</table>
GENERAL INTRODUCTION

During a somewhat difficult three years, which have however allowed considerable time for reading and reflection, I have had the opportunity to select the articles and chapters in these four volumes to represent the field of educational management. What is presented here is a collection that has taken account of the professional judgements of a large number of those, mainly from higher education institutions, who have been generous in their commitment to the process of defining the intellectual territory of educational management. What is presented is the best I could achieve, given their guidance. It was agreed that management would be the most appropriate focus for the whole, because of the importance of providing a historical perspective in the collection and to ensure that this did not date. Over the last thirty years, the British Educational Leadership Management and Administration Society (BELMAS) has followed the changing emphases in the field, and the political and policy trends, and transformed itself from BEAS (British Educational Administration Society) established in 1971 to BEMAS, in 1980, with the incorporation of ‘Management’ into its title. In 2001 it succumbed to the further changed focus of research and practice and incorporated ‘Leadership’ into its title, BELMAS. Its major academic journal followed the same process, changing its name from Educational Administration to Educational Management and Administration and finally to Educational Management, Administration and Leadership in 2004. The articles and chapters selected here, which attempt to map the whole field of educational management, have been derived from the Gunter definition,

a field is a metaphor for understanding the intellectual territory which members inhabit, there are spaces where field members locate themselves and their work, and there are boundaries which demarcate those who are within the field from those outside.

(Gunter 1999: 230)

These historical changes have resulted in the very strong recent focus on educational leadership, although Earley and Weindling (2004) show, in retrospect, that it is possible to demonstrate that there has been twenty years of research on
educational leadership. This emphasis is also, at least partially, a consequence of changing definitions and understandings about the nature of leadership and management. The establishment of a National College for School Leadership (NCSL) in the UK in 2000 illustrates this new centrality. It is not yet clear how long this particularly strong focus will be sustained. However, for a new organisation focusing on current priorities, there is clearly less need for NCSL to give standing to education management. What would appear to be the case is that the flow and rationale for this evolving process from administration to management, and the grounds for the strong current significance given to leadership, have not been widely researched within this large historical context. Gunter (1999a) has presented a framework derived from interviews with the senior scholars and researchers in the field in the UK and an examination of the BELMAS archive which articulates a structure for this evolutionary process. As early as 1984, she notes, Harris Jenkins classified education management writings, having considered 473 references, in four categories (Gunter 1999: 73–74). These have remained useful in creating a framework for further analysis.

The Comparative Approach in which management in educational institutions is compared for similarities and relevance with industrial and commercial practice.

The Organisational Approach in which models and concepts from organisation theory such as structure, leadership and roles are discussed in relation to educational institutions.

The Managerial Approach in which managerial approaches and techniques are identified as being increasingly separate from policy studies, but which recognises the potential for reintegration through the common aim of organisational effectiveness.

The Environmental Approach in which education management sees the educational institution within a social and economic environment through the application of systems theory.

The different understandings of management and leadership presented in these four volumes variously define leadership as a subset of management, as above, and management as a subset of leadership. Therefore, it is interesting to note that the other major UK journal in the field changed its title from School Organisation to School Leadership and Management in 1997.

There has been a similar historical development and debate about the relative significance of the distinct but complementary research traditions of school effectiveness and school improvement. In selecting the articles for these volumes, this created an issue of how significant for representing the field of educational management are school effectiveness and school improvement traditions. School effectiveness is arguably about management through research into what characterises success, and school improvement about the leadership of schools to success through people. The place of this tradition within the scope of
It was determined that the full four volumes should be entitled *Educational Management* because, arguably, this has represented the central tradition historically over the last forty years. The titles for the four separate volumes – ‘Educational values’, ‘Educational theory’, ‘Educational leadership’ and ‘Educational change’ – have resulted from an attempt to impose coherence and meaning on the collection of articles which, it was judged, best represent the field – albeit largely after the selection of articles was made. The rationale for determining the subsections was similarly driven by the articles chosen. This would seem, in retrospect, to be an appropriate way to characterise the intellectual territory. The four volumes represent the major areas on which research and scholarship has focused for the last forty years. It is confidently expected that any reader seeking to understand the intellectual history of the field and the current central issues will be able to find them both in this coherent collection of articles. There is a clear emphasis on articles which have stood the test of time.

