational unit for organising secondary school teaching. Therefore, subject departments exhibit very powerful social relations functions in schools, as Goodson (1996) pointed out. Where teachers spend time together and work together, this can, positively, lead to the development of friendship groups. Conversely, subject departments can become sites of inter-personal rivalry. Where this conflict cannot be diffused through the trust between colleagues (Blase & Anderson 1995; Stoll & Fink 1996) it is likely to degenerate into confrontation or continuous friction. Thus the informal and formal relationships between teachers can create disparate working cultures between and within schools and departments. In the case of the least effective departments, research has indicated how dysfunctional staff relationships within a department can negatively affect departmental culture and performance (Harris 1997, 1998).

People’s connections with the world outside the department and the school will influence both their attitudes to their work and how and how well they carry it out. The range of professional knowledge and skills which people have, and how well they carry out their job (Blase 1995) will affect teachers’ relationships with each other both in the department and in the school. For subject leaders to work effectively with colleagues individually and collectively requires them to develop expertise in transformational leadership and to, themselves, recognise and enact the importance of the moral dimensions of collegial working and leadership (Hodgkinson 1991).

The views on subject knowledge and pedagogy held by their heads of department are, then, of major concern to subject staff. Further, how well middle managers act as transformational leaders and exercise inter-personal skills will affect the extent to which they build a genuine collaborative culture (Blase 1995). Stoll and Fink (1996) cite this as indicative of healthy departments and schools that are likely to bring about improvement in practice.

**Departmental status and the organisational context: implications for leadership**

The third parameter for analysing departmental culture is that of its relationships with its environment. These can be divided into two sectors: those with the internal organisational processes and contexts of a school, and those with a school’s external socio-political environment. The latter can be subdivided into national and local or civic environments, which interact with each other (Barker & Busher 1998).

In the internal organisational context, the quality of relationships of a department with the rest of a school is often manifested by the status in which a department is held for the academic performances it attains. As noted earlier,
although this will be affected by the status of its subject area (Siskin 1994), other status comes from the contribution that it makes to the core purposes of a school. The status a department acquires depends upon the academic and technical performances of the students it teaches, on its contribution to the extra-curricula activities of a school, and on the quality of profile it helps the school to gain with its local community (Bush 1992). Thus, departmental status can be used as a means of gaining extra resources. The department can be an important source of organisational power to those people with access to it.

Subject departments have an administrative function (Goodson 1996) in the functional organisation of secondary schools. They provide the structures and channels for managing the teaching and learning of students and staff. In doing so they tend to serve as arenas for communication between colleagues within the department and as channels of communication between staff in distant parts of a school. In both these aspects, a department is likely to be judged by its members and its observers for the effectiveness of its processes. Where these processes are effective, the head of department as manager of these formal communications is in an influential position to shape the professional interactions and perceptions of staff. Control of these communication channels can also contribute to the strength and bargaining power of department heads in their claims for increased resources (Bush 1992). Heads of department who know how to make contact and bargain with colleagues through an array of micropolitical processes are in a stronger position to implement or defend the policies of their departments than are those who do not. Subject departments therefore play important mediating roles between the demands of a subject area on staff and the demands of the school on them.

Local and national socio-political environments also have a major influence on the culture of schools and departments (Earley et al. 1998) and on members’ leadership styles of heads. Glatter (1997) makes the point that researchers into the management of school organisations tend to overlook the importance and influence of external environment on internal school processes. Simkins et al. (1992) and Wallace (1993) point out the impact that the introduction of local management for schools in England and Wales has had on the internal workings of schools. Hargreaves (1994) debates how the roles of teachers are changing as a consequence of the changes in the socio-political contexts of their work.

Grace (1995) suggests that, in part, the relationships which formally appointed school leaders at any level develop with their teacher colleagues depends on how they view and respond to changes in the national socio-political environment. Hence, the culture of a department will be affected by how its leader mediates legal and curriculum changes facing schools from agencies in the national or local environment. Influencing leaders’ actions and interpretations will be not only their subject expertise, but also their educational, social and political values.

A particular external influence on heads of department in secondary schools in England and Wales in the mid to late 1990s, is that of the Office for Standard
in Education (OfSTED). Through its inspection process, this agency sets a series of demands about how subject departments should be run in order to deliver what it considers to be quality teaching and learning. Heads of department, under the guidance of more senior staff, have to interpret and implement these demands. This external influence has reinforced hierarchical processes and strengthened imbalances of power between leaders and followers amongst staff at whatever level in a school. Successful heads of department are expected to have a clear awareness of what the OfSTED process expects of themselves and their colleagues, and to be able to advise departmental colleagues on how to implement the required processes effectively. How heads of department act in these circumstances is likely to have a considerable impact on the culture of a department.

At another level, the civic community that a school serves will have a considerable effect on the curriculum decisions made by heads of department and their colleagues. In particular it will raise questions about the pedagogy they use to meet the learning needs of students from particular ethnic and religious backgrounds and of varying socio-economic status. Combined with the level of resources available to a department, these factors will have a considerable effect on how teachers work with students. The ability of heads of department to recognise a creative range of solutions within whatever resources and personnel they have or can gain is likely to have a considerable effect on the performance of a department, and hence on its status and culture.

**Coda**

It is increasingly stated that effective management requires staff at all levels to be involved in decision-making and policy formation. As Peters (1988: 23) remarked, writing within a business context, in a fully developed organisation the front line person should be capable of being involved in strategy making. Heads of department are very much in the front line, but their degree of involvement in strategic matters or organisation decision-making is likely to vary according to the nature of the organisation, the management approach of senior staff and the culture of the organisation.

Most importantly, perhaps, levels of involvement are a function of the confidence, expertise and skill in management exhibited by the middle manager or subject leader. While recognition of the role of the head of department has been shown to be very important to the personnel concerned (Glover *et al.* 1988), the status and power based recognition is often complicated by the multiplicity of tasks being undertaken by these middle managers.

So, if as Huberman (1990) suggests, the ‘goofy logic’ of focusing change at the school level is resisted and, instead, the department is regarded as the unit of change, then the role of the head of department is of major importance. Indeed, while the literature repeatedly finds attributes such as goal consensus, collaborative norms and shared experiences to be essential components of effective
schools, there is less clarity about how to achieve such social cohesiveness. However, it is clear that heads of department, as explored in this article, can play a central role in defining and sustaining collegial sub-cultures, by ensuring that departments operate as socially cohesive communities where all members work collaboratively with a high degree of commitment. Within this middle management role, more than any other, is the real potential of organisational change and improvement.

MIDDLE LEADERSHIP

DISTRIBUTED PROPERTIES
A new architecture for leadership

Peter Gronn

Introduction
The question addressed by this article is: ‘What is to be done with leadership?’
This question represents an extension of what has become an ongoing concern
for the future of leadership, which was first articulated in an invited keynote
address to BEMAS in 1995 (Gronn, 1996). In that state-of-the-art paper, I syn-
thesized current trends and developments in leadership and considered whether
the field was on the cusp of a fundamental rethink—driven mainly by the need
to accommodate new organizational change and restructuring imperatives—
which would supersede all that had gone before it, and which would alter
forever our view of leadership. Implicit, always, in these kinds of speculations
about shifts or switches in perspective is the lurking spectre of historicism.
There is a cautionary tale here, therefore, for anyone who wishes to make pro-
nouncements about alleged turning points, movements to higher stages, water-
sheds, paradigm shifts and the like, as any of us who have been spectators of the
debate (or furore?) following the publication of Francis Fukuyama’s (1992)
influential The End of History and the Last Man will be aware. I have no wish in
what I say now to stumble into the pitfalls of end-ism raised by that particular
episode. Rather, my intention is to connect with some of the threads of my 1995
address in an effort to move forward our understanding about the phenomenon
of leadership with which we, practitioners and commentators alike, are dealing,
because I believe that most of us still labour under serious misapprehensions
about its nature. My purpose is to identify some of those deficiencies and then to
sketch the framework of what I believe is a much more promising possibility.

One of the developments which I summarized in the 1995 paper was a bifur-
cation in leadership thinking around two broad polarities: the one, stimulated
principally by Bernard Bass’s (1985) ideal type of transformational leadership,
representing a kind of apogee of individualism, and the other, typified by Elliott
Jaques’ (1989) managerial leadership, a vigorous reassertion of systemic proper-
ties and role structures, but devoid (virtually) of any identifiable sense of agency. In my review (Gronn, 1996: 17) I pointed to some of the more obvious shortcomings in the work of both writers. That said, it has to be conceded that individual or structural perspectives on leadership are not entirely devoid of merit. Thus, work which, on the one hand, permits a better understanding of the psychological and ethical dispositions of leaders is as welcome as, on the other hand, any elucidation of the structural dimensions of the roles and contexts in which various leaders lead. But what I now want to assert is that the way of the future lies with neither of these perspectives, for the choice posed by these or other similar approaches which privilege agency ahead of structure, or vice versa, rests on a false ontological dualism. The dualism is false because neither constitutive element of social reality, agency nor structure, reduces to the other; rather, the relationship between the two is always one of interplay through time: each element is analytically distinct from, but is ontologically intertwined with, the other. Thus, while an existing social structure is always a precondition for the actions of future cohorts of agents, it also represents the outcome of the pur-

positive, generative (as well as unintended) actions of previous sets of agents and is potentially modifiable by agents yet-to-be-born (Archer, 1995: 66–79).

In answer to the question of what is to be done with leadership, therefore, I shall be bypassing both of these two broad conceptions of leader–follower relations. Instead, I intend to go straight to the heart of the agency-structure inter-
play and will focus my remarks on activity. Activity is the bridge between ageney and structure. The structural patterns taken by various social or organi-
zational formations are activity-dependent and an analysis of the activities engaged in by particular sets of time-, place-, space- and culture-bound sets of agents permits an understanding of agential-structural relations through the process of structuring. The structuring actions of agents may serve two possible ends: the reproduction or the transformation of existing sets of institutional rela-
tions. My point of departure from prevailing conceptions of leadership, particu-
larly those which accord generous dollops of voluntarism to key individuals (acting either within or without formal positional roles), will be to emphasize the centrality of conjoint agency. That is, the satisfactory completion of discretionary tasks is attributable to the concertive labour performed by pluralities of interdependent organization members. Leadership and influence comprise part of that labour within those structured relationships, but I shall argue that the properties displayed by leadership are more likely to take a distributed, rather than a concentrated, form, a claim I have already rehearsed elsewhere (Gronn, 1999a and b).

Unlike some critics in education and beyond who plead for the abandonment of leadership altogether, therefore, I shall be maintaining that leadership can, and should, be salvaged, albeit in a distinctly different form. To achieve this end, I will develop the argument that, if our perspectives of leadership are to continue to serve useful analytical and practical purposes, then they must be grounded in a theory of action. This possibility, I hope to show, requires those of
us with an interest in leadership to rethink current organizational practices, and
the ontological properties of the activities which aggregate to constitute those
practices. The reason is that a distributed view of tasks and activities implies the
existence of a new form of the division of labour at the heart of organizational
work. Such a development has important implications for traditionally defined
individual roles and for crude dualisms such as leader–follower and leadership–
followership. For these and other reasons, an attribute like distribution needs to
be incorporated into a reconceptualized view of the appropriate unit of analysis
if we are to ensure that leadership is to retain its credibility, viability and utility.
One promising approach for rethinking leadership which I consider briefly is
activity theory (see e.g. Engeström, 1999a). My aim is to show that leadership
will retain its relevance provided that it is reconceptualized as part of a model of
jointly performed and tool-mediated activity.

The article begins with a brief recapitulation of the shortcomings of prevail-
ing views of leadership, and next considers two recent claims: the first is that
leadership should be abandoned because there are other more appropriate factors
which can be shown to substitute for it, while the second is that there are,
indeed, no other factors which can be substituted. The article then develops the
notion of distribution and appraises some recent approaches to organizational
work (including activity theory). Finally, the significance of distributed leader-
ship systems will be spelled out before I consider some of the issues raised by
the discussion and their implications for future research.

The trouble with existing dualisms

Of the two broad polarities mentioned above, the individualistic view of leader-
ship dominates the field (and for that reason, and for purposes of economy, I
confine most of my discussion to it). This individualism may be typified as naive
realism or the belief in the power of one, and it is grounded in the assumption
that ‘effective performance by an individual, group, or organization is assumed
to depend on leadership by an individual with the skills to find the right path and
motivate others to take it’ (Yukl, 1999: 292). Implicit in this kind of reasoning is
a crudely abstracted leader-follower(s) dualism, in which, inter alia, leaders are
superior to followers, followers depend on leaders and leadership consists in
doing something to, for and on behalf of others. Space limitations preclude a
detailed consideration of the difficulties with this exaggerated sense of agency
attributed to leaders (but see Gronn, 1999c: 1–20), save what in my view are the
most serious deficiencies to which it gives rise: an undertheorized view of task
performance and accomplishment, and a neglect of the division of labour. These
shortcomings were first highlighted in claims about substitutes for leadership.1

In an important article, Kerr and Jermier (1978) argued that there was ample
(statistical) evidence in numerous studies of a lack of demonstrated leader
effects in explaining organizational outcomes. They then showed how a number
of typical, hypothetical, organizational outcomes could be accounted for without
resort to leadership as the sole or exclusive candidate, causal explanation. At least three other substitute factors made the leadership of a superordinate individual redundant: the personal attributes of organization members (e.g. their self-motivation to perform), organizational processes (e.g. autonomous work group norms) and characteristics inherent in the work itself (e.g. its routine or programmed nature). In retrospect, the timing of the publication of this argument proved to be unfortunate. Although the late 1970s yielded a number of remarkably insightful contributions to the field of leadership studies—some of which are discussed below—it was also, for some commentators, something of a 'doom and gloom' period (Hunt, 1999: 133) in which leadership had forfeited any claim to validity or utility as a legitimate area of study. In the 1980s, however, students of leadership discovered organizational culture, so that heroic, neo-charismatic approaches to leadership underwent a resurgence, and the popularity of visionary and transformational leadership soared. In this climate, Kerr and Jermier's substitutes claim was virtually lost from view until its revival in 1997 in a symposium in the *Leadership Quarterly*. After 20 or so years, both authors maintained that their argument about leader substitutes had never been properly addressed by the field (Jermier and Kerr, 1997: 97).

The significance of the substitutes argument is twofold: first, it focuses our attention on what it means to perform and accomplish tasks: and, second, by discounting the causal omniscience of leadership it invites a reconsideration of the connection or relationship between leadership and task performance. On the first point, self-evidently, the tasks confronting organization members vary in status and are usually amply differentiated in most contexts. Thus, relatively straightforward, well-rehearsed operations (e.g. responding to a customer inquiry, or processing a student's admission application) differ markedly from complex, ill-defined problems (e.g. allocating educational resources under severe financial constraints). Kerr and Jermier are clearly right: tasks in the former case reduce over time to learned and refined routines (and are typically encoded in procedural or operating manuals) which when implemented, on the face of it, require nobody's leadership at all. Here, most employees, for most of the time, appear to know what to do and when to do it, and can be said to act out of habit or, in effect, in a quasi-programmed manner. This example leads to the second point and invites the question of the kinds of circumstances which might necessitate leadership and what form that leadership could be expected to take. In this connection, Robinson (forthcoming: 6) has proposed that leadership is evident 'when ideas expressed in talk or action are recognized by others as capable of progressing tasks or problems which are important to them'. This is a viewpoint entirely consistent with the now widely accepted attributional basis of leadership (see Lord and Maher, 1993), asserting, in essence, that leadership is a phenomenon in the eye of the beholder. Thus, for Robinson, leadership will be manifest in the effect or effects of contributions which yield contributions from others, and which secure the coordination of those contributions and accomplish the tasks in hand.
Before pursuing this valuable lead provided by Robinson, two possible objections have to be considered. The first, which amounts to an extreme version of the substitutes line of reasoning (e.g. Lakomski, 1998), is to assert, not (as Kerr and Jermier, and Robinson do) that leadership in some form counts for at least some of the time in the work of organizations, but that it counts for none of the time. That is, an enduring substitute or alternative explanation can always be found for leadership. On this view, the contributions of some organization members which produce or trigger contributions from other members need not be taken as evidence of leadership, but as evidence of something else: namely, learning. The second objection, a rejection altogether of the substitutes argument, asserts that there is no such thing as a substitute for individual leadership. Instead, what different eras reveal are alternating views about the leadership of individuals represented in either allegedly weak (1970s) or strong (1980s and 1990s) theories. From this perspective, the attraction of the substitutes argument (and even of distributed leadership) among commentators is evidence or a sign of the adoption or dominance of weak leadership theories within the field (Shamir, 1999: 50). These objections are discussed in the next two sections.

Do we still need leadership?

Despite the well-documented and widespread phenomenon of the romance of leadership (Meindl, 1995), anti-leadership proponents emerge periodically. Beginning with Miner (1975: 200), who asserted that leadership had ‘outlived its usefulness’, a batch of them surfaced in the late 1970s (e.g. Argyris, 1979; Calder, 1977; Pfeffer, 1977) and then were submerged by a kingtide of culturally grounded theories comprising what Bryman (1996) terms the ‘new’ leadership. But with this new leadership now being subjected to the intense scrutiny of critics—which, in turn, has stimulated equally intense defensiveness on the part of its proponents (e.g. Bass and Steidlmeyer, 1999)—anti-leadership arguments have begun to emerge once again, perhaps the most vocal and sophisticated proponent of which, at least in education, has been Lakomski (1998, 1999a and b; Lakomski and Evers, 1999).

Briefly, the claim against leadership put forward by Lakomski (1998: 99) is that there is no natural entity or essence which can be labelled ‘leadership’. This is a similar assertion to the claim advanced previously by Calder (1977: 185–7), which was that it was impossible to identify a universally agreed upon concrete referent for what, essentially, is a lay label of convenience intended to attribute personal potency to someone’s observed or reputed behaviour. Despite the best endeavours of commentators to find such a natural object, the most that decades of leadership research has yielded, according to Lakomski (1999b: 6), is: first, a mass of largely inconclusive results: second, an awareness that the determination of leadership effects differs from one organization to another: and, third, the realization that leadership means different things to different people in different contexts (the attributional argument mentioned above). Lakomski (1999a: 36)
readily concedes the point about potency—‘there is no doubt that there have
been, and are, strong individuals who by dint of their abilities and personalities
were and are able to have a positive impact on organizations’—yet she suggests
that the more appropriate generic object of study is not leadership but effective
organizational practice. Thus, if some people do seem to be able to motivate
others, to make superior or appropriate judgements and to secure performance
beyond expectations, then the really interesting questions for her are: ‘How did
they learn to do that?’ and ‘How did leaders learn [to] lead since no-one is born
to lead?’ (Lakomski, 1998: 100).

Rather than engage in a point-by-point rebuttal of the remainder of Lakom-
ski’s agnosticism, I would simply make two brief observations. First, the fact
that commentators cannot agree upon a set of behaviour that amounts to leader-
ship, and that their researches have produced inconclusive results, does not con-
stitute an argument for jettisoning the concept altogether. Perhaps these
commentators would be advised to rethink their approaches and to continue the
search. Second, if, as she claims, contextual factors keep on bobbing up in study
after study, then maybe that tendency should caution against anyone maintaining
universalist pretensions to knowledge applicability and, instead, invite much
closer contextual analyses of leaders and their leadership. My major concern,
however, is with Lakomski’s abandonment of the study of leadership for the
study of learning, for no argument is offered by her for substituting the object of
study, it seems to me, other than that leadership appears to ‘reduce quite readily
to the study of effective administrative practice’ (Lakomski, 1999a: 48). But what
does it mean to ‘reduce’? Is she proposing a simple lexical switch in terms here?
And suppose that leadership did reduce in the way she appears to suggest, what
would be the justification for her claiming, not merely that leadership (suitably
rethought and contextualized in the manner that I have foreshadowed) was just
one of a number of ingredients making for good practice, but that it was no
longer a legitimate ingredient at all?

The substitution of learning for leadership proposed by Lakomski looks sus-
piciously like an attempt to privilege a model of an organization as akin to a
cognitive economy: ‘it is much more plausible to think of organizations as con-
stituting networks of distributed cognition’ (Lakomski, 1999b: 9, original
emphasis). But why, solely, a cognitive economy? What happens to the notion
of a political economy of interests proposed by Barnard (1982: 139–60), for
example, who devoted an entire chapter of his classic study, The Functions of
the Executive, to elucidating the argument that organizations comprised an
economy of material incentives and inducements to cooperation? While I would
endorse Lakomski’s claim that cognition is indeed a distributed property of
organizations, and that its distributional form is networked, I would part
company with her over the idea that cognition is the sole organizational attribute
which is distributed and that learning is all that counts. Moreover, for reasons
that will hopefully become clear shortly, I would argue that in any model of
organizations grounded in a notion of distribution, leadership remains an import-
ant component. But, first, what is meant by distribution? In order to understand this concept, it is helpful to begin with some assumptions about organizing.

The idea of distribution

If, following Weick (1995: 85), the notion of organizing can be seen as an evolving response to the various flows comprising the flux of phenomenological experience, then a minimalist view of an organization is to understand it as an assemblage of individuals or, in Burns’ (1996: 1) colourful phrase, ‘congeries of persons in more or less autonomous arrays’ engaged, continuously through time, in acquired and learned modes of practice. At some point during the evolution of those practices, typically when those involved desire to represent themselves to themselves and to the wider world as a formally constituted membership unit, an emergent process (organizing) begins to harden into an entity (organization). Entitative status entails patterned and reproduced activity-based conduct, enshrining varying degrees of tightly or loosely coupled relations between the agents involved, and this becomes the source of organizational structure. Those relations (as I hope to show) are also tool-mediated. Through time, that emerging and always potentially modifiable organizational structure, in turn, acts back on or shapes the conduct of the agents. This reciprocity expresses the analytical duality of agency and structure referred to earlier. But what are some of the principal components of organizational structure?

Potentially, there is an endless number of sub-elements of structural relations. Extending slightly an earlier summary list (Gronn, 1986: 45–6), the five most significant are: authority, values, interests, personal factors and resources. I include authority because it is always the locus of overall organizational responsibility and legitimacy, and anchors the role system of an organization. Values provide the justifications or ends to which organization members are committed. A particular balance of interests represents the outcome of the relations between, and the material stakes among, the actors as they pursue their various ends. Personal factors frame the willingness or predisposition of members to act in preferred or required ways. Resources, finally, in all of their manifold forms, including the pattern of their utilization and deployment, are the means which facilitate organizational actions, and affect the likelihood of organizational effectiveness, success or failure. Next, suppose that I posit a continuum of the possible formations which might give material expression to, or might be taken by, these constituent components, with a distributed or dispersed form comprising one polarity and a focused or concentrated form making up the other. According to this arrangement, then, the properties of each constituent element, solely or in combination, are relatively distributed or focused. Hence, if we have a set of attributes in mind which tend to be focused, we might talk of there being concentrations or monopolies of power, whereas if something else tends to be distributed then it is more likely to be shared or diffused. Distributed forms may be achieved by any number of modes of allocating the components,
but principally by means of stratification, laterality, aggregation, webbing, networking, clustering or randomness. Thus, Jaques’s (1989) structural theory of managerial leadership, which is grounded in Stratified Systems Theory (SST) is, like other models based on a notion of hierarchy, one (albeit orthodox) form of a distributed system of leadership. The reason for this is that roles in his SST model are differentiated according to vertical stratification and are intended to be spread over seven (or sometimes eight) levels according to the principle of subsumption which is the basis of all hierarchies. Subsumption means that each succeeding layer of responsibility subsumes, encapsulates or is superordinate to all of those below it.

At any one point in time in an ongoing trajectory of organizational evolution, therefore, particular organizational forms represent oscillating possibilities or potential differences in the degree of focus or distribution taken by the properties of the components. The critical questions then become ones to do with causality and timing. The first question is: which are the factors that contribute to relatively dispersed or concentrated forms of leadership? The second question is: when is the leadership of organizations likely to take a dispersed or focused form? Both questions are answered in the discussion section of this article. In short, my claim is that a distributed-focused continuum is an evolutionary constant. This position contrasts with the orthodox way in which people tend to represent organizational leadership in their minds, namely, something that is invariably individual and heroically male (Meindl, 1995). My line of argument also contrasts sharply with Shamir’s (1999) view that distributed forms represent a difference in kind rather than degree (between two evolutionary possibilities), and that the attention accorded distributed or non-distributed forms arises purely as a consequence of pendulum swings in the popularity of theoretical approaches in different eras. Likewise, the position I am defending is different from the argument of Gee et al. (1996), who also see the property of distribution as representing the hallmark of a different kind of phenomenon, but one which has emerged only in conditions peculiar to the fast capitalism of late modernity. That is, distributed systems are ‘a leitmotif of late twentieth century life’ and arise only because of an ‘exponential growth in variety, variability and diversity of all sorts in all areas’ (Gee et al., 1996: 51, original emphases). Yet, despite the evolutionary possibility of distribution, discussions of it in respect of leadership are few in number. By far the most popular area of application of the notion of distribution in the study of organizations, and the most advanced area of understanding distributed systems, has been cognition.

Central to the view of socially distributed cognition is the idea that mind and mindfulness are not solely features of the interior mental life of individuals, but are manifest in jointly performed activities and social relations. Distributed mind, therefore, means the pattern of overall activity-based attention between socially positioned actors, and their relations with various representational and computational objects, tools or implements in the performance of tasks. This definition means, in turn, that situations and contexts, and their objects, both
structure and mediate thinking. The corollary of a distributed view of mind is that learning—the outcome of task-focused, multi-party cognition—is also socially structured, and is part of the overall system of collective relations between agents, activities and objects. Distributed mind and distributed learning are especially evident in working environments in which decision making is heavily dependent upon the rapid processing of large amounts of information as part of networked, computer-mediated work practices and similarly complex technological artefacts. In these environments—which include the more obvious examples of the flight decks of aircraft carriers (Weick and Roberts, 1993), airline cockpits (Hutchins and Klausen, 1998) and the control rooms of mass transit systems (Heath and Luff, 1998)—individuals perform tasks to some extent autonomously but mostly in concert. That is, the actions which comprise their jointly performed work are either coordinated or programmed to occur either simultaneously—conjointly, in parallel or sequentially—sometimes in circumstances of bodily co-presence, and in others when the actors collaborate but are separated by zones of time, space, place and culture (Gronn, 1999b). What of leadership? In what way can it be said to be distributed?

The claim made earlier about an emerging balance between degrees of distribution or focus is not new, for it was first raised early on in the development of leadership studies as a field by Gibb (1954), but lay dormant until its resurrection by Brown and Hosking (1986). Gibb’s (1954: 884) claim was that ‘leadership is probably best conceived as a group quality, as a set of functions which must be carried out by the group’ and that it could either be concentrated, monopolized or focused, on the one hand, or dispersed, shared and distributed, on the other. He then proposed two forms of distribution: the overall numerical frequency of the acts contributed by each group member and ‘the multiplicity or pattern of group functions performed’. The first of these conceptions is really an accumulation or aggregation model of distribution, whereas the second is a systemic or holistic perspective. Gibb’s former view of distribution is still consistent with a perspective on leadership as comprising individual behaviour in which the totality of leadership acts is the numeral sum of every single contribution. This represents a minimalist view of distribution which encompasses leadership as a shared phenomenon. The second, alternative conception of distribution, on the other hand, requires a reconceptualization of the unit of analysis to encompass conjoint agency and plural member work groupings (see Gronn, 1999a and the discussion below).

Gibb’s thinking was remarkably prescient. He was uncomfortable with the idea of the solo leader and adopted an interactional standpoint. He noted, for instance, that the entitative idea of an organization seemed to imply clear and fixed role differentiation, yet, in the importance he attached to formative group and organizational processes, he highlighted the fluidity of circumstances in which there was a ‘tendency for leadership to pass from one individual to another as the situation changes’ (Gibb, 1954: 902). This was an emergent view of leading, and Gibb developed it by showing how the popular idea of leaders
and followers as mutually exclusive categories was grievously mistaken. Instead, he claimed (Gibb, 1968: 252) that ‘each of these is but a transient status’, so that ‘leaders and followers frequently exchange roles and observation has shown that the most active followers often initiate acts of leading’. The important idea was that leaders and followers were to be thought of as collaborators in accomplishing group tasks. Gibb even highlighted studies which showed formally designated leaders to be captive of long-standing traditions and values, and as even having those traditions forced on them, so much so that as leaders they were reactive, and ‘forced to follow the behavior of those who in the [experimental] pre-test situation had followed’ and who simply ‘led the group in the direction it would have taken had [she or] he not been there’ (Gibb, 1954: 898). Moreover, leaders ‘inevitably embod[jed] many of the qualities of the followers, and the relation between the two may often be so close that it is difficult to determine who influences whom and to what extent’. Indeed, so difficult was it in practice to monitor such influence flows that Gibb suggested official leader designations be jettisoned and that observers concentrate instead on leader behaviour in groups. In this way ‘no a priori assumptions are made as to the distribution of those functions among members’ (Gibb, 1968: 271–2).

For these kinds of reasons, then, leadership is more appropriately understood as a fluid and emergent, rather than as a fixed, phenomenon. This view is perfectly consistent with Robinson’s notion that leadership is something which is acknowledged for the purposes of successful problem solving, and that as an attributed status it may endure (from the perspective of those doing the attributing) solely for the duration of a task. From this possibility it follows that the pay-offs or gains from persisting with traditional, static dualisms entrenched in leader-follower roles are limited.

**The rudiments of a theory of action**

In this section of the article I consider two implications of the possibility that the constituent components of organizational structuring, especially leadership, are likely to take a distributed form. First, I argue that for commentators distribution requires a new conception of the unit of analysis. This, as is evident from the earlier discussion of distributed mind, is mainly because account has to be taken of various forms of conjoint agency. That is, conjoint agency presages a new division of labour in which the authorship and the scope of the activities to be performed have to be redefined to encompass pluralities of agents whose actions dovetail or mesh to express new patterns of interdependent relations. Second, the abandonment of fixed leader–follower dualisms in favour of the possibility of multiple, emergent, task-focused roles necessitates a reconceptualization of the nature of influence and its relation to activity.
In this section I review the respective merits of two approaches to activity in leadership and management: first, the research of the work-activity school: second, activity theory.

1. Work-activity: a false start?

The ‘work-activity school’ was the name given by Mintzberg (1973: 21), author of the highly influential book *The Nature of Managerial Work*, to an inductive approach to research conducted in a variety of management settings. Central to this approach was the attempt to describe the content and characteristics of the day-to-day work of managers. At the time of its publication, Mintzberg’s study was distinctive because, rather than rely as his predecessors had done on data procured from diaries completed by samples of managers, he generated first-hand field reports by shadowing managers while they managed. Mintzberg labelled this field strategy structured observation, rather than participant observation as conventionally understood in anthropology or sociology. This form of observation entailed the collection of what he termed ‘structured’ and ‘anecdotal’ data. Anecdotes comprised descriptive background notes on incidents observed, while structured data meant procuring for any observed event three forms of quantifiable information: a chronological record of observed activity patterns, a mail record of incoming and outgoing mail and a contact record of who talked to whom (Mintzberg, 1973: 232–3).

Mintzberg’s research was influential in triggering off scores of replication studies over the next two decades or so in a variety of managerial spheres (including education). Given the emphasis of Mintzberg and his followers on description—explicit in the research question for which they became famous: ‘What do managers do?’—it seemed possible in the 1970s and 1980s that this work-activity approach might generate an enduring scholarly tradition in an academic discipline long dominated by prescriptive, normative approaches to knowledge. This was not to be, for work-activity and structured observation studies have declined in number and significance. Their original purpose was to track the dynamics and flow of work as experienced by managers. In this regard, Mintzberg was probably the earliest researcher to document the fast-paced and interrupted flow of the work, as captured in his pithy summary of managerial activities as comprising ‘brevity, variety and fragmentation’ (Mintzberg, 1973: 51). There were some shortcomings in the structured observational approach of the work-activity school (see Thomas, 1993: 47–55). For present purposes, the most glaring of these was its assumption that the individual, free-standing, solo-performing manager was to be taken as the appropriate unit of analysis. Yet, as Engeström (1999b: 63–4) has pointed out, this mode of representation tends to depict managerial work as a linear or cumulative flow of discrete, task-related, individual actions. Moreover, even ethnographies of managerial work or leadership,
according to Engeström, frequently lack a critical developmental dimension, even though they have the added advantage over structured observation studies of being better situated or contextualized, and sometimes provide a psycho-socio-spatial dimension for the reader’s understanding. This lacuna occurs because ‘there is no room and no language for representing horizontal interactions between various parallel tasks of an actor, or between different actors, or between actors and their artifacts’ (Engeström, 1999b: 64).

As I pointed out (Gronn, 1982, 1984, 1987) in response to the application of work-activity school research designs to the investigation of the work of educational leaders and managers, a shortcoming of the traditional Mintzbergian structured observation approach was that it left substantial dimensions of managerial work performance implicit, tacit, unsaid or invisible. Part of my rebuttal of its proponents in educational administration was that the promise of structured observation—namely that ‘through the eyes of the observer . . . the important “invisibles” of principals’ administrative behaviors are at last being documented “as they really are”’ (Thomas et al., 1981: 70)—was a claim on which it could not deliver. That is, upon the completion of structured observational studies of educational executives, a substantial proportion of the so-called invisibles of management still remained invisible (e.g. managers’ cognitive representations of their tasks). By and large, the popularity of the work-activity school had run its race by the early 1990s, mainly because, while structured observational studies yielded superficially appealing, low-level descriptions of what managers did and how they performed their work, these ‘[did] not tell us whether what they do is management’ (Thomas, 1993: 54).

A more recent and promising approach to the study of the work of leaders and managers is activity theory or, as it is sometimes known, socially distributed activity theory. This aims to take a more holistic perspective on the study of organizational work, which is consistent with the second of Gibb’s two understandings of distribution. Central to activity theory is the division of labour (the critically important dimension glossed over by the work-activity school) and it also takes as its unit of analysis the notion of a collectively performed activity system. Moreover, this approach represents an explicit attempt to make visible the dimensions and properties of, and to analyse the internal relations between, the components of activities.

2. Activity theory: a fresh start?

The intellectual roots of activity theory are disparate but find their principal expression in Russian Marxist psychology, particularly in the writings of L.S. Vygotsky (1978) and A.N. Leont’ev (1978, 1981). The most vigorous recent proponent of activity theory has been Engeström (1999a and b). There have been few discussions of activity theory in leadership and management (although see Blackler, 1993), but its attraction for students of leadership is that it offers an entirely new conception of workplace ecology. Activity theory has three particu-
lar advantages. First, the components of its activity system model are sufficiently encompassing to rectify the typical contextual gaps and omissions identified previously (see Gronn and Ribbins, 1996) in discussions of leadership. Second, it provides a thorough analysis of the pragmatics of accomplishing organizational work. Third, an understanding of the contribution of leadership to learning in the workplace is facilitated by the developmental and emergent approach to practice implicit in the activity system model. These points are discussed in turn.

Activity is a vehicle for representing human behaviour in and engagement with the material (i.e. natural and social) world. Flows of activities comprise the constituent elemental stuff of human existence (Leont’ev, 1978: 66). The key components of the model of an activity system are outlined in Figure 1.

The first features to note is that the relationships between the six components located at equidistant points around the perimeter of the equilateral triangle are always mediated rather than direct. That is, the link between actions of the Subject (S, individual or collective) and the Object (O) of her or his work-oriented, purposive actions is not direct but is mediated through various Instruments (Is): that is, artefacts or tools (including symbols and linguistic systems) which purport to represent experience, accumulated learning or solutions to previously encountered problems. Instead of S > O, then, the relationship is more accurately expressed as S > I > O. This idea of mediation stems from Vygotsky’s (1978: 30) contention that in child development ‘the path from object to child and from child to object passes through another person’, or, as Leont’ev (1978: 59) expresses it: ‘equipment mediates activity connecting man (sic) not only with the world of things but also with other people’. Likewise, that same Subject–Object relation occurs within a Community of practice (C) in the form S > C > O: it is subject to various culturally derived Rules (R), expressed as S > R > O, and it is embedded within a Division of Labour (DoL), or S > DoL > O.

But the model does not define an activity per se. Rather, it is a template for facilitating the analysis of particular activities. The critical point about the structure of activities is that they always form part of a collective labour process and, as Leont’ev’s (1981: 210) example of the hunt indicates, the definition of

![Figure 1](image-url)
activity comprises the three elements of motives, actions and operations. Motives express objects (or objectives) which meet needs, and actions fulfil purposes in pursuit of objects:

When a member of a group performs his labour activity he also does it to satisfy one of his needs. A beater, for example, taking part in a primaeval collective hunt, was stimulated by the need for food or, perhaps, a need for clothing, which the skin of the dead animal would meet for him. At what, however, was his activity directly aimed? It may have been directed, for example, at frightening a herd of animals and sending them towards other hunters, hiding in ambush. That, properly speaking, is what should be the result of the activity of this man. And the activity of this individual member of the hunt ends with that. The rest is completed by the other members. This result, i.e. the frightening of game, etc. understandably does not in itself, and may not, lead to satisfaction of the beater’s need for food, or the skin of the animal. What the processes of his activity were directed to did not, consequently, coincide with what stimulated them, i.e. did not coincide with the motive of his activity; the two were divided from one another in this instance. Processes, the object and motive of which do not coincide with one another, we shall call ‘actions’. We can say, for example, that the beater’s activity is the hunt, and the frightening of game his action.

For any activity, operations are the means of facilitating actions and they comprise its content. In this example, they would include the beating of bushes and disturbing of habitat by this particular member of the hunt, and the direct attack on and killing of the game by other members (with, note, no separation into the familiar categories of mental and manual operations being made by Leont’ev).

Although this description concentrates mainly on the actions and activity of one man as a subcomponent of a larger system, Leont’ev’s hunt example points up the centrality of the division of labour in human activity. There are two points to note here. First, the actions of each individual only make sense from the perspective of the overall pattern or system of labour relations between them. Thus, ‘the beater’s action is possible only on condition of his reflecting the link between the expected result of the action performed by him and the end result of the hunt as a whole’ (Leont’ev, 1981: 212). Second, in conjoint actions such as those comprising a hunt, the labour relations between individuals are interdependent. Just as the actions of others ‘give sense to the object of the beater’s action’, then so too do the beater’s actions ‘justify and give sense to the actions of the people who ambush the game’, for, ‘were it not for the beaters’ action, the making of an ambush would be senseless and unjustified’ (Leont’ev, 1981: 212–13).

The next point to notice about the model is the fluidity of relations inherent within it. This attribute is represented by the dual-directional arrows which express the interactional relationship between all of the components. The
The significance of this reciprocity is that it allows for the duality of constraint and enablement in respect of action—as in the structure–agency duality adumbrated earlier in the article. That is, at the same time that all Ss act within particular contexts determined by unique configurations of R, I, C and DoL, the dimensions of R, I, C and DoL and the pattern of the relations are potentially modifiable by the actions of those same Ss. Thus, in the relationship S<>I<>O, the degrees of freedom experienced by Ss in respect of potential accomplishments or outcomes are at once circumscribed by the range of existing artefacts, but also potentially widened as new technologies become available. In this way, the universe of possibilities is expanded. These dynamic relations in the model are further enhanced to allow for emergence by the incorporation of Vygotsky’s (1978: 84–91) notion of the zone of proximal development. In his discussion of the relationship between the learning and development (or maturation) of children, Vygotsky observed that all learning has a history. As part of that history, the zone of proximal development stands for the space between two levels on a trajectory of development: the actual (or retrospective) and the potential (or prospective). In the distance between the two levels lies a series of embryonic functions yet to mature, their maturation being contingent upon appropriately structured learning.

Transposed to the activity system model, the zone of proximal development expresses the emergent, evolutionary potential of activity. Thus, the dimensions of the particular arrangement of R, C, I and DoL which obtain for an actor or actors at Time1 (T1) may, at T2 and T3 etc., form a different configuration. Hence, if we bring to mind the image of a series of activity system triangles randomly positioned in a roughly ordered left–right sequence, then (Engeström, 1999b: 67):

The zone of proximal development may be depicted as a gray area between actions embedded in the current activity with its historical roots and contradictions, the foreseeable activity in which the contradictions are expansively resolved, and the foreseeable activity in which the contradictions have led to contraction and destruction of opportunities.

The dynamism inherent in Leont’ev’s (1978: 50) notion of activity is expressed in his view that activity not only has a structure but ‘its own internal transitions and transformations: its own development’. What is not clear from his explanation, nor from Engeström’s discussion of Figure 62.1, however, is what provides an activity system with its dynamism, nor what happens in the case of more open-ended, less well defined and new activities for which actions are less clearly culturally circumscribed and well defined than in the archetypal instance of the hunt. For this reason, in my view, some statement about the connection between influence and action which makes allowance for the non-occurrence as well as the occurrence of activity (and, therefore, its opposite state, inactivity, an
eventuality which Leont’ev (1978: 156) appears reluctant to countenance and relegates solely to the human experience of sleep) is necessary to amplify the model.

**Leadership and activity theory**

In discussions in social and political theory of what might be termed the family of power terms, commentators generally see a number of closely related concepts forming a tightly knit cluster. The principal ones include power, influence, authority (discussed in the next section), force, coercion, manipulation and deterrence—although rarely, interestingly, leadership. Each term provides a qualitatively different description of the relations obtaining between nominated sets of agents or actors (role incumbents). I commence with some remarks on power and then influence in which, because most commentators in leadership studies treat the two terms as synonymous (see Gronn. 1999c: 7–8), I conflate leadership and influence.

In the 1970s and early 1980s, at the same time that the so-called ‘new’ leadership was superseding anti-leadership views, social and political theorists were engaged in a prolonged debate over the locus and form of power in political systems and communities, and their connection with the interests of various parties (for a brief summary see Gronn, 1986: 46–50; Hardy and Clegg, 1999). In regard to the locus of power, the argument mainly concerned whether power was concentrated in one centre, and exercised by an individual or by an elite, or dispersed or decentred among a plurality of elite groups. In respect of the form of power, much of this debate focused initially on the status and legitimacy to be accorded latent, as opposed to manifest, behaviour in the political sphere and whether or not decision-making procedures could be rigged to stifle the expression (let alone the representation) of interests, or even prevent their formation.

From the findings of a number of strategically conducted comparative case studies emerged a recognition that while issues might become public events in some communities, elsewhere they remained non-events. While there was evidence of issue-oriented action (e.g. in respect of air pollution) in community A, therefore, nothing whatsoever transpired in community B. The explanations invoked for these disparities in policies and approaches ranged from overt preventative measures exercised by powerful groups, through self-censorship on the part of the disaffected (because they imputed power and influence to reputed others) to the absence of alternatives and possibilities in the minds of the disaffected (due to effects of their cultural socialization, prior learning, etc.). Thus, in parallel with the claim about possible substitutes for leadership in organizations, there existed a variety of candidate substitute explanations other than the orthodox behavioural view that outcomes were attributable to the decisions of identifiable individuals or groups.

The likelihood that power and influence might be dispersed or concentrated, that they did not have to be manifest or overt, and that their covert and latent
forms of expression could result in inaction as well as action, has significant conceptual and empirical implications for organizational leadership. First of all, if leadership is an instance of influence, then, like influence, it need not be expressed in ways that are obvious to the naked eye. Consider the case of anticipated reactions, which was central in the debate just summarized. In circumstances of either the imagined or embodied presence of the members of an organization, suppose that one party surmises how another might respond were she or he to initiate an action. The particular supposition may be based on previous direct experience or on the reputation of the other party. Anticipating a possible negative outcome, perhaps, the first party refrains from doing anything. Ostensibly, then, while no action has occurred, the second party (unbeknownst to her or him, or anyone else) has been influential. That is, covert leadership has produced a significant effect, in this case negation. This example is not unlike the inferential reasoning explanation provided by causal attribution theorists of leadership (e.g. Lord and Maher, 1993: 55).

Second, although the instance just given is clearly an exception, organizational influence is frequently reciprocal. The explanation for this feature lies in the division of labour. Inherent in the division of labour is a duality between specialization and interdependence. That is, tasks are broken down into their detailed specialist components, which are then performed by different individuals. But this fragmentation of effort leaves each worker dependent on others for the completion of an overall task. Paradoxically, then, labour (i.e. Leont’ev’s notion of operation) has to be reintegrated at the same time as it is differentiated (Sayer and Walker, 1992: 15–17). Influence is one means of reintegrating work tasks to achieve cooperatively generated outcomes. In Leont’ev’s archetype of the hunt, for example, the actions of the beaters and the shooters combine to accomplish the activity and to attain the desired outcome because, even though the actors perform different operations, they depend and rely on and influence one another. But unlike the kinds of organizational activities normally associated with leadership, a hunt is a set-piece, low discretionary level activity in which people are likely to play their appointed roles automatically. Nonetheless, in activities in which there is greater scope for discretion, examples of reciprocally expressed influence abound. In the relations between organizational heads and their immediate subordinates, or between executives and their personal assistants, for example, couplings form in which the extent of the conjoint agency resulting from the interdependence and mutual influence of the two parties is sufficient to render meaningless any assumptions about leadership being embodied in just one individual (Gronn, 1999a).

Third, there is an emergent dimension to influence. I have already cited Gibb’s work on this point. Emergence means that in the variously connected arrays of persons proposed by Burns (1996: 1), for example, the potential for leadership is present in the flow of activities in which a set of organization members find themselves enmeshed. Thus, a person or persons within this kind of web of relations, an initiator, perhaps—‘who because of certain motivations
of her own combined with a certain self-confidence, takes the first step toward change, out of a state of equilibrium in the web’ (Burns, 1996: 1)—may succeed in triggering a chain or cycle of multiple interactions which crystallizes into a patterned response over time. One implication of emergence is that, as the actions play themselves out as part of activities some actors are likely be more influential than others (their actions carry greater consequences for all concerned). It is at these points in time, perhaps, that the task-related leadership recognition process to which Robinson (forthcoming: 6) refers comes into play. Perceptions of some individuals as being more important than others—due to current, previous, imagined or reputed performance—may eventually solidify into an enduring expectation about anticipated consequential behaviour in future activities, but they need not.

Finally, although discussions of leadership are frequently expressed either timelessly or a-temporally, influential actions are inescapably time-bound. This neglect of time is part of the failure adequately to specify the particular contexts for action. There are, of course, different senses of time. Sometimes the influence exerted is purely momentary—as in the instinctive response to an exclamation alerting us to impending danger. But influence also endures. Moreover, there are degrees of endurance. A good illustration is Meindl’s (1995) idea of the romance of leadership. This phenomenon provides evidence of the long-term persistence of hardened, culturally shared sets of expectations about the locus of influence. The significance of this enduring dimension of influence is that the consequences of actions may only become apparent after lapses in time. The absence of evidence of immediate causal effects at any point in time, therefore, should not be interpreted as absence of influence or leadership. A useful analogy here is the accumulation of water stains on hard surfaces over time in which the gradual build-up is not necessarily evident to the naked eye while a tap is observed to be dripping. One advantage of Vygotsky’s notion of a proximal development zone in this context is that it alerts us to the transformation of activities through time, to the influential actions which contribute to that transformation and to the possible future expansion or contraction of activities (Engeström, 1999b: 67).

**Discussion**

I turn now to the two earlier questions which were concerned, respectively, with the factors which might explain the emergence of distribution as an organizational phenomenon and those factors which might permit us to hypothesize about the likelihood of leadership being either focused or distributed.

**Determinants of distribution**

The first point to note is that some version of distributed leadership has always been in evidence, not merely in the aggregated sense distinguished by Gibb but
in his second holistic sense as well. Apart from the leadership couplings just cited, the more obvious instances are the typical kinds of collaborative decision-making forums common to most educational settings such as teams or committees. In respect of the activity system model, these two are membership (Ss) units in particular settings and locales (Cs) which, drawing on specialist expertise (DoL) and utilizing various tools—such as regulations, documents, statistics—(Is), endeavour to perform tasks or solve problems (Os). These units operate according to explicit and implicit conventions or codes (Rs). Team and committee deliberations can be expected to manifest all of the evanescent properties of influence distinguished in the previous section of the article. Thus, at different points in the life of these units, different members will exert influence (and therefore leadership). The patterns of influence in evidence may or may not accord with the overall status relations of the members.

But there are also other less obvious instances of distributed forms. Long before the idea of distribution even became part of the lexicon of the field of leadership (with the exception of Gibb), Hodgson et al. (1965) had published a study of the role constellation formed by three senior psychiatric hospital administrators. This conjoint work unit represented more than the aggregated efforts of three self-contained individuals enacting their own particular roles. It evolved from a process of adaptation negotiated between the three men as they intermeshed their personalities while reworking a pre-existing set of relationships following a leadership succession process. Hodgson et al. (1965: 284) describe a constellation as a ‘latent substructure’, that is, an unspoken and implicit sense of a bonded relationship. This awareness was grounded in the intersubjectively shared knowledge that each constellation member possessed his own unique set of specialist attributes, predisposing each one to rely on the other two. And the fact that each individual’s specialist expertise was clearly differentiated from but still complementary to, that of their colleagues, and that each person trusted his two executive peers, worked to the mutual advantage of all three men and provided a sound grounding for their interdependence. Complementary specialization enabled each man to engage in actions and operations of his own choosing for which he was best fitted within a jointly agreed-upon framework of activities, in pursuit of the interests and well-being of the hospital.

In other less obvious examples, distributed leadership is even manifest in what appear to be the most self-evident and uncontestable instances of standalone or focused leadership. In the sphere of politics, consider the cases of tyranny, dictatorships or coups in which a military general takes charge. While the individuals in each case may exercise naked, supreme or virtually untrammeled power, they generally act on behalf of or with the blessing of an army council, a junta or a cell group. They institutionalize new organs of state, thereby creating a new regime of authority that they may seek to manipulate at will but on which they are also heavily dependent. Likewise, in more familiar democratic arrangements, there are often vast networks of specialist advisers, minders and officials that form an apparatus of shared responsibility and
influence surrounding heads of state and government. In each of these instances the division of leadership labour, I would argue, can be demonstrated to be shared or dispersed. Why, then, does this attribute appear to be unacknowledged or unnoticed? The reason lies with the word ‘head’. As a close reading of Gibb (1968) will show, when people use ‘leadership’, more often than not they really mean ‘headship’. Whereas leadership denotes influence, headship, on the other hand, denotes authority and describes the exercise of authority by the most senior role incumbent in an executive hierarchy. The confusion is caused, therefore, by the slippage in usage from the person who heads becoming cast as the person who leads. Authority overlays the actual division of labour so that the head individual who exercises overall responsibility becomes vested with a monopoly of influence. Thereafter an expectation solidifies that the chief authority figure or head is also, by definition, the leader.

The key component in the activity system which accounts for organizational leadership taking a distributed form, as I have been arguing, is the division of labour, despite the appearance of concentration, as in some of the above examples. The division of labour is the principal driver or generative mechanism for the structuring of work and workplace relations. This is because it defines the overall amount of work originating in the task environment to be performed, and the nature and extent of the specialization into which the totality of that work is subdivided. Yet the acknowledged form taken by the division of labour in a particular context, in respect of the allocated work, will always be determined by the structuring elements distinguished earlier: authority (whose effects we have just witnessed), the values, interests and personalities of the members concerned and the resources at their disposal.

**Incidence of distribution**

Given my claim that, appearances to the contrary, leadership invariably takes a distributed form, there are two questions which demand answers. First, why have commentators seemingly only just begun to accord explicit recognition to distributed leadership? Second, has the character of distribution changed over time? And, if so, why?

In regard to the first question, all of the indications are that distributed leadership is an idea whose time has come. The term is appearing in discussions of decision making in schools, although mostly only in Gibb’s minimalist sense or as a euphemism for collaboration and spreading the burden of decision making (e.g. Clift et al., 1995). Another reason for its appeal may be the dawning realization that the roughly two decades-long preoccupation with visionary champions is flawed, particularly in respect of their demonstrated accomplishment of direct effects on organizational effectiveness (Hallinger and Heck, 1999: 185–6). Another, perhaps, is that organizations and systems are reaping what they have sown. That is, having diminished dramatically the overall number of (especially middle) managers through processes of downsizing and de-
layering—with all of the negative consequences of the erosion of culture, loss of collective memory and so on—the justification for traditional manager–managed and leader–follower distinctions begins to weaken. Suddenly, the possibility opens up of all organization members becoming managers (Grey, 1999) and of all followers becoming autonomous leaders (Miller, 1998: 18), a consideration I have discussed elsewhere (Gronn, 1999b). Another, clearly, is the rise in popularity of organizational learning and the learning organization. The attractiveness of these two notions is accounted for less, perhaps, because of any prima facie connection between learning collectively and the notion of distributed cognition, than because of the awareness that the (tacit and codified) knowledge required to solve complex problems is dispersed throughout organizations. Hence, perhaps, the recent rise in the popularity of teams as vehicles for harnessing collective expertise.

The second question is the more difficult of the two. A trite answer would be to say that the character of distribution is likely to alter substantially whenever there are dramatic changes in the division of labour, particularly when the volume and complexity of problems and tasks increase. Despite the enduring attachment of commentators to an individualistic leadership paradigm, as a normative option in such circumstances distributed organizational leadership has, prima facie, much to commend it. Distribution entails maximizing sources of information, data and judgement, and spreading the detrimental impact of the consequences of miscalculation and risk. Because of the pooling of expertise and sources of advice, it also affords an increased likelihood of detecting errors in judgement and more attention being accorded feedback. These things amount, in short, to an overall widening of the net of intelligence and resourcefulness. But quite apart from what may be the inherent attraction of these features, the division of labour in human service organizations has been changed recently beyond all recognition by the availability of networked electronic communications technology, namely, the tools, artefacts (or Is) of the activity system template. Reliance on networked office computers, for example, now facilitates the transcendence of previously insurmountable barriers of time, place and space by opening up entirely new possibilities for the performance of collaborative work. New arrangements for scheduling and programming tasks simultaneously, sequentially or in parallel with one another by geographically separated work units, for example, have suddenly become tangible options. The inherent advantages of distribution can be realized on a scale and in a form previously not contemplated.

At the same time as the creation of these new possibilities, existing routines and operating procedures cease any longer to provide ready-made answers. The search for new solutions begins as part of the ongoing dialectic between design and adaptation in the workplace. Strauss’s (1985: 4) term for these new configurations of tasks is trajectory. The creation and re-creation of task trajectories requires the labour of articulation. Articulation and rearticulation work is central to what it means to manage, and is crucial for resolving the paradox at
the heart of the division of labour. That is, coincident with the process of differentiating tasks into their subcomponents is the simultaneous requirement that these be reintegrated by means of coordination and control mechanisms (Sayer and Walker, 1992: 17). Task integration is a precondition of cooperative effort and effective conjoint activity, yet 'none of this work is called into play automatically', remarks Strauss (1985: 5). It is for this reason that proposals that organizations can be reduced to networks of distributed cognition should be treated with caution. Cognition, clearly, is important but not so important that it is a substitute for everything else.

Conclusion

In this article I have sought to revise orthodox thinking about leadership. Building on the early work of Gibb, and in the face of a resurgence of anti-leadership arguments, I have argued for the retention of leadership, but in a form which accords more with the realities of the flow of influence in organizations, and which disentangles it from any presumed automatic connection with headship. I have discussed the merits of activity theory, as a means of tracking distributed influence and leadership, and have suggested that the activity system model at the heart of this approach forms a helpful and useful bridge between organizational structures and the actions of agents. The particular attraction of activity theory is its model of a work context, principally because of the way this foregrounds the division of labour. Provided leadership commentators and researchers focus their analyses on the actual divisions of labour obtaining in systems and organizations, especially on the ways in which the specialization–integration duality is resolved or plays itself out, rather than applying traditional stereotypic dualisms like leader–follower(s), then realistic portrayals of leadership should be attainable. This kind of outcome should result in more accurate knowledge of the causal connection between leadership and the outcomes of action, which was the original trigger for the substitutes of leadership argument. It should also generate more realistic hopes for leadership, including a less widespread lay romanticism of the concept, and a revised set of role expectations among future cohorts of aspiring educational leaders.

Those in education who insist that the achievement of sound and effective practice, and ascertaining the factors which contribute to that practice, should be the overriding goals of commentators and practitioners alike are right. My approach, however, has been to show that leadership (albeit in a considerably different form) still has a significant role to play in accomplishing good practice. But if the perspective outlined here is to have an enduring impact then there remains much to be done. Having cast doubt on learning as a sole substitute or replacement for leadership, I have said very little about its connections with leadership (although see Gronn, 1999b). On this point, activity theory has much to contribute to understanding learning and its impact on the division of labour through such processes as visibilization (Engeström, 1999b; Star and Strauss,
I have also relied on a relatively undifferentiated notion of tasks and have tended to treat these as synonymous with problems. Tasks and problems and their connection with the kind of distributed, conjoint agency view of leadership propounded here, needless to say, warrant much closer attention. The disarming implication of my argument for those with a vested interest in defending leadership as the vital ingredient in the success of organizations, however, is that attending to both of these matters of unfinished business entails foregrounding organizational work and labour more and more as the focus of analysis and discussion, with leadership being relegated to a contributory role. On the other hand, the argument of this article will have succeeded provided it demonstrates that removing leadership altogether from the stage is premature.

Note

There are, of course, numerous other potentially fatal weaknesses likely to be triggered when an exaggerated sense of agency is attributed to leaders. Grandiosity is one. At the time of writing (late 1999, early 2000), the ruling Liberal–National Coalition government in Victoria has recently been ejected after seven years in office in what was widely tipped to be an unlosable election. The Liberal Party’s campaign strategy (based on what its spin doctors believed was the Premier’s extraordinarily high public profile and popularity rating) was to embargo all its ministers from public comment, and to confine every policy announcement and public statement to the party leader and Premier, the Hon. J.G. Kennett. The Premier even established his own website (www.jeff.com)—since abolished—and produced radio advertisements with voices exclaiming ‘Jeff f****** rules!’ and the like. Following a complete electoral debacle (loss of 13 seats and government), the Coalition agreement collapsed, and Kennett has since resigned as premier, party leader and member of state parliament. The subsequent by-election held for the former premier’s seat was then won (for the first time ever) by the new minority Labor government with a massive voting swing of about 10.5 per cent. The resignation of the leader of the National Party is imminent, thereby creating another by-election.

HEADS ON DEPUTY HEADSHIP
Impossible roles for invisible role holders?

Peter Ribbins

I. Introduction
Headteachers are interesting: deputy headteachers, it seems, are not. The former have routinely, and over many years, attracted the attention of biographers, dramatists, novelists and stage and screen directors (Ribbins, 1997); the latter have been, virtually, ignored. While many headteachers have written about themselves and about headship, I could discover no substantial autobiography and few published accounts of deputy headship written by deputies. As I write, there is now a BBC television serial, Chalk, programmed after the late evening news, which has as its central character the deputy headteacher, Mr Slatt, of Galfast High Comprehensive. It is billed as a comedy and Slatt is more anti-hero than hero. No doubt, there are real deputy headteachers up and down the land who might be described in similar terms, but my reading of the literature and research suggest that many more should be regarded as victims not villains.

In developing this theme I will attempt two things. First, to say something about how deputy headship is depicted in the literature in general and the journal in particular. Second, to draw selectively on research into heads and headship in which I have been involved, with Michael Marland, Christine Pascal, Steve Rayner and others, to consider the views of heads on deputy headship. This took the form of 34 substantial, face-to-face conversations with 11 heads of secondary schools,1 12 heads of primary schools or units2 and 11 heads of special schools/units or schools with substantial numbers of pupils with statements of special need.3 Some of these conversations are in print (Ribbins, 1997; Ribbins and Marland, 1994) and the rest will be available shortly (Pascal and Ribbins, 1997; Rayner and Ribbins, 1998). For many, their experience of deputy headship is remembered with, at best, mixed feelings. In this there is a match in the extant literature, a good deal of which has been produced by heads or former heads.
II. Deputy headship in the literature

There is a published corpus of work on deputies and deputy headship in the primary and secondary school, if not in the special school, which might just about be characterized as a literature. I recall reading Peter Lawley’s book on Deputy Headship in the secondary school, which claimed to be the first book of its kind (1988). More recently, Gareth Thomas has published Primary School Deputies Handbook, which describes itself as the first dedicated text for primary deputies (1996). While I am not sure what a ‘dedicated text’ is, I do know that the literature on deputies and deputy headship is far more modest than that available on heads and headship. A comparative examination of the space devoted to these two themes in Educational Management & Administration over the last 25 years illustrates the point. No other theme has received anything like the same attention as has headship. During that time the journal has in 38 editions published 50 article and 14 reviews on headship (several other contributions have dealt with aspects of school leadership at a senior management level more generally). Of the articles, 17 focus on headship in secondary schools, 9 in primary schools, 2 in middle schools and just 1 on special education: 10 of the articles and 5 of the reviews were by heads, with most of the rest from academics. Only one article and one review on headship was from a deputy head. As well as many articles on headship in the UK, there have been contributions from Africa, Australia, Canada, France, Germany, Israel, Kuwait, Malta, Thailand, South Africa and the United States. The first articles on headship, a debate on training between Harry Gray and Alan Barnes, were the opening contributions to the first issue. More significantly, the third issue contained a paper from the founding editor, Meredydd Hughes (1973), on ‘The Professional-as-Administrator: The Case of the Secondary School Head’, which has proved to be one of the most influential, and most often quoted, in the field.

The journal’s record on deputy headship is far slimmer and much less impressive. To date it has published in five issues, five articles and one review. Of the articles, three focused explicitly on deputy headship in the primary and one in the secondary school. More than a decade passed before the journal published an article on deputy headship. A paper from Owen, then a deputy head, and his colleagues on ‘The Role of the Deputy in the Secondary School’ has the distinction of being the first, as well as the last, article specifically on this theme (Owen et al., 1983). That edition also contained the first review of a book on (primary) deputy headship. This cannot be described as an embarrassment of riches. But things may not be quite as bad as this account may make them seem. This is so because some of the most thoughtful studies on deputy headship which the journal has published are not explicitly labelled as such. One of the best, from Alan Coulson (1976), is entitled ‘Research Report: Leadership Functions in Primary Schools’. It has much to say on headship, deputy headship and the relationship between the two.
This is not the first substantial examination of deputy headship in recent times. Burnham, some years before, undertook a study of deputies for his M.Ed. His thesis (1964) and a chapter (1968) in a book by Allen offer the fullest available account of the origins of deputy headship within the English educational system. The role is an ancient one. Its genesis has two main strands. The first dates back to ‘the position of the usher in the Endowed Grammar Schools of the fifteenth century. At that time the concept was the simple one of substitute for the Headmaster, acting as a stand in when the head was absent’ (1968: 169). But, ‘by the end of the eighteenth century the usher was being given full charge of the Lower School, his authority including the right to hire and fire staff’ (p. 169). Later still, ‘the usher’s deputyship became associated with a struggle for top-man leadership in the school’ (p. 170). The second strand, that derived from the notion of the first assistant in the elementary school, developed in the late 19th/early 20th century. These studies establish that from its origins the role of the deputy has depended crucially upon how the role of the head is interpreted and on what headteachers wish to make of the position of their principal subordinate.

Coulson (1976) examines ‘the conceptions of primary school heads and deputy heads for the role of the deputy head . . . in order to discover how, and to what extent, staff leadership functions are divided between the head and the deputy’ (p. 37). He reports:

In general, heads and deputy heads agreed that instrumental leadership (behaviours concerned with organizing, directing and evaluating) is more appropriate to the head and that administration is more appropriate to the deputy. However, the conceptions of the two groups diverged in regard to the expressive or socio-emotional (behaviours indicative of friendship, integration, personal concern) leadership of teachers; whereas heads perceived this as mainly their concern, deputy heads considered it more appropriate to themselves. In most schools, delegation to the deputy head appears to be limited, mainly involving the performance of routine tasks on the head’s behalf

Coulson concludes that, as things stand: ‘deputy headship often appears to be neither intrinsically satisfying, nor an adequate preparation for headship, since the aspiring deputy rarely has the opportunity to make the type of decision which will face him after promotion’ (p. 46).

So much for the primary sector, what of the secondary school? Todd and Dennison (1980) have a similar tale to tell. They argue that the job of:

deputy headteacher has not been clearly defined, and in part this has arisen from a similar lack of role definition for headteachers, who have tended to exercise the powers of a paternalist autocrat. As a result headteachers have viewed their deputies as extensions of themselves, and in

391
doing so have deprived them of an authentic role... many (complain) they were frequently reduced to carrying out a few minor technical or clerical duties which did not encourage, or even allow, the use of initi-ative and expertise. In addition the 'man in the middle' position—between the headteacher and his staff—was a major source of difficulty and dissatisfaction.

(p. 304)

In the light of all this it is hard to deny Coulson’s claim that ‘as things stand, deputy headship appears to be neither intrinsically satisfying, nor an adequate preparation for headship’. On this last point, Gross and Herriott (1965) have also concluded that ‘some school systems promote individuals to the principalship only after they have served an apprenticeship as an assistant or vice principal, apparently in the belief that it is a valuable training’ (p. 68); ‘our findings suggest that they should not’ (p. 156).

Curiously and despite such evidence, it seems that a belief in deputy headship as an effective preparation for headship is now even more strongly entrenched than it was when Burnham, Coulson, and Gross and Herriott were undertaking their research. At the time many more made the jump to headship, without having been a deputy, in both primary and secondary schools than is the norm now. Research by Hilsum and Start (1974) undertaken in 1971–2, involving a national sample of 881 schools and 6,722 teachers in those schools, suggested that promotion to headship from lower levels within the teaching profession than deputy headship was commonplace at that time. They found that 51 percent in primary schools and 53 percent in secondary schools had not been deputies when appointed to their first headships. Much has changed since the early 1970s and it is high time for this fine study to be replicated. New research would show that the figures now, especially in the secondary sector, are much lower. Thus, for example, of the 34 heads we interviewed only four had not been deputies. What else has changed?

A reading of recent studies of deputy headship, still an undemanding task, encourages a short answer to this last question—not much! But this may oversimplify. Some contemporary authors do strike an optimistic, or, at least, a hopeful, note. Edith Jayne (1996) talks of the roles of head and deputy (or, as she would prefer, ‘associate’) head as ‘varyingly described as complementary, yin and yang, or the leader partnership’ (p. 317). In employing the term ‘associate head’ rather than ‘deputy head’, Jayne cites West (1992), who uses it to mean deputy as in deputy-head-of-school rather than as head’s deputy. Developing this idea West talks of the head as pilot and the deputy as co-pilot of the school. Even so this notion is based upon a partnership model in which both head and ‘associate head’ share a responsibility for ‘the art of headship’. These and related ideas have been developed by others. Southworth (1994: 6) suggests ‘assistant heads should be responsible for at least one aspect of the school on their own’. He concludes that the future of
primary deputy heads seems to lie on the role being rethought and enhanced. If a dynamic partnership can be formed between head, deputy and staff, and if the position can be regarded as that of assistant head . . . who are managerial partners with their headteachers . . . (this) will ensure the old adage is true: two heads are better than one.

I have two problems with this thesis. I doubt if it is particularly novel and do not believe we have the evidence to judge the extent to which it represents a reality in practice. Burnham’s ideas on deputy headship, advanced some thirty years ago, were not dissimilar, nor did they lack theoretical force, but they failed to be heard by or, if they were, to persuade many headteachers to change their ways.

In taking this view I rely upon evidence from two of the best of ethnographic studies of headship published in the United Kingdom. I do so, not least, because some of the most revealing observations about deputy headship are located in research which focuses on headship or has been conducted by heads or former heads. Elizabeth Richardson (1973) has, to the best of my knowledge, never been a headteacher or a deputy headteacher. Even so, her study of Nailsea (Secondary) School remains one of the most illuminating studies of a deputy headteacher of a secondary school. This notwithstanding the fact that it was undertaken 25 years ago and despite the fact that its treatment of the role of Robin Thomas, the deputy headteacher, and of Joan Bradbury, the senior mistress, is very much slighter than that of Denys John, the headteacher. She admits that, before she began her research at Nailsea.

I had previously thought of ‘top management’, in so far as I had used this term at all, mainly in terms of a pair . . . of a head and his or her deputy . . . What I saw at Nailsea was something a great deal more complex than . . . my image of the head/deputy-head partnership, for I had to begin by looking at a trio, not at a pair, and then found myself having to shift my perspective again in order to look at a small (leadership) group of six.

(pp. 207–8)

In introducing this aspect of her discussion, Richardson remarks that ‘the role of deputy head was a difficult one to sustain in a school where other leadership roles seemed to be overshadowing it’. This despite the fact that ‘Denys John’s deputy, both because he himself had the necessary inner strength and because of the head’s trust in him, could and did take over his role, if necessary for quite long periods’ (p. 210). However, if a deputy’s relationship with his head is a key dimension of his evolving role, there are others, each of which have a contemporary relevance. First, there are the implications for the role of individual deputies when, as in most secondary schools, there are two or more of them. This, in effect, was the situation at Nailsea. Thus, for Richardson, ‘the experiences of Robin Thomas and Joan Bradbury during the years of expansion
cannot be studied in isolation . . . these two people felt themselves to be equally trapped in straight jackets—the one as “the administrator”, the other as “the carer” (p. 218). In developing this theme she stresses the extent to which role stereotyping of this kind reflects ‘ancient assumptions about masculinity and femininity’. In such a context

in an expanding school the increasingly heavy administrative task is liable to be identified more and more with the deputy head, however strenuously he may resist this . . . so (he) may find himself having to cope with their [the staff’s] unwillingness to acknowledge that he has any skills that are not purely administrative.

(p. 220)

Second, there are problems in regarding deputyship as essentially a preparation for headship. If most secondary schools have more than one deputy there are practical difficulties. Not all can achieve headship. But there may be other problems. As Richardson puts it, Robin Thomas

lived with a good deal of uncertainty about how far the school, and particularly the headmaster and the governors, were committed to him. He had been told at interview that he would not be expected to stay for more than four years or so. Now an observation like this could be interpreted in two ways. Did the governors (and the headmaster himself) mean to imply that they would hope to get rid of him after about four years? Or did they mean that they would not wish to stand in his way if, after about that time, he had the chance of being appointed to a headship?

(p. 222)

What Thomas had not heard was

Denys John’s uneasiness about . . . subjecting an experienced and skilled teacher and a potential headmaster to what might well turn out to be a role tied to dull administrative chores, relieved only by occasional opportunities to deputize for himself and so to have periodic experiences of being, in effect, the headmaster.

(p. 222)

Ironically, these well-intentioned concerns led Thomas to be uncertain about his tenure and whether his colleagues believed ‘Denys John trusted him, as deputy head, with responsibilities in the leadership of the school’. He also wondered if he was seen ‘as a yes-man [to the head], who at best could only step into the head’s shoes and do what he had been told to do?’ (p. 224). Richardson concludes that
lacking any continuing leadership role [other than, presumably, ‘dull administration’] . . . it was, it appeared, very difficult for Robin Thomas to imagine he could ever appear to them as anything more than [‘admin-man’ or] the occasional stop-gap headmaster. In his own mind, the real task leader, the ‘ideas man’, the inspirational head was Denys John. It was hard for him to convince himself he was any more than the organizational assistant who might help to get ideas implemented, the ‘man on the ground’, the person whom colleagues might bring their confusion and anxieties.

(p. 225)

If this was the case with a head as concerned for the well being of his colleagues as was Denys John and with a deputy as able as was Robin Thomas, then we might expect problems of this kind to be commonplace. We certainly found echoes of them in our discussion with many secondary headteachers. What of deputy headship in the primary school?

In thinking about this I turned to a study by Geoff Southworth (who has been a headteacher) of Ron Lacey, head of Orchard Community Junior School (Southworth, 1995). In the context of his belief in the need for a ‘dynamic partnership’ between the head and deputy in which ‘two heads are better than one’, Southworth was ‘intrigued’ that Dave (the Deputy) should figure in such a pale form, even though they appeared, on the surface, to work as partners. They spoke to each other, kept in touch and seemed to enjoy one another’s company. Dave covered for Ron in his absence and kept him informed of developments among the staff. Yet, when Ron spoke about headship, he tended to talk about it in an individualized, as against shared way. Ron focused upon what he did, or was thinking and planning. Dave barely figured in Ron’s analysis. Nor was Dave regularly consulted about what actions to take. Ron tended to determine courses of action about which Dave was, at most, informed. In other words, the partnership of Ron and Dave was relatively shallow. Ron largely worked independent of Dave.

(p. 139)

In puzzling on this, Southworth explores five possible ‘single strand’ reasons why this should be so but plumps for a single ‘multi-strand’ interpretation which suggests that Dave was a relatively weak figure in the school because Ron regarded the headteacher as the most important person in a school. Hence there was an in-built asymmetry to any partnership between himself and his deputy . . . It shows that deputy heads are heavily reliant upon their headteachers.

(p. 140)
Relating this to his earlier paper (Southworth, 1994), he concludes that ‘Deputies cannot be assistant heads . . . unless their headteachers facilitate such a partnership’ (p. 141).

This is not to suggest that headteachers today are uninterested in deputy headship or unconcerned about the welfare of their deputy heads. On the contrary, many are. One such is Nick Butt (1997), head of St Edmund’s Community School in King’s Lynn, who fears that deputies may too often lead ‘a dawg’s life’. As a result,

more deputies burn out than either heads or class-room teachers, despite the well-documented concern about both these other groups.
Deputies are the silent minority, the forgotten troops in the education army, suffering the most casualties, providing the most support and receiving none of the glory.

(p. 10)

Deputies, it seems, can and must learn to say ‘no’ if they, like the Vulcans, another unduly stoic people, are to survive and prosper. Butt has much useful advice to offer deputy heads but I wonder on what evidence he bases such grand claims as

The majority of deputies work their socks off with very little appreciation from their heads, colleagues, parents or the local authority. It is expected that deputies will be at everybody’s beck and call, drop everything for whoever, have no agenda of their own and be a constant source of balm, encouragement, inspiration and energy.

It would have been interesting to know, for example, the extent to which, if any, his views on deputy headship represent aspects of his experience as a deputy head. If they do, he will be in good company. Surprisingly few of the 34 headteachers interviewed by my colleagues or myself recalled their experience of deputy headship with affection and several retain negative views of the role. It is to this theme that I will now turn.

III. Heads on deputy headship

In what follows I will focus on what the heads in our studies say on three themes: what they felt about their experiences as deputies; what they regard as the role of the deputy; and how they compare headship with deputy headship. I will illustrate the discussion with reference to the views of heads drawn from across all sectors. I look forward to examining the data according to age, experience, gender, ethnicity, etc. However, since all the conversations will be published within the year, others can engage in similar analysis. My colleagues and I would welcome this.
1. Heads on the experience of deputy headship

All but three or four of the headteachers in our studies had been deputy heads; most for relatively short periods, some at greater length. Fewer still had been a deputy in more than one school, several had worked for more than one head. How did they recall this experience? Relatively few remember their days as a deputy headteacher with overwhelming enthusiasm or the head(s) with whom they worked at the time with unqualified warmth. These are demanding tests. I should not paint too bleak a picture, some enjoyed deputy headship, viewed it as an appropriate preparation for headship and had a high regard for their headteachers.

(a) Deputy headship as an experience

For several of the headteachers in our study, the transition to deputy headship had been a great disappointment. Some found its demands disappointingly slight, others unexpectedly heavy:

[My] experience [of deputy headship] I found very frustrating. The head was a very different style of leader than the one I had worked for. She was much more autocratic . . . I found I actually had more power and decision making and responsibility as a head of infants than I now did as deputy head.

(Sue Beeson)

I found the step from head of department to deputy headship the biggest I ever made . . . in my eighteen years of headship, five of the seven deputies I have helped appoint are now heads and good heads. I have always told them that the step to deputy head is much bigger than that to head. I think most of them would agree.

(John Evans)

Sue Beeson stresses the extent to which her headteacher was responsible for making her experience of deputy headship a ‘frustrating’ one. John Evans has a higher regard for his headteacher (or rather ‘acting head’) of the time but nevertheless suggests that he was, at least in part, responsible for making his time as a deputy so demanding. More generally we found headteachers from each of the three sectors of schooling who enjoyed their time as deputies and others who did not. More often than not their attitudes, both positive and negative, had been shaped significantly by their memories of one or more of the heads with whom they had worked.

(b) Deputy headteachers and their headteachers

Several of the heads in our studies have good memories, as deputies, of their headteachers and of the part which they played in preparing them for headship.
I became a deputy headteacher to a head who was six years from retire-
ment and was very much looking forward to it . . . He was a wonderful
man . . . I [took on] a lot of things during my deputy headship which I
simply continued to do in my headship. In that respect, the deputy
headship was a good grounding for headship . . . [As deputy] I seemed
to do most of the organizing in school . . . In many respects I suppose I
ran the school on a day to day basis . . . I was, I suppose, the curriculum
leader and kind of personnel manager . . . I felt involved and I felt he
appreciated my work . . . There is nothing like being appreciated is
there? . . . I think my years as a deputy served me well.

(Edna Ross)

I worked for somebody who viewed her role as head as being to train
me for headship. I don’t think I had that in mind . . . She groomed me
for headship . . . The head helped to push me in the right directions. She
was great because she allowed me to make mistakes, helped me to discuss
situations, but also sometimes left it entirely to me and said ‘No, it’s your
problem, you deal with it’. I guess it wasn’t mapped out in a clinical
sense, but all of the basic areas which are involved in the organization of
school were covered.

(Mike Gasper)

I saw an advert for the post of Vice-Principal of Burleigh . . . I sent for
the details and . . . they jumped off the page at me . . . They were
written in a particular style by a woman who turned out to be one of the
formative influences on me. She was called Joan Gregory and was the
Principal of the College. She was quite outrageous, but her educational
vision was absolutely wonderful . . . most importantly for me, there was
a clear role for the deputy: to work as sort of lieutenant to her. It was
the most brilliant experience working for her . . . Jumping on, when I
applied for this job [his present headship] and was interviewed, I was
asked why I should be appointed. What made me the person for the
post? I was able to say, without hesitation, that I’d had this apprentice-
ship and experience of working alongside these two [Keith Foreman
succeeded Joan Gregory on her retirement] remarkable, powerful
people each . . . Their style was that they were grooming me, I knew
they were. I reached a point where I found myself feeling that I could
have a go at most of the things that Keith did, that Joan had done . . . I
learned from working with them and from many conversations with
them.

(Bernard Clarke)

In most cases, however, such expressions of regard, tended to be qualified:
I learnt a great deal from my . . . head. He had previously been a lawyer which was useful for learning aspects of headship. It certainly made me more careful. He was a good mentor . . . [But he] was not very good at talking to parents. He would try to avoid them. I felt that was a bad mistake . . . One does tend to learn what not to do rather than what to do. I learnt how frustrating it can be to work for some heads which was partly why I wanted to move on. I hope I give space and freedom.

(Valerie Bragg)

Several were openly, sometimes scathingly, critical. Some expressed this discreetly. Helen Hyde, for example, notes simply that ‘I did not get on very well with my head and only stayed four years . . . Why did I want to leave? Partly because I didn’t get on with the head.’ Others made the point bluntly. Rosemary Whinn-Sladden recalls that during the appointment process:

I went to look around the school with the head and thought it was the worst school I have ever seen in my life! I decided as I looked around that I couldn’t possibly work with this headteacher. His views were so unlike mine that I really didn’t want the job [but] I got the job. I went to see the headteacher afterwards to talk about what my responsibilities would be and first of all was told that I would have 38 first and second year children, the other full time teacher would have 24 and he would have 18 . . . He said I wasn’t to worry about curriculum areas or responsibilities as a deputy because he didn’t really want me, he didn’t need a deputy. If I just looked after the children in my classroom and didn’t cause any problems, after two years he would give me a good reference and I could go and work somewhere else. This was before I even started!

Even this was not the worst experience we learned of. David Haigh will never forget the first day of his second headship:

At 10.15 the head called me into his office. I had only been in the school an hour, he ranted and raved, said I’d nothing to offer as far as he was concerned, it hadn’t been his idea to appoint me and so on and so on. I went out quite badly shaken, but one of the other deputies said don’t worry, he does that to everybody. I was lucky he didn’t do it in the corridor. He . . . didn’t improve during the six years I was there . . . They were unhappy years. He used to do things like say ‘I’ll fix it so that you’ll never get another job in this Authority’. In my case it was true. I made 76 applications and got 8 interviews. I’d a first class degree and a masters in educational management, experience of everything under the sun special needwise, a history of rapid promotion . . . it didn’t help.
If some heads are remembered as nasty, others are recalled as lazy and unappreciative. It is still possible, however, for such experiences to offer a useful preparation for headship. Liz Paver, for example, when she ‘first became a deputy head’, was shocked to realize:

> you could bring your newspaper in and your electric fire and your toast and sit and be a head . . . I had no respect for [her] as a person and none as a head. [Even so] I learnt more from her than others . . . she taught me how I should never allow myself to be. Her lack of appreciation of others was a great lesson, and the fact that if we ever had irate parents she wouldn’t tackle them and she wouldn’t defend her staff . . . Furthermore, whilst you don’t have to be first on site and last off to prove you are a good head; it does help to be there at the end of the day.

(c) Deputy headship as a preparation for headship

In taking this view Liz Paver is in good company. She is one among several who believe that what they had learnt as deputy heads from the example of their headteachers had more to do with ‘how not to do’ than ‘how to do’ headship. Rosemary Whinn-Sladden is another who acknowledges that her poor experience and unsupportive headteacher ‘taught me things I didn’t want to do’. Sue Abrol makes a similar point,

> there were things I learnt not to do. I rebelled because I didn’t think that what was happening was right. One or two of my heads were very insular and their word was everything, you could not challenge it. I felt this was not on.

In contrast, while Ann Hinchcliffe’s memories of her heads are very positive she still claims that ‘I have also learnt what not to do from them, but it’s not what I emphasise in my own mind.’

Others, while not necessarily critical of the example they had received, did not feel supported or prepared for headship by their headteachers. As Sue Abrol remembers it,

> [My heads] did not overly prepare me for headship. I think they thought I’d never be a head anyway. Nobody expected me to be a head. Not even the head where I was deputy. I can still see his reference, it was balanced, that’s about it. Not necessarily saying I had the qualities needed for headship. He sat on the fence. Most of them did.

David Davies also felt he ‘had no support from the heads I’d worked for. That was wrong of them.’ Chris Morgan apportions blame more widely:
I progressed to deputy headship despite and perhaps even in spite of the system, rather than with any positive support or guidance. There was no real planning and certainly no preparation. [...] There was absolutely no formal preparation [for headship] offered by the LEA or schools I worked for, and the headteachers gave me no real help.

Conversely some believed that they had worked with headteachers who were as well disposed and supportive as circumstances allowed:

I [was appointed] to a deputy headship at a small school for pupils with SLD ... The headteacher was a very nice bloke but unfortunately he was suffering the after-effects of a serious illness. He had to take early retirement less than two years after my arrival at the school. [...] I thought my headteacher was a good bloke with a well thought out philosophy of education and in many ways influenced my approach to leadership and school management. I think he would have been a greater influence upon me as a manager if he had not been unwell.

(Rob Ashdown)

Finally, there were a few who believed that a spell as a deputy was a necessary and valuable preparation for headship. As Paul Craig put it, ‘I do think a period as a deputy is a valuable thing. I would advocate it. It is a necessary preparation ... if you do it for a number of years, it gives you a better insight into the job of headship. You get the chance to see if you really do want to take the next step.’ This testament would have perhaps been more persuasive if Craig had not also been one of the few who had not been a deputy!

2. Heads on the role of the deputy head

The headteachers in our study voiced a wide range of views on what they might expect of a deputy. Valerie Bragg identified three main aspects of the role of the deputy

first, you sometimes stand in for the head. Secondly, you are learning to be a head so you need the opportunity to try a variety of tasks and gain the necessary experience. Thirdly, the role is also a dogsbody’s job. It is part of the learning process ... picking problems up, filling in the jigsaw, noticing what has not been done and doing it.

Many heads, and deputies, would probably agree with this description as far as it goes but might suggest that it does not go far enough. For example, it seems to discount the possibility that deputy headship can be a worthwhile job in its own right and that deputies can be significant people within schools. We talked to heads, from primary and secondary schools, who believed the opposite. In the
strongest expression of this view, it was claimed that deputies were almost working as headteachers:

I’ve two deputies because the school is on split sites. The deputies need to be able to manage and administer their buildings. . . . My deputies are working almost as headteachers and I delight in seeing what they are doing.

(Mike Ashford)

In a school the size of mine, nearly 1800 pupils, the senior managers are virtually my equal in the sense of the shared responsibility we have for the school. Each of my deputy heads has a sectional responsibility for a part of the school which in terms of pupils is bigger than most of the schools in the country . . . They have a great deal of individual responsibility but it is crucial that we meet as a team very regularly; we co-ordinate what we are doing and we try to get the interpretation of policies consistent across the whole school.

(Peter Downes)

The idea that deputies should carry significant individual responsibilities was stressed by many other headteachers, although how they described and justified this could vary a good deal:

To me, you deal with the detail as a deputy . . . One of my deputies . . . (is) brilliant at the student affairs end of things and as a project manager . . . [The] other deputy, has a background in the pastoral side . . . she does the work brilliantly. I feel comfortable about her handling the timetable, the staffing and the curriculum . . . [The third deputy] manages the budget. . . . [Its] playing to people’s strengths and looking for the gaps and seeing what we haven’t got. Then asking if there is anybody who could do it.

(Bernard Clarke)

The deputy headteacher . . . isn’t just a shadow of the headteacher, she has a very different set of responsibilities related to TVEI, Records of Achievement, Inset and Child Protection. There are a number of other things, too, which form her remit . . . generally I would describe the management of the school as a partnership.

(Rob Ashdown)

The idea that the head and deputies, along with other senior staff, must be able to work in partnership and as members of a team was also often identified as a
key aspect of the successful management of the school. Several headteachers also stressed that while it should be clear who was responsible for what, a degree of shared responsibility for major aspects of the school and its management would enable ‘cross-fertilization’, continuity and a ‘consistent interpretation of policy across the school’:

We do work in a partly collegiate way. I have three deputies and a senior teacher who I meet as individuals and as a group every week . . . but they also see the benefits of the arrangements in place. [They mean] that the finance resources deputy is heavily involved with the curriculum because she is working with the heads of department. That is how it should be. The pastoral deputy . . . also looks at curriculum matters. So there is a lot of cross fertilization.

(Helen Hyde)

The leadership of the head . . . is important but so, too, is that of the management team as a whole. It is only when my Deputy Head, my leaders in the curriculum and I are together on things that we can be at our most effective.

(Joan McConnell)

Brian Sherratt, head of the largest school in the country, makes some similar points and says something about what he expects of his deputies and what the deputies might expect from him:

They should expect my confidence in them and my support . . . They should expect leadership and professional guidance from me . . . In a very real sense when I am not around they are me. They are the head. They should expect that I will be happy with the decisions they make. If I am not, they would expect me to say so . . . they should expect thorough-going delegation. Because I trust them and because we are working from the same map. My deputies and I form a team . . . What do I expect of them? I expect their support, their loyalty. I expect them to work tirelessly. I expect total commitment to the school. I expect them to move things forward, to lead in their areas: they are very clearly defined areas . . . We tend to rotate roles periodically . . . and this represents excellent career development; it provides deputies with an excellent repertoire of skills. Great Barr deputies have little difficult in moving on to headships . . . Deputies here are very much members of a team and we work together every working day. In a large school like ours there is a clear division of labour between the deputies. Where such lines of demarcation are clear, deputies tend to show a natural reluctance to trespass on each other’s areas of responsibility without invitation. Because of this it may appear to the observer that support
between deputies is not as evident as in smaller institutions where the responsibilities are less clearly visible.  

(Brian Sherratt)

3. Heads on deputy headship in comparison with headship

Contemporary headship may be tough, but one of the most striking features of the conversations taken as a whole is the extent to which the headteachers in our studies share Bernard Clarke’s view that ‘being a head is the most privileged job there is . . . I absolutely love it’. Helen Hyde also told us

I really love the job (of headship)—I love coming to the school—I love dealing with the personnel side—I like dealing with my staff—I like to feel I am helpful and I like to feel my school is achieving for the girls. I love the job—I really do.

Similar sentiments were expressed by those who work in primary and special education as well. Joan McConnell said ‘I enjoy it very much. I love it very much . . . it’s still a very rewarding job. In fact I don’t see it as a job.’

Such expressions of delight are unrestrained; others are qualified in various ways: suggesting that, whatever its merits, the job does not carry a high social status, others argue that the job is much harder than it used to be. For Brian Sherratt

There were people at [my] school . . . who nowadays occupy high prestige positions, which make my job seem totally insignificant . . . I am not saying that I don’t consider being head of a large comprehensive school an enormous responsibility . . . But in the grand scheme of things I’m not at all sure society ascribes great importance to the role of comprehensive schools, does it?

And David Winkley remarks ‘so many people have said to me in the past, “Oh, you are only a primary school head, why don’t you do something else?”’.

Others stress how much they love being a head and how demanding it is now. Margy Whalley told us ‘I love it [but] I think its tough being a head in the 90s’. Ann Hinchcliffe agreed

I love my job. I’m a very happy headteacher. Not that I haven’t been pushed to the very edge, the brink of feeling I just cannot take this anymore. I love it. It’s been a marvellous joy to me to have been appointed to this job at Ash Field.

Others go even further. For John Evans
Headship is a superb job . . . But some of my best headteacher friends have retired because of illness or stress. I am talking of people I rate highly who are not just looking for a way out. To survive you’ve got to be much tougher than in the past. I’m diabetic with serious stomach problems and think this is stress related. It’s part of the job. But it’s still the most rewarding job there is . . . I cannot think of anything I would rather do than be the head of a big comprehensive school.

Some were even gloomier. Chris Morgan pointed out that Merthyr has about thirty headteachers . . . and eleven of those retired this summer . . . Two . . . have died since they retired . . . [one] just dropped down dead. Everybody thought she was fit and well and were shocked. It . . . makes you think doesn’t it? A lot of my colleagues are turning to drink to help them to relax.

He was one of many who believe ‘the job . . . is going to get more difficult’. Unsurprisingly, some warn that those considering headship should be absolutely sure it’s what you want to do because with the territory comes some very unpleasant and difficult tasks . . . I think it is [still possible to enjoy the job] . . . everything is a bit harder earned nowadays. I do feel that more than perhaps I did that I now earn every single penny of my salary.

(Rob Sammons)

Others suggest that good deputies are becoming more reluctant to consider headship. John Evans stresses ‘My current first deputy is superb but doesn’t want to be a head’ and Mary Gray warns ‘There’s definitely a group of deputies who have seen the reality of being heads and have decided not to take on the headship role.’

Many felt deputy headship was worse. For Mike Gasper the job was absolutely thankless, the worst job on earth. Once I realised that, it was inevitable that I would go for headship . . . I didn’t like being in the position when I was the pig in the middle between the staff and the head and didn’t have ultimate responsibility or control over where or when things were going or how they were done.

The most uninhibited expression of this view came from Rosemary Whinn-Sladden:

I like being in charge. I’m sure this is one of the seven deadly sins . . . I absolutely love being the head. I love being able to do things and see
something happen. I have always been a lousy Indian and . . . known I
was going to be a head . . . I love walking round the school when it’s
full and when it’s empty. I look around and think . . . ‘I did that’ . . .
where else can you have a job where, whatever you do, a little wave
just gets bigger.

IV. Final thoughts

I have examined the literature and drawn on research in which I have been
involved to consider the role of the deputy head seen mainly from the perspect-
ive of headteachers reflecting upon their days as deputies. While very many of
them openly admit to ‘loving’ being a head, very few enjoyed being a deputy.
For several this more or less unhappy experience has shaped how they interpret
deputy headship and relate to their deputy heads. They believe that they have
learnt hard lessons from the mistakes of others. Some were passionate about
this. Since we did not talk to their deputies or others in their schools or observe
them in action I am not in a position to confirm or to deny such claims. I can,
however, make two final comments. First, ethnographic style studies of head-
ship, such as those by Richardson and Southworth, suggest that good intentions
might not, on their own, be enough. Second, and by way of conclusion, I have
been deeply impressed by something Roy Blatchford told one of my colleagues:

I have worked with seven headteachers, and you do learn. I remember
one of them saying to me ‘Well, you’ll watch me, you’ll watch me
make mistakes and you’ll go elsewhere and you won’t make these same
mistakes but remember you’ll make your own!’ I always remember
that. And I can think of the people that I’ve worked with from whom I
learned a great deal about what to do and what not to do, in the certain
knowledge that you’re going to make your own mistakes.

SOME ASPECTS OF THE “HEADMASTER TRADITION”

George Baron

“It is a tradition of English life,” wrote Norwood (Norwood and Hope, 1909) “that the Headmaster is an autocrat of autocrats, and the very mention of the title conjures up in the minds of most people a figure before which they trembled in their youth, and with which they have never felt quite comfortable even in mature life. The Headmaster, in most English schools, certainly holds a position of absolute power, for which no analogy can be found in any other profession whatever, a position, further, of authority and in influence far surpassing all that is exercised by those of the same rank in other countries.”

The assessment is no longer generally valid but the position of the headmaster, both in old-established public and grammar schools and even in the “new” secondary schools, still continues to be a distinctive feature of English education and attracts, as it has always done, the attention and surprise of foreign visitors. Whilst he can no longer, without arousing opposition or ridicule, exert the autocratic powers which made his Victorian predecessors legendary figures, he is still, in a very real sense, the pivot and focus of his school, whether it is controlled by an independent governing body or by a local education authority. A headmaster is expected, if not to rule, certainly to lead, both by staff and pupils alike and one who is “weak”, in that he fails to protect his colleagues from outside interference, or who cannot make decisions and enforce them within his school, is little esteemed, no matter what qualities of personal charm, sympathetic understanding or academic distinction he may possess. Moreover, he is expected to have sufficient acquaintance with each of the hundreds of pupils in his school to satisfy parents who wish to discuss details of their children’s education with him. Indeed, a major popular criticism made of the comprehensive schools now being opened in London is that no head could conceivably know personally two thousand children and the suggestion that this particular responsibility should be assumed by his colleagues does not give widespread satisfaction.

In spite of the importance attached to his office, little examination has been
made of the evolution of this concept of the “Headmaster”. At most, it is ascribed
to the respect for “tradition” usually considered characteristic of the English
approach to social institutions. But this is merely to note that what exists now has
existed for an appreciable span of years and furnishes no explanation as to why a
particular institution has survived, nor what successive and diverse influences have
sustained and modified its original form and later growth. Close examination of
such influences may, however, show that what is termed “tradition” is in reality
not merely due to inertia and an aversion to change, but to a delicate counterpoise
resulting from a series of dissimilar but compensating social factors.

In the case of the headmaster the tradition is not one distantly seated in our
history. Until the beginning of the nineteenth century the “Headmaster”, as dis-
tinct from the “Master”, hardly existed, save in a few of the larger and better
known schools. A school consisted of one man and his pupils. Even when an
“Usher” was appointed it was not unusual for him to be quite independent of the
Master and to be responsible to the trustees of the foundation alone. Only excep-
tionally, when numbers rose and when the Master wished to lighten his duties,
did he engage personal assistants at his own expense.

The rapid development of the more famous Public Schools in the first half of
the nineteenth century, however, resulted in the Master being obliged to engage
a number of assistants, whose numbers rose or fell with the fortunes of the
school. In some cases their position was little better than that of the ill-paid and
half-literate teachers in some of the private schools of the time; in others they
enjoyed profits earned from boarding pupils in their own houses or augmented
their stipends by fees received for private tuition. In the newer schools, such as
the City of London School and University College School, founded to meet
rising middle-class demands, the need for a “staff” in the modern sense of the
term was apparent from the earliest days and the number of assistant masters
and their conditions of service were determined by energetic Governing Bodies.

At this stage in the development of secondary education the position of the
headmaster was by no means as stable as it was later to become. At Eton, West-
minster and Winchester he was “an officer and subordinate member of the Foun-
dation or College, and subject to the superintendence of its head, the Provost,
Warden or Dean” (Public Schools Commission, 1864); and at the newly founded
Liverpool Institute School his office hardly existed at all in that its powers were
shared in turn, on the Scottish pattern,\(^4\) by a number of masters of equal status. It
was, indeed, by no means certain how a large school should be organised and
especially where the centre of power should lie. Had it not been for the appoint-
ment of Arnold to Rugby the issue might conceivably have been a major one.

The originality of Arnold lay in his regarding his school first and foremost as
a community which shaped the characters of his boys as well as their minds.
Moreover, because of his sense of pastoral mission, which expressed and was
supported by the liberal evangelism of his time, he was convinced that he must
be the centre of that community and exercise his influence on every individual
member of it. Thus he developed his well-known prefect system through which
he enlisted, though not without difficulties, the aid of older boys to discipline and guide the younger and placed his carefully chosen assistant masters in charge of the “houses” hitherto run by “dames”. Throughout, to parents, old boys and his many friends and correspondents, he never tired of showing how his work at Rugby was a vocation.

It is understandable that the example of Arnold spread to other boarding schools of similar status and importance: the conditions under which boys were taught, the absence of effective organisation, the misuse of endowments and, above all, the low moral tone of school life became increasingly repugnant to the awkening conscience of early Victorian England. It was not inevitable, however, that it should exert the profound influence that it did on the wide range of endowed grammar schools, both boarding and day, which were so drastically reformed in the middle of the century, nor that it should be adopted in the many new foundations which came into being. That this was the case resulted from other factors, including the determination of the rising industrial and commercial interests to break down institutions based upon privilege and patronage and to apply, in their reconstruction, the lessons learnt in the business firm and the factory in which rewards, and, indeed, security depended upon day-to-day performance. What took place, then, was an “organisational” as well as an industrial revolution, which produced the Civil Service, the Army of the Cardwell reforms and later the organs of local government which we know today. In educational matters the Public Schools Commissions of 1864 and the subsequent Public Schools Act of 1868, though by no means root and branch in their approach, firmly remodelled the government of the major Public Schools and made their headmasters responsible to, and dismissible by, the governing bodies of their schools, whilst at the same time affirming their control over internal organisation.

Four years later, the members of the Schools Inquiry Commission (1868), in the course of their thorough and detailed examination of all other schools providing secondary education in some form, found many extraordinary instances of gross mismanagement and neglect. They recommended, therefore, that in all cases a Master should be dismissible by his governing body and that, furthermore, his emoluments should be “largely and intimately connected with his success”. It was indeed urged by Sir John Coleridge with the formidable backing of Mr. John Stuart Mill and Mr. Morley that the Master should be guaranteed nothing save house and grounds rent free. Beyond this he should receive a fixed sum for each boy admitted to his school. Other Commissioners felt, however, that a small regular income should also be guaranteed in order to give new Masters time to build up their schools (Vol. I, p. 599).

This approach, the counterpart in secondary education of “payment by results” in the elementary field, reflected the current belief that the methods which had proved so successful in the industrial field would be similarly beneficial elsewhere.

W. E. Forster certainly espoused it wholeheartedly. “We had,” he said in the House of Commons, when introducing the Endowed Schools Bill of 1869, “to consider carefully this question—whether it is desirable that masters should...
have any payment out of the endowment or should entirely depend upon school fees. I confess that I formed my opinion on this point in a great measure from my trade experience. I looked upon masters as persons employed by the trustees to do certain work and—I hope that they will not feel the comparison a disparaging one—I thought it would be right to treat them as I should treat persons whom I employed to do any commercial work. Now, I have found that the way to get the best service in such cases is to give a small fixed income, which makes a man independent of great want and calamity and then make the remainder of his income depend, fairly and generously, upon the success of the undertaking in which he is engaged. I believe that will be the system by which we can best regulate the payments to the masters of these schools whereas very frequently their income is entirely independent of the success of the school and in those cases the school does not succeed” (Hansard, 1869).

In the revision of school schemes which followed the passage of the Endowed Schools Act the recommendations of Forster and his colleagues were substantially accepted and the personal fortunes of headmasters intimately linked with those of their schools. More important still, the staffing of the schools was, in the great majority of cases, placed wholly in the hands of the headmasters. They were given full powers to appoint and dismiss their assistants and, provided that the total expenditure did not exceed a fixed sum, to pay them whatever salaries they considered advisable. The supremacy of the nineteenth-century headmaster in his school was thus based upon his possessing all the powers of the nineteenth-century employer.5

Many consequences followed. Since the emoluments of a headmaster depended upon his success in increasing the numbers in his school, he had not only to make a show of efficiency, but he had to bow to the increasing pressure to bring scientific subjects, modern languages and geography into the curriculum. Similarly, he had to respond to the demands of parents and employers for visible results and hence sought to enter as many pupils as possible for examination such as the Oxford and Cambridge “Locals”, the London Matriculation and those of the College of Preceptors. Another important result of the widening of the curriculum and the development of new specialisms was that the prestige of a headmaster came to be based less upon his scholarship, although this might on occasion be considerable, but upon his organisational powers; his capacity for maintaining and developing the “tone” of his school and for fostering its corporate life through athletics and out-of-school activities; his sense of occasion as expressed through morning assemblies and speech days; and the personal links which he established with parents, old boys and civic leaders.

The Schools Inquiry Commission (1868) had reported adversely on the virtual monopoly of headmastership by clergymen. “It is said,” they wrote, “and we think with justice, that the profession suffers from the frequent restriction of valuable masterships to men in Holy Orders—and we believe those of our witnesses are right, who consider that their abolition would go a long way to give the profession of teaching a position and importance of its own” (Vol. I, pp. 611–12).
Despite the subsequent removal from many schemes of clauses requiring headmasters to be in Orders, the replacement of clerics by laymen proceeded slowly. The evidence submitted to the Royal Commission on Secondary Education (1895) by the Assistant Masters’ Association showed that of the 596 headmasters of the public secondary schools of which details had been obtained, as many as 283 were clerics (Vol. IV, Minutes of Evidence No. 13, 099). It was not until local education authorities, influenced by their nonconformist voters, began to be represented on governing bodies after 1902 that the possession of Holy Orders ceased to be an important qualification for a headmastership of an endowed grammar school. Moreover, the long continuance of the clerical headmaster tradition could not fail to influence the attitudes of those who were laymen. They assumed, and were expected to assume, something of the moral purpose of their predecessors and often paid particular attention to religious training. Indeed, even at the present day, the headmaster, because he conducts the “daily act of worship” and not infrequently takes upon himself the religious education of his senior boys, is linked with the older order.

From the point of view of the consolidation of the “idea of the headmaster” an important factor was the influence of reform in creating a community of understanding among those so clearly responsible for the well-being of their schools. The Headmasters’ Conference brought together the leaders of the most prominent schools from 1869 onwards, whilst by the end of the century the Headmasters’ Association, set up in 1890, had enrolled practically every headmaster of a secondary school of note. Through the latter body in particular, the man working in some obscure country grammar school or some newly-founded municipal secondary school was brought into touch with the great figures of the day, heard them declare with passion their determination to defend their independence against the central authority and local authorities proposed by the Royal Commission on Secondary Education and was strengthened in his own resolve to assert his authority over his school and its destiny. The headmaster remained no longer an isolated figure, dependent only upon his school and his personal qualities for his status, but was a member of a well-organised body of vigorous and active men, who, through the Conference and the Association, constantly voiced their disapproval of any infringement of their authority and their autonomy. Thus when the Board of Education and the local education authorities eventually came into being they entered an area in which the chief vantage points had already been seized by well-organised and determined forces.

By comparison with the headmasters, their employees, the assistant masters, were slow in developing a sense of identity and common purpose. This was largely because of the very great diversity of men staffing the schools. They ranged from graduates of Oxford and Cambridge, whiling away a few years before entering upon a good “living”, to youths who remained at their schools for two or three years as underpaid drudges. Between these two extremes there were ex-elementary school teachers, who had, in some cases, secured degrees of London University by part-time study; athletic young men prepared to “look
upon cricket not only as their pleasure but as their duty” (The Journal of Education, 1886); and a motley and changing assembly of others who had failed to make good in a recognised profession. Tenure, even for well-qualified men, was insecure and not infrequently a change of headmaster meant the dismissal of the entire existing staff of the school.6

Salaries, too, were low, even by the standards of the day, and there could be little hope of increments for length of service. Finally, nothing in the way of superannuation existed, save in the most well-endowed schools.

Nevertheless, the expansion of the older Universities following the reforms of the mid-century and, more particularly, the increasing number of graduates produced by London, Wales and Victoria, meant that the core of well-qualified men serving as assistant masters was growing. It was not until 1891, however, that their frustration first expressed itself in an organised form through the Assistant Masters’ Association. It is significant that the earliest energies of the latter were not devoted to campaigns for adequate salaries or pensions, but to securing that its members should no longer be regarded as the employees of their headmasters and should be accorded equal status with them as employees of the same governing bodies.

This first objective was attained with the passing of the Endowed Schools (Masters) Act of 1908 and the assistant masters in grammar schools ceased to be the paid servants of their headmasters.7 From this time their position was closer to that of teachers in elementary schools and secondary schools maintained by local education authorities in which head teachers and staff alike were employed by the latter or by appropriate governing bodies.

As has been suggested, there was, during the last decade of the nineteenth century, considerable nervousness among the well-established headmasters of existing grammar schools lest the proposed Board of Education and local education authorities would bring about the loss of their independence and oblige them to conform to rigid codes and regulations of the kind associated with the elementary school world.

In the event, the Board proved to be their ally and lost no opportunity for emphasising that all secondary schools should, through the institution of individual governing bodies, enjoy a wide measure of independence and that headmasters and headmistresses alike should retain the preeminence which they had attained during the preceding century.8

Some of the new local education authorities, however, were not always of this mind. They, and particularly their Secretaries and Directors of Education, were striving to establish their position in respect of schools which had hitherto held them at a distance and in respect also of their own higher grade and day technical schools which, in some cases at least, were seeking to secure something of the independence of the secondary schools proper. Hence they were anxious to acquire or retain control of staffing and tended to treat headmasters with scant respect. Close local control was, nevertheless, strongly resisted by the Board. Its officials were men educated in schools of national status and prestige and they viewed secondary education as a vehicle for the cultural life and traditions of the nation as a
whole rather than for local and sectional interests. It was therefore, to protect the headmaster against undue interference that they stressed the importance of every secondary school having its own governing body, composed not only of members of the local education committee but also of men and women with special knowledge and interests in educational matters. It is interesting to note that, from this time, governing bodies were intended to become the protectors of the independence of the headmasters of the new secondary schools rather than, as envisaged by the nineteenth-century reformers, the means for checking their excesses.

During the vital formative years between 1902 and 1914, moreover, the influence of the Board made itself insistently felt through its indefatigable teams of inspectors. They did not hesitate to recommend the removal of an inefficient headmaster, but they emphasised the importance of his office by the detailed attention which they paid to it during full inspections and by the support which they strove to give to men who could bring the spirit of the established grammar schools and of the older Universities into the new county and municipal schools. In many areas local authorities began to think on similar lines and show a preference for men with distinguished educational antecedents.

To some extent, the years following the first world war saw a shift in what might be termed the “centre of gravity” of secondary education. The rapid increase in the number of secondary schools maintained or controlled by local education authorities meant that their staffs, benefiting from the activities of the National Union of Teachers in the elementary school field, secured a standard salary scale through the Burnham settlement, a nation-wide superannuation scheme and, as a result of stubbornly fought battles with individual local authorities, a vastly increased security of tenure. In that headmasters in such schools were now dealing with men independent of them as regards their salaries and tenure, they were in a far less autocratic position than before. Similarly, in independent and direct-grant schools, whilst headmasters retained their powers to appoint and, with the approval of their governing bodies, to dismiss their assistant masters and whilst salaries and pensions depended upon the custom of each individual school, the ability of any school to attract able and well-qualified masters depended upon it offering them conditions of service at least as favourable as those available to them if they joined the service of a local education authority.

Yet despite these factors and despite also the changed social atmosphere of the post-war years, the headmaster, both in maintained and in less closely-regulated schools, still continued to enjoy a distinctive position. Paradoxically enough, a major reason for this was the freedom which the Board of Education sought to give to each school and indeed to each assistant master in his actual work in the classroom. Since the duties of the latter were not defined and still less the precise content of his teaching or the methods he should use, he had, within the school itself, no clearly formulated professional rights. He could be required by his headmaster, who alone was responsible for internal organisation, to teach subjects for which he had little liking, or to accept what he considered an undue proportion of difficult or backward forms. Furthermore, although his
headmaster could not bring about his dismissal, save after a hard-fought and
wearing struggle with his professional association, he could exercise an often
decisive influence through the open testimonial or the confidential reference. On
the other hand, the increasing uniformity of the academic and professional back-
ground of headmasters and assistant masters, combined with the revolt in the
twenties and the thirties against the authoritarianism prevalent in many occupa-
tions in Victorian and Edwardian times, made the confident exercise of such
powers less attractive to headmasters themselves.

It remains to be seen how far the greatly expanded conception of secondary
education resulting from the Act of 1944 will bring new elements into the situ-
ation. There has been a reversion, as regards the basis of the headmaster’s
salary, to the principle of it being closely linked to the number of pupils in his
school, but the motive has not been to encourage headmasters to attract more
pupils but to ensure that salaries roughly correspond to existing responsibilities.
The former inflexibility of the Burnham scales has also been modified, so that
headmasters can exercise decisive influence over the allocation of allowances
for advanced work to assistant masters. On the other hand, the difficulty of
finding men to staff the schools, at least in science subjects, restricts any tend-
dency towards arbitrary and capricious action in any side of school organisation.
Furthermore, the interlinking of all forms of school with the agencies of the
welfare state brings constant pressure on a headmaster to think in terms of
immediate administrative necessity, of compromise to meet the wishes of the
many bodies and individuals concerned with his school and of quick and effect-
ive response to the social situation in which he works.

So far, however, there are few signs of any significant change, on a scale com-
mensurate with that which took place in the last century, in fundamental thinking
concerning the headmaster’s office. It might perhaps be expected that, just as the
prevailing industrial philosophy of a hundred years ago affirmed his autonomy and
his personal responsibility, so might the present-day development of managerial
training lead to attempts to analyse and assess his position in a world of increas-
ingly complex inter-relationships. But, despite the vast scope of secondary educa-
tion and the incorporation within it of secondary modern schools and secondary
technical schools, some of the roots of which lie deep in the old traditions of ele-
mentary education, very little has yet been said or written bearing on the subject.
In particular, no thought appears to have been given to examining how assistant
masters might, before entering upon headmasterships, prepare themselves through
organised and intensive study for their new duties. There is, of course, no inten-
tion here to suggest that the headmaster is less sensitive to changing circumstances
than the businessman or the civil servant. The reverse is frequently true. What is
argued is that serious thinking and consequently popular speculation about his role
and about school structure is dogged by recollections of earlier stereotypes derived
from the time-hardened images of the great Victorian individualists and hence dif-
ficult to assess within the close-knit patterns of shared responsibility characteristic
of present-day enterprise. As a result the demands made by rapid social change
and by the vast network of welfare services linked with the school tend to be regarded as extraneous, or at most peripheral, to the main task of leadership within the school itself.

It has been seen that, quite apart from considerations of social philosophy, the increase in the size of schools and their staffs was a major factor in the growth of the “Headmaster Tradition” in the nineteenth century. It seems more than likely that the stimulus to remodel it will come from the new comprehensive schools which, by reason of their complexity as well as, in some cases, their size, will make the distribution of authority essential. If this is so, it is to be hoped that its basis, though widened, will remain within the school itself and not be imperceptibly transferred, owing to the weight of administrative considerations and outside influences, to the “community” or its representatives. A stand on this issue, which will only be successful if based on careful thought by those concerned, will preserve the essence of the position taken up by those who, like Thring and many others, fought for the independence of the school from directed political and social pressures and who, in their day, could only achieve their ends by stressing their own personal privileges and authority.

Postscript (1974)

This paper provides a bench mark from which the developments of the past twenty years can be measured. Its publication did, in fact, coincide with the beginnings of interest in the role of the head and in the management of schools. Since then there has grown up a wide range of literature seeking to throw light on the position of the head and on his part in decision-making within the school (Hughes, 1970; Barry and Tye, 1972) and, more recently, action research studies in the processes of change and innovation (Richardson, 1973 and 1974). In addition, there has been a substantial amount of writing by heads themselves (Allen 1968; Halsall, 1970), in which they describe how they have dealt with the new demands being made on them.

Indeed, it is now clear that the kind of significant change in fundamental thinking about the head’s role (the absence of which I noted in my paper) has now taken place. One train of thought has been concerned to minimise the positional authority of the head within the school by advocating some form of participatory committee control. Indeed, committee structures within large schools are commonplace and have grown up from sheer necessity; but they do not, from the studies and experience available, necessarily diminish the “pivotal” role of the head. On the contrary, they strengthen it (Musgrove 1971). Another train of thought has been perhaps more far-reaching in that it is concerned with the integration of the school with the community it serves. This has led, especially in primary schools, to an acceptance of the case for bringing parents into touch with the school’s life and work; and in secondary schools, to the launching of community service schemes and work experience projects, to the school advancing beyond its usual boundaries. Furthermore, as a result of some forms
of secondary reorganisation (for example, those involving “Middle Schools”) and the coming of “linked courses”, schools relate to the outside world not only through the head, but through teachers necessarily concerned with curricular planning extending beyond the school walls.

As I pointed out in my paper there was, at that time, the beginnings of an awareness of the complexity of the educational setting within which the head worked: this awareness has increased with the coming of new forms of examination and assessment, with such innovations as team-teaching and counselling, and with the introduction into schools of a wide range of audio-visual and other aids. Between the head in his study and the teachers in their classrooms, laboratories, studios and workshops there are areas of cooperative planning and decision-making in which his role is that of catalyst rather than that of leader. Nevertheless, in moments of crisis and in major confrontations with political or other pressure groups, the positional authority of the head becomes of critical significance. This is because his responsibility to his local authority and its expectations of his role have not substantially changed. There has not yet taken place in schools the formal redistribution of responsibility and powers which, in colleges of education and further education, has resulted from the rewriting of articles of government and the setting up of academic boards and councils.

I have argued that the prevailing industrial philosophy of the mid-nineteenth century had a major part in shaping the “headmaster tradition” at that time. It is again from industry—in the shape of modern theories of management—that ideas, including some as shocking as those that disturbed the unreformed endowed schools, are entering the minds of those responsible both for the school system and for individual schools. The trend in this direction has been met and reinforced by concern for the efficient use of resources at Department of Education and Science level and at local authority level. As a result, a “managerial” dimension in the concept of the head’s role has now become part of established opinion. But debate is fierce and likely to be prolonged as to the nature of this new dimension. A first and inevitable step has been to draw on the experience of management teaching developed in industry, the armed forces and other branches of the public service. There are, of course, obvious limitations in this approach: schools and educational institutions generally do not fit into the patterns of product or service providing agencies; their purposes or “objectives” can only, save in a very limited sense, be assessed within wide social and occupational contexts; furthermore, schools exist within an environment of central and local government institutions which cannot be equated with that of the industrial world. Nevertheless, there are elements in common: the urgent need is to define these and also those aspects of educational institutions which merit their own distinctive forms of study and analysis.

The influence of industrial thinking in the mid-nineteenth century resulted in a redefinition of the role of the head in an entrepreneurial society. Trade unionism and “industrial relations” played no part in this process. In the second half of the twentieth century a major task in educational administration and in the management of schools, colleges and universities is to come to terms with this
other side of the industrial world. The urgency of this task has been underlined by the entry of the National Union of Teachers, the Association of Teachers in Technical Institutions and the National Association of Schoolmasters into the Trades Union Congress and the increasing exasperation being felt by teachers in difficult schools with their conditions of work. There are signs of an emerging conviction among at least some groups of teachers that the duties they are assigned by heads acting on behalf of local education authorities should be matters not only for informal negotiation but also for collective bargaining. Action with regard to school meals supervision some years ago, and more recently in respect of over-large classes, has already tended to place heads in situations of a kind they have not hitherto experienced. The present emphasis on the managerial role of the head does not take into account the incipient “industrial relations” dimension of his task. Yet it is in this area, rendered still more sensitive by the mobilisation of parent and pupil interest groups, that the future distribution of decision-making in schools will be determined.

Notes
1 Although much of this paper might apply, with slight variations, to the office of the headmistress in girls’ schools and, with much greater variations, to the office of headteacher in the superseded elementary school, attention in this study is limited to the main body of tradition evoked by the term “Headmaster”.
2 Its relevance until recent days is suggested by the literature of school-mastering in the present century, from Walpole’s *Mr. Perrin and Mr. Trail* through Bernard Henderson’s *Schoolmasters All; or Thirty Years Hard* and H. S. Shelton’s *Thoughts of a Schoolmaster to Chalk in my Hair* by “Balaam”.
3 This aspect of the headmaster’s role probably derives from Thring, who declared that “as long as the Headmaster knows each boy, he is a Headmaster; the moment he does not, the man who does is so far Headmaster.”
4 In Scotland, according to H. M. Knox (1953), as the range of subjects studied in secondary schools grew during the nineteenth century, there was a “tendency for the virtually independent heads of the separate departments to form a council of masters, sometimes presided over by each in turn, to manage the internal affairs of the school in republican fashion”.
5 In some cases the new governing bodies set up by the Endowed Schools Commissioners signally failed to show the zeal expected of them and resorted to “farming” their schools to the headmaster. That is, they made over to him the income of the trust and let him keep whatever fees he could obtain. In return he shouldered all financial responsibility for the running of the school (Royal Commission on Secondary Education, 1895), Vol. I, pp. 45–6). This system persisted in remote rural grammar schools until the early years of the present century.
6 A notable case occurred at Grantham School in 1899, when a retiring headmaster dismissed his three assistants at short notice and his successor told them, a few days before a new term began, that he had appointed his own men and did not wish to reengage them. (*The Journal of Education*, 1899). That this was not an isolated instance is borne out by the evidence of one of the witnesses before the Royal Commission on Secondary Education (1895), who stated that “when you dismiss the headmaster you dismiss every man in the school”. Questioned further, he maintained that “unless the new headmaster cares to take them on, they must all go”. These statements were
accepted without challenge (Royal Commission on Secondary Education (1895), Vol. IV, Minutes of Evidence No. 13, 223).

7 The Act provided that, in an endowed school, “any master in the school, by whomsoever appointed, and whether appointed before or after the passing of this Act, shall be deemed to be in the employment of the governing body for the time being of the school”.

8 This was stressed with particular insistence in the Prefatory Memorandum to the Regulations for Secondary Schools (Board of Education, 1905). “Experience proves that in a school of the Secondary type full efficiency can be secured and the best teaching and organisational power attracted, only where the Head Master or Head Mistress is entrusted with a large amount of responsibility for and control over teaching, organisation and discipline. In particular the appointment and dismissal of Assistant Staff is a matter in which a voice ought to be secured to the Head Master. In the majority of Secondary Schools of the highest grade the appointment and dismissal of the Staff is entirely in his hands, subject to the obligation to report his action to the Governors and his liability to dismissal for improper exercise of his powers. In other cases he exercises these powers subject to the approval of the Governors. In any case, it is important that he should have formally secured to him the right to be consulted by the Governing Body and to submit his proposals to the Governors and have them fully considered, both as regards staff appointments and on all points relating to the conduct of the school as an educational organisation.”

9 Save by W. O. Lester Smith (1950), who has tentatively suggested that teachers of experience should be able to follow courses designed to illuminate in a liberal way problems of educational organisation and administration. He envisages that “such courses should serve education much as the Staff College serves the Army as a preparation for leadership”.

During the past decade there has been a substantial increase of research activity in many varied aspects of educational administration. To provide an overview of the whole field is a task which is as impossible to achieve as it is fascinating to engage in. But an overview has to be attempted, if subsequent discussions in this seminar are to be based on a commonly available stock of knowledge. This then will be my first endeavour.

I shall go on to say what I consider to be the main characteristics of the research done up to the present.

Against the background thus established, I shall examine some main areas of debate and controversy.

Finally, I shall set out the various positions which may be taken in approaching research in the hope that in so doing I can throw light on the especial role of the British Educational Administration Society.

The scope and content of research in educational administration

It is not my purpose here to enclose what follows within a carefully delimited definition of educational administration and to set out the relationship between the various emphases on the behavioural, the economic, the managerial, and the political which can already be identified within the field. Nor shall I rehearse the possible contributions of the social science and other disciplines in its further development. These are tasks I have attempted elsewhere and there is a substantial amount of writing seeking to clarify the significance of the terms ‘administration’ and ‘management’.¹

In this chapter I shall extend my consideration to all, or at least most, of the themes and topics which appear in references to educational administration. Such references are scattered in a number of sources. These include books and articles dealing with general educational theory or with specific themes such as
curriculum development or the education of the handicapped, lists of theses and dissertations, and reports of complete work or of work in progress compiled by research foundations and funding bodies.\textsuperscript{2} In addition there is a growing amount of factual survey material collected by professional associations, unions, and voluntary associations.\textsuperscript{3}

In so far as there is any systematic ordering of this material it is in topic form, as in the Howell\textsuperscript{4} and Coulson\textsuperscript{5} bibliographies, rather than in terms of subject disciplines or research methodologies. I propose to adopt a broad classification which will reveal the main themes under which recent and current researches can be grouped. In no sense, of course, can my treatment be exhaustive and no doubt opinions will differ about my choice of examples to illustrate my argument.

**Leadership\textsuperscript{6} and the internal organization of schools and other educational institutions**

The first theme with which I wish to deal is that of leadership in the school or college, and in particular the role of the head or principal. It is within the individual institution that educational and administrative considerations are most closely interwoven and it is within the role of the head or principal that their relationship can be at its most sensitive. The form of providing agencies at national, federal, regional, or local level may be highly diverse, as may be also the nature of the relationships between teachers, officials, students, parents, and community, but leadership within the institution and its internal organization are the channels through which other elements in the process must express themselves in pedagogical terms. That this is generally realized is shown, I would argue, by the place occupied by the study of the principalship in North American literature and by the attention now being given to the training of principals in countries as far apart, in terms of geography and culture, as Sweden and Singapore.

In this country we have made a beginning, but only a beginning, in studies of the position of the head. Hughes\textsuperscript{7} has drawn on role theory to relate the professional and administrative aspects of the head’s task and Cohen\textsuperscript{8} has examined heads’ views of their role as modified by the nature and size of their schools. There is also a study of the development and selection of secondary school headteachers by Bispham\textsuperscript{9} and the analysis by Bernbaum\textsuperscript{10} of a national sample of secondary school heads in terms of their social origins, experience, values, and guiding ideas. The position of the deputy head in the secondary school has been studied by Burnham\textsuperscript{11} and this study was followed by an examination of the influence of school size on the deputy head’s role by McIntyre\textsuperscript{12} and by another of the deputy head in the primary school by Coulson.\textsuperscript{13} It is surprising, in view of the substantial amount of discursive and prescriptive writing on the theme of the head,\textsuperscript{14} that, apart from the studies named and a few others, it has attracted relatively little attention from researchers. The neglect of the headteacher position in the infant and the junior school is particularly marked.

Studies in school organization are also sparse. Here again there is much discus-
sion and accounts of current practice, but little in the way of major research save
that contained in a series of studies conducted by the National Foundation for Edu-
cational Research.15 But there is a wide-ranging survey by Halsall16 which also
includes North American material and the highly distinctive study by Richardson17
of interrelationships within a single school. The handbook by Lyons18 differs from
others of similar purpose by being based on empirical studies and points the way
to the translation of research findings into practical terms.

Closely related to the study of school organization viewed in terms of structure
and roles is the growing and important area of the administration of the curricu-
rum. Curriculum studies have, in recent years, come to constitute a major field in
their own right and increasingly they are extending their range, as indeed they
must, to take into account the political and administrative context. A pioneer study
is that by Marten Shipman,19 Inside a Curriculum Project, which gives a micro-
cosmic view of curriculum change in a small group of schools. Also falling within
the territory of educational administration as well as of curriculum studies is The
Dissemination of Curriculum Development, by Ruddock and Kelly.20 It is in this
context too that I would place the ongoing work at the University of Bristol School
of Education described by Bolam in his paper at this seminar.

Both general school organization and the administration of the curriculum in
particular are now, of course, being greatly influenced by the wave of interest in
evaluation and the related concern with accountability. The Assessment of
Performance Unit21 signalled a new interest in government circles in monitoring
the work of the schools and in developing, through research, sophisticated tech-
niques and tests to make this possible. Last summer a substantial programme in
studies in accountability in education was announced by the Social Science
Research Council. This programme is making grants totalling £200,000 available
to encourage studies seeking to clarify such concepts as democracy, professional
responsibility, and parental rights; to promote legal studies in the powers and
rights of the various agencies and groups concerned with the provision of educa-
tion; and to make possible studies in policy formation and implementation.22

The further itemization of research areas could, if space permitted, be
extended to embrace such distinctive fields as special education, adult education,
and the education of the young worker. In all of these, the translation of policy
into administrative action is attracting increasing attention.

Government of educational institutions

A clearly defined area of research has emerged, as a result of the increased inter-
est in the government of schools, further education institutions, and universities.
The first study to emerge in the schools field was my own, with D.A. Howell,
which resulted from my somewhat idiosyncratic concern with the (at the time)
neglected existence of school governing and managing bodies coinciding, by
happy chance, with the pending reform of local government.23 It is unfortunate
that a similar research survey has not been carried out into developments in the
government of further education institutions since the Weaver Report. There is, however, a well-designed study being made of the school councils set up in Scotland following the Local Government (Scotland) Act, 1973.24 This is an interesting and important exercise which traces in detail the action taken in every region in Scotland in response to legislation and government action. There is every reason for a study on similar lines to be made in England and Wales in respect to whatever changes result from the forthcoming Education Act.25 Research on a countrywide basis could then be followed by case studies of individual authorities, of the kind presented by Bacon26 in his detailed examination of school government in Sheffield and its decade of reform. It is interesting to note that a study has been made of school councils in Australia27 and that a major project is under way in Canada to examine public involvement in educational decision-making at all levels.28

In view of the significance attached to local education authorities in England and Wales and to the regional authorities in Scotland the amount of work done on their internal structures and their activities is disappointing. In the United States and Canada there are a very large number of studies of school boards and of their functions and membership. Here the field is only just being opened up, through such studies as that by David29 on local education of clerks as an occupational group; by Greenhalgh and Booth30 on local education of clerks as an occupational group; and by Bolam31 and others on the functions of local education authority advisory services. Individual local education authorities were studied some years ago by Peschek and Brand,32 who dealt with Reading and West Ham; Leicester has been the subject of research theses by both Brand33 and Mander,34 and there is a historical account by Gosden and Sharp35 of the superseded West Riding local education authority. A more general and very well-informed study of politics and policy-making in local education authorities is provided by Jennings,36 an American student of local politics in England, and there is the substantial and closely researched examination of the local allocation of resources by Byrne.37 Resources and particularly their allocation is also the subject of a major project being carried out in the University of Sussex.38 There is need for further comparative studies across a substantial number of authorities of both pre-Maud and post-Maud committee structures, of clerical roles, and community relations. Equally needed are studies comparing English and Welsh authorities and Scottish authorities. The advantage, for research purposes, of having two major and distinctive systems of educational administration in England and Wales on the one hand and Scotland on the other continues to be unrecognized.39

In the main, energies devoted to the studies of local education authorities have been directed to the reorganization of secondary education, of which the most scholarly is that by Saran.40 This topic features largely in several of the studies already mentioned and is a popular theme for theses and dissertations.41

A new factor in the situation, as far as local education authorities are concerned, is that the need for research or at least for scrutinizing some aspects of present practice is being felt by education of clerks themselves. Thus the Society
of Education Officers has published a study, *Management in the Education Service,* which looks at programme structures and objectives and resource allocation and management in four authorities. The society also commissioned a short-term empirical investigation of the reactions of chief education officers to the coming of corporate management.

Research studies of how the Department of Education and Science and the Scottish Education Department are structured, staffed, and shaped to meet new needs have not been undertaken, although there is a substantial amount of report material which has been brought together for governmental purposes. Still less can it be said that research as such has been carried out into the present-day inspectorate in either country although, as in the case of the departments, there is a substantial literature of analysis and comment.

**Teacher and other associations**

Beginnings have been made in the study of teacher associations which, together with the departments and the local authorities and their associations, constitute the main framework within which educational policies and their execution are determined. Manzer opened up this area in his *Teachers and Politics* and this study was followed by those of Roy and Coates, whilst Kogan has carried out a far-ranging analysis of the major interest groups involved in the decision-making process at both national and local levels. The field is a tempting one, with such topics to be explored as the changing roles of the local authority associations, the consequences for the teacher unions of TUC affiliation, and the rising power of unions of which nonteaching staff are members. There is certainly need for studies of strikes and other forms of industrial action by teachers, both because of their significance in delimiting many areas of administrative action and as elements in the wider arena of industrial relations.

More generally, the greatly increased weight of legislation (e.g., the Health and Safety at Work Act, 1974; the Contracts of Employment Act, 1972; the Employment Protection Act, 1975; the Sex Discrimination Act, 1975; the Race Relations Act, 1976) have already revealed far-reaching implications for education. Furthermore, complaints against local education authorities can now be investigated by a Commissioner for Local Administration (Ombudsman). A new factor is a European presence in the shape of the European Court of Human Rights which has shown interest in the use of corporal punishment in our schools and in the teaching of the mother tongue to immigrants. In short, the whole area of the law relating to education needs to be systematically explored and studied in terms of the consequences of recent trends for our administrative structures and practices.

**Education in its wider social and administrative settings**

The relationship between school and community has long been one which has lent itself to exhortation and general discussion. Specific areas have attracted
political controversy, notably social class influences on education and education in deprived areas. Studies, too, have been made of the problems of immigrants and other minority groups. It is work in these areas which demonstrates the difficulty of defining what is to be classified as ‘administrative’ for my purpose here. Researches into the causes of educational deprivation and handicap are clearly of great general interest for those concerned with fashioning policy and giving it expression in administrative action; but a line has to be drawn somewhere between such studies and those which direct themselves at least in part to the specifically administrative role. A beginning has been made in the examination of the school welfare service by Macmillan, but otherwise there seem to be no research studies made of the various groups of nonteaching staff in the education service whose numbers and importance have increased so greatly in recent years.

Research into the administration of higher and further education

In higher and further education there has been, certainly since the publication of the Robbins Report, with its substantial research appendices, a constant flow of descriptive, analytical, expository, and polemical writing and also extensive statistical surveys of student numbers, qualifications gained, and financial costs. An appreciable amount of this effort has gone into the examination of major policy decisions (such as that which led to the introduction of the ‘binary’ system) or of social class influences on student recruitment. For some ten years much work was done by the Higher Education Research Unit of the London School of Economics, which was particularly concerned with problems of higher education and highly qualified manpower and which extended its range to the education system as a whole in some of its published studies.

To identify writing in this field bearing on the administrative as distinct from the economic or statistical aspects of higher and further education is a difficult task. But studies with a substantial administrative content include that on university government by Moodie and Eustace, the work of Burgess and Pratt on colleges of technology and the polytechnics, and the edited collection of papers by Lomax on the education of teachers. These and other studies utilize research findings from a wide range of sources, including the weighty appendices of the Robbins, Franks, and Murray Reports, and the statistics emanating from government departments, the University Grants Committee, and other agencies. They also draw on a considerable amount of comment, criticism, and minor research reported in such journals as the Times Educational Supplement and the New Universities Quarterly. A major piece of work, now being brought up to date by its author, is Berdahl’s study of the University Grants Committee. Other research studies are Taylor’s study of teacher education and Howell’s examination of the coming of the B.Ed. degree. Studies for higher degrees range over a wide field. Several deal with the economics of higher education and particularly with its cost-effectiveness. Others deal with resource allocation and with issues of structure and government.
Operational research at school system level

Any survey of developing areas of research in educational administration would be incomplete without mention being made of the detailed statistical studies essential for the maintenance and improvement of large school systems. Such studies, in some form or another, are carried out by government departments and local education authorities, and also by the Schools Council and examination boards. In more specific form they are found in the context of the Local Government Operational Research Unit which has, since its inception in 1965, made studies in pupil population forecasting, in school transport costs, and in computer-assisted timetabling.

The Inner London Education Authority has its own Research and Statistics Group which has made quantitative studies of school population projections and sixth-form patterns, truancy and non-attendance, and of the construction and use of priority indices of the in-service training and of the induction of probationary teachers. Somewhat similar studies are being carried out in other local education authorities.

Management development

Finally, I think that we should bring very much to the forefront of our minds the major thrust in educational administration at the present time. This is the effort being made to improve management effectiveness and to do this by staff development programmes which include carefully constructed courses built up from case studies and field experiences, and exercises based on the needs of individual course members. By its nature much of the exploratory work being done in polytechnics, in some local education authority centres and others such as the Further Education Staff College, does not easily fit into the accepted categories of academic research. Yet, because it is advancing into unknown and problematic territories, in which the guidelines of established disciplines and methodologies are soon found inadequate, it can constitute research of a high order. It depends upon intensive and exacting study of actual management situations in local education authorities, schools, and colleges, the laborious compiling of records, and the utilization of whatever is of use from the social and mathematical sciences. Glatter has given an account of work of this kind in connection with a programme financed by the Calouste Gulbenkian Foundation and, with Piper, subsequently described the Staff Development in Universities Programme, financed by the University Grants Committee. There has, as yet, been no comprehensive presentation of the developmental work done in this area in the several polytechnics and other institutions which run their own or CNAA-validated programmes. There have, however, been a number of dissertations, one of which, by Bernard Baron, has recently been published.

Characteristics of research in educational administration

1 Educational administration, as a field of research, has very ill-defined boundaries. It can be taken to embrace planning, economics, and the politics of
education; and also substantive areas such as the administration of the curriculum or the recruitment and supply of teachers. But central to it, at least in the North American context, is the study of the behaviour of those who carry out administrative functions. Only isolated studies in this area (among them, those of Richardson, Shipman, and Tipton,\textsuperscript{70} throwing light on individual and group motivations) have so far appeared in Britain. In the main, attention has been directed away from the dynamics of interpersonal and intergroup relationships towards the structure and functioning of institutions, resource allocation and use, and policy-making and its implementation.

2 There has been little funding of research in educational administration from governmental or other sources, but there is increasing attention being paid to how research findings in curriculum development or educational technology are to be put into practice. Projects in such areas are thus tending to produce spin-offs for educational administration. In addition, inquiry into policy-making at national level has been encouraged by critical comment by the OECD\textsuperscript{71} and at local level by the after-effects of local government reorganization. But there has so far been no massive and continued research effort on the scale made possible by the Kellogg Foundation grants in the United States and Canada.\textsuperscript{72} Save in the case of studies by the National Foundation for Educational Research and, for a time, some studies of the Higher Education Research Unit of the London School of Economics, each project has stood in isolation and has operated through ad hoc teams recruited from young graduates in the social sciences, teachers on secondment, retired heads, or education officers. Indeed, most of the published research dealing specifically with educational administration has been the result of individual part-time work by graduate students in teaching or administrative posts or by junior academic staff. Under present conditions, such men and women, although virtually our only source of research expertise, have little prospect of being able to carry out further and more advanced work.

3 Factors determining the choice of research topics are varied. Governmentally funded research tends to be supportive of projects which can help in throwing light on immediate and urgent problems such as those associated with comprehensive secondary education and with resource use, evaluative processes, and ‘accountability’. And generally, and this is true of the National Foundation for Educational Research and the Scottish Council for Research in Education as well as the independent foundations, interest centres on pedagogical rather than on administrative issues. For this reason we owe a debt to visitors from North America (such as Manzer, Berdahl and Jennings), Australia, and elsewhere, who can take a broader view of our concerns and whose interests lie in policy-analysis and the working of our institutions.

4 Despite what has been argued so far, there are positive aspects of the present situation. There is a quickening of interest in the Department of Education and Science and in the Scottish Education Department in research designed to improve practice, an interest which, as has been seen, extends to local education authorities also. The old reliance on custom and use has been replaced by a
willingness to accept that research should be able to contribute to better decision-making and administrative action in education just as it contributes to improvement in other activities of modern life. But there is very genuine uncertainty concerning what research can actually achieve, in which areas rare resources should be deployed, and by what means research findings can be translated into practice.

**Problem areas**

Rather than attempt to answer directly the questions just raised, I think it may be helpful in structuring discussion to concentrate attention on debates in which we each individually have to take up positions. These I would characterize as the academic/practitioner debate, the theory/practice debate, the systems theory/phenomenology debate, and the relationship of educational administration to the social science disciplines.

*The academic/practitioner debate*

The conflict between academic and practitioner arises from each party necessarily inhabiting a different universe. As the researcher develops his approach to his problem, no matter how ‘practical’ its orientation, he draws on material and ideas from outside the immediate situation to help him in his analysis and his explanations. By so doing he distances himself from the administrator who, when subsequently reading the research report, is alienated by what appears to be irrelevant and extraneous material: furthermore, from his experience he brings to his reading a multitude of questions stimulated by the research but not answered by it. Discussing this conflict, Taylor writes:

>The roots of the problem lie in the fact that the knowledge about education that is possessed by all the people who are labelled teachers, administrators, inspectors, researchers and so forth, is to a large and increasing extent *role specific knowledge*.

This kind of conflict is not between different kinds of people, or even between different types of mind: it is a situational conflict, which occurs even if the researcher is an experienced administrator and the reader a career academic concerned with a practical problem which is the subject of the research. Moreover, we each have, or may have as individuals, two or more types of role-specific knowledge: for example, that which follows from being a practising teacher, that which follows from being a student of curriculum development, and that which follows from being a parent whose children are facing school-leaving examinations. Conflict of this kind cannot be resolved, although awareness of its nature may enable it to be contained and lived with.

Other problems arise which can be avoided by greater competence or good-
will on the part of those concerned. Shipman, in his capacity as a research worker with the Inner London Education Authority, wrote:

From within local government the research enterprise based in academia seems to deliver the wrong goods, at the wrong time, without an invoice. It also produces conclusions about education that are subject to gross misinterpretations. The net harmful impact arises from the combination of failure to help in the solution of practical problems, of the promotion of dubious theoretical notions and in the recommendations whose implementations are beyond the dreams of even optimistic administrators.\textsuperscript{74}

In reply to this, the comment by Brian Simon on the role of educational research in general is apposite:

The real issue is whether scientists are to operate as scientists, educationists as educationists, researchers as researchers; or whether all are to become service personnel, waiting cap in hand for orders in response to which appropriate methods will be sorted out to produce acceptable results or conclusions.\textsuperscript{75}

The tension is further increased, of course, when it is a governmental or public body which is the funding agency. The argument put forward some years ago by Lord Rothschild\textsuperscript{76} takes the hard line that the funding agency says what it wants and the researcher works within a defined brief. Against this, there is the broader view that research in the social sciences necessarily draws on concepts and knowledge of which the sponsors are not aware and which modify the content of the problem as work progresses.\textsuperscript{77}

It is, I think, helpful that the Department of Education and Science is now clarifying its position, by expressing its concern with policy-related research, by identifying specific topics within agreed areas, and by seeking early reconciliation between the interests of the parties involved.\textsuperscript{78} Such a stand makes possible a parallel clarification of positions by those primarily concerned with research and not directly concerned with policy matters. It is here that the Social Science Research Council has a major role to play and it is to be hoped that this seminar will assist it in establishing the place of educational administration within the total field of educational research.

\textit{The theory/practice debate}

To what extent should research in educational administration, whether serving the purposes of the practitioner or the academic, seek to be theory-based? This is the first question which confronts the nonsocial scientist who encounters for the first time the highly organized teaching and research programmes of American,
Canadian, and Australian universities. There the place of ‘theory’ in educational administration is accepted, though its content and its uses and abuses are vigorously debated: here there is still, in so many quarters, a contemptuous dismissing of any study going beyond the collection of opinions and facts.

In a recent book Rosamund Thomas has boldly contrasted the American and British approaches to administrative studies. She argues that, in Britain,

doctrines [of administration] remained essentially a philosophy and not a theory of administration, embodying description, subjective attitudes and explanations rather than rigorous, systematic analysis.79

On the other hand, she argues, in the United States respect for the expert in administration has led to more attention being paid to academics and more attempts being made to theorize, with the result that administration has advanced ‘from miscellaneous description to an integrated body of knowledge’.80

The absence of native-born theory in this country and of anything approaching ‘an integrated body of knowledge’ explains the fascination felt for the work of North American theoreticians as a source for conceptual frameworks into which schemes of research can be neatly fitted. This has dangers, if it results in our limiting topics to those which can be so treated, or in our setting out, once a problem has been identified, to unearth a theory to give it academic respectability. Certainly, the understanding of the researcher should be fortified by a thorough critical acquaintance with reading in the works of the major theoreticians in his field. But it would be unfortunate if it came to be a convention that each piece of work must be related to a specific theory or theories. Moreover, as Hughes81 has pointed out, research studies describing and analysing current administrative practice do not necessarily require highly sophisticated theoretical underpinnings to be of value.

There is a way of reducing unproductive conflict and of avoiding the reification of theory as being an entity or entities having some kind of existence independent of the world of real events. Glaser and Strauss82 advocate the notion of grounded theory, by which they mean the gradual generation and testing of explanatory concepts as a piece of research proceeds. The emphasis is on theorizing rather than on theory. Their approach means, of course, that the researcher is not only knowledgeable about existing theories but that he has a capacity for theorizing. It follows that the training or self-education of the researcher needs to be broad and diffuse: the aim of his reading of theory is to nourish his powers to perceive and to relate, rather than to lead him to work within the confines of the formulated perspectives of others.

The systems theory/phenomenology debate

To some extent the issue I have just attempted to present has bearing on the far-reaching debate which followed Green’s paper in the 1974 International Intervisitation Programme. This debate has been conducted with warmth by
many better fitted than myself. I refer to it because it bears so intimately on the uses of theory. One charge made against Green eld’s paper is that he has failed to provide a viable alternative paradigm to that provided by systems theory; another is that he has not shown how research can emerge from a phenomenological perspective. Both charges seem to me to sidestep his argument because implicitly, if not explicitly, ‘research’ and ‘paradigm’, in their taken-for-granted meanings, are within the world of systems theory and the positivist approach.83 To me, Green eld’s paper made its impact not so much because it put forward a ‘phenomenological perspective’ as an alternative to ‘systems theory’, but rather because it was a first frontal attack on the latter and particularly on the ‘emphasis which much of social science places upon quantification, more complex mathematical models, and bigger number crunchers in the shape of better and faster computers’.84 This explains, to me at least, why Green eld incurred the wrath of the ‘establishment’ of research in educational administration within which, at Stanford, Chicago, and Alberta, hypothesis-formulation has been a prevailing orthodoxy; it also explains the welcome accorded to his argument in Britain by academics uneasy with the formidable research apparatus of the North Americans and reluctant to acknowledge its achievements, and by practitioners happy to seize on any vindication of intuitive judgement.

**Educational administration and the social sciences**

Some years ago, in my contribution to *Educational Administration and the Social Sciences*,85 I sought to show how the latter could contribute to our field of study. My thinking was very much in venced by my contacts with American and Canadian scholars and with the work of Professor William Walker in Australia; and it was motivated by the political need to legitimate the study of educational administration in the university world in this country. Certainly, at the University of London Institute of Education, educational studies were and are regarded largely as the philosophy of education, the sociology of education, the economics of education, and the psychology of education. Difficulty then arises in arguing the case for fields of study, such as curriculum development, comparative education, and educational administration: in this context it is necessary and appropriate to stress the contribution of the ‘disciplines’. I do not wish to quarrel with the position I then took up, although I think I would now incorporate within it the idea of ‘squeezing’ the disciplines, which Glatter took over from Richard Snyder.86 But, when it comes to research in educational administration, I am much more aware than I was before of the problems which arise when subject specialists are recruited into the field after their primary allegiance has been established. I think that Brian Simon (in the paper already quoted) expresses my concern more adequately than I could myself in a passage relating to general research in education. He writes:

> The study of education has manifestly suffered from subordination to disparate modes of approach and methodologies deriving from fields
quite other than education which have simply been transferred into the educational sphere and which, once there, have tended to maintain their distinctive languages and approaches, or pursue their own ends.

Later, he argues that:

If he [the researcher] starts from the position established in a particular discipline with corresponding norms of its own, the research is likely to be primarily directed to adding to the capital of that discipline. Conducted by methods evolved within its confines it may well have a direct connection with education only insofar as use has been made in the given way of educational materials.87

In Britain, because of our high degree of specialization in university studies and the strength of the allegiance of the scholar to his initial discipline, the dangers Simon suggests are very real. But I see no justification for throwing up the barricades, even if that were possible. On the contrary, we need to seek to enlarge the field of endeavour so that all can play their part, no matter what their earlier academic affiliations. If this can be done, it may be possible to resolve some of the issues which I have put before you in this chapter.

Research for understanding, research for policy development, research into administrative structure and process, evaluative research

What are the various positions from which we can view research? I can identify four, but others may no doubt occur to members of this seminar and readers of this chapter.

1 Research for understanding

This, I suppose, is the position of the historian, who is concerned with explaining the past in terms comprehensible to the present. It is also the position of the anthropologist, concerned to explain in terms of his own culture the practices of primitive peoples. The results of such labours may be of use to the politician, the administrator, or the professional worker, but this is not their main purpose. The audience for research of this kind is composed of those with similar or closely related interests, able to cope with highly technical and esoteric language.

2 Policy-related research

I am indebted to Brian Kay for this term, which he uses for research promoting ‘the formulation of national policies on a more secure foundation of knowledge, and of monitoring and evaluating the implementation of such policies’.88 Such
research requires specialized knowledge combined with a readiness to work within the frameworks established by political and administrative practicalities. Much work on resource allocation falls within this category.

Policy-related research may precede and help in policy-formulation or it may monitor the working out of policies already being put into operation. In either case it is expensive, it is likely to take time, and it requires considerable adjustment of attitudes and working habits by both the academics and the administrators involved. Its immediate audience is relatively small, since by design it is directed at the limited numbers concerned with policy-making at national or local level.

3 Research into administrative structure and process

In putting forward this category I am very much aware of the difficulty of distinguishing usefully between ‘policy’ and ‘administration’. But it seems to me to be essential to give identity to that vast area of research concerned with the performance of administrative functions and roles, whether these be in relation to running a school, a college, a department, or a supporting service; or with the setting up and maintenance of structures for governing institutions and regulating their relationships with their environments.

This is the area in which I would argue that the maximum effort should be made at the present time; and it is also the area in which all members of the Society are concerned in one way or another.

4 Evaluative research

Evaluation is necessarily a part of any research project. But what I have in mind here is research which is able to stand outside the world of the policy-maker and the administrator and view their intentions and their activities from a variety of political, social, and cultural standpoints. It seems to me a main vehicle for research of this kind should be comparative studies, in which scholars and administrators from elsewhere would share in substantial projects in this country. A network of Commonwealth and European agencies exists to foster such exploration and we have our own affiliations with the Commonwealth Council for Educational Administration and the European Forum.

I have spent a little time in presenting these very tentative categories of research for consideration because I feel that it is important for this seminar to consider what should be its focus for the future activities and indeed for the efforts of the British Educational Administration Society in the research field. Clearly, we are interested and supportive of all four categories; indeed interest in the one presupposes at least some measure of involvement with the others, since they are interrelated. My own conclusion, however, is that we should at this time pay particular attention to that which I have termed ‘research into administrative structure and process’. It is in this area that most of the problems which beset
those responsible for the conduct of our educational institutions and those with similar responsibilities in other countries lie. It is also a major aim of this Society to advance the practice of educational administration.

Notes and references

* Paper given at the seminar on Research in Educational Administration held by the British Educational Administration Society, University of Birmingham, March 1979.
3 Notably in the journals and publications of the Advisory Centre for Education, the Educational Institute of Scotland, the National Association of Governors and Managers, the National Association of Schoolmasters/Union of Women Teachers, the National Association of Teachers in Further and Higher Education, and, latterly, the Society of Education Officers.
6 The term ‘leadership’ may, in this context, jar on the sensitive British ear, but it is widely used in the literature in Europe as well as in the United States, Canada, Australia, and elsewhere.
HISTORY AND RESEARCH

15 In particular the two reports (ed T.G. Monks) of the NFER Comprehensive Education Project, Comprehensive Education in England and Wales: a survey of schools and their organization, 1968, and Comprehensive Education in Action, 1970, both published by the NFER.
19 Shipman, Marten, Inside a Curriculum Project: a case study in the process of curriculum change, Methuen, 1974.
21 The work of the unit is briefly described in Assessing the Performance of Pupils, DES Report on Education, Number 93, August, 1978.
24 This study, supported by a grant from the Scottish Education Department, is being carried out in the Department of Education, University of Glasgow. An interim report has been published, Foundation Facts about Scottish School Councils, 1977.
25 The omens are favourable, as the department has already made a substantial grant to the Open University for the preparation of a course for school governors and to carry out research into the ways in which the course is used and its effectiveness.
28 This project is being carried out by the Canadian Education Association and is particularly concerned with public involvement in decision-making at school level. No reports are yet available.

This project, which is under the direction of Professor Eric Briault, was set up ‘to examine the curriculum and associated management problems and to set out the options open to local education authorities and secondary schools’.

But the way has been cleared for such comparative studies by the stimulating *Patterns of Education in the British Isles*, by Robert Bell and Nigel Grant, Allen and Unwin, 1977.

As, for example, in the Report from the Select Committee on Education and Science 1967–1968, Part I, Her Majesty’s Inspectorate (England and Wales), HMSO, 1968. It should be noted that no attempt has been made in this paper to bring within its scope the growing number of historical studies of educational policy and administration (although some examples have been cited: Greenhalgh and Booth, Gosden and Sharp). Such studies have become increasingly attractive to historians with the coming of easier access to the twentieth-century file material of government departments and local authorities. A major study is *Education in the Second World War: a study in policy and administration*, Methuen, 1976.

Manzer, R.A., *Teachers and Politics: the role of the National Union of Teachers in the making of national education policy in England and Wales since 1944*, Manchester University Press, 1970. This is a much abbreviated version of a Harvard Ph.D. thesis for which the field work was done in this country. Unfortunately, chapters of the original thesis showing how Manzer relates his empirical data to Beer-Eckstein interest-group theory are not included in the book.

2 The Higher Education Research Unit was set up in 1964 and continued until 1974. Its successor was the Centre for the Economics of Education, which gave way in 1977 to the Centre for Labour Economics.

To understand “Transformative Power,” the following question must be addressed: what are the components of an organization that can translate intention into reality and sustain it? The question itself contains a complexity and depth as well as a chronic elusiveness. The question, probably for the preceding reasons, tends to be avoided – though it is the essence of what is ordinarily meant to be organizational leadership. Even when it is obliquely touched on, the writer tends to avoid the orchestral richness which inheres in the question for the doctrinal, predictable, and prosaic clichés. Between the blur produced by trying to say too much at once and the banality produced by dismissing mysteries, there remains the possibility of articulating just what it is that causes some organizations to translate an intention into reality and sustain it. This is the starting point for an examination of what I am referring to as transformative power.

The environment of leadership in the 1980s

This much can be said about leadership for the ’80s: those responsible for governing the enterprise will be spending more and more of their time managing external relations. All organizations are surrounded by an increasingly active, incessant environment – one that is becoming more and more influential – the senior partner, as it were, in all kinds of decisions which affect the institution.

Leadership, and its companion decision-making, will become an increasingly intricate process of multilateral brokerage including constituencies both within and without the organization. More and more decisions made will be public decisions; that is, they will affect people who insist on being heard. Leaders will have to reckon with the growing role of media as a “fourth arm” of government available for use by the people who oppose a particular decision as well as the people who support it. The idea of a relatively small group of “movers and shakers” who get things done is obsolete. Increasing numbers of citizens and
stakeholders (and even those who are only indirectly involved in an issue) are interesting themselves in its outcome – and when the decision goes the “wrong way,” very noisily so. This state of affairs has led one writer to describe the organization-of-today as a “jungle of closed decisions, openly arrived at.”

The bigger the problem to be tackled, the more power is diffused and the more people have to be involved. Thus decisions become more complex and ill defined, affecting more different and sometimes conflicting constituencies.

Inevitably there will be frustration, not only among leaders but among followers who ask, “Who’s in charge here?” as more and more people and groups have to be consulted. Leaders ask, “How do you get everybody in the act and still get some action?”

The name of the game is ambiguity and surprise, and leaders have to lead under uncertain, risky conditions where it’s virtually impossible to get ready for something when you have to get ready for anything. Just as effective leaders know about and are becoming more competent in coping with the politicization of our institutions – by which I mean that institutions are becoming the focus for a new kind of politics, i.e., mobilizing public opinion or working more closely with legislative bodies at both the state and federal levels and other key constituencies – they are also learning more about an enlarged concept of the “management team.”

No longer can “managing external relations” be left in the hands of the public relations department. Top leadership must be involved – directly. In short, the political role of the organization leadership’s responsibility must be reconceived.

These trends, these changing characteristics of the organizational and managerial environment that we are now living with, will become even more pronounced and problematic over the next ten or so years.

The three components of transformative power

The leader

There are some important clues about the nature of effective leadership that have come out of a study I recently completed of 80 chief executive officers (CEOs) plus ten in-depth interviews conducted over the past few months with ten successful, “innovative” leaders (Bennis, 1983). These studies provide a basis for making some generalizations about those leaders who successfully achieve mastery over the noisy, incessant environment – rather than simply react, throw up their hands, and live in a perpetual state of “present shock.” In short, the study which I am about to summarize was able to illuminate some of the darkness around the question earlier posed: how do organizations translate intention into reality and sustain it? Leadership is the first component, though as we shall see later on, leadership must be held within a context of other interacting factors.

What all these effective CEOs shared and embodied was directly related to how they construed the role of the CEO/chairperson. To use a popular
distinction, they viewed themselves as leaders not managers, which is to say that they were concerned with their organization’s basic purposes, why it exists and its general direction. They did not spend their time on the “how to . . .,” the proverbial “nuts and bolts,” but with purpose and paradigms of action. In short, they were concerned not with “doing things right” (the overriding concern of managers) but with “doing the right thing.” They were capable of transforming doubts into the psychological grounds of common purpose.

By responding to the question which guided my study – what common set of characteristics, if any, did those leaders possess who were capable of translating intention into reality – I can clarify the role of the effective leader. In varying degrees, it seemed that all of the CEOs possessed the following competencies:

**Vision:** the capacity to create and communicate a compelling vision of a desired state of affairs, a vision (or paradigm, context, frame – all those words serve) that clarifies the current situation and induces commitment to the future.

**Communication and alignment:** the capacity to communicate their vision in order to gain the support of their multiple constituencies.

**Persistence, consistency, focus:** the capacity to maintain the organization’s direction, especially when the going gets rough.

**Empowerment:** the capacity to create environments – the appropriate social architecture – that can tap and harness the energies and abilities necessary to bring about the desired results.

**Organizational learning:** the capacity to find ways and means through which the organization can monitor its own performance, compare results with established objectives, have access to a continuously evolving data base against which to review past actions and base future ones, and decide how, if necessary, the organizational structure and key personnel must be abandoned or rearranged when faced with new conditions.

In short, nothing serves an organization better – especially during these times of agonizing doubts and paralyzing ambiguities – than leadership which knows what it wants, communicates those intentions successfully, empowers others, and knows when and how to stay on course and when to change.

**The intention**

The second element of transformative power refers to the “compelling vision” mentioned earlier that will now be referred to as “the intention.” The expression of an intention is the capacity to take an organization to a place it has never been before. The characteristics of the intentions that successful leaders employ include:

**Simplicity:** this characteristic is also known as or akin to Occam’s Razor, the Law of Parsimony. This implies that each assumption or element is independent. The word “simple” derives from the notion of oneness or unity.

**Completeness:** this criterion requires that all the facts that are available are included. In most organizations the bulk of the major tasks that have to be
accomplished are easily and readily incorporated within almost any kind of organizational structure. It is those few remaining tasks that test or prove the adequacy of the organization. Not only should the organization be capable of incorporating tasks that need to be performed at the time it is set up, it should also be capable of adjusting to and assimilating new tasks as they arise.

Workability: does it deliver the goods? Does the context achieve the organizational goals or contribute to them? William James, as usual, says it well: “By their fruits ye shall know them, not by their roots.”

Communicability: this last criterion for judging contexts contains two components: the more obvious one relates to the ease in which the context is understood by the organization. The robustness of the organization, in terms of its empowerment, depends to a large extent on the degree to which the context is clear and understood. The other meaning of this criterion is alignment; not alignment, though, of organizational members, but alignment with other contexts indigenous to the particular organization. In other words, to understand organizational structure and its significance, it is important to keep in mind that its effectiveness is related to the mutual relatedness of its various contexts.

The problem with the above characteristics is betrayed by application of one of them, “completeness.” The list is not complete. Originality, muting of ego, subtlety, and an aesthetic are all important which space limitations preclude anything but their mention now. The one exception to this is “an aesthetic,” an exception based both on its significance and neglect. Indeed, I believe that the aesthetic of the intention plays an important, perhaps key, role in understanding how intention can lead to implementation, which is, after all, the whole point of leadership.

The organization

Transformative power implies a transaction between the leader and the led, between the leadership and some sort of participative response. If the leadership expresses the characteristics noted earlier and if the vehicle of this expression, the intention(s), are effectively expressed, the organization becomes a blending of each individual’s uniqueness into collective action.

Such an organization is similar to something observed in healthy individuals; in fact, it is isomorphic to a healthy identity in an individual. More technically, we can assume that an organization possesses a healthy identity – organizational integrity – when it has a clear sense of what it is and what it is to do.

Achieving “organizational integrity” is easier said than done. Part of the problem is the lack of understanding of the various substructures that all organizations, no matter how small, contain. One block to our understanding is perpetuated by the myth of organization-as-monolith, a myth reinforced almost daily by the media and the temptation of simplicity. The myth is not only grossly inaccurate but dangerous as well. When the evening paper, for example, announces that the Defense Department or the University of California or IBM (or any corporate
body for that matter) will pursue this or that course of action, the said action is typ-
ically consigned to a single, composite body, the administration. This administra-
tion, whose parts vibrate in harmony and whose acts, because we are denied a look
at the human drama that leads up to them, take on an air of superhuman detach-
ment, is as mythical as the griffin. Into every step taken by the administration goes
a complicated pattern of meetings, disagreements, conversations, personalities,
emotions, and missed connections. This very human process is bureaucratic poli-
tics. A parallel process is responsible for our foreign policy, the quality of our
public schools, and the scope and treatment of the news that the media choose to
deliver to us each day.