Volume I, ‘Educational values’, includes articles incorporating research into the ethical, moral and religious as frameworks for considering educational values. The emotional context of management and gender can be understood as allied to the central concerns of research on values. Politics and micropolitics have been conceptualised in the literature selected here as directly related to the ethical. This volume, in particular, raised the issue of coverage of the field. It was judged important that certain content areas were sufficiently represented because of their relative importance in any exploration of educational values.

Volume II centres on theory with considerable reference to the broader international context of analysis and research in this area. This incorporates the application of theory to the school effectiveness and school improvement traditions. The implications of applying research and theory to financial management and the distinctive context of further education are also presented here. Particularly in the articles selected, these issues are strongly related to management.

Volume III concentrates on leadership. Initially there is a strong focus on headteachers or school principals, the original focus of almost all leadership research and articles about learning leadership, again with an international focus, which extends this consideration. This volume is brought to a conclusion by chapters exploring the more recent focus on middle leadership or, as frequently conceptualised, distributed leadership.

The fourth volume, ‘Educational change’, opens with a section which explores the history of the changing research focus and changing conceptions of the field of educational management. The second part of this volume explores the change process more pragmatically and the relationships between strategy, culture and marketing, all of which can be conceived as distinctive manifestations of major changes in the field. This structure, which has again been partially derived from the articles selected, but also from the process described below,
may represent another framework for mapping the wider field and defining the content of educational management.

If this had been a USA-based collection, the process for determining those scholars who would best represent the field might have been more straightforward. Paul Bredeson, of the University of Wisconsin-Madison, confirmed that Division A of the American Educational Research Association (AERA) had initiated a task force to study inquiry and scholarship in the field of educational administration in response to a concern about the quality of research. He drew my attention to a list of fifty recognised highly productive and influential scholars, professors of educational administration, which was completed in 2000. The Task Force Research and Inquiry Report – Part 1 (Tschannen-Moran, Firestone, Hoy and Moore Johnson 2000) explored the differences between these ‘elite scholars’ and ‘typical scholars’. The ‘elite’ list certainly provided a rationale for making a selection of suitable scholars from the USA and Canada to include in these volumes because peers had determined the identified sample. The independence of all the scholars and the peer review process meant that the list had professional integrity. The characteristics that distinguished the elite from the typical could also be at least partially applied in the UK. The elites published more than three times as many articles in prestigious refereed journals as the typical, and the productivity gap widened over the span of their careers. They tended to have a more rapid career track development and their first and current positions were more likely to be in the highest quality research institutions. They put more emphasis on lasting contributions derived from research, using research to create and test theory rather than focusing on the pragmatic, and drew ideas for scholarship from theoretical literature and research. This rationale has partially helped focus this selection as well as determining the scholars from the UK to be considered. This is particularly interesting in considering the elite as determined by Gunter (1999) in the dissertation discussed below.

The second part of the AERA Task Force on Research and Inquiry Report (Ogawa, Goldring and Conley 2000) provided an additional framework of analysis for this collection. There is the tension between an abiding intellectual interest and responding to shifts in practice and policy. The recommendation emerging from the task force was that research should be co-ordinated around deeper, larger, conceptual problems attending to larger organisational dilemmas. The central issue to be addressed was the degree to which the academic field should concentrate on some specific sets of research questions or educational problems to improve the knowledge base and the degree to which the academic field could or should co-ordinate research efforts to advance knowledge. The central problem was how research could be both of high quality and high utility. In this collection, I have attempted to achieve both.