Our perceptions of organizational decision-making, based on such reports
and other stimuli, tend to emphasize the product of decision-making, never (or
rarely) the process. The result, of course, is false, at times destructively so.
Those elements of chance, ignorance, stupidity, recklessness, and amiable con-
fusion are simply not reckoned with; they are selectively ignored, it seems.
Thus, the public rarely sees the hundreds of small tableaux, the little dramas,
that result in a policy statement or a bit of strategy. It sees only the move or
hears only the statement, and it not unreasonably assumes that such an action is
the result of a dispassionate, almost mechanical process in which problems are
perceived, alternative solutions weighed, and rational decisions made. Given
human nature, that is almost never the case.

In order for an organization to have integrity, it must have an identity, a sense
of what it is and what it is to do. Perhaps an analogy taken from personality
theory will illustrate as well as foreshadow this point. Every person is a summa-
tion of various “selves.” If those units of the person are not in communication,
then the person cannot maintain valid communications with others. The problem
of integrity, which is central to much of the contemporary literature in the
mental health field, can in organizations be examined by understanding the
various “organizational selves” or structures that exist.

Every organization incorporates four concepts of organization, often at odds
with each other or existing in some strained coherence. There is the manifest
organization, or the one which is seen on the “organization chart” and which is
formally displayed. There is also the assumed organization, or the one that indi-
viduals perceive as the organization were they asked to draw their view of the way
that things work, very much like the legendary New Yorker’s view of the U.S. in
which the Hudson River abuts Los Angeles. There is further the extant organi-
zation, or the situation as revealed through systematic investigation by, say, an
outside consultant. Finally, there is the requisite organization, or the situation as it
would be if it were in accord with the reality of the situation within which it exists.

The ideal, but never realized, situation is that in which the manifest, the
assumed, the extant, and the requisite are aligned as closely as possible with
each other. Wherever these four organizational concepts are in contradiction, the
organizational climate is such that its identity is confused and its integrity diffi-
cult to achieve.
Another useful analogy to mental health shows up in this discussion. Many, if not all, psychotherapeutic schools base their notions of mental health on the degree to which the individual brings into harmony the various “selves” that make up his or her personality. The healthy person will be much the same person as he or she is known to others.

Virtually the same criterion can be used to establish organizational integrity, that is, the degree to which the organization maintains harmony – and knowledge – about and among the manifest, assumed, extant, and requisite concepts. It is not necessary that all four concepts be identical; rather, all four types should be recognized and allowance made for all the tensions created by imbalances. It is doubtful that an organization can or even should achieve total congruence. The important factor is recognition, a heightened consciousness of the confusions and contradictions.

To achieve openness, and through it integrity, in our organizations, each individual within the organization – particularly the leader – must strive to be open. From its embodiment in the individual, openness moves to the group level and, through individual and group interaction, infuses the organizational culture that sustains the characteristic of openness. The process is as slow as the building of a pyramid, and far more complex.

The artform of leadership

We have gone only partway in understanding leadership and transformative power by decomposing the three key elements at the political center of a complexly organized society, like an organization, into 1) a leader or governing elite or strategic core, 2) a set of symbolic forms expressing a tapestry of intentions, and 3) those constituent groups and individuals who make up the membership of the organization. The intention and its expression – crowns and coronations, limousines and conferences – give what goes on in organizations its aura of being not merely important but in some odd fashion connected with the way the world is built. The gravity of organizational leadership and the solemnity of high worship spring from liker impulses than might first appear.

The extent to which leadership is truly effective is based on the extent to which individuals place symbolic value on the intentions and their expression, the aesthetic referred to earlier. It is the relationship of the governed to the active centers of the social order that makes the difference between transformative power and other forms. Such centers have nothing to do with geometry and little with geography. Such centers have nothing to do with “humanizing the work place,” Theory X or Theory Y, the “quality of worklife,” or “participative management.” What is important is that the organizations and their members are essentially concentrated on what appears to be serious acts. They exist at the point or points in a society where its leading ideas come together with its leading institutions to create an arena in which the events that most vitally affect members’ lives take place. It is involvement, even oppositional involvement,
with such arenas and with the momentous events that occur in them that “translates intention into reality and sustains it.” *It is a sign, not of popular appeal or inventive craziness but of being near the heart of things.*

In sum, the transformative power of leadership stems less from ingeniously crafted organizational structures, carefully constructed management designs and controls, elegantly rationalized planning formats, or skillfully articulated leadership tactics. Rather, it is the ability of the leader to reach the souls of others in a fashion which raises human consciousness, builds meanings, and inspires human intent that is the source of power. Within transformative leadership, therefore, it is vision, purposes, beliefs, and other aspects of organizational culture that are of prime importance. Symbolic expression becomes the major tool of leadership, and leadership effectiveness is no longer defined as a “9–9 grid score” or a “system 4” position. Effectiveness is instead measured by the extent to which “compelling vision” empowers others to excell; the extent to which meanings are found in one’s work; and the extent to which individual and organization are bonded together by common commitment in a mutually rewarding symbiotic relationship.

THE CURRENT CALIFORNIA SUPERINTENDENT OF PUBLIC INSTRUCTION, WHO CAMPAIGNED ON A PLATFORM CELEBRATING A NORMAN ROCKWELL VIEW OF SCHOOLING, APPOINTED AS HIS DEPUTY A SAVVY SCHOOL SUPERINTENDENT WHO HAD DEVELOPED ONE OF THE FEW SYSTEMATIC EFFORTS IN THE STATE TO IMPLEMENT THE FINDINGS DRAWN FROM THE EFFECTIVE SCHOOLS RESEARCH. IN 1981 ALASKA GOVERNOR JAY HAMMOND APPOINTED THE TASK FORCE ON EFFECTIVE SCHOOLS THAT RECOMMENDED PRACTICES DRAWN FROM THE SAME BODY OF RESEARCH FOR ALL OF THE STATE’S SCHOOLS. ACCORDING TO A RECENT REPORT FROM THE EDUCATION COMMISSION OF THE STATES, EIGHT OTHER STATES HAVE ESTABLISHED SPECIFIC PROJECTS ANCHORED IN THIS LITERATURE. NEW YORK CITY, SEATTLE, PITTSBURGH, MILWAUKEE, ATLANTA, AND A SCORE OF OTHER CITIES ACROSS THE COUNTRY HAVE INSTALLED PROGRAMS TO IMPROVE THE ACADEMIC PERFORMANCE OF STUDENTS. CONSUMER REPORTS,
Parents magazine, and other popular journals feature articles entitled “How Effective Are Your Schools?” or “What makes a Good School?” Television programs portray “miracle worker” Marva Collins in her private preparatory school in Chicago as an examplar of a first-rate teacher who has established an effective school. Finally, in the surest test of popularity, the vocabulary of effective schools research has entered the daily language of school administrators: high expectations, instructional leadership, an orderly environment, a positive climate, and consensus over academic goals echo a trendy jargon.¹

The initial impulse behind the study of effective schools was to improve student academic performance in low-income, largely minority schools. Researchers in the mid- and late-1970s reacted sharply to the 1966 Coleman Report and its progeny, which suggested that teachers and administrators could have little effect on student achievement. One line of research was based on the linkage between teaching practices and improved test scores – the coin of the realm à la Coleman; another utilized investigations of schools which, given their ethnic and socioeconomic mix of students, produced unexpectedly high test score gains. Both strands of research identified teacher behaviors and school practices that intersected neatly with practitioner wisdom on what schools should do to become academically productive. Like the Coleman Report, these studies measured productivity in terms of performance on standardized tests in math and reading.²

Practitioners seldom wait for researchers to signal that school improvement can move forward. Nor have the substantial methodological problems in the research findings on effective schools halted policymakers from converting them into programs. With a quick look over their shoulders at a skeptical public, many school boards and superintendents, believing that tightly coupled organizations can affect children’s academic performance, have moved quickly to implement the growing body of research on effective schools. I do not suggest that policies anchored more in faith than in statistical significance are misguided. On the contrary, I suggest that policies are forged in a crucible that mixes political realities, practitioner wisdom, technical expertise, and whatever can be extracted from research. The task is difficult because the empirical research seldom reveals clear causal links to policy, and yet practitioners, who must make decisions every day, are anxious to locate those decisions in a technical rationality.

When I served as superintendent of schools in Arlington, Virginia, I initiated, with the school board’s blessing, a six-school improvement project. These schools contained predominantly minority children, many of them from low-income families, who scored in the bottom quartile of the district’s elementary schools. Lacking designs drawn from research or a tested formula that had worked elsewhere, we invited leading advocates of effective schools to speak to teachers and administrators. Resources, modest to be sure, were set aside to purchase staff time and materials for the six schools. Enthusiasm ran high, and my successor continues to support the project. Standardized test scores in the six schools have risen. The school board has identified the improvement of elemen-
tary schools as a top priority for 1983–84 and has expanded the mission of the district team of specialists to encompass all elementary schools in the county.

My own experience and that of other superintendents and school boards who have converted research findings into mandates for improvement informs the following policy discussion. I will concentrate on those policy issues with which local boards and superintendents must wrestle when transforming research findings into different administrative and teaching behaviors. Unlike the way things happen in fairy tales, school reform requires more than a kiss to convert a frog into a stunning prince. Furthermore, productive schooling entails more than raising test scores.

I want to be clear that, as a practitioner-academic for over a quarter-century, I share the commitment of colleagues across the nation to improve schooling. While these words may ring defensively, I write them to separate myself from the predictable academic challenge to the premature or selective implementation of any body of research findings. The familiar pattern of a burst of romance followed by frustration and disappointment appears to describe the trajectory of the effective schools enthusiasm (I was about to write the word “movement”). Notwithstanding recent criticism of the research methods, findings, and efforts to create effective schools, there is much to be learned from an analysis of what has and has not been done, from what is and is not known about local district initiatives in building effective schools. Experience outstrips research in districts implementing improvement policies; this experience may offer clues to other local policymakers and furnish promising leads for researchers to pursue. Several problems with the research on and practices in effective schools have already become evident.3

No one knows how to grow effective schools. None of the the richly detailed descriptions of high performers can serve as a blueprint for teachers, principals, or superintendents who seek to improve academic achievement. Constructing a positive, enduring school climate remains beyond the planner’s pen. Telling principals what to say and do in order to boost teacher expectations of students or to renovate a marginal faculty into one with esprit de corps remains beyond the current expertise of superintendents or professors. Road signs exist, but no maps are yet for sale.

There is no agreement on definitions. Half a dozen methodologically identical studies have produced as many different definitions of effectiveness. The concept of “climate” varies with the researcher and practitioner using it. Moreover, some feel that the term “leadership” is undefinable. “Instructional leadership,” for some, resides in the role of principal; for others, in the teaching staff; and for others, it is beyond definition.

The concept of effectiveness is too narrow. Tied narrowly to test scores in lower-order math and reading skills, school effectiveness research and programs ignore many skills, habits, and attitudes beyond the reach of paper-and-pencil tests. Educators and parents prize other outcomes of schooling that transcend current definitions of effectiveness. Some of these outcomes are sharing,
learning to make decisions, developing self-esteem, higher-order thinking skills, and a sense of the aesthetic.

*Research methodologies leave much to be desired.* Most of the studies that use multiple variables and regression models of analysis have failed to control for school populations and previous history of achievement. Similarly, because most studies sample a district at one point in time, determining which variables cause which outcomes is a thorny, if not impossible, obstacle. Do high faculty expectations produce higher student achievement, for example, or are the higher staff expectations a result of improved student test scores? Furthermore, because many studies are done on “outliers,” generalizing to the larger population of mainstream sites is, at best, risky.

*Most research has been limited to elementary schools.* With a few exceptions, effective schools research has occurred in the lower elementary grades. Junior and senior high schools are organizationally and culturally quite different from the lower grades.

*Little attention is directed to the role of district leadership.* Concentration upon the local school site and the principal’s leadership dominates the research. This implicitly ignores the pivotal role that school boards and superintendents play in mobilizing limited resources, giving legitimacy to a reform effort and the crucial interplay between central office and school site that can spell the difference between implementation success and failure. Few researchers stress the fact that schools are nested in larger organizations that constrain while permitting choice at the local site. Thus, the broader perspective of district administrators is often missing from the researchers’ analyses of effective schools. Yet, with all of these shortcomings in the literature on high-performing schools, school boards have mandated and superintendents have implemented effective school programs, showing little concern for the danger of converting correlations into policies.

Coincident with the rising interest in these research findings has been a gradual trend toward higher test scores among elementary students who previously had registered declines. The National Assessment of Educational Progress reports that reading scores have risen. Big city districts publish tests scores that register gains in skills. In my judgment, however, these changes reflect a steep rise in the learning curve of boards of education and school chiefs, rather than a causal linkage with school improvement programs. Administrators have discovered that forging tighter organizational linkages between what teachers teach and the content of test items results in higher reading and math test scores.

Let me now divide the discussion into three parts. I will discuss district policies to improve overall productivity (as measured by test scores), implementation strategies, and unanticipated consequences. Let me remind the reader that this is an exploratory analysis, since few effective schools studies have focused on district-level policies or given explicit attention to implementation strategies; the thrust of the research has been on the school site and classroom. Hence, citations will be few.
District policies

Districts that have embraced the mission of improving schools along the lines suggested in the literature of effective schools – that is, goal setting, targeting academic aims, establishing and maintaining high expectations, frequent monitoring, and so on – have assembled a roughly hewn set of policies drawn from state mandates, other districts, and previous experience. They are conceptually simple and targeted like a rifle shot on lifting test scores. These policies promote a tighter coupling between organizational goals and the formal structure, while relying on a traditional top-down pattern of implementation. Sometimes at the behest of a school board, but more often at the instigation of a superintendent, these policy decisions trigger a similar pattern of activities in all participating districts.5

This pattern includes the adoption of the following policies:

1. School board and superintendent establish districtwide instructional goals, often stated in terms of student outcomes – that is, improvement in test scores.
2. School board revises student promotion policies in line with stated outcomes for certain grade levels; board strengthens graduation requirements by making course content more substantive, increasing amount of seat-time during classes, and adding extra subjects.
3. Superintendent mandates planning process for each school. Each staff produces schoolwide and individual classroom goals targeted upon student outcomes and aligned with the district goals.
4. The district curriculum for kindergarten through twelfth grade is reviewed to determine if the objectives for subject matter and skills, the textbooks and other instructional materials, and both district and national tests are consistent with what is taught in classrooms.
5. Superintendent revises district supervisory practices and evaluation instruments used with teachers and principals to align them with district goals and the literature on effective teachers and principals.
6. Board and superintendent create a districtwide assessment program to collect information on what progress, if any, occurs in reaching system, school, and classroom goals. Information is used to make program changes.
7. Superintendent introduces a staff development program for teachers, principals, central office supervisors, and the school board. The program concentrates on effective schools and teaching, goal making, assessment procedures, evaluation of staff, and the steps necessary to implement each of these.

Few districts have installed all these policies at once or in a sequence resembling the one above. Often, superintendents begin on a pragmatic, ad hoc basis with, for example, goal setting and test analysis. They then become aware of the
crucial need to achieve a match among curriculum objectives, promotion policies, district goals, and test items. Or in the overhaul of staff evaluation, a school board member or central office administrator will ask if the new instruments and procedures should be keyed in to district goals for student performance, thus forging another linkage. Though serendipity plays a part, the drift toward organizational tautness is unmistakable.

From images popular in the academic journals of schools as loosely linked, amorphous enterprises with plenty of slack, a counterimage now emerges from such districts of organizations tightly coupled in both goals and formal structure, targeted sharply on academic productivity. District officials pursuing policies that fasten individual schools snugly to the central office believe they have found just the right hammer to pound in a nail.

There is a growing acceptance among practitioners that these policies work. Like a popular television show that begets clones in order to achieve a larger share of the audience, school boards and their executives seek out what works elsewhere and use exactly the same procedure in their own districts. Findings from the effective schools research spread through informal superintendent networks, national conferences of school board associations and administrators, journals read frequently by school officials, and other information on what pace-setter districts do. But the fact remains that no studies have yet shown which policies, independently or in combination, produce the desired effects. No research has yet demonstrated which strategies for executing policy decisions yield the desired results. While improved student performance on tests after the introduction of such policies has created some believers, it has not yet been established that the policies themselves have caused the improvement. Even more important, success in lifting scores exacts a price from the organization that few policymakers have yet calculated. In this brief summary of district policies aimed at improving systemwide effectiveness, I have failed to mention the bread-and-butter items, the staples of district policymaking: money and personnel.

Money

Born in the backwash of the 1966 Coleman Report and coming of age during a retrenchment on a scale unequaled since the 1930s, the effective schools research implicitly asserts that money does not make a difference. People do. Spending more is less important than strategically redirecting existing funds to promote effective staff performance. Given today’s shrinking enrollments and fiscal retrenchment, the prospect of converting ineffective schools into effective ones for pennies is most attractive. This message, however, is accurate only in a severely restricted sense. In my own experience and that of colleagues, a districtwide school improvement program involves large expenditures. While there are substantial indirect costs and modest direct ones in initiating a limited school effectiveness effort, far more important is the larger issue of total district
resources available to fund an entire improvement program of schooling. Teacher salaries, recruitment of new teachers, retention of gifted senior faculty, and the addition of instructional leaders to an administrative cadre are also linked to district improvement.

The primary costs of initiating and implementing systemwide policies to increase productivity arise from retraining staff, hiring consultants, and reassigning central office supervisors and administrators. Since 1979 New York City’s School Improvement Program has spent over $1 million a year in state and foundation grants on additional staff, teacher, parent, and evaluator time to introduce site-based programs in almost twenty schools. In most instances, however, far smaller sums have bought consultant and teacher time, materials, and supplies. Most costs are hidden, with no extra dollars added to the budget. In Arlington, Virginia, for example, $20,000 was added to the budget to initiate an effective schools project involving six out of twenty-one elementary schools. The 1980 operating budget for the entire school system of thirty plus schools and over 2,000 employees was in excess of $53 million.

Far more money, however, was spent in staff time to design, monitor, and assess annual school plans in relation to goals and objectives; to analyze test items in all standardized and locally developed instruments; to review current curriculum goals and their match with district tests and goals; and to revise existing evaluation tools for teachers and administrators to bring them into line with district goals. I estimate that for the Arlington school system, with a student enrollment of 20,000 in 1974 and 15,000 in 1981, the equivalent of $75,000 to $100,000 in staff time was spent for each of the first few years in getting policies in place, training staff, monitoring results, and returning information to principals, teachers, and the community. Because I had no specific staff assigned to do this work, I assumed a portion of the workload and directed central office administrators to do tasks beyond their assigned responsibilities until school board-approved reorganizations could realign individuals with the thrust of new policies on goal setting, annual school plans, curriculum revision, and the like. In Atlanta, Alonzo Crim, superintendent of schools, similarly reorganized and reassigned existing staff in order to concentrate upon student outcomes. Donald Steele, Seattle’s former superintendent, lacking funds yet embracing the effective schools approach, assigned central office administrators not involved in instruction to advise individual elementary schools in addition to their regular duties.7

These rough cost estimates are for policies implemented in a top-down manner; estimates would differ for implementation efforts that begin with the school site and proceed from the bottom up or for combinations of the two approaches. A careful analysis has yet to be done of direct and indirect costs associated with adopting and implementing district policies designed to improve school effectiveness. I suspect that when such a study is done, it will reveal substantial costs in redirected staff time, a modest investment of additional money, and foregone costs in neglecting other aspects of the district’s program.8
Personnel

Hiring, training, and evaluating staff, and increasing staff awareness of effective schools are the primary personnel tasks. In Arlington, a lowered budget ceiling made hiring new staff impermissible. The school board approved only new jobs supported by federal and state grants. I presume that few districts since the late 1970s have been able to hire new staff except with the help of private or public funding external to the school system.

In the literature on effective schools, establishing a staff consensus over an instructional agenda is a high priority. In each school the principal and teachers shape that agenda and consensus. A principal needs to judge which teachers will work best within that school’s culture. In the best of all possible worlds, the principal is free to choose the staff that he or she will need to make a school effective. The world that principals currently inhabit, however, offers severely restricted choices in assembling staff. Reassignment of teachers as a result of shrinking enrollment, the closing of schools, or similar events usually favors senior over junior teachers. When senior teachers come to a school involuntarily, bumping enthusiastic but junior teachers, the faculty’s commitment to certain goals, staff morale, and the continuity that is so important in constructing an effective school may suffer. Thus, teacher assignment policies, often embedded in contracts if not in tradition, may work against district efforts to implement effective schools, particularly when the system is retrenching. Although reduction-in-force policies vary across districts, I have observed that principals and personnel chiefs have developed informal ways of abiding by the letter of the policy, while eluding the policy’s intent by securing those teachers who might be better matched for one school over another. One tactic used by some principals who need teachers is to scan the recall list of teachers who have been pink-slipped because of shrinking enrollment. Knowing which teachers are viewed as weak, principals keep in daily touch with the director of personnel to determine exactly when to create a new class of students – the trigger for securing a teacher immediately. Invariably, the astute principal creates the class when a weak teacher has been assigned elsewhere and the next teacher on the recall list is more in keeping with what that principal seeks. These informal maneuvers are limited efforts to strike a practical compromise between conflicting policy aims in a district.

Selection and reassignment of principals involves less policy conflict but can generate opposition anyway. According to the growing literature, the principal is central to fashioning an improved school. Most districts allow the superintendent to choose principals for various schools. Career rotation, early retirement, and similar policies generate some turnover in school positions. But dilemmas persist. What can the superintendent do for a school with a high percentage of low-income children, where test scores are unacceptably low and no improvement has occurred for five or more years under the same principal. Transferring the principal shifts the problem to another school staff and parent community.
Due process and evaluation procedures usually prevent the transfer of a principal because of low student performance; few districts have included in their selection criteria or evaluation policies the clear expectation that principals will improve student academic performance. To move a principal on the grounds that he or she has failed to improve the school’s academic performance might be viewed as capricious, unless such a standard was embedded in existing policies and remedial help was offered.

In Arlington, where administrators are unionized, the school board approved the overhaul of the administrative evaluation policy. The new policy called for joint setting of goals and objectives by the superintendent and principal, a clear linkage between district goals and the principal’s school goals, and the development by the administrator of a professional improvement plan. Leadership, instructional improvement, and managerial skills were explicitly stressed in the process. My assistants and I met with principals individually two or three times a year to discuss both their professional and school plans and to help them revise their goals, if necessary. Workshops were held on instructional supervision, managing teacher evaluation, assessing school improvement, and analyzing test scores. When I brought before the school board the instance of a principal whom I had evaluated twice as unsatisfactory in instructional leadership and in managing the school program, most of my evidence rested on repeated efforts to improve the principal’s instructional management and the persistent erosion of student academic performance over a five-year period. The school board approved the transfer of the principal to a non-school post.

Buried in the language of principals as instructional leaders and effective teachers, then, is a crisp accountability for student performance – a steel fist encased in velvet. Boards and superintendents are driven by the inexorable logic of the research findings on effective schools to wrestle with the issue of marginal and incompetent staff beyond passing them from school to school or, as one superintendent put it, “engaging in the dance of the lemons.” Because so little has been written or discussed openly about teacher and principal incompetence in terms of technical inability to improve students’ academic performance, a district must often devise its own way of dealing with staff who cannot meet the higher expectations for their roles.9

Researchers interested in effective schools have yet to examine the cross-cutting policy conflicts that occur in selecting, assigning, and evaluating both teachers and administrators when districts embark upon an improvement program, especially when confidence in the schools is low and the climate is hostile to budget increases.

Implementation strategies

Current practitioner wisdom harnessed to effective schools research cultivates the image of a trim bureaucratic organization that can get the job done – that is, improve test scores. District policies on goals, school plans, revised curricula,
analyses of tests, new evaluative procedures, and frequent monitoring of systemwide progress, according to the growing consensus among boards and school chiefs, will produce outcomes that satisfy both professional and community expectations. But little notice has been given to how this will occur. Announcing a decision with a bang of the gavel is not the end of a process but merely the beginning of a sequence of events, many of them unanticipated, in the complicated process of implementation.10

A tighter coupling between the central office and individual schools along particular lines—such as goal setting, monitoring, evaluating, and specifying outcomes—often gets translated into the familiar pattern of top-down implementation. By that, I mean a strategy founded upon the belief that a chain of command, stretching tautly from the board of education through the superintendent, directs principals to lead teachers who, in turn, will raise student academic performance. Proponents of this strategy claim that the use of formal organizational tools such as technical assistance, rewards, and sanctions, increases both compliance and productivity. Central office administrators, viewing themselves as having the largest and most accurate picture of district needs, often see top-down implementation as efficient and swift. Their thrust is to set targets, establish control, and reduce discretion. According to this view, increased uniformity in practices will produce improved results. Two key assumptions guide this line of thinking: first, that there is a body of knowledge and expertise that can be used to produce high test scores in basic skills; second, that superintendent leadership and managerial savvy can weld a consensus in a mission and drive the organization toward its achievement. School districts from Portland, Maine, to Atlanta, Georgia, from Milwaukee, Wisconsin, to Milpitas, California, have used this pattern of implementation. These assumptions reflect the bind that superintendents, principals, and teachers find themselves in when they are compelled to act in the face of acute external pressures, yet lack a complete technology to achieve outcomes.

School boards and superintendents commonly use these top-down approaches to translate policies into practice for a number of reasons. Pressure for results pinches the school board and superintendent far more than it does the teacher or principal. Community dissatisfaction with performance leads to far more turnover among board members and superintendents than among principals or teachers. Moreover, the implicit indictment in the literature on effective schools is that if teachers and principals would only alter their beliefs and practices, student performance would improve. To expect teachers and principals, who are street-level bureaucrats at the bottom of every district organizational chart, to agree that they are both the problem and solution is to ask them to become scapegoats for a district’s failure to improve academic performance. Few scapegoats have been noted for volunteering. Finally, more often than not, administrators who make the decisions believe that the top-down strategy works. Because time is often short, cries for results are loud, pressures pinch acutely, and routines are already in place, top-down implementation is administratively convenient.
In contrast, implementation strategies adopting a bottom-up approach would concentrate on each school’s determining its own agenda, monitoring and evaluating itself, and using district funds in the manner that staff and parents chose. In short, each school would decide for itself how best to reach district goals. Rooted in the literature on organizational development, the bottom-up strategy concentrates on generating among staff a shared vision of what the school might be, creating a team spirit, cultivating mutual trust, and building emotional bonds through collaborative decisionmaking on school issues. Many practitioners and researchers, convinced of the importance of staff commitment, local ownership of decisions, and joint efforts at the school site, have cited instances in the effective schools research where such implementation strategies have produced desired outcomes in test performance. Organizationally, such strategies sustain the existing loose linkages between central office and school; encourage more, not less, principal discretion; and produce redundancy and, for efficiency engineers at the top of the organization, untidy arrangements. Superintendents who find this arrangement congenial lean heavily on informal communication, use networks within the district, and adroitly handle organizational rituals and traditions. Although infrequent in occurrence, bottom-up approaches do appear in the literature on effective schools.11

So far, I have implied that a top-down strategy of implementation means that directions drafted in the central office will be executed in each school across the district. Similarly, a bottom-up approach means that school-generated decisions unique to each setting will vary from school to school in the district. Mixes of top-down and bottom-up strategies, which are not necessarily tied either to district or school-based applications, also occur. Consider the following diagram.

![Diagram of Implementation Strategies](image)

*Figure 1 Implementation strategies.*

For example, a superintendent can direct principals in each school to set goals, plan and establish programs, and assess outcomes. By directing from the top a process to occur at each school without prescribing the content of the decisions, a variation on the familiar bottom-up approach emerges. In short, seeking tighter coupling of district practices to school action does not necessarily mean mandating the same effort districtwide; it can be triggered by superintendent mandate but proceed gradually on a school-by-school basis.

Whichever strategy is proposed, policymakers need to address critical issues concerning voluntarism, inservice training for teachers and principals, incentives, sanctions, and related points. It is still not clear which implementation strategies are most effective because few researchers have investigated the
connections between strategies and outcomes. Most researchers have recognized
the tangled complexity of such diverse elements as context, roles, individuals,
organizational factors such as size, history, and culture, quality of leadership at
both district and school levels, timing, and other critical determinants of suc-
cessful implementation. Beyond recognizing this complexity, few researchers
have proceeded further than to construct inventories and taxonomies of essential
points in establishing causal relationships between strategies and outcomes.
Three issues illustrate the larger complexity involved in implementing policies
aimed at making schools effective.12

**Choice or mandate**

Many practitioners and researchers believe that volunteers bring high energy and
a positive outlook to producing an effective school, while draftees only find fault
and complain. What, then, do superintendents do with schools mired in low
performance for years, whose principals and faculties express great reluctance to
join in an improvement program? Mandates, as many school officials know, can
produce compliance with the letter of the order without also leading to improve-
ment. Even when the superintendent, in a heavy-handed compromise between
choice and coercion, advises a principal to volunteer, some grudging level of
compliance is about all that can reasonably be expected.

The strategies adopted by various school districts offer little guidance. In
New York City, the chancellor invited Ronald Edmonds, one of the effective
schools researchers, to introduce a school improvement program based upon his
research, and in which voluntarism played a major role. Schools were invited to
participate, and from the pool of volunteers Edmonds and his staff chose a
number for the project. In Milwaukee, the superintendent designated eighteen
schools with the poorest test scores for the effective schools project. In New
Haven, Milpitas, and Seattle, all schools participate in the program. In Arling-
ton, elementary schools other than the six initially selected may choose to enter
the program and receive the services. Of course, superintendents employ mixes
of choice and coercion. Generally, however, tight-coupling strategies favor man-
dating involvement, whereas bottom-up approaches favor allowing staffs to
choose. Although superintendents’ beliefs are strong as to which approach
works, no body of evidence yet supports one tactic or the other.

Local context and superintendents’ beliefs about change, rather than actual
evidence, may often determine whether requiring schools to participate or offering
them a choice is the tactic to use. In Arlington, the six schools which were at the
bottom in academic performance formed a natural grouping. For two of the six, for
example, opting out of participation would have left the school board and me
vulnerable to legitimate parent complaints that principals and teachers were insen-
tive to deteriorating student achievement and resistant to improving the situation.
The tradeoff in requiring all six staffs to join the program was apparent in the
varying levels of enthusiasm for the initial effort and, in some cases, foot-dragging
reluctance. In districts where there is a history of voluntary piloting of new approaches, tradition dominates. Thus, the issue of choice or mandate may hinge less on evidence than on local contextual conditions and on policymakers’ beliefs about which implementation approach works. The issue of choice needs explicit attention if for no other reason than to assess the anticipated trade offs.13

Inservice training

In mobilizing for an improvement program, the primary means of delivering help to schools is technical assistance. The implicit theory of change embedded in inservice programs is that faculties and administrators, as individuals and small groups, need additional knowledge and skills in order to implement research findings: change individuals and the school will become effective. But consideration of the impact of the school structure upon individual behavior is often missing from any discussion or analysis of inservice training. Organizational regularities involving teachers and students, principals and teachers, school staff and district office, parents and school – not to mention how the school is organized for instruction and its use of time – are rarely included in the usual technical assistance packages offered as part of school improvement.

Some researchers have suggested directions for altering a few organizational norms that shape teacher behavior. Judith Little, for example, has shown that breaking down teacher isolation and cultivating a norm of collegiality can lead to improvement in teaching practices.14 New work norms of teachers observing one another, talking frequently about pedagogy, and engaging in joint planning stimulate the sharing of values that nourish school improvement.

What is offered to teachers is all too familiar. Most teachers and principals know the concepts in the research on effective teaching and schools insofar as classroom instruction and schoolwide leadership are concerned, although the language and emphasis may be unfamiliar. For teachers listening to lectures and reading articles there is little that is complex in the research or that calls for major shifts in classroom practice, although evidence that teachers practice these concepts may be lacking.

On the other hand, the literature on instructional leadership calls for extensive inservice education for principals on the components of managing an instructional program, such as establishing and communicating a mission for the school, supervising instruction, and creating a positive climate. This emphasis does not mean that principals are unaware of instructional management or that they do not perform the function. However, principals themselves report that they give such managerial activities less time because the nature of the job forces them to concentrate on noninstructional tasks, such as maintaining school stability and coping with the often competing interests of the central office, school faculty, parents, and others. In addition to principals’ self-reports, observational studies confirm that instructional management is secondary to noninstructional tasks in the daily whirl of a principal’s life.15
Few training sessions for teachers or principals, however, make either aware that the sharpened expectation for the principal to exert leadership will end the silent agreement between administrator and faculty to honor each other’s separate domain. A principal who shifts into a mode of visiting classrooms daily, monitoring student achievement monthly, and evaluating teacher performance quarterly may become a threat to some teachers. Similarly, few inservice sessions deal with dilemmas touching teachers and principals who are asked to implement programs about which they have had little say and with which they may disagree, such as using test results as the major standard for judging success.

How is technical assistance delivered? Researchers agree that the one-shot workshop in the district office, with no follow-up, is at best symbolic, and at worst trivial. Numerous studies of inservice training state that encouraging teachers and principals at each school site to leave their fingerprints on the training format and content – even to the point of reinventing the obvious – is linked to improved staff performance. While partisans of organizational development note such findings, others have observed that local-site staff training permits teachers to adapt new knowledge and skills to their unique circumstances. Continuous sessions with ample and direct follow-up activities are commonly recommended in these studies.16

Who does the training? In New York City schools these liaisons, as they are called, are veteran teachers or supervisors in the system who are familiar with both the formal and informal structure of the city’s public schools. They work with staffs a few days a week in planning, implementing, and evaluating school improvement plans focused sharply on Edmonds’s five factors of effectiveness: strong administrative leadership, orderly school climate, high expectations for student achievement, basic skills emphasis, and frequent monitoring of pupil progress. In the process, they line up consultants and, whenever possible, provide expertise themselves. Arlington uses a team of central office teachers and supervisors in reading, math, and writing who spend concentrated periods at a school on particular tasks, such as coordinating the entire reading and writing program across grades, providing materials, and working with the school staff on a consulting basis for the rest of the school year. Other districts train a cadre of teachers from participating schools so that each school has an on-site trainer who is a resident member of the staff. Some school systems hold a series of workshops at a central location throughout the year, with follow-up done by designated supervisors. The common pattern, however, still seems to be a series of uncoordinated workshops for principals and teachers, with pounds of reading material circulated and a pat on the back.17

Technical assistance attempts to increase the capacities of the participants to do a productive job. It is the linchpin of any school improvement. Modest sums of money are needed. For programs aimed at delivering the training during the year at the school site, $3,000 to $4,000 a year per school is probably sufficient to purchase the consultant time, materials, and substitute teacher time involved
in getting a program solidly started. For programs using liaisons split between two or three schools, the cost would be higher initially, unless those liaisons are reassigned supervisors or other central office personnel who have themselves received some training.

**Incentives and sanctions**

In top-down implementation, formal and informal incentives and sanctions are organizational tools available to superintendents to shape what happens and to introduce managerial control into an ambiguous set of arrangements. With test scores as the coin of the realm, public recognition of school improvement – by such means as certificates of achievement awarded by the board of education or school-by-school scores published in newspapers – acts as an inducement for principals, teachers, and students. School board recognition of the academic achievement of both schools and individuals – such as higher test scores or winning of academic olympics – attracts media and citizen notice; far more important, however, is the fact that the top authority takes the time to acknowledge and honor academic excellence. Principals who behave in a manner consistent with descriptions of instructional leadership and produce higher test results become candidates for promotion. Similarly, teachers who develop reputations for consistently turning out classes with high test scores are sometimes viewed as potential principals.

Securing parental support becomes easier when a school’s performance is anchored in standardized test data that reveal promising achievement. For individuals who derive pleasure from a heightened sense of professionalism, attending workshops, reading materials unavailable to other staff, and participating in an effective schools program are rewards in themselves. For others, improved student performance at either the school or the district level encourages a sense of belonging and involvement in a larger, worthwhile effort. The last two are among the informal rewards associated with bottom-up implementation. An important incentive is the powerful feeling that can grow in a staff that works together and succeeds in producing higher test scores. The sense of shared purpose and pride in group achievement fuels further effort, increases participants’ self-esteem, and enhances their confidence in tackling tough jobs. Wise superintendents, aware of the influence of their positions and sensitive to the power of both formal and informal rewards, also know that their participation in teacher and principal work sessions tells staff and parents what is important in the district.

Sanctions also exist. When test scores plunge without recovering, the implied, if not actual, consequence for teachers and principals may well be criticism that escalates into warnings or even threats of removal. The effective schools research points inexorably to the conclusion that children can achieve. When test scores fail to rise or continue to decline, teachers and principals receive the blame. Although such severe penalties as removal seldom occur, the unspoken threat remains. Union contracts and due process requirements protect
instructional staff from swift termination on the basis of test results, but the pattern of long-term class or school deterioration has been used to institute charges of incompetence.

The issues of choice, inservice training, and incentives and sanctions are a few of the thorny questions that arise when embracing and executing policies presumably anchored in research findings. Another element missing in the literature on effective teaching and effective schools is the role of district leadership.

**Leadership**

Most studies of effective schools stress the pivotal role of the school principal. The research says that no school can be labeled effective (again, using the criterion of test scores) unless its principal exerts – and here the words vary – a strong administrative presence, an active style, or some other trait demonstrating leadership. But no study that I have seen lays out empirically-derived principal behaviors that produce the desired outcomes. Instead, there are recipe-like prescriptions stemming from personal experience, case studies of principals, or inferential leaps based upon theories or data drawn from other organizations. Thus, the connective tissue, the set of behaviors that principals engage in to develop a school climate that supports academic achievement – to gain staff commitment, to engender high expectations, to supervise individual teachers and the entire instructional program, while carrying on the varied and complex duties connected with maintaining order in the school – none of these complex, interacting behaviors has been linked in the literature to the production of higher test scores. So far, only a general notion of leadership is a correlate of high student achievement. Practitioner faith and folk wisdom sustain the conviction that school-site leadership makes a difference. Research has yet to catch up with this lore to either inform, shape, or contradict practice.18

Faith and folk wisdom also suggest that the superintendent exerts a critical role in establishing the district agenda, communicating the mission of the district to both the staff and community, creating a systemwide climate favoring achievement, targeting essential personnel and funds, and monitoring and assessing the overall program in order to implement school board policies directed toward school improvement. As with the principal, experience-based knowledge about superintendents as instructional leaders exceeds the present state of research-produced knowledge. The accounts by or about superintendents embracing an effective schools approach describe attitudes and activities typical of an earlier generation of superintendents – teacher-scholars who were deeply interested in the instructional process and active in schools and classrooms. A century ago, superintendents had to teach teachers what to do in classrooms; they inspected what was taught, listened to children recite, taught classes, and, in general, were unmistakably visible in the school program. That model of superintendent as instructional leader gave way to a managerial approach that has dominated the superintendency for the last three generations. With the mounting interest in using effective schools research, the older
model of a school chief knowledgeable about both curriculum and instruction and visible in the schools beyond the symbolic tour is reasserting itself.19

Given that the literature on effective schools suggests that no school can become effective without the visible and active involvement of a principal hip-deep in the elementary school instructional program, then it also seems likely that no school board approving policies aimed at systemwide improvement can hope to achieve that condition without a superintendent who sustains a higher than usual involvement in the district’s instructional program. Of course, there will be districts that have some effective schools regardless of the superintendent’s familiarity with instruction, just as in a school with a principal who is uninvolved with the instructional program and sees his or her task as keeping the ship afloat, there will nevertheless be first-rate teachers who maintain high standards of instruction. Moreover, the superintendent can delegate many tasks to subordinates; he or she cannot be everywhere at once, anymore than a principal can.

The size of a school system is also a factor. Can the Chicago superintendent with a half-million students perform as an instructional leader in the same way as her colleague in Alexandria, Virginia, who deals with fewer than ten thousand children? Yes, but large districts require far more symbolic and shrewd instructional leadership targeted upon principals rather than teachers. The superintendent’s personal, active involvement in the district instructional effort seems to be a necessary condition. I state the above as a proposition derived from the logic of existing practice in improving school productivity. No facts yet exist on superintendent behaviors that cause district improvement. Because of the absence of studies investigating the superintendent’s role in improving schools, the literature leaves us with discussions of the ineffable quality of leadership.

At a time when budget, program, and staff cuts and school closings are affecting most districts, when a crisis of confidence in schools is attracting media attention, and when administrators are privately and publicly bewailing the lack of money and the restrictions upon their power, policymakers and academicians are calling for inspired leadership. If the research on effective schools has yet to produce reliable prescriptions tested in numerous crucibles, the literature on leadership for both principal and superintendent reveals a similar barrenness. Long on rhetoric and dictates, much of what is written leans heavily on perceptions of what school leaders do. Within the last decade a few scholars have produced behavioral descriptions of principals and superintendents. Yet the tasks that administrators choose to work on, the language they use, the discretion they employ, the symbols they manipulate, the incentives they extend, the style and commitment they project – all dance beyond the grasp of researchers. There are also organizational theorists who argue plausibly that formal leadership is a myth constructed by those who need to attribute influence to incumbents. Hence, what principals and superintendents do daily to create the conditions for instructional improvement and to influence students directly remains in the shadows of research-produced knowledge, though honored by practitioners and sought by parents.20

I prefer to acknowledge that leadership is ineffable rather than to embrace
popular recipes that worked once in someone else’s kitchen. My experience and
that of other superintendents, however, presents some untested propositions that
researchers and policymakers may find worthy of consideration.

First, no superintendent can secretly improve a school district. The source of
formal authority for a superintendent’s initiative is the school board, which
needs to approve the general direction and to work in tandem with the superin-
tendent. Self-evident as this may seem, the commonplace needs to be stated.

Second, the superintendent sets the agenda and develops the mission, using
his or her managerial skills to decide when to open the gate to ideas and when to
close it, when to veto and when to support – in short, how to develop policy.

Third, the superintendent establishes a climate which nurtures instructional
improvement in the district. Once the superintendent becomes identified with the
mission of school improvement, even symbolic visibility in schools and class-
rooms carries weight. Encouragement and support (without conceding anything
on expectations) for principals and teachers, such as protecting the instructional
day and nourishing professional development, are also important.

Fourth, the school chief uses a number of managerial tools to implement the
mission: targeting limited resources on activities that promise a payoff; placing
like-minded, skilled staff in key positions that will advance the district’s
mission; and actively participating in monitoring and assessing the instructional
program.

Such behavior on the part of the superintendent describes a high-profile,
active involvement in the instructional side of school operations. Will it produce
improved student academic performance? Maybe. Experience-derived know-
ledge says yes, but no body of independent evidence yet exists to demonstrate
that engaging in these tasks will yield dividends. What these assertions about
superintendent behavior suggest is that some degree of direction and top-down
implementation is necessary in launching an improvement program. Once
launched, however, the improvement process can travel many routes, ranging
from organizational development techniques employed with small groups to
tightly managed, orchestrated tasks, resembling a chess game. Personal prefer-
ence and belief systems seems to determine the course adopted.

This description of superintendent behavior is narrowly targeted on the acade-
ic performance of students. The goals of schooling, however, go well beyond test
scores. If the mission of a district embraces many goals, some of which may require
substantial changes in teaching practice such as developing student initiative, deci-
sionmaking, and cooperativeness, other leadership tasks may also be involved.
Since a great deal of existing pedagogy and principal behavior is shaped by the
structure within which both teachers and administrators work, improved academic
achievement is well within the margin of change set by organizational boundaries.
Hence, changes directed toward test scores are incremental and very different from
a major overhaul of the entire district’s instructional program.

Whether or not such leadership activities as described here have, indeed, pro-
duced the higher academic achievement reported in districts across the nation
has yet to be demonstrated. But it is clear that there are many unanticipated consequences of tightly coupling the central office to the local school and of concentrating on raising achievement on tests.

**Unanticipated consequences**

**Increased uniformity**

The school effectiveness literature stresses the importance of managing the instructional program and coordinating the curriculum at the school site. Yet districts concentrating upon improving academic achievement experience a strong, irresistible tug toward a standard curriculum and systemwide use of the same textbooks and student workbooks. Tailoring supplementary materials to student differences becomes less frequent, as does grouping of students within classrooms on the basis of achievement. The notion of a single, best curriculum and managerial style echoing the pre-1900 years of public schooling reasserts itself. The press toward uniformity is neither good nor bad; every school district must strike some balance between uniformity and diversity in curriculum and program management. My point is simply that adopting the school effectiveness research will drive the curriculum and school management toward uniformity.

The same trend is visible in teaching. The research on effective teaching practices has singled out and emphasized particular techniques as being effective means of improving test results. The boosterism surrounding direct instructional methods such as teaching the whole class at one time, teacher-directed activities, and continual monitoring of student work, presses teachers toward these practices. What the literature has done is to certify direct instruction as the single best way of teaching. But uncritical cheerleading for this brand of teaching stamps whole-group instruction, lecturing, recitation, and seatwork as effective, going far beyond what the research findings promise or even suggest. Moreover, repetitive, low-level intellectual skills are now surrounded by a halo of legitimacy. Filling in blanks, getting test-wise to multiple-choice items, and completing exercises elevate tedious tasks to the status of effective instruction. Concern for student interest, motivation, and the life of the mind diminishes with accelerated use of dittos, seatwork, and pre-and post-tests. Learning becomes a series of repetitive tasks that need to be completed, placed in folders, and marked by the teacher. An increase in drill and routine is justified in the name of direct instruction and concentration on low-order but important basic skills. While mastery learning, the use of individual contracts, and small group instruction through teams stand as alternatives to direct instruction in producing academic gains, such approaches remain largely at the margins of the pedagogical radar screen.

The result is that the ineffable elements of teaching as an art – tempo, improvisation, drama, and excitement of performance – receive little acknowledgment as important qualities and even less attention from district policymakers. The pleasures that teachers derive from their relationships with children, the
unpredictable, the unexpected, the unplanned, and the joyful, go unnoticed by partisans of effective teaching. There is a danger in smothering the craft and rewards of teaching in the rush to make instruction scientific and efficient. The dream of an efficient one-best-system of instruction of an earlier generation of reformers appears to have resurfaced with the undisguised fervor for direct instruction.

**Narrowing of the educational agenda**

In the pursuit of improved test scores, areas viewed as nonacademic – such as music, art, speaking, and self-esteem – receive less attention. Partisans of effective schools seem to take the position that if a subject or skill cannot be directly linked to student academic performance, then the burden of proof that it is a legitimate part of a school curriculum rests on those who see schooling in broader terms than spelling bees and multiplication tables.

Narrowing the agenda for public schools was a necessary response to the ballooning expectations of the last half-century. But schools can do more than raise test scores of all children. Both citizens and educators must be concerned about shrinking the school district’s agenda to the least common denominator.

**Increased conflict between teachers and administrators**

Heightened interest in instructional leadership causes a shift in administrator behavior. The principal’s weekly presence in classrooms, periodic evaluations, and scrutiny of each class’s test achievement boosts teacher anxiety over potential loss of classroom autonomy. The principal’s insistence on the use of direct instructional methods may be viewed as a slur on the teacher’s ability to make pedagogical judgments. The likelihood of overt conflict increases when teachers feel that their professional domain is being penetrated by administrators who know little of the students they face daily and the craft they practice hourly.

Similarly, latent hostility between principals and the central office is produced by the differences between the view of the district from the principal’s office and the view from the superintendent’s desk. This conflict sharpens noticeably when the superintendent takes a greater interest in schoolwide test scores and holds principals accountable for meeting district goals. Revision in evaluation instruments for administrators raises the spectre that principals’ jobs are on the line if they don’t produce. Few researchers have pursued this potential conflict as a consequence of adopting policies based upon effective schools research.21

**Lack of focus on schools with high test scores**

Because the focus of recent efforts is on lifting test scores, little attention is paid to the curriculum, instruction, or organization of schools with median percentile ranks above 95 in math and reading. The presumption is that all is well, yet the
analysis of sub-groups in high-scoring schools often reveals that there are students who need remedial help. The high achievers in these schools may also receive inappropriate instruction if teachers are using only grade-level materials. And teachers may resist moving them ahead to advanced lessons because of the ripple effects upon the next grade’s teachers, whose materials are geared to a certain expected level. Also, low expectations of high achievers – “they are so smart, they will get it on their own” – often pervade such schools, insulating students from improvement, since the schools look terrific in terms of percentile ranks.

**Misapplication of research findings**

While there is an intuitive and craft wisdom to many of the findings, there are sharp limits on their application to the high school. One limit is that the organizational structure of the high school resembles that of the college more than that of the elementary school. In terms of size, mission, the structuring of time, student-teacher contact, previous training of teachers and their worldview of what is important for young men and women, the high school is profoundly different from the elementary school. Certainly high schools can become more effective, but to claim that formulas that have proved effective in the lower grades will also be effective in the upper ones is a misuse of research. The Charles Kettering Foundation, for example, sponsors a program that lists fourteen attributes of effective high schools. It is a melange of traits drawn from findings on effective elementary schools and from theory undergirding organizational development. The U.S. Department of Education has recently recognized as effective high schools across the country which possess these fourteen attributes. Principals are told that if they become instructional leaders, supervise instruction, coordinate curriculum, and evaluate classroom teachers, test scores will improve. Grafts of formulas used in elementary schools will fail, in my judgment, until a more sensitive, grounded organizational analysis is made of the high school. The misapplication of research findings is very tempting to policymakers who hear shrill criticism from taxpayer associations, government officials, academicians, and professional reformers. Conclusions from research studies that demonstrate high positive correlations between certain activities and improvement in test scores are often too seductive for district policymakers pressed to increase productivity to ignore. Accordingly, districts tend to perform the slippery twist that converts correlations into action agendas.  

These and other unanticipated consequences raise the obvious question: If productivity improves and parents and policymakers are pleased with higher test results, can we conclude that children are receiving a better education? Inner-city children across the nation who have received a schooling built upon false beliefs in their incapacity to learn are clearly the beneficiaries of effective school efforts. This fundamental first step is a moral as well as an educational one. No excuses are acceptable.

But improved test scores are simply not enough. To conclude that a school is effective once it demonstrates test-score gains is, implicitly, to conclude that
students need to develop no other capacity than to answer multiple-choice items correctly. The concern that drives many schools today — that of improving student performance on achievement tests — is a short-term, useful but constricting one. The framework for a response to this concern regarding elementary schools comes from research on effective teaching and schools. That framework, I am confident, is useful and will prove successful in lifting test scores. But, while it is a necessary first step, it will prove insufficient in reaching for broader, less easily measured yet fundamental goals of schooling. The dangers of confusing means (test-score gains) with ends (multiple aims of schooling) are real. Based upon my experience and an awareness of the inevitable trade offs in the implementation of effective school programs, I suggest that the expressed concern regarding test scores be reformulated as a question: In improving test results, how can the general, more complex and non-quantifiable goals of schooling be achieved? Such a question places test results in a ranking position in relation to such other important outcomes as problem solving, cooperativeness, independence in decisionmaking, positive feeling for learning, caring for others, an appreciation for the aesthetic, and similar aims.

To evaluate the effectiveness of such complex organizations as schools solely on the basis of a percentile rank is little better than to judge a car’s quality solely on the basis of its miles-per-gallon or a hospital’s effectiveness solely by the number of its vacant beds. School officials who have adopted effective schools research, concepts, and language need to use many policy tools to improve school productivity, not just standardized test scores. Tightly coupled organizational procedures sharply focused on academic goals, as measured by test results, are clearly among those tools. Too often, however, those who believe their only tool is a hammer begin to treat everything like a nail. For that to occur now would be, in my judgment, a mistake for the children of the nation.

**Acknowledgement**

This is a revised version of a paper commissioned by the National Institute of Education on district links with school sites in improving schools. A shorter version of this article, "Effective Schools: A Friendly But Cautionary Note," appeared in the June 1983 issue of *Phi Delta Kappan*.

I wish to acknowledge the helpful comments of Steve Swerdlick.

**Notes**

TRANSFORMING THE FROG INTO A PRINCE

5 I draw from my experience in Arlington, Va. (1974–1981), from my observations of school districts in the San Francisco area that have adopted school effectiveness as a program, and from the following accounts: Alonzo Crim, “A Community of Believers,” Daedalus, 110 (Fall 1981), 145–162; Robert Benjamin’s chapter on Modesto, California, in his Making Schools Work (New York: Continuum, 1981); Bennett and Eastland, “Making a School System Work,” on Portland, Maine; and Wilson, “Do Seattle Schools Work?” The Summer 1982 issue of State Education Leader, published by the Education Commission of the States, lists the steps that schools, districts, and state agencies should pursue (such as setting goals, cultivating principal leadership, developing staff, and coordinating curriculum).

8 See, for example, the description of New York City’s School Improvement Project.
and the funding necessary to sustain central administration of the program, liaisons
for the schools, and other costs, in Terry Clark and Dennis McCarthy, “School
Improvement in New York City: The Evolution of a Project,” Educational

9 My colleague, Edwin Bridges, is completing a long-term study of how school districts
manage incompetent staff. His search of the literature produced very little on either
teachers or principals.

10 The literature on implementation grows yearly. Case studies and theoretical contribu-
tions have slightly increased our understanding of the complex process of converting
policy decisions into practice. See Richard Elmore’s “Organizational Models of Social
Program Implementation,” Public Policy, 26 (1978), 185–228. Elmore’s taxonomy of
implementation models is useful for differentiating the technical-rational approach, cur-
cently enjoying a vogue among school policymakers, from the bureaucratic, conflict-
bargaining, and organizational development models. Federal and state experience with
Title I, P.L. 94–142, and special projects since 1965 has demonstrated how legislative
intent is persistently twisted into shapes congenial to local needs. The tension between
securing compliance and releasing local capacities runs like a red thread through the
accounts of these efforts. The projects that were judged effective, according to the intensive
case studies of federal programs by Paul Berman and Milbrey McLaughlin, were
ones that somehow put their unique stamp upon the federal project’s goals, activities,
and outcomes. See Berman and McLaughlin, Federal Programs Supporting Educa-
tional Change, Vol. VIII of Implementing and Sustaining Innovations (Santa Monica,
Calif.: Rand Corporation, 1978). In a critique of the literature on implementation of pro-
grams, Berman concludes that implementation is determined by so many factors and
circumstances that it is idiosyncratic; see Berman, “Educational Change: An Implementa-
tion Paradigm,” in Improving Schools, eds. Rolf Lehming and Michael Kane (Beverly
Hills, Calif.: Sage, 1981). “Mutual adaptation,” a phrase extracted from the Rand
researchers’ work, has become a shorthand expression for implementation strategies
that embrace grassroots participation. Whereas some efforts have employed the findings
of implementation researchers that staff commitment and a stake in decisionmaking are
of pivotal importance to effective schools policies, most programs implementing effect-
ive schools research employ top-down strategies.

11 The New York School Improvement Project is one instance of a top-down strategy
employing a school-based approach. For an analysis of bottom-up and school-based
strategies, see Jane L. David, School-Based Strategies: Implications for Government
Policy (Palo Alto, Calif.: Bay Area Research Group, 1982).

12 See Michael Fullan, “Implementing Educational Change: Progress at Last,” Paper
and Fullan and Alan Pomfret, “Research on Curriculum and Instruction Implementa-
tion,” Review of Educational Research, 47 (1977), 335–397. See also David Crandall,
Joyce E. Bauchner, Susan F. Loucks, and William H. Schmidt, “Models of School
Education Research Association, New York City, March 1982; and Meredith Gall,
“Using Staff Development to Improve Schools,” R & D Perspectives, Winter 1983.

13 Edmonds, “Programs of School Improvement,” pp. 4–11; and my own acquaintance
with efforts in Milpitas, Calif. Levine and Eubanks, “A First Look,” p. 702, recom-
mend mandating school participation if sufficient funds are available but do not
mention trade offs between choice and coercion.

14 Little, School Success and Staff Development: The Role of Staff Development in Urban

15 For teacher staff development and new work norms, see Little, School Success &
Staff Development. Among the many investigators of the role of principals, Harry

16 See Mary Bentzen, Changing Schools: The Magic Feather Principal (New York: McGraw-Hill, 1974); for several productive discussions, see the essays in Ann Lieberman and Lynne Miller, eds., Staff Development: New Demands New Realities, New Perspectives (New York: Teachers College Press, 1979); and Little, School Success and Staff Development.

18 A number of researchers have begun to investigate this critical area. Steven Bossert, David Dwyer, and Brian Rowan, all at the Far West Regional Lab, San Francisco, Calif., have undertaken a series of studies based upon their model of instructional management. So far, they have produced an explication of the model and five ethnographic studies of principals in effective elementary schools. Hallinger, in “Management Behavior of Principals,” discusses varied principal behaviors in ten elementary schools in a California district and concludes that the literature on effective schools is essential for improved student performance.

21 Identification of these potential sources of conflict comes from my observations in school districts implementing effective schools research; Hallinger’s observations in “Management Behavior of Principals”; and my own experience in Arlington.

22 I obtained these materials in May 1983 while serving as a site visitor for the U.S. Department of Education’s recognition program of exemplary high schools. The issue of generalizability surfaces whenever I speak to groups of administrators on effective schools research. I do not claim that the findings of the Kettering Foundation or the Department of Education are irrelevant. But in the few high schools identified as effective that I have observed firsthand, I saw organizational procedures and structural changes quite different from those of the typical high school.
IMAGES OF TEACHING AND PROPOSALS FOR REFORM

A comparison of ideas from cognitive and organizational research

William A. Firestone*

Organizational analysis and studies of teacher thinking both contribute to discussion about how to professionalize teaching, but these two bodies of research have not been well synchronized. Teacher-thinking research examines teachers’ thought processes and makes recommendations for training. Organizational analysis emphasizes the importance of teacher commitment and the redesign of existing schools to increase teacher collegiality and participation. This article juxtaposes these two literatures to clarify and suggest ways to combine divergent images of the good teacher. It also suggests that recommendations for reform are incomplete and argues that these ideas need to be put into a wider framework.

The most recent interest in teacher professionalism, heralded by the reports of The Holmes Group (1986) and the Carnegie Forum on Education and the Economy (1986), is almost a decade old. Ongoing efforts to promote developments as diverse as professional development schools and site-based management (White, 1992; Wohlstetter, Smyer, & Mohrman, 1994) indicate that interest in enhancing teacher professionalism persists. Yet, debate about what it means to professionalize teaching and how it should be accomplished precedes these reports and continues (e.g., Burbeles & Densmore, 1991; Sykes, 1991). Two areas of research contribute to thinking about the teaching profession. Cognitive research provides an image of the professional teacher that can support arguments for the professionalization of teaching. Organizational analysis helps to clarify the conditions of work necessary for teachers to act as professionals, but its image of the good teacher is very different from what comes from cognitive research.
There have been a few efforts to link research on organizations and cognition (e.g., Murphy, 1991), but these have rarely focused on teaching. As a result, these two bodies of research have not been well-synchronized as they apply to teaching. When they turn from students to educators, cognitive researchers delve deeply into the thought processes of teachers and, for the most part, have made recommendations on the training and certification of (usually new) teachers. Organizational analysis in education draws on a long, out-of-education tradition of research on organizational behavior to suggest something close to generic prescriptions to reform schools in light of a universal image of the self-motivated worker. How those prescriptions are linked to the work of professional teachers is unclear.

My intent in this article is to juxtapose these two literatures in order to suggest some implications for the reform of schools. Table 1 provides a capsule summary of how I see the similarities and differences between these literatures.) I begin by clarifying the image of the good teacher inherent in each literature. The cognitive literature elucidates the knowledge and thought processes of teachers, whereas the organizational research stresses the importance of commitment. Then, I examine the reform proposals associated with each: teacher training and assessment in the cognitive literature, and variations on the themes of participation and collegiality in the organizational literature. Finally, I argue that both sets of recommendations are useful but incomplete and suggest some other reforms that need to accompany them.

Comparing these literatures is not easy, because both are rich and complex. Both are moving forward on a variety of fronts with a certain amount of ferment, differences of emphasis, and debates within each. Moreover, there is a substantial asymmetry. The cognitive literature explicitly analyzes certain aspects of good teaching while largely ignoring what schools are like. Organizational work focuses on schools while making (often ambiguously specified) assumptions about what constitutes good teaching. What follows then is necessarily a simplification of two dynamic fields of study.

The good teacher

Among the numerous efforts to define a profession and distinguish it from other occupations, a few themes repeat themselves and appear to be especially relevant to education. One rationale is that a profession provides a service that is difficult to monitor in a situation where the client knows less than the service provider or is otherwise vulnerable (Wise, 1989). Because of the uncertainty surrounding service delivery, quality control is maintained over the professional rather than over the service itself. Because discretion is required, it is necessary to assure that professionals have both the requisite knowledge and appropriate values (Darling-Hammond, 1989; Weick & McDaniel, 1989). The importance of knowledge is widely recognized, although the nature of that knowledge is currently the subject of considerable ferment (Schon, 1987). The values issue has received less attention. Still, professions have been defined as elites responsible for the protection of a social value (Weick & McDaniel, 1989). The importance of values becomes apparent from both the complexity of the task and the vulnerability of the client. Just as it is important (and problematic) that the medical doctor not prescribe unnecessary procedures to make money at the expense of the patient’s health or purse, it is crucial that the teacher’s primary concern be the welfare of the student, not him- or herself. The cognitive literature focuses on teacher knowledge. Organizational research gives relatively more attention to values by focusing on attitudes and commitments.

Teacher knowledge

Research on teacher knowledge is new, perhaps 15 or 20 years old. It is partially a reaction to the process-product research that focused strictly on teacher behavior; appeared to emphasize uniform, noncontingent recommendations for the improvement of teaching; and took existing definitions of student achievement as given. This new research is based on the assumptions that knowledge and thought are related to behavior, that teaching is contingent, and that much of what the teacher does is design and adjust teaching strategies and tactics in light of both the students and the content to be taught. It emphasizes the complexity and frequency of teacher decision making (on average one decision every 2 minutes), and it is more oriented toward developing higher-order thinking skills than is usually the case (Clark & Peterson, 1986).

This research draws on and parallels the cognitive science treatment of student learning (Bransford, 1979; Peterson, Fennema, & Carpenter, 1991). That research delves into the microparticulars of what it takes for students to understand a mathematics problem, a science lab, or a writing assignment. One analysis from mathematics suggests that understanding involves:

**Structures**, or kinds of content, computing algorithms, principles, ways of translating word problems into computations, and other things that must be known about mathematics. These are often implicit.
Representations, or ways of describing and presenting structures to oneself or others. These may be invented or include commonly accepted symbols, such as the formal symbols for addition, subtraction, and so forth.

Connections between various structures and representations. Deep understanding is often characterized by rich connections among various structures. Without such connections, for instance, it is difficult to apply structures learned in school (such as long division) to real-life problems.

Active construction of knowledge. Essentially, this means that students cannot accept or memorize structures or representations; these must be actively constructed through some kind of learning task, activity, or application.

Situated cognition, which means that understanding is intertwined with specific physical and social situations. The ability to estimate the time it takes to do a job, for instance, is a mathematical skill that comes from doing a kind of work.

(Putnam, Lampert, & Peterson, 1990)

This view of understanding is a way of thinking about what higher-order thinking is. Moreover, it has important implications for instruction. For instance, the principle of active construction means that teachers cannot effectively tell students about specific structures. Depending on the particular subject area, telling can help. However, students generally have to develop their own structures through some kind of work, and they develop best what they work on. Thus extensive drill and practice of mathematics facts does not help with the application of those facts to story problems or to problem solving in unknown situations. Another implication seems to be that it is not necessary to teach basic skills (computation) before more complex skills. The two can be learned together. Finally, because students do construct their own understanding, it is necessary to build from what they already know. A good deal of teaching then becomes making contact between the curriculum and students’ knowledge (Bransford, 1979; Peterson et al., 1991).

Similar analyses are being conducted of teacher knowledge. Inquiries into structures focus on what teachers must know. Shulman (1987) provides one of the most inclusive typologies of teacher knowledge. It includes content knowledge; general pedagogical knowledge, including principles of classroom management; curriculum knowledge of the materials and programs with which teachers work; pedagogical content knowledge, the blend of content and pedagogy needed to communicate with students; knowledge of learners and their characteristics; knowledge of educational contexts from the classroom to district governance to communities; and knowledge of educational ends and values. He argues further that pedagogical content knowledge is the special province of teachers, for they must know their content, not so that they can advance what is
known, but so that they can communicate it to students who often lack all or part of the necessary background understanding.

Because students usually lack either the structures or the connections to understand what the teacher has to offer, representation becomes a special challenge. Teachers must find ways to bridge the gap between what students currently know and what they should know. One way to do so is through the use of metaphor, and the kind of metaphor the teacher uses will highlight some aspects of what must be learned rather than others. For instance, Shakespeare’s *Julius Caesar* can be taught in ways that emphasize language, history, or moral conflict (Wilson, Shulman, & Richert, 1987); but for some students, a teacher might better use an episode of *Star Trek* to get at the latter issue because it is more familiar.

Teachers apply static structures through complex reasoning processes that take place both in the classroom while working with students and outside while planning for an activity and assessing its effectiveness. For instance, teaching a lesson on a given topic requires understanding its purposes and the subject matter; transforming it into a set of representations and activities through which students can understand it better; actually conducting the activities while managing the presentation, interactions among students, group work, discipline, and so forth; evaluating student understanding; reflecting on the results; and creating new comprehension for later lessons (Clark & Peterson, 1986; Shulman, 1987).

Research on teacher knowledge helps describe the kind of teaching through which students can actively construct their own knowledge. Teachers must have the deep understanding of their content that helps generate multiple representations and activities and select those that best fit the students taught. These must be accompanied by a subtle ability to pick up cues emanating from students as the classroom activity unfolds and to adjust that activity to student progress. With this knowledge and ability, teacher talk becomes limited. Although teachers sometimes have to describe fundamental structures and cue students to what they are looking for, much more class time is spent in student activity and sometimes in dialogue than is usually the case. The art of teaching is not so much the good lecture or the teacher-dominated discussion as the good activity. Teaching is more interactive, and learning is more active than is typical of most present practice. Experimental evidence suggests that this approach to teaching effectively helps students develop higher-order capacities in both reading and mathematics. Moreover, where the teacher knows more about students’ current knowledge, those students learn more (Palincsar & Brown, 1984; Peterson et al., 1991).

The ability of knowledgeable teachers to promote higher-order thinking is crucial to the argument for professionalizing teaching. Efforts to change teachers’ status have been made previously with relatively little success. One thing that makes the current situation different is that the United States is now competing in a global, high-technology market where other countries often have the advantage. A literate, inventive, and socially responsible workforce will be
necessary for the United States to hold its own in the future. As the proportion of poor, minority, and immigrant children in the populace grows, such a workforce may become increasingly more difficult to achieve. If more knowledgeable teachers contribute significantly to that end, the public may be more likely to accept the professionalization of teaching (Devaney & Sykes, 1988).

Not all the research on teacher knowledge contributes to this picture of professionalized teaching. Although most of this work examines the application of pedagogical content knowledge, there have also been analyses of teachers’ knowledge of classroom management. Carter and Doyle (1987), for instance, describe teachers’ structures for organizing their classrooms. Some structures help teachers avoid disruptions, switch topics quickly to maintain student attention, and otherwise maintain the flow of classroom events. Others encourage teachers to challenge disruptive students rather than ignoring them or changing the flow of activity. The first structures are much more adaptive for maintaining a stream of instructional work than the second. This line of work suggests that the overwhelming imperative of classroom life is maintaining order and that teachers learn strategies of classroom management and presentation of lessons that facilitate that end. In fact, teachers may avoid the activities that facilitate deeper student understanding when they learn that such activities can be particularly disruptive.

**Values and commitment**

The organizational research on teaching is older than the cognitive. Most of this work is guided by theories of organizational behavior, a field that highlights the similarities among schools, universities, factories, and armies in order to develop general principles about how they work. Topics of interest include power, leadership, motivation, and structural arrangements (Boyan, 1988). Thus, whereas the cognitive research focuses on classroom particulars, the organizational research looks outside of education for general patterns. This generalizing nature has advantages and disadvantages. On the one hand, it can lead to solutions to problems that might not otherwise be considered. On the other hand, it can direct attention to solutions to nonproblems or to structural arrangements that better fit other situations.

Another important characteristic of the organizational research is that until recently, much of it was conducted in the service of administrators or at least to help them become more effective. The teacher variables of interest often include satisfaction, loyalty, and trust (Conley, 1991). Those characteristics make teachers more compliant and easier to work with but not necessarily more professional (because part of professionalism includes independence) or effective instructors.

Recently, however, some organizational researchers have begun to explore the characteristics of schools that facilitate or impede teachers’ efforts to act as professionals (Bacharach & Conley, 1989). One manifestation of this change is a shift from dependent variables, such as satisfaction to commitment. Although
this shift is not a complete solution, it is a distinct improvement. Commitment has been defined in many ways, including as internalized motivation, a partisan attachment to the goals and values of an organization, and the attachment of the personality system to social relations seen as self-expressive. A common theme in all these definitions is a psychological bond between the individual and the object of commitment, a bond that takes on special meaning and importance for that individual. The committed person should believe strongly in the goals or purposes associated with that object, be willing to exert considerable effort on its behalf, and desire to remain affiliated with it (Firestone, 1990).

Theoretically, commitment has two advantages over satisfaction. First, it is more stable, developing slowly but persisting (up to a point) through the bad times, whereas satisfaction diminishes swiftly. Second, satisfaction implies contentment with things as they are, whereas the committed individual should be open to improvements in line with the underlying values to which that person is attached (Firestone, 1990).

The effects of commitment must be understood in light of the market and demographic forces that hold people in teaching. As people become older, the costs of changing careers become high, even if the psychic bonds tying an individual to a line of work attenuate. Thus, especially as the teaching force continues to age, loss of commitment can have a substantial effect on teachers’ plans to leave teaching for another occupation but almost no effect on actual quitting behavior (Dworkin, 1987). As a result, many teachers feel trapped in their work and are no longer committed to providing the skill and effort they did earlier. This may be one reason for the repeated findings that teacher effectiveness peaks at about 5 years of experience and that almost a third of current teachers report that they would not choose the same occupation again (Dworkin, 1987; NEA, 1987; Rosenholtz, 1985).

Commitment is more closely tied to aspects of teachers’ work that are under their control. For instance, the attendance of committed teachers is higher than that of their less committed colleagues. Moreover, lack of commitment has been linked to teacher burnout. Burned-out teachers tend to be less sympathetic toward students, have a lower tolerance for frustration in the classroom, and feel exhausted and anxious. They also plan less for their future and develop fewer plans to improve the academic quality of instruction. In line with thinking about professionalism, they are also less likely than their more committed colleagues to challenge authority when they experience rules that constrain them from teaching in ways they see as effective (Farber, 1984; Rosenholtz, 1989).

Because organizational research typically focused on teacher behavior and orientations rather than the ultimate outcomes of student learning, and because attention to commitment is relatively new, there are not many studies linking it to student learning. However, the available evidence is suggestive. In Tennessee, Rosenholtz (1989) found that teacher commitment contributed to gains in elementary student achievement. In a better controlled study, Kushman (1992) also found significant associations between commitment and academic achievement.
One problem with this line of research is that it is not always clear to what teachers are committed. Their work commitments can compete with those unrelated to work. They can also become attached more to some parts of their work than others; hence the common observation that high school teachers become especially committed to their subjects, whereas elementary teachers are more committed to their students. Most research has been about undifferentiated commitment to teaching. A few more fine-grained studies are beginning to explore the variety of teacher commitments and their consequences. Firestone and Rosenblum (1988) found that high school teachers could be committed to any combination of their place of employment, their students, or their subject matter, suggesting that the nature of those commitments shape the educational experiences students have. Other researchers have found different organizational correlates for teachers’ sense of personal efficacy, community, and expectations for students (Louis, 1991; Newmann, Rutter, & Smith, 1989).

Although most of this research links particular commitments to teaching outcomes, Conley points out that teachers operate in an organizational context. This context may appropriately constrain (although not necessarily dictate) teachers’ educational commitments. Moreover, some of those commitments should be to their school and colleagues, because these will affect the quality of their instructional work. Such commitments also reflect the larger social responsibility of the professional (Conley, 1988).

This examination of microcommitments is important for three reasons. First, this more differentiated analysis parallels the treatment of values in discussions of professionalism. Generic commitment to teaching might not be all that different from satisfaction as a facilitator of managerial work because it contributes to a hard-working (if not always compliant) staff. Yet, the observation that professionals are committed to specific values—for example, the welfare of students—suggests the need for both normative analysis, to clarify what teachers’ commitments should be, and empirical analysis, to find out what they actually are.

Second, the focus on microcommitments is similar to the cognitive research on teaching, with its fine-grained analysis of kinds of teacher knowledge. Moreover, the distinction between knowledge and values breaks down at times, especially in areas like education, where disagreement about purposes is high. Even when knowledge and values are analytically distinct, they may vary together. Thus teachers with a deeper knowledge about their children’s mathematical skills also have a previous belief in the value of cognitively oriented instruction. That is, their attitude is that children construct their own mathematical knowledge, that instruction should help children develop their knowledge, that ideas should be sequenced according to what children already know, and that skill instruction should not be separated from problem solving (Peterson et al., 1991).

Finally, there is more evidence about the relationships between these microcommitments and student learning than there is about the effects of generic commitment. For instance, teachers’ sense of efficacy and expectations for
students are associated with conventional measures of student achievement, and teachers’ beliefs in cognitively oriented instruction are associated with learning more complex mathematical skills (Ashton & Webb, 1986; Peterson et al., 1991). Thus, although organizational researchers have not attended as carefully to what teachers know and think as the cognitive researchers, the focus on microcommitments provides an opportunity to join these two research agendas.

Recommendations for reform

The research on teachers’ knowledge and thinking has been used primarily to address problems of preparation and accreditation. This research suggests ways to rethink the content, methods, and policies of teacher education. Some suggestions do not change the form of preparation, but they do lead to ways to more effectively help prospective teachers develop their own structures for teaching and make the connections between those structures and application situations. Other changes, such as professional development schools that bring the classroom training of prospective teachers closer to a hands-on experience, should substantially facilitate beginners’ efforts to actively construct their approaches to teaching using existing knowledge as a guide (Floden & Klinzing, 1990; The Holmes Group, 1990).

The other development is in new forms of testing. These move away from past practice, which stressed either multiple choice tests or in-class observation of generic dimensions of teaching that do not take either students or subject matter into account. Instead, a variety of simulations are being suggested that force those tested to address problems more like those in real teaching situations and to articulate not only a solution but also the process of deriving that solution. Teachers must represent the structures with which they work and demonstrate the ability to make connections among those structures using materials closely related to real teaching situations. Such tests are likely to be part of a program for advanced or board certification of teachers, if not initial licensing (Haertel, 1991; Peterson & Comeaux, 1989).

If appropriately designed and implemented, improved teacher preparation and more rigorous entry and licensure requirements can be an important part of any effort to professionalize teaching. Such requirements model more established professions, so they should help to legitimate the occupation. At the same time, they are likely to ensure that the teaching force of the future is more knowledgeable in ways directly relevant to educational practice (Darling-Hammond, 1984). Nevertheless, by themselves they are not likely to make a great difference, if only because most teachers are old teachers. The proportion of teachers with less than 5 years of experience has fallen from 32% in 1966 to 10% in 1986 (NEA, 1987). Thus, even in times of expansion, change by regeneration progresses very slowly. Experienced teachers will establish the normative climate into which new recruits arrive. Past experiments at educational reform by bringing in cadres of fresh faces have not worked well (Corwin, 1973). Moreover, because
beginners can more easily leave teaching than those with more experience, many of those who have experienced new forms of training and passed new accreditation tests are likely to depart. In fact, the best, the brightest, and the most effective are likely to be among those who leave education most quickly under the current circumstances (Vance & Schlecty, 1982).

Thus a comprehensive effort to professionalize teaching will have to reform existing schools to both create a more conducive context for new cohorts of better trained teachers and to increase the knowledge and change the commitments of those already present. In fact, a number of proposals to reorganize teaching have been made over the last decade. Most attempt to increase teachers’ participation in educational decision making, their collegial interaction, or both. There are good reasons to believe that these kinds of changes will improve teachers’ commitment and either enhance their knowledge or allow them to use it better. However, the basic ideas of participation and collegiality also have important flaws that must be addressed.

**Participatory reforms**

The traditional distribution of influence in schools gives teachers substantial autonomy in the classroom but limited input to decisions made at the school or district level. The image of a profession as a self-regulating body of experts suggests that giving teachers more influence will substantially improve the quality of education (Carnegie Forum, 1986; Conley, 1991). Proposed changes in governance give teachers more influence over out-of-class decisions affecting such issues as curriculum, budget, and personnel. They go beyond past practices of delegating some decisions to departments or creating ad hoc committees.

One of the most popular approaches to increasing teacher participation is site-based management, where many decisions previously made at the district level are delegated to the school. When these decisions are not monopolized by the principal but made by a committee including the principal, teachers, and perhaps students and/or parents, and when the authority of teachers within such a committee is high, teachers become more empowered. There have been numerous studies of this phenomenon in the last few years (e.g., Carnoy & McDonnell, 1987; Weiss & Cambone, 1994; Wohlstetter et al., 1994). Although there have been fewer studies of such cases, teachers can also influence district decisions through district-established procedures or those negotiated with a union.

Empirically, teachers experience a lack of participation—especially with such issues as curriculum, grading, discipline policy, and reporting procedures—as a deficit, and that deficit has been linked to reduced commitment (Bacharach, Bamberger, Conley, & Bauer, 1990). Participation can contribute to commitment in a number of ways. When teachers have genuine in uence over a decision, their sense of autonomy increases, and they are likely to take more responsibility for that decision. The process leading up to the decision helps teachers understand the rationale behind it, so their purposes and those of
administrators become better aligned. The course of action thus becomes more meaningful to teachers. Moreover, by providing information about how decisions fit with existing practices and potential barriers to new courses of action, teachers increase the fit with the current context and the likelihood that necessary resources are provided. Thus the decision becomes more realistic and feasible. In effect, participation has the social psychological effect of increasing teachers’ ownership of the decision while allowing them to use their knowledge in another context. Teachers’ substantive input combined with the knowledge they bring permits a technically better outcome that should enhance their work (Firestone & Pennell, 1993). Whether participation has the effects expected will depend in part on the nature of the decision (e.g., classroom, school, or district) and the particular microcommitments of interest. That is, certain participation experiences will affect some commitments but not others.

**Rank differentiation and collegiality**

A second set of reforms introduces rank differentiation to teaching. Included are career ladders and mentor teacher programs. The career ladder proposal of The Holmes Group and Carnegie Commission called for three ranks: novice, professional, and lead teachers. Novices would have reduced responsibility and receive extensive support and assistance from lead teachers. Professional teachers would operate much like most teachers today. Lead teachers would continue to teach but also take responsibility for mentoring novices, training and coaching all staff, developing curriculum, devising testing and measurement systems, conducting action research, and even contributing to building management (Sedlak, 1987).

Although the term career ladder became quite popular and was adopted by several states, few systems encompass the differentiation of rank, remuneration, and responsibility encompassed by the original proposals. Some are little more than merit pay under a different label. Others, such as Utah’s and Arizona’s, allow for real role differentiation so that teachers can interact with and offer support or assistance to colleagues. These programs are particularly difficult to describe because they allow for local program development so that important rewards, selection criteria, and role responsibilities vary from district to district (Brandt, 1990).

Mentor programs through which experienced teachers offer advice or assistance to beginners also permit such interaction and support. California’s program paid mentors $4,000 a year for special projects that were expected to feature giving help to new teachers. Connecticut’s system offered more structure, in that mentors were expected to help teachers prepare to pass 15 competency criteria required for certification. Like career ladders, these programs include differentiation of ranks and build interaction among teachers, but the emphasis on helping beginners and the limited responsibility of mentors often makes them more palatable to regular teachers (Little, 1990a).
These programs are expected to have a number of benefits. By staging teachers’ careers, they presumably provide incentives for continued professional development through the life cycle. Some career ladders offer the opportunity for increased participation for teachers with higher ranks. However, the focus of attention here is on the attempt to increase interaction and collegiality among teachers. Traditionally, teachers are isolated in their classrooms. They spend much more time talking to students than to colleagues; occupational norms reinforce organizationally enforced privacy. Whatever talk goes on among teachers tends to be social rather than discussion of the craft of teaching. This isolation limits professional group control; colleagues cannot monitor and enforce standards when they do not know what others are doing. In addition, it is difficult to develop a common professional language or conceptual base without sharing (Darling-Hammond, 1989; Little, 1990b).

It has been argued that more collegial interaction among teachers around issues of teaching should make teachers more knowledgeable and effective. In principle, collaborative action could range from the casual swapping of stories through providing advice and sharing materials to joint work where some aspects of actual instruction are done together. The latter could include team teaching with more than one teacher in the same classroom, but it could also include certain forms of communal planning and curriculum development. Advice giving and sharing can occur spontaneously where a school culture promotes interaction, but formal mentor-teacher and career ladder programs should enhance such interaction (Little, 1990b).

Collegial interaction significantly facilitates program implementation. It helps teachers better understand what is expected of them and how to accomplish it (Fullan, 1991). More generally, at least through informal advice giving and sharing, collegiality is indirectly related to both teacher commitment and student learning. When a school’s staff has common goals, sharing increases teachers’ opportunities to enhance their knowledge by learning from each other. Increased learning opportunities for teachers are associated with both increased student achievement and teacher commitment. The arguments here are fairly complex and especially interesting because they link knowledge and commitment. To simplify, collaboration can provide an opportunity for teachers to learn from each other. As a result, their knowledge increases so they are better prepared to face the challenges of teaching. This preparation pays off directly in increased student learning. Where teachers get feedback to this effect (and feedback from their peers about their own competence), they become more committed to their work (Newmann, Rutter, & Smith, 1989; Rosenholtz, 1989; Shulman, 1989).

**Problems with the proposals**

Studies and evaluations of these changes are beginning to appear; as often happens, ideas that appeared extremely promising in embryo turn out to have problems in practice. Some of these problems come from the different cultures of
adapting new ideas to current practice. For instance, efforts to promote collegiality run up against strong norms of privacy and equality among teachers. To offer advice is often viewed as putting oneself above others, whereas asking for advice is seen as a sign of weakness. Sharing practice information creates the risk of becoming indebted to or criticized by others who are more skillful or simply have different definitions of good teaching (Little, 1990b).

The heavy emphasis on differences of rank in programs that build collegiality add to the problem. Where special positions are distributed by administrators, there is a tendency to hoard ideas to compete more effectively for scarce rewards. Then the selection process actually works against collegiality. Where teachers play a major role in selection, they may use their power to chastise those who appear more ambitious than others by giving them low evaluations. Even after positions are obtained, teachers who have not taken on additional responsibilities may ridicule those who have as rate busters (Firestone & Bader, 1992; Rosenholtz, 1987).

Participation is also problematic. In spite of rhetoric about increasing teacher influence not reducing that of administrators, many view increased authority of formal subordinates as a threat. Even those who do not may fail to understand the implications of true sharing of influence; hence the apocryphal story about the superintendent who says “we are going to have site-based management, and we are going to do it my way.” Teachers may become embittered when opportunities to make decisions they thought were offered do not materialize. Even when opportunities to share influence prove genuine, the time involved often proves substantial. School- and district-level decision making competes with classroom demands, so teachers either become exhausted or let something slip. Moreover, when site-based management is mandated, teachers often find that the threats to existing relationships with administrators outweigh anticipated gains (Corbett, Dawson, & Firestone, 1984; Firestone & Bader, 1992).

Little (1990b) raises an even more fundamental problem when she asks,

Bluntly put, do we have in teachers’ collaborative work the creative development of well-informed choices or the mutual reinforcement of poorly informed habit? Does teachers’ time together advance the understanding and imagination they bring to their work or do teachers merely confirm one another in present practice?

(p. 525)

There is considerable evidence that most teachers do not know how to teach in the way suggested by research on cognitive science and teacher thinking. Moreover, the commitments that must go with that knowledge may also be absent in many instances. This becomes apparent from studies of the knowledge and norms of teachers. In many cases, much of that knowledge is tacit, unarticulated. Teachers often cannot represent what they know, nor can they reflect on the conditions under which particular strategies or tactics are most appropriate.
In some cases, norms of discourse actively prohibit reference to theory or any experience outside the classroom (Hargreaves, 1984; Little, 1990b).

Moreover, the typical pattern of educational practice is quite different from that recommended by cognitive scientists. Cuban (1984) describes a pattern of teacher-dominated classrooms that features whole-group instruction, teacher monopolization of classroom talk, reduced student movement, and the prevalence of worksheets and short exercises, a pattern that has persisted with only minor variations since before the turn of the century. Within this pattern, teachers appear to emphasize getting the right answer. They do not need to know much about how students do so and may not be able to model more complex cognitive capacities. This pattern is robust. It persists in spite of several previous aggressive efforts to propagate educational approaches similar to those advocated by researchers on teacher thinking (Cuban, 1984).

At the high school level, teacher-centered instruction frequently takes the form of a bargain or treaty between teachers and students. In this bargain, teachers reduce the intellectual demands they make on students in return for more pleasant social relations and a more orderly classroom. Often, teachers and students agree to engage in learning of ritualistic school knowledge that is not particularly relevant to the world around them, but is safer or easier for all concerned. Although this pattern may be more obvious in urban schools, it appears in schools teaching students of all races and classes (McNeil, 1988; Powell, Farrar, & Cohen, 1985; Sedlak, Wheeler, Pullin, & Cusick, 1986).

There are several possible explanations for the patterns noted here. First, insofar as teachers teach the way they were taught as students, they simply lack familiarity with alternative approaches and are unable to execute them. Careful observation of efforts to implement more cognitively demanding approaches to instruction through both local restructuring and state policy reveal that teachers who think they are implementing new approaches substantially misunderstand what is expected of them and how to achieve those ends. Their knowledge of how to teach and definitions of appropriate teaching behavior are thoroughly at odds with these changes (Educational Evaluation and Policy Analysis [EEPA], 1990; McCarthey & Peterson, 1991).

Second, teacher-centered instruction and bargains may be a functional response to current organizational arrangements. Teachers must both maintain order and help students learn the curriculum. The prevailing system of age grading, self-contained classrooms, class sizes of over 25, and methods of accountability for student learning may create an imbalance in favor of maintaining order. Cognitively based, active instruction can be extremely difficult under these conditions; it may require more energy than most teachers are willing to commit, create too many problems, and offer too few rewards. Thus, many teachers may give order precedence over learning, not because of ignorance but because of a combination of physical constraints, their own values, and the values of those around them (Carter & Doyle, 1987; Cuban, 1984).

Beyond the typical schools are those most often found in urban settings,
where a combination of lack of administrative support and feedback from stu-
dents create times when, as one teacher explains, “you think you’re really
cooking and [students] say, ‘can I go to the bathroom?’ When you look into
their eyes and you can see clear out of the backs of their heads” (Firestone &
Rosenblum, 1988, p. 285; see also Metz, 1986). In these situations, teachers
become extremely alienated. To preserve their professional self-respect, some
teachers blame poor performance entirely on students and administrators and
refuse to take any responsibility for the results of their work. In fact, there may
be reason for some of these teacher views; Anyon (1994) graphically describes
the absurdity of focusing on professional development in dysfunctional urban
schools in dysfunctional neighborhoods, where just getting through the day
becomes a major challenge. Under these conditions of extreme disorder and
alienation, it may be futile to think about complex modes of teacher thinking or
active forms of student learning until more fundamental problems are solved.

Most teachers’ knowledge and values differ substantially from those congru-
ent with approaches to teaching that reinforce higher-order thinking, but what
teachers know and believe may be quite functional for the current way that
schools are organized. These circumstances limit the benefits to be expected
from both participation and collegiality. When teachers do not understand
alternative models of teaching, they will not use greater influence to create con-
ditions that support those models. As an example, effective schools programs
begun in the early 1980s often used a team of teachers and the principal to plan
improvements. In a substantial number of programs, the focus of these group
deliberations was on improving discipline and the physical plant. It was difficult
to get them to address issues more directly related to curriculum and
instruction.¹

Nor will collegial interaction allow teachers to share knowledge they do not
have. The knowledge that Rosenholtz’s collegial teachers shared among them-
selves frequently consisted of particular techniques to teach a specific concept or
work with one individual within the existing framework of educational practice
and goals. In a recent case study of a career ladder that successfully increased
both collegial interaction and teacher influence within the district, a great deal of
effort went into developing new curriculum. Examination of the products that
resulted from that work show serious efforts to improve teaching, but within the
currently typical model of instruction. Typical improvements included a new
Advanced Placement course, special programs for at-risk youth, and modifica-
tions of the way elementary art and music were taught. Although classroom
observations were not conducted, there was little reason to believe that major
changes took place (Firestone & Bader, 1992; Rosenholtz, 1989).

Toward a more comprehensive agenda

Research on teacher cognition suggests that professionalized teachers use understandings that are not now typical, to teach in ways that are not currently preva-
ent, to help students construct knowledge that is deeper and more interconnected than is now usually the case. Organizational reforms such as participation and collegiality can facilitate this professionalizing agenda. Such changes have motivational value; they help teachers share what they know; and they help ensure that teachers will operate in situations that facilitate their instructional efforts. These reforms help teachers reach their current images of appropriate pedagogical practice and even bring about new images of practice. They are secondary to changing how teachers teach, but they remain crucial. That is, changing organizational arrangements without helping teachers to become more knowledgeable is not likely to lead to great change. Yet, teachers are not likely to become more knowledgeable without the motivation to do so.

**Teachers’ knowledge and commitments**

A minority of teachers are probably already committed to facilitating the active learning advocated by cognitive science, which builds from what students already know. To most teachers, however, these ideas are likely to be foreign. These ideas were not part of how these teachers were taught as students or what they learned in college or graduate school. Three changes in their knowledge and commitments are especially crucial.

- Teachers will need different images of the good student. It is not enough for students to be cooperative and produce the right answers. They must become self-motivated learners who are curious and able to regulate their own learning. They will be more active (and noisy) than current students and more likely to challenge revealed authority if only to understand the evidence and reasoning behind conventional knowledge.

- Teachers will have to know more about teaching the curriculum. In many cases, they will need a better grasp of the content they teach in order to address topics adequately. They will have to understand how students learn what they teach and how to diagnose students’ existing comprehension structures. They will also need the pedagogical content knowledge to bridge the gap between the curriculum to be taught and students’ current knowledge (Shulman, 1987; Wilson et al., 1987).

- Teachers must understand approaches to classroom management that facilitate students’ active involvement in new learning experiences and are still orderly enough to allow groups to operate in limited space (Carter & Doyle, 1987).

Because these ideas are not yet widely accepted among teachers, they will have to come from the outside. Most teachers are not well-placed to learn about these ideas or share them with others. Administrators and district staff, who have better access to such knowledge, will have to play a major role. Where they are present, lead teachers may also contribute. If these ideas are to catch hold with
more than a minority of teachers, it will be necessary to turn to some of the large-scale staff development approaches that have been developed for upgrading the knowledge of whole schools. Most of these model with teachers the kind of active learning that is suggested for students. These include the Gheens Academy in Louisville, Kentucky, and the Schenley High School in Pittsburgh, Pennsylvania, where large numbers of teachers have had access to new learning opportunities. Professional development schools will also be important insofar as they include in-service for current teachers as well as contributions to preservice preparation (The Holmes Group, 1990; Wallace, Young, Johnston, LeMahieu, & Bickell, 1984). State-supported professional development networks, such as the California Subject Matter Projects may also prove important (Lieberman & McLaughlin, 1992).

One dilemma to be faced here is that it is important for all teachers to be introduced to these ideas. However, these ideas cannot be mandated because of what we know about the importance of both teacher participation and autonomy and the need for active learning. If these ideas are to be widespread, it is important for district administrators to indicate that the ideas have top priority through (a) their own involvement in professional development activities (as both participants and facilitator); (b) the allocation of resources to the task; and (c) the creation of opportunities for teachers to discuss what they are learning and to act and reflect on their efforts (Corbett & Wilson, 1992).

Organizational arrangements

Two sets of organizational arrangements will have to be addressed: those that constrain teachers’ opportunities to use their knowledge to promote active student learning and those that undermine their commitment. Teachers may know correctly that active learning is extremely difficult in egg-crate schools where individual teachers work with classes of 25 to 35 students grouped by age and often by ability. The high school practice of moving students among courses every 45 to 55 minutes adds even further constraints. Elmore (1991) suggests that changing teaching practice will require modification in four regularities of schools: how students are grouped for instruction, how teachers’ work is defined with respect to groups of students, how content is allocated to time, and how students are assessed. He suggests that these regularities are like a genetic code that makes schools recognizable and constrains how the activities of teachers and students can be organized. Only certain approaches to teaching are possible within specific arrangements, and some of those will be easier than others. Thus, an elementary teacher can use activity centers in a regular classroom, but it is extremely difficult (Elmore, 1991).

One difficulty for reformers is that when one moves away from the conventional structure, it is not clear what range of options exists, and whether some more effectively promote active learning and flexible teaching for higher-order thinking than others. It does appear that teachers trying to adopt these ideas find
constraining the current age-grade grouping structure, the division of content into discrete topic areas, and—especially where the stakes are high—conventional approaches to assessment. Some efforts to restructure schools around the country are experimenting with more flexible grouping arrangements, but it will be some time before we know a great deal about which ones are preferable. At this point, the experimentation itself is important and should be expanded.

More is known about the factors that affect teacher commitment, an important issue if—as it appears—these new approaches to teaching require educators to work consistently harder. To simplify a great deal of literature, these factors can be divided into those that will require more money and those that can be provided by administrators within existing parameters. The financial issues include time, salary, and materials. The absence of free periods for teachers is a recurring barrier to staff development, as are the implementation of new practices and teacher participation in decision making. Buying teacher time can facilitate these activities. Moreover, new approaches to active learning are likely to require more than current levels of teacher planning and preparation. Right now the amount of time devoted to planning varies greatly from teacher to teacher (Corcoran, 1990; Firestone & Bader, 1992; Hansen & Corcoran, 1989; McLaughlin, Talbert, & Bascia, 1990).

Salary is intimately related to professionalization. One reason teachers want to become professional is to increase their salaries. Salaries also help the field retain the knowledgeable people needed to professionalize it. Low salaries are an important reason why teachers leave the occupation, and higher salaries contribute to the retention of the more academically talented teachers needed to implement these new instructional strategies. Treating time separately from salary raises questions about whether it is more effective to buy more time for teachers to increase their income or to raise their salary with the expectation that their working year and day will be routinely longer than that of students. However one addresses the issue, it is clear that teachers work fewer days and hours per year than most professionals. It is reasonable to link increased salary to the expectation that teachers put in more time. Finally, especially in urban schools, the absence of necessary books and materials can be a significant impediment to teaching (Corcoran, 1990).

Administrative contributions come through maintaining an orderly environment, providing additional support, and respecting teachers. Generally, teachers expect teachers to maintain an orderly environment in a building so they can concentrate on their own teaching (Firestone & Rosenblum, 1988). The meaning of order in a school where students’ active construction of knowledge is the norm has not yet been fully worked out. Although it probably does not mean empty hallways (students may have to move into hallways to work on projects), silent classrooms, and students always under direct teacher supervision, it certainly does not mean a setting where students or adults feel unsafe. Given the typical space use of most American schools, there will also have to be some adjustment so that various groups of active learners do not disrupt each others’
work. Administrators are likely to be involved in negotiating the new meaning of order in schools characterized by active learning. The major responsibility for maintaining an environment conducive to learning in the public spaces between classrooms is likely to fall to administrators.

Teachers also expect that administrators will support them by trouble shooting on special problems and protecting them from bureaucratic and parental interference. Finally, teachers are often discouraged by what they see as a lack of respect that is apparent in informal interactions with administrators, isolation from those administrators, and failure to recognize (even informally) good performance (Corcoran, 1990, Firestone & Rosenblum, 1988; Louis, 1991).

Conclusions and questions

The image of the professional teacher that is developing through the cognitive and organizational research on teaching is of an individual who is committed to helping all children understand more challenging content. To meet this objective, professional teachers must be more knowledgeable about their subjects and their students and about how to make the connection between the former and the latter. A substantial body of research is helping to clarify what this knowledge is, but that work could be expanded by considering as well the microcommitments of expert teachers. It is already becoming clear that knowledgeable teachers will use approaches that move away from the adult-centered pedagogy that dominates American schools today; such approaches may require substantially more effort than the bargains that many teachers now strike with their students.

Recommendations to make schools more professional workplaces by increasing teacher collegial interaction and participation in decision making are important, but they only address part of the agenda for professionalizing teaching. These recommendations make inadequate assumptions about teachers' present knowledge and only address relationships among adults, not those between teachers and children.

A more complete agenda will include several additional elements. Provision must be made to improve the training, recruitment, and selection of new teachers, an issue to which much attention is currently being given. More attention, however, must be given to upgrading the knowledge and changing the commitments of current teachers. In addition, it is necessary to attend to the regularities of schooling that affect the joint assignment of teachers, students, and content and the assessment of student progress. Finally, it is important to address some more mundane aspects of school organization having to do with time for planning and interaction, salaries, material, discipline, support, and respect for teachers.

Juxtaposition of the cognitive and organizational literature raises a number of theoretical and practical issues. Perhaps the big theoretical question is how to synthesize these two literatures into a more coherent theory of schooling and
school administration. The premise that organizational technology should determine organizational design suggests that a major effort is needed to deduce principles of school structure and operation from new research on student learning; the cognitive literature should be in the driver’s seat. Rowan (1990, 1995) has taken important steps in trying to link these literatures, and too few are following his lead. Nonetheless, there are likely to be a number of problems with a simplistic cognitive-technological determinism. For instance, in people-processing organizations such as schools, technologies are socially constructed and therefore malleable. Although cognitive approaches dominate thinking about teaching for the moment, there is a strong body of process-product research suggesting a rather different approach to instruction from what comes out of cognitive science research and constructivism (see Rosenshine, 1983). As far as I can tell, the process-product research was never “disproven;” it seems to have gone out of style for esthetic and normative reasons that to my knowledge have not been clarified. Thus the selection of a theory of instruction to guide organizational design is problematic and should not be made casually although the intellectual winds are clearly blowing toward constructivism and active learning at the moment.  

Moreover, instructional strategy and organizational structure may turn out to be loosely coupled, in that organizational form may not clearly preclude or facilitate certain approaches to teaching and learning. Observers of current restructuring efforts seem to disagree as to whether the current way of organizing schools really precludes significant instructional change (compare Prestine & Bowen, 1993, with Peterson, McCarthey, & Elmore, in press). Moreover, the technology problem of schools is more than cognitive; there are also motivational dimensions. My discussion of teacher commitment raises the problem of obtaining the cooperation of staff; the more challenging problem may be getting student concurrence. Although there are indications that more active approaches to student learning are more intrinsically motivating than teacher-centered instruction, it remains to be seen what range of students will take to these new approaches. 

In addition, classical analyses of organizational structure suggest that it mediates between technology and environment. If, as Thompson (1967) suggests, organizations buffer their technologies from an uncertain environment, structures will have to reflect these external uncertainties. In institutionalized sectors such as education, organizational forms are likely to be adopted as much for their cultural and political relevance as for their technological rationality (Powell & DiMaggio, 1991). Thus the task of combining cognitive research with organizational studies to rethink how schools should be redesigned is extremely challenging. 

At a more practical level, this analysis raises questions about the contribution of administrators to the professionalization of teachers. As schools and districts are presently constituted, it is clear that administrators can play a major role by arranging for and emphasizing the importance of appropriate staff development,
obtaining resources, and supporting teachers in a variety of ways. On the other hand, schools and districts now assume a hierarchical relationship between teachers and administrators that is not easily reconciled with professional status for the former. In particular, many administrators feel threatened by efforts to expand teachers’ influence through greater participation.

In fact, there are two important questions about administrators. First, what should be the division of labor in schools designed to facilitate knowledgeable professional teachers—how should present administrative functions be assigned? Because structure should follow in large part from technology (Mintzberg, 1983), the current arrangement is likely to change. Second, how can administrators help schools and districts move from the present configuration to one more conducive to professional teaching, and what will motivate them to do so?

Although these and a number of other questions need to be addressed, it is fairly clear that attending to the knowledge base of teachers without considering organizational arrangements is likely to lead to a situation where new ideas are only adopted by a minority of practitioners and are weakly institutionalized. However, changing organizational arrangements without a clear sense of what teaching and learning should be like can lead to goal displacement, where these arrangements become ends in themselves and do not contribute to the educational outcomes they are expected to produce. An adequate program to professionalize teaching must address both sides of the coin.

Notes

* Thanks are due to Sharon Conley, Susan Fuhrman, and Hermine Marshall, who offered useful feedback on an earlier draft, and to Nona Prestine for her encouragement. This study is being conducted under a grant furnished by the Department of Education, Office of Educational Research and Improvement, Grant No. R117G1007. Research reports are issued by the Consortium for Policy Research in Education (CPRE) to facilitate the exchange of ideas among policymakers and researchers who share an interest in education policy. The views expressed in the reports are those of individual authors and are not necessarily shared by the U.S. Department of Education, CPRE, or its institutional partners.

1 For the description of effective schools programs, I draw upon private conversations with Thomas Corcoran, former director of the Research for Better Schools program, and Matthew Miles, who did a national survey of such programs.

2 I do not have normative problems with this constructivist revolution. I find both the vision of what students should learn and the ideas of instructional processes embedded in it very attractive. I do, however, question the process by which the current cognitive view of student learning and teaching work has taken the field.

A CENTURY’S QUEST TO UNDERSTAND SCHOOL LEADERSHIP

Kenneth Leithwood and Daniel L. Duke

Educational administration scholars have devoted considerable time over this century trying to understand school leadership and leaders. They have done so for several reasons. Some assumed that a concept of leadership would be of assistance to them in describing the behavior of individuals in the roles of leaders. Others apparently were prompted to conceptualize leadership in ways that could help explain school outcomes or effects. Still others seemed intent on developing concepts of leadership for such prescriptive purposes as guiding the preparation of future administrators or the further education of incumbent administrators.

This chapter explores two major sources of insight about school leadership. Concepts of leadership found in the educational literature are the first source of insight. In order to facilitate the empirical study of schools as organizations, school leaders, and school effects, a number of scholars have tried either to conceptualize leadership in general and school leadership in particular or they have endorsed an already existing concept of leadership. To appreciate work of this kind, the next section of this chapter describes the results of a review of all articles dealing with leadership in four major educational administration journals over approximately the past decade. These results suggest that six major categories of leadership dominate contemporary writing about school leadership.

A second major source of insight about school leadership, explored in the third section of this chapter, is the historical and theoretical sources to which alternative conceptions of school leadership appeal for their authority. These sources—tradition, religion, and fields of inquiry such as psychology, sociology, social psychology, and philosophy—help to explain why each leadership concept at some point during the century has had a dominant influence on both the understanding and practice of school leaders. They also explain why that dominance eventually was overshadowed by an alternative. Educational leaders
have both changed and expanded the number of such sources as the century unfolded in response to changing social forces impinging on schools.

It is important to be clear at the outset that what has been learned about leadership in schools over the century has not depended on any clear, agreed-upon definition of the concept, as essential as this would seem at first glance. Indeed, Yukl argues that:

It is neither feasible nor desirable at this point in the development of the discipline to attempt to resolve the controversies over the appropriate definition of leadership. Like all constructs in social sciences, the definition of leadership is arbitrary and very subjective. Some definitions are more useful than others, but there is no correct definition.

(1994, p. 4–5)

This observation, echoed by other respected students of leadership (Bennis, 1959; Burns, 1978; Bass, 1981), might be viewed as casting a pall over the central purpose of this chapter. Clark and Clark, for example, argue that you cannot talk about leaders with anyone until you agree on what you are talking about. That requires a definition of leadership and a criterion for leadership acts that can be agreed on (1990, p. 20). In the same vein, Rost begins his analysis of leadership and leadership literature in non-school organizations by arguing that lack of attention to definition has been one of the main impediments to progress in the field. Indeed, he notes that over 60 percent of the authors who have written on leadership since about 1910 did not define leadership in their works (1991, p. 6).

One wonders how so many smart people could have overlooked such an obvious issue. Or did they? More likely, we think, they were at least in implicit agreement with Lofti Zadeh, the father of fuzzy logic, who framed the Law of Incompatibility: As complexity rises, precise statements lose meaning and meaningful statements lose precision (McNeil & Frieberger, 1993, p. 43). As these authors go on to point out, the Law of Incompatibility captures a feature common to most complex disciplines, that is, they teem with complex concepts. Responding to worries over the lack of precision in defining the meaning of strategic management, for example, Thomas and Pruett (1993) ask: “how much more precise are economists when they discuss ‘innovation’ or ‘regulation,’ or psychologists when they talk about ‘intelligence’?” Whereas simple concepts are typically open to crisp definition, complex concepts are usually defined vaguely. Persevering on the development of a precise definition of a complex concept like leadership is likely to be counterproductive, following this line of reasoning.

Although Yukl pointed to lack of consensus about the precise meaning of leadership, he did discern a core of agreement across definitions very similar to what Bass (1981) detected a decade earlier. “Most definitions of leadership,” Yukl claimed, “reflect the assumption that it involves a social influence process whereby intentional influence is exerted by one person [or group] over other people [or groups] to structure the activities and relationships in a group or
organization” (1994, p 3). In uence then seems to be a necessary part of most conceptions of leadership. It suggests, as Yukl does, that most of the variation in leadership concepts, types, or models might be accounted for by differences in who exerts in uence, how in uence is exerted, the purpose for the exercise of in uence, and its outcomes. In the conclusion to this chapter, we begin to develop a relational conception leadership by identifying the “elements” potentially interacting to generate in uence and the different types of in uence that may be generated.

**Models of contemporary leadership practice**

Six distinctly different models or approaches to leadership are described in this section. These models were identified through analyses of a representative sample of contemporary literature concerning leadership in schools, a sample intended to reflect the result of this century’s quest. The sample consisted of all feature length articles concerned with leadership published in four representative English-language educational administration journals. These journals were reviewed at least as far back as 1988, the year in which the *Handbook of Research in Educational Administration* (Boyan, 1988) was published. The chapter in that text by Immegart entitled “Leadership and Leader Behavior” provided a point of departure for the present chapter.

Two of the four journals selected for review in this section, *Educational Administration Quarterly* (EAQ), and the *Journal of School Leadership* (JSL), publish work largely from North America. Papers in the *Journal of Educational Administration* (JEA) reflect perspectives from Australia, New Zealand, and other countries, as well as North America. *Educational Management and Administration* (EMA) primarily reflects contemporary thought on leadership in the United Kingdom, but some other countries as well. Because of the reputations of each of these journals and the relatively broad theoretical perspectives they reflect collectively, it seems likely that most significant contemporary conceptions of leadership would find some expression in their contents.

Table 1 notes the total number of volumes reviewed in the case of each of the four journals and the total number of articles included in each volume. Approximately eight volumes were reviewed for each journal, several less in the case of JSL because it was not established until 1991, and several more in the case of EMA so as to balance the almost exclusively North American perspectives reflected in EAQ and JSL.

Table 1 also shows how many articles were concerned directly or indirectly with leadership and were therefore used as the basis for helping answer the questions of interest in this section of the chapter. These articles, totaling 121, were of several types, including descriptions of leadership theories, reviews of literature, empirical reports, and critical analyses.

Table 2 lists 20 different leadership models or concepts explicitly mentioned in the 121 articles (the category label “participative” was not explicitly

mentioned). We applied it as a category label to include “group,” “shared,” and “teacher,” leadership). Noted, as well, are the number of articles from each journal, and the total number of articles from all four journals mentioning each concept. Based on Table 2, the three most frequently mentioned conceptions (versus categories) of leadership over the past decade were instructional leadership (13 mentions), transformational leadership (11), and contingent/leadership styles (9). Instructional leadership appeared almost exclusively in the North American journals or in papers written by North Americans published in the non-North American journals. Although most often mentioned in North American journals, all four journals also contained papers about transformational leadership. Mention of leadership styles was distributed across the journals. The next most frequently mentioned leadership concepts were moral leadership (8), managerial leadership (8), and cultural leadership (6). The remaining 14 leadership concepts were found in five or fewer articles. Some articles explicitly

Note

¹ The number of articles listed for each “category” (such as transformational or moral) refers to the number of articles that explicitly used the category label. Subcategory citations are independent. For example, charismatic leadership was the explicit focus of one article (in EML) and this is in addition to the 11 articles explicitly concerned with transformational leadership, the superordinate leadership concept.
discussed as many as three or four such concepts (such as Cusack, 1993; Walker, 1989; and Gronn, 1996). This is why the number of mentions of leadership concepts exceeds the total number of articles reviewed.

In the case of 54 articles, the focus was on leadership but no attempt was made to label leadership or to conceptualize it as a particular form of leadership. Some of these articles supported multiple perspectives on leadership, while others treated leadership as a generally understood phenomenon without specific discussion of its meaning. There were also many instances in which an implicit leadership concept was evident, such as Hayes’ (1995) study of collaborative relationships (or “shared leadership”) in a British primary school, and Goldring’s (1990) examination of principals’ boundary spanning activities (or “organizational leadership”).

Finally, as is also evident in Table 2, each of the 20 separate leadership concepts has been assigned to one of six broad categories. These categories cluster together leadership concepts sharing the same primary focus and key assumptions. The remainder of this section describes the central focus and assumptions of each of these categories and summarizes what the review articles had to say about each. Where one was available, a relatively well-developed exemplar of each leadership category also is described as a means of further clarifying the features of each leadership category. The sources of these exemplars are not confined to articles included in the four journals.

**Instructional leadership**

This concept of leadership was mentioned in 13 of the 121 articles selected for review. Instructional leadership, a single, separate category, typically focuses on the behaviors of teachers as they engage in activities directly affecting the growth of students. Many versions of this form of leadership focus additionally on other organizational variables (such as school culture) that are believed to have important consequences for such teacher behavior. This has led Sheppard (1996) to distinguish between “narrow” and “broad” views of instructional leadership. Most conceptions of instructional leadership allocate authority and influence to formal administrative roles (usually the principal), assuming as well considerable influence through expert knowledge on the part of those occupying such roles.

Lack of explicit descriptions of instructional leadership (Foster, 1986) makes it difficult to assess the extent to which such leadership means the same thing to all those writing about it. Geltner and Shelton (1991) modified the term, referring to “strategic instructional leadership,” but offering no notion of what non-strategic instructional leadership might mean. Stallhammar (1994) used the term “pedagogical leadership.” Kleine-Kracht (1993) differentiated between “direct” and “indirect” instructional leadership, noting that principals alone cannot fulfill all of a school’s need for instructional leadership. Others argued that original beliefs concerning the principal as the primary or most important instructional
leader required rethinking. Davidson (1992), for example, argued for the value of teachers serving as instructional leaders, while Floden et al. (1988) focused on district-level instructional leadership. Achilles (1992) challenged the idea that instructional leadership (or any form of leadership for that matter) was necessarily a substitute for capable management.

Examples of extensively elaborated contemporary models of instructional leadership include Duke (1987), Smith & Andrews (1989), and Hallinger and his colleagues. In each case, this orientation to leadership is described along multiple dimensions, each of which incorporates a number of functions or behaviors, and evidence is reviewed concerning the effects of these practices on important outcomes. The most fully tested of these models, the one developed by Hallinger and his associates (Hallinger & Murphy, 1985; Hallinger & McCary, 1990, for example), consists of three broad categories of leadership practice: defining the school mission, managing the instructional program, and promoting school climate. Associated with these broad categories of practice are a total of 21 more specific functions (such as supervising instruction). Using a teacher survey developed by Hallinger (1992), considerable empirical evidence has accumulated in support of the contribution these leadership practices and functions add to student achievement as well as other types of outcomes (see Sheppard, 1996, for a review of this evidence).

**Transformational leadership**

In addition to writing that refers explicitly to transformational leadership (11 articles), included as part of this leadership category are writings about charismatic, visionary, cultural, and empowering concepts of leadership. Mentioned in a total of 24 articles, the focus of this category of leadership is on the commitments and capacities of organizational members. Higher levels of personal commitment to organizational goals and greater capacities for accomplishing those goals are assumed to result in extra effort and greater productivity. Authority and influence are not necessarily allocated to those occupying formal administrative positions, although much of the literature adopts their perspective. Rather, power is attributed by organization members to whomever is able to inspire their commitments to collective aspirations, and the desire for personal and collective mastery over the capacities needed to accomplish such aspirations.

In the literature reviewed for this study, the concept of transformational leadership was subject to varying interpretations. Kowalski and Oates (1993), for instance, accepted Burns’ (1978) original claim that transformational leadership represents the transcendence of self-interest by both leader and led. Dillard (1995, p. 560) preferred Bennis’ modified notion of “transformational leadership—the ability of a person to ‘reach the souls of others in a fashion which raises human consciousness, builds meanings, and inspires human intent that is the source of power.’ ” Leithwood (1994) used another modification of Burns, this one based on Bass’ (1985) two-factor theory in which transactional and
transformational leadership represent opposite ends of the leadership continuum. Bass maintained that the two actually can be complementary. Leithwood identified seven factors that make up transformational (and transactional) leadership. Hipp and Bredeson (1995), however, reduced the factors to five in their analysis of the relationship between leadership behaviors and teacher efficacy. Gronn (1996) noted the close relationship, in much current writing, between views of transformational and charismatic leadership, as well as the explicit omission of charisma from some current conceptions of transformational leadership.

The most fully developed model of transformational leadership in schools has been provided by Leithwood and his colleagues. This model conceptualizes such leadership along seven dimensions: building school vision, establishing school goals, providing intellectual stimulation, offering individualized support, modeling best practices and important organizational values, demonstrating high performance expectations, creating a productive school culture, and developing structures to foster participation in school decisions (Leithwood, 1994). Each dimension is associated with more specific leadership practices and the problem-solving processes used by transformational leaders has also been described (Leithwood, Steinbach, & Raun, 1993).

A recent review of empirical research on transformational school leadership offers modest amounts of evidence for the contributions of such leadership to student participation in school with a variety of psychological teacher states mediating student learning (such as professional commitment, job satisfaction), as well as organization-level effects such as organizational learning, and the development of productive school climate (Leithwood, Tomlinson & Genge, 1996).

Downton’s (1973) study of rebel leadership is often cited as the forerunner of systematic inquiry about transformational leadership in non-school organizations. However, charisma, often considered an integral part of transformational leadership, has substantially more distant origins, typically attributed to Max Weber’s (1947) efforts almost five decades ago. James McGregor Burns’ (1978) prize-winning book first drew widespread attention to the concept of transformational leadership. Based on a sweeping historical analysis, Burns argued that most understandings of leadership not only overemphasized the role of power but held a faulty view of power, as well. There were, he claimed, two essential aspects of power—motives or purposes and resources—each possessed not only by those exercising leadership but also by those experiencing it. The essence of leadership is to be found in relationships between motives, resources, leaders, and followers: “the most powerful in uences consist of deeply human relationships in which two or more persons engage with one another” (p. 11). Burns’ distinction between transactional and transformational types of leadership hinges on this appreciation of power-as-relationships.

In contrast to transformational leadership, transactional leadership occurs when one person takes initiative in making contact with others for the purpose of exchanging valued things (economic, political, or psychological “things,” for example). Each person in the exchange understands that she or he brings related
motives to the bargaining process and that these motives can be advanced by maintaining that process. But because of the nature of the motives at issue, those involved are not bound together in any continuing, mutual pursuit of higher purposes. With this form of leadership, motives or purposes may well be met using the existing resources of those involved in the exchange. Neither purposes nor resources are changed, however.

Transformational leadership entails not only a change in the purposes and resources of those involved in the leader-follower relationship, but an elevation of both—a change “for the better.” With respect to motives or purposes: “transforming leadership ultimately becomes moral in that it raises the level of human conduct and ethical aspiration of both leader and led, and thus has a transforming effect on both” (Burns, 1978, p. 20). This form of leadership, according to Burns’ view, also aims to enhance the resources of both leader and led by raising their levels of commitment to mutual purposes and by further developing their capacities for achieving those purposes.

Burns’ seminal work provided a solid conceptional footing on which to build the distinction between transactional and transformational types of leadership, and it also illustrated the meaning of these forms of leadership in many different contexts. Not to be found in this work, however, was a testable model of leadership practices or any empirical evidence of their effects. The prodigious efforts of Bass and his associates have responded to these limitations. Bass’ (1985) book *Leadership and Performance Beyond Expectations* provided an impressive compendium of survey research evidence about the effects of one model of transformational leadership. Among the most important features of this model are the dimensions of leadership practice it includes and the proposed relationships among these dimensions.

Referred to in more recent publications as the four I’s (Bass and Avolio, 1993, 1994), Bass and his colleagues consider transformational leadership to include idealized influence or charisma, inspirational motivation, intellectual stimulation, and individualized consideration. In addition to these dimensions of transformational leadership, three dimensions define the meaning of transactional leadership: contingent reward, management-by-exception, and a laissez-faire or a “hands off” form of leadership.

Whereas Burns considered transformational and transactional practices as opposite ends of the leadership continuum (essentially more and less effective forms of leadership), Bass offers a quite different conception, a “two-factor theory” of leadership; transactional and transformational forms of leadership, in his view, build on one another (Avolio & Bass, 1988; Waldman, Bass & Yammarino, 1990; Bass & Avolio, 1993; Howell & Avolio, 1991). Transactional practices foster ongoing work by attending to the basic needs of organizational members. Such practices do little to bring about changes in the organization, however. For this to occur, members must also experience transformational practices. Enhanced commitment and the extra effort usually required for change, it is claimed, are consequences of this experience.
Transactional practices were the traditional focus of attention for leadership theorists until the early 1980s. Disillusionment with the outcomes of that focus, however, gave rise to a number of alternative approaches, among them transformational leadership. These approaches are referred to collectively by Bryman (1992), Sims and Lorenzi (1992), and others as the “new leadership paradigm.” Empirical studies of transformational leadership, reflecting this pessimism with transactional practices, often give them minimum attention. This is the case with Podsakoff, MacKenzie, Moorman, and Fetter (1990), for example. Although Podsakoff and his associates adopted a quite limited conception of transactional leadership for their research, they offered arguably the most comprehensive set of transformational leadership dimensions available to that point, dimensions based on a synthesis of seven prior perspectives on transformational leadership.

Moral leadership

As a category, moral leadership includes those normative, political/democratic, and symbolic concepts of leadership mentioned in a total of 16 articles included in the review. During the 1990s, the normative dimension of leadership has been one of the fastest growing areas of leadership study (Duke, 1996). Those writing about moral leadership argue that values are a central part of all leadership and administrative practice (Bates, 1993; Evers & Lakomski, 1991; Greenfeld, 1991). Indeed, Hodgkinson, one of the best known proponents of this orientation to leadership, claims that “values constitute the essential problem of leadership . . . If there are no value conflicts then there is no need for leadership” (1991, p. 11). The focus of moral leadership is on the values and ethics of the leader, so authority and influence are to be derived from defensible conceptions of what is right or good. Nevertheless, much of the writing about moral leadership, as in the case of transformational leadership, adopts the perspective of those in formal administrative roles.

Many of those writing about moral leadership over the past decade take, as their point of departure, Herbert Simon’s claim that values have no place in administrative decision making as well as positivistic conceptions of knowledge assumed by the “Theory movement” in educational administration. Attempts to cast the study of administration in purely rational terms unconcerned with values are seen as dangerously misguided because, as Hodgkinson points out, “The intrusion of values into the decision-making process is not merely inevitable, it is the very substance of decision” (1978, p. 59).

The papers reviewed from the four journals illustrate quite different approaches to moral leadership. For example, Duignan and MacPherson (1993, p. 10), in discussing their concept of “educative leadership,” contended that leadership should be concerned with right and wrong, not attitudes, styles, or behaviors. William Greenfeld (1995) maintained that leadership entails five “role demands” or “situational imperatives,” including the moral, instructional, political, managerial, and social/interpersonal. Reitzug and Reeves (1992)
argued that cultural leadership involves defining, strengthening, and articulating values but warned that leaders may manipulate culture to further their own ends. Reitzug (1994) argued further that leadership is moral, but only under certain conditions. Lees (1995, p. 225) argued that leadership in a democratic society entails a moral imperative to "promote democracy, empowerment, and social justice."

Among the issues of greatest concern to those exploring moral perspectives on leadership is the nature of the values used by leaders in their decision making and how conflicts among values can be resolved. A brief synopsis of the well-developed positions of Hodgkinson, Evers and Lakomski, and Slater help illustrate the range of views on these issues evident in contemporary literature.

At the heart of Hodgkinson’s position on the nature of administrative values is an “analytic model of the value concept” (Hodgkinson, 1978, 1991). This model includes three categories of values, distinguished from one another by their adequacy in justifying administrative choices. In general, the model recommends that leaders choose higher over lower level values when confronted with value conflicts. Related to this general position, however, are refinements allowing for difficult cases to be addressed in authentic and morally responsible ways.

The least adequate set of values are “subrational” and encompass the leader’s self-justifying preferences, manifestations of feeling and emotion. More defensible are a set of “rational” values. Leaders using this set of values justify their choices based on either consensus among those effected, or an appeal to some future consequences of choice held to be desirable. The most defensible set of values on which to base decision making, according to this model, are “transrational.” No particular set of values is associated with this category. Rather, Hodgkinson refers to such values as having a metaphysical grounding: they are principles that “take the form of ethical codes, injunctions, or commandments . . . their common feature is that they are unverifiable by the techniques of science and cannot be justified by merely logical argument” (1991, p. 99).

Evers and Lakomski (1991) offer a thoughtful analysis of Hodgkinson’s position on moral leadership and go on to develop their own. A fully adequate description of their position is beyond the bounds of this chapter. Central to their position, however, is the claim (after the importance Dewey attributed to the virtues of problem solving as a means of improving the human condition) that “the basic normative framework for educational administrators is provided by the general requirement that decision and action should be, in the long term, educative; that the growth of knowledge be promoted” (1991, p. 186). Because administrative structures are not morally neutral, Evers and Lakomski advocate forms of educational leadership that enhance organizational learning. In these respects, the views of Evers and Lakomski are essentially similar to those of Willower (1994).

A third position on leaders’ values and how value conflicts are to be resolved is political in its origin. In addition to a concern for specific sets of values, this aspect of moral leadership focuses on the nature of the relationships among those within the organization and the distribution of power between stakeholders both...
inside and outside the organization. This form of leadership assumes that even though the formal organization may clearly specify power relationships, lines of communication, and procedures for carrying out the organization’s work, the informal organization may be quite different, as well as providing a more authentic explanation for organizational activity.

Forms of leadership referred to as “symbolic,” “democratic,” or “political” can equally well be placed in either moral or participative categories of leadership because the central argument for participation is justifiable by democratic theory. Slater (1994) illustrates this orientation to moral leadership. Because democracies value freedom, he argues, they are opposed to traditional sources of authority and encourage “fresh examination and scrutiny” (p. 98) of almost everything. But for reasons related to lack of time, energy, or capacity, this examination does not often happen and there is a tendency for majority opinion to prevail and for the meaningfulness of community values eventually to be eroded. Under such conditions the purpose of leadership is to correct the tendency to rely only on majority opinion “which in very large groups tends to be lowest common denominator” (p. 98). Leadership should also “help restore meaning and common purpose to daily life” (p. 99). School leaders, from this perspective, should be committed to the democratic ideal and work toward replicating that ideal in the life experiences of students in school organizations.

As Slater makes clear, political and symbolic versions of moral leadership value wide participation as a reflection of the society in which we live. Public institutions, such as schools, cannot be governed or administered in ways that violate democratic principles no matter how cumbersome some might think those forms of governance and administration to be.

Participative leadership

The term “participative leadership” was adopted from Yukl’s (1994) description to encompass a total of 10 articles concerned with “group,” “shared,” and “teacher” leadership. Participative leadership stresses the decision-making processes of the group. One school of thought within this category of leadership argues for such participation on the grounds that it will enhance organizational effectiveness. A second school rests its case for participation on democratic principles, such as those discussed above in relation to moral leadership. Additional reasons for participation emerge in the context of site-based management approaches to participatory leadership. In the case of this form of leadership, authority and influence are available potentially to any legitimate stakeholder in the school based on their expert knowledge, their democratic right to choose, and/or their critical role in implementing decisions.

A majority of the 10 articles associated participative leadership with enhanced organizational effectiveness. For example, evidence from Hayes’ (1995) study in a single primary school demonstrated that the head’s success in managing the government-driven change agenda depended on forging mutually
bene cial relations with all signi cant groups of internal and external stakehold-
ers. Johnston and Pickersgill (1992) as well as Vandenberghhe (1992) argued that
the substantially increased demands placed on school leaders by changing con-
texts and expectations could best (or only) be met by moving toward forms of
shared or team leadership. Citing such changes as increased complexity, uncer-
tainty, ambiguity, workload, and expectations for innovation, Murphy and
Hallinger (1992) and Hallinger (1992) conclude that school leaders will need to
adopt more participatory forms of leadership, forms of leadership that are more
consultative, open, and democratic and that involve teachers and parents much
more in school decision making.

Savery, Soutar, and Dyson (1992) illustrate approaches to participatory
leadership driven largely by arguments for democratic processes. The frame-
work for this study included seven categories of decision making (such as school
policy and student discipline), each of which incorporated from two to ve more
speci c decision categories. Teachers were asked to indicate their preferences
for five different types of participation in each decision category ranging from
the principal making the decision herself to staff deciding themselves. This
study began to illustrate what would be required to develop a fully speci ed
model of participatory leadership in a school, viewed from a democratic
perspective.

The centerpiece in a majority of the past decade’s school restructuring ini-
tiatives, site-based management (SBM) is arguably the most fully developed and
widely advocated conception of participatory leadership available. Murphy and
Beck (1995) suggest that SBM usually takes one of three forms; administrative-
controlled SBM, professional-controlled SBM, and community-controlled SBM.
Much less in evidence but still visible is a fourth type of SBM in which power is
exercised equally by school professionals, parents, and other community
members.

Administrative-controlled SBM is aimed at increasing accountability to the
central district or board of ce for the ef cient expenditure of resources on the
assumption that such ef ciencies will eventually pay off for students. These ef-
ciencies are to be realized by giving local school administrators greater authority
and in uence over such key decision areas as budget, personnel, and curriculum.
Advocates of this form of SBM reason that such authority, in combination with
the incentive to make the best use of resources, ought to get more of the
resources of the school into the direct service of students. To assist in accom-
plishing that objective, the principal may consult informally with teachers,
parents, students, or community representatives. Site councils are typically
established to advise the principal.

When teacher-controlled SBM is advocated, the goal is to make better use of
their knowledge in such key decision areas as budget, curriculum, and (occasion-
ally) personnel. Basic to this form of SBM is the assumption that profes-
sionals closest to the student have the most relevant knowledge for making such
decisions (Hess, 1991) and that full participation in the decision-making process
will increase their commitment to implementing whatever decisions are made. Participatory democracy, allowing employees greater decision-making power, is also presumed to lead to greater efficiency, effectiveness, and better outcomes (Clune & White, 1988; David, 1989; Mojkowski & Fleming, 1988). Site councils associated with this form of SBM typically have decision-making power and although many groups (parents, students, administration) are often represented, teachers have the largest proportion of members.

Increased accountability to parents and the community at large along with “consumer satisfaction” are the central purposes for establishing community-control forms of SBM (Lee, et al., 1993; Malen, Ogawa & Kranz, 1990; Wohlstetter, 1990; Wohlstetter & McCurdy, 1991; Wohlstetter & Mohrman, 1993). The basic assumption giving rise to this form of SBM is that the curriculum of the school ought to directly reflect the values and preferences of parents and the local community (Ornstein, 1983; Wohlstetter & Odden, 1992). School professionals, it is claimed, typically are not as responsive to such local values and preferences as they ought to be. Their responsiveness is greatly increased, however, when the authority to make decisions about curriculum, budget, and personnel is in the hands of the parent and other community constituents of the school. School councils in which parent and other community constituents have a majority of the membership are the primary instruments for the exercise of such authority.

Community-control SBM aims to increase the authority and influence of parents and community members. There is, however, another focus of community control in which parents are given a choice of schools, the most direct form of accountability by schools to the community. Although analysis of such choice is beyond the boundaries of this chapter, it is part of some forms of community control found, for example, in England. It has been suggested that, as SBM evolves and schools become unique, choice will eventually be an integral part of the SBM approach to participatory leadership.

Finally equal participation forms of SBM attempt to accomplish the purposes of both community control and professional control forms: making better use of teachers’ knowledge for key decisions in the school and being more accountable to parents and the local community. Unlike the pure community-control version of SBM, the equal control versions assume that professionals are willing to be quite responsive to the values and preferences of parents and the local community under conditions in which parents are in a position to act as partners with schools in the education of their children. Both parents and teachers, it is assumed, have important knowledge to bring to bear on key decisions about curriculum, budget, and personnel. Site councils associated with this form of SBM have decision-making power and their membership is balanced between school staff and parent/community members.
Managerial leadership

In addition to explicit concepts of management, this leadership category subsumes a form of leadership referred to as organizational in a total of 10 articles. Managerial leadership focuses on the functions, tasks, or behaviors of the leader and assumes that if these functions are carried out competently the work of others in the organization will be facilitated. Most approaches to managerial leadership also assume that organizational members behave rationally. Authority and influence are allocated to formal positions in proportion to the status of those positions in the organizational hierarchy. The terms “management” and “manager” frequently appear, especially in papers originating in the U.K., but without explicit attempts to conceptualize their meaning.

Several studies included in the review characterized management as a form of leadership to be replaced or supplemented in the face of present organizational challenges and the need for change (Cusack, 1993; Hallinger, 1992). Lesourd, Tracz, and Grady (1992) contrasted “managerial leadership” with “visionary leadership,” for example. Others assumed the utility of managerial tasks and inquired about how they had been intensified by recent changes (Dunning, 1993) or how they affected the quality of teachers’ work lives (Rossmiller, 1992). Other articles continued the long-standing debate over the relationship between the concepts of leadership and management. The majority of these articles (Achilles, 1992; Atkinson & Wilmore, 1993; Bolman & Deal, 1992; Bolman & Deal, 1994; Reilly, 1993; Whitaker et al., 1991) treated leadership and management as distinct and, to some extent, as competing concepts. But two articles (Leithwood, 1994; Reitzug & Reeves, 1992) regarded leadership and management as complimentary concepts that should not be considered separately.

The distinction between leadership and management found outside these papers usually entails allocating management the responsibilities for policy implementation, maintaining organizational stability, and ensuring that routine organizational tasks are “done right.” Classical management theory (March & Simon, 1958; Massie, 1965) assumes that these purposes are likely to be accomplished through such functions as planning, organizing, supervising, coordinating, budgeting, and staffing. Leadership, in contrast, is assigned the challenges of policy making, organizational change, and making sure “the right things get done” (Zaleznick, 1970; Bennis & Nanus, 1985; Hodgkinson, 1991).

The exchange relationship between leaders and followers, which Bass’ conception of transactional leadership is based on, points to one of the central psychological mechanisms through which this view of managerial practices provides the organizational stability on which transformational leadership builds. “Transactional leadership,” according to Bass, “is contingent reinforcement. The leader and follower agree on what the follower needs to do to be rewarded or to avoid punishment. If the follower does as agreed, the leader arranges to reward the follower” (1985, p. 121).

In school contexts at least, justifying a conceptual distinction between
management and leadership is difficult. For example, Duke’s (1995) historical analysis of one school’s struggle for survival over a 63-year period provides vivid evidence that maintaining organizational stability in a turbulent environment requires the same types of responses on the part of organizational leaders as does organizational change. Furthermore, close analysis of the actual activities of formal school leaders (Kmetz & Willower, 1982; Harvey, 1986; Davies, 1987) indicates that whatever in uence they exercise in their schools takes place through their responses to a host of often seemingly mundane tasks that they face from day to day. As a minimum, school leaders need to adopt a “bifocal” perspective (Deal and Peterson, 1994) in carrying out their tasks.

To what does management refer, however, when it is treated as a unique form of school leadership in its own right? Those studies explicitly responding to this question illustrate a range of possibilities. For example, Rossmiller identi ed two broad functions: buffering the technical core (curriculum and instruction) of the school from excessive distractions and interruptions, and smoothing “input or output transitions [such as organizing support groups for students experiencing stress]” (1992, p. 143). This study also described a number of subdimensions, speci c ways in which principals carried out each of the two broad functions. In a second example with private sector origins, managerial functions in Myers and Murphy’s (1995) study included six “organizational control” mechanisms: supervision, input controls (such as teacher transfers), behavior controls (such as job descriptions), output controls (student testing), selection/socialization, and environmental controls (community responsiveness). Goldring (1990) inquired about the “boundary spanning” function of school principals. Caldwell (1992) argued that leaders of self-managing schools should engage in a cyclical process “of goal-setting, needs identi cation, priority-setting, planning, budgeting, implementing, and evaluating in a manner which provides for the appropriate involvement of staff, and community” (1992, p. 16–17).

Duke and Leithwood’s (1994) review of five different types of leadership literature identi es a relatively comprehensive set of school management dimensions. Two of the five sets of literatures addressed managerial issues most directly; these included 21 original studies of principal leadership speci cally in the context of school restructuring and an additional 19 studies describing principals’ practices and effects across varied contexts. These studies provided evidence of many aspects of leadership encompassed in other categories. As well, there were 10 sets of managerial tasks or functions described in these 40 studies as a whole:

- Providing adequate financial and material resources;
- Distributing financial and material resources so they are most useful;
- Anticipating predictable problems and developing effective and ef cient means for responding to them;
- Managing the school facility;
• Managing the student body;
• Maintaining effective communication patterns with staff, students, community members, and district of ce staff;
• Accommodating policies and initiatives undertaken by district of ce in ways that assist with school improvement goals;
• Buffering staff so as to reduce disruptions to the instruction program;
• Mediating con ict and differences in expectations;
• Attending to the political demands of school functioning.

These 10 functions summarize most of the explicit as well as implicit conceptions of managerial functions in schools as they have been portrayed in writing over the past decade, separated from those leadership dimensions associated with other models. As Rost (1991) suggests, there is evidence of considerable support in the literature and among practicing leaders for managerial approaches to leadership, but this support and the meaning of such leadership often has to be inferred. As a whole, these functions convey an orientation to leadership similar to the orientation found in the classical management literature. This is quite different from the relatively entrepreneurial, creative, and change-oriented view of leadership referred to as “strategic management” in the non-school literature (Thomas & Pruett, 1993; Spencer, 1993). Those writing about educational leadership in the past decade appear to have incorporated such orientations in other, non-managerial models.

**Contingent leadership/leadership styles**

Included as part of this category are leadership “styles” and “problem-solving” concepts referred to in a total of 18 articles (including “re ective” and “craft” views of leadership). The focus of this approach is on how leaders respond to the unique organizational circumstances or problems that they face as a consequence, for example, of the nature and preferences of coworkers, conditions of work, and tasks to be undertaken. This approach to leadership assumes that there are wide variations in the contexts for leadership and that to be effective these contexts require different leadership responses. Also assumed by this approach to leadership is that individuals providing leadership, typically those in formal positions of authority, are capable of mastering a large repertoire of leadership practices. Their influence depends, in large measure, on such mastery.

While sharing the same focus and assumptions, the “styles” and “problem-solving” orientations to contingent leadership are otherwise quite distinct. Leadership styles have been the stimulus for extensive empirical investigation in both school and non-school organizations. Examples of earlier research include the Ohio State studies, which led to the widely used Leadership Behavior Description Questionnaire and subsequent work by investigators such as Blake and Mouton (1964) and Hersey and Blanchard (1977). Nine studies included in this review made explicit reference to leadership style. Dimensions of leadership
style investigated in these nine studies varied considerably: task versus relationships (Heller, Clay & Perkins, 1993), managerial versus visionary (Lesourd, Tracz & Grady, 1992), initiating structure versus consideration, autocratic versus facilitative (Cheng, 1991; Fenech, 1994; Hoy & Brown, 1988; Johnston, 1986; Uwazurike, 1991), and male versus female (Coleman, 1996). Bredeson (1993) inquires about the relationship between an individual’s leadership style and the role strains resulting from restructuring efforts in schools.

The literature on leadership styles focuses on overt leadership practice, attempting to define a relatively small number of coherent, effective patterns of such practice. In contrast, the literature on problem solving focuses on the internal cognitive and affective processes engaged in by leaders as they ponder the challenges facing them and decide how best to act. From this perspective, there is a virtually unlimited universe of leadership practices. Leaders choose or invent those patterns of practice that appear to make most sense to them in response to the challenges they are addressing. What leaders do depends on what they think.

Problem-solving orientations to leadership, reected in nine studies included in the review, are of two types. Those describing leadership as a reective or craft-like enterprise stress the importance of leaders’ internal processes without attempting to explicitly model such processes. For example, Sergiovanni (1989), Battersby (1987), and Clark (1988) use Schön’s (1983) concept of reective practice, or knowing-in-action, to explore the limited utility to practicing leaders of formal, scientiﬁc theory. Bredeson (1988) advocates the use of metaphors as stimulants for administrators’ thinking and problem solving, whereas Willower (1994) invokes Dewey’s method of inquiry as a frame to use in developing habits of reection on the part of school leaders.

Also focused on leaders’ thinking were four articles explicitly framed by contemporary cognitive science models of such processes. Three of these studies appeared in a special issue of EAQ entitled Cognitive Perspectives On Educational Administration (see also Hallinger, Leithwood and Murphy, 1993). Leithwood and Hallinger (1993) and Leithwood (1995) argued for the usefulness of cognitive perspectives on leadership and outlined what inquiries guided by such an orientation would entail. Allison and Allison (1993) invoke schema theory in their comparison of the domain-speciﬁc knowledge structures of novice and experienced school principals. Elsewhere, Allison (1996) reviews the literature on cognitive processes associated with problem interpretation and its application to the thinking of school leaders. Leithwood, Steinbach, and Raun (1993) describe the problem-solving processes of superintendents within a framework that attends to those cognitive processes entailed in problem interpretation, goal setting, anticipating constraints, the use of personal values and principles (see also Moorhead & Nediger, 1991), solution processes, and the mood or affect. Based on this framework, Leithwood and Steinbach (1995) offer the most comprehensive set of research results to date, exploring the nature of expert school leaders’ problem-solving processes and their consequences for leadership practice.
Summary

What have been the results of a century’s quest for a conception of school leadership? The six different categories of leadership described in this section is one answer to this question. These approaches include instructional, transformational, moral, participative, managerial, and contingent forms of school leadership. Although they have been presented as distinctly different leadership models, they are by no means pure types. The six approaches are most distinct with respect to their basic foci and the key assumptions on which they are premised. Significant differences also exist with respect to the nature and locus of leadership power.

But there are many aspects of these approaches that are quite similar, depending on whose version of an approach one adopts. For example, although moral leadership was the approach most visibly concerned with leadership ethics and values, there is a value position at least implicit in all six approaches. And transformational and participative approaches are quite explicit about the centrality of specific types of values to leadership. Additionally, whereas transformational approaches are arguably most explicit in their concern for organizational culture, many forms of instructional and moral leadership show evidence of a similar concern.

In sum, then, approaches to conceptualizing school leadership in contemporary literature offer eclectic and overlapping perspective on what should be the focus of leaders’ attention and how leadership manifests itself in practice. Five of the six approaches (instructional leadership excepted) have well developed counterparts in the non-school literature and this literature figures prominently in how school leadership is conceptualized. This is probably both good and bad, good because there is an extensive academic and popular leadership literature that in our view has too often been ignored when it could have enriched thinking about leadership in schools, and bad because most of the literature included in our review that relied on a concept of leadership developed outside school contexts failed to address sufficiently the significance of that context for how leadership ought to be conceptualized.

Historical and theoretical sources of school leadership authority

Described in this section are the sources of authority that those writing about leadership in schools have appealed to over the century. One purpose of the section is to show how those sources have evolved and multiplied. A second purpose is to explore the extent to which contemporary models of leadership, summarized in the previous section, depend on one or more of these sources including tradition, religion, psychology, sociology, and a combination of social psychology, philosophy, and critical theory.

After Webster’s Third New International Dictionary (1967), authority is
defined as “the power to influence.” Herbert Simon (1965) defined authority as the power to make decisions that guide the actions of others. Extending Simon’s definition to focus more clearly on the consequences of decision making, Daniel Griffiths, in his theory of administration-as-decision making, argued for an understanding of authority as:

the willingness of some to accept the power of another. That is, members of the organization acknowledge the legitimacy of the decisions made by some to control the decisions of others.

(1959, p. 88)

Conceived of in this way, the meaning of authority is essentially the same as Weber’s concept of domination, “the probability that a command will be obeyed” (Roth & Wittich, 1968, p. 53).

Although status in the organizational hierarchy is the source for authority most readily evoked by Weber’s definition, he argued that there were actually three “pure types of (or grounds for) legitimate domination,” in addition to any other “less pure” grounds, such as habit, persuasion, and the like. These included rational or legal grounds (essentially the commonly evoked grounds mentioned above), traditional grounds (rooted in widely shared beliefs of the sort that allowed males to be the taken-for-granted heads of the households in many Western cultures until quite recently, for example), and charismatic grounds (the authority that flows from the perception that a person possesses exceptional or exemplary characteristics).

The meaning associated with the term “authority” as it is explored in this section includes but is not limited to the control-oriented views of authority offered by Simon, Griffiths, and Weber. Also included is, for example, the authority or power that a person or group is awarded as a consequence of special or highly valued knowledge (about the nature of human learning, for example), expert levels of skill in the execution of a task or performance considered important by others (such as the facilitation of group problem solving), and exceptional capacities for appreciation (such as understanding the hostile behavior of a student at school). Kenneth Benne’s concept of anthropological authority, “a teaching authority who seeks to both mother and wean the young relative to the wider life in a community” (cited in Maxey, 1991, p. 9) is relevant as well. This section demonstrates that the historical sources for understanding the authority that contemporary leadership models rest on include but extend considerably beyond Weber’s “pure types.”

This section also demonstrates that the history of educational leadership and administration in North America, as it has been told in the most frequently cited and widely respected sources (Tyack, 1976; Tyack & Cummings, 1977; Tyack & Hansot, 1982; Callahan, 1962; Campbell, 1972; Campbell et al., 1987; C ulcerston, 1981, 1988; Griffiths, 1959), does not fully reflect the variety of grounds that have been appealed to historically as sources of authority by prac-
ticing school leaders. Rather, with the notable exception of Beck and Murphy’s (1993) recent text, the story captured in these scholarly sources appears to have been influenced, to a fault, by efforts to establish and maintain a distinctive discipline of educational administration within the university.

**Tradition**

Tradition, one of Max Weber’s three “pure types of legitimate domination” (Roth & Wittich, 1968, p. 215), is defined by Weber as “belief in the everyday routine as an inviolable norm of conduct . . . (and as) piety for what actually, allegedly, or presumably has always existed.” He further argued that:

> Patriarchalism is by far the most important type of domination the legitimacy of which rests upon tradition. Patriarchalism means the authority of the father, the husband, the senior of the house, the sib elder over the members of the household and sib; the rule of the master and patron over bondsmen, serfs, freed men . . . of the patrimonial lord and sovereign prince over the subjects.

(Gerth & Mills, 1946, p. 296)

The system of norms associated with traditionalism is typically considered sacred and there is an element of arbitrariness associated with enforcing these norms on the part of the leader who judges primarily in terms of personal as distinct from functional criteria. Traditional authority is in this sense irrational (Gerth & Mills, 1946).

Traditional authority is, of course, an important instrument for cultural transmission and the preservation of community. As Slater points out, in the absence of tradition “old attachments to family, neighborhood, and community, attachments upon which and out of which one’s sense of self developed, lose their vitality” (1994, pp. 98–99). Evidence available concerning the effects of using tradition as a source of leadership authority in schools suggests that those effects have been largely negative, however.

Traditionalism based on patriarchy has manifested itself in prejudicial hiring practices applied to women in favor of an “old boys network” (Miklos, 1988), widely shared, male-dominated, leadership stereotypes that result in perceptions that women lack critical leadership skills and dispositions (Riehl & Lee, 1996) and ostracism from informal leadership networks (Shakeshaft, 1987). Factors such as these help explain the continuing disproportionate number of males occupying formal, especially senior, leadership positions. Tallerico and Burstyn (1996) cite evidence indicating that between 1928 and 1993 the percent of all U.S. superintendents of K-12 school districts who were women changed from 1.6 percent to only 5.6 percent. Cummings (Appended to Tyack, 1976) reported that 99.4% of American superintendents were male in 1952; typically, they also have been overwhelmingly Protestant, white, middle-aged, and from a rural
background with no experience in a job outside of education (Tyack, 1976). In 1993, Montenegro reported that in the U.S., 71% of all K-12 teachers were female, whereas only 7.3% of superintendents, 24% of assistant superintendents, and 34% of principals were female. In addition to gender biases, tradition also has introduced bias into the ecology of school leadership based on culture, language, and race (Anderson, 1996; Mitchell, Ortiz, & Mitchell, 1987).

The influences of tradition on the development of contemporary leadership models appears to have been neither direct nor clear.

Religion

Protestant religious values were the source of authority appealed to by pre-1900 public school leaders, especially in the United States. These were men, not infrequently ministers, who preached both the value of public schooling and aims for such schooling based on their interpretation of the virtues required to lead a “good” life. These values were considered both absolute and equally appropriate for all students, even though a very high proportion of such students were not of the Protestant faith.

In these early years, religious values served as the base for determining the more exalted aims of education, but they were considered values that school leaders should themselves live by and model as well. Based on a reading of superintendents’ own writings from that era, Tyack suggested that: “superintendents in the nineteenth century conceived of their task in part as an evangelical enterprise, a search for organizational means to realize the goal of creating a ‘redeemer nation’ ” (1976, p. 258).

Certification of superintendents, Tyack also concluded, was based not so much on possession of some body of professional knowledge as by their church membership and a shared earnestness. Superintendents in homogeneous small communities personified and enforced the official morality of the village. Tyack refers to the image that many superintendents of this period had of themselves, which was as “aristocrats of character” (1976, p. 258) who helped create an ideal of heroic leadership.

That school leaders of this period should look to religion as the basis for their legitimacy is not surprising. Many Victorian Americans believed that their country had been chosen as the preeminent Christian nation and that good citizens acted in accord with Christian values. The public school was viewed by these people as a key instrument for institutionalizing their beliefs and so they were among the most vigorous in the development of such schools (Smith, 1967; Tyack, 1970).

The influence of religious values as a source of public school leadership authority persisted well into the 1920s (Beck & Murphy, 1993) during which time it was invoked alongside “scientific management.” But as the Protestant church and its values gradually relinquished its hold on the public school, the leadership of those schools turned to other sources of authority. By the 1930s,
religion was rarely seen as a source of authority among public school leaders. During the 1990s, public schools have been reintroduced to the political power of religious values as a source of leadership authority. This has occurred as the “religious right” has challenged the leadership provided by local trustees and senior administrators to set outcomes for student learning that appear to usurp domains of children’s development traditionally assumed to be the responsibility of families and the church (Spady, 1994). In many instances, these challenges have been successful with majority representatives from the religious right elected to local school boards.

Throughout the twentieth century, religion consistently has been a critical source of leadership authority in a significant proportion of North American schools established with the express purpose of transmitting the values of specific religions. Catholic schools are the most conspicuous examples, attracting 5.4% of the student population in the U.S. (Bryk, Lee, & Holland, 1993). Although Catholic school leaders are the largest single group of North American educational leaders continuing to use religion as a significant source of their authority, many in North America were established to transmit the values of some other religion. It is safe to infer that religion remains a strong basis for the authority of leaders in these schools as well.

Contemporary approaches to moral leadership, as described in the previous section, rarely consider religion a source of values, preferring instead to draw on democratic traditions and values. Nonetheless, in making the case that leadership authority should be based on concepts of what is right and good, religion provided one of the earliest roots of today’s concept of moral leadership.

**Psychology**

The contributions of psychology, both positive and negative, typically are underestimated in the most frequently cited accounts of the evolution of sources of school leadership authority. However, developments in psychological theory and research begun in the 1880s have informed and helped legitimate the decision making of school leaders about both students and teachers throughout the twentieth century. These developments also have assisted in the understanding of school leadership practices directly.

**Students**

As Campbell et al. (1987) argue, “science” as a source of leadership authority was founded originally on the early work of Cattell, James, Thorndike (in particular), and others who extended and applied the ideas of these pioneers beginning in the 1880s:

Thorndike’s work, perhaps more than any other single factor, imbued the scientific movement in education with its psychological and statistical
In 1902, Thorndike offered a course in the application of ‘psychological and statistical methods to education’ . . . [this course] outlined what would be the emphasis and content of educational research for at least the next three decades. (Campbell et al., 1987, p. 30)

As tools for the measurement of intelligence, aptitude, and achievement were further developed, school leaders were provided with a basis for managing students: grouping, sorting, and advancing students, as well as screening them for subsequent levels of schooling. The birth of quantitative student testing arising from this early work in psychology persists with many re nements and modi - cations as a major in uence on decision making in schools to this day. Debates also continue to rage about issues such as the validity of information collected through standardized achievement tests for decision making (Worthen, 1993), the meaning of “intelligence” and its educational role (Sternberg & Wagner, 1986), and the effectiveness and equity of tracking decisions based on pupil achievement and aptitude tests (Oakes, 1985).

During the 1940s the emphasis in psychology began to move from its interest in human traits and their measurement toward the development of formal behavioral theories of human functioning. Due in no small measure to the seminal work of B. F. Skinner (1938), educators found themselves being admonished to approach curriculum, instruction, and student discipline using theories of contingent reinforcement.

These contributions by psychology to student testing practices, along with the implications for instruction flowing from behaviorism, were perceived to establish a highly “scienti c” basis for managing the technical core of schooling. In combination with those methods of job analysis initially developed outside schools and associated with the scienti c management movement, these developments in psychology provided considerable impetus for managerial approaches to leadership.

During the past 20 years, developments in psychology with clear relevance to education have rejected behaviorism in favor of attempting to better understand mental processes (Anderson, Reder, & Simon, 1997). Cognitive psychology has made considerable progress in developing constructivist (Bereiter & Scardamalia, 1996), connectionist (Rumelhart, 1989), and social cognitive (Vygotsky, 1978) understandings of the nature of student learning. These more recent understandings have resulted quite directly in the development of such student-related educational innovations in North America as discipline-based curricular frameworks (Robitaille, et al., 1993) and curriculum guidelines, as well as content and performance standards (National Council for Teachers of Mathematics, 1989) developed by many states and provinces.

Such developments demand high levels of professional expertise and judgment on the part of teachers to implement. So, while a potential source of leadership authority, they do not justify highly control-oriented approaches to such leadership. Depending on the amount of discretion left to school leaders in
implementing such changes and the extent to which further local development of these changes is required for actual use, these sources of power nourish a view of school leaders as either middle managers or instructional leaders.

*Teachers*

At least four lines of psychological research and development have been especially influential as sources of authority for school leadership. One line of research was the extension of tools for student testing, initially developed in the early 1900s, to the evaluation of teachers. This practice became especially pronounced in North America in the context of the behaviorally-guided “process-product” era of research on teacher effectiveness (Brophy & Good, 1986). Research with this focus produced lists of discrete teacher behaviors that correlated positively and significantly with student achievement. These behaviors, in turn, became the basis for summative evaluation instruments, often checklists, used by administrators while observing classroom teaching (Popham, 1987). These contributions of relatively behavioristic forms of psychology to the supervision of teaching have been widely criticized, for example, as assuming a labor- or craft-like view of an activity and role better conceived of as a profession or an art (Darling-Hammond & Wise, 1985) and providing no information to assist in the explanation for observed practices (Stiggins & Duke, 1988).

Widespread use of these approaches to the evaluation of instruction was fostered by the parallel work of Madeline Hunter (Hunter, 1976) and her associates, along with the calls for a simple, managerial, and control-oriented form of instructional leadership emanating from the effective schools research of the 1970s and early 1980s.

Results of psychological research describing the career stages of teachers is a second source of leadership authority with respect to teachers (Fuller, 1969; Huberman, 1989). Evidence from this research indicates that teachers pass through a relatively predictable set of stages over the course of their careers. These career stages intersect in crucial ways with broader life stages and cannot be separated from them. Furthermore, early career stages are formative and administrative decisions concerning teaching assignments and the like make an enormous difference to long-term career success and satisfaction. This evidence also suggests that, during the middle stages of a career, teachers are highly motivated to experiment with change initiatives. Most teachers become especially interested in their own classrooms as distinct from the school or district as a whole during the later stages of their careers.

This research is a rich source of understanding about the motivational predispositions of teachers, helping to match expectations for improvement efforts in the school, with the interests of individual staff members (Leithwood, 1989). As a source of authority most consistent with transformational approaches to leadership, it also offers useful guidelines to educational leaders for the continuous professional development of teachers (Oja, 1979).
As a third source of leadership power with respect to teachers, psychology has provided theoretical tools for better understanding forms of leadership that are appropriate in influencing a host of teacher variables considered to be critical mediators standing between leaders’ practices and the effects of these practices on students. Throughout the century, research about school leadership has inquired about forms of leadership that influence, for example, teacher job satisfaction (Conley, Bacharach, & Bauer, 1989), teachers’ commitment to change (Leithwood & Menzies, in press), and willingness to participate in school decisions (Kushman, 1992). For the most part, this line of research is a source of power for participative and transformational approaches to school leadership.

A fourth and final line of psychological research serving as a source of leadership authority with respect to teachers is to be found in applications of cognitive psychology to a better understanding of the nature of teachers’ thinking and decision making (Clark & Peterson, 1986). Although the results of this research had a considerable impact on some teacher preparation programs, there is little evidence of their application as sources of leadership authority. This is in spite of their considerable potential to help those providing transformational leadership to develop a better understanding of the thinking of their teacher colleagues and to inform them about how to exercise influence with their teacher colleagues in ways productive to them both.

**Expert leadership**

Research on teacher thinking, however, did provide a well-developed set of theories and methods to help guide parallel research on the nature of school leaders’ thinking and decision making (Leithwood & Steinbach, 1995; Hallinger, Leithwood & Murphy, 1993; Allison, 1996). This quite recent research, a source of authority for contingent approaches to leadership, offers insights concerning the nature of leaders’ expertise (Leithwood and Steinbach, 1995) as well as experiences useful in the development of such expertise (Bridges & Hallinger, 1992).

In addition to the work on teacher thinking and decision making, current research on expert leadership thinking can be traced back to a much earlier preoccupation with administrative problems and decision making. Allison (1996) dates the beginning of this line of work to Strayer’s 1925 volume *Problems in Educational Administration* and describes an ongoing interest in the use of case problems in textbooks for the purpose of helping to teach conceptual material throughout the subsequent 70 years (Hoy & Tarter, 1995; Culbertson, Jacobson & Reller, 1960). Griffiths’ (1959) theory of administration as decision making provided the pre-cognitive framework for a substantial research effort by Hemphill, Griffiths, and Frederiksen (1962) to understand the nature of administrators’ problem interpretation. Curiously, in spite of its scope, the work begun in this study does not seem to have been pursued by others between its completion and the quite recent spate of cognitively-oriented research on leadership expertise and its development.
Sociology

Two distinct lines of theory and research have been appealed to by school leaders as sources of authority for their practices during the twentieth century: theory and research about organizational change and about organizational design.

Organizational change

One of the main sources of school leaders’ power in implementing change can be traced to the seminal works of Everett Rogers (Rogers & Shoemaker, 1971) and Ronald Havelock (1971). In both cases, the primary focus of attention was on what would now be called the pre-adoption and adoption phases of the change process. During the 1960s and 1970s, this phase of change also was the object of attention by those interested in school leadership. Carlson’s (1972) study of the processes used by superintendents in the adoption of innovations in school districts exemplifies this work. In this work, roots can be found leading not only to a middle manager view of school leadership but also aspects of participative, instructional, and transformational approaches to leadership.

Although knowledge about pre-adoption and adoption processes offered some useful guidance, especially to senior school leaders, it soon became apparent that adoption decisions by such leaders did not have much to do with actual uses of whatever was adopted in classrooms. Charters and Jones’ widely influential paper, On the Risk of Appraising Non-Events in Program Evaluation (1973), made this point from the perspective of those evaluating the impact of changes on classroom practices and student achievement. John Goodlad’s widely cited study, Behind the Classroom Door (1970), also made this case in an especially compelling way for school practitioners. His League of Cooperating Schools focused attention on implementation processes within the school as the unit of change and on the principal as a key agent of change.

The Charters and Jones and Goodlad papers were among the more visible early stimulants for a line of sociological research about implementation processes. This research acquired considerable currency as a formal source of authority for how leaders should approach change in their schools during the 1970s and 1980s. Early stages of this research entailed mostly case studies of failed change initiatives in schools. For example, Gross, Giacquinta & Bernstein (1971) described the troubled path of an elementary school staff faced with implementing an activity-based curriculum without adequate material support or consistent, supportive leadership; Smith & Keith’s (1971) ethnography documented the gradual “normalization” of a much-publicized, newly constructed public school built around the ambitious and innovative open education visions of the district superintendent and the school’s first principal, both of whom exhibited strong transformational and participative leadership features.

This early work contributed in turn to a line of essentially sociological
research and development about educational change and school improvement processes that had become a dominant source of authority for many school leaders by the mid-1980s. This source supported a more decidedly “change agent” view of school leadership than had any other prior source. In relation to the six categories of leadership concepts outlined in the previous section, this source provided support for some elements and versions of participative, transformational, instructional, and managerial orientations to leadership.

Among the more noteworthy large scale research efforts aimed at providing a data-based set of prescriptions for practice were the Rand Change Agent studies (Berman et al., 1975) and the “DESSI” study (Loucks et al., 1982). Michael Fullan had begun his career-long effort to synthesize research on educational change and to make it accessible to educational practitioners (Fullan & Pomfret, 1977; Fullan, 1982; Fullan & Steiglebauer, 1991).

Also by the mid-1980s, Gene Hall and his associates had fully developed their Concerns-Based Adoption Model (CBAM). Used widely in the U.S., as well as in parts of Canada, the Netherlands, Belgium, Australia, and elsewhere, CBAM provided school leaders with tangible tools for diagnosing key aspects of their organization and specific strategies for implementing innovations (Loucks, Newlove & Hall, undated). Although clearly one of the best researched and disseminated, CBAM was but one example of a genre of R&D products, school improvement procedures, of which there were many others. Indeed, one outgrowth of the effective schools movement was a set of models specifically designed to implement the correlates of effective schools.