It is significant that the AERA elite were designated as professors of educational administration. They were therefore inevitably from a large number of different educational institutions providing a range of complementary expertise and focus. One scholar on that list, Kenneth Leithwood, would certainly be widely
recognised internationally. Leithwood clearly should be represented in this collection because of the quality and range of his work on leadership, but there has then been the difficulty of selecting from the eleven books, twenty-nine chapters and thirty-six refereed journal articles on leadership listed on his website. Even this number of possible sources for selection of representative, characteristic or significant Leithwood work excludes all the other books, articles and refereed journal articles listed on the same website under the headings of policy, change, and leadership development. In making the selection for these volumes, policy, change and leadership development are certainly incorporated within the wider field of educational management.

As with the problem of the relative significance of school effectiveness and school improvement within the field of educational management, there is an associated problem raised as a result of examining the Leithwood website: how fully should policy be represented in this collection. This issue was also raised by Ben Levin, who has considerable knowledge and interest in this particular component of the map of educational management. He is another who has continuously offered guidance throughout the selection process. This procedure, with Leithwood as with many others, allowed the possibility of asking directly the elite, and others whose eminence deserved, at the very least, serious consideration, to make recommendations about their most significant work and to explain their individual rationale for its particular importance. Many scholars were very generous in assisting in this process. In the end, however, I have to be responsible for the selection and the coherence of the total collection. What has helped refine my deliberation process has been that Leithwood, Levin and many others were willing to engage in an iterative discussion process about their own work and that of others in representing the field.

It was agreed that there would be no new commissioned work for this undertaking. The project was to represent the field as it had evolved. It was also decided that the most appropriate initial approach would be to seek guidance from the members of BELMAS and the Standing Conference for Research on Educational Leadership and Management (SCRELM), the most significant and influential independent organisations in the UK. A welcome number of people responded very positively to this approach to define educational management. This provided a very clear foundation for a subsequent iterative process of refinement. It was judged that a model which asked individuals to suggest ‘influential and productive scholars’, although that language was not used, and the articles that best represented their uniqueness would approach as fully as possible the methodology used by Division A of AERA. This was using a process that, if inevitably more arbitrary, approximated to peer review. From the USA and Canadian reports presented below it would appear that ‘inquiry’, which is close to research, and ‘scholarship’ are perceived as equally important and complementary significant elements in the publications evaluated. Research and scholarship are similarly corresponding in the UK, with scholarship arguably focusing on the wider significance of a broader range of research.
In the process of determining the selection for these volumes, it was initially requested that particular scholars or researchers should be recommended and that subsequently the recommendations should be of particular articles or chapters by these scholars or researchers. It was judged that for these purposes such a process would be professionally acceptable and have integrity. A number of scholars were very willing to give a considerable amount of thought and time to making recommendations and to reflect on the choices that were emerging from the process. There has been anonymity throughout, particularly important for those who were willing to make professional judgements, especially about which of the articles that were being considered, in their judgement, were not of sufficient relative significance to be included. This was equally important for those who were prepared to be self-critical and to make an honest, subjective evaluation of the significance of their own work in relation to that of others. All those who helped appeared to be willing to accept that, for this publication, working with a model that asserted that the field would be best defined by selecting the most significant works of the major scholars, was appropriate. I am personally very grateful for the support of the process, which strongly guided my reading, that was shown by many scholars of international repute.

This raised another major conceptual and pragmatic issue. Many scholars, but not all, who agreed to recommend from their own considerable number of publications, would have preferred to select their most recent work because this often represented the climax of their development and achievement and frequently built on their earlier work. However, this collection is intended to represent educational management with articles and chapters which explore significant developments throughout the last forty years. What is clear is that some scholars have focused on a particular range of questions for a considerable period because of their developing expertise and understanding. This leading-edge knowledge defined their uniqueness and professionalism and this created the unique capability for further development within a more constrained focus. This very competence led to the development of greater and more rounded expertise through professional learning and further research. However, given the intention to focus on a forty-year timespan, and given some of the scholars currently producing high-quality work as well as the early founders of BEAS who have been producing research throughout this period, one problem has been to select what has been most significant historically. This meant seeking some understanding of the work of these scholars throughout their publication history and attempting to evaluate the most significant developments along their journey. The best guides for this were frequently the researchers themselves, but some scholars and researchers were again willing to reflect on the most significant work of their peers. Such a selection of the most important articles of elite scholars had to be managed whilst attempting to present a map of the range of research, learning and achievement within the whole field of educational management.

The current strong focus on leadership should be put in historical context. The Open University course ‘Effective leadership and management in educa-
tion’ (1997) has now been succeeded by a totally rewritten course but with a not dissimilar title, ‘Leading and managing for effective education’ (2003). The first title was catching what was then the relatively new strong focus on leadership, despite the evidence from Earley and Weindling (2004) that there had already been research for twenty years. The Open University Masters Programme in Education, of which the above course is a part, now firmly established as the most popular postgraduate degree for educational professionals in Europe, has over 3,000 students registering each year. The titles of the modules for these two courses illustrate the changing emphases. For the first course the titles of the modules were ‘Education management: strategy, quality and resources’, ‘Organizational effectiveness and improvement in education’, ‘Leadership and teams in educational management’ and ‘Professional development for educational management’. They were made available to most of the first cohort of candidates for the National Professional Qualification for Headship (NPQH) to embed their professional learning more fully through access to the literature. Leadership was emerging but the focus in the titles was still on management. The modules for the new 2003 course are ‘Strategic leadership and educational improvement’, ‘Effective educational leadership’ and ‘Leading people and teams in education’. The new emphasis is clear but apparently relatively recent.

Ribbins and Gunter (2002) and Gunter and Ribbins (2003) have explored the mapping of the educational leadership field. Their map, as presented in Chapter 27, is inevitably simplified but even the limitations imposed by focusing on the headings illustrates the complexity of any mapping process in such a heavily researched field. The five groupings of work around key knowledge claims are: conceptual, critical, humanistic, evaluative and instrumental. This model was based on an analysis of publication outputs in the field. These five knowledge domains can be understood in terms of seven major factors or groupings of work: purpose, focus, content, method, audience, communication and impact. This creates thirty-five dimensions to be considered which are explored in the two articles. It was also suggested that there are five distinct audiences for this work: citizens, clients, policy-makers, practitioners and researchers. Ribbins and Gunter decided that it was appropriate, pragmatically, to adopt the ‘Ten propositions’ generated by the Think Tank for the National College for School Leadership in order to chart leadership themes whilst recognising that this is, in practice, one reading of the territory. These propositions state that school leadership must:

- be purposeful, inclusive and values driven;
- embrace the distinctive and inclusive context of the school;
- promote an active view of learning;
- be instructionally focused;
- be a function that needs to be distributed throughout the school community;
- build capacity by developing the school as a learning community;
be future-oriented and strategically driven;
be developed through experiential and innovative methodologies;
be served by a support and policy context that is coherent, systematic and implementation driven;
be supported by a National College that leads the discourse around leadership for learning.

The complexity of the mapping proposed by Ribbins and Gunter, which it is recognised is oversimplified here, links analysis with these propositions established for the purpose of improving practice. The five key knowledge domains are most important for our purposes here and have been applied to the wider historical context and broader field of educational management towards the end of the selection process.