Common among all these products was an attempt to simplify the complex processes of school change and make them more manageable for school leaders. Usually this meant conceptualizing the change process as a series of temporally sequenced stages, each focused on a key set of functions or tasks such as diagnosing readiness for change, developing goals for change, choosing programs to achieve the goals, and the like. School improvement models served as the basis for considerable in-service training of school leaders and became for a while the official approach to change not only in many school districts (Stoll & Fink, 1994) but in whole states and provinces as well. (Matthew Miles [1993], a seminal figure throughout this 40-year period of research and development, provides a much more extensive and reflective analysis of the evolution of approaches to change).

Approaches to change described to this point, emerging largely from sociological inquiry and serving as major sources of power for several different approaches to school leadership, evolved through three stages. The first stage documented failure and drew general implications or guidelines for success; this stage assumed that the seeds of success are evident in failure, a risky assumption. The second stage found examples of successful practice and recommended they be used by others; this gives little weight to the importance of the context for change, also a risky approach. At a third stage are efforts to prescribe a set of sequenced tasks to be carried out in order to manage the change process in an
orderly fashion; the obvious flaw in this approach is the assumption that an invariant set of tasks is useful for all changes and for all points of departure.

These shortcomings, among others, gave rise to school restructuring, an elastic concept often including many components of change (Murphy, 1991) but usually including at least some form of school-based management (Murphy & Beck, 1995). School-based management brings together sources of school leadership authority based on knowledge of change processes and knowledge about organizational design, largely in support of participative and transformational models of leadership.

Organizational design

Throughout the twentieth century, organizational design theory has provided another, primarily sociological, source of authority for educational leadership. The story of how this source of authority evolved in schools begins with Frederick Taylor and the scientific management movement, transforms itself into a preoccupation with bureaucracy, and then moves on to an interest in open systems theory. The atheoretical correlates of effective schools’ research then supplants formal open systems theory, although the correlates themselves contain an open systems perspective. During the past 10 years, a resurgence of interest has occurred in a more complex, open systems theory that has yet to be synthesized into a formal theory. This more complex design characterizes the school as a learning organization or a learning community.

Managerial leadership has its genesis most directly in scientific management. This approach to organizational design emerged as a significant source of leadership authority in the second decade of the twentieth century (Tyack, 1976; Campbell et al., 1987; Callahan, 1962). At the core of this form of organizational design was the time and motion study, a procedure to be used by supervisors to find the best way for carrying out a task and then telling the workers responsible for the task how to do it. The initial attractiveness of scientific management was as a response to two problems. First, traditional forms of control, authority, and communication, as well as existing methods to measure productivity, had proven ineffective in dealing with modern industrial problems. Second, industry was marked by intense labor unrest stemming from substantial changes in the nature of the work; there was an absence of effective supervisory procedures and uniform production standards required in a modern industrial organization.

Within education, scientific management offered itself as a solution, particularly for superintendents of large city school districts, to managing rapid growth in facilities, school staffs, and increasingly diverse student populations. The immense growth in school systems during this time also prompted growing concerns among the public about the costs of education and the need for greater financial accountability. These were problems scientific management seemed to have the potential to solve. Callahan (1962) argues as well that the high social
status of business leaders who were promoting efficiency through the use of scientific management in their own organizations, in combination with the low status and public vulnerability of school leaders, made it inevitable that such practices would be adopted in schools for purposes of self-preservation, whether or not they had any effect on the quality of education. Pajak (1993) claims, however, that although scientific management was the focus of considerable writing in education, it had very little influence on the actual practices of educational leaders at the school level.

Although explicit interest in Tayloristic versions of scientific management (Taylor, 1947) had dissipated by 1930, it continued less explicitly as a part of the classical approach to administrative study into the 1940s that was reected, for example, in the work of Fayol, Gulick, Urwick, and Mooney (Campbell et al., 1987). It also was reected in analytic approaches to administration, part of the Theory Movement in educational administration during the '50s and '60s.

As originally conceived by Weber, bureaucracy provides the organizational basis for one of his three pure types of authority (rational grounds) and another key source of power for managerial approaches to leadership. According to Weber, this source of authority rests on a belief in the legality of enacted rules and the right of those elevated to authority under such rules to issue commands (Roth & Wittich, 1968, p. 215). Conceived of as an especially enlightened form of organization, Weber described it in terms of rule-governed systems of relationships defined by a hierarchy of roles and duties (Gerth & Mills, 1946, p. 196).

The translation of Max Weber’s work into English (Gerth & Mills, 1946) prompted considerable attention outside of education to the study of bureaucracy between the mid-1940s and mid-1970s. Particularly influential were the extensions and critiques of this work by the influential sociologists C. Wright Mills, Talcott Parsons, and Amatai Etzioni. Bureaucracy became a popular focus of study within education especially after 1960 “when students of educational management began to work within the framework of general administration and began to employ behavioral science approaches to organizational study” (Campbell et al., 1987). Its attractiveness can be partly explained by its following on the heels of the Human Relations movement in school leadership, which gave no attention to structure and organization.

At the same time, post-war expansion of the educational system created levels of administrative complexity that added to the hierarchical character of school systems; in the U.S., for example, the number of school districts went from 100,000 (Campbell, et al., 1987, p. 86, originally reported by the National Commission on School District Reorganization) to 16,000 between 1948 and 1980.

Bureaucracy is rarely viewed today as the enlightened form of organizational design conceived by Weber. Nevertheless, the work of Eliot Jaques (1989), a scholar and consultant to governments and private enterprise, continues as a powerful justification for hierarchy in organizations. This work is presently an
important and growing source of leadership authority outside education and may be instrumental in fostering renewed interest in bureaucracy in school organizations (see Gronn, 1996). Other aspects of Weber’s work also served as important elements in the attack led by Green eld (Green eld & Ribbins, 1993) on positivistic and rational approaches to educational administration and, ironically, managerial approaches to school leadership.

From the late ‘50s to the mid-’80s, considerable effort was made by organizational theorists inside and outside education to formulate a clearer conception of the place of the wider environment in the functioning of schools and other types of organizations. Interest in the development of open systems theory was stimulated in part by growth in skepticism on the part of the public concerning all social institutions, changing social values, and a general questioning and reexamination of the traditions and cultures of North American society. Considerable efforts were made to rid social institutions of racism, for example, including school desegregation, the Civil Rights Act of 1964, and the Voting Rights Act of 1965. Also evidence of the emergence of a newly dominant set of values was the youth revolt against the Vietnam war, rise of a new individualism, and the women’s movement.

These social forces created a substantially changed milieu within which educational leaders had to work. Changing the context of leaders’ work even more directly was a loss of consensus about the purposes of education in the U.S. (Ravitch, 1983). Collective bargaining for teachers was widespread by the mid-1960s and there emerged a strong trend at this time toward federal intervention into education: PL 94–142 (education of students with special needs) and PL 92–318 (end of sex discrimination in schools and colleges) are just two examples of such intervention.

During this period, schools also experienced a rise in the number of special interest groups trying to influence their programs. Educational administrators now had to work not only with parents and trustees, but the wider community as well. Increased demand for parental choice helped create alternative schools (Raywid, 1985) and gave rise to experimentation with voucher systems (Hertling, 1985).

Many of these pressures on schools to envision themselves as more integrally connected with their wider environments continue to evolve unabated to the present. Rooted directly in these earlier pressures are current efforts, such as altering the governance of schools to give greater control to the local community (Malen, et al., 1990) to develop “full service schools” and to redesign secondary education so that it is more sensitive to the needs and demands of business and wider public interests (Hogan, 1992).

Open Systems theory stresses the complexity and variability of component parts of the system (both individual and subgroups) and the looseness of the connections between them. The interdependence of the organization and its environment shifts attention away from structure and purely managerial orientations to leadership, as in the case of bureaucracy, to process in organizations
Outside of education, the theory is illustrated in Talcott Parsons’ (1960) concept of formal organizations including three levels, systems, or functions, the technical, managerial, and institutional or community systems. According to this conception, no organization is wholly independent, especially in the relationships between the managerial and institutional systems. Three types of institutional control stand over the managerial system—generalized norms, interstitial organization (trustees, for example), and governmental structure to oversee the interstitial and managerial levels (such as state education agencies).

Another example of Open Systems theory, one providing sources of power for political versions of participatory leadership, can be found in the work of David Easton (1965). Schools are viewed as political subsystems, the larger social environment providing input to the subsystem. The idea of systems, including schools, operating in a “loosely coupled” fashion (Weick, 1976) is also part of the Open Systems’ rationale that has received considerable attention in the literature aimed at school leaders (Deal & Kennedy, 1982). Conceiving of schools as learning organizations (Watkins & Marsick, 1993) or professional learning communities (Louis, Marks & Kruse, 1996) can be considered a continuation of the interest in Open Systems’ theory. Knowledge generated from research about this design is a source of power for transformational approaches to school leadership.

The so-called correlates of effective schools were and in many places continue to be unprecedented in the extent of their use as sources of authority for instructional approaches to school leadership created by the academic community. Research to discover these correlates was initiated more or less in parallel in U.K. secondary schools (Rutter et al., 1979) and in U.S. inner city elementary schools (Edmonds, 1979). By 1980, the original empirical work from this perspective had accumulated to a corpus of at least a dozen studies. Reviews and critical analyses of these studies were being widely published and explicit efforts were underway to bring results of this research to the attention of school leaders (Duckett, et al., 1980).

For academics conducting the original effective schools research, controversial evidence presented by James Coleman (1966) concerning the small proportion of variation in student achievement accounted for by schools, as compared with other factors, was the main stimulus for their inquiry. They viewed schools as a primary instrument for the achievement of social and economic equity and were alarmed that Coleman’s findings would be used by policy makers as a reason to allocate fewer resources to public education. Thus it was crucial from their point of view to find evidence to dispute Coleman’s claim and to embark on efforts to recreate as many schools as possible in conformity with this evidence.

For school leaders, the attractiveness of effective schools research as a source of authority could be accounted for by its accessibility and the straightforward, “implementable” nature of its findings. Creating a safe and orderly environment,
providing strong leadership, monitoring student progress, and engaging in active instruction, while not simple tasks to carry out in schools, were at least on the surface clear and familiar. Furthermore, the inner-city, economically-disadvantaged context in which much of the research had been carried out was the same context in which many school leaders were experiencing their greatest challenges.

Diffusion of effective school research also was speeded up considerably by the unusually well-targeted communication channels used for disseminating the research results; the emergence of a widespread perception that education was in crisis; and the fact that effective school research does not require fundamental revisions in the way schools are run, which rather works on improving existing practices; and the amount of effort devoted by districts, states, and professional associations to creating in-service programs for school leaders built around effective schools correlates (such as the Harvard principal center, and so on).

By the time Louis and Miles were ready to undertake their study of effective secondary schools in the U.S. (1990), they were able to select their sample from a population of schools claiming to be implementing effective school research results, estimated to be approximately 279.

**Philosophy, social psychology, and critical theory**

These three sources are discussed together because, although independent in their genesis, they combine in giving rise to and sustaining interest in participative and democratic forms of school leadership. These forms of school leadership came to prominence first in the early 1930s, and interest in them in their original form was sustained into the 1960s, especially in the teacher supervision literature (Pajak, 1993; Lindsay & Schwarcz, 1960). Support for these forms of leadership initially arose in response to the dehumanizing aspects of scientific management, greater community involvement in schools because schools were increasingly situated in suburban areas and in closer proximity to parents, and a trend toward administrative decentralization.

During the early development of participative and democratic concepts of leadership, “educational” philosophy was an important source of authority. In this context, educational philosophy refers to a position initially developed by Dewey (1916, 1929, 1946) concerning democracy and scientific inquiry. In Dewey’s view, the challenge to democracy lay in extending the spirit of participation at the heart of the American political system to the economic world of men and women at work. The long standing goal of political and social equity was to be erected in participatory forms of organizational governance, allowing the benefits of production and decisions about work to be shared by all. These decisions would be arrived at through consciously reasoned, cooperative problem solving (reflective inquiry).

This position was further developed by others in education and promoted as an ideal form of school organization and leadership. As Kilpatrick explained,
“education will not contribute to the reconstruction of the social process until it seriously experiments with the reconstruction of its own procedures” (1933, p. 210). Although somewhat dormant for several decades, this basic position has been resuscitated more recently by critical theory, as we explain below.

Although democratically-oriented educational philosophy promoted participatory forms of leadership on essentially moral grounds, parallel developments in social psychology provided evidence that such participation was an effective means of achieving organizational goals. The Hawthorne Studies carried out by Mayo, Lewin, and others (Mayo, 1933) are typically cited as the genesis of this work. The ideas of Mary Parker Follett (Metcalf & Urwick, 1940) concerning the nature of power and decision making were almost identical to those expressed in the current literature on educational restructuring and teacher empowerment (Dunlap & Goldman, 1991). Reflecting these ideas, the 1943 ASCD Yearbook portrayed leadership in schools as an educative force. Its aim, according to the authors, was to expand the horizons of the group by encouraging group members to think beyond the level of existing opinion and practice. This perspective is remarkably similar to Argyris and Schön’s (1978) concept of “double loop” learning.

Although early interest in participatory and democratic forms of leadership were promoted by Dewian philosophy and social psychology, the emergence of critical theory, along with post-positive orientations to the philosophy of science, has resulted in them being attributed renewed relevance in response to contemporary problems. Evers and Lakomski (1991) characterize critical theory approaches to administration as complex and covering ethical, political, social, linguistic, and personal dimensions. This analysis is limited to features of both post-positivism and critical theory stimulated in response to three features of the theory movement in educational administration: a positivist orientation toward knowledge, a structural-functionalist conception of organizations, and a control-oriented, managerial, view of leadership. Critical theory, arising in objection to these features, among others, is defined for our purposes by the positions it has developed as alternatives.

Structural-functional assumptions about the nature of school organizations are rejected by critical theory. Such “system-based functionalism” in Foster’s terms (1986, p. 3) includes assumptions about a high level of consensus in respect to existing school goals, the appropriateness of such goals for all stakeholders, and the non-political nature of defensible processes for arriving at an agreement about such goals. These assumptions also treat as unproblematic contemporary developments in science and technology, as well as the hierarchical nature of relationships traditionally found within the school organization. According to Maddock (1995), the task of critical theory is to subject such contemporary developments and relationships to continual scrutiny on their own terms and to demonstrate the contradictions and limitations of these ideas and practices.

Critical theory also offers a more decisively normative, socio-cultural analy-
sis of schools. This analysis points out how structural-functional assumptions have encouraged schools to establish structures of authority and control, both mirroring and reproducing systematic inequalities in the wider society. These inequalities arise from differences among groups of people in race, class, religion, gender, and geography. Cultural analysis, explains Bates:

insists that the culture of a society cannot be understood unless the nature and organization of the relationships and struggles between dominant and subordinate cultures are taken into account. Indeed, it is the struggle among such cultures that constitutes the major dynamic of cultural change.

(1987, p. 90)

Structural-functional views of the school organization remove the possibilities of schools serving as agents of democracy and social justice.

This basic objection to how school organizations have been conceptualized in the context of the theory movement in educational administration has given rise to a view of leadership that, although somewhat distinct in its emancipatory emphasis, supports at least three of the leadership models described in earlier sections of this chapter. Critical theorists argue that a managerial conception of leadership has dominated the field over the past several decades (Smyth, 1989; Bates, 1993; Foster, 1986). This conception of leadership assumes dominance or control over organizational members and separates educational from administrative concerns, privileging the latter (Ortiz & Marshall, 1988; Bates, 1993). The genesis of critical theorists’ orientation to leadership is its responsibility to develop educational organizations whose fundamental purposes are to nurture not only equity among organizational stakeholders but also the freedom and autonomy of individual members. A control orientation to leadership and administration flies in the face of these emancipatory intentions. Foster (1989), as a consequence, argues that leadership must be critical, transformational, educative, and ethical.

Critical leadership assumes that because existing conditions of social life have been constructed by people (rather than simply received), they can be reconstructed to be more equitable, democratic, and just if they are found wanting in these respects. One of the key responsibilities of leaders is to engage colleagues in self-reflection on and analyses of existing social and organizational conditions, along with the social cultures of both the school and the local community.

When these analyses reveal room for improvement in social and organizational conditions, leadership also entails assisting colleagues to envision more suitable social and organizational conditions appropriate to the social culture. Foster (1986) refers to this visioning process as “educative leadership,” a process that enables colleagues to consider alternative ways of ordering their lives and raising their level of consciousness about social conditions.
Leadership also entails ethical commitments. Building on Burns’ (1978) conception of how transformational leadership functions, such commitments are the elevation of colleagues’ moral consciousness about the social conditions in which they find themselves. As part of their ethical commitments, leaders should be advocates for principles of democracy, respect for others, social justice, and equality. According to Foster (1989) and Bates (1987), leaders always have a moral agenda.

Given a vision of a more desirable set of social and organizational conditions, transformative leadership entails assisting colleagues in making judgments about suitable courses of action to achieve these conditions (Bates, 1987; Foster, 1986) and implementing these actions. Judgments about suitable courses of action require:

- a balancing of theory and empirical understanding, of political and ethical factors, and of traditions and customs. It is in this way that administrators’ approaches go beyond the scientific without becoming arbitrarily subjective.

(Maddock, 1995, p. 66)

The contributions of critical theory to conceptualizing leadership have been quite significant. As the exercise of critical theory matures, its potential contributions promise to be far greater, not least because of the balance it provides to the neo-conservative philosophy presently raging through most Western political systems and posing unprecedented threats to equity and social justice as goals of education systems.

We are much less positive, however, about the contemporary contributions of philosophy in educational administration to the development of concepts of leadership. Clearly this is a contrarian view, one that flies in the face of judgments by many presently writing in the field. We refer here to the extensive literature in educational administration devoted to post-positive or post-empiricist conceptions of epistemology and the role of science in informing leadership practice. Greeneld is generally acknowledged as having initiated (Greeneld, 1975) and nourished this literature along (Greeneld & Ribbins, 1993), in concert with scholars who joined him in debate (Grifths, 1979; Willower, 1985). And Evers and Lakomski (1991) have offered cogent overviews, analyses, and extensions of their own.

What this line of theorizing in educational administration adds up to, stripped of its often obtuse references and dense, abstract language, appears to be as follows:

- Agreement with and understanding of knowledge as personally constructed;
- Claims that organizational behavior is often not especially rational, not only because people lack information but also because organizational members pursue their own goals and values;
• Most decisions faced by administrators are value-laden;
• Human systems are by definition less predictable than physical systems;
• What passes for “scientifically objective knowledge” in human organizations is more adequately characterized as “socially shared” knowledge;
• The meaning people give to events is shaped by their goals, values, feelings, existing knowledge, and past experiences.

Perhaps there is more to it than this, but not much. And what it adds up to is a series of “blinding flashes of the obvious”—obvious in terms of existing understandings from other scholarly sources, not to mention the common understandings of most school leaders. At least for the purposes of this chapter, it is remarkable that, whatever current writings in educational administration philosophy might have contributed, a more sophisticated conception of educational leadership is not one of them.

Summary
This section of the chapter identified, as historical and theoretical sources of leadership authority, tradition, religion, psychology, sociology, and a combination of philosophy, social psychology, and critical theory. Knowledge developed through psychological and sociological inquiry have been especially influential in justifying the exercise of leadership, but most contemporary approaches to leadership in schools have significant roots in at least several different sources of power and authority. Further, each source of power, while capable of nourishing several different leadership offspring, is relatively hostile to others. Finally, this section also has shown that all the sources of leadership authority, save postpositivism and critical theory, are quite mature. To the extent that these sources are central to concepts of leadership, as we have argued, contemporary leadership approaches are best characterized as evolutionary in nature.

Conclusion
Few attempts have been made to look broadly at the quest for an adequate conception of leadership in schools as it has unfolded over the twentieth century. Beck and Murphy’s (1993) work is likely the most recent among these efforts. Having attempted the task ourselves, we are especially aware of the many different ways in which any single description of the quest could be viewed as missing essential understandings critical in someone’s view. In this concluding section, we briefly reflect on the nature of the quest itself, offer a synthesis of results to the mid-1990s, and identify some priorities for future theory and research.
Nature of the quest

Viewed up close or at one point in time, it would be easy to conclude that efforts to conceptualize leadership in schools over the past century have been going in circles. From an upclose perspective, it is especially difficult to understand several issues with which this chapter has been centrally preoccupied: the genesis of different concepts of leadership; why a leadership concept falls into favor at one point in time only to fall out of favor eventually, overshadowed by a different concept; and whether the multiple leadership concepts encountered in the literature are truly competing with one another or, rather, reflecting different elements of some, as yet to be described, more sophisticated conception of leadership in schools. Chaos or complexity?

Although chaos seems to be the fashionable answer among most of those who have written about development in the field of school leadership, the inquiry described in this chapter arrived at a moderately more optimistic conclusion. Unquestionably, conceptual development related to educational leadership over the century has not occurred through any widely agreed on, explicit game plan (more like the flight of the bumble bee than a bullet, to use Phil Jackson’s metaphor). But then what social science concept has? Rather, the developmental process seems to be well captured by Hutchin’s (1995) view of organizational learning as a process of mutual adaptation manifest in the actions of individual members of the leadership community as they reacted to, criticized, and built on one another’s ideas. It is neither necessary nor likely that many individual members of the leadership community have understood the pattern of actions represented in the community as a whole. So justifying the claim that the concept of school leadership has developed through some defensible process does not also require justifying the claim that those in the midst of the process intentionally designed it that way.

From the perspective of our own analysis, the mutually adaptive process through which concepts of school leadership have developed over this century has consisted of conceptual differentiation, recalibration, and elaboration. This seems to be the case for all leadership concepts. Some version of each category of leadership concept, if not the specific models that each subsumes, was evident by the middle of the century. Differentiation is evident, for example, in the gradual increase in number of sources of power and authority used by scholars to justify the exercise of leadership and in the further clarification of implications of each of these sources for leadership practice. Recalibration is visible in the adaptation or updating of the meaning and expression of enduring leadership concepts in acknowledgment of changing problems and contexts. Elaboration is illustrated in efforts to deepen understandings of those sources of leadership legitimization as well as to extend knowledge of the practices associated with each different approach to leadership. The outcomes of this process, although not synthesized well to date, are conceptions of leadership in schools that are increasingly complex (a good thing), multi-dimensional, ecologically valid, defensible, and user-friendly.
A relational conception of leadership

A type of synthesis of contemporary leadership literature has been accomplished through the six-fold classification of leadership concepts that subsumes an initial, more specific set of 20 (refer to Table 2). These categories, however, are not directly comparable. They do not provide alternative solutions to the same problem. Rather, these concepts focus attention on different aspects of the organization. For instance, managerial leadership awards considerable importance to organizational policies and procedures, whereas instructional leadership focuses on the organization’s core technology. The six leadership categories also attend to different pieces of the leadership puzzle. Contingency approaches, for example, focus on leaders’ problem-solving processes whereas moral leadership attends to leaders’ values. Finally, the six sets of leadership concepts also concern themselves with different aspects of those designated as followers. Transformational leadership emphasizes the importance of followers’ commitments whereas participative leadership concerns itself largely with followers’ roles in decision making, as an illustration.

Thus these six approaches to leadership do not explicitly represent a set of discrete dimensions that, taken together, provide a comprehensive account of what is entailed in leadership. They still place excessive emphasis on the practices or internal processes of an individual person designated as “leader,” for example.

In this concluding section of the chapter, we explore and illustrate the possibility of developing a more comprehensive account of leadership based on relationships. After Wheatley (1994) and others, such a conception views leadership as a more or less complex set of relationships cohering around a core of common intentions. The ways in which existing leadership concepts differ from one another suggest three of the four sets of elements likely to be interacting in such relationships: the leader, the follower, and the organization. The fourth element is the environment within which the organization and its individual members find themselves.

Leaders and followers

For purposes of developing a more comprehensive account of leadership, these elements of both leader and follower that interact might be conceptualized as capacities (knowledge and skills), attitudes, values, and goals (elements of motivation), and practices (more or less overt behaviors). School leadership literature is replete with treatments of leadership defined by the relationships between one or more of these elements of leaders and followers; for example, the relationship between a principal’s vision (goals) and a teacher’s classroom practices (as in instructional leadership), or a principal’s practices and a teacher’s motivations (as in transformational leadership).
Organizational theory offers several ways to conceptualize relevant elements of an organization. By way of illustration, we have found significant relationships in some of our own work (Leithwood, Jantzi, & Steinbach, 1995) between leadership and a set of six organizational elements derived from such a theory (Daft, 1988; Banner & Gagné, 1995; Galbraith, 1977; Bolman & Deal, 1991). These elements include mission and vision, culture, structure, information collection and decision-making processes, programs and instruction, strategies for change, and policies and resources. The literature on school leadership also provides many examples of leadership defined in terms of the relationships between some of these elements of the organization and one or more of the other sets of variables included in this conception. Symbolic leadership, for example, describes relationships between the values both implicit and explicit in a leader’s practices and the culture of the school. Participative leadership focuses attention on, among other things, the relationships among teachers’ practices, principals’ practices, and organizational structures.

Environment

A fourth element interacting in a relational conception of leadership is the environment within which the organization functions (in other words, whatever is defined as outside the “boundaries” of the organization). Although given considerable attention in organizational theory, this element is not well represented in most existing categories of leadership concepts: the subcategory of moral leadership referred to as “political” in Table 2 is the primary exception, sometimes focusing on the relationship between the interests of those inside and outside of the organization. Our review of the historical and theoretical roots of these concepts suggests that this is an unfortunate shortcoming. The perceived value of a leadership concept at any point in time, as well as its eventual fall from favor, seem largely to be explained by events in the larger environment within which the organization finds itself.

As with organizations, critical elements of the environment in which schools find themselves can be defined in a variety of ways. Daft (1988) offers a set of elements with demonstrable relevance to schools:

- The pool of human resources which employees are drawn from (such as the extent to which talented college graduates choose to enter or not enter teaching);
- The market for services provided by the organization (the challenge to public schools’ quasi-monopoly on students provided by the recent charter schools movement);
- The availability of financing for the organization’s initiatives (erosion of support for school funding by increased public demand for health care and other social services);
• New technologies in the environment that may threaten the need for the services provided by the organization (the extent to which computer-based technologies provide access to educational services and information outside the bounds of formal educational institutions);
• Economic conditions that influence the volume of business (the impact on support for school bond issues of recessionary business cycles);
• Governments and the nature of their policies and regulations (the extent to which many current western governments are embarked on major educational restructuring initiatives);
• Sociocultural conditions such as social value systems and demographics (generational shifts in the size of the school age population and the effects this has on support for education of youth).

These elements making up the wider environment of schools and other organizations offer leadership some of its greatest challenges, as just the handful of examples provided here demonstrates. Some recent leadership inquiries have begun to take them explicitly into account. For example, an interest in the relationship between leader practices, teacher practices, and government restructuring initiatives is evident in recent research on leadership in the context of school-based management (Murphy & Beck, 1995). Goldring and Rallis (1993) explore the meaning of school leadership through the relationship between leaders’ practices and most of the elements of the environment identified by Daft (1988). But the importance of most environmental elements has not been well reflected in efforts to conceptualize school leadership to date.

Relationships

Although it is necessary to specify at least illustrative elements of each of the constructs interacting in a relational conception of leadership, the most complex and important aspects of leadership are to be found in the nature of the relationships themselves. How can such relationships adequately be conceptualized? The generic definition, with which the chapter began, of leadership as an influence process concerning the choice of goals and the development and implementation of the means for their achievement, is one starting point for answering this question. Additionally, these relationships can be viewed from both descriptive and normative perspectives. With purely descriptive purposes in mind, variation in influence processes can be explored within such dimensions as strength, direction (one way, reciprocal), and type, for example. Normative interests in the relationships of a leadership act require exploration of additional dimensions of influence. For example, transformational theorists argue that such influence ought to elevate the motives of both leaders and followers (Burns, 1978). Critical theorists argue that in influence exercised through leadership ought to stimulate analysis and reflection about collective intentions and the means of their achievement, as well as be empowering (Foster, 1986). Warwick and
Kelman (1976) provide an illustration of the different forms that in uence can take and how these forms vary in the autonomy and freedom they offer individuals affected by them, an essential condition of empowerment. At the least empowering end of their continuum of influence types is coercion, “[a situation in which] one person or group forces another person or group to act or refrain from acting under the threat of severe deprivation” (1976, p. 484). Facilitation, the most empowering form of influence according to this view, is “designed to make it easier for an individual to implement his own choice or to satisfy his own desires” (1976, p. 491). Between these two extremes is persuasion (the use of argument and reason to influence a person to change), and manipulation (altering factors that in uence a person’s choices without their knowledge).

The distinction between management and leadership contributes little or nothing to an understanding of leadership conceived of as a set of relationships. Relationships simply vary in their complexity. At the least complex extreme, such relationships entail a relatively small number of transparent interactions. Someone in a formal leadership role, for example, tells a willing member of the organization to undertake a non-trivial task, understood by leader and follower in the same way, in order to accomplish a goal of the organization that both leader and follower value. Although this interaction might be considered a prime candidate for classification as “management,” it still conforms to the basic properties of leadership conceptualized from a relational perspective.

Given this conception of leadership, such simple forms of leadership are probably the minority, however. The potential complexity arising from varying forms of relations among leaders, followers, organization, and environment helps explain the difficulties leadership theorists have experienced in developing a widely agreed-upon understanding of leadership. Stimulated by complexity theory (Waldrop, 1992), it is reasonable to represent the relationships constituting many individual leadership interactions as forming a system. Although each such system may include some relationships that are linear, many are likely to be dynamic, reciprocal, and, therefore, highly unpredictable. Potential followers, for example, may develop quite different interpretations of the same influence initiative, interpretations sufficiently varied as to make the same initiative both facilitative and coercive, depending upon who is doing the interpreting. What distinguishes a relationship defined as leadership from some other type of dynamic, non-linear, social interaction is its intentionality.

Implications for future research and theory

It is possible to imagine a large number of promising directions for future theory and research about school leadership in light of our relational conception of leadership. Two directions stand out as deserving special attention. First, rather than devoting exclusive energy to the development of new leadership concepts, there is much to be learned from further development of existing concepts such as the six categories of leadership summarized in this chapter. In particular, it

132
would be useful to pursue such questions as: What are the similarities and differences among these leadership categories in terms of key relationships? What is the nature of the influence evident in these relationships? and What are the consequences of these key relationships for followers and the organization as a whole?

The second promising direction for future theory and research would be to extend the small body of recent research examining, in particular, the relationships between leadership practices, capacities, and motives, and selected elements of the environment in which schools are located. An especially neglected aspect of that environment is social values. Although such values appear to be of increasing salience in a rapidly globalizing world (Hallinger & Heck, 1996; Wong & Cheng, 1996), all six conceptions of leadership reviewed in this chapter reflect western values and have been developed within a framework of western assumptions, problems, and evidence. “Which cultural values have different conceptions of leader capacities, motives, and practices most adequate?” is a question that needs to be pursued as part of the agenda for future research and theory concerning school leadership. Part of the inquiry required by this question includes the identification of additional leadership concepts, those with their genesis in non-western cultures.

HISTORY AND RESEARCH

A CENTURY’S QUEST TO UNDERSTAND SCHOOL LEADERSHIP

Anniversary reflections

Recent education reforms have produced some unintended effects. Measures taken to subject a vast area of public spending to greater predictability and control, to by-pass bureaucracy and give back initiative to teachers and parents, seem to have encouraged quite different and unforeseeable developments.

One of these is that education, as an institution, has become more reflective upon itself. From its beginnings in the nineteenth century, public education was dynamic with a sense of missionary social purpose. Dissemination of knowledge, cultivation of enlightenment and provision of opportunity for all were goals which positioned teachers and schools centrally within the nation state’s modernising, civilising, project.

Today, we are not so sure of ourselves. Politicians focus on mini-max strategies, re-casting policies which generate least opposition in order to yield as much recordable improvement as can be squeezed from inelastic resource levels. But parents and teachers are more sceptical and unsure; emerging ‘partnerships’ between them are understood as collaborative, discursive encounters in learning, for their own and their children’s personal bene t. Missions are for marketeers, whilst there is ‘no mission’ for traditionalists clinging to earlier beliefs in ‘social progress’. Local ‘communities’ are now atomised, fragmented, disempowered. Increasingly, individuals search for alternative networks in search of companionship or a livelihood, grasping electronic access to virtual communities for meeting and for learning opportunities which their particular locality is now unable to provide. Access, rather than provision, is the most that can be offered close to home. Education has slipped, somewhat unwittingly, it seems, over the precipice of post-modernity.

Another approach to the past, at a moment of anniversary, is to re-examine the recorded events themselves over the period of 25 years. It was a most turbulent period in the history of British education; Labour’s incomplete
efforts to introduce comprehensive education were followed by more than fifteen years of Tory reforms, still being implemented and extended, even, most recently, under a New Labour government. LEAs once ‘owned’ their schools, and, in the 1970s, were urged to adopt corporate management techniques to replace their historic tradition of local or municipal stewardship. The Houghton pay awards acknowledged the increased complexity of schools and encouraged teachers to think that at last they were not only socially valued but would be financially and commensurately rewarded. Implementing ROSLA was on the horizon; then came the ‘oil crisis’. Interesting and progressive new curricula were being developed such as MACOS, Nuffield science and the School Council’s history project. The main anxieties were about a shortage of student places and teachers, and providing physically and educationally for ROSLA pupils.

Now, 25 years later, we have been ‘reformed’, yet everyone is searching for a ‘role’. The LEA’s is diminished and unclear. Parents want to be more actively involved in their children’s learning but too few know how, with any confidence. Some schools are still short of teachers, but there is no physical shortage of student places. Most young people stay in education until they are 18 but then enter an adult world undermined by a bewildering array of ‘risks’ and unequal opportunities (see pp. 30–31). Instead of ‘mission’, the contemporary climate is one of ‘panic’, confusion and the search for ‘security’. Preoccupations of this generation of parents are about standards, testing, drugs and unemployment. Neither rationality nor its applications in the natural and calculative sciences seem to secure the requisite freedom from life’s anxieties.

This book is offered as a celebration of work published in the BEMAS journal between 1972 and 1997, a resource to assist critical review and reflection and, in the limited space available, provides challenging and at times provocative comment by four editors who have collaborated in the selection and editing of the material. The first issue of the journal appeared in the Summer of 1972 as The Educational Administration Bulletins, under the editorship of Meredydd Hughes. It was renamed Educational Administration in 1975 (Hughes, 1997) and after 1979 was edited by Ray Bolam (1979–1983), under whom it became Educational Management and Administration, published by Longmans. Michael Locke was editor between 1984 and 1991 and Peter Ribbins from 1991 to the present.

This review considers a sample of all the papers published over those 25 years. They vary widely in quality, content and approach. Some of them expose earlier research agendas, others illustrate and explore the flux of professional concerns and uncertainties. All the papers identified for discussion will, it is hoped, repay re-reading. One of their most striking features is the extent to which action and outcome have become more important than knowing for its own sake. Theoretical questions, once examined for their intrinsic epistemical significance, are now considered primarily for their methodological or positional implications. Performativity, consideration of, for example, what will strengthen
the position of educational research in a wider and more open marketplace for research funds, dominates institutional and individual incentive structures. Public policy issues in education are discussed in *EMA* in the early 1980s, but become gradually less prominent as professional and organisational controversies assume increasing importance. Many of these issues form the subject matter of four short editorial commentaries which introduce the four sections of selected papers.

We think some of those papers are outstanding and regret the extent to which they have been abridged. They are felt to be representative of the experience of those engaged in education during that time, as well as indicative of the journal’s significant achievements over the period. In contrast, this essay attempts to anthologise, illustrate and critically review the whole of the journal’s output from 1972 to 1997, in its ever-changing historical and educational context. An impossible, perhaps, but not unrewarding task.

### I Saying and doing

Meredydd Hughes’ first editorial stated the aims of the new Society and its journal as: ‘to facilitate the dissemination of knowledge about research, training and practice in educational administration, and also to provide a forum for the discussion of new approaches to the preparation and development of administrators and new developments in research’ (Hughes, 1972c). He expressed the hope that *EAB* ‘will help to forge the links of the dynastic alliance which will surely follow the obsequies of the old order’ (Hughes, 1972b). The ‘old order’ referred, in William Taylor’s phrase, to ‘the tired old dichotomy between theory and practice in education which ought to have been dead long ago’ (Taylor, 1973, Chapter 8). But was the dichotomy really dead? Recent experience supports scepticism; reforms are increasingly devised and formulated with scant attention to professional or academic advice. Under Sir Ron Dearing the National Curriculum had to be rescued by teachers and academics and the government’s recent Green Paper on the Learning Society (DfEE, 1997a) seems to have incorporated few of the insights offered, for example, in the Fryer Report (DfEE, 1997b).

#### Theory and practice: views of practitioners

Yet questions concerning relations between theory and practice in education are enduring and deep-lying. In an early article by H. L. Gray (1972, p. 1), the training which senior teachers received was said to be based on ‘the learning of practical skills and self-knowledge’; theory was ‘a support to an understanding of . . . skills and self-knowledge’ and, through its capacity to explain, can ‘provide useful models for analysis and prediction.’ The imputed ‘power of prediction’ itself generated suspicion regarding the value of research. This is evident in the comment of another headteacher (Morrison, 1973) on contributions by aca-
demics (McKenzie, 1973; Cumming, 1973). Behind an otherwise restrained endorsement by teachers for the work of academic colleagues, there seems to have lurked a fear that academic research might lead to a loss of professional autonomy for teachers and the replacement of schools as ‘communities possessing a kind of organic solidarity’ with ‘mechanical contrivances powered by direct command.’ Another ground for practitioner suspicion emerges from the reference by Cumming (1971) to his classic (and in many ways still isolated) study of educational costs. His article illustrates the inherent futility of conceptualising educational research in manipulative or instrumental terms, an error into which researchers themselves sometimes fall. ‘Persons at all points in the education business, including researchers themselves, often unconsciously expect the system to be changed by research as it is currently conceived.’ This, for Cumming, is not only a ‘crass naivety’ but endangers the positive functions of research in fields of social and institutional life. He agrees with Gass (1971) in his OECD review of Educational Policies for the 1970s that there is ‘an argument against the support of basic research with the objective of obtaining “results” which may be “applied”’. Short-termism and instrumentality are exemplified in the reported response of Scottish Education Department officials to his work. They were ‘surprised’ to be asked how and when the research data on school and college costs could be used, though it had been gathered in institutions they administered. For ‘they, like other administrators, desire, albeit unconsciously, to keep the mystique of their work to themselves and see researchers as the providers of facts which others (themselves) can interpret’. There is more than a suggestion here that identifying clearly what educational research is to be used for will assist definition of what it should be.

**Greenfield and the positivists**

Green eld (1976) made his first appearance among contributions to a symposium which he led at the IIP Conference in 1974. None of the reviewers is outrightly opposed to Green eld’s position; Michael Harrison is warmly appreciative of Green eld’s ‘connectivity’, and its recognition of the human constructedness of organisational life (ibid., p. 3). Pat and John White (ibid., pp. 6–10) are severe on Green eld’s subjectivism and an inconsistency they detect in his rejection of both ‘realism’ and ‘idealism’. They suggest his insights might have been more cogently developed if they ‘were not entangled with the trendy nonsense of “phenomenology” ’. Hoyle’s commentary (ibid., pp. 4–6), though short, is both thoughtful and synoptic in its range of suggestion. He reminds us that phenomenology reveals how individuals make their roles rather than take them. Today, we might say that they both make and take them, from the patterned, differentiated historical circumstances of their lives (Giddens, 1995). But this is an excellent and instructive short essay in criticism; constructive and balanced. It opens windows and invites the reader to explore theoretically what is
meant by the organisational dimension of the teacher’s role in the management of learning.

Green eld himself, in his rejoinder (Green eld, 1978a), takes Hoyle’s comments very seriously, though the tone of much of his piece is one of quiet resignation in the aftermath of an unholy row at the 1974 IIP in Bristol. He clings tenaciously to what are still today important questions: ‘What is real about organisations?’ and ‘What can theory about them mean, if we do not agree on that reality?’ (p. 86). That ‘reality’ is frequently, for many individuals, a prison, formed of ignorance, poverty, and the unequal distribution of human power to effect change in the disposition of institutional possibilities in the social world. To Grif ths (1977), Green eld was contesting the self-evident:

I also wonder about Green eld’s basic contention that organisations are not ‘real’. To me, New York University is ‘real’, the Salvation Army is ‘real’, IBM is ‘real’ and the Catholic Church is ‘real’.

Green eld, for his part, wanted to change the way in which such organisations served human ends. Some of those institutions had not always acted in ways bene cial to human development. They tended to pursue their own organisational aims by dedication to internally coherent and ‘rational’ rules. Yet, as Bauman, Chomsky and countless millions of twentieth century victims of injustice and barbarism have shown us:

The greatest crimes against humanity (and by humanity) have been perpetrated in the name of the rule of reason.

(Bauman, 1993, p. 238)

Green eld’s integrity of social purpose and justi cation as a theorist shine through in this paper: ‘Social and organisational theories are thus perhaps seen as visions of the world which people act out. In this view, “veri cation” of theory becomes as much a moral judgement as an empirical process’ (1978a, p. 88).

**Wisdom and knowledge**

Kendell and Byrne (1978), two less well-known American academics, continue the debate, observing that so far it had been concerned with ‘victory’ rather than ‘demonstration’ and was therefore essentially a political controversy (pp. 107–8). But there is little evidence in this debate of awareness of the insights of Kuhn (1974), of the work of Bernstein and the sociologists of knowledge, or of the emerging assaults (Feyerabend, Lyotard, Derrida) upon the very concept of knowledge as truth authorised by application of heuristic method. Methods are tools not forms of underwriting truth; their selection is value laden. Similarly, the Vatican’s treatment of Galileo turned on issues of core belief and values; an allusion taken up by Green eld in response to Hoyle:
The image of the telescope is fortunate, since it evokes the history of another ideological battle about nature and how we should perceive it . . . Only faith in a new order of things, in a new method of enquiry, and in a new cosmology could bring one to see the rightness of the heliocentric view.

(Green eld, 1978a, p. 91)

Here perhaps is the root of Green eld’s vulnerability. Since the Reformation, a single, authorising ‘faith’ (in Scripture) had been ‘defeated’, at least in principle, by the claims of empirical rationality. Green eld hoped that phenomenology’s superior capability to ‘account’ richly for the experiences and exigencies of lived reality might redeem the failure of positivistic educational theory to show how teachers could enhance what they provided for learners, in particular learning settings. The utter poverty of positivism’s contribution to educational practices is revealed starkly in the use made by Kendell and Byrne of Patrick Suppes (1974):

It is often thought and said that what we most need in education is wisdom and broad understanding of the issues that confront us. Not at all, I say. What we need are deeply structured theories in education that drastically reduce, if not eliminate, the need for wisdom. I do not want wise men (sic) to design or build the airplane I fly in, but rather technical men who understand the theory of aerodynamics and the structural properties of metal. And so it is with education. Wisdom we need, but good theories we need even more.

Green eld saw that this was wrong; that in education we need wisdom more than anything else. Ask any child what is most desirable in a parent – wisdom and goodness or knowledge and power? What Green eld could not perhaps realise in 1975 was the impossibility of any single theoretical or political perspective providing the necessary ground from which to remove the baneful influence of ‘theory’ and its instrumentalities. Only now can we dimly perceive that wisdom and its ethical postulates must in future be plurally articulated, contested and found room for in a disharmonious social world, replete with disjunction, indeterminacy and radical uncertainty. Different ethnicities, genders (including their transformations) and value systems must be given freedom to cohabit with their differences intact.

Contested control

It would be mistaken to see Hughes’ editorship (1972–1979) as dominated by theoretical confrontations. Management training (Vols. 1.1; 3.2; 4.1), the relation between the professional and educational roles inherent in Headship (Vol. 2.1), current innovations in management within local government (Vols. 1.1;
3.1; 7.2), in-school evaluation (Stanton, 1978, 42–53) and the implications for professional as distinct from lay participation and responsibility in the curriculum and, more particularly, in the management of schools, received increasing attention. The publication of the Taylor Report (DES, 1977) was highly influential and perhaps stimulated interest in ‘innovation’ and ‘change’ (Vols. 4.1; 4.2; 6.1). A response to Taylor in early 1978 (Barnes, Humble, Davies and Lyons, 1978) concludes with some prescient reservations:

- it is important not to expect too much from structural reform – people and processes will begin to change things but structure by itself will not do. Further attention to decision-making processes and the style of leadership of heads is thus needed.
- there may be no discernible relationships between ‘better education’ (whatever that may be) and this type of structural change.
- there are other pressures leading to centralisation of decision-making which will effectively counter the decentralisation movement – control of the curriculum, the economic circumstances, declining school populations, etc.
- we are still left with the fundamental dilemma that, within these proposals there may be little congruence between public and social accountability (embracing the wider community) and financial accountability (still through the LEA).

Indeed, though Taylor turned out to be formative in altering the public and professional ‘terms of reference’ within which these questions came to be examined, and its core proposal that the curriculum could no longer be a matter solely for teachers (DES, 1977, p. 49) was implemented with increasing specificity in the Acts of 1980, 1986 and 1988, some crucial qualitative improvements (participative school leadership, understanding of the relation between forms of school organisation and their educational effects, closer ‘t’ between pupils’ school experience and the requirements of the social and economic conditions for which they are being prepared), remain as elusive as ever. And the apparently unsolvable conflict between the interests of individuals, localities and central government in matters of social policy are still as much a source of parental discontent as the conflicts between teachers and parents which led to the William Tyndale débâcle (ILEA, 1976) and the establishment of the Taylor Committee itself.

II Educational agenda in a more politicised environment

The Society’s first Research Seminar 1 in Birmingham in March 1979 produced a volume rich in historical knowledge and illumination. Current British research is reviewed and there is a comprehensive post-mortem on transatlantic bickerings about ‘Theory’. Greenfield’s reflections (Greenfield, 1979a) and Hughes and Ribbins’ (1979) astute and pragmatic commentary are most valuable.

George Baron (1979a) surveys a decade of ‘Research in Educational Admin-
The conflict between academic and practitioner arises from each party necessarily inhabiting a different universe. As the researcher develops his approach to his problem, no matter how ‘practical’ its orientation, he draws on material and ideas from outside the immediate situation to help him in his analysis and explanations. By so doing he distances himself from the administrator who, when subsequently reading the research report, is alienated by what appears to be irrelevant and extraneous material: furthermore, from his experience the administrator brings to his reading a multitude of questions stimulated by the research but not answered by it.

(Baron, 1973, pp. 13–15)

Different mental worlds are revealed here, arising from the multiplicity of interests, knowledge, goals and motives of research users and makers of educational knowledge. There is also a particular kind of knowledge possessed by those professing education, as distinct from the knowledge claimed by colleagues in the social sciences and other disciplines (Taylor, 1973, p. 194): ‘... knowledge about education is to a large and increasing extent role specific knowledge.’

Dissatisfaction among users of research is summed up by Shipman (1976): ‘From within local government the research enterprise in academia seems to deliver the wrong goods, at the wrong time, without an invoice.’

Lord Rothschild (CPRS, 1971) exemplified for Baron the central government interest being articulated with increasing force in the 1970s, foreshadowing those orthodoxies later enunciated by the Office of Science and Technology (OST, 1993) in Realising Our Potential: ‘the funding agency says what it wants and the researcher works within a defined brief.’

Believing that the DES, aided by the SSRC, would protect the research community from these onslaughts, Baron separates out ‘Policy Related Research’, the particular interest of government, from other areas in which the majority of academics can work relatively free from outside interference. He suggests the following four categories:

- Research for Understanding
- Research for Policy Development
- Research into Administrative Structure and Process
- Evaluative Research.

The purpose of Baron’s distinction was to protect academic freedom. But today, a different division seems to be emerging; one in which educational research is parcelled into ‘soft’ areas (action research, school effectiveness studies,
curriculum evaluation and monitoring), safely entrustable to the weaker, less well-resourced institutions (obtaining Grade 4 or less in the Research Assessment Exercise), and ‘hard’ research, large-scale critical investigations of educational structures and goals, which can be cross-fertilised and strengthened by links with contributory social science disciplines, of the kind envisaged by the ESRC thematic programme areas (ESRC, 1997).

**Interests and approaches**

The phenomenological ‘shift’ and its applicability to ‘case study work’ is exemplified by Best, Jarvis and Ribbins (1979) on pastoral care in the comprehensive school. The gap between the (functional) realities of practice and the (heavily prescriptive) rhetoric of practitioner accounts is neither ignored nor allowed to inhibit discovery and innovation. Attempting ‘to marry the logic of Falsificationism with the Phenomenological premium on meanings’, hypothesis testing is undertaken through questionnaires and a ‘Rhetoric Detector’ designed to untangle and expose intricacies and substitutions in the language of justification used by practitioners (pp. 64–6). The language in which teachers account for their actions and their pupils’ unrealised attainments is as thoroughly permeated by the child-centred philosophy of the Plowden Report as the explanations of their successors today are imbued with terms drawn from accountancy and management. For example, the learner’s ‘busy-ness’, an indication then of fruitful learning in process, is now expressed as an aspect of **efficiency**; the learner’s ‘readiness’ to move forward at an appropriate stage, significant then diagnostically, is taken now as evidence of attainment and becomes an index of the school’s **effectiveness**.

At around the turn of the decade, a new and more urgent preoccupation with the relationship between educational research, public policy and the needs of pupils and practitioners is discernible. Policy ‘directions’ were becoming more prominent in researchers’ agenda, at the expense of methodological concerns. Interestingly, Lakomski (1989, p. 43) notes a similar shift in her consideration of Australian work at about the same time:

> This move makes possible the focus on political values, and power, and thus helps address normative issues in educational administration hitherto neglected.

In a brief Conference introduction, Glatter (1981) observes that:

> Whatever the precise meaning of ‘research into educational policy-making’, it seemed to be agreed that not much of it had actually been done.

(p. 5)
This would soon change, along with a developing awareness in the DES of an urgent need for harder-edged, policy-related information and research. Following the publication of the Yellow Book, the Ruskin College Prime Ministerial speech of 1976, and LEA responses to Circular 14/77, in which the disparate and passive role of many local authorities in curriculum matters was exposed, the new Conservative government brought a fresh impetus to the need adumbrated in the Taylor Report to remove control of the curriculum and organisation of schools from its long-standing niche within the traditional ‘partnership’ shared by teachers, LEA of cers and DES of cials. Central government (at least, certain political groupings within it) soon began to dismantle fences and poke more intrusively and purposefully among the intricacies of what had been cultivated as a ‘secret garden’.

**Externalities**

Education was being compelled to answer more specifically to its natural aspiration to contribute to the welfare of society at large. Educational research was being required to answer empirical questions, illuminate the relationship between normative changes and their implications for educational organisation and practice, and specify appropriate action which could win public support.

In the terms of Drake’s (1981) paper, attending to externalities required a more forceful determination by educational researchers to assist with the discovery of modes of educational and training delivery which were consonant with internal and external efficiency.

> By internal efficiency is meant that combination of resources which yields the maximum achievement of [educational] objectives for a given commitment of resources. By external efficiency is meant the gearing of [education] to objectives external to the [education] system, e.g. production of a desired flow of skilled manpower or meeting certain equity objectives for employment.

(p. 15)

The introduction of GNVQ and, more recently, Ofsted’s campaign to eliminate ‘progressive teaching methods’ (TES, 1996) may be considered thinly nourished legates of that rationality. Yet, sadly, too little of the rigorous method of enquiry outlined in Drake’s paper has contributed to either educational policy or its implementation in succeeding years. For example, greater attention to ‘the effect of financial arrangement on the parties to the [educational process]’ has for almost ten years now been used to justify delegation of local financial powers. Schools and colleges will, it may reasonably be claimed, make more efficient and effective decisions if the power to allocate resources is more generally available to them. Yet the equity consequences of assessment-led teaching and the ‘marketised’ environment in which schools compete on the basis of
accredited results have been ignored by central government (Simkins, 1995). Even now, more than twenty years after OECD articulated the need for a shift of resources within education systems from the front-end of statutory provision (5–16) to a more ‘end-loaded’ investment in ‘lifelong’ education, with all the implications of such a shift for more equitable and socially relevant patterns of both distribution and learning outcomes, only fragmentary indications of such a redirection, chiefly bearing upon HE funding and in response to fiscal pressures, are apparent.

A noteworthy attempt (Pascal, 1987) to remedy the ‘scarcity of empirically grounded studies’ is evident in a subsequent study undertaken from 1981 to 1985 in the University of Birmingham. The work of governing bodies and their working relationships with parents, teachers, other politicians and administrators is examined and discussed by reference to four different dichotomies which were identified. The effectiveness and appropriateness of recent reforms of the composition and functions of school governing bodies were studied from four conceptually different but related perspectives: elitist and pluralist models of the distribution of power in the practice of decision-making, assessment of the relative claims of centralised and devolved approaches to the distribution of powers and duties, the extent and consequences of role ambiguities experienced among professional and lay representatives, and the incidence and implications of functional conflict arising from contradictory expectations of support and accountability on the part of parents and the general public. The report concludes that the distribution of powers ‘embodied, but not clearly defined, in the 1944 Act, is inadequate and out of date’ and that ‘major redefinition’ is required, beyond that provided in the 1986 Act. Unfortunately, the grant of extensive additional powers to governing bodies in the 1988 Act, as well as in the Teachers’ Pay and Conditions of Service Act of 1991 (DES, 1991b) clarified matters only by adopting a thoroughly managerialised concept of the governing body, without resolving the ambiguities and conflicts inherent in the continuing and extended exposure to the twin claims of accountability and a delegated managerial function. Governors retained responsibilities to represent the community, fulfill the requirements of central policy and regulation, and account to both parents and legally constituted authorities (LEA, employment tribunals, admissions appeal boards, residual powers of the Secretary of State) for what schools managed to achieve within their own exigencies of devolved budgets, subject both to centrally approved formulae and centrally imposed rate capping.

Quality and satisfaction

More generally recognisable than the somewhat forbidding abstraction implied by ‘externalities’, the term Quality Control in Education was the focus of discussion at the Society’s Ninth Annual Conference in 1980 and was accorded a special issue of the journal (Vol. 9, No. 2, 1981). Taylor (1981) points out that quality is a relational, not an absolute property. Indeed, it has no meaning except
in relation to some generally understood function (ibid., pp. 2–3) and, as such, bears a cost derived from society’s agreed allocation of available resources, earmarked to secure desired social outcomes. Quality control, far from being a technically discrete operation, lies at the heart of the political process, in which rival claims on social resources are contested and resolved. Quality always carries a price tag. Achieving it requires intricate estimations of needs and satisfactions which must be explored at the level of both individual and collective consequences (Drake’s externalities once again). It is the ‘public good’ component and its relation to individual consumption and investment considerations which make simplified ‘objective’ measures so dangerous and lead to Taylor’s forthright reminder that ‘customer satisfaction is not the sole criterion of satisfaction in educational provision’ (p. 6). The ambiguous and underdeveloped role and contribution of the Inspectorate in relation to these issues is brought out in the succinct conclusion of Young (1980) to her review of HMI’s Aspects of Secondary Education in England.

What was difficult to discern, however, were the underlying models or theories of the nature of teaching and how schools function that were used to make the professional judgements contained in the survey; no framework of theoretical and methodological assumptions was apparent with which to assess the quality of the evidence. I find this a serious omission.

III Change and continuities

Professional development for senior teachers

Fittingly, Hughes (1982) contributed the opening paper of Volume 10.1 to report on a two-year research project, funded by the DES, to study the extent and nature of courses of professional development. The 1978 Conference had chosen a similar theme and two papers from that earlier conference are also examined here (Glatter, 1979; Baron, 1979b). Under review at the conference had been an issue which, in the words of Royston McHugh, ‘was of direct professional relevance and of major importance to all members of the Society’, as well as that of the future development of the Society itself.

Hughes’ report argued for the establishment of a School Management Unit under the general oversight of the Schools Council, itself at that time the subject of review by Mrs Nancy Trenaman. However, the Trenaman recommendation ‘that the Schools Council should continue and with its present functions’ was not accepted by the government. Her recommendation ‘for a representative Schools Council’ and a ‘new initiative in management development and training for headteachers and senior staff . . . associated with a widely representative educational body such as the Schools Council’ (Hughes, 1982, pp. 13–14) was ignored. The aftermath is well known. Extended powers for governing bodies
were introduced in 1986 and 1988; locally delegated schemes of financial management and school admissions and a prescribed pattern of curriculum and assessment have followed from the 1988 Act. But little was done to prepare senior staff in relation to their new management duties until the recent initiatives by the Teacher Training Agency. Hughes’ recommendation had been for:

- a structured programme of award bearing courses . . . to meet the long term career needs of those involved in, or aspiring to, management responsibilities in education;
- a flexible programme of short courses of more immediate relevance, focused on particular topics or skill requirements and possibly aimed at specific levels of responsibility. (p. 9)

Teacher unions and the Society of Education Officers were to have had a major role in the provision to be organised by the School Management Unit. BEMAS too was to have lent at least some form of regional support. A question uneasily forming itself on reading these deliberations of more than ten years ago is: could our educational establishment have done more to provide a more secure and well-founded future, at least in relation to a structure of provision for professional development which ensured a constructive and innovative role for members of the profession itself?

**Dualism in practice?**

The 1978 conference had produced two papers, by Baron (1979a) and Glatter (1979), setting out contrasting approaches to professional development, two quite different conceptions of how the Society and the activity and aspirations of its members should interact to enhance ‘effective practice’. In Baron’s paper, a pervading dualism, of theory and practice and of thought and action, is evident from the first page:

> educational administration . . . a field of study which contributes to effective practice.

(p. 1)

Starting from two key propositions, that educational administration is a field of study, practice and training distinct from other forms of administration and that it should be studied systematically, alongside planned periods of practice, by those holding administrative positions, firm conclusions follow: more resources, more academic departments, more recognised courses and a national accrediting body responsible, among other things, for ‘preparing the ground for’ a national policy for recruitment and professional development. The paradigm position adopted here appears to be one in which the University/Academy/Professional Body is the significant creator, coder and repository of knowledge, prerequisite for the shared
Glatter’s approach and perspective is very different. While Baron sets himself explicitly to review ‘what we have achieved, as measured against the aims . . .’, Glatter entitles his paper ‘Future Directions . . .’ and begins by setting out biographically his entry position as ‘humble administrator’, a practitioner who became an academic in order to ‘understand something of the processes in which I was engaged’ (p. 19). Dichotomies for Glatter are to be sought out as potential fault lines in a network of social and professional relations, the originating source of practice, not as orienting contours in a process of conceptual clarification and systematisation. The potentially restrictive implications of the term ‘professional development’ should not be allowed to create an enclave within which professional insiders can more readily arm themselves with jargon, ‘psychobabble’ and other protective devices. Provision, he argues, should be extended to lay participants, politicians and governors.

On a conceptual level, an emerging dichotomy between policy and management is deplored both because it conflicts with the reality of how educational and governmental institutions actually work and, even more importantly, because ‘the separation of values from techniques always seems to me potentially dangerous’. Surveying briefly some current developments in North America and Northern Europe, Glatter argues unequivocally for educational administration, not as a discipline or field of study in its own right but as an applied professional field requiring a theory of practice (italics added) ‘based much more than in the past on the special features of leadership, management and change in educational institutions’, rather than relying on ‘general theories drawn largely from the social sciences and the broad literature of administration’ (p. 25). Much more clearly in Glatter, theory is drawn from practice rather than developed in enclaves in order to contribute to practice.

What Glatter does most valuably here is to provide colleagues with a contextualized agenda and orientation on the basis of a clearer and more purposeful specification of role and action for those engaged in professional development. Many of the features put forward for emulation in his 1978 paper are now routine currency. In the meantime, however, the ‘social sciences and the broad literature of administration’ have themselves undergone a sea-change, emancipating themselves and voyaging far from the well-defined territory and positivistic rubrics of functionalist theory and associated research designs, diversifying in terms of their relationships with other disciplines and modes of thought and inquiry. Can education, and the study of education management and administration in particular, attentively serve the interests of learners and absent itself from this plural and formative process, excluding itself from the role which social science now fulfills within a much larger context of radical social change?

The social and natural worlds today are thoroughly infused with reflexive human knowledge; but this does not lead to a situation in which
collectively we are masters of our own destiny. Rather to the contrary: the future looks less like the past than ever before and has in some basic ways become very threatening . . . In most aspects of our lives, individual and collective, we have regularly to construct potential futures, knowing that such very construction may in fact prevent them coming about. New areas of unpredictability are created quite often by the very attempts that seek to control them.

(Beck et al., 1994, p. vii)

Thus defined, the role of social science, within which education is surely a key location, is becoming coterminous with that very process of social re-definition and reconstruction. Is not the paradox of having ‘regularly to construct potential futures, knowing that such very construction may in fact prevent them coming about’, precisely what teachers experience when they implement a ‘whole school’ approach to Special Needs and find that the school’s curriculum policy has also to be redefined in consequence, or when they establish planned provision for the less able, only to find that it impacts unexpectedly on pedagogy and assessment practice across the school? Glatter’s reflective and speculative thoughts in this paper capture, I believe, something of these ‘reflective’ uncertainties which are inherent in the task of management in educational settings.

**Micropolitics**

The conditions of endemic and constitutive uncertainty (Preston, 1996) in which British education is now conducted were the focus of the Society’s Tenth Conference, held at Bristol in 1982. The highlights of that collection are three papers by Glatter (1982), Hoyle (1982) and Bailey (1982), which contribute significantly to an understanding of educationalists’ managerial tasks. Bailey’s rejoinder to Hoyle tries to integrate ‘the study of micropolitics into the broader framework of organisational theories’. This is a balanced and pragmatic, more philosophically detached contribution which relates the topic to more enduring and important implications, especially in relation to our obligations to children, as well as to all learners.

School is for most children their first experience of organisational life and of the wider society beyond the family. The quality of its micropolitics is in itself a powerful educational force maintaining or denying the quality of life in our society.

(Bailey, 1982, p. 105)

Pratt (1982) notes changing perspectives within these contrasting approaches. In the decade 1972–82, the preoccupation, associated with the process of local government reform (DoE, 1972) had been ‘one of designing structures for the achievement of specified purposes’. This approach came increasingly to be chal-
RECORDS OF ACHIEVEMENT

lenged by an opposing camp of ‘realists’ who resisted imposition of a ‘“managerial” view of reality’, phenomenologists by method, who looked for theory to be ‘grounded’ in reflection drawn from practice. What was being questioned by some and rejected by others is the domination in organisational and management studies of a narrowly rational view of human action. Glatter (1982) supports these endeavours to reveal the micropolitics of schools in their conduct of the daily work of teaching. Yet, he points out, the attempt to form and implement policy on a rational basis is also a human propensity which can be and sometimes is attempted with success (p. 161). More significantly, Glatter warns of the danger implicit in expecting too much from a single model. Just as the dominant ‘rational’ models of the 1960s and 1970s ‘were based on an underlying set of values, connected with optimism and a belief in the possibility of progress largely through “technical” means, so the micropolitical approach, which at times comes close to nihilism, is in tune with the cynicism and demoralisation of our age.’

Hoyle exposes a somewhat gloomy picture of school organisations; as Machiavellian, darkly imbricated within a-a-like intrigues and ‘hidden agendas’. But he is concerned also to find realistic and illuminative strategies, with a ‘theory-for-understanding’ which might help schools examine and extricate themselves from obstructive growth, lurking in their routine dynamics of interaction and control, hitherto neither fully understood nor confronted. The paper is a lucidly and economically written introduction to a carefully selected range of writers and ideas drawn from organisational theory.

The politics of management

Pratt (1982) seems to have marked a turning point when he summarised the concerns of members as moving away from the ‘management of politics towards . . . “the politics of management”’. Acknowledging the importance of Greenfield’s contributions he notes evidence in the educational literature of a growing recognition ‘that structure, function and process [are] interactive.’ The shift of focus (from macro to micro) and of method (from technical/instrumental to discursive/interactive) may have been symptomatic of an increasingly general readiness to acknowledge that educationalists were less sure of the direction in which they should go and of the purposes for which their skills should be employed. This sense of a ‘turning point’ and a felt need of directions amidst the encircling gloom may have prompted the title of the next Conference: Education Today and Tomorrow: Challenge and Response (Vol. 11, No. 2). At any rate, out of the turbulence surrounding the discussions and emerging research agenda of the period up to 1982, a new, more exploratory focus on practical problems and the feasibility of their solution is discernible in the period 1983–1995.

Volume 11 also exemplifies the journal’s continuing double achievement in identifying new professional perspectives and disseminating studies of organisational practice. 11.1 considers ‘the Role of the Deputy Head in Secondary
HISTORY AND RESEARCH

Schools’ (Owen, Davies and Wayment, 1983), ‘institutional Factors and School Absenteeism’ (Reid, 1983) and ‘Microcomputers in Secondary Schools’ (Pratt, 1983). This last paper contains an interesting nugget on the role now termed IT co-ordinator. Pratt, drawing upon an NFER study of LEA Advisers and Innovation (Bolam et al., 1979) and an unpublished Bristol MEd dissertation (Reilly, 1982) advocates reversal of received wisdom regarding dissemination of IT expertise: instead of appointing substantive experts as consultants and advisers, ‘experienced process experts [should be] required . . . to acquire the substantive expertise’ (p. 61). This approach now characterises professional good practice (North, 1991).

In the next volume, a new political focus is followed up by a fresh and more rigorous economic approach to organisational and policy questions (Thomas, 1984; Hough and Warburton, 1984; Crispin and Marslen-Wilson, 1984). New structures and mechanisms which would have significant implications for education at all levels were also being examined in the journal. A small-scale study of the impact of the National Advisory Body on the management of a large college appeared (Bush and Goulding, 1984). The NAB was precursor of the national funding councils (FEFC, HEFC, Funding Agency for Schools), and the Cambridgeshire (Hinds, 1984) and Solihull (Humphrey and Thomas, 1986) pilot schemes of school delegation paved the way for the national introduction of LMS. Two of these authors (Hough and Thomas) were subsequently appointed to Chairs in the Economics of Education and their Inaugural Lectures have now been published in *EMA* (Hough, 1991; Thomas, 1996). In the next section, a number of these papers on financial and economic issues will be discussed as indicative of the journal’s contribution to the promotion of studies in this field.

IV An economic approach

Education, like many public services, only recently came to be subjected to economic analysis. The ‘dismal science’ connotes aims, values and methods of enquiry unrelated if not alien to the aspirations of teachers, carers and healers. Brian Knight expresses similar observations in his short paper ‘Attitudes to Educational Finance’ (Knight, 1984).

Why is it that those who work in maintained schools and colleges believe that outside certain limited areas financial information is not important; that they are not concerned with the detailed costs of the work they do; that the financing of a school and college is not a subject for serious study; that interest in such finance is misplaced, even sinister or odd?

A peculiar English sensitivity regarding explicit discussion of money matters may also have inhibited application of economic theory to educational contexts. R. H. Tawney, as Hough (1991, p. 219) reminds us, described the economics of
education as ‘that repulsive hybrid’. The socialist tradition in general, so in u-
ential in parts of the English educational tradition, has been especially resistant
to application of an ‘economic’ approach. But those thought worlds, if they ever
existed in such a rare ed form, have now disappeared utterly, as schools con-
front, within a framework of delegated school budgets, the challenges of com-
puter-based Management Information Systems and the opportunities to be made
available by the ‘Superhighways’ Initiative (DfEE, 1995).

The recent origin of the subject is usually dated to the address by Thomas
Schultz to the American Economic Association in 1960 and his enthusiastic
advocacy of a human capital approach to investment in education (Schultz,
1963). Attention to the subject in this journal may be traced to the pressure of
more pragmatic concerns, in particular to the modifications made to local
government finance after 1972, which eroded the independence of LEA financial
decision-making, to the cumulative effects of associated overall expenditure
reductions on education, and to the pressure on schools in particular, following a
chronic fall in birth-rate after 1964. Volume 12 is notable for its preoccupation
with the consequences of these structural and seemingly irreversible changes, by
attention to issues such as: managing effectively in ‘small’ schools (Mountford,
1984), LEA responses to the effect of the 1981 Block Grant (Crispin and
Marslen-Wilson, 1984), and the quality consequences for teachers and pupils of
the ways in which contraction of the teaching force was being effected (Thomas,
questions of individual school costs, in a short paper whose citations reveal both
the dominance of American work in this field and the relative lack of attention
hitherto accorded to such questions in the journal. This has been remedied to
some extent in subsequent issues, notably by the contributions of Simkins (1986,
Thomas and Bullock (1992) and Thomas (1996). Noteworthy too is Bondi’s
Manchester-based study (Bondi, 1988) of the relation of school costs to policy
and community variables. In what may be an undeservedly overlooked contribu-
tion in this area, her conclusion, that falling school rolls have less in uence than
had generally been supposed on variations in costs, and especially on premises-
related costs, is surprising, and, in view of what is now known about some of the
effects of formula funding, worrying.

‘Patronage, Markets and Collegiality’ (Simkins, 1986) exempli es what few
individual papers fully achieve, namely illumination of a general institutional
problem through analysis which maintains positive interaction between school-
based research data and a simple, but robust, conceptual model. The literature
cited is apposite, selective and suitable for the widest possible readership.
Simkins (1986, p. 17) argues, perhaps presciently, that ‘something of a move-
ment to broaden the scope of schools’ financial responsibilities’ is afoot. What
strategies are available to schools for ensuring that often crucial marginal
choices within tightly constrained limits of discretionary decision are made most
effectively in terms of both the school’s internal ef ciency and its broader,
underlying effectiveness as a learning institution in the care of a committed and motivated staff? The paper deserves to be read for its intrinsic qualities, and is a most valuable teaching resource. After almost ten years now during which schools have been working with greater freedom to make independent resource decisions, perhaps it would be timely and profitable to reassess some of the paper’s conclusions (pp. 28–9). To what extent have participative decision processes survived? How closely related are current school resource allocation procedures to processes of curriculum decision-making? How widespread and effectively are formulae in use in schools (Boulton, 1986)? Some recent findings (Webb and Vulliamy, 1996) point to the emergence of a damaging divide between the needs of the curriculum and seemingly inescapable organisational pressures within schools. The impact of these has been ‘to create “a new headteacher”, with more hierarchical forms of management style creating a gulf between headteachers and the staff’ (p. 313). In the case of primary schools, Webb and Vulliamy conclude:

Thus, not only is there currently a tension between the administrative and curriculum leadership demands of primary school headship, there is also a growing tension between collegial and top-down management strategies at the whole school level . . . The current climate thus encourages headteachers to be powerful and, if necessary manipulative leaders in order to ensure that the policies and practices agreed upon are ones that they can wholeheartedly support and defend.

(p. 313)

**Structural and qualitative change**

A new employment structure embracing both pay and conditions for teachers was established between 1986 and 1992. The professional implications of these impending changes were considered by Henson (1987) in a brief but usefully synoptic review of the literature and the implications of a more hierarchical set of relationships implicit in the Baker proposals. A fundamental question, which has been obscured if not suppressed by the *dirigisme* employed by recent governments in relation to education and by the historically diminished influence of the teacher unions on both government and public opinion, is whether learning can and should be *controlled* by teachers and whether the schools are to be institutions in which learning will be ‘delivered’ as product, or ‘nurtured’ as a process in which all are expected to participate. If teachers cannot or should not control the conditions and processes of learning, how can they be ‘managerially’ responsible for attainment of stipulated learning outcomes? If schools are to belong meaningfully to the communities they are there to serve, can and should they be required to operate with a centrally imposed specification of required learning activities and outcomes?
Perhaps a more inscrutable factor which has inhibited sharply focused consideration of these questions has been the nature and rapidity of changing social and economic conditions. The Callaghan initiative in 1976 to steer schools more pragmatically to meet the needs of the workplace was almost certainly premised upon a conception of work, its nature, value and availability, which is now seriously obsolete. Succeeding governments have moved forward with an ideological, some might say quasi-religious belief in the social and economic virtue of establishing market conditions as prerequisite for the efficient operation of almost every social activity and service. Yet in the globalised economy which every day impinges more directly upon the lives of each individual, it is becoming apparent that the scope for markets is increasingly constricted to the *stimulation of the consumption and distribution* of goods; creation and production require the distributive, co-ordinative, informational, and creative qualities and capabilities of a kind which are achieved more effectively within network relations. Levels of mutual trust and qualities of human interaction which suffice in exchange relations are inadequate for an increasing number and variety of human interactions and institutional formations. Might not learning be one of them?

Two contrasting papers (Glatter, 1987; Dennison, 1988) made their contributions to this continually emerging debate by setting an educational agenda for the year 2000. Glatter considers current attitudes and practice with regard to management and policy and identifies five specific issues: staff management; profession/parent relationships; institutional effectiveness; the management/policy interface; and the role of BEMAS. He found it disturbing that the issue of parental involvement seems ‘to have been appropriated by one part of the political spectrum.’ With hindsight now we are beginning to see some of the consequences of crude attempts to redefine parents and learners as ‘consumers’ and ‘users’ and must surely hope that the ‘upheaval of reaction’ which Glatter refers to will be successful in identifying and winning support for more enlightened community involvement in education. On institutional effectiveness he draws attention to a neglected aspect of the self-concepts of members of organisations, a theme addressed more philosophically by Patricia White (1987). On policy and management Glatter challenged the current ascendancy of the ‘accountancy’ approach to education policy-making and in particular points to the detrimental effects of an unsustainable separation between policy and management, despite the stubborn refusal of the Audit Commission ‘to comment on issues of education policy’. Referring to Maw (1984) and Inglis (1986) he just hints at the threat to professionalism inherent in attempts to separate policy and management, which Glatter (1987, p. 9) believed to be ‘even more closely intertwined’. If authority over educational values is reserved to ‘policy’ bodies, the teaching profession may be stripped of the moral basis of its professional role, increasingly technicised, refashioned as chief instrument or conduit for the implementation of policy (Hargreaves, 1994; Webb and Vulliamy, 1996). Implications of these developments were to be explored later in contributions by Ranson (1992).
HISTORY AND RESEARCH

and Strain (1993) and elsewhere, with particular reference to curriculum management, by Hargreaves (1994) and Ball (1993a).

Dennison’s paper, ‘Education 2000 – Trends, Influences and Constraints to the Turn of the Century’ is more avowedly futurological in both aims and approach. Four ‘dominant factors’ are identified as demanding attention:

- the changing nature and structure of skill requirements in response to technological change;
- the consequences of consumerism on schools and the teaching profession;
- continuing reductions in the volume of public expenditure on education;
- the extended application of IT in learning, school management and staff development.

What we have learnt since then has revealed how little is yet understood which might help us respond practically to these challenges. A further train of thought is suggested; if Dennison’s predictive agenda were aptly chosen, have those issues (work-related education, the implications of social change, resources in education and the application of IT) been adequately represented in contributions to this journal? It is hoped that this review might prompt readers to consider such questions.

Financial management in schools and colleges

Notable among papers given at the 17th Conference (Volume 17.2) was Levacic’s (1989) discussion of the rules to determine LEA’s distribution of formula-based budgets to schools and colleges. She shows how schemes of delegation require a balance to be struck between conflicting sets of preferences regarding anticipated outcomes. Since decision-makers will use formulae to achieve their particular interests and objectives, explicit normative criteria should be stipulated. This enables self-interested or sectional purposes to be disentangled from those based on the values (efficiency, effectiveness, equity, accountability) which the scheme is intended to promote. Schemes are intended to encourage schools to be more efficient by generating savings and using them for chosen purposes; schools are therefore permitted to carry forward budget surpluses. Other elements of the formula, however, seem to allow schools to operate self-interestedly without regard to general principles. In Northern Ireland, for example, the inclusion of a weighting to support provision for children from materially or socially deprived backgrounds encourages schools to admit as many children as possible within that category but to spend resources differentially in support of learning by those children most likely to succeed in external examinations. In Levacic’s words, ‘reference to general principles helps in reaching agreed and consistent solutions to specific issues’ (p. 89).

Professional understanding of the relations between policy intentions and educational outcomes is indebted to the work of Levacic (1992) and Thomas
and Bullock (1992). Both reveal interim indications that some significant improvements in efficiency and accountability may be attributed to the operation of LMS. Cost information is more transparent, inducing more focused accountability, and school autonomy, particularly in respect of virement, is resulting in more efficient resource allocation within schools (Levacic, 1992, p. 27). Some more equitable patterns of distribution are also evident, arising from instances where discretionary funding has been replaced by application of general rules. Yet, some disturbing contrary tendencies are also revealed and the interim verdict on the extent to which the reforms have increased equity or contributed to enhanced teaching and learning is sceptical and mixed. Though opportunities for the exercise of parental choice have been increased, resources seem to be shifting away from smaller primary schools in favour of larger ones and away from secondary schools (Thomas and Bullock, 1992). On qualitative learning outcomes, ‘important factors found to be associated with school effectiveness – purposive leadership, positive school climate . . . high expectations, curriculum planning, work-focused activities, recording pupils’ progress’ are not specifically enhanced by LMS reforms (Levacic, 1992, p. 27).

**Competing values**

‘The Equity Consequences of Educational Reform’ are scrutinised a little later in an excellent paper by Simkins (1995) in which he discusses a range of ‘input’ and ‘output’ definitions of equity, and points out that a formula and local market circumstances ‘only determine the degree of equity between schools in the system and hence place constraints on the opportunities which schools can provide for individual pupils’ (p. 224). In his conclusion he argues that LMS ‘clearly embodies a concept of procedural equity but has consequences for distributional equity too’ (p. 230). In this respect, the ‘input-based definition of equity with pupils classified primarily on the basis of age’ may result in further disadvantage for primary school pupils, especially those in smaller schools, or who have special educational needs or who come from disadvantaged backgrounds. Some of the conceptual difficulties inherent in attempts to resolve these problems are explored further in Thomas (1996, pp. 40–1; on the use of weighting procedures which incorporate non-utility information based upon underlying principles) and Strain (1996, pp. 55–6; on the ‘endowment effect’ and school strategies to avoid instances of ‘local injustice’).

How economic concepts illuminate education policy choices and assist practitioners at the institutional level in their efforts to achieve learning aims for pupils is explained by Thomas (1996).

A ‘market’ . . . represents those circumstances where decision-making is decentralised and self-interest is assumed to be the motive force of human action.
The education system in England and Wales is a ‘mixed economy’ embodying market-like aspects, where agents make decisions on the basis of self-interest, as in circumstances where parents choose a particular school or a teacher chooses to take up a professional post, as well as extensive features of a ‘command’ economy, one in which the resources judged necessary for particular productive processes to take place are commanded by a central agency which enjoys authority within a hierarchical set of institutional relations. As Thomas reminds us, even in today’s devolved conditions of school management:

the maintained school system is almost wholly funded by general taxation and, for parents and pupils, is free at the point of consumption. The overall level of spending is determined by government (central and local), and the means of production are largely owned or employed by the government, which also determines the rules for allocating funds to schools. More important still, the curriculum and assessment of pupils is largely determined by the Secretary of State.

Whether the consequences are efficient and equitable is then examined in relation to an earlier study (Thomas and Bullock, 1994). This raises questions such as whether the ‘current [irregularly stepped] funding profile’ of LEAs in relation to Age-Weighted Pupil Units (AWPU) is consistent with what is inherently required by ‘the continuous nature of the education process’. The Isle of Wight is now known to allocate 2.9 times more to provision for 16-year-olds than it does for 8-year-olds, compared with 2.08 times by Sunderland. In the (primary) school size range 122–3 the level of funding per pupil may vary by as much as 25 per cent. With these findings it is indeed possible and necessary to ask more pointed questions about the efficiency and equity effects of current funding practice.

Is it necessary, for example, for comparable schools to be funded at such different levels in order to provide the same national curriculum? Are the schools with comparatively high levels of funding providing a superior experience and achieving more than the less well-funded schools?

With wry, ironical detachment, Thomas goes on to observe that:

It is only as a result of the new system of funding schools that there is evidence which enables these questions to be considered – a clear benefit from introducing a greater emphasis on ‘command’ in the funding of schools.
V New ways of examining old questions

In this final section, the focus is deliberately restricted to a small number of papers in search of possible new ways of thinking and learning about educational management. Some of these experiments with new methods emphasise continuity with earlier approaches; others attempt radical redefinition of professional and organisational agenda. All assist our understanding of emerging requirements of organisational leadership in schools and colleges and of the role and purpose of ‘public’ education ‘systems’, within a ‘Learning Society’.

Leaders and followers

Gronn (1996) exposes some significant defects in the ‘new’ cult of ‘leadership’, whose rise to prominence he dates from the early 1970s. Recent conventional conceptions of ‘leader-followership’ posit a cause-effect relationship between leaders and followers, consistent with a range of self-justifying, instrumentalist assumptions associated with ‘managerialism’ (‘the manager’s right to manage’; ‘the government’s right to govern’ etc.).

Leadership is seen as something performed by superior, better individuals (invariably, ageing white males), rather than by groups, located in top positions, and as something done to or for other inferior, lesser people. Causal significance is achieved when relevant counter-factual conditions are satisfied (e.g. the outcomes for followers otherwise would not have transpired but for the leader’s leadership; all rival candidate explanations for the outcomes have been eliminated).

(Gronn, 1996, p. 12)

Recalling the ‘critical role’ accorded to followers by Max Weber, Gronn most persuasively cites ‘an emerging consensus that leading is an inherently symbolic activity’, an activity imbued with the intrinsically human capacity to frame meaning, ‘to make sense of one’s own and others’ experiences of the world’. If leadership activities are to contribute as we would wish to the construction of a shared social reality, support of the group must be mobilised through exchange of shared symbols and meanings. This is how identities are formed (Anderson, 1991). For these processes to be active, a level of consent and participation will be necessary on the part of the group. Transforming organisations is part of a cultural project. Identifying the extent and organisational forms by which this can become operative and fruitful, is a central task in a continuing, interdisciplinary endeavour.

It is enduring moral values and culture which give organisations their distinctive characters and styles. Any cult of efficiency and effectiveness is of secondary import; these are essentially instrumental and
operational values, necessary conditions for the persistence of the co-operative system that constitutes organisation . . . but not sufficient. For, antecedent to both efficiency and effectiveness is some overall abiding purpose or end, a moral economy, which provides people’s willingness to co-operate with its justiﬁcation from the outset.

(Gronn, 1996, p. 24)

Gronn’s paper accords well with the aims and methods attempted by Ribbins and Sherratt (1992) in their efforts to supplement a large-scale research project examining ‘the changing patterns of governance and management . . . in response to recent legislation’ through the use of ethnographic accounts of what is actually happening in schools. As well as using traditional sources of evidence, such as collections of documents, interviews, diaries, discussion and observation, they try to set the Head’s accounts against those of other key actors and to involve Head, teachers and researcher in a process of reﬂection and interpretation which they term ‘a dialectic of biography and autobiography’.

**Professional implications and principles**

Busher and Saran (1994), after exploring ‘the various models which might be used to illuminate the work of headteachers’, argue convincingly for ‘the need for micropolitical theories of organisational life to be inclusive of both formal and informal aspects of organisations’ and to support positively the development of ‘consensual interactions’ without neglecting conﬂictual elements. They identify the main features of leadership activities in schools as: constructing an organisational culture which embraces the shared values and beliefs of members, managing the external environment and ‘using and diffusing power to handle conﬂicting values and interests between stakeholders’ (p. 8). Their distillation also retains the essential characteristics of a political model of organisation, in essence a human social construct whose purpose and processes are deﬁned through uncoerced discourse which responds primarily to moral, rather than technical, claims. These purposes in turn derive from ‘a duty to serve the best interests of the pupils’:

heads who acted in this way built their credibility as professional leaders with teachers.

(pp. 11, 12)

Further exploration of how these qualities of leadership might be developed and practised in a morally defensible organisational framework (Hodgkinson, 1993) can be found in Volume 21, No. 3. The merits of generic as distinct from sector speciﬁc standards of competence are reviewed by Earley (1993); Ouston (1993) examines management competence speciﬁcally in relation to the ﬁndings of school effectiveness studies and teachers’ assessment and training needs. Eraut
RECORDS OF ACHIEVEMENT

(1993b) delves more analytically into what must be a prerequisite for signifi-
cant advance on these fronts by arguing the need for a new epistemology to ful-
al the aims outlined in Schön’s Reflective Practitioner. Such a model incorporates the
personal and professional knowledge which teachers actually draw upon in their
teaching and managing in schools. The paper is both carefully constructed and
conceptually rich. Following Argyris and Schön (1976), listening and actively
seeking feedback from colleagues is encouraged in order to correct for the tend-
ency ‘of people’s perceptual frameworks to be determined by what they want or
expect to see’ (p. 230). These are termed ‘meta-processes’, which assist contin-
uing critical adjustment of cognitive frameworks and assumptions. They are
essentially processes concerned with self-knowledge and self-management.
Eraut later adds ‘the conception of a meta-evaluation framework’ as central to
the notion of professionalism. In the case of teachers, he suggests, such a frame-
work should be founded on two moral principles: the twin obligations to practise
child-centredness and, for the sake of future generations, continuously to
improve one’s professional expertise.

The learning society

The importance of principles, assumptions or values such as these lies not in
their embodiment of intrinsic authority or some immanent guarantee to practi-
tioners of being ‘right’, or of enabling them through practising them more reli-
ably to ‘do things right’ – their signifi cance is, much more elusively, that they
constitute the foundation of any education system. One Head’s expression of
belief in his own school’s constitutive values was recorded by Ribbins (1992):

it has to do with how we value children; all children and not just some
children. We believe that all children have a right . . . to achieve. Our
first job as teachers is to enable them to achieve. This still applies even
if they don’t want to achieve. I do not believe that children always
know what is best for them . . . I think also we have sometimes to say to
parents as well that something is good for their child. Within this we
have a firm commitment to equal opportunities. We want to help all
children to broaden their horizons and visions. We want to help them
all to understand there is a world beyond the one they know and that
they can all participate in it. The school is just a step to this and
teachers are there to help to make it possible. My task is to create the
conditions which make this possible for teachers and children to
achieve. It is not a task I can achieve alone.

(p. 67)

Of course, values espoused are not always or entirely matched by results in prac-
tice. In particular, entrenched historical and social patterns of underachievement
are hard to change. Introducing his seminal essay ‘Towards the Learning
Society’, Ranson (1992) notes the ‘stubborn statistic’, recently acknowledged by HMI (DES, 1990), of one in three children receiving a poor education, under-achieving. He attributes this to ‘the long cultural tradition of educating a minority’.

Underachievement, Ranson argues, is institutionalised in our schools ‘because of principles and assumptions which are constitutive of the education system’. Many of these assumptions, by their appearance of being ‘only common-sense’, conceal the shaping force of underlying values which contribute to the ‘distribution’ of unequal, unjust or undesirable educational consequences, such as under-achievement. Ranson lists some of these in ential and readily recognisable ‘principles’. Education is an activity for schools and parents, when children are young; training is for colleges and employers. Learning involves instruction by those whose authority to teach derives from their knowledge and skills. The Curriculum should also transmit skills in identified areas of (objective) knowledge. The learning outcomes of education processes should be measured by universal objective tests whose results should be published to reward and enhance the credibility of the successful, encourage the average and penalise the ‘failing’ institutions. By these latent mechanisms or constitutive principles, failure to ‘deliver’ what central government specifies to be the appropriate ‘outcomes’, which may or may not match the kind of organisational values articulated by the Head quoted earlier – to enable children to achieve even when they don’t want to achieve – is transmitted and explained publicly as the failure of the school itself, a failure of professional competence or application, or, more unfairly still, the fault of the individual child and its family.

The remedy proposed by Ranson is to alter fundamentally many of these constitutive principles by replacing them with new, socially agreed conceptions of the place of learning in society and of a more ‘civilized’ working relationship between working, civic, learning and caring roles in the lives of individuals. These constructs, institutions which sustain and mediate our social relations and experiences, are the responsibility of all, in common. Learning is an indispensable part of such a polity at all stages of an individual’s life. This is the conception of ‘The Learning Society’ whose advocacy Ranson concludes with:

A different polity, enabling all people to make a purpose of their lives, will create the conditions for motivation in the classroom. Only a new moral and political order can provide the foundation for sustaining the personal development of all. It will encourage individuals to value their active role as citizens and thus their shared responsibility for the common-wealth. Active learning in the classroom needs, therefore, to be informed by and lead towards active citizenship within a participatory democracy. Teachers and educational managers … can, I believe, play a leading role in enabling [original italics] such a vision to unfold not only among young people but also across the public domain.
RECORDS OF ACHIEVEMENT

The end is where we start from... 

This review has attempted to sift and encourage a second reading of some of the enquiries and debates which have been published in this journal. It has not attempted to assess their intrinsic merits as publications but from them to recapture and re-present still pertinent ideas, experiences and ways of examining the challenges now facing teachers and learners.

Our practical understanding of the relation between theory and practice in education has changed beyond recognition since the early days of the Bulletin and the 1974 IIP Conference. The recognition of the value of action research for teachers as both practitioners and researchers has been crucially influential in this respect. Yet the logical and conceptual foundations underpinning such activities still exercise the concern of theorists. Evers and Lakomski (1993, p. 150) opt for explanations of social behaviour which are reconcilable (coherent) with those of natural science. Others, notably Hodgkinson (1993, p. 184), resist tenaciously all attempts to blur the line between ‘fact and value’, insisting on the separate, moral, humanistic nature of administration. The domain of the ‘social’, what is experienced routinely, intersubjectively and in common among human beings, is almost lost sight of in this long-running battle between positivistic ‘coherentists’ and humanistic ‘idealists’ (Bates, 1993, p. 174–5). My own preference is to insist, with Bates, on the primacy of the intersubjective and the ‘social’ (Strain, 1996, pp. 50–51), to continue to search for ‘real’ possibilities of learning.

SCHOOL MANAGEMENT IN NINETEENTH-CENTURY ELEMENTARY SCHOOLS

A day in the life of a headteacher

Angela M. Thody

Introduction

The late twentieth century in England has witnessed what might be described as a ‘back to the past’ movement in education, its management and administration. Devices last utilized in the nineteenth century have re-emerged with minor variations. There are, once again, for example, a National Curriculum for schools, apprenticeship ‘on-the-job’ training for teachers, performance-related pay for staff and institutions (at least in higher education), school governors with real power, proposals for smaller, dedicated, local government units to replace the all-purpose local authorities, a requirement to re-introduce the monopoly of the Christian religion in schools and a ‘back to basics’ call for teaching methods. All these requirements impact on systems of management employed in schools although so far there have been no requirements for this to return to nineteenth-century arrangements. If, however, this ‘back to the past’ movement is to be successful, perhaps it will need reinforcement with the appropriate management techniques.

What were these techniques? This article reports the outcome so far of an attempt to discover how schools were managed in nineteenth-century England. If our dilemmas appear to be persistent, then perhaps the managerial solutions will prove to be likewise and we may then have some ‘new’ ideas to guide our schools’ leaders.

This topic has not previously been researched, as far as can be ascertained. This article was intended as an exploration to see whether there was sufficient material to make such a study possible and this has proved to be the case, although little of it is directly on school management. The sources used are...
discussed in the methodology section at the end of this article, together with reflections on the value of history in the study of education management.

The author, having used observation techniques to describe and analyze the work of twentieth-century school leaders, decided to adopt a similar approach to recording the work of a mythical headmaster of the nineteenth century. Hence readers are invited to follow a day in the life of Mr Thody, headmaster of Reynold Street Board School, London. The observation had, perforce, to be second-hand having been ‘factionalized’ from various nineteenth-century sources.

**Back to the past: the headmaster’s day**

**Place:** The lodgings of Mr Thody, proximate to the school.

**Subject:** Mr Thody, age 30 years, unmarried. In his first year of headship following Assistant Teacher status at another London Board school. He became a Pupil Teacher at fourteen and then progressed into provisional certification followed by full certification.

**School:** Reynold Street Board School – 360 scholars including 80 infants. Two certificated teachers, one provisionally certificated (Mr Thody, headmaster; the Senior Assistant, Mr Davison; the Assistant, Miss Sinclair) each deemed responsible for 40 pupils each (‘By Article 84, a woman over 18 years of age, and approved by the Inspector, is accepted in mixed, girls’ and infants’ schools as equivalent to a pupil-teacher’. Two pupil teachers, each allowed to supervise 40 pupils, and one candidate for pupillage permitted 20 pupils. There are seventeen on the managing body.

**Context:** Mr Thody has completed his ablutions, personal devotions and dressing. School paperwork is habitually undertaken at this time of day. During school hours, he will have his own teaching to conduct or will be otherwise engaged in superintendence. The lunch time, and before and after school, are his management times.

**6.00–6.30 a.m. Registers/administrative tasks**

Mr Thody commences by checking that the pupil teacher delegated to take the register daily has marked in ink only, with no erasures and with no pencil entries inked over, boys’ names in the upper part, girls’ names in the lower part and a daily total noted for numbers present. He then works out, and records the average daily present for the past week, notes the numbers of unexplained absences and the reasons for other absences. Today, he has the additional task of ensuring that the admissions, progress and withdrawal records are complete, together with the summary book, log book, fee book and stock book. Each child is numbered in order to avoid double counting and Mr Thody is very proud of his work.
his accurate date of birth records. He informs the observer that he has had to visit the registrar’s of ce to obtain the details of ten of his pupils whose parents had been unable to supply the information.

All this is a final check to reassure himself that all is ready for the inspectors’ visit next week. He is nervous at the prospect of his first inspection and there is a managers’ meeting this afternoon as a preliminary in order to see that all is ready. He has his own pupil progress book ready for display; he is hoping the managers will approve the idea for all his teachers to adopt. Mr Thody explains to the observer that the importance to school management of the correct keeping of the registers arises from the relationship of attendance to grant received and to examination results. The school is paid according to how many children attend and what results they achieve in examinations. Keeping the registers is an extremely time-consuming element of a head-teacher’s management tasks and Mr Thody is hoping that the National Union of Elementary Teachers will make representations to the Board of Education to lessen the detail required. The Union generally concerns itself with curricular matters, such as the representation made earlier in the 1880s that parsing should not be required from 4th Standard children studying grammar. Mr Thody hopes the Union will bring pressure to bear on management issues too.

6.30–6.45 a.m. Daily planning

Mr Thody shows the observer his timetable for the day. He says he usually glances over it to remind himself of the day’s outline. He re ects how pleased he is that he decided to have a timetable since it enables him to ensure that when one class is doing something noisy, such as reading, then other classes in the same room would be doing quiet work while the infants should not undertake more than three hours’ work. Mr Thody had discovered that advance timetabling means he is less harassed since he does not have to decide what to do next when he is busy with the activities of the day and can concentrate better on what is in hand. The children bene t since it enables planned progress, and impresses them with the value of time and the morality of obeying routines. ‘A timetable is to a school what grammar is to a language’, quoted Mr Thody.

6.45 a.m. Equipment orders

Mr Thody selects the order book for equipment. He is listing the number of slate pencils required. He pauses to consult a supplier’s catalogue for guidance on the appropriate lengths of pencils for different ages of children.

6.46–7.05 a.m. Management meanings

Mr Thody ﬂexes his hand and rests his quill. Leaning back in his chair he ruminates aloud to the observer. ‘Strange how one’s training never seems to cover the
essentials of management. Now if only I had known how to judge the minimum length of slate pencils. Still, things have improved. Consider the syllabus through which I must guide my pupil teachers. School management is a compulsory subject.’ He hands the observer the 1887 General Syllabus for Certificate Examinations:

\[\text{School management}\]
\[\text{First year}\]

1. The methods of teaching reading, writing and arithmetic with special reference to the development of the intelligence of children.
2. The form of school registers, the mode of keeping them, and of making returns from them.
3. The training for the senses and of the memory, and the order in which the faculties of the children are developed.

\[\text{Second year}\]

1. To teach a class in the presence of Her Majesty’s Inspector.
2. To answer questions on the following subjects:
   a. The different methods of organising an elementary school.
   b. The form of the school registers, the mode of keeping them, and of making returns from them.
   c. The ventilation and drainage of school premises.
3. The processes of reasoning; the order in which the faculties of children are developed; the formation of habits and of character; all considered in their application to the methods of teaching and of moral discipline.

[The syllabus for female candidates was identical except that Notes of Lessons did not appear in the Second Year and Methods of teaching Infants and of organising Infants’ Schools were included in the first year]

Mr Thody continues: ‘I like the way the syllabus acknowledges that curriculum management and teaching methods are all seen as part of school management. The objective of management is to maintain the conditions for the implementation of good teaching. One can trace this back to Bentham’s 1818 Chrestomathia, which could be considered to be one of the founding books of our discipline. Bentham stated that the objective of good school management should be effective delivery in the minimum of time with the maximum of uniformity but he didn’t neglect the registers of course. Providing evidence of different pupil outcomes through “his book keeping function [is] one of the more important responsibilities of the master”. Bentham, however, failed to separate the major and the minor tasks as Gill has now done in his latest textbook.
‘I support Gill’s separation of school management and school keeping. He defines management as not being my responsibility but being that of the “body termed school-managers over the appointments and labours of the teachers, the school buildings, furniture and apparatus and the income and expenditure . . . [school keeping is that branch of management] by which a master becomes fully conversant with the . . . attendance, payments, instruction, progress of the scholars . . . their health and comfort’.15 He’s been one of the best selling authors on school management16 and he has not significantly changed his ideas over time. In fact, I have not needed to buy this 1883 edition although it does elevate school keeping to a branch of management.17

‘There have been changes in how we see management, of course. We have progressed since the limited view that management simply comprised how best to classify the scholars18 or was seen as just the Mechanical Arrangements (the whole building, its furniture and apparatus), Systems of Organization, Time-Tables, Monitors, Discipline.19 Naturally, all the authors this century have made teaching methods an integral part of school management. Indeed, as late as 1842,20 they were virtually the whole of school management but now we headmasters no longer do all the teaching ourselves so that our management must include managing those who teach for us. “Management is now as essential to success as the power to teach, or the ability to govern.”21 My aim is to make school a pleasure and, therefore, school should be “invested with attractions and associated with agreeable feelings”.22 Hence, I must ensure that classes are not disarranged, that pupils do not display slovenly posture, that they are punctual, march in an orderly fashion and do not hear improper words in school.23 Without good management, there can be no effective teaching;24 system is essential if the importance of childhood development is to be realized.25

‘Oh yes, you may smile at that, but I am a modern headmaster. Things were different in my father’s time – he kept a school in the 1850s when it was a matter of coping with children rather than developing them. The average child then was described as “in a state of constant irritation; its matted hair – its filthy flesh – its skin a prey to foul insects . . . corroded with disease – its clothes tattered, or so coarsely botched or, it may be, secured with string and nails . . . soiled with nameless dirt and reeking with disgusting odours – his shirt a foul rag, his stockings in pieces, and his shoes scarcely clinging to these feet”.26

‘And it was everywhere much the same; the United States of America, for example, struggled with similar difficulties of school superintendence.27 My father’s contemporaries could be called first-generation school managers. Even the great Matthew Arnold saw management simplistically as the arrangement of the rooms28 but he recognized even the importance of that to good organization . . .

‘Good Heavens, is that the time? I must breakfast soon if there is to be any good organization today at Reynold Street.’
Mr Thody explains that his landlady brings his breakfast to him on a tray to enable him to work through the meal. Today, he has Blakiston’s school management hints propped up against the teapot. In the evening, he takes his tea in the downstairs front parlour on his own; when he was an assistant teacher he ate with the family.

7.20–8.30 a.m. Finance

Mr Thody began a report for the managers’ concerning the fees that should be charged. He commented on how he enjoyed the financial aspects of management despite the time needed to see that grants were earned according to examination passes, that money was accounted for and that the books balanced. ‘School management’, he said, ‘is no different from factory management . . . [we are well] aware that [we are] dealing with the allocation of limited resources, and consequently that it [is] essential to effect economies in time, labour and expense’. In his report, Mr Thody wrote that fees charged ‘should always be such as shall honestly avow to the parents the true market value of the education imparted’, a statement he felt would encourage the managers to increase the fees which currently contributed just under 30% to the total expenses of 53/5d per child (£2.66) per annum. ‘At threepence per week fees,’ continued Mr Thody’s report, ‘Reynold Street has a reputation as a school only for the poor. If fees are raised, the school would attract a better class of entrant. The consequent rise in examination passes would increase the government grants and permit the school to increase its attractiveness.’ The Form IX returns were attached as an appendix to the report, together with some examples of other schools’ expenditure to demonstrate how well Mr Thody was managing this school’s finances (e.g. rural school, £98 11s 4d [£98.56] income from school fees, subscriptions and proceeds from a bazaar; £36 8s 8d [£36.43] expenditure on salaries, books, coal, consumables etc; £62 2s 8d [£62.13] balance in hand).

8.30–8.45 a.m. Travel

Mr Thody collects his papers and books and walks to school.

8.45–9.00 a.m. Admissions

Two parents have come to request admission for their children. Both families have relocated from other areas of London. Mr Thody informs them that the school is full and the managers have decided not to admit new children above Standard One. One parent states that his two sons have always achieved highly in examinations for both class and specific subjects. Mr Thody asks the parent if this year’s examination results are at hand but it seems that the inspector has not
yet reported them. Mr Thody promises that he will review the request for admission when the examination results are available. [Observer’s note: Mr Thody seems willing to ignore the managers’ decision if there is a possibility of attracting able children. Presumably this accords with his policy of upgrading the school by increasing fees.]

9.00–9.25 a.m. Walking the school/staff management

Mr Thody walks round the school to check its readiness for the pupils. He notes cleanliness, asks that the windows be opened, it being a fine day promising growing warmth. He reminds a pupil teacher to ensure that all slates are in the desk racks. He commends the map drawn by the senior assistant teacher in readiness for the geography class in the gallery. The Infant Mistress, Miss Johnson, proffers the needlework being gathered in preparatory to the inspectors’ visit and Mr Thody discusses with her how it might best be displayed. He praises her introduction of different coloured cotton threads to denote each stage of needlework achievement which will make it easy for both him and managers unfamiliar with domestic sewing to assess pupils’ progress at a glance.

Mr Thody returns to his desk in the centre of the hall to await the pupil teachers after they have completed their pre-school tasks. He explains to the observer that ‘the encouragement and stimulation afforded to staff by my morning perambulation makes them feel important’. ‘Often, at the end of my tour, and as the outcome of my observations of staff throughout the day, I enter into a reference book my criticisms and suggestions for improvement which I will discuss with them privately at the end of the day. They are aware that I constantly appraise them. I will have “none of this half apologetic way which some head masters have of coming into the class of an assistant with some pretext as if they felt they were intruding”’. Of course, the teachers’ classification also depends on the examination results of their pupil and the inspectors’ reports but they ask for my comments. I hear that the same system was introduced as long as forty years ago in New South Wales, so highly is it regarded. It is an effective means of ensuring quality teaching although I hear there are still cases where “Whitehall trembles when it seems the weakest of the N.U.T.s”.

‘The effective management of staff is so important’, continues Mr Thody. ‘We are all so aware of the need to maintain a high morale – fortunately it has been rebuilt since the first shock of the introduction of the Revised Code in 1862 but one must be vigilant. We do not suffer the same teacher absenteeism and rapid turnover of staff as do the poor rural schools and we insist on good healthy teachers. The best come here, of course, because we can pay more than the voluntary schools which do not have the benefit of public money from the rates, but only of fees, subscriptions and the grant from the Committee in Council. Being a headmaster must have been so much easier when Lancaster’s Mutual Instruction system was in vogue, during the early years of this century. Of course, I could not approve of all the teaching being delegated to the
untrained monitors but at least it left the schoolmaster free to manage the school.41

9.25–9.30 a.m. Classification

Miss Sinclair, Female Assistant, asks about transferring a pupil to a higher class. Mr Thody suggests they must wait until after the inspectors’ examinations the following week when Mr Thody also wishes to reconsider the whole school’s classification. It would be a major management task to alter this, Mr Thody explains to the observer and to Miss Sinclair.

The school had adopted Matthew Arnold’s recommendation that children of all abilities should be age-grouped for collective teaching into one section and subdivided into smaller classes for desk work to test individual attainment and then into smaller groups of ten (known as ‘drafts’) for sessions facilitating individual practice. The school hall was partitioned (with curtains and temporary boarding about three-quarters the height of the room) so that a semblance of the classroom system could be essayed but Mr Thody said that he would prefer a full classroom system with ability dictating a child’s place in the Standards in order to improve school results and attract a better class of parent. Classification by ability was the best way to excite ‘emulation and vigorous exertacion’42 although Mr Thody reminded Miss Sinclair that there had been a time when scholars were classified according to the level of fees they paid; the more they paid, the higher the class they were put in irrespective of their abilities or previous learning.43

9.30–9.45 a.m. Pupil teachers’ lessons

Mr Thody listens to the home lessons of the pupil teachers who will later listen to the other children. He also listens to some of the senior scholars’ work as it cannot all be fitted into the time allotted later in the day. Usually, this would be done during the school hours by the pupil teachers but, with the inspectors’ visit imminent, it is important that the headmaster does it. He tells the weaker scholars that he will hear them again after school has finished in the afternoon.44 He hands the pupil teachers their rotas for the week; their teaching duties are assigned so that they do not miss the same classes each week.

9.45 a.m. School begins

The headmaster walks to unlock the school door to admit the scholars, lamenting that he is not leading a school in his father’s day when headmasters were paid extra for instructing pupil teachers. He recalls Gill’s advice that headmasters must demonstrate a love of school by always being present before the children arrive.45 He shouts to the stragglers only just entering the yard and remarks sotto voce ‘but I blame the parents. I report to them when their children are late...
and it should be their responsibility to ensure they are here on time. It is part of basic family values’.

9.55–10.00 a.m. Cleanliness inspection

Mr Thody gives a ‘hasty glance’ at the children’s hands, faces and hair as they file past him. He then oversees the movement of scholars to their places. They appear to know which of them is to go to the gallery, which into the desks within particular partitions and which to the drafts, without being told, so Mr Thody clearly has well-established routines. All the teachers are present, to Mr Thody’s obvious relief. Absentee teachers mean that the headmaster has to double his class in addition to the supervision of the school.

10.00–10.30 a.m. Seniors’ dictation, desks in partition one

Mr Thody checks their home lessons. He calls each draft of pupils and completes two large drafts in the half hour; pupil teachers hear the rest. Drafts not being inspected read silently under the care of the head pupil. Mr Thody explains to the observer that he has arranged the timetable to ensure that all pupils have contact with him at some point in the week. When not teaching, he superintends to ensure that all are in ‘perpetual employment’ but he feels it important that all pupils should have the benefit of his expert teaching which would also enable all the teachers to learn from his example.

10.30–11 a.m. Juniors’ dictation, desks in partition three

Mr Thody sits at his desk in the centre of the room. His attention is directed to the pupil teacher who is guiding this class. The pupil has dictated the passage and then leaves the scholars to make corrections while she completes hearing the home lessons. Mr Thody leaves his desk to give the children help with the correct holding of pens and to make them aware that the ‘presence, example, and spirit of the master must pervade in every class, and must especially be felt in the weak ones. All temptation to idleness must be prevented.’ He returns to his desk to commence the monthly pupil references which he thinks will increase parental interest in the school.

11.00–11.30 a.m. Seniors’ writing, desks in partition one

Mr Thody informs the observer that he only superintends this lesson on a Thursday usually but he is supervising today because of the impending inspectors’ visit. The pupils work silently from their own books. The candidate pupil is instructed by Mr Thody in how to check the writing. There is some classroom disturbance and Mr Thody has to move to the Infants’ room to assist Miss Johnson.
11.30–12 noon Seniors’ arithmetic, drafts on the floor

One of the most important lessons of the day and always managed by Mr Thody. Arithmetical tables and mental arithmetic are taught to two drafts concurrently. He achieves this by having them stand in a large circle instead of in two semi-circles, each facing the wall. The other two drafts are working on slates on exercises dictated by the pupil teachers.

12.00–12.30 p.m. Break – buildings, staff, reputation management

Mr Davison supervises the yard. Mr Thody completes his daily tour of the buildings. He checks that the drains, urinals and WCs have been flushed for the second time today. He notes where the dark chocolate paint below the dado needs retouching before the inspectors’ arrival and enters a request for a blackboard pointer into the stock book for perusal by the managers at their meeting later that afternoon. He comments to the observer that they would probably discuss whether or not the school could adopt a full classroom system to replace its current tripartite division. He explains that the classroom debate is a major issue for school boards at the moment and the schools’ managers were wanting to put their views to the boards. Many felt that there were insufficient pupils at the same standard in a division to make the gallery sessions, for a full division, really useful. His solution had been to propose the floor partitions which permitted small class work while still enabling him to see the whole school at once. He was concerned that if full classroom divisions were introduced then teachers would be permanently attached to one class or to one subject to the detriment of their whole-school knowledge.

Mr Thody gathers the papers wanted for the managers’ afternoon meeting. He calls to a pupil teacher to go round and retie those corks which have become detached from their ink bottles. He remarks to the observer that he was pleased with that particular pupil whom he had recommended as a teacher because of her good attendance and ability in all subjects.

He begins to arrange ‘specimens of [the childrens’] fine handwriting [for an exhibition] to attract parents’. Mr Thody also intends to ask the managers to see the display and to bring their acquaintances. He feels that this is important to the school’s reputation management. There are already strong school community links but he wants to obtain the attention of ‘in essential persons in the neighbourhood’. He wants to show them that his school represents ‘the moral code of an ascendant bourgeois culture’ which they might feel able to support. He laughingly recollects, for the observer, that there are still those who need to be disabused of views such as those of Lady Ludlow as portrayed by Mrs Gaskell in her 1858 novel: ‘if our lower orders have these edge-tools [reading and writing] given to them, we shall have the terrible scenes of the French Revolution acted over again in England’. Mr Thody adds that there is also competition from the voluntary schools in the area. ‘They continue to thrive despite their higher fees and lower salaries so we must look to our reputation.’
12.30–1.00 p.m. Seniors’ geography, gallery

The topic is taught by Mr Thody to the whole group utilizing the map drawn earlier by Mr Sinclair. Mr Thody occasionally turns during his lesson, to frown at the over-loud rendition of poetry by the junior class in the drafts. Mr Matthew Arnold’s praise of rote learning of poetry resulted in the teachers trying to ensure that the whole school has the requisite 200 lines by heart for the following week. Mr Thody interrupts his lesson to move to partition one in order to quell an incipient pupil disturbance but ‘modern ideas of schoolmastering prevent[ed him] from falling upon [pupils] and murdering [them], so that [he] could do no more than hurl a book or a bit of chalk’.

1.00–1.30 p.m. Junior girls’ needlework, desks, partition two

The headteacher is superintendent but the work is led by the female candidate. Mr Thody’s presence helps secure concentration for needle drill.

1.30–2.00 p.m. Juniors’ reading, drafts on the floor

This is the first of four days on which Mr Thody will be in charge of this activity. The division is divided into three drafts, each of 20 pupils and, of these, the pupil teachers take two and the headmaster takes one. The master first glances to see that the senior division are well engaged then begins to question his draft. The pupil teachers listen to the other two drafts. On subsequent days, the headmaster will question the drafts heard by the pupil teachers.

2.00–2.30 p.m. Seniors’ geography, gallery

Mr Thody examines the scholars’ recall of his earlier lesson and then the remaining time is spent on Africa and Zululand again because of Matthew Arnold’s preference for geography to be more than one’s own parish.

The managers’ meeting

During this lesson, three of the school’s managers cross the school room to commence their meeting in the vestibule. They acknowledge Mr Thody who steps from the gallery to meet them and to pass over his registers and report. After dismissing the young children, Mr Thody leaves the school to the care of Mr Davison and proceeds to the managers’ meeting. They agree with him to recommend to the School Board that nine long desks be removed and 22 dual desks substituted; that the few remaining copies of Hughes’ stories for Standards I–IV (no longer approved by the School Board) could be given away; that marching lines could be painted on the floor of the Infants School and that six chairs, a long pointer and an inkstand could be ordered.
2.30–2.35 p.m. Dismissal and break

Infants and lower standards are dismissed and the headmaster superintends their leaving. Mr Davison supervises the older pupils marching in the yard and eating lunch packages.

2.35–3.40 p.m. Reading

Mr Thody hears the oldest children reading while the pupil teachers hear the others. During the week, the groups will rotate so that each child will be heard by the headmaster. Home tasks are announced and Mr Thody watches their dictation by the monitors. He sets home tasks because then ‘the parents get the impression that their children are well looked after’. The last ten minutes are for his reading to the whole division.

3.40–3.45 p.m. Good conduct and dismissal

Good conduct and achievement badges are awarded on the basis of last week’s results. Mr Thody reminds the pupils of the importance of competition. While the pupils hurry out, he comments to the observer that rewarding merit has a long tradition since Lancaster originated weekly medals for outstanding performance and small cash prizes for good work. ‘As long ago as 1804’, intones Mr Thody, ‘Lancaster allocated 22% of his budget for prizes and rewards’.

3.45–4.30 p.m. Pupil teacher training/managers’ meeting

In continuance of the five hours’ teaching he is supposed to give the pupil teachers each week, Mr Thody directs them to revision of the names of rivers. He requires them to read Chapter V of Joyce’s 1864 Handbook on School Management and Methods of Teaching which explains how to plan a geography lesson. He discusses with them Joyce’s views that pupils should know the geography of Britain better than that of any other parts of the world. This view conflicts with that of Matthew Arnold who thought it could be just as interesting to learn about the four quarters of the globe.

He leaves them to complete their tasks alone (although he expresses concern about his lack of time to supervise them adequately) as he goes to say goodbye to the managers. He states that the correspondent will become ‘fairly mothered’ unless he goes to help him write up the minutes neatly. Mr Thody expresses his relief that his managers do not have the responsibilities of those of voluntary schools but says that he thinks all managers’ responsibilities should become those of the Boards.

Only three managers attended the meeting (a usual number, states Mr Thody) one of whom was female [Observers comment – she certainly reflects Mr Sneyd Kinnersley’s description of a lady manager:}
There was a time when she was a prominent personage: she assisted at the inspection, and waited for hours that she might see the inspector blundering over the ‘garments’. She called his attention to specially meritorious stitches, and deplored the blindness of My Lords in their selection of sewing tests; she deprecated mathematics and urged the superior claims of housewifery. She gave private information on the characters of the pupil-teachers and the children generally hinting that the pretty ones were undesirable . . . It was not only at inspection that she appeared: in many schools she was to be found without fail two and three days a week; possibly assisting in the needlework; possibly taking a general interest in the girls; always full of good works.[68]

4.30–5.00 p.m. Staff management/quality assurance

Mr Thody holds a weekly short conference for staff. Today he reminds them of the importance of the merit registers and the regular reports to parents who would thereby know their children’s position in class.[69] He reads out the programme for the Inspectors’ visit. He tells them that after this visit, he will be instituting half-yearly examinations so that the scholars’ development can be more accurately known.[70] He reminds them to prepare their lessons tonight, telling them he will be spending the evening ensuring that the feared Form IX gives an accurate picture of the state of the school in respect of attendance, instruction and pupils’ ages.[71] He informs them that the inspectorial system is so well respected that New South Wales has adopted it. [72] He bids them good-night, expressing his confidence that they will do well at the examinations next week.

5.00–5.15 p.m. School closes and walking home

After checking that the school will be locked, Mr Thody walks back to his lodgings. He tells the observer that he has heard that the London School Board may be introducing ‘organizing teachers’, copying the 1856 system of the Irish Commissioners of National Education. Their job was to improve and bring uniformity to national schools and to educate teachers in school keeping. The organizing teachers themselves received lectures on the science and practice of school management.[73]

5.15–6.15 p.m. Tea

This is served to him in the front parlour. He has a newspaper beside him, which he would usually read at this hour. He asks if he might have conversation with the observer instead as it is rare that he has a social evening. ‘It is so difficult’ he states, ‘to find the right people with whom to meet socially. One feels the general disdain for teachers amongst the upper classes[74] but parents are generally too low with habits and thoughts repugnant to mine. Small trades people seem to
feel I will be critical about their speech while better trades people feel above me. Professionals distrust my learning and I can hardly consort with masters of private schools. A manager may give me leave to walk in his grounds but could scarcely expect me to be his guest.75 He brightens when the observer asks if there are fellow elementary school heads with whom he might discourse and he responds with comments about two heads he has recently encountered at a London School Board meeting for newly appointed headmasters.

6.15–8.00 p.m. Managing change

Mr Thody completes the school log book for the day. Usually he writes it once a week but with the inspectors’ visit imminent he is punctilious about the niceties. He selects Trollope’s Australian travelogue for personal reading76 but finds he cannot settle. He says his mind is too much occupied with the inspectors coming. Like the teacher in Crabbes’s The Borough, he must set aside his personal reading and ‘To this sad duty his sound mind apply, And Vex’d in spirit, throw his pleasures by’.77 He wonders whether he has been long enough in this job to introduce major changes at Reynold Street. He feels he has ‘sufficient experience of the school to enable [him] to judge of their expediency’78 but recollects Gill’s advice that ‘No wise man will rashly innovate’.79 Mr Thody is aware of the disorder and confusion that can arise from hasty change and knows that what he chooses to do must be apposite to the character of the district.80 He feels strongly, however, that better class children must be attracted to the school. At this point, the observer leaves.

Learning from history?

The value of lessons from the past

Has Mr Thody presented us with approaches we have not adopted? Do his methods strengthen our own by demonstrating their earlier applicability? Do these questions suggest that historical examples ought to be useful if a study of history is to be justified? Usefulness has been seen as dangerous since if we look at past events as a source of advice on today’s practicalities, we may select ‘only those facts which suit our present interests, [so that] we may distort the past and merely find in it what in some respects we have put there ourselves’.81 Readers may wish to reflect whether or not this has happened in the foregoing account. I chose to categorize Mr Thody’s work in twentieth-century terminology (e.g. Reputation Management) which serves to stress similarities rather than the differences which Seaborne feels should be what we should try to comprehend. Is there more merit in perceiving differences rather than similarities?

Seaborne argues that the reasons for studying history ‘must rest, in the last analysis, on the intrinsic interest of the study of past events’82 but is it not because of similarities to our own time that past events become of interest?
Once such interest is aroused, it becomes possible for ‘historical study to trace the development of education . . . and so to reach a deeper understanding of the function it ful ls today’. The functions of school management have become of major political, practitioner and academic interest since the mid-1970s, the time when Silver was criticizing research on the Victorian period for neglecting the content of schooling and educational processes because only those issues in Victorian education that had ‘meaning in twentieth century terms have been admitted to the de nition of the history of education’. A neglect may, however, begin to be recti ed when current interests invite comparisons.

Silver feels, like Seaborne, that selecting history for twentieth-century needs precludes the Victorian period being understood in its own terms because this may make us question our cherished assumptions. Silver’s views gain credence from, for example, Hogan’s reassessment of Lancaster’s system of monitorialism. Hogan demonstrates that it is from this system that the current competitive individualism in classrooms began, although we might not like to admit it. Further, how many of us readily accept the criticisms of Lancaster’s system while at the same time thoroughly commending our own system of peer tutoring? The Lancaster and Bell monitorial schools are also credited with having been the basis of the incorporation of business management methods into schools; we may think that managerialism in schools is new and unwelcome but it appears to have been deep in the English education system since the beginning of the nineteenth century. The monitorial schools transferred to education the factory methods that were just beginning to be incorporated into industrial processes, hence providing ‘a kind of innate characteristic or psychological trait which has helped form . . . a characteristic approach to the problems of public school administration’.

If we accept this last view, it seems to reinforce the value of selecting issues that link the nineteenth and twentieth centuries. To claim, as Silver appears to do, that there was a Victorian interpretation seems surprisingly singular since views changed during the century. It could even be unreasonable to claim that any Victorian interpretation of their own and proximate times has more claim to veracity than views from the twentieth century. Reactions from all periods could be said to be subjective. Using history as a tool in education management lies between the realist and subjectivist schools. Real data are used but as one time-travels, subjectivity is revealed as one reads how each generation tends to revile the choices of its immediate predecessors in order to justify their own activities. Such subjectivity should not be seen as a cause for disallowing twentieth-century interpretations of earlier periods: ‘case study and comparative and historical methods become the preferred means of analysis [for research which] aims at dealing with the experience of people in speci c situations’.

**History for education management**

The speci c situation of school management would bene t from a historical base. In an elegantly argued paper, Sungaila suggests that such a base would
contribute to the emergence of shared values amongst academic and practitioner managers. Part of her argument centres on the Heideggian realization that truths about a discipline are apparent the more one understands ‘having been-in-the-world’. People are perceived as a continuum of past, present and future which ‘allows man [sic] to perceive the possibilities that he has inherited and realize in the historical “moment of vision” what he can be for his own time’.

This is to move our discipline on from being a practical response to a practical need (borrowing from business management and basing itself in being a technical discipline arising from information gleaned from collating and categorizing information about current management practice). Already, our discipline has acknowledged the value of experience in the establishment, since 1991, of a mentoring scheme whereby newly appointed headteachers are guided by experienced headteachers acting as mentors. Similar acknowledgement is apparent in the movement to school-based management, and intending-teacher education. This acknowledgement needs extending to include historical knowledge about what it means to be an education manager.

Such a study would accord with Seaborne’s views that education history is more interesting if studied thematically than chronologically. For education management, there is more at stake than interest alone. Education management emerged in the 1950s from social sciences, building also from business management. The latter began around 1900, apparently full grown with its theories of scientific management. What happened before then seems blank, yet a discipline surely needs a strong origin if it is to grow to maturity. Its origins can become apparent from studies such as this.

As the concept of educational administration as a profession and social science gains ever wider recognition and acceptance, it becomes appropriate to examine the theory and assumptions which underlie the field. In particular we need to ask whether the theory and assumptions still appear to hold in settings where they were developed before they were recommended and applied in totally new settings.

History is our laboratory and it may yet rescue us from our current preoccupation with regarding quantitative proofs as the only ones of any value in the testing of our ideas.

The nineteenth century and the history of education management

Having indicated the value of history and its particular relevance to education management, why then select the nineteenth century particularly? First, I must confess to a personal interest as a reason for this choice, arising from work completed as a student teacher in the long forgotten days when the history of education was a compulsory subject for study. Second, although there may be concerns that this period is already well researched, the studies have not con-
considered school management. There is a great deal of work on the development of
the government of the system, on the curriculum and on teaching methods.
There are many individual school histories (though relatively few on state ele-
mentary schools, and these, being singular, leave us with inadequate notions of
what typical schools were like). It remains true that the research on the educa-
tional history of the nineteenth century could be described as limited to very few
areas and approaches with gaps to be filled, notably in the format of the educa-
tion of the poor.96 Third, it could be said that this is the only century, other than
the twentieth, in which there were schools of significant size to be managed.

Methodology and sources

This study intended to illuminate what it meant to be a nineteenth-century edu-
cation manager through creating an image that:

... re ect[ed] [a school’s] character and quality and that [told] us some-
thing of what the experience of schooling is like. Since schools are
made up of different people in different times and places, it is to be
expected that images which re ect the experience of schooling must be
many and varied . . . [they are] sets of ‘one-sided viewpoints’.97

This particular one-sided viewpoint explored the possibilities of ‘factionalized’
shadowing, hoping thereby to respond to Seaborne’s plea for writing history
comprehensibly so that it can be understood easily98 through using the advan-
tages of observational techniques.99

This account was created as far as possible from contemporaneous sources. It
was constructed around school timetables published in Joyce and Currie.100 On
to these was built information from other management textbooks published
during the century. Material published before the period to which this account
directly refers was incorporated in the form of the headteacher’s re ections on
times past in order to provide a flavour of how school management changed
during the century. It was assumed that the headmaster would still be using
some of the methods of the past; headteachers today do not all use all the most
recommended modern methods and Victorian school leaders presumably
behaved similarly. One feature had to be invented (pupils’ lunch) since no refer-
ence could be found to it in the texts consulted. Various texts outlined daily
timetables but none exhibited more than very short breaks. It seems unlikely that
the children went all day without either breaks or food so five minutes have been
permitted in the above account. Whether or not this is accurate awaits informa-
tion from further research.

In attempting to ascertain how far the textbook accounts were translated into
practice in schools, the books themselves were first compared to see how far
they all agreed. Where several books suggested the same ideas, these were
incorporated into this study. Recourse was also made to novels, poetry, source
books on childhood in the nineteenth century, school log books, managers’ record books, autobiographies and biographies and inspectors’ reports. A small sample of each was used in order to assess the value of each as a potential source for more extensive use later. Secondary sources which utilized other nineteenth-century sources were also used.

Reflecting first on novels and poetry, it ‘has long been recognised that imaginative literature can be used to infer contemporary assumptions and accepted social values’. Novels, however, depend on creativity, ‘selection . . . interpretation, on a personal vision of social fact’ and, hence, literature is not usually a good source of commonplace fact. This is borne out by the relatively few sources located on public elementary schools and the recognition that, for novelists, a drama is more interesting that is everyday procedure. References are scattered and short and locating them is not easy, which explains the value of biographical guides to fictional sources.

Novelists do not seem to have been attracted to school leaders as heroes. They appear in novels briefly (Sue’s headteacher in Hardy’s *Jude the Obscure* for example). Combined with other sources, however, novels help to fill out a general picture. Trollope’s *The Claverings* reminds us of the social opprobrium faced by teachers as the hero, Henry, rises in status when he departs education to become an engineer. Mrs Gaskell’s *My Lady Ludlow* well illustrates the changing attitudes to popular education over the first fifty years of the century. I often wonder if Matthew Arnold was inspired by a school inspection to write ‘And we are here as on a darkling plain, Swept by confused alarms of struggle and fight, Where ignorant armies clash by night’.

Accounts of peoples’ childhoods were investigated as a source but these were found often to be written by those outside the social bracket that would have patronized the state-supported schools. Alternatively, autobiographers found school not worth writing about. In Armstrong’s *Victorian Peepshow*, for example, he recounts his governesses in some detail and those of his siblings, merely recording that ‘I was by that time at day-school’ with no details. He later recounts two humiliations at the hands of schoolmasters and that ‘I don’t remember to have been in the least interested in what I learnt’. For girls, there was the added issue of writers despising girls’ education and being concerned that girls were being educated outside the home at all. Autobiographies of adults operating the education system as teachers, inspectors or administrators appear to be a more fertile source.

Log Books and Managers’ Minute Books provided useful outlines of what happened on a daily basis in schools and have the advantage of providing the headteacher’s viewpoint, which few of the other sources do. On the other hand, they are usually very brief and records for individual schools are patchy.

Inspector’s Reports provided a further perspective. Those of Matthew Arnold tended to comment on major issues in the system rather than on the minutiae of school management but there is material to be culled from them, especially as his reports cover such a long period. Sneyd-Kinnersley’s autobiography was
used. The reports and reminiscences used for this article, although published in collections in 1908, related to the period selected for this observation. The value and availability of other inspectors’ reports and government documents are discussed in Sutherland.111

This pilot study has demonstrated that there is more than enough material to make a fuller study of nineteenth-century school management worthwhile. In addition to the sources outlined above, there are also investigations to be made of periodicals, of school histories and of many secondary sources.112 The study has found that some approaches were more prevalent at particular times in the century so that further research might be able to characterize different periods. A brief foray into the literature of New South Wales, Tasmania, Ireland and the USA indicates that research material is available. An interesting development of this research would be to compare Anglophone countries, at very different stages of development in the nineteenth century, but with similar expectations of schooling, to see if they had common patterns of school management.

Tale end

Sadly, the study of the history of education as an element in the training of intending teachers has long been abandoned in England and Wales despite the assertion in 1966 that its value was so self-evident that there was ‘no need to make out a case for the study of the history of education as an essential aspect of the course offered to intending teachers’.113 In contrast, the management of education has recently been recommended as an essential element of the training of intending teachers.114 Combining the history and management of education might help tomorrow’s school managers (and today’s) to achieve a fuller appreciation of possible solutions to managerial challenges – at least they might have more arguments to advance for or against reintroducing payments by results.

Notes

In sourcing this article, the assistance of Mr Roy Kirk, Librarian at the School of Education, University of Leicester, is gratefully acknowledged. Thanks are also due to Emeritus Professor Brian Simon who has commented on the text. Any errors are the fault of the author.

1 In contrast with the rest of the world, common practice in the UK is to use the term ‘management’ for ‘administration’. To attempt to avoid confusion, ‘management’ is defined here, as it was in nineteenth-century textbooks, as the activities of the head teacher (see note 3) in running the school. These activities encompass strategic and tactical matters, such as planning, curriculum and staff management and detailed ‘administrative’ tasks such as keeping the registers and arranging lunch for the inspectors. Administration in nineteenth-century England appears to have referred to the local and central levels of the government of education rather than to the institutional level which is the subject of this article.
The term ‘headmaster’ seems to have emerged in the latter part of the nineteenth century, developing first from its usage in the public schools for upper class children. It became accepted terminology in the state elementary schools as they increased in size and employed more certificated teachers who became known as ‘Assistant Teachers’. Prior to 1870, the word, ‘schoolmaster’ was the more common description of he who managed the school. There were often no other staff so the schoolmaster did not need to be distinguished by title. Assistants would be monitors or pupil teachers. In this article, ‘headmaster’ or ‘headteacher’ is generally used though ‘schoolmaster’ sometimes appears in references to pre-1870 material. The modern, international term, ‘school leader’, is also utilized occasionally. Writers of nineteenth-century texts concerning school management pre-date our era of political correctness. They therefore assumed that man embraced woman, that he subsumed she and that headmasters represented the unalienable, dominant order. It was decided to retain masculine terminology in reporting their words and ideas in order to recount their views with contextual sensitivity.

Reynold Street is a mythical school since records available for individual schools are vestigial. Some creative licence has been needed in order to ensure that many elements of management are touched upon in one day. Further discussion of ‘factionalization’ is to be found in the methodology section at the end of this article. The London School Board was real; it was one of the many local authorities for education established after the 1870 Education Act to provide schools which would fill the gaps not covered by voluntary schools. The London School Board commenced work immediately after the 1870 Act in view of major deficiencies in the capital’s educational provision; elsewhere, the voluntary authorities were given several years’ grace to provide more schools before the School Boards commenced. Board Schools were financed from fees (until 1896), local property taxes and central government grants (the latter dependent upon attendance and examination results).

In some areas, including London, the School Boards had opted to have managing bodies for their individual schools but they were not found in all areas. Voluntary schools all had managers. The definitive work on Victorian school managers is P. Gordon, The Victorian School Manager (London, 1974).

Pupil teachers were only allowed to complete the registers during their final two years of training but it remained the headmaster’s job to complete the compilations and he was, of course, the responsible agent.

38 The Revised Codes were the first English National Curriculum. For each standard there were attainment targets in Reading, Writing and Arithmetic in which all pupils were examined. Other subjects were optional but likewise had targets. Achieving the targets meant that the pupils earned grant for the school (known as payment by results). Matthew Arnold, the famous poet and one of the HMIs for London, resolutely opposed the Code and criticized what he saw as its stultifying effects. Others were, however, in favour and it was viewed as a means of raising standards and of ensuring that all children received the same entitlement to the curriculum. The Codes were abolished at the turn of the century but the arguments for and against them have become apposite again since England reintroduced its National Curriculum in 1988 (in much greater detail, and with many more compulsory subjects than in the nineteenth century).

General introduction

GENE R A L INTRODUCTION
PART 1 Values and religion

ethics and conflicts. The Journal of School Leadership, 8(4), 399-422.

Evers, C.W., & Lakomski, G. (1996). Exploring educational administration. Toronto:

These semantics are instructive. Innumerable assertions, laudatory or pejorative, can be made about the executive, the administrator, the leader—but what cannot be said is that the office, the role, or its incumbent is without power. This drives home to us what we already know at the deepest level, even though it may take some semantic conjuring to raise it to the surface of consciousness. What is then revealed is the absolute necessity for power in administrative affairs. Power is the first term in the administrative lexicon. 1

Without defining, or confining, this primal concept of power, it may be said that it is the human analogue of the physical science term energy, that is, the ability to do work, to accomplish ends. But in administration, in human affairs as opposed to the simplicities of physics and mechanics, power is much more. It is above all else the ability to impose one’s will. Here the contrast with natural science is revealing. In physics power is equivalent to force and is measurable in quantitative terms such as watts, joules, ergs, or pounds per square
inch. But physical events are not human events. At most they are only com
ponents of human events. In science one presumes a
determinism, a mechan
ism, a law of causation—notwithstanding that at the quantum
level of analysis
(that is, subatomic particle physics) strange paradoxes and
‘irrationalities’ are
observable that seem to defy our ordinary understanding of
cause and effect. In
human events a new factor appears. In addition to the
mechanistic–determinis
tic laws of cause and effect to which human beings are
themselves subject there
is now introduced a concept of will or voluntarism. Thus the
human agent in
the total equation of determining forces is felt to possess
a freedom of choice—
whether that sense of freedom is illusory or whether or not
it is an epiphenom
enon, a psychological by-product of unconscious vectors
that are the real
determinants. Administration cannot exist without either
the reality or the illu
sion. And science itself stops short at the edge of
voluntarism, at the frontiers
of conscious choice. For this reason a distinction between
administration and
management is essential: 2 the former opening upon the
limitless horizons of
philosophy, the latter upon the restricted field of vision
right and proper to
science and technology.
It follows that administration is a form of life in which wills enter into a
complex domain of conflict, reconciliation and resolution. In other words,
adadministration is politics: the creating, organizing, managing, monitoring and

resolving of value conflicts, where values are defined as concepts of the desirable. 3 In principle or in theory the accomplishment of administrative ends, goals, targets, aims, purposes, plans and objectives is no more than the imposition of a putative collective will upon the resistant and countervailing forces of matter, circumstances, materials, resources and contending wills. To be without will would be to be without power and, conversely, to have power is to have the ability to impose will. And here for the tender of heart and the already disaffected it may be allowed that ‘to impose’ can also be rendered as ‘to change’. The will to power.

At this point one may consider a deeper motivational concept: the will to power.

This formulation is central to the philosophy of Friedrich Nietzsche 4 although its origins can be traced through his mentor Schopenhauer (the will to life) back to Vedantic Indian philosophizing about the life-force and the eternal dynamic of creation, preservation and destruction. 5 Less metaphysically and more simply, in
administrative terms it can be said to refer to the primal maxim; self-preservation is the first law of nature. I have represented this elsewhere as the first of the metavalues. 6

How does the will to power bear upon administration? It does this in obviously fundamental ways. For example, inasmuch as administration is an attempt via organization to control the future, it is a philosophical activity: Genuine philosophers, however, are commanders and legislators: they say, ‘thus it shall be!’ . . . With a creative hand they reach for the future, and all that is and has been becomes a means for them, an instrument, a hammer. Their ‘knowing’ is creating, their creating is a legislation, their will to truth is—will to power. 7

Conway expands upon the theme in this way: As commanders and legislators, they must introduce order and discipline into the formless economy of Nature, thus ‘correcting’ for Nature’s profligacy. Toward this end philosophers legislate a hierarchy of values that both promotes the flourishing of certain forms of life and excludes other forms . . . 8

This point is directly relevant, we may note, to postmodern and politically correct conceptions of inclusion. The will referred to here is of course, despite the totalitarian nuance, the nomothetic will, the will of the collectivity. Corporations, organizations and nations can in this sense be said to be imbued with the will to power.

But now the problem of will has ramified. It can be seen as deriving from the individual, from the group and, as Weber made specific, from the environment,
In essence Weber argues that, on the one hand, the administrator takes cultural values as given and is, for example, ‘politically correct’ in the contemporary sense. This would allow the administrator to assume the mantle of self-righteous ‘responsibility’ and to steer a satisficing course to given ends as per the doctrine of H.A. Simon. On the other hand, the administrator may embody convictions (and commensurate will) towards ends which may or may not be either cultural or those of the corporate entity he represents. This leads to the potential for ‘irresponsibility’ or bureaupathology, as when the interpretation of orthodoxy (Weltanschauung) is appropriated by the leader. Will to power here acts as an administrative countervailing force to the downward impress of cultural and organizational dictates. Yet even in the case of the administrative factotum—administrator as Simonian agent simpliciter—will to power as a depth motivation is a powerful determinant in the overall collective equation. Granted that administration is the very business of power, that power is its preeminent characteristic, it is somewhat curious that (with a few exceptions, notably Machiavelli) the standard literature glides so smoothly and blandly over the prob...
lematics of power. Two very deep-seated assumptions seem to underlie this phenomenon: assumptions so entrenched and buried that they might be regarded as meta-assumptions, 12 or assumptions at the unconscious level that pass without question, scrutiny or examination. Before we examine them, however, it should be repeated that these are assumptions in the literature, in the theory of administration, in the conventional wisdom and orthodoxy. It should also be noted that the assumptions selected for critique are only two examples of presumptive error in administrative thought and praxis; others such as the naturalistic, homogenetic, militaristic and excisionistic fallacies have been dealt with elsewhere. 13

The first of these meta-assumptions or presumptive fallacies is that ‘We are all honourable men’ (and/or women, to satisfy the politically correct). The second is that authority and leadership in and of themselves legitimize power.

Taken together these two unspoken assumptions effectively divorce the administrator from problems of ethics, morals, values, axiology or philosophy—leaving their place only problems of technique, of managerial efficacy and efficiency; problems in decision-making and implementation that can in principle be solved
by the application of rationality and technology. Systems theorist MacNamara’s

belated apologia for the Vietnam War is a case in point. 14 Flowing from these assumptions is the concept of power as neutral instrumentality; a means to righteous ends (derived from outside the system) which means are also the profes sional property of a managerial elite. Thus honourable men and women pragmatically muddle through to resolve the ongoing problems of their particu lar organizational interest—making a profit, breaking even, delivering quality services, satisfying educational demands, winning the war against crime, or drugs—whatever it might be. Or else the same honorati apply the full force of rationality, systems theory, technocracy, bureaucracy and quantitative methodology to produce pro tem solutions that satisfy or satisfice the stakeholders and constituencies involved. Either way, ends are achieved and our leaders rise above their earthbound followers, escaping the bonds of gravity by means of their virtue, borne aloft on the wings of these grand assumptions, and falling from grace only with failure to maintain the proper altitude and attitude for air borne manœuvring.

Alas! neither assumption withstands the light of conscious scrutiny. The first
assumption can be rejected not on the grounds that fools and knaves assume the administrative mantle—fools and knaves know no boundaries of role or occupation—but on the simple logic of universal self-interest. Self-interest, when it takes the form of egoism, vanity and careerism, is often (but not always) antagonistic to the organizational and higher interests. But more subtle considerations compound the potential for pathology. For example, consider, as Nietzsche does, the feeling of power, the affective quality of power. Nietzsche’s analysis in the Gay Science dissects this in ethical terms: By doing good and doing ill one exercise one’s power upon others—more one does not want! By doing ill upon those to whom we first have to make our power palpable [. . .] By doing good and well-wishing upon those who are in some way already dependent upon us [. . .] Whether we make a sacrifice in doing good or ill does not alter the ultimate value of our actions: even if we stake our life, as the martyr does for the sake of his Church—it is a sacrifice to our desire for power or for the purpose of preserving our feeling of power. [. . .] Certainly, the condition in which we do ill is seldom as pleasant, as unmixedly pleasant, as that in which we do good—it is a sign that we still lack power [. . .] 15 This analysis hardly needs explication for the practicing administrator. It is a matter of simple experience, even if that experience goes unscrutinized and unexamined. It penetrates and permeates the affective life and insidiously subverts the claim to honour. It is at the root of Lord Acton’s aphorism that power corrupts, and its little known corollary: ‘Great men are almost always bad men.’ 16 V A L U E S A N D R E L I G I O N The second assumption, the assumption of formal legitimacy, falls even more calamitously and precipitously into the pit of decadence. This is because it is entirely a dependent function of a special perception, namely, the perception of the common good, the common interest, of, in a word, the commons. Before legitimacy can be assigned to the formal role of leader there must be agreement upon the collective purpose or the public interest or, simply, the larger
interest. But what is this legitimizing interest in a neo-feudal, 17 corporatist 18 social structure where everyone is obliged to defend the parochial interest of some organization or subset of an organization, the interests of which may well be antagonistic to the whole? This is a system wherein the first duty of each administrator is to ‘fight his own corner’: where everyone and anyone is a ‘stakeholder’; and where devices for litigation and conflict resolution and power equalization (ombudspersons, equity and harassment officers, quotas, commissars for this and that perceived abuse) proliferate ad absurdum. In all of this is there somewhere a commons, a source of legitimacy, or has it nihilistically gone to the wall in the general pandemonium of postmodernism? Is it not fair to say that our present condition is one wherein the sense of commonality tends to dwindle to the vanishing point among contending ideologies? In this condition, paradoxically, the demand for conformist orthodoxy and political correctness frustrates the use of reason and speech and inhibits dialogue and dialectical examination of values. Surely any experienced academic or politician would vouch for the resultant bad faith and loss of community? Surely also every practising administrator knows the meaning of political expediency and has faced the choice between personal welfare and the common good on some occasion? And yet the myth remains. The leader represents and embodies the good of the whole and thus has the authority and power of a legitimized will. L’état, c’est lui, c’est elle. But, despite the assumptions and presumptions of the textbooks, administrative reality is less a field of honour than a battleground of wills, a domain of confused, confusing and conflicting values and, as often as not, a ‘darkling plain . . . where ignorant armies clash by night’. Will, affect and circumstance

On the darkling plain victory is a function of will. Will and power, the will to power, these concepts are correlative, they are aspects of one another. In Nietzsche’s view, and he was as much psychologist as philosopher, there is nothing simple here. Willing goes beyond both feeling and thinking; it transcends the affective and the cognitive faculties. But it is essentially an experience of com
manding—whether this be of others or of oneself. T H E T R I U M P H O F T H E W I L L What is called ‘freedom of will’ is essentially the emotion of superiority over him who must obey: ‘I am free, “he” must obey’—this consciousness adheres to every will, as does that tense attention, that straight look which fixes itself exclusively on one thing, that unconditional evaluation ‘this and nothing else is necessary now’, that inner certainty that one will be obeyed, and whatever else pertains to the state of him who gives commands. A man who wills—commands something in himself which obeys or which he believes obeys . . . 21

Here, it seems to me, Nietzsche is alluding to what I have elsewhere described as a Type I level of valuation. 22 In the face of this charismatic quality of will, lesser individual wills are, as it were, psychologically disempowered. Resent fully or otherwise one either submits or, aligning with the leader, gains force from a psychological identification with the stronger ‘freer’ power. . . . he who believes with a tolerable degree of certainty that will and action are somehow one—he attributes the success, the carrying out of the willing, to the will itself, and thereby enjoys an increase of that sensation of power which all success brings with it. ‘Freedom of will’—is the expression for that complex condition of pleasure of the person who wills, who commands and at the same time identifies himself with the executor of the command—who as such enjoys the triumph over resistances involved but who thinks it was his will itself which overcame these resistances. 23

There is enough in these enucleated Nietzschean insights to preoccupy the reflections of the thoughtful administrator for a long time but it must be noted that what they are pointing towards is the triumph of the will, not its defeat, not its failure nor its décadence. 24 The healthy will derives its exuberance and its
power from a clarity of interest and a commitment to
values—whatever the
content of those values. Technical competence or expertise
doesn’t enter into it.

But the will, free or unfree, always encounters
circumstance. For the most part we delude ourselves about the freedom of our will because we are not con-
scious of the extent to which we are mechanistically
determined or programmed
by external, subjective and objective, factors. Our
capacity to shape events, for
ourselves and others, is much less than we might think.
Nothing new in this. The
Romans said it: Fata viam inveniunt, things happen by
themselves. In complex
circumstances things just happen and consequently the
honorific of leadership
(or administration) is often falsely attributed to an actor who is simply in the
right place at the right time. Fate has smiled upon him. His plan has worked out.
His enterprises have been successful. All of which, pace Nietzsche, speaks
nothing to either his virtue or his will. ‘Yes. But he brought this great matter to a successful conclusion.’—
That means something, but not enough; for we rightly accept the VALUES AND RELIGION maxim which says
that plans must not be judged by results. The Carthaginians punished bad counsels in their captains even when they were put right by a happy outcome. And the Roman people often refused to mark great and beneficial victories because the qualities of leadership of the commander were inferior to his good luck. In this world’s activities we often notice that Fortune rivals Virtue: she shows us what power she has over everything and delights in striking down our presumption by making the incompetent lucky since she cannot make them wise. She loves to interfere, favouring
those performances whose course has been entirely her own. That is why we can see, every day, the simplest amongst us bringing the greatest public and private tasks to successful conclusions. 25

To sum up: will is one thing, affect is another, and fate and accident are always administrative parameters. Malaise

Let us move now from the Renaissance and classical allusions to our own post modern times. The practical wisdom of Montaigne has long since been forgot ten. Nowhere are fate, accident, affect and will explicated or seriously discussed in the management literature of our day. The managerial technopundits have no vocabulary to comprehend or cope with such untidy concepts. In the dialectic between the philosophy of administration and the science of management the latter has achieved a salience unthought of or undreamt of in earlier epochs.

Thus today the president of a Canadian bank can confidently assert that ‘The manager’s principal aim is to remove uncertainty.’ 26 And MacNamara in his apologia still maintains, ‘To this day, I see quantification as a language to add precision to reasoning about the world. 27

Paradoxically this very modernist orientation occurs in a condition of post-modernity and questions arise as to whether it is a triumph or a failure of the will. Is it victory or defeat, affirmation or negation, health or pathology? Is this
tacit administrative philosophy—one could call it managerialism—an aspiration
towards the ultimate Apollonian ascendancy over the Dionysian forces of
passion, violence and unreason which might threaten it?

To answer such questions or to try to is to engage in philosophy, more pre

cisely, in axiology: the problem of values. Doing philosophy and doing axiology
can be demanding—such efforts require will. The line of least resistance is to
retreat into managerialism, to stick to the book and the numbers, to become a
functionary, a factotum. To abdicate one’s will in the face of complexity is all
too understandable, if not entirely forgivable.

This malaise or failure of the will is a pathology. Its therapy requires some
understanding of the morphogenetics of value. The distinctive value dimensions

bearing upon administration can be visualized as a series of concentric spheres T H E T R I U M P H O F T H E W I

of influence. These descend from a cultural level (V 5 ) through subcultural (V 4 ),
organizational (V 3 ) and group (V 2 ) levels to the irreducible level of the indi
vidual (V 1 ). This whole constitutes the morphogenetic field, a complex of value
forces, an ecology of interests and will, which forms the axiological context of
practical administration (praxis). This schema allows us to identify the central
value conflict and source of contemporary malaise. It points to the hypothesis

that the root conflict is not the conventional idiographic contest between V 1 and

V 3 but rather a dual conflict. There is first the tension between individuals (V 1 )
and their organizations (V 3 ), the orthodox idiographic-nomothetic dissonance.

Second, there is the conflict between the state as representative of (V 5 ) culture
and its component corporate units (V 3 ), where the terms of interest conflict can
be specified in economic terms: the greed of the parts being in opposition to the
welfare of the whole. This in turn leads us to the idea of neo-feudalism.

As society becomes organizational, with large, complex, bureaucratic corpor
ate entities increasingly dominant and increasingly international and global in
scope, so the phenomenon of the individual deriving psychological identity from
the organization which dominates that individual’s life as the source of livelihood

becomes more and more the norm. Saul has defined ‘corporation’ as any interest group: specialized, professional, public or private, profit-oriented or not. The one characteristic assured by all corporations is that the primary relationship of individual members is to the organization and not to society at large. In a corporatized society the group replaces the individual and therefore supersedes the rule of democracy. In their own relationship with the outside world corporations deal whenever possible with other corporations, not with individuals. The modern corporation is a direct descendant of the medieval craft guild. 28
To whom then is one beholden as liege lord? The more one is beholden in a hierarchical structure, the more one is in the power of one’s immediate superiors, as well as one’s peers!

Such dependency throughout the working life is not necessarily to be condemned out of hand. This is exemplified by the Japanese experience but theirs, of course, is a culture of the East and Japan, we must acknowledge, can lay claim to having been the modern world’s first police state. Neo-feudalism is also familiar to the West in all its forms of military organization. But its scope and ramification, its penetration of the public mind at the unconscious level, is a novel aspect of contemporary rational-legalistic, bureaucratized, scientific-technological mass society. Those who have such neo-feudal affiliations—that is to say, us—are the fortunate. Those without liege lords, the unemployed for example, are the unfortunate. Such ronin suffer economically but worse, they find no modality for self-identification, for self-worthiness, for life meaning, save perhaps in so far as they can accept the label of victim and alleviate their resentment through political action. 29

In Saul’s view, corporatism represents the triumph of fascism over demo
cracy; democracy in the romantic Athenian or practical
Swiss sense, fascism in
its proper original sense as a collectivity of V 3
interests bound together by the
State—the emblem of which was the bundle of sticks (fasces)
bound together
around an axe and carried before the Roman senators by the
lictors as a symbol
and reminder of the common good. One can easily break one
stick but the
bundle of them is invincible. (It is interesting to see how
Greece and Rome part
company.) Examples of contemporary sticks (and feudal
identities) are the pro
essions, the bureaucracy, the corporations of industry,
trade, commerce and
entertainment. Rather thick sticks, one must admit, but by
them we come to
identify ourselves to ourselves not as individuals, as
persons, but rather as
doctors, or lawyers, or civil servants, or educators, or
administrators. Thus we
leach our individuality, our wills and our very
consciousness into the roles pro
vided by the organizational forms.
The administrative implication of this malaise is that it
tends to exacerbate the
imperative to fight one’s own corner, whatever that might be: the department or
section or company or corporation or private practice. The
larger good is always
decided elsewhere and, increasingly, if at all. Our eyes
are on the next prize and
prizes are bestowed close to home. One is not rewarded for blowing the whistle
in the greater interest. In this state of affairs our consciousness of ourselves is
defined and limited by our roles and our wills are weakened by corporatist and
subcorporatist myopia. What is good for General Tobacco may be good for the
nation or not but it is certainly good for a GT chief executive officer. And as to
democracy, with respect to the greater good of the commonwealth, what dif
fence does one-man-one-vote make in a mass electorate? What is one vote
among a million? What power attaches to a drop in the ocean? What is one will
against the will to power?

Again, and at a larger level of generality than the organizational, there is a V 5
examination or value impress stemming from the Zeitgeist, the spirit of the
times. To this can be assigned the descriptor postmodernism. 30 For administra
tive purposes, postmodernism can be described simply as that condition where a
loss of value coherence typifies the overall culture. Its hallmarks are, variously:
pluralism, relativism, nihilism, multiculturalism, bien-pensant liberalism, iden
tity politics, anomie, alienation, victimology, eco-activism, terrorism, meaning
lessness, ressentiment, political correctness. One merely peeks beneath the lid of
the Pandora's box before snapping it shut, remarking only
that Nietzsche pre
dicted such outcomes a century ago, not least as a
consequence of his most
famous utterance that God is dead. 31 This selective
catalogue may seem like a
vision of hell and the worst of worlds but it must be
remembered that it is simply
a partial assortment of value ills associated with the
postmodern condition and,
in any event, it is ‘where we are at’. Each epoch has its
own ‘worst of times’ and
this is merely ours. Our concern here is not with the
putative glories of our era,
which are surely many, but with its malaise, with those
aspects that confront the
will to power and that dissipate and enervate the will to
lead. T H E T R I U M P H O F T H E W I L L
The point for administrators is that, to the extent that
postmodernism consti
tutes a discernible condition of organizational context,
they have the onus to
become aware of the issues it entails, of the philosophical
arguments and of the
postmodern polemic itself. Failure to take up this onus
again means loss of con
sciousness, loss of meaning, submission to mechanical
determinism, failure of
nerve, and weakening of the will to power. The outward
manifestation of this
weakening appears in the declension of leadership towards
pragmatic mediation
of interests, in pandering to designated minorities and
vocal activists, in the
compulsive search for consensus, in the reluctance or inability to say no, in the
endless oiling of squeaky wheels, in meek surrender to group-think or politically
correct orthodoxy. The postmodern administrator harbours a fear of violating any
norm. In the words of the Comte de Mirabeau, ‘There go the mob and I must
follow them for I am their leader.’ Recuperation
Restoration, reclamation of the will, the justification and recovery of power,
consciousness: what can be done to achieve such aims?
First of all let us acknowledge the administrative-managerial distinction. 32 It
can then be asserted that in the preparation of administrators generally the man
agerial side of things is fairly well taken care of. We can even commend our
selves on this. Managerial science (or proto-science), systems theory,
quantitative methods, rational problem-solving and inquiry, research methodol
ogy and so on, are with varying emphases well covered in the curricula of our
professional schools. The administrative side is more open to critique but even
here commendation is possible. Sampling only from the subset of educational
administration there is a quite respectable endowment. One need only consider
the highly sophisticated common sense of Willower and Sergiovanni 33 or the
highly sophisticated uncommon sense of Evers and Lakomski. 34 To these can be

added the ethnological work of Gronn and Ribbins 35 and, of course, the radical

insights into the social construction of organizational reality of the late T.B. Greenfield. 36 One could of course go on and still leave many contributors to this

side of the equation unacknowledged. Indeed the temptation is to say that, as

compared with other disciplinary subsets, educational administration is in the

van of curricular progress. In any rigorous comparison, however, the differential

emphases of subsets would have to be taken into account. 37 Nevertheless, what

falls short generally, or at least what tends to receive cavalier treatment, is what

might be called administrative philosophy, or the humanities in so far as they

exceed or transcend conventional social science and social psychology. So

called human relations, group dynamics, personnel ‘management’ and the like

are de rigueur. Even ‘leadership’ in a sort of reductio ad absurdum to anecdote or pencil-and-paper tests is often a required study. But what I have been

talking about and reaching towards in this paper is conspicuously absent. By

philosophy here I do not mean what goes on by and large in academic depart...
logic and rhetoric, and focusing above all on the nature and problem of value,

which are directly relevant to administration and leadership praxis. Such an

administrative philosophy would also subsume every aspect of Realpolitik of

bureaupathology, and of contemporary polemic. Begley has recently expressed

in succinct and persuasive form the practitioner argument for axiology in leader

ship training and preparation. 38 The case for the components of logic and

rhetoric is equally cogent, while the case for the education of the will has, so far

as I am aware, not even been thought of in any serious manner. Curricular

change in these directions, while it cannot of itself bring about rebirth, or the

rejuvenation of a flagging and failing will, could hypothetically provide a

preparatory educational context that would be supportive of recovery, simply

because its manifest function is to enhance and deepen understanding. The

ability to understand and penetrate issues, to reveal fallacies and to lay bare

faulty reasoning and indefensible sentiment is a prerequisite to the health of the

will to power.

Yet in the end we are inexorably returned to V 1 , the value-phenomenology of

the individual, and to the character of the leader. This is the elusive central vital
element in the entire complex of mysteries conjured up by the terminology of
will, power, value, consciousness and leadership. The education of the will

The will to power is an abstraction. Nietzsche himself refused to advance posit
ive characterizations of the will to power. It was simply that which 'resides at
the most basic level of intelligibility', 39 in other words, the primal motivation. It
becomes reality as it is embodied and manifested in the individual. Moreover it
must be understood that, at the individual level, will (intention) is a faculty dis
tinct from either thinking (cognition) or feeling (affect). What commonly passes
for will is not that at all but simply an unconscious resultant of competing affec
thereafter rationalized (if it is thought about at the conscious level) as an 'act of
will'. Actually it is the act of an automaton. ‘Thus I chose’ could be translated
‘Thus it chose for me’. Let us discriminate then between apparent will and real
will, between mechanical will and free will. The question before us then
becomes: is it possible to acquire the free will, to become free? To put it another
way, can one achieve self-mastery?
The general answer to this question is yes. But the education or training
necessary to achieve this affirmative is unlikely to be found in the schools of
leadership, management and administration in the West. 40
The military disci
plines of leadership training practised in officer schools
of both West and East,
while they clearly confront part of the problem through
go-submission tech
niques and anti-akrasia do not thereby educe freedom of the
will. On the con
trary, it could be argued that such education is moral
programming or T H E T R I U M P H O F T H E W I L L
conditioning rather than any inducement to Socratic
examination of self or ques
tioning of authority. With reservations, much the same
might be said of elite
schools of administrative preparation generally. Indeed,
short of adopting Ori
tal, monastic or Zen principles of character development
and training, all that
can be reasonably said or done is to hypothesize the
psychological sequence
implicit in these more esoteric methods of training and
offer them up for reflec
tion and consideration.
The essential central and primary element in all such
methods would appear
to be introspection. In our society, the administrative
leader, man or woman, is
engaged continually in action, in affairs, in gossip, in
the hurly-burly and the
rough and tumble of politics, calendars, schedules,
meetings, conferences and
human contacts which, if not always abrasive, are always
demanding of energy.
In consequence, the psyche is drained. Any spare time is occasion for guilt that there is spare time. Such time is not generally conceived as retreat, as space for solitary reflection, or for the inward look of contemplation. (Vampires don’t like looking in mirrors either!) Such time is more generally regarded as an opportun
ity for well-earned egoistic self-indulgence (and possibly more wear and tear).

Now from the standpoint of the emergence of true will I would like to plead that, whether action and contemplation are conceived of as being at opposite ends of a psychic continuum, or whether they are just plain dichotomous, either without the other is insufficient. I would go further and assert that the one without the other is a vanity and a futility.

Let us return to the hypothetical psychological sequence implicit in will development. Such an hypothesis would be verifiable not in the empirical scien
tific mode but in the sense of individual experience or personal experimentation.

Reflection or introspection or self-observation is then assumed to lead to an inner understanding which is accompanied by increased awareness or conscious
ness of one’s being and of one’s actions. This sensibility is then directly trans
ferable to others because it increases the capacity for Mitfühlung, for empathy
and insight into the motivations of one’s fellows. One becomes a Menschenkenner; one senses or knows what makes people ‘tick’, and this knowledge is power. But power also comes from another direction, from the hypothesis that consciousness and will are correlative. 41 The increase of the former creates at least the potential for a corresponding increase of the latter.

None of this is novel. It takes us back a very long way, to pre-Socratic times when the Delphic oracle answered seekers after power with the maxim, ‘know thyself’. This may be called the ultimate leadership imperative. 42 It is quite safe because in truth we actually know so little of ourselves—we do not see our selves as others see us, for example—and indeed we tend to avoid or shy away from such knowledge even if we firmly believe in the maxim that knowledge is power. The education of the will is then inseparable from the revelation of the self. The approaches to this have been alluded to above but, in the West at least, it appears to be something of a lost art.