**Conceptual** research is concerned with the issues of ontology and epistemology and with conceptual clarification... **Critical** research is concerned to reveal, and emancipate practitioners from, the various forms of social injustice and the oppression of established but unjustifiable structures and processes of power... **Humanistic** research seeks to gather and theorize from the experiences and biographies of those who are leaders and those who are led... **Evaluative** research...may be taken to mean any research that seeks to abstract and measure the impact in this case of leadership and its effectiveness at micro, macro and meso levels of social interaction... **Instrumental** research seeks to provide leaders and others with effective strategies and tactics to deliver organizational and system-level goals. (Ribbins and Gunter 2002, pp. 374–376)

A major problem throughout this process has been to determine the geographical balance. The collection was to be a UK-based publication but this raised the issue of how fully the rest of the world was to be represented and the evaluation of contributions from throughout the world to the field of educational management. BELMAS in particular has always included an international membership and the influences on the developing field of educational management in the UK have always been international. What was clear, however, was that many of the reading lists used in UK universities included significant international contributions, with a strong emphasis on the USA, Canada, Australia and New Zealand. There was remarkably little from Europe because it would appear that any high-quality work is rarely translated into English. The work of scholars from Hong Kong and India is part of the canon when the scholars have written in English but it is unclear whether or not this is the most intellectually-challenging work from those areas. Informal evidence suggests that the UK, Australia and New Zealand appear to reach out to learn from overseas, but in the USA, and to a lesser extent in Canada, there is a very limited knowledge of the
UK context, thinking or research apart from a few scholars with an international reputation. As early as 1969, Baron (in Gunter 1999, p. 48) was aware of international issues and the theory–practice divide:

In England much American writing on educational administration is of absorbing interest to the social scientist who is seeking avenues of approach to the study of school organisation and policy formation in this country. At best it is charged with imaginative insights that throw new light on problems of leadership, structure and innovation. To the practitioner in England, however, writing of this kind can appear highly remote from his concerns, since the urgent needs at the moment are to translate into teachable form the managerial aspect of the headmaster’s role.

I am grateful to those who were willing to send me copies of less accessible articles and also to comment on what they judged were the distinctive qualities of those articles they had selected. Some were willing to select their three or so most significant articles which was enormously helpful. I am particularly grateful to those who were prepared to revisit the list of articles as it evolved and to continuously reflect on the changing selection, in particular Geoff Southworth, Ron Glatter, Helen Gunter and, most supportively and challengingly of all, Peter Ribbins. It has been a privilege to reflect on the reflections and comments of these and many other leaders in our field. Even more of a privilege has been the opportunity to read many of the articles from which the selection has finally been made, both those in the final collection and the many, certainly almost equally worthwhile, that it was not possible to include.

The historical development of educational management has followed, to some extent, the changing approaches and priorities in business management. After discussions with a number of scholars in business schools, it was determined that within these four volumes, it would not be possible to incorporate a sufficiently extensive selection of articles from the business school tradition to make any selection appropriate. It is evident that many educational leadership development programmes in the UK reach out to a limited number of complementary business leadership books rather than articles and that these are almost entirely from the USA, whilst the business leadership programmes accessed use little or no evidence from education.

The final area in which a major decision had to be made was what to do about further education, higher education and adult education. It was determined that it would be appropriate to present a limited selection of articles on further education in Volume II. It was agreed, however, that it would only be appropriate to explore the overlapping areas of school and college management and leadership.

This section draws fully on the doctoral dissertation of Helen Gunter (1999), for which she interviewed many of the leading scholars in the field and drew
extensively on the BELMAS archive. This dissertation approaches the AERA process but she additionally interviewed what might be categorised as ‘elite’ UK scholars: Professor Sir George Baron, Professor Les Bell, Professor Ray Bolam, Professor Tom Bone, Dr Mike Bottery, Professor Tony Bush, Professor Lynn Davies, Professor Ron Glatter, Professor Eric Hoyle, Professor Meredydd Hughes, Agnes McMahon, Dr Janet Ouston, Professor Peter Ribbins, Professor Sir William Taylor, Professor Hywel Thomas and Professor Len Watson.

This eminent group enabled the full time span from the 1960s to the present to be covered, since a number of them were centrally involved in the establishment and early development of BELMAS. This allowed reflection on the professional practice of those who worked within higher education institutions as presented through an analysis of their publications, research and training. They were all from centres of training and research and many had international reputations for expertise in particular aspects of work including theory, finance and professional development. Gunter (1999, pp. 43, 83) developed a summary of the purpose and stages of development in the field of educational management that has also informed the final selection process here.