At a minimal level any new curriculum with the radical objective of the independence of the will would have to aim at self-discipline and self-mastery in the domain of emotion, particularly negative emotion. The assumption is that
one can control one’s emotions, one can be detached, indifferent. In the vernacular, one can keep one’s cool, or as Kipling puts it so perfectly, keep one’s head while all about are losing theirs. 43

Of course there is a great caveat here. In all of this there must be authenticity or else it is mere dramaturgy, and dangerous contemptible dramaturgy at that.

Sartre, who had an exaggerated and in my view fallacious notion of the degrees of freedom in human will, nevertheless followed his existential logic through from a false premiss to a true conclusion. Sartre emphasized that man must never disclaim the responsibility for his actions. Nor can we avoid the responsibility of making our own choices on the grounds that we ‘must’ go to work or we ‘must’ live up to certain middle-class expectations regarding how we should live. Those who slip into the anonymous masses will never be other than members of the impersonal flock, having fled from themselves into self-deception. On the other hand our freedom obliges us to make something of ourselves, to live ‘authentically’ or ‘truly’. 44

To live authentically and truly would be to have acquired sufficient strength of will to be ‘unimpressed’ (literally so) by all value levels above V 1 . Such a degree of freedom does not mean that those levels would be disparaged but that the leader would use the levels V 2 -V 5 to the end of the common or organizational good without being used by them. That is, the leadership agenda would be neither unconscious nor reactive. It would be a function of a value system
which is itself a reciprocal function of will and consciousness. It would imply at least the embodiment of some Type I values in the leadership. 45 Does this prospect distress the more managerial amongst us? Tant mieux! Such leadership may also be, is likely to be, politically incorrect. Again tant mieux! This follows because it is the manifestation of an authentic Socratic individualism; this kind of leadership would always be a challenge to social norms and hence it is not without risk. Ideally one could imagine a full comprehension and sensibility of the entire V2 – V5 range, yet with an independent V1 interpretation which, while often held in restraint to subserve the consensus, nevertheless at its greatest moments becomes in truth a triumph of the will. This is clearly what we do not have today and so the question is, can such an authentic integrity of will and praxis be taught? It probably cannot, save by osmosis and, perhaps, mimesis; by the coming into contact and communion with an exemplar. The education of the will may of course happen by chance; by some happy accident or through association with a mentor or patron or peer, or by some inherent personal quality of natural charisma that achieves this consummation autonomously. Such patterns are not only informal but they are improp
erly understood and far from being transparent in nature. They can as well have THE TRIFLUS.

outcomes contrary to the notion of freedom of the will: for example, in the crys

'tallizing of a learner’s will in the image of the teacher or in the Christian and

Islamic paradoxes of ‘In His service is perfect freedom’ and ‘Inshallah! (As God

wants!’) Once again it becomes important to remember the distinction between

training and education. That these two pedagogical strategies can run at cross

purposes is always a hazard to any educative project of the will. If the will is

free then it cannot be said to be trained, only to be educated. But are these strat

gies independent or symbiotic?

Even if these problematics remain intractable that does not mean that they are

imponderable. Surely we can, and should, teach about them. Surely we could

include them within the compass of our total research effort? Is not administration

a specially important part of the general search for meaning? Axiology, value

analysis, value auditing: all deserve a better place in the professional sun. The

 gods of passion also deserve to be restored to the administrative pantheon. Dionys

sus and Apollo are brothers after all.

What I have crudely sketched here is but a prolegomenon to potential years
of labour in the academic vineyard. Such a tentative
reconnaissance of the terri
tory probably does not warrant any pointed conclusion.
Nevertheless, in the

spirit of the text one might essay a latter-day postmodern
Nietzscheanism: The Song of the Herd is We shall overcome.
The Song of the Leader is I have overcome . . . Myself!

Dare one, could one, ought one then add the words ‘For
them’? Endlogic

The point of this exploration has already been made: to
repeat the peculiar onus

upon the leader to acquire self-knowledge and self-mastery.
This is not an ethereal or impractical conclusion but rather an
ultra-practical or even hyper-practical suggestion. That it is avoided as often as not is
merely the mark of malaise,
of the flight into reason rather than beyond it.

The more pedestrian practical inferences to be drawn can be summarized as

follows:

1 There is never any shortage of leadership positions.
2 There is never any dearth of aspirants for those positions.
3 Therefore the problem is now, as it was in Plato’s time, curricular.
4 The administrative curriculum is lifelong.
5 The managerial side of this curriculum is currently adequate, the administrative or leadership side inadequate.
6 The inadequacies are axiological not epistemological.
7 Axiology is defined as: The philosophical theory of value
in general, embracing ethics or the philosophical theory of morality, but extending far beyond it to include aesthetic, technical, prudential, hedonic, and other forms of value. Any field of human discourse in which the general value-terms ‘good’ and ‘ought’ figure falls within the range of axiology, even that of scientific method with its principles about the degree of belief we ought to give to a hypothesis in the light of a given body of evidence.

8 Hence, the emergent curriculum would include consideration of the problem of the will, the problem of the commons, Realpolitik, social critique and bureauopathology in all its forms.

9 At a minimum, the emergent curriculum would incorporate practical training in the arts of common-sense logic, rhetoric and polemic.

10 Administration proper is a high-risk, high-reward vocation. Notes

Paper given at the Toronto Conference on Values and Educational Leadership, OISE Centre for the Study of Values and Leadership, University of Toronto, October 1996.

1 Christopher Hodgkinson, Towards a Philosophy of Administration (Oxford: Blackwell, 1982), prop. 6, p. 217.

4 Considering the administrative theorists’ concern with power, it is curious that Nietzsche is so rarely cited or referred to in the literature. A text in English exists—The Will to Power, tr. Walter Kaufmann and R.J. Hollingdale (New York: Vintage, 1968)—and it can be noted that this concept recurs...
throughout all the Nietzschean opus as a dominant leitmotif or threnody in his philosophy.

5 Nietzsche sees it as an ultimate driving force in the economy of life and nature going beyond merely human affairs: ‘Life itself is essentially appropriation, injury, over powering of what is alien and weaker; suppression, hardness, imposition of one’s own forms, incorporation and, at its mildest, exploitation . . . Life simply is will to power.’

Christopher Hodgkinson

Abstract This chapter critically surveys the cultural and educational context of the period 1960-2020 and seeks to analyze the implications for educational leadership. Sources range from early contributions of Donald Willower to the latest prognostications of experts in Cambridge and the USA. Both general and special conclusions are drawn and a new test, the A3M3, is introduced as part of the presentation. Tomorrow, and tomorrow, and tomorrow, Creeps in this petty pace from day to day, To the last syllable of recorded time; And all our yesterdays have lighted fools The way to dusty death (Macbeth)

These words of Shakespeare seem to imply a deep despair or cynicism about the possibility of benevolent change in human affairs. They are surely the very antithesis of American optimism and progressivism. For organizations they bespeak drudgery, wage slavery, Dilbertian anomie, pathological compartmentalization, ennui. They deplore meaninglessness. But they refer not to some sort of Nietzschean eternal recurrence of the same but simply to the line of time each one of us inhabits, a line which never wavers and always runs from past through present to future.

As one ages (and there’s an absolute for you) one automatically has more
past and less future. More behind, less in front. Less hope, more regret. And so

the very natural tendency is to approach the future, as McLuhan once put it,

looking in the rearview mirror. I shall try to struggle against this tendency. To

that end the bulk of this paper will deal with what is to come, with what might

be and the lesser part with the past, with what might have been or seemed to be.

But what of that past? It cannot be ignored. The way it might have been

One of the aims of this chapter is to heighten our sensitivity about the cultural

impress that is always determining, subliminally and subconsciously, our value

orientations and judgments. We are always creatures of our times and the times

themselves are a flood of events that are always somehow out of focus. In short

my topic is what used to be called history but that word has fallen into con

tention 2 and today is being displaced by exotica such as cultural anthropology,

sociobiology, evolutionary psychology, and bio-genetics. Yet history or tempo

rality conceived as the intellectual linkages between past, present, and future is

the very province and substance of administration. Certainly it is the meat of

leadership 3 in that administration is the management of the future and its

achievements become the legacy of the past. The conference for which this
chapter was originally prepared hardly came about without past planning and a complex cascade of policy and managerial decisions, each of which was present in its own instance. Administration is also karma-in-action for the past comes back to haunt it. As an eminent management consultant recently put it, some what facetiously, ‘The leader knows the future and has agreed to share it with the company instead of using this awesome power to make a fortune gambling.’ 4

But to comprehend or understand the future – the way things might be, it is logi cally necessary to understand the past – the way things were or, at least, seemed to be. As for the interim between these two things – the so-called present – let’s leave this for the moment; I’ll come back to it.

Shortly before my lamented and esteemed colleague Donald J. Willower sadly left us to join what he would call the Great Majority he gave me a now treasured possession. This was an inscribed book he had edited, together with Jack Culbertson, back in 1964 (Willower & Culbertson, 1964). It is a chorus of voices from the past and serves to remind us, as Nietzsche put it, that ‘The living are only a species of the dead, and a rare species at that.’ Included in the contrib utors were such greats as Roald Campbell, Dan Griffiths, and Joseph Schwab.
Also among them was a professor of medicine, George Miller. The book taken as a whole presents a vision of what educational leadership was seen to be and what the preparation of educational leaders might have been at the beginning of my survey period (c. 1960–c. 2020). These clearly were the days of a new dawn.

A heady sense of the importance and virtue of our professoriate existed. The Midwest Administration Centre at the University of Chicago was the centre of the world. Nevertheless, the general tenor and gist, if not the explicit agenda of the work, was to establish the intellectual credibility and respectability of a new discipline, grounding itself if not in science and theory per se then certainly in the social sciences and even in philosophy. Its place in the academy was formidably asserted. There was a distinct flavour of elitism and the development of the professorship in educational administration was favourably compared to its equivalent in medicine. Schwab, a ‘mathematical geneticist by training and a philosopher by choice’ (Willower & Culbertson, 1964, p. 48), felt it reasonable to commend to administrators ‘a sophisticated and cynical grasp of about a dozen separate and distinct bodies of theory’ (1964, p. vii). And even though the young Don Willower’s contribution was more down to earth,
it too stressed the

ideal and the philosophical components of our art. The field was to appeal to

‘the imaginative, inventive individual who wants to work in a profession which

seeks to contribute to human progress and growth’ (1964, p. 150). He had

already enunciated the theme he was to pursue throughout his career: a pragmatic reconciliation of theory and practice but with a marked stress on reflection and reflective methods concomitant with a commitment to educational ideals.

Dewey revivibus. All in all it was an inspiring manifesto, both dignifying educational administration and projecting for it a future where, as once perhaps in the past, men of action were also men of contemplation, of wisdom, of passion and honour. Did all this what-might-have-been come about? You be the judge. Well, perhaps the timing was a little out.

Recall the 1960s. Remember San Francisco where, then, one wore a flower in one’s hair. I was at Berkeley at the time. Momentarily it was the epicentre of a new revolution: the counter-culture. Wonderful as it all was in its beginnings things soon soured. In the end they even had to create concentration camps in California to hold some of the more exuberant dissidents. And the challenge to authority had slogans like ‘Burn, baby, burn’. Mao buttons
were de rigueur,

Minutemen and Black Panthers were lionized as were
communes, long hair, and

free casual sex. It was the time of Sharon Tate and the
Manson gang, Vietnam.

Drugs. Sex. Dionysus. (we’ll return to him later.)

In the end order was restored. But by then Thom Greenfield
had fired the

epistemological shot that was heard around the world of
educational administra
tion. The authority of science itself was now challenged.
Reality was a social
construct. Organizations were moral entities, or should be.
Camps formed and
camp followers lined up. In Canada Royal Commission
followed Royal Com
mission, each more eager than the rest to overturn the
traditional order. Change

was equated with progress. Permissive lib-chic became the
orthodoxy of the
day. (It still is, only now crystallized into a
non-permissive political correctitude.

The University of Alberta extended its influence, via
educational administration,
to Australia while the newly formed Ontario Institute for
Studies in Education
became a world-class centre for our subject. This too still
is. Heady times. Great
debates: Greenfield-Griffiths, Greenfield-Hills,
Greenfield-Willower. Back then

only 6% of the population in Canada had a university
degree. Now 90% of

school superintendents have a master’s and 10% the
Between past and future lies a mystery. The present. Now. ‘Now’ in logic is a very fuzzy term. Taken as the moment it doesn’t exist, in the same sort of way as it doesn’t make sense to talk of instantaneous velocity in the differential calculus. But the calculus works and our sense of time seems real enough. Yet subjective experience and inner attention are always a mixed-up blodge of the past (memory) and the future (hopes, fears, and expectations). Unless you want to go the Zen route and aspire to be like the samurai who can pick a mosquito out of the air with his chopsticks, ‘now’ would not be precisely meaningful. I fancy, however, that most educators inhabit a permanent state of bell-ringing anticipation: blissful if it signifies the end of a class or a lecture, and the contrary otherwise.

Collectively the same holds true. ‘Today’s news wraps tomorrow’s fish’, ‘You can’t step into the same river twice’. Postmodernism, the label for our now, is a-historical and chimerical. Fuzzy logic writ large. So ‘now’ does not mean right now. It means rather a blurry spread of contemporary events stretching back a bit and forwards a bit. In administration it may be fairer to say that it stretches back a lot and...
forward a lot for we stumble

into the future hobbled by plans and commitments made in
the past and our

forward reach exceeds our grasp. As for the present as
often as not there’s no

‘there’ there. For our purposes then it is sufficient to
simply regard the now as

the last decade or so together with the shadow it extends
into the future. This

historical sound-bite (sub specie aeternitatis) is
increasingly recognized and

classified as postmodern and postmodernism is something we
must look at more

closely. This NOW is, however, radically different from its
predecessors. The

following items are indicative of this difference: the pill
(perhaps the most revo

lutionary technical advance since the wheel), the chip, the
micro-chip, the PC,

the global village, day-trading, cloning, genetic
engineering, social engineering,

E-commerce, E-everything, Mars orbiter, jumbo-jets,
Concorde, neutron bombs,

cell-phones, websites, quantum physics, astrophysics,
astroturf . . .

All this and much more comprise the technological
infrastructure of our

present culture. All in the ‘now’. Technology has always
been around but previ

ous infra structural changes like the Industrial Revolution
occurred over much

larger sweeps of time. The present curve of change (and its
learning curve) is, in
comparison, exponential. All such changes affect the social superstructure or
culture because they change context: the mise-en-scène. But there is a complica
tion. Culture is dependent on science and technology but it is also autonomous.

It’s not simply a matter of correlative dependency and interaction. The explana
tion for this is a logical difference between value and fact. Science speaks on
facts but is silent on values. The humanities speak (or used to speak) on values
but have to accept whatever facts are placed before them. The gulf between
these two realms of discourse is radical. To try to get values from facts is to
commit the naturalistic fallacy - a fallacy that has never been refuted. You can’t get an ‘ought’ from an ‘is’. But you have to take the is’s into account. As Third Reich scientist Werner von Braun used to say, ‘I send the rockets up - Who cares where they come down?’ Worrying about where or when they should come down is not science, it’s administration.

For example, will the final mapping of the genome change human nature?
No, but it will give us more power perhaps, and certainly it will add to the
information overload that we have already. Great changes occur; the scientific sands are shifting underfoot. But the really interesting thing is that human nature
changes very little. Crucifixion is out of fashion at the moment but a Roman
soldier returning to earth today, after due wonderment at the technical changes
about him and a sigh of despair at the state of the Colosseum, would soon feel at
home. Genocides and holocausts, man-made events, are still around. On the
other hand there has been no nuclear war (yet) and no world war since
Hiroshima. (And no army used gas in World War II.) This emphasis on human
nature is important because to be an educator is by definition to be a humanist,
maybe even a classicist. Certainly there are two Greek gods we should get to
know. Their names are Apollo and Dionysus. Apollo is blond and beautiful,
impeccable, he is the god of the sun, of light, of reason. A worthy representative
of science but also a bit of a fascist. Dionysus is dirty, dishevelled, wild, the god
of orgies and sensuous destructive abandon; the god of all things irrational,
against all order, for all chaos, all indulgence, a sort of über-hippie. These two
gods represent a dialectic ever-present in human nature and human history. Very
crudely put the post-Enlightenment period of modernism could be called Apol
Ionian and the philosophical confusion that followed on Nietzsche's lament of
God's death in the late Victorian era with its consequent cataclysm in 1914 -
postmodernism in other words - can be called Dionysian.

This dialectic occurs at many levels in human nature. It is exemplified in our
times as a psychological contest between reason and
passion; desire for order

and rebellion against restraint; the triumph of science and
the naturalistic fallacy

concomitant with the malaise of moral relativism and the
malaise of totalitarian

political correctness. You can apply this analysis to
education for yourself and

all of you have been exposed and are being exposed to the
stress and tension

which these two immortal archetypes, these two gods, create
in our cultural

fabric. Listen for a moment to Nietzsche commenting on the
death of God: . . . Are we not plunging continually?
Backward, sideward, forward, in all directions? Is there
any up or down left? Are we not straying as through an
infinite nothing? Do we not feel the breath of empty space?
Has it not become colder? Is not night continually closing
in on us? . . . God is dead. God remains dead. And we have
killed him . . .

Not too bad a description of the postmodern condition. But
postmodernism is

not merely relativistic about value it is also nihilistic
about truth. Our Roman

soldier could well ask Pontius Pilate's famous question
with even more justification.

What is truth? What is the truth about truth?
(Anderson, 1995). That there is

no truth. There are only Nietzschean 'perspectives' or
'interpretations'; only

Lyotard's 'incredulity towards meta narratives'; only
Derrida's 'il n'y a pas de
hors-texte’ – there’s only a text, and its only meaning is that provided by its reader.

This then is the structure of NOW. On the one hand hyper-rational bureaucratic legalistic complex organizations (school systems, multinationals, governments), on the other hand increasingly stressed individuals and small groups divested of, but searching for, meaning and value in an endless variety of ways from hedonistic materialistic consumerism to profound and authentic spiritual search and striving.

The Way it is becoming. What comes after postmodernism? Such a question invokes the great imponderable – the future – which, while it extends to infinity really only concerns us within the range of our immediate mortality. Soon we too will be part of the Great Majority. And, as always, there is a dialectic of opinion: the sun of Ecclesiastes under which there is nothing new and the river of Heraclitus into which one cannot step twice. Plus ça change, plus c’est la même chose . . . and yet the new forever being born. With this dialectical tension in mind let us look fleetingly at the short term ahead. To help us do this I have resorted to alma mater Cambridge. From those hallowed cloisters emerges a picture of post-postmodernity based on Cantabridgian expertise. This in very digested and kaleidoscopic form I now present for your
But first a Persian thought, even a Caribbean one? . . . Ah, fill the cup - what use is to repeat how time is slipping underneath our feet. Unborn 'Tomorrow', and dead 'Yesterday'. Why fret about them if 'Today' be sweet! Population

By 2050 two-thirds as much more protoplasm than we have today: 10 billion bodies. But food production efficiency outpaces population growth. Risks to the environment, however. 'Better governance, better institutions, better markets, better schools' will be necessary. But desire for progeny may decline. Climate

Nothing really bad until at least 2050. Need to get rid of present type of cars, however. Scientific opinion is split. Hotter? Colder? We don't know. Water

Massive pipeline shifts, Canada to U.S. Also, dams don't exist forever, they're aging. Water will soon be metered like electricity. The poor already have a water crisis. A problem of equity rather than engineering.

C O N C L U S I O N

Energy Plenty of it but again the environmental problem. Correlated to living standards as one might expect. New cars needed. 'Globality and 24-hour, hyperactive, inter-connected, e-mail fuelled, sleep-deprived' new millennium is upon us. Superpowers

Present condition an historical first (if one excludes Rome). Other powers on the rise, e.g., China and a revitalized Russia. And ethnicity a problem. Presently Pax.
Americana. Trouble Spots

Terrorism. United Nations

Richest 20% have 86% of the world’s wealth. Poorest 20% have 1%. U.N. is aging now, too. Like the dams. East and West

China’s tough line on population control has been a great contribution to human

Germany a ‘state’. But all very exciting and Europe could become number one

in 30-40 years time. Money

Capitalism is ‘the permanent equilibrium state of human society. Everything else was a sideshow.’ ‘The motivation to compete, to own and acquire wealth is a fundamental fact of human existence, just like the need to eat or have sex.’ But

the mixed economy form now well established and no more crises for at least 15

years. Markets

Stock markets will be electronic and global. Big problem of regulation. Com panies must grow or die. But double-entry bookkeeping will remain, as it has,

since the 15th century. VALUES AND RELIGION

Electronics
The symbol of the 1980s was the personal computer. The symbol of the 90s was the web. The next thing will be sensors. These will be low-cost, very high performance, and they’ll be everywhere, ‘from Macdonald’s fries to insulin delivery for diabetics’. We will soon have entire PCs on a chip. But information technology will be supplanted by biotechnology. The genome and all that. Internet This could be a liberating force in the Third World. Can also be cultural dumbing-down (Hollywood and porn). It’s an information toy but how long can interest be sustained? Cars Next big step the automated road: regulating vehicles in convoys. Sensors can make this a reality. ‘You would just pay a toll, couple your car into an electronic convoy and sit back to enjoy the ride’. Adelaide already has automated bus routes. Aircraft Flight has lost its glamour. Passengers are bored and uncomfortable. The aim will be speed. Airlines will either have to get you there faster or make flying more enjoyable. Fuel and turbulence set technological limits and problems. Space Lots of other planets but life on them may have been millions of years in the past or will be millions of years in the future, our time. So don’t bet on extra terrestrials. Families
System breaking down in the West. Women can’t do it all: adopting a male agenda in life arguably only another form of submission. Smaller families and more childless families. Being a parent used to bring social status, it doesn’t now. Ethnicity

Very complex. Very postmodern. ‘Identity’ will depend more on one’s set of values than where one comes from.

Crime

Up but more property crime than violent crime. Prison populations up. Christianity

Growing West and East. Current modes (military and dynastic leadership) may shift towards democratic forms. Big problem remaining: fundamentalism. English

World language for next half-century then shift to possibly Spanish. Chinese if they can solve the orthography problem. But English will fragment. Process well under way. English teachers jobs very secure. (Even in Quebec.)

Bodies

Twenty-five percent of the population will be over 60. But healthier. Cliché problem is to ‘add life to years’ rather than converse. Big educational implications.

Minds

Depression, dementia, stress, Alzheimer’s. Boomers already
trembling. Four

and five-generational living families. Grandparents may be too busy minding
great-grandparents to look after grandchildren. Reproduction

Divergence between developed and developing regions. In the former sex for

pleasure and conception for the laboratory. More test-tube babies, sperm and

egg-banks. Chinese interventional experiments need watching. Funding health

Seven percent of UK Gross Domestic Product presently goes to Health; 9% in

Netherlands, 10% France and Germany. But outcomes very comparable. Prob

able shift from universal coverage to ‘top-up’ or ‘opt-out’ schemes; i.e., basics

paid, user-pay for the rest. Even so higher taxes and rationing on the way. (Since VALUES AND RELIGION

health and education compete for the public purse one can safely predict more

stresses and strains in both systems.)

This is by no means all. It is only a sampling of the multiple facets of post

modern life as examined by the Cambridge experts cited but it is surely a peek at

the shape of things to come. That shape, through a glass darkly, may disappoint

- or it may excite - but futurology is perforce a very modest business since the

future itself is a combination of the causal and the casual: of past determining

forces which have yet to run their course and the totally
unforeseen. So prophets had better be modest. Nevertheless what is glaringly conspicuous by its absence from the above forecasts, what is missing from all this arcana of tribal peoples, telecoms, film, even Judaism; what is totally lacking in this glimpse at the coming century is the category of philosophy. And this from the academic home of Russell, Moore, and Wittgenstein. This from the institution that gave an honorary degree to Derrida! Not a peep, not a peek. To the end of history must now be appended the demise of philosophy. But before leaping to this conclusion let us look at the view from our side of the water. The American view As part of the same millennial frenzy that inspired the Cambridge authors, a special issue of Time magazine was devoted to such questions as: Will we live on Mars?, travel in time? discover another universe? figure out the brain? get rid of cockroaches?, etc. Admittedly, the questions are scientific-technological, but they are carefully considered by the finest expertise in the respective fields, including many Nobelists. To make a short story even shorter the answers can be summarily summed as no time travel, no extra-terrestrial contact, no final ‘theory of everything’, no explanation of consciousness, no solution to the mind
body problem, no perpetual motion machinery, and no controlling the weather.

Or cockroaches. And again no philosophy even though several commentators had inevitably to deal with issues such as mind, consciousness, and meaning.

Granted the project was non-normative, rationalistic, and scientific-techno logical in the best tradition of the Enlightenment and the Age of Reason. And, come to think of it and if memory serves, Time has not devoted a special issue to philosophy for over thirty years. At which time it declared it dead, killed by the academicicians. Even Time gets things right on occasion.

General conclusion
The values of the short-term future are implicit if not explicit. It is likely to be an unholy Apollonian-Dionysian mix of rationalistic legalistic bureaucratic scientific technological pragmatics and a reactive postmodern relativistic hedon istic narcissistic materialistic nihilism. For education this might imply a skew towards the digital, the mathematical, the marketable, and the meritocratic. That is to say, not the mindless but the meaningless. And all the consequent C O N C L U S I O N Dionysian reactions of rage, resentment, ressentiment, and violence this might invoke. I hope these words are not prophetic and a product more of dimmer than of clearer sight. But I have long perceived with some empirical verification the
cultural tendencies to valorexia and philosophobia: the twin diseases of loss of meaning and abhorrence of philosophy.

Of course we as educators must be concerned with literacy of all types, including the digital; of course we must attend to earning-learning of all the marketable kinds; but we must also restore our responsibility for general social decorum, even in postmodernity; we must hand down traditions and history even if they offend some multicultural persuasions; and we must have a concern with the larger purposes of being human. Failing this we are not educators but just another form of teaching machine: programmers, trainers, info-dispensers.

Information may equate to knowledge but knowledge does not equate to understanding. None of this is to say we cannot joyfully embrace the future. Amor fati is always an option. 7 That the questions which this admittedly disjointed and tumultuous sweep of time and events are always: what changes and what stays the same? Mark Twain’s remark is relevant, ‘History does not repeat itself. But it sure rhymes.’

Simply put what changes is context, what doesn’t change is human nature.

But, as already mentioned, human nature just happens to be the essential raw
material of education. More, it is also the essence of administration and leader
ship. (Think character instead of characteristics.) Moreover still, human nature
and the human condition are the quintessential subject matter of real philosophy.

John Dewey said, and our late colleague Don Willower endorsed this, that the
whole of philosophy is the general theory of education. I would go further and
assert that the whole of philosophy is also the general theory of administration. 8

True, philosophy in the academic sense is largely remote from practical affairs
but administrative philosophy is a discipline the whole aim of which is to inform
practicality. And this sort of philosophy is the birthright of everyone. To make
my point please take the following A3M3 test:

1 Do you really know how to tell right from wrong?
2 Do you really know how to tell good from bad?
3 Can you tell a sound argument from a fallacious one?
4 Do you know enough about human nature?
5 Do you know enough about the human condition?
6 Do you really know yourself?
7 Are your answers to the above questions adequate for your role as leader or aspirant to leadership? Special conclusion

The test you have just been subjected to calls for some further words of
comment. Contrary to what you might now modestly assume, it is possible to VALUES AND RELIGION
score a perfect seven. At the very least it is possible to impute or ascribe such a score since the test may be extroverted and attributed onto unwitting targets.

Thus, all the great charismatic leaders for good or evil might score a 7: Jesus Christ, Gandhi, the Lord Buddha on one side and Josef Stalin, Adolf Hitler, and Pol Pot on the other. I myself have known leaders who, for me at least, fit the 7 bill nicely: my mentor Sir Geoffrey Vickers for one and a certain university president for another - although both might well have been loath to acknowledge the ascription.

More importantly, the test implies an agenda for leadership preparation and research the component parts of which are already established and need only to be assembled. Essentially they suggest a shift in theory emphasis from epistemology to axiology; a short course in elementary logic and rhetoric; some exposure to the arts in the Greenfield tradition and due consideration of pathology (see Greenfield & Ribbins, 1993).

As for research the work already done in the leadership initiative of these conferences is one example. Credit must be given in this respect to the labours of Professor Begley. Analytical tools for value praxis already exist and the
ethnological studies of Peter Ribbins in the United Kingdom (Ribbins & Sayer, 1998) and Peter Gronn in Australia (Gronn, 1999) provide examples of how insight can be gained into the administrative form of life. This curricular emphasis should supplement and complement rather than displace the current studies in social science.

In the A3M3 quiz the crucial question, which cannot be formulated so as to yield a precise answer, is of course number 6. Philosophers and non-philosophers alike may argue cogently and validly that it is unanswerable in any objective sense, short of mystical illumination or transcendental revelation. Nevertheless it is always possible to arrive at a tentative subjective judgment, and the question should always be held before us for if it is not asked then it is answered — in the negative. Not for nothing was the exhortation 'Know thyself' above the Temple of Apollo at Delphi in ancient Greece.

Finally, two lesser considerations: first, the test is subject to modification in that the rigid requirement for a dichotomous yes or no answer might be relaxed and, second, perhaps the test calls for a more innocuous and user-friendly title than the one temporarily assigned: Administrative Arrogance And Managerial Modesty Measure. I am sure that neither the A nor the M
attributes exceed the
limits of propriety in the present audience, and that the
circle of what might have
been can be closed into what yet still might be. Notes

7 Nietzsche’s solution. But this depends on the degree of freedom and reality of the will. Which calls for another paper beyond this one.

9 Theoria, op.cit. note 4; and also Macmillan (2001).
From experience I can recommend Robert Thouless (1974). The elements of argument do not change with the fashions of the times and this was first published in 1930.

As for note 2.

Managing moral purpose and change agentry is at the heart of productive educa
tional change. It is necessary to take a closer look at each of them, and to make
explicit their organic relationship. Moral purpose

In their major study of teacher education, Goodlad and his colleagues found
themselves being pushed deeper to the moral purposes of education in order to
understand the basic rationale for teaching in post-modern society: ‘We came to

see with increasing clarity the degree to which teaching in schools, public or

private, carries with it moral imperatives—more in public schools, however,

because they are not schools of choice in a system requiring compulsory school

ing’ (Goodlad, 1990a, p. 47, my emphasis; see also Goodlad, Soder and Sirot

nik, 1990). Goodlad singles out four moral imperatives:

Facilitating critical enculturation The school is the only institution in our nation specifically charged with enculturating the young into a political democracy . . . Schools are major players in developing educated persons who acquire an understanding of truth, beauty, and justice against which to judge their own and society’s virtues and imperfections . . . This is a moral responsibility. (pp. 48–9) Providing access to knowledge The school is the only institution in our society specifically charged with providing to the young a disciplined encounter with all the subject matters of the human conversation: the world as a physical and biological system; evaluative and belief systems; communication systems; the social, political, and economic systems that make up the global village; and the human species itself . . . (Teachers) must be diligent in ensuring that no attitudes, beliefs, or practices bar students from access to the necessary knowledge. (p. 49) Building an effective teacher-student connection The moral responsibility of educators takes on its most obvious significance where the lives of teachers and their students intersect . . . The epistemology of teaching must encompass a pedagogy that goes far beyond the mechanics of teaching. It must combine generalizable principles of teaching, subject-specific instruction, sensitivity to the pervasive human qualities and potentials always involved. (pp. 49-50) Practicing good stewardship If schools are to become the responsive, renewing institutions that they must, the teachers in them must be purposefully engaged in the renewal process. (Goodlad, 1990b, p. 25)

One of Goodlad’s colleagues, Sirotnik (1990, p. 290 ff) adds his list of moral
requirements: commitment to inquiry, knowledge, competence, caring, freedom, well-being, and social justice. In his own words: The implications of moral commitments to inquiry, knowledge, competence, caring, and social justice go farther than curriculum and classroom experiences. They go to the very heart of the moral ecology of the organization itself. This can be readily seen in the extent to which these commitments are reflected in the work environment of educators outside of classroom teaching per se. To what extent does the organizational culture encourage and support educators as inquirers into what they do and how they might do it better? To what extent do educators consume, critique, and produce knowledge? To what extent do they engage competently in discourse and action to improve the conditions, activities and outcomes, of schooling? To what extent do educators care about themselves and each other in the same way they care (or ought to care) about students? To what extent are educators empowered to participate authentically in pedagogical matters of fundamental importance - what schools are for and how teaching and learning can be aligned with this vision. (p. 312)

At a policy level, growing concerns about educational equity and economic performance mirror the more particular issues just described. The restructuring movement, in intent at least, places a renewed focus on the education of all students, 'especially those who have been ineffectively served in the past' and attempts to reorganize schools for that purpose (Murphy, 1991, p. 60). Poverty, especially among children and women, racism, drug abuse, and horrendous social and personal problems all make the equity and excellence agenda more serious and poignant day by day (Hodgkinson, 1991).

My main point, however, is not to consider these matters at
the institutional level – at least not at this time. The building block is the moral purpose of the individual teacher. Scratch a good teacher and you will find a moral purpose. At the Faculty of Education, University of Toronto, we recently examined why student teachers wanted to enter the profession. We have a post-baccalaureate fifth year program which results in certification after one year. It represents a particularly select group because there is a great demand to enter teaching in Ontario. For 1992/93 there were some 7000 applicants for 1100 positions. We use as admission criteria a combination of two factors weighted equally – academic grades, and an applicant ‘profile’ designed to capture experience and reasons for entering teaching. Because of the emphasis on experience, the average age is 29. In a small study we drew a random sample of 20 per cent of those in the 1991/92 year (Stiegelbauer, 1992). We set out to derive from the written profiles, what student teachers said about ‘why they want to become teachers’. The most frequently mentioned theme was ‘I want to make a difference’ reflected in the following sample of quotes: I hope my contribution to teaching, along with other good teachers’ contributions, will help result in a better society for our future. I care about children and the way that children are learning. Education is an important factor which determines the quality of an individual life
and the future of society as a whole. No other profession enables one the opportunity to provide such a positive impact on a child’s overall development. I want to effect positive change in students’ lives. I’ve always thought that if I could go into a classroom and make a difference in one kid’s life . . . then that’s what I am here for.

I am not suggesting that the mere statement of purpose is a straightforward matter. We cannot automatically take these statements at face value (although VALUES AND RELIGION our day-to-day experience with student teachers provides ample corroboration of this theme), and there are different motivations for entering teaching among any cohort: But I am saying that we have a kernel of truth here. Many, many teachers enter the profession because they want to make a contribution – they want to make a difference!

What happens here-on-in – in teacher preparation, induction, and throughout the career – is a different story. Those with a non-existent or limited sense of moral purpose are never called upon to demonstrate their commitment. Those with moral potential, however inchoate, are never developed. Those with a clearer sense of purpose are thwarted. Hargreaves and Tucker (1991) address the latter issues in their treatment of teaching and guilt. They quote Davies (1989, p. 49) ‘at the centre of the feeling of guilt is self disappointment, a sense of having done badly, fallen short, of
having betrayed a personal ideal, standard or commitment’. Hargreaves and
Tucker (1991) also suggest that aspects of moral purpose like caring may be too
narrowly conceived. They argue that there is more to it than personal caring and
interpersonal sharing: ‘Care . . . carries with it social and moral responsibilities
as well as interpersonal ones’ (p. 12).

The argument is somewhat subtle, so let me make it more directly. If con-
cerns for making a difference remain at the one-to-one and classroom level, it
cannot be done. An additional component is required. Making a difference, must
be explicitly recast in broader social and moral terms. It must be seen that one
cannot make a difference at the interpersonal level unless the problem and solu-
tion are enlarged to encompass the conditions that surround teaching (such as
the collaborative school, chapter 4), and the skills and actions that would be
needed to make a difference. Without this additional and broader dimension the
best of teachers will end up as moral martyrs. In brief, care must be linked to a
broader social, public purpose, and the latter if it is to go anywhere must be pro-
pelled by the skills of change agentry.

We now come to the integrative theme of the chapter: teachers are agents of
educational change and societal improvement. This is not as
highfalutin as it

sounds. I have already argued that they are part way there on a small scale with their

aspirations for making a difference. And they are there ecologically with expecta
tions of reform constantly swirling around them. In addition to making moral

purpose more explicit (thereby clearly declaring what business we are in) educators

also need the tools to engage in change productively. Care and competence, equity

and excellence, social and economic development are natural allies in this quest. Change agentry

I will have more to say about change agentry later. Here I want to outline some

of its elements at the individual level. How to produce more of it, and under

what conditions it can be further developed and sustained are the subjects of the

remaining chapters. MORAL PURPOSE AND CHANGE AGENCY

I define change agentry as being self-conscious about the nature of change

and the change process. Those skilled in change are appreciative of its semi

unpredictable and volatile character, and they are explicitly concerned with the

pursuit of ideas and competencies for coping with and influencing more and

more aspects of the process toward some desired set of ends. They are open,

moreover, to discovering new ends as the journey unfolds. In chapter 3, the
complexities of the change process and some of the insights and lessons arising

from the new mindset will be explored in detail. At this stage the question is,

what conceptions and skills should the teacher of moral purpose possess in order

to become a more effective change agent.

I see four core capacities required as a generative foundation for building greater

change capacity: personal vision-building, inquiry, mastery, and collaboration. Each

of these has its institutional counterpart: shared vision-building, organizational

structures, norms and practices of inquiry; focus on organizational development and

know-how, and collaborative work cultures (chapter 4). For reasons that should be

increasingly clear throughout this book we need a dual approach working simultan

eously on individual and institutional development. One cannot wait for the other.

And if they are not working in concert, in particular settings, it is necessary to work

on them separately looking for opportunities to make them connect.

The individual educator is a critical starting point because the leverage for

change can be greater through the efforts of individuals, and each educator has

some control (more than is exercised) over what he or she does, because it is

one’s own motives and skills that are at question. Moreover, working individu
ally on the four capacities about to be described makes it inevitable that there will be plenty of intersection of effort. I am not talking about leaders as change agents (more of that later) but of a more basic message: each and every educator must strive to be an effective change agent.

I start with personal vision-building because it connects so well with moral purpose contending with the forces of change. Shared vision is important in the long run, but for it to be effective you have to have something to share. It is not a good idea to borrow someone else’s vision. Working on vision means examining and reexamining, and making explicit to ourselves why we came into teaching. Asking ‘What difference am I trying to make personally?’ is a good place to start. For most of us it will not be trying to create something out of nothing. The reasons are there, but possibly buried under other demands or through years of disuse, or for the beginning teacher still underdeveloped. It is time to make them front and centre. We should not think of vision as something only for leaders. It is not a farfetched concept. It arises by pushing ourselves to articulate what is important to us as educators. Block (1987) emphasizes that ‘creating a vision forces us to take a stand for a preferred future’ (p. 102); it signifies our disap
pointment with what exists now. To articulate our vision of the future 'is to come out of the closet with our doubts about the organization and the way it operates' (p. 105). Indeed, it forces us to come out of the closet with doubts about ourselves and what we are doing. VALUES AND RELIGION

Says Block writing more generally about organizations: 'We all have strong values about doing work that has meaning, being of real service to our customers, treating other people well, and maintaining some integrity in the way we work' (p. 123). Teachers, as I have indicated, are in one of the most 'natural' occupations for working on purpose and vision, because underneath that is what teaching is all about.

Several points in conclusion. First, I cannot stress enough that personal purpose and vision are the starting agenda. It comes from within, it gives meaning to work, and it exists independent of the particular organization or group we happen to be in.

Second, personal vision in teaching is too often implicit and dormant. It is often expressed negatively (what people want to get rid of, or not see happen) or narrowly in terms of means (more time, smaller classes). We need also to have positive images as driving forces. Teachers do not have to
wallow in hubris in realizing that they are in a strategic position. Teachers should be pursuing moral purpose with greater and greater skill, conceptualizing their roles on a higher plane than they currently do.

Third, once it gets going, personal purpose is not as private as it sounds. Especially in moral occupations like teaching, the more one takes the risk to express personal purpose, the more kindred spirits one will find. A great deal of overlap will be experienced. Good ideas converge under conditions of communication, and collaboration. Individuals will find that they can convert their own desires into social agendas with others. Remember, personal purpose is not just self-centered, it has social dimensions as well such as working effectively with others, developing better citizens, and the like.

Fourth, personal purpose in teaching should be pushed and pushed until it makes a connection to social betterment in society. This is what it is at the one-to-one teacher-student level anyway. It has greater scope and meaning, and calls for wider action if we realize that societal improvement is really what education is about.

Fifth, and an extension of the previous point, is the realization that personal
purpose in teaching is a change theme. Gardner (1964, p. 72) quotes Petrarch: By citizens, of course, I mean those who love the existing order; for those who daily desire change are rebels and traitors, and against such a stern justice may take its course.

Today, the teacher who works for or allows the status quo is the traitor. Purposeful change is the new norm in teaching. It has been bouncing around within teaching for the past thirty years. It is time we realized that teachers above all are moral change agents in society - a role that must be pursued explicitly and aggressively.

Finally, and paradoxically, personal purpose is the route to organizational change. When personal purpose is diminished we see in its place groupthink and a continual stream of fragmented surface, ephemeral innovations. We see in a phrase, the uncritical acceptance of innovation, the more things change, the more they remain the same. When personal purpose is present in numbers it provides the power for deeper change: Cultures get changed in a thousand small ways, not by dramatic announcements from the boardroom. If we wait until top management gives leadership to the change we want to see, we miss the point. For us to have any hope that our own preferred future will come to pass, we provide the leadership. (Block, 1987, pp. 97-8).

All four capacities of change agentry are intimately interrelated and mutually reinforcing. The second one - inquiry - is to say that the formation and enact
ment of personal purpose is not a static matter. It is a perennial quest. One of the

new paradigm writers, Richard Pascale (1990) captures this precisely: ‘The

essential activity for keeping our paradigm current is persistent questioning. I

will use the term inquiry. Inquiry is the engine of vitality and self-renewal’ (p.

14). Stacey (1992) puts it this way: ‘A successful, innovative organization must

have groups of people who can perform complex learning spontaneously.

Because in open-ended situations no one can know what the group is trying to

learn, the learning process must start without a clear statement of what is to be

learned or how’ (p. 112).

Inquiry is necessary at the outset for forming personal purpose. While the

latter comes from within, it must be fueled by information, ideas, dilemmas and

other contentions in our environment. The beginner, by definition, is not experi-

enced enough with the variety and needs of students, and with the operational

goals and dilemmas of improvement to have clear ideas of purpose. Habits of

‘questioning, experimentation, and variety’ are essential (ibid). Reflective prac-
tice, personal journals, action research, working in innovative mentoring and

peer settings are some of the strategies currently available (see Fullan and Harg

Learning is critical for the beginning teacher because of its formative timing.

But we are talking about more than this – lifelong inquiry is the generative characteristic needed because post-modern environments themselves are constantly changing. We are probably never exactly right in the first place, but in any case we need the checks and balances of inquiry because in changing times our initial mental maps ‘cease to fit the territory’ (Pascale, 1990, p. 13). Thus, we need mechanisms to question and update our mental maps on a continuous basis. For Pascale, the question is the answer: ‘Our quest isn’t just a New Management Paradigm of the Nineties but a way of thinking that is continually open to the next paradigm and the next and the next . . .’ (p. 265). What could be closer to change agentry? Values and Religion

The relationship between the first two capacities – personal vision and inquiry – involves the ability to simultaneously express and extend what you value. The genesis of change arises from this dynamic tension.

The capacity of mastery is another crucial ingredient. People must behave their way into new ideas and skills, not just think their
way into them. Mastery
and competence are obviously necessary for effectiveness, but they are also
means (not just outcomes) for achieving deeper understanding. New mindsets
arise from new mastery as much as the other way around. Mastery then is very
much interrelated with vision and inquiry as is evident in this passage from
Senge (1990): Personal mastery goes beyond competence and skills, though it is grounded in competence and skills . . . It means approaching one’s life as a creative work, living life from a creative as opposed to a reactive viewpoint . . . When personal mastery becomes a discipline – an activity we integrate into our lives – it embodies two underlying movements. The first is continually clarifying what is important to us (purpose and vision). We often spend too much time coping with problems along our path that we forget why we are on that path in the first place. The result is that we only have a dim, or even inaccurate, view of what’s really important to us. The second is continually learning how to see current reality more clearly . . . The juxtaposition of vision (what we want) and a clear picture of current reality (where we are relative to what we want) generates what we call ‘creative tension’. ‘Learning’ in this context does not mean acquiring more information, but expanding the ability to produce results we truly want in life. It is lifelong generative learning. (p. 142)
It has long been known that skill and know-how are central to successful change, so it is surprising how little attention we pay to it beyond one-shot workshops and disconnected training. Mastery involves strong initial teacher education, and continuous staff development throughout the career, but it is more than this when we place it in the perspective of comprehensive change
agentry. It is a learning habit that permeates everything we do. It is not enough to be exposed to new ideas. We have to know where new ideas fit, and we have to become skilled in them, not just like them.

Block (1987) says that the goal is: (to learn) as much as you can about the activity you are engaged in. There’s pride and satisfaction in understanding your function better than anyone else and better than you thought possible. (p. 86) MORAL PURPOSE AND CHANGE AGENTRY

We also know that inquiry, learning, and mastery are intrinsically anxiety producing: ‘Almost every important learning experience we have ever had has been stressful. Those issues that create stress for us give us clues about the uncooked seeds within us that need attention’ (ibid, p. 191). This means that the capacity to suspend belief, take risks, and experience the unknown are essential to learning. We can be more selective in what we try (as distinct from accepting all change) but in exploring selected new ideas we must be patient enough to learn more about them and to look for longer term consequences before drawing conclusions.

Rosenholtz (1989) found that teachers in schools characterized by these ‘learning enriched’ habits, not only learned more and became better at what they did, but they became more confident. The more accustomed one becomes at
dealing with the unknown, the more one understands that creative breakthroughs are always preceded by periods of cloudy thinking, confusion, exploration, trial and stress: followed by periods of excitement, and growing confidence as one pursues purposeful change, or copes with unwanted change.

Back to Senge (1990): People with a high level of personal mastery live in a continual learning mode . . . personal mastery is not something you possess. It is a process. It is a lifelong discipline. People with a high level of personal mastery are acutely aware of their ignorance, their incompetence, their growth areas. And they are deeply self-confident. Paradoxical? Only for those who do not see that ‘the journey is the reward’. (p. 142)

In order to be effective at change, mastery is essential, both in relation to specific innovations and as a personal habit. New competencies and know-how are requirements for better understanding and judging the new and are the route to greater effectiveness.

Collaboration is the fourth capacity. Aside from the power of collaboration which we take up in later chapters collaboration is essential for personal learning (Fullan and Hargreaves, 1991). There is a ceiling effect to how much we can learn if we keep to ourselves. The ability to collaborate - on both a small and large scale - is becoming one of the core requisites of postmodern society. Personal strength, as long as it is open minded (i.e., inquiry oriented) goes hand-in-hand with effective collaboration - in fact, without
personal strength
collaboration will be more form than content. Personal
mastery and group
mastery feed on each other in learning organizations.
People need one another to
learn and to accomplish things.
Small-scale collaboration involves the attitude and
capacity to form produc
tive mentoring and peer relationships, team building and
the like. On a larger
scale, it consists of the ability to work in organizations
that form cross-instituV A L U E S A N D R E L I G I O N
tional partnerships such as school district, university and
school-community and
business agency alliances, as well as global relationships
with individuals and
organizations from other cultures.
In short, without collaborative skills and relationships it
is not possible to
learn and to continue to learn as much as you need in order
to be an agent for
societal improvement.
In summary, skills in change agentry are needed, because
the processes of
improvement are dynamically complex, and as we shall see, these processes are
to a certain extent unknowable in advance. Chaos in a
scientific sense is not dis
order, but a process in which contradictions and
complexities play themselves
out coalescing into clusters (see Gleick, 1987, Stacey,
Scientists talk about ‘strange attractors’ as forces that pull chaotic states into periodic patterns. Moral purpose is one of the change processes’ strange attractors because the pursuit and pull of meaning can help organize complex phenomena as they unfold. Strange attractors do not guide the process (because it is not guidable), they capitalize on it. Without moral purpose, aimlessness and fragmentation prevail. Without change agentry, moral purpose stagnates. The two are dynamically interrelated, not only because they need each other, but because they quite literally define (and redefine) each other as they interact.

I have argued that moral purpose and change agentry, far from being strange bedfellows, should be married. They keep each other honest. They feed on, and fulfill one another. Moreover, together they are generative in that they have an in-built capacity to self-correct and to continually refigure what should be done.

Not only are they effective at getting things done, but they are good at getting the right things done.

I have also claimed that moral purpose and change agentry separately, but especially in combination, are as yet society’s great untapped resources for improvement. We need to make them explicit, and make them part and parcel of
personal and collective agendas. We need to go public with a new rationale for why teaching and teacher development is so fundamental to the future of society. We need to begin to practice on a wide scale what is implicit in the moral purpose of teaching. To do so we need the capacities of change agentry.

Source: V. Houghton, R. McHugh and C. Morgan (eds), Management in Education: The Manage

In common parlance we speak of organizations as if they were real. Neither scholar nor layman finds difficulty with talk in which organizations “serve func
tions”, “adapt to their environment”, “clarify their goals” or “act to implement policy”. What it is that serves, adapts, clarifies or acts seldom comes into ques
tion. Underlying widely accepted notions about organizations, therefore, stands the apparent assumption that organizations are not only real but also distinct from the actions, feelings and purposes of people. This mode of thought pro
vides the platform for a long-standing debate about organizations and people. Is it organizations which oppress and harass people or is it fallible people who fail to carry out the well-intentioned aims of organizations? The debate continues on issues such as whether it is better to abolish organizations, to reshape them along more humane lines, or to train people to recognize the goals of organizations more clearly and to serve them more faithfully.

In contrast, this paper rejects the dualism which conveniently separates people and organizations; instead it argues that a mistaken belief in the reality of organizations has diverted our attention from human action and intention as the
stuff from which organizations are made. As a result, theory and research have

frequently set out on a false path in trying to understand organizations and have
given us a misplaced confidence in our ability to deal with their problems. If we

see organizations and individuals as inextricably intertwined, it may not be so
easy to alter organizations, or to lead them, or to administer them without touch
ing something unexpectedly human. More importantly, the view that people and
organizations are inseparable requires us to reassess the commonly accepted
claim that there exists a body of theory and principle which provides the touch
stone for effective administrative action in organizations. The belief in the
reality and independence of organizations permits us to separate the study of
organizations from the study of people and their particular values, habits and
beliefs. The common view in organization studies holds that people occupy
organizations in somewhat the same way as they inhabit houses. The tenants
may change but, apart from wear and tear, the basic structure remains and in
some way shapes the behaviour of people within. Studies have therefore focused
largely on the variety of organizational structures and their effects upon people.
These structures are usually seen as invariate over time.
forms into which individuals may move from time to time, bringing with them idiosyncrasies which colour their performance of the roles prescribed by the organization (Getzels, 1958, p. 156). Organizational science and the profession of administration

The science of organization has found its way into studies of schools and influenced the training of those who are to administer schools. In this science, schools are a variety of the species organization which can be distinguished chiefly by the nature of their goals and their bureaucratic structure (Bidwell, 1965, pp. 973–4). The science of organization is, therefore, assumed to provide useful knowledge about schools even as it does about other kinds of organizations. Accepting this position, Griffiths (1964, p. 3) rejects “the opinion that educational administration is a unique activity, differing greatly from business, military, hospital and other varieties of administration” and endorses (p. 118) a “general theory which enables the researcher to describe, explain, and predict a wide range of human behavior within organizations”.

In a profession of administration based upon organizational science, the task of the administrator is to bring people and organizations together in a fruitful and satisfying union. In so doing, the work of the
administrator carries the justification of the larger social order (Getzels, 1958, p. 156), since he works to link day-to-day activity in organizations to that social order. In schools, the administrator may be director or superintendent, principal or headmaster, department head or supervisor. Whatever their titles, their tasks are always the same. They bring people and resources together so that the goals of the organization and presumably of an encompassing social order may be met (Gregg 1957, pp. 269–70).

No matter what circumstances he finds himself in, the administrator mediates between the organization and the people within it. The task is difficult; he needs help with it. As the argument runs, such help is fortunately to be found in the emerging science of organizations. Since organizations do have a human component, knowledge about organizations is usually described as a social science. But social or not, this science like all others is seen as universal, timeless, and imperfect only in its incompleteness.

The claims for a science of organization and for a profession of administration based upon that science have in recent times made a marked impact upon education. For over two decades now, scholars have attempted to improve education by applying organization theory to the conduct of
affairs in schools and VALUES AND RELIGION

by training educational administrators in that science
(Culbertson and Shibles, 1973). Celebrating its emancipation from the press of immediate practical affairs

(Griffiths, 1964), the field turned instead to discovery of the basic relationships

and principles which underlie day-to-day concerns. The professor supplanted the

practitioner as the source of valid knowledge about administration. If practition

ers did not know or accept that they were no longer masters of the basic know

ledge which underlay their craft, it did not matter. Even the scholar-practitioner,

Chester Barnard, in introducing Simon’s classic writings claimed that it was the

scholar’s knowledge of the “abstract principles of structure” rather than the prac

titioner’s knowledge of “concrete behavior” which leads to an understanding of

“organizations of great variety” (Simon, 1957, pp. xlii-xliv). Things are not

what they seem, in educational administration as in other realms of reality. We

need the scientist and his theory to interpret them to us. His knowledge, though

it may be incomplete and is certainly subject to improvement, has the virtue of

universal applicability. Acting on this conviction, scholars in educational admin

istration have sought to understand how organizations really work and to use
A survey of representative writing in educational administration (see Campbell and Gregg, 1957; Halpin, 1958; Griffiths, 1964; Getzels, Lipham and Campbell, 1968; Milstein and Belasco, 1973) reveals that inquiry in this field has leaned heavily on the belief that a general science of organizations has provided the needed theoretical underpinnings for understanding schools and for the training of the administrators who are to run them. While a general theory of organizations provided the rationale for understanding schools, the sister social sciences provided the research tools and the “sensitizing concepts” needed to identify and resolve their administrative problems (Downey and Enns, 1963; Tope et al., 1965). Since this happy combination of theory and method yields an understanding of organizations as they really are, it then becomes possible to say how educational administrators may be trained to improve organizations and administrative practice within them (Culbertson et al., 1973). Although the claim is seldom if ever made explicitly, this line of reasoning, linking a general theory of organizations to the training of administrators, implies that we have at hand both the theory and method which permit us...
to improve schools and the quality of whatever it is that goes on within them.

That change in schools proceeds without assistance from an applied organization theory, or indeed, in contravention to it (Fullan, 1972), usually fails to shake our faith in such theory.

cited to this point that most of them are American in origin, since it was in the United States that the movement to conceive educational administration as a social science arose in the late 1940s. A decade later the movement had taken hold in Canada and some time later in Australia and Britain. As the concept of educational administration as a profession and social science gains ever wider recognition and acceptance, it becomes appropriate to examine the theory and assumptions which underlie the field. In particular we need to ask whether the theory and assumptions still appear to hold in the settings where they were developed before they were recommended and applied to totally new settings.

Such an examination is not only appropriate but essential in the face of an alternative view which sees organizations not as structures subject to universal laws but as cultural artefacts dependent upon the scientific meaning and intention of people within them. This alternative view, which
stems from nineteenth century German idealism (Deutscher, 1973, p. 326), bears the awkward name phenomenology (Phillipson, 1972), though it might with equal justification be called the method of understanding, as it is in the work of Max Weber (Eldridge, 1971, p. 28). What we call the view is not important. What matters is that there exists a body of theory and assumption which runs squarely at odds with that which has provided the ideological underpinnings of educational administration as it has developed over the past two decades. The ideological conflict between these views rests on two fundamentally different ways of looking at the world. One is the established view both in the study of organizations generally and in the study of educational administration. In this paper, I will outline the alternative view and recommend its application both in organization and administrative theory.

It is surely no accident that the alternative view has its roots in European philosophy and social science. And it is at least noteworthy that this view has a current flowering in Britain, where it is exerting a strong influence in both sociology (Filmer et al., 1972; Dawe, 1970; Brittan, 1973) and in education (Young, 1971; Cosin et al., 1971), I do not wish to drive the
differences in the views to
the point of a spurious contrast between American and
European social science.

The alternative view which I will outline has its
supporters in the United States
too (Garfinkel, 1967; Cicourel, 1964; Louch, 1966; Wilson,
1970). Two points
should be made here. First, and of lesser importance,
phenomenology has yet to
influence the study of organizations in the United States
despite the existence of
a long-standing phenomenological tradition in some
sociological schools of
thought in that country. 1 In Britain, both theory and
research on organizations
reflect the phenomenological perspective (Tipton, 1973;

Second, and more important since it relates to the heart of
the issue, the exist
ence of the two competing ideologies illustrates the
fundamental contention of
phenomenology that there are no fixed ways for construing
the social world
around us. These ways are products of particular settings
and circumstances
rather than expressions of universal ideals and values. Our
concepts of organi
zations must therefore rest upon the views of people in
particular times and
places, and any effort to understand them in terms of a
single set of ideas, values
and laws must be doomed to failure.

The alternative view rejects the assumption, underlying
much of organization

theory, that organizations belong to a single species which behaves in pre
dictable ways according to common laws. This view finds forceful expression in

the work of Mayntz (1964), a European scholar of organizations: Values and Religion
Propositions which hold for such diverse phenomena as an army, a trade union, and a university... must necessarily be either trivial or so abstract as to tell hardly anything of interest about concrete reality...
After all, the distinct character of an organization is certainly determined, among other things, by the nature, interests, and values of those who are instrumental in maintaining it. [pp. 113-114]

If people are inherently part of organizations, if organizations themselves are

expressions of how people believe they should relate to each other, we then have

good grounds to question an organization theory which assumes the universality

of organizational forms and effects. This argument suggests that organizations

theorists have been so busy defining the forest that they have failed to notice dif
ferences among the trees—and worse, have ignored objects in the forest that are

not trees at all. It suggests, too, that an academic industry which trains adminis

trators by disclosing to them the social-scientific secrets of how organizations

work or how policy should be made indulges at best in a premature hope and at

worst in a delusion. Two views of social reality

The conflicting views on organizations of which I have been speaking represent
vastly different ways of looking at social reality and rest on sharply contrasting
processes for interpreting it. These contrasts are summarized in Table 1 in which
I have compared the two views and suggested how they differ with respect to a
number of critical issues. Each of these issues has implications for the theory of
organizations and for research undertaken in line with such theory. Necessarily
then, these contrasts also have implications for a number of practical questions
in the conduct of affairs in organizations. Some of these will be explored in the
concluding section of this paper. Although there are no generally accepted
names for identifying the two views contrasted in Table 1, it may suffice to note
that the crux of the issue is whether social reality is based upon naturally exist
ing systems or upon human invention of social forms. Social reality is usually
construed as a natural and necessary order which, as it unfolds, permits human
society to exist and people within it to meet their basic needs. Alternatively,
social reality may be construed as images in the mind of man having no neces
sary or inevitable forms except as man creates them and endows them with
reality and authority. In the one perspective, organizations are natural objects—
systems of being which man discovers; in the other,
organizations are cultural artefacts which man shapes within limits given only by his perception and the boundaries of his life as a human animal.

The systems notion posits an organizational force or framework which encompasses and gives order to people and events within it. The system—unseen behind everyday affairs—is real; it is the organization. The force of THEORY ABOUT ORGANIZATION VALUES AND RELIGION

THEORY ABOUT ORGANIZATION

“natural” in the descriptor is to evoke the view common in systems theory that organizational forms are shaped by powerful forces which in large measure act independently of man. The organizations so formed will be right and good, if the natural forces are allowed free play. Mayntz (1964, pp. 105, 115) has noted that such views in which an unseen organizational hand works for the greater social good are likely to be most congenial to scholars who share a faith in the ideals of the Western liberal democracies. In identifying organizations as social inventions, the alternative view identifies organization with man’s image of himself and with the particular and distinctive ways in which
people see the world around them and their place in it. This view is the perspective of phenomenology. In it organizations are the perceived social reality within which people make decisions and take actions which seem right and proper to them. (Greenfield, 1973, p. 557). The heart of this view is not a single abstraction called organization, but rather the varied perceptions by individuals of what they can, should, or must do in dealing with others within the circumstances in which they find themselves. It is noteworthy that this tradition—the decision-making tradition (Cyert and March, 1963; Simon, 1964) in organization theory—is frequently cited in scholarly writing, but seldom followed in analyses of organizations. This tradition, culminating currently in the creative insights of James March (1972) into organizational realities, reaches back into the work of Simon (1957; March and Simon, 1958) and thence into the work of Max Weber (trans. Gerth and Mills, 1946) and the German philosophers and sociologists of the phenomenological tradition (Deutscher, 1973, p. 327; Silverman, 1972, pp. 184-5).

What are some of the particular issues involved in the contrast between the systems and phenomenological views? These are suggested in
Table 1 where the
two views are compared on a number of points. In the
discussion which follows,

Table 1 Continued What is social reality?

the phenomenological view is emphasized, since it is assumed that the founda

tions of the systems view are the more familiar of the two views. Philosophical basis

The systems view assumes that the world is knowable as it is. Although the acqui

sition of such knowledge requires the intervention and help of scientists, theorists

and scholars, there exists an ultimate reality which may be discovered by applica

tion of the scientific method and similar forms of rational analysis. In systems

theory, the prevailing image of the organization is that of an organism. Organi
organizations exist; they are observable entities which have a life of their own. Organis
izations are like people, although sometimes the image is more that of the
recalcitrant child rather than the mature adult. In any case, the theory endows
organizations with many human properties. They have goals towards which they
direct their activities: they respond and adapt to their environments. Nor can
organizations escape the fate of organisms ill-adapted to their environments.
Indeed, the fate of organizations depends upon their ability to adapt to an increas
ingly complex and turbulent environment. Following the Darwinian logic inherent
in their image of the organization, systems theorists (Bennis, 1968) see small,
quick-witted, democratic organizations replacing the ponderous, bureaucratic
forms now expiring around us. The fact that bureaucratic organizations appear as
large, robust and formidable as ever does not appear to shake belief in organi
zations as living entities subject to stringent laws permitting only the fittest to
survive. Indeed, our belief in the living organization is likely to be so strong that
we fail to notice that the systems theorists have shifted from telling us about the
way organizations are to telling us how they ought to be. “If only organizations
were adapted to their environments,” the argument runs, “imagine how quickly
these bureaucratic forms would disappear.” In thinking about the dazzling prospect of a world in which organizations were creatures closely adapted to a benign, well-intentioned environment, we forget that the role of theory is to tell us the way things are rather than how they ought to be or how we should like them to be. Our image of the organization as an entity, as a living entity, rests upon an analogy. But we fail to draw the conclusion (Willer, 1967, p. 33) that the analogy is useless when discrepancies appear between the image and the phenomena observed.

The phenomenological view of reality contrasts sharply with that of systems theory. This view has its origin in the distinction Kant drew between the noumenal world (the world as it is) and the phenomenal world (the world as we see it). For Kant, a world of reality does indeed exist, but man can never perceive it directly; reality is always glossed over with human interpretations which themselves become the realities to which man responds. And man is always learning, always interpreting, always inventing the “reality” which he sees about him. In popular form, the Kantian philosophy has been expressed as follows: “Man does not create his world, but he does make it.” It therefore comes as no surprise to the phenomenologist that people are killed by “empty” guns.
nomenologist, beliefs are always of greater consequence than facts in shaping behaviour. The bullet may indeed be in the gun, but it is the individual’s belief about an empty chamber which causes him idly to pull the trigger. Deutscher (1973) summarizes the phenomenological view as follows: The phenomenological orientation always sees reality as constructed by men in the process of thinking about it. It is the social version of Descartes’ Cogito, ergo sum. For the phenomenologist it becomes Cogitamus, ergo est—we think, therefore it is! [1973, p. 328] The role of social science The implications of the phenomenological view are of critical importance in shaping our views both of the social sciences and of a study of organizations founded on them, as may be seen in the contrasting positions taken by Weber and Durkheim (Bendix and Roth, 1971, pp. 286-97). For Weber, working within his “method of understanding”, “there is no such thing as a collective person ality which ‘acts’”, only individuals acting on their interpretations of reality. In contrast, Durkheim, convinced of an ultimate, knowable social reality, sought to eliminate the perceptions of individuals and to find “the explanation of social life in the nature of society itself” (Bendix and Roth, 1971, p. 291). Thus Durkheim spent his life building a sociology around notions of “elemental” forms which provide the invariable units out of which
social life is built. Weber,
on the other hand, explored the ideas, doctrines and beliefs with which men
endowed their organizations and which provided the motivation for action
within them. Durkheim’s path leads to generality, abstraction and universality in
the study of organizations; Weber’s leads to the particularistic, the concrete, and
the experience-based study of organizations. Durkheim’s path leads to an ascep
tic study of organizations, Weber’s to one which smells of reality.
The phenomenological view leads to the concept of organizations as “invented
social reality” (Greenfield, 1973, p. 556) and to the paradox that, having invented
such reality, man is perfectly capable of responding to it as though it were not of
his own invention (Silverman, 1970, p. 133). More basically, however, the phe
nomenological perspective questions the possibility of objectivity in what Weber
calls “the cultural sciences”. While it is possible for such sciences to pursue
inquiry within a logically rigorous methodology and for them to take into account
certain basic social facts such as where people live and what they do, it is not
possible for cultural scientists to give us “a direct awareness of the structure of
human actions in all their reality” (Eldridge, 1971, p. 16). Thus the notion of dis
covering the ultimate laws which govern social reality becomes an ever receding fantasy which retreats as we attempt to approach it. Such bogus ‘laws’ as the law of supply and demand were, both for Weber and Durkheim, “maxims for action”, advice to people on how to protect their interests if they wished to be “fair and logical” (Eldridge, 1971, p. 18). In Weber’s view, then, it is impossible for the cultural sciences to penetrate behind social perception to reach objective social reality. Paradoxically, this limitation on the cultural sciences is also their strength, since it permits them to do what is never possible in the physical sciences: the cultural scientist may enter into and take the viewpoint of the actor whose behaviour is to be explained. We can accomplish something which is never attainable in the natural sciences, namely the subjective understanding of the action of component individuals . . . We do not ‘understand’ the behaviour of cells, but can only observe the relevant functional relationships and generalize on the basis of these observations. [Weber, 1947, pp. 103–4]

While the cultural scientist may not discover ultimate social reality, he can interpret what people see as social reality and, indeed, he must do so according to a consistent, logical, and rigorous methodology (Eldridge, 1971, pp. 9–10). It is such a discipline for interpreting human experience which provides the science in the cultural scientist’s work, not his ability to discover ultimate truths.
about social structure. Thus the purpose of social science is to understand social reality as different people see it and to demonstrate how their views shape the action which they take within that reality. Since the social sciences cannot penetrate to what lies behind social reality, they must work directly with man’s definitions of reality and with the rules he devises for coping with it. While the social sciences do not reveal ultimate truth, they do help us to make sense of our world. What the social sciences offer is explanation, clarification and demystification of the social forms which man has created around himself. In the view of some (Dawe, 1970, p. 211), the social sciences may lead us to enlightenment and to liberation from the forces which oppress man. In the phenomenological view, these forces stem from man himself, not from abstractions which lie behind social reality and control man’s behaviour within that reality. Theory about what?

The two views give rise to opposing theories about the world and the way it works, since each sees reality in different kinds of things. Each approaches theory building from a point of view which is normative rather than descriptive.

In the natural systems view, the basic reality is the collectivity; reality is in society and its organizations. Assuming the existence of an
ultimate social

reality, the role of theory is to say how it hangs together or how it might be

changed so that it would hang together even more effectively (Merton, 1957; Etzioni, 1960). Thus functional analysis—the theory associated with the systems

view—becomes a justification of the way social reality is organized rather than

an explanation of it. In this view, the theory becomes more important than the values and religion research because it tells us what we can never perceive directly with our senses:

it tells us the ultimate reality behind the appearance of things and it establishes a

view which is essentially beyond confirmation or disproof by mere research.

The phenomenological view begins with the individual and seeks to under

stand his interpretations of the world around him. The theory which emerges

must be grounded (Glaser and Strauss, 1967) in data from particular organi

zations. That these data will be glossed with the meanings and purposes of those

people and places is the whole point of this philosophical view. Thus the aim of

scientific investigation is to understand how that glossing of reality goes on at

one time and place and to compare it with what goes on in different times and

places. Similarly organizations are to be understood in terms of people’s beliefs
about their behaviour within them. If we are to understand organizations, we
must understand what people within them think of as right and proper to do.

Within this framework we would certainly not expect people everywhere to
have the same views. In fact, it is the existence of differences in belief structures
which provides us with the key to interpreting them. People are not likely to
think of their own views as strange. Indeed it is only in contrast to other views
that we come to understand our own. Theory thus becomes the sets of meanings
which yield insight and understanding of people’s behaviour. These theories are
likely to be as diverse as the sets of human meanings and understandings which
they are to explain. In the phenomenological perspective, the hope for a univer
sal theory of organizations collapses into multifaceted images of organizations
as varied as the cultures which support them.

The view of theory as arising from our understanding is expressed by Walsh
(1972): The point about the social world is that it has been preselected and preinterpreted by its members in terms of a series of commonsense assumptions which constitute a taken-for-granted scheme for reference . . . In this manner factual reality is conferred upon the social world by the routine interpretive practices of its members. The implication of this is that every man is a practical theorist when it comes to investigating the social world, and not just the sociologist. [p. 26]

Thus, the naturalist tries to devise general theories of social behaviour and to
validate them through ever more complex research methodologies which push him further from the experience and understanding of the everyday world. The phenomenologist works directly with such experience and understanding to build his theory upon them. As Kuhn (1970) points out, our theories are not just possible explanations of reality; they are sets of instructions for looking at reality. Thus choice among theories and among approaches to theory building involves normative and—especially in the social sciences—moral questions.

Choice among them is in part a matter of preference, but choice may also be made on the basis of which theories direct us to the most useful problems and which provide the most helpful insights into them. Research and methodology

In the systems view, research is directed at confirming theory. Theory, in this view, is something which scientists build, largely from the armchair, by thinking up what must be the ultimate explanation for the phenomena observed. Contrary to accepted opinion, Kuhn (1970, p. 16) has argued that such theory is never open to disproof and serves instead as a “consensual agreement among scientists about what procedures shall constitute scientific activity and hence which expla
nations will count as scientific explanations” (Walsh, 1972, p. 25).

From the phenomenological perspective research, theory and methodology
must be closely associated. Theory must arise out of the process of inquiry itself
and be intimately connected with the data under investigation. In this view, the
aim of theory should be explanation and clarification. Thus research and theory
which fulfills this aim must depend not only upon what is being explained but
also upon to whom it is explained, and with what. Louch (1966) argues this view
as follows: Explanation, in Wittgenstein’s phrase, is a family of cases joined together only by a common aim, to make something plain or clear. This suggests that a coherent account of explanation could not be given without attending to the audience to whom an explanation is offered or the source of puzzlement that requires an explanation to be given. There are many audiences, many puzzles. [p. 233]

Research in the naturalist mode is prone to use experimental methods to
establish relationships among variables. The research often substitutes math
equations models for the substantive theoretical model and is satisfied if statisti
cally significant relationships are found among the variables of the mathematical
model. The aim is to relate variables \(x\) and \(y\), usually with a host of other vari
ables “held constant”. Little effort is spent on determining whether \(x\) and \(y\) exist
in any form which is meaningful to or has consequences for actors within a
social situation. Nor is there much effort to ask whether holding one or more
variables constant yields an interpretable result among those remaining. In phys-

c ical systems, we can understand what it means to hold volume constant, for
example, while we raise the temperature of a gas and observe the effect on pres-
sure. But what does it mean when we come to a social system and speak, as
some researchers do, of holding social class constant while we observe the effect
of school resources upon achievement? Whereas the physicist manipulates
materials and apparatus in specific, understandable ways, the social researcher
frequently makes no intervention at all in the social system which he is attempt-
ing to explain. Instead, he does the manipulation of variables in his mind, or in
the workings of his computer. Can we rely on the suggestion that if we manipu-
late variables in a social system, we will get the same results the researcher gets
from his intellectual manipulation of them? The doubt is growing that we will
not, as is apparent, for example, from critiques of school effects research
(Spady, 1973, pp. 139-40) demonstrating that schools may account for a great
deal or virtually nothing at all of pupil achievement, depending on which of
several alternative but statistically acceptable procedures
the researcher chooses
for his analysis.

Phenomenologically based research, on the other hand, aims at dealing with
the direct experience of people in specific situations. Therefore the case study
and comparative and historical methods become the preferred means of analysis.

These methods are perhaps found in their most developed form in the work
Weber did in building ideal types for organizational analysis. These types should
be seen as “characterizations or impressions of ways of thought and styles of
living” which permit comparison and understanding of them (Louch, 1966, p.
172). What Weber did in building these ideal types was to worm his way into
the heads of bureaucrats, clerics and commercial men in order to “discern logical
connections among propositions expressing [their] beliefs about the world”
(Louch, 1966, p. 173). The moral consequences of these beliefs may also be
made plain and checked against “reality”. The close connection among theory,
research and ethics thus becomes obvious.

Thus an organizational theory based upon understanding rejects the emphasis
which much of contemporary social science places upon quantification, more
complex mathematical models, and bigger number crunchers in the shape of
better and faster computers. As Burns (1967, p. 127) has pointed out, better
manipulation of numbers cannot substitute for the emptiness of the concepts to
which they apply. This fixation on numbers without concern for the concepts
they are thought to represent leads to a sickness of social science which Sorokin
has called “quantophrenia” and which Rothkopf (1973, p. 6) likens to the Leer
lauf reactions described by Lorenz. In these reactions, animals go through
elaborate stereotyped performances for hunting or mating when no other living
creature is there to see or respond to the performances.

If we move towards improved understanding in our research we might
change our image of what constitutes the essential research tool and supplant the
computer with Weber’s notion of the ideal type. An ideal type provides us with
an image of a social situation at a particular time and place. We may then sur
round this image with others made of different organizations or of the same
organization at other times. By looking at these images comparatively by seeing
them almost as the frames of a motion picture, we begin to understand our world
better and to comprehend its differences and the processes of change occurring
within it. This direction in theory and research leads to an investigation of lan
guage and the categories it contains for understanding the world (Bernstein, 1971a; 1971b). It leads also to an investigation of the processes (Scheff, 1973; Theory About Organization Garfinkel, 1964) by which we negotiate with each other and so come to define what we will pay attention to in our environment and our organizations. Society and its organizations.

In the systems view, the problem of society is the problem of order. Without society and its organizations, chaos and anarchy would result. The social order is seen as a basically well-working system governed by universal values. In the phenomenological view, the organization as an entity striving to achieve a single goal or set of goals is resolved into the meaningful actions of individuals. Organizations do not think, act, have goals or make decisions. People do (Georgiou, 1973; Greenfield, 1973), but they do not all think, act and decide according to preordained goals. Thus the notion of the organization as a necessary order maintaining instrument falls and the notion of organization as the expression of particular human ideologies takes its place. In this way, the problem of order becomes the problem of control (Dawe, 1970, p. 212). Or, to put the question otherwise, the problem is not whether order shall be maintained but rather who
maintains it, how, and with what consequences. The image which this view calls
to mind is the organization as a battlefield rather than the organization as an
instrument of order. People strive to impose their interpretations of social reality
upon others and to gain command of the organizational resources which will
permit them to do so. The warfare in this battlefield usually takes the form of
linguistic attack and defence, although the physical forms of warfare fit just as
comfortably within the perspective.

Take as an example this exchange between a principal and a new social
worker after the social worker had spent considerable time and effort coun
selling a student who had been persistently truant and tardy. 2

P: It was really simpler and more effective in the old days when the truant officer just went straight to the student’s home and brought him back to school.

SW: Actually, I do the work truant officers did, but I do it a different way.

P: That may be so, but we used to get results more quickly. If the students wouldn’t come to school, we expelled them. They had to recognize our authority or quit school. That’s what I mean by simple. Now everything is complicated. Why can’t we deal with these cases without a lot of red tape?

SW: I prefer to see my work as treatment. The aim is not to wind up a case quickly but to keep the student in school and learning. And in any case, Mr. Principal, legally I am the truant officer and you need my backing to expel a student for truancy.

It is surely not hard to see in this exchange a battle going on over what the job of
the social worker should be and behind that a struggle over how
the school should define its responsibilities to students. The issue is how the job of the social worker shall be defined and who shall control the school’s power of expulsion. Each of the protagonists is inviting (and threatening) the other to accept a particular definition of the situation and the way it is proper to act within it.

The conflict view of organizations thus links up neatly with the decision making tradition in organizational analysis. In a recent significant contribution Perrow (1972, pp. 145–76) demonstrates how this tradition, developed brilliantly by March and Simon (1958), complements the insights of Weber. A major concern of Weber was for the way in which the power of bureaucracies would be used outside the organization. March and Simon demonstrate how power may be marshalled within the organization. As Perrow points out (p. 196), the supposed plight of professionals within bureaucracies is a minor complaint compared to what others have suffered from professionals who have been able to act out their ideological beliefs through their control of organizations.

We should also be grateful to Perrow (p. 90ff) for pointing
out the contrasts

between Barnard’s theory and his practice. For Barnard, (1938, pp. 46–61)

organizations were by their very nature cooperative enterprises. In this respect,

Barnard was a good systems theorist whose theory dealt with abstractions about

organizations and not with the ideologies of those who ran them. In an astonishing case study, Barnard (1948) spoke to a group of the unemployed who had recently seen “police clubs flying, women trampled, men knocked down” (p. 64)

in the following terms: I’ll be God damned if I will do anything for you on the basis that you ought to have it just because you want it, or because you organize mass meetings, or what you will. I’ll do my best to do what ought to be done, but I won’t give you a nickel on any other basis. [pp. 73-4]

In his commentary on this situation, Barnard makes it very clear that he realized he was in a position of conflict over ideology. But his theoretical concern lies not with the ideologies, but with his proposition that men under “states of tension” will do what is “utterly contrary to that which is normally observed in them” (p. 62). While he explains in detail how he won the ideological battle which gave him power to decide what the men “ought to have”, he makes no mention of his final decision. The content of decisions is not important in systems theory. However, Barnard does take pains to denigrate the ideology of
the unemployed workers and their claims for better treatment. He also considers

in a footnote (pp. 73–4) whether a person of “superior position” should swear in

front of those of “inferior status”, and confides that “the oath was deliberate and

accompanied by hard pounding on the table”.

In this example, Barnard as theorist merely adds the notion of “states of

tension” to his earlier developed principles of cooperative action in organi

zations. Do these ideas tell us the significant aspects about organizational life T H E O R Y A B O U T O R G A N I Z A T I O N

with Chester Barnard? The phenomenologist holds that Barnard’s ideology is

the significant variable shaping the experience of many people in the organi

zations which he controlled. Without understanding the ideological issues

involved in an organization, and in particular without knowing what ideology is

in control, the general principles of organization mean relatively little in terms

of what people experience in an organization.

Organizational pathologies and cures

The systems theorist looks for pathologies in the body of the organization itself.

These stem from ill adaptations of the organization to its environment, to the

ultimate goals it should serve, or to the needs of individuals. The solution to

these pathologies is obvious: change the structure of the
organization to improve

the adaptation and thus the performance of the organization. The phenomenolo
gist, on the other hand, sees structure as simply the reflection of human beliefs.

If there are problems in organizations—and problems are certainly to be

expected—they must therefore rest in conflicting beliefs held by individuals.

Solutions to such problems cannot be found simply by changing structures. The

root of the problem lies in people’s beliefs and the ability to act upon these

beliefs. Thus the argument that we must make organizations more liveable, more congruent with human values and motives, ignores the fact that it is one set of human motives and values which is in conflict with another set of motives and values. There is no abstract entity called organization which can be held accountable—only other people. [Schein, 1973, pp. 780–1]

Our penchant for thinking about organizations as entities, as things with a life

of their own, blinds us to their complexity and to the human actions which con

stitute the façade which we call organization. It leads us to believe that we must

change some abstract thing called “organization” rather than the beliefs of

people about what they should do and how they should behave with each other.

The more closely we look at organizations, the more likely we are to find

expressions of diverse human meanings. The focus of our efforts to improve

organizations should not be, “What can be done to change
the structure of this
organization?” but, “Whose intentions define what is right
to do among people
here involved with one another?” and “How might these
intentions be
changed?” The task of changing organizations depends, first,
upon the varieties
of reality which individuals see in existing organizations,
and second, upon their
acceptance of new ideas of what can or should be achieved
through social
action. We know little about either, but it is clear we
should understand the first
before we attempt to direct the second. V A L U E S A N D
R E L I G I O N Implications
Where do the ideas based on phenomenology leave the notion
of “organization”? And what of the science that studies
organizations? And where does a
profession of educational administration which bases its
practice on this science
now find itself? In conclusion, let me briefly develop some
answers to these
questions and suggest some directions for future study.
1. Organizations are definitions of social reality. Some
people may make
these definitions by virtue of their access to power while
others must pay atten
tion to them. Organizations are mechanisms for transforming
our desires into
social realities. But the transforming mechanism lies
within individuals. It is
found in individuals striving to change their demands or
beliefs into definitions

of reality that others must regard as valid and accept as limitations on their

actions. This notion of organizations as dependent upon the meanings and pur

poses which individuals bring to them does not require that all individuals share

the same meaning and purposes. On the contrary, the views I am outlining here

should make us seek to discover the varying meanings and objectives that indi

viduals bring to the organizations of which they are a part. We should look more

carefully too for differences in objectives between different kinds of people in

organizations and begin to relate these to differences in power or access to

resources. Although the concept of organization permits us to speak of the domi

nating demands and beliefs of some individuals, and allows us to explore how

those with dominating views use the advantage of their position, we need not

think of these dominating views as “necessary”, “efficient”, “satisfying” or even

“functional”, but merely as an invented social reality, which holds for a time and

is then vulnerable to redefinition through changing demands and beliefs among

people. Where then may we go from here? Let me suggest some lines of devel

opment.

2. We should begin to regard with healthy scepticism the
claim that a general

science of organization and administration is at hand. Such
theories carry with

them not only culturally dependent notions of what is
important in an organi-

zation but also prescriptive ideas of how study and inquiry
into organizational

problems should go forward. The movement toward
international associations

for the study of educational administration should be
welcomed, but these

associations should open windows on our understanding of
organizations rather

than propagate received notions of organization theory. If
the movement can

provide a comparative and critical perspective on schools
and on our notions of

how they should be run, the association will serve a
valuable role. Since the
dominant theories of organization and administration have
their source in the

United States, it is these ideas which should receive
searching analysis before

they are blindly applied in other cultural settings. In
Britain, this critical exami

tation of theory and its policy implications has already
begun (Baron and

Taylor, 1969; Halsey, 1972), though one is hard pressed to
find similar critical

examinations in other national or cultural settings. T H E
ORY ABOUT ORGANIZATION

3. Willy nilly, the world does seem to be shrinking towards
the global
village. Yet there are still strong forces which maintain vivid cultural distinctions within it. Despite these forces, the interests of the mass media, which the academic community seems all too ready to ape (Perrow, 1972, p. 198), direct attention more frequently to the symptoms of social problems rather than to their sources. While the mass media are usually ready with prefabricated solutions to these problems, students of organizations should doubt the utility of solutions which ignore their sources in the truly critical and powerful organizations of our societies. If we are unwilling to understand our own organizations, or if we regard acquiring such understanding as a trivial task, we should be aware that there are often others willing and waiting to apply their own preconceptions and answers to the tasks of defining the organization, identifying its problems, and prescribing solutions to them. Our own experience of our own organizations is a valuable resource. It is with this experience that the organization theorist must begin to understand the nature of organizations. Since an understanding of organizations is closely linked to control of them and to the possibility of change within them, the phenomenological perspective points to issues of crucial importance both to the theorist and the man of prac
tical affairs.

4. The possibility of training administrators through the study of organization theory has been seriously overestimated. Such theory does not appear to offer ready-made keys to the problems of how to run an organization. Through credentials, such training does appear to offer sound prospects for advancement within administrative systems. While such training may increase social mobility, each society must decide whether it wishes to pursue this goal, and, if it does, whether this method is the most appropriate for doing so. If training of administrators is to serve its avowed purposes, then it seems clear that the nature of the training must move in virtually the opposite direction from that advocated in recent years. That is to say, training should move away from attempts to teach a broad social science of organizations-in-general towards a familiarity with specific organizations and their problems. That the training should continue to have critical and reflective dimensions should not conflict with this redirection of training programmes. It appears essential also for training programmes to develop a much stronger clinical base than is now common in most of them. In such training, both the theoretician and the practitioner must be intimately
involved.

5. Research into organizational problems should consider and begin to use

the phenomenological perspective. This redirection of research should awaken

interest in the decision-making tradition of organization theory and in the insti

tutional school of organizational analysis (Perrow, 1972, pp. 177-204) with its

emphasis on the exposé and ideological analysis of specific organizations

(Bendix, 1956). In methodology, research should turn to those methods which

attempt to represent perceived reality more faithfully and fully than do the

present highly quantified and abstruse techniques. And researchers should avoid V A L U E S A N D R E L I G I O N

prescribing solutions to pressing social problems on the basis of prescriptive

theory and research. For example, those who concluded on the basis of the

Coleman study that the achievement of black students in American schools

might be raised by integrating black and white students were dazzled by the nat

uralist assumption that a statistical relationship represents social reality. They

therefore were led to the error of believing that social relationships may be

manipulated in the same way in which variables from the research design can be

manipulated. In doing so, they failed to reckon with the
reaction of black stu
dents to greater integration as a “solution” to their problems (Carlson, 1972).

Indeed researchers and social scientists might consider the cultural imperialism
which is frequently inherent in their recommendations for solving social prob
lems and strive first to understand (Bernstein, 1971b, Sarason, 1971; Holbrook,
1964) the social and organizational world for which they hope to prescribe solu
tions.

What is needed for better research on schools is better images of what
schools are and what goes on in them. “Better” in this case means creating
images of schools which reflect their character and quality and which will tell us
something of what the experience of schooling is like. Since schools are made
up of different people in different times and places, it is to be expected that
images which reflect the experience of schooling must be many and varied.

These images would be sets of “one-sided viewpoints”, as Weber called them,
each throwing “shafts of light” (Eldridge, 1971, p. 12) upon social reality in
schools.

As the natural systems have provided the dominating model for studies of
organizations (Mayntz, 1964, p. 116), the image of the school as a unit of pro
duction has dominated investigations of schools (Levine, 1973; Spady, 1973).

The production model of the school is a systems variant which sees the school as a set of roles and resources arranged to yield a product which conforms to pre-determined goals. We are often so accustomed to this model that we fail to notice the enormous discrepancies between it and what typically goes on in schools. To begin with, most sets of official educational goals would justify schools doing virtually any good thing for the individual or the society in which he lives. Secondly, the products of school are nearly impossible to identify, if by product we mean something which is unmistakably due to the efforts of the school itself. The clearest measure of school product—the results students obtain on standardized and other kinds of tests—correspond poorly to the goals of education and are usually accounted for most readily by influences outside the school. Thus whether schools do anything to achieve a set of vague goals can never be determined within the model of the school as a unit of production.

If we shear from our image of schools the notion of overriding goals and visible products, what are we left with? The image is now that of pure process in which people strive to shape a social environment which is
congenial to them

and which they believe serves their purposes or the purposes which other people

ought to have. The image of the school is now not the factory or the system but THEORY ABOUT ORGANIZATION

the public utility (Pincus, 1974) which produces a service which people use for

their own ends. It is not surprising in this conception of the school that people

involved with it—teachers, administrators, pupils, parents, etc.—have strong

feelings about what services should be provided and how they should be pro

vided. Moreover, it should be apparent that experience with the school’s ser

vices leads to strong, though not necessarily universally accepted, beliefs about

what kinds of service and conditions of service are good and bad and to convic

tions about which of them are effective and ineffective. However, lacking objec

tive criteria to judge the relevance and validity of their claims, and lacking even

a common basis of experience with the school’s services, people holding these

beliefs and convictions are likely to clash with others having different but

equally firmly held convictions. We learn to believe in our own experience of

school process and to doubt the validity of others’ beliefs. In this way, the pro

posal model accounts both for the apparent stability of schools—their resistance
to change—and for the continuing conflict about what schools are for and how
they should be organized and run. It suggests as well that the path to understand
ing more about schools must lie through interpretations and analysis of the
experience of people in schools, not through attempts to decide which structural
elements of schools yield outcomes that best approximate their ultimate pur
poses.
6. The research advocated above and the rationale for it developed earlier in this
paper do not imply only the description and analysis of subjective states. Weber is
said to have advised researchers first to get the facts about the basic elements of
social situations and then to move to a subjective interpretation of them (Eldridge,
were such matters as wages, costs of materials, the people involved, and descrip
tions of them in demographic terms. These are the typical resource variables which
are of frequent concern in analyses of the school from the perspective of the pro
duction model. The questions usually investigated are whether the school is making
effective and efficient use of its resources in pursuit of predetermined educational
goals. Answers to such questions are complex, contradictory and unconvincing,
as Spady (1973) has demonstrated. The reasons for such unsatisfactory outcomes are obvious when pointed out, as Gagné (1970) has done. Children do not learn from “environments” from “resources” or from the “characteristics of teachers”. They learn from their specific involvement with people, things and events around them. Thus knowledge of the basic facts about a social situation is only the beginning of an understanding of it. What is needed beyond these basic facts is a knowledge of how people in a social situation construe it, what they see as its significant features, and how they act within it. Such knowledge can only come from the interpretation of particular experiences in specific situations.

In this respect, it might be useful to think of two kinds of variables in a social situation—outside and inside variables. The outside variables are those which lend themselves readily to quantification and which involve a minimum of interpretation. As has been suggested, these variables provide information about the values and religion characteristics of the people and resources found in a social situation. The inside variables are those which may only be expressed through interpretation of experience. Both kinds of variables are important, though in most organizational studies of schools, emphasis has usually fallen exclusively
It would be helpful to replace our usual notion of the school as a system with

the idea of the school as a set. Where the system idea
implies preordained order

and functions in the school, the notion of set leaves completely open both the defi

nition of the elements of the school and the description of relationships among

them. Defining the school as a set leaves as a problem for investigation what the

elements of the situations are and what the meanings of relationships among the

elements are. With such a view of the school, we might recognize both external

and internal variables; as follows: External variables.

Pupil characteristics: their age, sex, home background, individual abilities and previous learning. School characteristics: building design, facilities and equipment. Classrooms: number of pupils, subject of study, methodology. Teacher characteristics: training and length of service, personality, intelligence, abilities and interests. Internal variables. What is the quality of relationships among teachers, pupils and others in the school? What experiences do they have in terms of (a) their expectations for the environment, (b) the opportunities and problems they perceive, (c) the efforts they make to learn, help or teach, (d) their feelings of accomplishment or failure? What decisions do different people in the school make and why do they make them? How are people and situations defined and evaluated?

The variables listed above are intended to be suggestive rather than exhaustive.

The final point to be made about them is that both of these major dimensions are

essential for describing and understanding schools fully. In fact, some of the
most revealing analyses will arise from contrasts between the school seen in terms of external variables and the school seen in terms of internal variables.

That organizational theory has too frequently directed attention to the external variables and that it has presumed rather than explored their relationships to internal variables are points which have already been made at length.

7. A continued study of organizations from the perspectives of the social sciences is certainly warranted. Schools as one of the most significant of our social institutions deserve particular attention. It seems appropriate, however, for students of schools as organizations to consider the meaning of their studies and to redirect them towards investigations which increase our understanding of organizations as they are before attempts are made to change them. Paradoxically, the efforts which promise to yield the most penetrating insights into organizations and the most practical strategies for improving them are those efforts (March, 1972) which deal with the way people construe organizational reality and with the moral and ethical issues involved in these construings.

If, as the phenomenologist holds, our ideas for understanding the world deter
mine our action within it, then our ideas about the world—what really exists in it, how we should behave in it—are of the utmost importance. And if our ideas about the world are shaped by our experience, then the interpretation of our experience is also of paramount importance. It is this process, the placing of meaning upon experience, which shapes what we call our organizations and it is this process which should be the focus of the organization theorist’s work. And unless we wish to yield to universal forces for determining our experience, we must look to theories of organizations based upon diverse meanings and interpretations of our experience.

SILVERMAN, D. (1972) “Methodology and Meaning”, in Filmer et al. (1972, pp. 183-200)

For students of educational administration, 1974 was an exciting year. It was the year in which the third International Intervisitation Programme was held. At the conference Thomas Greenfield delivered a paper which changed the face of educational administration as a field of study. To understand why it is necessary to locate the paper in its historical context.

Since the 1950s educational administration had been dominated by positivist thought in the form of the ‘Theory Movement.’ This envisaged the development of a general theory of human behaviour, within which the theory of administrative behaviour in educational contexts would be a sub-set. In this paradigm the natural sciences, especially physics, would provide the model (Griffiths, 1957, 308).

By the late 1960s doubts were being voiced. But as Griffiths...
acknowledges, its ‘demise came at the 1974 meeting of the IIP in Bristol. . . .

The coup de grace was delivered by Greenfield who made an across-the-board denunciation of every aspect of the theory movement’. Since then, Greenfield

‘has broadened and deepened his critique. In an impressive series of papers . . .

he has sought to develop a systematic view of social reality as a human invention, in opposition to the systems scientific perspective of social reality as a natural system. He has constructed strands of argument on the nature of knowledge, on administrative theory and research, on values, on the limits of science, and the importance of human subjectivity, truth and reality . . . the magnitude of his undertaking and a corresponding elegance of argument make his work the most important theoretical development in recent educational administration’

(Evers and Lakomski, 1991, 76).

Accordingly, his papers are eagerly sought in many parts of the world but are not always easy to get hold of individually or collectively. A solution is the publication of a collection and since 1990 we have been involved in producing one. We have done so in all the usual ways including spending several days together in Birmingham in June 1991. Some hard choices have
had to be made

in selecting ten papers to represent his thinking from among the sixty Greenfield has published since 1961 [Appendix 1]. Once this was done we have been involved in the equally demanding task of editing in a way that respected the integrity of individual papers but which minimized repetition in the text as a whole. With this under way two tasks remained – producing a foreword and writing a postscript. The former was straightforward – we had only to ask Christopher Hodgkinson.

The latter took more thought. We wished to enable the reader to locate the set of papers within the context of Greenfield’s personal and professional history as he saw it. This led us to a ‘novel’ approach. During the five days of our meeting in Birmingham we conducted a series of wide ranging discussions. These were taped and transcribed. Since then we have refined, revised and elaborated the text of these talks. They represent an unusually sustained attempt to explore with a scholar how and why his thinking developed as it did.

Before 1961: towards the scholar’s life

PR: Let us try and get some purchase on the development of your thinking over time. Partly by looking at your life, career and work. You were born in Saskatchewan?

TG: Into a farm family and I lived the first few years of my life on a farm.
PR: You didn’t enjoy farming much?

TG: I didn’t experience much of it but I remember from an early age having a longing for something else. That something else was the city. I can recall my mother telling me of cities and their various wonders.

PR: Most of your schooling was in city contexts?

TG: From the ‘Second Grade’ to my degree studies in English and German at the University of British Columbia.

PR: These studies were an influence you came back to later in your career and thinking?

TG: They certainly were. I fell into those choices of study, as many do, but it left a lasting impression on me. After finishing my degree I needed a job quickly and teaching seemed the easiest and most obvious thing, also my mother had been a teacher so perhaps there is that kind of influence. If I’d been more courageous or had more money I might have done other things.

PR: So you spent a number of years teaching in an elementary school?

TG: I was trained as a secondary school teacher and worked as one briefly and VALUES AND RELIGION was quite happy at it. But I was offered the job in Vancouver and they put me in an elementary school because that was where there was a shortage of teachers. Initially I found that difficult.

PR: Presumably you became reasonably good at it because from ’58 to ’59 you had a year as a Vice-Principal?

TG: Yes that’s right. I guess by the end of my teaching career I had some success. It was in an interesting school. Some of us were advanced and I was one of those.

PR: What were your responsibilities?

TG: Assistant to the head. That was my first insight into practical administration. The principal was the opposite of the previous one. He was very aggressive and direct whereas the other man had been incompetently laissez-faire. He was repressive with the children and indifferent to the teachers. I suppose that was when I first began to think about what administrators do.
PR: You had a year as a deputy principal?

TG: Then another happenstance from above. Someone in Edmonton contacted the BC Teacher’s Union and asked if they knew of somebody to nominate for a scholarship in educational administration. The thought of getting away for a year from that principal was attractive.

PR: Did you also want to research?

TG: My plan was simply to go for the year. I realised that if I did go I would probably be launched into an administrative career. 1961-1971: Objectivist years – from certainty to doubt

PR: In Alberta you studied Teacher-Leader Behaviour and Its Relationship to Pupil Growth. Why?

TG: The Department was just establishing itself. It had been going for only two years and there were two kinds of staff. Older people who had come to an academic position from a background of senior positions in administration and those, like the professor I worked with. He had some experience of education and then had gone to study in the University of Chicago, which is where the thrust of the Theory Movement arose. When I started my studies, I had a sense that the difficulties and complexities I had been introduced to in my study of the arts could be answered. They could be calculated, they could be resolved – exactly. I had a sense of turning my back on what I had understood to be knowledge for many years.

PR: That in comparison what you had known hitherto was sloppy, impractical, soft?

TG: That’s right, there was clarity, answers and certainty. As I understood more of the New Movement theory I saw it could bring discipline and knowledge to thinking in the field, to make it more useful.

PR: Was your Doctoral research a development of your Masters work?

TG: It was. My masters’ study focused on leadership, and I worked within a

EDUCATIONAL ADMINISTRATION AS A HUMAN SCIENCE pre-existing instrument designed to measure leadership. The standard thing to do was to take such measures and relate these to other variables. I
related these to measures of output, in particular to measures of pupil growth. For my doctoral studies I tried to understand more of how these measures of output were related to organisational variables.

PR: This was very much within the positivistic frame?

TG: Oh absolutely!

PR: It relied on a good deal of number crunching?

TG: I did a great deal of number crunching. This was offered to us as the methodology. All problems in education were thought to be ultimately resolvable in this way. Of course we were drawing on the whole school of thought that is described as ‘Logical Positivism’.

PR: This was a time in which the Theory Movement and logical positivism were at the height of their influence.

TG: Logical positivism was powerful in the social sciences generally and predominant in philosophy. We were not aware of this. These things were simply offered to us as part of the method we should use. We were aware there were problems to be solved in education and this was the means for understanding and resolving them.

PR: At a fundamental level it was taken for granted that tackling such problems raised technical rather than philosophical considerations?

TG: That was reflected in our training program. There were two kinds of emphases, the first and most important, was on quantitative method, the second was on an understanding of the social sciences. The social sciences were seen as a great repository of knowledge that would give us ideas and theories on which we would use our methods of quantitative analysis. We learned the social science of empiricist realism, that is the methods of logical positivism. We were also involved in studies that from the new perspective were seen as rather useless. We did a course in educational philosophy, which was taught by one of the old line scholars who had grown up in the tradition of Dewey. He took us through thinking on education, from Spencer onwards. We looked at thought right back to the Greeks. We had wonderful discussions and debates and being in that class re-awakened ideas that entered our heads as undergraduates. They certainly interested and challenged me. But when you walked out of that class you realised it didn’t really help at all.
PR: It was entertaining - but not really useful?

TG: It was simply self-indulgent, and didn’t address the great social issues of the day. I’d grown up in an environment of protest, a generally left-wing ideology. I was raised by my mother. She had a vivid sense of social outrage at the social injustices she suffered. I also had a sense of social mission, that there were great problems in the world that had to be set right.

PR: And that science was the way to do it?

TG: My first inclinations were towards the arts but I came to feel that was for VALUES AND RELIGION nothing and one ought to devote oneself to studies that could be socially useful.

PR: The serious citizen is a scientist? You published three papers in 1961.

TG: From early in my studies I could write well enough to put things clearly and forcefully, to draw people’s attention, to get good marks. Since then I’ve thought about my writing a great deal more. As Barnes says, ‘Mystification is easy, clarity is the hardest thing of all.’

PR: Your early papers use an essentially quantitative approach?

TG: They do. Within the systems metaphor that orders the whole thing. The school is a productive unit, there are distinguishable outputs, they are caused by effective process, all under the control of the administrator.

PR: And such thinking informs your Ph.D. study: ‘Systems Analysis in Education –A Factor Analysis and Analysis of Variance of Pupil Achievement’?

TG: A terrible title - but it displays the things I was proud of at the time. I cringe to think of it, a blaring trumpet advertising method, and no substance at all.

PR: Ideas derived from systems theory backed up by great technical skills in manipulating the numbers.

TG: I had a sense I was a possessor of a kind of arcane knowledge and had to display that in the title.

PR: You were an insider?
TG: I was inside, I could do a factor analysis, I could do an analysis of variance.

PR: And you felt comfortable with that at that time?

TG: Oh yes.

PR: When you finished your Ph.D., you became Research Director at the Canadian Teacher’s Federation?

TG: In Ottawa. I had gone to Alberta for a year, but had stayed four. I was too educated to return to the ordinary classroom. But there wasn’t an academic position available at that time in Canada. So I took an opportunity to get into research administration.

PR: To what extent was this a research role?

TG: My main role was as an advocate for research. There were interests the Federation wanted pursued with regard to the interests of teachers. They wanted salary scales, benefits and things of that kind examined. It was low-level survey research. There was also interest at that time in classroom research. I published several papers advocating that role for the classroom teacher in research.

PR: Did you hope for a ‘proper’ academic appointment?

TG: I went there happily but before long I became less happy. I found the position was that of tame scientist, in which you were hired because you could add a certain cachet to the proper opinions that my employers wanted to highlight. We were very much on display as scientists of education.

PR: Paid to find things you were expected to find or at least to find evidence to support such expectations?

TG: You could say what you wanted as long as you didn’t question certain sacred truths. I came to be very aware of that.

EDUCATIONAL ADMINISTRATION AS A HUMAN SCIENCE

PR: So there were frustrations in working in that context and when the chance came to get a post at OISE [Ontario Institute for Studies in Education] in Toronto you were interested.
TG: I was very much imbued with the attitude that saw the
typical role of the researcher as the creator of superior
knowledge, so I did resent the political control that was
put on me, even though it wasn’t all that binding. So when
the university system began to expand I remember thinking
long and deeply about leaving the Federation. But I had the
opportunity to join the newly formed OISE. What decided me
to go was the knowledge that my former Professor, John
Andrews, was going to the Institute. That was a strong
attraction. Also the thought of moving to a big city was
very attractive.

PR: Andrews was quickly promoted. In 1967 you became Head
of the Department and held this post for the next four
years. What was involved?

TG: The chief thing was managing its growth. The Institute
was growing very fast, money seemed to be no object. Every
year there was a competition among the departments for the
increased resources given to the Institute. Growth was seen
as good in itself.

PR: Presumably at that time you accepted this?

TG: Oh I did, and we were growing also in terms of students
and of the depth and complexity of the programmes we were
offering.

PR: How large was the Department by the time you completed
your term?

TG: We were twenty or more by 1970.

PR: Good grief.

TG: Good grief yes!

PR: What was managing that growth like?

TG: Appalling.

PR: What kind of administrator were you?

TG: I was proactive. I saw things to do and I did them. I
didn’t feel badly about using my power, except sometimes,
and I thought I was working for the greater good.

PR: Did you see yourself as a consultative manager?
TG: I didn’t mind overriding a decision that I thought needed to be overridden. I didn’t do that very often but I saw the need for it. I was keenly aware of the demands the Department was under, demands to expand both research and training. We had to meet our obligations, and this moved me to take risks. I pursued senior scholars, but not many of them came. So the salvation of the Department lay in recruiting new, untried talent. I appointed a woman to the faculty at the time when such an appointment was exceptional. I also took risks in the specializations I promoted and the greenness of the persons I recommended. I was pretty green myself.

PR: How did your four years experience as an administrator shape your thinking as a scholar?

TG: It shaped it a very great deal. When I finished my first term as Head, I was up for review for a second term and I felt that there was no question about VALUES AND ELIGIBILITY. To my surprise one of the senior people came to me and said he wanted the job. I was just completely dumbfounded. He said he would get it and that the best thing I could do was to step down. That was my first encounter with the Realpolitik of organisations and, of course, it rubbed me the wrong way. I might have been persuaded to leave and go back to doing what I really preferred. I decided he was wrong, that he didn’t have the power, and even if he did, I wasn’t going to go that way. The ensuing months were sheer hell. He was a consummate political animal and he was able to find enough resentment about things I had done and exploit this. It came to a vote of the whole Department, staff, students, support staff - everybody. I could see that to win by a small margin, which I did, was not enough, so I quit.

PR: So you went back to being a professor and ceased being an administrator. That experience must have been one you learnt from?

TG: During that time I was aware again that we were expected to be tame scientists.

PR: Even at OISE?

TG: We were an instrument of provincial government policy, and one of the issues was the amalgamation of schools and school districts. There was a belief that bigger was better. I saw that I was being used as a kind of strategic lever against popular opinion. I could see the complexity of the issues. I could see these were to do with values. I
was there to build the technical argument, to give it credibility. But on more than one occasion people would listen and then say, ‘That may be true if you say it. We still don’t want to do it.’

PR: So the doubts which have dominated much of your work since then can be traced back to this period? And these doubts were wide ranging and fundamental, relating even to your understanding of the methods that you were using? This takes us neatly to the first of the papers in which you begin to express these doubts in a published form. ‘Critique of a Tradition’, in 1968 raises doubts concerning the ideas and methods of researching that had characterised your work in the past.

TG: My task was to review the research years at the University of Alberta, research using the instrument known as the Leadership Behaviour Description Questionnaire, the LBDQ. There had been much research of this kind. I looked at its outcomes and its implications. As I did the paper, I came to realise the limitations of such theory and methodology. I said in a muted way that these methods were inadequate as a means for studying leadership.

PR: Were you also beginning to have doubts about the quantitative approach itself as a means of understanding things like educational leadership?

TG: I had to think things out, I had to understand them as deeply as I could. My arts training left me with the idea that the world was a mystery and that understanding of it was gained only with great difficulty, much scepticism and a lot of work. When I examined a body of findings based upon the LBDQ, that scepticism returned.

PR: Unlike some who share your reservations about the quantitative approach you had a very good grasp of statistics. You spent a decade or more working with statistics. You were very comfortable with them but began to see their limitations?

TG: There are enormous subjective elements in these supposedly objective methods. I knew too that numbers opened up a whole arcane study which was immensely satisfying because of its apparent exactitude and closed logic. That such logic is comfortably abstruse and impervious to question by non-initiates is part of its
attraction. It impresses by its apparent power while repelling questions, hiding the fact that it often has much less to say to the everyday world than it seems to. Numbers can be useless, but strongly addictive.

PR: What was it about the late ‘60s which began to make you doubt all this?

TG: I began to think through the nature of my science. Earlier I had become aware of the enormous subjective elements in these supposedly objective and quantitative analyses. There were problems with factor analysis, one of the prime tools, and also with multiple regression. With factor analysis, for example, there is no unique solution. Solutions are imposed by the researcher and what is interpretable becomes the decision of the researcher. In multiple regression, subjective decisions such as the order in which the variables are input significantly affects the result. In Coleman’s study of equal opportunity, for example, the order of entering the variables shifts the value of in-school factors from virtually everything to almost nothing. On one occasion when members of a Senate committee asked about the meaning of the beta weights that powerfully shape his findings, Coleman replied they were purely mathematical concepts which had no bearing on practical reality.

PR: Such an approach may manipulate quantitative data, see various pretty patterns and suddenly say ‘This pattern represents truth, life and reality!’

TG: That’s it exactly. Much later I came across a statement from Francis Bacon where he says, ‘God forbid that we should mistake a dream of the imagination for a pattern in the world.’ Many findings produced by the quantitative methods are dreams of the imagination asserted as truth. For example, if statisticians find a relationship statistically significant, then all the variation in the display which does not reveal that pattern is called error.

PR: And is systematically set aside?

TG: You simply eliminate the error and everything looks better because you are dealing with it through a lens that draws you up close, and instead of seeing the whole of the aquarium you’re looking at a tiny little droplet.

PR: And then extrapolate to the whole phenomenon.

TG: In this context an objection often made against the
that he doesn’t understand the relationship between the regularities observed and a larger world, that inference and representation is impossible. That is exactly the problem: the quantitative researcher creates in eliminating error.

PR: Concern for such issues is evident in your 1973 paper ‘Social inventions’. When did you first begin to think in such terms? 1971–1974: Towards an alternative paradigm

TG: I saw these problems before the end of my formal studies. But I did not appreciate their full implications until I realised these matters touched upon the essence of the claim that science offered salvation for the social problems of the world. This is first expressed in my 1968 paper, which ends with a series of questions. These questions and their wider implications were forming in my mind and between 1968–1972 they came to the fore. In 1971–72 they crystallised.

PR: Before we turn to this, let us first consider what you mean by ‘empiricism and ‘the empiricist approach’?

TG: It arises from applying logical positivism to the world. I first encountered this view in an aphorism from Spearman: ‘Anything that exists, exists in some quantity, and anything that exists in a quantity can be measured.’ This implies that anything immeasurable does not exist, not beauty, justice, or truth.

PR: Does Spearman’s claim self reference? How do you measure a claim? What of the hypothetico-deductive method itself? It does not necessarily derive from logical positivism or empiricism?

TG: No it doesn’t, except that there is an easy bridge between that view and mathematical physics.

PR: That reminds me of Griffiths’s point, made many years ago, that properly conceived the study of educational administration could replicate Kepler’s Laws of motion. It could produce general laws of human behaviour in social contexts.

TG: That’s right, and there is an enormous leap of logic and faith in such a claim. It is only in retrospect that you realise that what is being advocated is a view of the social world that sees it as a version of the physical world. The methods which enabled understanding of the
physical world are exactly the methods that will bring us to an understanding of the social world.

PR: The argument advanced was that the objectivist approach had brought vast leaps of knowledge in physics so why should it not do so in the social sciences? But let us try and clarify your own epistemological position. Evers and Lackomski seem to claim you doubt objectivity in the physical as well as the social world.

TG: I don’t doubt the objectivity of the physical world. I do not question that, in

EDUCATIONAL ADMINISTRATION AS A HUMAN SCIENCE their example, a door may be a better way of leaving a room than trying to go through the wall, floor or roof. I would say that it’s not clear that the door is the only way out - there may be a window - even if it is forty floors up!

PR: As I understand it, what they want to do is to argue, following Quine and others, that there are ways of choosing between competing theories which are neither wholly positivist nor wholly subjectivist.

TG: They rely on something like an agreement among scientists.

PR: Perhaps a bit more than that - the criteria they propose are things like which of two or more competing theories is the more economic, which explains more, which leaves you with the fewest messy problems, which is related better to what we already know.

TG: Yes and that a significant group of people accept it - which to me puts it on a social basis. I think of the fate of Galileo and other heretics who were right but forced to say their theories were wrong. Evers and Lakomski’s arguments may best apply to the interpretation of the physical world, although conundrums exist there too. It ends in mystery in that reality too. The limits of both macro- and micro-analysis are found in emptiness, darkness, the unexplained, the unfathomable. But Evers and Lakomski’s argument becomes shaky indeed when it is applied to the social world. There truth is defined, as Szasz says, not by scientists looking into test tubes and telescopes, but by ‘experts’ who go not to their laboratories to observe, but to make judgement. As Szasz points out, whether schizophrenia is a disease, a sin, or an acknowledgement is a willful and moral choice.
PR: The paper in which you first began to voice the concerns which have dominated your subsequent writing was 'Social inventions' in 1973. Limitations of space have excluded it from our book. Why did it not cause the stir your 1974 paper did?

TG: Where it was known, it was as much a cause célèbre as the later one. I spent much of the year following my resignation doing very little, just teaching and licking my wounds, and then I had a leave. It turned out to be a very important year.

PR: What did you do with it?

TG: I went to the University of Alberta, then to the University of British Columbia and finally to Germany. I read and read, being drawn into the world of Max Weber. And I had to write a paper on change.

PR: That was for AERA? [American Educational Research Association]

TG: Yes. I tried to use the new understandings. After that I went to Germany. In going to Germany I was opening a door. I turned to things that had moved me as an undergraduate student.

PR: What kinds of things?

TG: Generally the arts – art, language and philosophy.

PR: How long did you spend in Germany?

TG: Only four months! V A L U E S A N D R E L I G I O N

PR: You didn’t go there to explore German thinking on the things which have characterised your later writing?

TG: No, I wanted to go through a door I had previously rejected. That turned out to be an important experience. I knew the fount of knowledge there. I encountered a body of thought that much of my critique rests upon. I lived in Germany in German, and that was difficult and stressful. We surround ourselves with our mother language, with the realities and assumptions of that language. To have that torn away and operate in a system that you suddenly don’t understand is hard. You don’t understand the social architecture.
PR: A hard existentialist experience.

TG: It is. That is a theme that comes back in my later writing, that we need that tearing away from our existing social reality to appreciate what it is.

PR: To see it in its strangeness and familiarity?

TG: And it's mutability. We think of it as inexorable, it's the water the goldfish never sees. I came to see German thought and history in a new context.

PR: It seems as if this experience confirmed rather than triggered your growing disenchantment with empiricism and your search for another way? What about the paper you wrote? What was the response to it?

TG: I don't think it was remarked on much. It was just one of thousands of papers at AERA.

PR: Can we now turn to something that did cause a major stir - your paper to IIP '74 in Bristol? How did you come to be asked to give the IIP paper?

TG: I knew George Baron. When he became the Coordinator of the IIP '74, he asked if I would do a paper on leadership. I said, 'I'd be happy to do that but I have to tell you that what I would say about leadership now would be rather different from what I said a few years ago.' I sent him a copy of the 1973 paper and he wrote back saying, 'Forget about leadership. Write some more of the new.' He referred to the work of contemporary British sociologists he thought I might find interesting. One was Filmer. It was from Filmer I picked up 'Phenomenology'.

PR: You must have known some of this work anyway?

TG: I did. I'd read Silverman and a good deal of German philosophy, sociology and history, centring in particular on Weber. Previously I'd used the 'action framework', a term Silverman draws from Weber. Filmer's book drew my attention to phenomenology in contemporary analysis. My critics thought it was a mistake. I remember writing the paper easily. It was all there. It was all sensible and apparent. It all came together. George gave me the title and I recall sitting down and the whole thing just seemed to flow out.

PR: In retrospect, what were you trying to say in the paper? Is it possible to pick out the main themes?
TG: I pointed to the inadequacy of social science as
science and to organization theory as a foundation for
management science.

PR: In Griffiths's memorable phrase, you were thinking
yourself out of a paradigm? Was that painful?

EDUCATIONAL ADMINISTRATION AS A
HUMAN SCIENCE

TG: It was painful.

PR: How did you come to reject the paradigm? What
objections were crucial for you? Were your objections
essentially epistemological? Evers and Lakomski seem to
think so and so also does Griffiths?

TG: I came to see there were complexities in the world
other than those that the systems framework had led me to
see. I was strongly aware of the existence of alternative
realities. The systems perspective offers certainty and an
ordered view, but I knew from my experience such a view of
the world was only one. The more interesting questions
often lay in the contestation between alternative
perspectives, how some became dominant and others
subordinate. Power was inadequately dealt with in the
systems model.

PR: In so far as it was dealt with at all?

TG: This came to me with an absolute clarity. My year away
solidified my views. It enabled me to return to my
intellectual roots. I was returning to understandings I had
been led away from.

PR: Into the more complex social world you discovered in
the study of literature for example?

TG: Exactly.

PR: A world in which motive, interest and reason are
important in shaping how people think and act. In your IIP
paper you used words and made claims which some found
difficult to cope with. Labels like subjectivist began to be
attached to you and your views. Were you ready to accept
such a label when you were writing the paper?

TG: Shortly thereafter I began to use the word
subjectivist. I don't know why I didn't use it earlier, I
can’t imagine that it wasn’t available to me.

PR: Subjectivism is implied in the paper but you don’t use it.

TG: I had a sense of working alone. I was still groping to understand. When I was in England, British sociologists like Beryl Tipton wanted me to become ‘structural’, but I always resisted the ethno-marxist or critical perspective. The people I talked to were books, some old, others new. I think, perhaps, I was subject to the error the solitary scholar is apt to fall into. I was unable to check things out by talking to other people, I did it mostly by myself.

PR: Were you aware in writing the paper that you were presenting an essentially epistemological argument?

TG: I didn’t set out to study epistemology. My key issue was ‘How are we to understand the social world?’ It is not known in the way the physical world is to be known. This was very clear to me. As was the notion that in some sense we construct the world around us.

PR: Which entails that it is different – in some cases significantly different – for each of us?

TG: And so science fails as a basis for rational social action. I saw the cultural differences between the world of educational administration as it then was and the things that I was reading, I saw the difference between those rules and the rules I had grown up with in undergraduate study. To an extent VALUES AND RELIGION saw this as part of a general split between European and North American modes of thinking and understanding. I acknowledged that in the paper, without wanting to drive it home too far. What I tried to emphasise was not the geographical aspect of the cultural difference, though this seemed real enough, but the different sets of ideas which some people used to understand the world. I was most clear about the invalidity of a claimed universal science using the methods of logical positivism: I was sure that was wrong and said so.

PR: Evers and Lakomski seem to argue you’re a subjectivist with regard to the physical and the social world. Is that a correct representation of your views?

TG: No. We are grounded in physical reality. That we do not escape, cannot escape, but there are other kinds of realities built on that. Schumacher makes this point. He
speaks of the great Chain of Being in which the world of self-consciousness is built first on consciousness, then both upon life, and ultimately all three on a fourth, the physical stuff of the world. Each of the links in the Chain is qualitatively different from, radically different from, the ones above and below it. The living body is not the dead one, though the physical reality of both may be virtually indistinguishable. Or as Lear says, carrying the dead Cordelia in his arms, ‘I know when one is dead, and when one lives.’ That is my position now: we exist in physical reality but we are not limited by it, much more we transcend it. After all, you can still enter the Lenin tomb in Moscow and see the body incarnate, as vividly as it was the day before Lenin died. This failure to recognise a hierarchical difference becomes a source of great error: a society congealed around a distorted and malevolent perception. Evers uses the example that you exit by the door of your office. For the most part this may be true, but it is not the last word. I could exit by the window or I could refuse to go out at all. That I cannot walk through a wall is meagre knowledge compared with how I might construe it. Is it a Wall to be wept at and venerated? Is it a Wall men may weep and pray at, but not women? Or should I take a bazooka and blast it? The interesting questions about the physical world are how we construe it. Oùsont les neiges d’antan? Auden writes of returning to a city where Euclid’s geometry and Newton’s mechanics would account for our experience, and the kitchen table exists because I scrub it. It seems to have shrunk during the holidays. The streets are much narrower than we remembered; we had forgotten the office was as depressing as this. Physical reality exists within a subjective reality. It’s a slippery slope we live on.

PR: You could take some quite simple alternative cases to the one they use

EDUCATIONAL ADMINISTRATION AS A HUMAN SCIENCE about a room. You could ask what a fine paintbrush means to me as opposed to somebody else? At a physical level it is the same for everybody. But someone seeing a paintbrush for the first time would not see it as I do. Nor, perhaps, would Michelangelo.

TG: Exactly. There’s a wonderful dialogue in The Countesthorpe Experience, which is a commentary upon Countesthorpe College and the many controversies which surrounded its development. The dialogue is between Armstrong the head of social studies at the school and Professor Bantock of the School of Education, University of
Leicester. They talk about the different ways people construe the world. At one point Bantock argues that Thomas Aquinas and the mediaeval peasant did not worship the same God, nor it might be added, did they worship in the same church. Quoting Blake, Bantock says, ‘The fool sees not the same tree the wise man sees.’ To me it is obvious that the realities we see are dependent upon what we think those realities are, and this includes our interpretation of the physical world.

PR: But the argument may be easier to make in the case of the social world than the physical world. Take the case of the roles people play. It is possible for two people to share similar roles but to interpret and enact them in very different ways. We make roles, we do not just take them. I suppose the issue we have to address as subjectivists is that if you push this argument too far it is hard to see what account one could give of the social world. Social life must at some minimal level be predicated on the idea that we can work together and share understandings about what we can expect of and from each other. The question becomes how do we work together if we see the world in different ways?

TG: You have slipped from talking about the physical world to the social. The two are quite different. One is a world of ‘is’ and the other of ‘ought to be’. Consider the differences of will. We manipulate the physical world, not create it. We do not ‘create’ the social. We assert ourselves, we want to control others. The social dynamic has no counterpart in the physical world. It is uniquely human. Attempts to control others’ perceptions are never completely successful. They work, by and large, but there’s always the possibility of the renegade and the rebellious. Patterns of social life are all ultimately controlled by the action, will and intention of individuals. We can try to organise and shape this and we spend a great deal of effort in doing so but are never more than partially successful. In thinking about this I find R. D. Laing’s discussion of the confrontation between the twentieth-century mother and the Stone Age baby very telling; ‘After fifteen years what you end up with is a half-crazed creature more or less adjusted to a mad world.’

PR: The IIP paper has been described as an ‘across the board attack’ on the kind of thinking that had dominated conventional theories about organisations and their management. Is this the way you saw the paper yourself and did you expect it to be seen by others in this way? V A L U E S A N D R E L I G I O N
TG: I didn’t go to Bristol to throw down a gauntlet. I went there having written out the dialogue that had been taking place in my own mind over the last few years. I went in the hope of inviting others to join the dialogue. I certainly saw the implications of the position I was adopting and I think I spelled these out clearly at the end of the paper.

PR: I am surprised to hear that? I’ve always read the paper as a kind of manifesto for a new paradigm. Has it not been interpreted by others in this way?

TG: I didn’t think in paradigms at the time but perhaps I thought what I had to say could be accepted as inquiry. I didn’t go to Bristol to cross the Rubicon, but as soon as I arrived I began to get intimations others would see things differently. The paper had been sent to the conference and distributed to participants. When I arrived a couple of days after the conference began, there was a kind of electric tension that burst out at the session itself.

PR: When I first read it the paper made a great impression on me. I had encountered some of the ideas it contained and these had begun to make me think hard about my own position which up to then was largely that of a conventional positivist. My first thoughts were ‘Great! Somebody has thrown down the gauntlet at last and has done so in an elegant forceful argument’. I thought it a crunching paper so I am surprised to hear you did not expect it to cause the stir it did.

TG: I think it was a kind of naïveté on my part. There were people there who were toweringly angry with me.

PR: Was there a respondent? What was his response?

TG: The respondent was Alan Crane. His response was largely to ignore the paper and to seek to repair the damage. Unfortunately his statement does not appear in the proceedings. As I remember it, his text affirmed the existing paradigm. He soon came to change his view.

PR: Who were the people who spoke forcibly for and against from the floor? What did they say?

TG: For the most part, the questions and comments were neither for nor against. They were exploratory, but the atmosphere again revealed the gulf, the audience behaving like schoolboys in an assembly where a visiting speaker has said all the wrong things, explored a forbidden topic, even
under the eyes of the headmaster. Griffiths’s brooding presence was very much apparent.

PR: He was present?

TG: He was indeed, he challenged me from the floor, but not before there was a forest of hands and questions after my presentation and Crane’s response. I don’t recall anything hostile from that response, only keen interest, if not support. It was clear something rather extraordinary was happening. Even before the session the atmosphere was electric. It was like a time-bomb waiting to go off, and I walked into the session with many doubts and uncertainties. As the paper had been circulated, I didn’t read it or even summarize its main points. I don’t remember what I said, I just wanted to get

**EDUCATIONAL ADMINISTRATION AS A HUMAN SCIENCE** the ordeal over with. I’d presented my thing, said a few words, made a few points, and Alan Crane stood up, seemingly to calm the horses, and then there was an explosion. Everyone, it seemed, wanted to say something. I remember George Baron saying to me afterwards, ‘Well, it had a slow start, but once you got wound up . . .’ He recalled an incident where Griffiths interrupted me as I answered a question. I had been saying that the dominating theorists of the field were systems thinkers - I may have added most were Americans. Later the whisper campaign against me claimed that the point of my critique was no more than a cover up for my administrative incompetence, a fight against my American nemesis in the struggle that deprived me of the Departmental headship. In any case, Griffiths interrupted at that point. ‘Name one,’ he demanded in his stentorian voice, ‘Talcott Parsons,’ I shot back. I might have added ‘Daniel Griffiths.’ Baron said he was in admiration of that exchange. Certainly from that point on the gloves were off, I have come to be deeply grateful to Daniel Griffiths for his latter day views, but it was another case in the beginning.

PR: I think I’ve met about 400 people who have told me they were there. What happened after the session?

TG: The room was full but it was a moderate sized classroom, with about sixty present. Immediately after the meeting people came to talk to me. Griffiths was seething with anger, telling me ‘You are poorly informed’ I remember those words. He then turned on his heel and left after advising me to read more. I tried to talk to him later, but it was difficult. I felt I had betrayed something, stabbed
Caesar. I had always stood in admiration of him – in awe even. It was painful. I felt alone and isolated. There seemed no community of scholars, no camaraderie. If there was support, it came from individuals who didn’t count, people from places on the periphery of the great world of theory and accepted thinking about it. Four years later when IIP ’78 was held in Canada, my colleagues ensured there would be no echo of the Bristol error. I was not invited to attend or make a presentation. I watched the IIP caravanserai as it passed briefly through Toronto.

PR: What happened after the conference? After 1974: The subjectivist year – from Bristol to Edmonton

TG: Things went quiet. I knew in UCEA [University Council for Central Administration] circles the thing would come back as a cause célèbre, I was aware Griffiths was speaking out. I began to get invitations to write, some of my later papers are a reflection of that.

PR: From North America as well as in Europe?

TG: There were exchanges in the UCEA Review. I remember by that time feeling almost paralysed by it all. I had not anticipated the bombshell that broke over my head. I began to understand the way it was seen. It was interV A L U E S A N D R E L I G I O N preted as deliberately challenging, threatening and hostile, I had not thought of it like this. I simply wasn’t prepared to mount any platform in an adversarial way. It was just not me, I didn’t want to go through some kind of trauma or intellectual combat, and for some time I felt paralysed. I felt I was not doing good work at that time, it took me a long time to overcome that fear. To accept a burden I didn’t want, a kind of curse of insight. In those years I was unsure about my insights, unsure at least that I could invoke them again to defend the original vision. That’s how I felt about it, as a vision whose source I was unsure of, and could not command. In each subsequent paper I had a sense of struggling to draw again from the deep well of insight that moved the 1974 paper. To reach the Muse, as it were, was uncertain, an undertaking fraught with risk. And in those days, the overthrow of reason and professional authority that Allan Bloom describes so well in The Closing of the American Mind – all that made it hard to be a scholar of any kind other than one who upheld the new political orthodoxy. It dismays me to find how often my writings are seen by younger readers as support for academic fascism then and now, for that is what it is. I learned to listen to the depths, to alternative realities for inspiration. I began to feel like
Winston Smith in 1984, beset from both left and right. I learned to listen to the depths, to alternative realities for inspiration. Though argument helped I learned to tune into and hearken to the non-rational, to return to modes of knowing I knew from the arts and my other training.

PR: In Britain, EMA [Educational Management and Administration] published a series of papers which tried to take up the debate. ‘Self’ in 1977–78 was a response to that symposium. What were you trying to say in it?

TG: I knew the argument about the social construction of reality brings in very personal issues. I realised you couldn’t just march into an assembly, as I did at Bristol, and present the intellectual arguments for a radically different view of social life and not see the personal dimensions it entailed. I’ve never seen my arguments as ad hominem. I aimed only at the intellectual issue, but of course you cannot advance such arguments without, as I say in my paper, cutting into something unexpectedly human.

PR: Were you not trying to insulate what you do as a scholar from the account you were giving of what social life is like?

TG: There was an element of the sorcerer’s apprentice in what I was doing. It is one thing to get all those brooms moving and another to stop them. I soon realised once it had started there was no going back.

PR: Are you saying you assumed that the kind of social world you were depicting would not quite apply to you?

TG: I was quickly disabused of that – ‘Self’ begins the march towards that recognition.

PR: Can you elaborate on that?

TG: Where does the self belong in the study of organizations? That’s the point. There are reflections of my struggle in that paper and it acknowledges that EDUCATIONAL ADMINISTRATION AS A HUMAN SCIENCE our ideas are very much connected to ourselves, to our personal constructions of the world, and to our values. That the assertion of one’s own self and values is apt to bring one into conflict with stronger dominating expressions of self.

PR: To some you might be the dominating . . .
TG: I definitely wasn’t then. The paper began to be talked about in unscholarly ways. I discovered something about my field: its pettiness, its calcified and limited vision, its conventionality, its hostility to dissenting opinion, its vituperativeness.

PR: The attack was personalised?

TG: The attack was personalised, it was by second-hand statement, innuendo – people who had not read the paper but claimed they knew what it was about.

PR: They attacked your motives not your arguments?

TG: Some put up the straw man ‘phenomenology’ saying I didn’t understand it, this was evidence of the inadequacy of my argument. I was aware I was being attacked unfairly in an unscholarly fashion, that people sought to explain the paper in personalised terms. They began to circulate stories about my administrative competence and the business about losing the leadership of the Department started to come up. I felt beleaguered and alone.

PR: Several of the EMA contributors were sympathetic.

TG: That was in England. The first person who extended the personal hand of friendship and support to me here was Chris Hodgkinson.

PR: You have not formally collaborated? A case of two people sharing a similar view of the world and learning together and sharing ideas as they learn together?

TG: He came to me at a time I was very vulnerable. This was about the time his book Towards A Philosophy Of Administration came out. He had sought me out. Chris’s style means there are no secrets with him, nothing you can’t talk about. We talked of the whole intellectual furore, my changing personal circumstances, my marriage dissolving. He would talk about everything, intellectual and personal, everything others avoided in disdain, disagreement, or embarrassment. He offered the steel of intellectual argument and the hand of friendship. There were no others like him. Everything was on the table, no averted eyes, no sham, no shame, no pitying condescension. No rejection. Acceptance, but also no-holds-barred disagreements when it came to that. But always understanding and support. The first time I met him, he said something like, ‘What’s this I hear about your taking up
the vices of the ancient Greeks?’ And I probably replied something like, ‘I’m not just taking them up.’ He was, as I say, a great, friendly, and supportive hand, and there weren’t many then.

PR: Not even amongst your colleagues at OISE?

TG: Not in that way. There were not the people there that I could talk to intellectually or personally. I always felt my Canadian colleagues waited to see how the show would play New York or Chicago before committing themselves. Well the ‘Phenomenology’ show is still getting mixed reviews in New York and Chicago, though fringe voices like William Greenfield’s Organization Theory Dialogue has invited my views, as is seen in ‘Phoenix’. My Canadian colleagues have now come around, too, though often they would rather put me on some kind of honour role than ask my views on anything. At one time however some of the colleagues closest to me virtually averted their eyes when they saw the fuss and furore. There were friends but not in a way that Chris was. I never felt with Chris a personal rejection although I did feel this with other people; a sense of being beyond the pale.

PR: How, and in what way did you begin to affect each others thinking? Had this begun to happen when you started to write ‘Truths’ in 1978?

TG: I had begun to take in what he said about administration as an act of will and choice, as asserting self, as dramaturgy. In the next paper, ‘Research in Educational Administration’, I cite Sir Geoffrey Vickers, after writing to him at Hodgkinson’s suggestion. Chris was in correspondence with Vickers, who was most generous with his time and thought, though he was old and ill. The correspondence between Vickers and Hodgkinson began after Vickers had written a critically appreciative review of Towards a Philosophy of Administration, a book that was admired everywhere but in educational administration, where it was ignored or misunderstood.

PR: So ‘Reflections’ in 1978 tries to work out some of the themes raised in the debates after 1974?

TG: I was trying to explain again what the 1974 paper was about, going over the same ground and speaking to the critics who had addressed it in print in the United States. I make reference to Hills, Griffiths, Kendell and Byrne.

PR: Who first criticised your use and understanding of
phenomenology?

TG: Griffiths and Willower did, and much of ‘The man who comes back’, in 1980 speaks directly to them.

PR: How were you using ‘phenomenology’?

TG: Not in the way some American phenomenologists were using it. I suppose you might say that I was using phenomenology with a small ‘P’, Griffiths and Willower were using it with a big one. And they insisted that if I was not using their way I must be using it incorrectly.

PR: This debate was conducted in the American context and with the American scholars who were key members of the ruling orthodoxy and who had been notable in defending it against you.

TG: For a long time that’s what I did. I was invited to these events as an enfant terrible to come and say again and again those threatening and outrageous things.

PR: What of ‘Ideology’ in 1979? In it your concern begins to turn from epistemological to value issues.

EDUCATIONAL ADMINISTRATION AS A HUMAN SCIENCE

TG: Here I was able to get away from the old platform. I was at last able to look ahead again, to resume the dialogue I had begun with the 1974 paper. I was able to set aside the debate and get on with the thinking.

PR: Let us turn briefly to ‘Talk, Chance, Action and Experience’ of 1979. What do you mean by experience and chance in this context?

TG: The world of chance is one the statistical view seeks to do away with. In stressing regularities, statistics leaves out irregularities even though they may explain a great deal about how the world actually functions. What is vivid, individual, living gets left out. In this paper and in ‘Truths’ I ask the question, ‘Why are we afraid of the specific?’ The argument for chance is to bring in the specific, the individual, the reality of contingency and circumstance and to recognise the importance these things can have in organizations. To take this view, is to move towards a historical view of social reality.

PR: How important is it to be clear about the notion of
experience if we are to understand social life?

TG: The word 'experience' echoes through many of my papers after 1974. We all exist within our own phenomenological reality, that is our experience. It is a great resource, it is irreducible and it is not to be summed up in statistical and general propositions. The important point about experience is what we think we know about it and how we come to understand it. In one sense our experience is irreducible but in another it needs explanation or rather it needs understanding. It doesn't come ready-made to us.

PR: Some of the gurus of the Theory Movement have challenged the idea that the experiences of practitioners as seen and interpreted by the latter can be an important way of understanding organizations and their management.

TG: That puts the point well. In many ways natural science is a matter of building knowledge that goes against experience. Our experience tells us the sun rises in the east and sets in the west but natural science tells us this is false, that the sun doesn't rise at all. Just about all natural science is a supplanting of immediate experience with better knowledge. That is the approach taken in much of the social sciences and in the Theory Movement. It amounted in practice to a belief that administrators did not and could not know what was really going on. They thought they experienced something but this had little to do with the reality of what was happening.

PR: They had to have their experience explained to them to understand it. They needed a theorist to do this?

TG: Against this I would argue that while experience may not in and of itself be sufficient to understand reality, it is a crucial building block for such an understanding. Any worthwhile explanations of social reality must not contradict that experience. It may reinterpret it but it must not contradict it. This is the perspective of phenomenology, the perspective of the first hand, the perspective of the subjectivist.

PR: Natural science can explain but not understand? V A L U E S A N D R E L I G I O N

TG: More and more I used images from literature and art. In 'Ideology' I quote from William Blake. He asked, What is the price of experience, do men buy it for a song? Or wisdom for a dance in the street? No, it is bought with the price Of all a man hath, his house, his wife, his
children’. One begins with the experience but there is more. You come to understanding through that bed-rock, through that thing that nobody can dispense with. We live in experience but what understanding are we to place upon it? A social science that assumes that experience must be obliterated or replaced is wrong.

PR: Can I have access to or learn from the experience of another?

TG: The only way we can gain access to another’s experience is in symbols of one kind or another, frequently linguistic symbols. We struggle with language to put names on our own experience, to understand better and to understand others. As Schumacher says ‘There must be an altruism, I must first of all believe that there is somebody else there who is sentient even as I am, whose experience is as valid as mine and which I ought to try and understand.’ That’s a moral principle.

PR: For what purpose should I do that?

TG: In the fundamental sense of respect for others, beyond the utilitarian sense of mutuality. In a deeper sense it has an ethical base: Love thy neighbour as thyself.

PR: ‘Research in Educational Administration’ of 1979 documents the continuing dominance of the positivistic, scientistic, empiricist paradigm in the study of educational administration in North America?

TG: I attempted to set out the credos of New Movement theory. Then I examine the research that flowed from it. I was trying to show its inadequacies in theory and research – attempting to lay out the alternative directions in which we might go.

PR: You talk a good deal of Andrew Halpin?

TG: I try to understand the genesis of the Theory Movement, and Halpin was very much involved in it. He was a founding father. I don’t think anybody has more penetratingly used Simon’s ideas - a brilliant mind. I find it interesting that in his earlier writings Halpin seems to have been clearly aware of the shortcomings of the idea of a Grand Theory. He was one of those who raised questions and did so right at the beginning. It has long surprised me why Halpin and others stopped asking them.

PR: I don’t know of a more evocative set of titles than
'The Broken Icon', 'The Fumbled Torch' and 'A Foggy View From Olympus'. Is his concern in writing these papers the same concern he expressed at the beginning of the Theory Movement? Or rather is he arguing that it is the theorists who have failed the movement rather than the theory which has failed the theorists?

EDUCATIONAL ADMINISTRATION AS A HUMAN SCIENCE

TG: What interests me are the doubts he expressed in some of his early papers. In ‘Ways of Knowing’ he ruminates on the idea that the way scientists know is not the way that administrators know. He recognises there are ways of knowing that are non-scientific. But later on, he put these doubts aside and becomes a committed convert to the New Movement. At the end he is saying that the Theory Movement failed because the following generation of researchers watered down and despoiled the pure and potent methodology, the vision the founding theorists handed down to them from Olympus. The methodology was not done the way it should be, the acolytes failed the priests. The rite became impure. So, I would question your statement that Halpin thought it was the theory the founders offered that was betrayed. Halpin was under no illusion that such theory existed. He complained bitterly about loss - the loss of the methodology. The rite - the methodology defined by Simon and in logical positivism generally - was no longer performed by knowledgeable and competent practitioners. Halpin went back to believing in pure positivist methodology, setting aside all his earlier doubts that it was adequate to the task set for it. It is those doubts I offer in this paper as foundation for a critique of the Movement.

PR: If this approach will not do, how and what should we research in educational administration? You begin to address these issues in the paper.

TG: I need to make an observation before I try to answer that question. We should ask ourselves why a flawed science persists. Why a science that does not work is still hailed as science. An answer can be found in the argument MacIntyre advances. There are strong reasons for believing in such a science, even if it doesn’t work. It offers a world in which there are answers to all problems. You must have been at sessions where the science of effectiveness is preached. It is a world of cheerfulness and certainty. The alternative is conflict-ridden and uncertain, opening up the pain that comes with recognising the different realities we live in, of confronting the value chasms that separate us.
The Canadian government hires conflict resolution ‘experts’ from America to ease the acceptance of its proposals for constitutional change. We want to believe such a technology exists and that it works to remove the value gaps separating Canadians. Welcome to the world of management science and the relief managers or politicians feel as their responsibility for value choice is devolved into a technical, non-responsible realm where choice is a product of scientific analysis, not personal judgement. Choosing responsibility leaves one in an exposed and vulnerable position, and so science comes to the administrator’s rescue: science not the administrator makes the decision, thus absolving the administrator from responsibility, while giving strategic advantage over the choice. To go back to your question, we should be studying decision-makers, how they make their decisions and what they decide. It is a conclusion I come to with assistance from Vickers and Hodgkinson: that a science of values is meaningless, that science cannot resolve value differences, though for strategic purposes we may wish to say it can. Without science the administrator simply makes choices. The choices made may be good or bad, but someone is responsible for them. This is a hard road and one reason why it is difficult to be a manager and why managers look for help from science. And finally I would note the paper argues that the proper role of research in the face of these dilemmas is description.

PR: How do you justify the existence of scholars of education administration given the assumptions you have outlined? How can we help?

TG: We can help by enabling administrators to understand their experience better. One of the implications I drew at the end of my 1974 paper said the study of educational administration should use the social sciences as windows of discovery, windows into alternative perceptions, windows into alternative values.

PR: In thinking about the way in which we construct reality, how do you see the balance between reality as individually and socially constructed?

TG: What the social researcher is doing is launching out upon an inquiry into other people’s realities. I assume that the portrait can be of value not just to the researcher but to people within that social reality as well or to others who have interests in it. I would also hope that enquiries into social reality make plain the contestation, the different visions of reality that people
have, of how one prevails over another, of how power is used to sustain and propel certain views over others, and to ask what the consequences are. But I do not see this yielding the technology of control that management research seeks. The research I have in mind offers the hope of achieving insight into social realities. It is overwhelmingly descriptive and historical. It looks for insight, but first it is descriptive. It records decisions and points to their implications.

PR: Can it help to improve things?

TG: Maybe it can but not in an instrumental way. We are not looking at physical reality but at a chancy, value-driven cultural enterprise. All we hope for is a better vision beyond the shadows in which people will somehow rise to what is good to what is better. It can bring us to argument, to better argument, to an appreciation of people and their values behind the argument. That is my position: description first, followed by argument and ultimately, of course, prescription. While positivistic management science wants to shut down argument by calculating the answer, I want to open it by standing at the gulf that separates us, by recognizing the chasm that must be overcome.

PR: I know ‘The man who comes back’ of 1980 gives you satisfaction, not least because of those marvellous quotes from Francis Bacon in the beginning. Why is it significant for you?

EDUCATIONAL ADMINISTRATION AS A HUMAN SCIENCE part of myself that I had earlier suppressed speak freely. This paper comes from the heart, not just from the head. Here I began to use strength out of gay realities to say something about the world. I drew strength from myself, from newly understood experience, to call upon the Muse, and to let myself speak the truth I saw. From that special reality I gained strength. The horrible uncertainty of the past, the doubt that I might have something to say to the world was largely assuaged, if not completely exorcised. ‘The Man Who Comes Back’ is a paper where I address my critics, but also advance the argument. I look at some of the deepest conundrums of understanding social reality. In doing so I don’t think I ignore my critics. I am attentive to what they say, but at the same time, I speak past them, trying to build a framework of sound understanding.

PR: And it’s built around nine propositions?
TG: It ends with those nine propositions saying how we might understand organisations. It seemed to have no impact in the central academic institutions of educational administration in North America. To this day it goes virtually uncited, as is apparent in the record of the major American citation index. Though EAQ [Educational Administration Quarterly] is sometimes reluctant to publish my papers, the editors know they represented good business. Issues in which they appeared were good sellers.

PR: Can’t get a better quantitative test than that!

TG: I attribute this response to the interests of students and junior faculty who read my articles almost as a subversive activity. One colleague starting his academic career told me recently students were enthralled or profoundly troubled when examples of my writing were offered them.

PR: ‘Anarchy’ of 1983 sketches an anarchistic theory of organisations, but does not draw on traditional anarchistic notions.

TG: I am using anarchism here, in the sense of an awkwardness of things, of things that don’t fit, of an unwillingness to participate, of a non-intended, but ultimately conscious rebelliousness. At the end I talk of the anarchy that adheres in all thought. It’s a personal statement in many ways. I am no longer addressing critics, I am simply stating my position. I suppose in a lot of my work there is a theme of the individual versus the organisation. I am for the individual, I am for freedom, for independence.

PR: Some of these papers reflect a return to themes you touched upon at the beginning of your academic career. Themes to do with leadership. You appear to be trying, in part, to bring this up to date with your contemporary thinking?

TG: In ‘Non-Natural Order’ of 1984 I take up Halpin’s ideas about ways of knowing. There are ways of understanding and expressing knowledge that are powerful, satisfying and important, but non-rational – ways that are essentially cast within an artistic, literary, historical, philosophical even journalistic mode. A mode that is descriptive, withholding judgement, though moving towards it, moving to insight.

PR: You began to develop an approach to understanding
leadership which entailed taking examples from literature which illustrates the analysis you want to make. In the paper there is a long section from A House for Mr Biswas. Why did you decide to use this?

TG: I found myself drawn to the book. It is powerful, evocative. Perhaps in it I saw something of my own experience. It tells us things about education which, narrowly conceived, the social sciences can’t begin to approach. It helps you to understand what education means, and what a painful process it is, if it works in a deep and fundamental sense. I found it a tragic expression in one sense and hopeful in another.

PR: What does it tell you about leadership?

TG: That leadership is more than an individual phenomenon; it is a cultural thing, that it’s embedded in whole lives, whole lives within cultures. The programme of education we see in Biswas is certainly not ‘implemented’. We see elemental cultural dynamics at work. There is a kind of leadership in what Naipaul describes, and Biswas is a leader too – he leads himself. ‘If you would be a leader,’ said Bethune, ‘first lead yourself.’ That’s antileadership, and I admire it, as I do this sentiment from Mackay, a Canadian poet: ‘Rend your heart and not your garments.’ Whatever the power or restriction of the wider culture, the person within it who thinks right, believes right is of ultimate importance.

PR: The idea of knowing yourself as a route to understanding educational management is a recurrent theme in your work. Along with the belief that the kind of excessively task-orientated approach to leadership development advocated in much of the literature is not a promising way to hope to achieve this.

TG: Technocratic approaches to leadership and technocratic approaches to literacy are empty. A text like Naipaul’s has more to say about illiteracy, say in the inner cities of England, than many of the technocratic studies that are talking about effective teaching. They do not begin to touch the power of insight Naipaul offers, insight into the importance of tradition. Mr Biswas moved from poverty in rural Trinidad to seeing his son embarking for Oxford. That is an awesome journey, but it is carried out within a tradition of knowledge, and reveals the dynamics that ultimately bring about change. These are not simple, technocratic variables, they are deep-seated attitudes towards knowledge. Biswas’s life tells us that all
education is in one sense invasive of individual experience. What Naipaul lets us see is the shaping of the individual in line with cultural values.

PR: Coming to grips with these things has been a kind of twenty-year odyssey for you. Who have been your guides as you struggled to think through the enormously complex issues that you have been trying to come to terms with? And are the old ones like Weber or Laing being supplemented by a very different set including Naipaul and Shakespeare?

TG: First a methodological point in terms of a question: ‘What represents the EDUCATIONAL ADMINISTRATION AS A HUMAN SCIENCE world and allows us to understand it?’ The claim of empiricist social science of course is that we can know reality only through its restricted rules. This is dangerously wrong in that its representations of the world are both limited and impoverished. What I came to realise is that other modes of representing the world are not just a supplement, as some people would see it, to the stronger objective and powerful understandings of science, they are true alternatives to it. But of course, they do not lead to what science promises us – control. So we follow the narrow route of science because of the false promises it offers. It doesn’t offer control, or if it does, in a very spurious mode. There are more fundamental and powerful insights into reality. These are descriptive; they do not yield control. You look at the life of Mr Biswas and it doesn’t tell you what to do, it doesn’t tell you which variables are to be manipulated, but it does give you an understanding and appreciation. It gives you what Sir Geoffery Vickers calls ‘appreciation’. There is that value-oriented stance again. A novel like Mr Biswas allows you to appreciate what was involved in the building of literacy. It has powerful policy implications but they’re not the kind that you deduce in the way that empirical scientists claim to do. The inference in empiricist science is supposed to be obvious and logical, I doubt they are. In ‘appreciation’ that obvious logic does not exist. One understands and comes to value. A look at Mr Biswas would incline you to evaluate education as a desirable end in itself – you certainly wouldn’t do it for a productive reason, you would do it for what it says about the maintenance of culture and what it offers the individual even though all individuals would not benefit from it. So the implications that I would draw there run against the kind of production-oriented, mechanistic, market-driven analyses that we have now. You
invest in education in and of itself. But the power of that investment can be such as to transform the individual and – possibly, ultimately – the culture itself. That is how change comes about.

PR: I am trying to understand the way your thinking has developed, as opposed to where you are now. Can we consider this in three questions: First, ‘What can I know?’ Secondly, ‘How can I achieve such knowledge?’ and thirdly, ‘Who can help me to know?’ And in considering each of those questions, can you also say something about the sequence in which your ideas have developed? What came first, what next and what last?

TG: Initially, I was seduced by a methodology that, collapses the first two questions. The first becomes irrelevant and the second all-important. The argument I’ve been making is that logical positivism offers us a shrunken view of the world. It offers a methodology for manipulating reality so as to control it, a methodology that promises more than it actually delivers. It ends up hiding more than it reveals. In terms of the nature of knowledge, I’ve turned my back on the people who were my mentors in educational administration. I have found myself going back to ways of knowing and bodies of knowledge that I had encountered much earlier. On coming to VALUES AND RELIGION educational administration I concluded that my earlier knowledge was useless, or more exactly, valueless. This paper recognises that those other bodies of knowledge are relevant and may be powerful. That they are not just supplements to what social science lets us understand, but are truly unique insights in their own right. Partly because they are not paralysed by the only way of knowing recognised in positivistic social science.

PR: How does art relate to social science?

TG: I don’t think we should see art as another kind of social science, the two are quite different. There is a role for social science as social science. It’s a very complex role, and it is not the social science that is envisaged by logical positivism. The vital point is that the arts are not to be cast into the role of a lower level support to social science. Studies of the humanities and educational administration say, ‘To illustrate the principles established in social science, to colour them in with the tones of fleshly reality, one draws on literature and the humanities.’ You read a Bell for Adano or view The Bridge on the River Kwai to add weight and relevance to general principles, colouring in the laws of social
science. Everything, including King Lear, can be brought into the service of social science. But for me the arts are not to be so easily dragooned to serve the propositions of social science by adding convincing evidence to support what such science has already established. Much more the arts speak to questions of how to live a life. People who make policy based on what social science tells them will need something more. They would do well to call on the humane vision that the arts can give. In this view of the arts, they are not simply a parallel vision of scientific truth. Theirs is a starkly different vision, one in which moral questions are to the fore. Should Henry Kissinger weep at his desk before ordering the fire of napalm to be dropped on peasant villages, a question raised in Wallace Shawn’s play, Aunt Dan and Lemon? Would such weeping make it impossible to do what has to be done? As Northrop Frye has said, ‘We don’t go to Macbeth to learn about the history of Scotland, but to understand what it’s like to gain the world and lose your soul.’ Somebody who understands that is a better person, certainly a better person to be in a leadership position.

PR: But how does it help you with the identification and education of such leaders?

TG: I have proposed that leaders require a period of withdrawal and contemplation, that is what I would see as the role for training. Certainly there is a role in training for the provision of information, concepts and theories. But I think the most valuable form of training begins in a setting of practice, where one has to balance values against constraints – in which one has to take action within a political context. I think only somebody who has acted in that way is ready for true training in leadership. In that context I would be Platonic, not striving to make philosophers kings, but kings philosophers, or artists maybe. To make them more humane in any case, more thoughtful of their power, more aware of the values it serves or denies.

EDUCATIONAL ADMINISTRATION AS A HUMAN SCIENCE

PR: Aristotle and Plato were not all that successful when they actually tried their hands at leadership?

TG: Which takes us back to the idea that the practising administrator may know something the philosopher and the theorist do not know, and vice-versa. I think we have to bring those things together. The ultimate training of a
leader would be a kind of philosophical withdrawal to look at the larger issues in fresh perspectives. Perhaps they will return and administer as they were doing it before but with an added insight. That’s all I can see as a hope, that there is an added insight. A deeply clinical approach to the training of administrators is needed, as it is for teachers. Our training for both is disjointed, reflection is separated from action, thinking from doing, praxis from the practical. Why do we merely throw people at these jobs, expecting them to do well with almost no experience of them, offering them no analysis of their experience? The answer seems to lie in a virtually anti-intellectual bias, in the belief that experience alone, shored up by quick nostrums of science will turn the trick.

PR: There is a practical hope as well?, That they will be better leaders for it?

TG: I think there is. One of the things I have sensed in speaking to leaders in education, is how impoverished their real world is. They don’t see beyond a narrow horizon. They don’t see the problems of education, except in rather technological terms, or if they do see it, if they talk about it in larger terms, they are sentimental or platitudinous. We need leaders in education who can think about some larger issues, it’s the only thing that’s going to save it. It is interesting that the reports we get from Japan indicate that is the way they see administrative training. Junior officers entering government or business spend time just sitting and contemplating the beauty of the flowers. Senior people are expected to have a sense of history, of their own culture, of what is ultimately of value and they spend time on such things. Yet these things may seem nonproductive, though of course the practical never escapes ultimate attention. It isn't just navel-gazing or New Ageism. Can we expect our educational executives to think of larger but seemingly non-productive matters? I hope so, but it will be an uphill struggle to bring them to such contemplation. Perhaps we need different kinds of executives in terms of character and vision.

PR: There are examples within western culture which have looked back at such folk, they can sometimes be very nasty in practice as well.

TG: What are thinking of, the Mandarins?

PR: I was thinking of Cosimo de Medici. Machiavelli’s Prince is a highly cultured person with a great understanding of many things but would you like to have him
as a role model for educational leaders?

TG: I'd rather have the Prince than the technocrats of today. Machiavelli helped him to understand what he was doing and why. I would prefer that to the people who are being swept over the precipice and don’t realise it.

PR: He understands politics and people. Is that not an intensely control-orientated vision? 

TG: Not in the technocratic sense. It is control in the political sense, the lawful sense.

PR: Is that an important distinction?

TG: I think so. Certainly organisations are control orientated, but my theme is that they should not work through a mechanistic kind of control, but rather through a lawful, personal, responsible form. That is the point emphasised in the title of this paper, the idea of wilfulness and non-natural order. The idea that the organisation is not natural, it is created out of somebody’s intention, purpose and will, and the people who understand this and its implications for theory and practice are the ones who will control it. That is the nature of organisations. The people who run organizations ought to understand this. Therefore, I prefer the Prince even though he is selfish and egotistical. He does not pursue the best goals but he knows what goals he is pursuing and how to pursue them. Hodgkinson would say what we need is an amalgam of Machiavelli and Plato, a Prince with better ideals. We need a Prince who knows he is responsible, not one who thinks science removes his responsibility or who manipulates us behind the mask of a fraudulent science.

PR: Plato did not seem to have somebody like the Prince in mind as a model ruler in the Republic. He believes if you are egotistical and selfish you will become the most terrible prisoner of your own vices and desires. He propose a form of selection and training which would liberate his guardians from this danger but he was not too precise about how you might achieve this.

TG: I don’t think there is a technology for that. All we can do is work with the character of leaders. This is a distinction which Hodgkinson makes. Whereas studies of leadership in the positivistic mode have looked at the characteristics of leaders, what is important is their
character. I think we look at the Prince and deplore his character, but how do you get people of good character into leadership positions in organizations? That would be the answer.

PR: But isn’t what Machiavelli proposed predicated on somebody who is like the Prince? Can you be other than the Prince if you operate in the kind of way that Machiavelli is proposing? Could Plato’s Philosopher Guardian operate as Machiavelli’s Prince is advised to do without becoming the Prince?

TG: We must hope it is possible. That is why I put emphasis on a withdrawal from the exercise of power so that leaders can examine what they are doing. The headlong pressure to act, to do, to be the leader militate against a reflective attitude – a stance that is needed for the growth of worthwhile values, of character. That is what I see as the ultimate in the nurture of leaders through training. It would be aimed at persons in power, fostering awareness of values and of the value choices that face them, and thereby perhaps assisting character growth.

EDUCATIONAL ADMINISTRATION AS A HUMAN SCIENCE

PR: So the effort is not to make them effective leaders, but to make them good persons first?

TG: To make them good persons, yes. I’d remind you that in German, Machiavelli’s genre is known as Furtenspiegel, writing from the ‘mirror for princes’. Seeing himself in the mirror, the Prince is to be transformed.

PR: Even so what makes a good leader? What, for example, makes St Paul a good leader? Why was St Peter less effective as a leader than Paul? How do you help leaders to be better people and more effective leaders?

TG: Paul, is a perfect example. He receives a blinding vision on the road to Damascus with a new moral insight and thereafter he combines, what you might call political strategies with mystical experience. ‘For now we see through a glass, darkly; but then face to face.’ He shows us what it is to be a good leader. His combination of vision with untiring effort and endless recipes and advice for making things work, seeing where values require taking a stand on what matters, and working out their implications in practical reality. For example, his decision to make Christianity more than just another Jewish sect by his
abandonment of the old Law and circumcision, opening the new way to all, to Gentile and Jew, to women, to men, to freeborn and slave, the insistence that redemption was open to all. That’s leadership, and it has a political element woven with the visionary. He is filled with concern for the world as it is and how to change it and organise it but at the same time he is touched by, in this case, a transcendental vision. The role that I see for the arts is the one that gives us some insight into the larger values, and that I think leaders very much need.

PR: That is one thing the arts could do. They could also give leaders an insight into motive and intention and the operation of will and the relationship between each and all of these things and actions.

TG: One of the implications of accepting a world of multiple realities is that leaders need to appreciate the realities that they are overriding in the pursuit of those they seek to inculcate. Again this requires a kind of withdrawal from the immediate reality to understand the complexities and the alternatives. But the leader cannot contemplate forever, contemplation must stop sooner or later and action must begin. But there is no calculus for resolving a conflict of values, a conflict of separate realities, except through force, varying from psychic to physical.

PR: Can we examine ‘Critical Perspective’ of 1985. It offers an economical yet comprehensive account of your thinking on educational organisation.

TG: What it represents in terms of something new, is a study of the foundations of our field in the work of Herbert Simon and Chester Bernard, especially Simon. Here is where I began to consider how Simon built up a foundation and pushed the field in a mistaken direction.

PR: What do you see as the mistaken direction?

TG: He established logical positivism as the methodology of the field. In doing so he understood it could not deal with values: there is no science of VALUES AND RELIGIOUS valuing. Simon recognised that. His solution removed valuing and purposing from the science of administration. His science came at the price of a neutered administrative practice, deploring on the one hand that administrators make choices out of their own values, creating on the other the administrative ‘moral cipher’ as the model for scientific action. In that sense, Simon is
worse than Machiavelli, much worse.

PR: He had a very technicist view.

TG: He scientised the field by eliminating the value choice questions. His whole aim was to reduce decision making, to eliminate values in choice questions. His whole aim is to reduce decision making to a calculable system. The only way you can calculate this is if there are values established within it. So Simon’s perfect administrator is a neutered cipher. Interestingly, he began by trying to understand what he called the ‘psychology of human choice’. But ultimately the thrust of his logic brought him to the study of artificial intelligence, as is seen in his model for choosing a diet that was maximally nutritious and of minimal cost, as though religious rules of diet were meaningless, and as if food fads and fetishes had no force. The endpoint of Simon’s thought is HAL of Kubrick’s 2001, the computer that is superrational, but non-human and non-humane, making up for the deficiencies of human thinking by obliterating the human power to have values to choose.

PR: What of Chester Barnard?