Higher education institutions are considered as sites of intellectual work by knowledge workers and their interaction with those working in field settings is analysed. This process raises questions about whether or not the focus on practitioner interest and problems has been at the expense of a responsibility to epistemology and whether or not the intellectual work has been more about
communicating knowledge to make policy work than producing theoretical insights to support critical understanding and alternative models of management practice. The approach which used professional biographical life histories from these selected members of higher education institutions asked the respondents to present their understanding of the development of educational management, the position of their own work within this, and the relationship between their professional practice and the policy context. This provides a post hoc rationalisation for the methodology used in determining this selection as a representation of the educational management field. Gunter describes those she interviewed as ‘a professional elite in which they have, and continue to provide, intellectual leadership for practitioners in schools and colleges’ (Gunter 1999, p.109). The articles selected for these volumes are an attempt to represent both the wider elite and the field of educational management.

The growing influence of the National College for School Leadership (NCSL) has clearly enhanced the status of school leaders. It now funds seventy five per cent of research on educational leadership with its own priorities. There is a danger that this might distort the focus of the broader field of educational management and not intellectually represent the field as presented by Gunter, however. The NCSL bibliography presents the knowledge pool as covering school improvement, alternative views about school improvement, leadership, instructional leadership, professional learning communities and capacity, coaching, action research and enquiry-based leadership, student leadership, future schools, urban and challenging contexts and also includes further suggested readings from the NCSL evidence-based archive. This bibliography has informed the articles selected for these volumes, although it eschews publications from before 1990. The complementary literature reviews of ‘What leaders read’, both from the business world and from education and beyond, have been carried out for the NCSL by scholars working in higher education institutions, in a management school and in an education department. This collection in contrast has asked those in higher education institutions, but not university management schools, to select articles or chapters from books, rather than whole books, so that within these four volumes there is a presentation of the whole field. The choice has however, ultimately, been the responsibility of one person.

There are other collections of readings, consciously more limited in scope because recently edited and focusing on the present and future, from the UK but with some international articles, the Handbook of Educational Leadership and Management, (Davies and West-Burnham 2003), and, with editors from the USA and Canada and published in Holland, the Second International Handbook of Educational Leadership and Administration (Leithwood and Hallinger 2002). The former focuses on a number of themes exploring their current context and how they are developing for the future. The latter concentrates on themes and insights that have developed since the first handbook, eight years earlier. In contrast, this collection includes what has been judged to be the most important articles by the most important scholars in the last forty years, including
contributions from the four editors of these volumes. The opportunity to manage the compilation process has been a privilege because it has allowed me the opportunity to read widely in the field, including many articles, I regret to say, I had not read previously. I am very grateful for the time given by many colleagues in the UK and throughout the world in helping me make this selection. I hope that they feel that the final selection justifies the time they have given in guiding my choice. I commend Educational Management to its readers.

I would like to thank personally the three Project Managers at Routledge-Falmer, Paula White, Jennifer Lovell and Zoë Botterill, who have supported me throughout this three-year project.

Part 1

VALUES AND RELIGION
IN PURSUIT OF AUTHENTIC SCHOOL LEADERSHIP PRACTICES

Paul T. Begley

Abstract

A practice-grounded and research-validated reinterpretation is presented of the ways in which values and ethics influence administrative practices in schools. The basic proposition is that acquiring administrative sophistication is a function of understanding the influence of personal values on the actions of individuals and the influence of values on organizational and social practices. A values perspective is used to link theory and practice with the objective of promoting authentic leadership and democracy in schools. The perennial challenges of leadership are discussed together with the special circumstances of our times. The following are then proposed: the pursuit of personal sophistication, sensitivity to others, and the promotion of reflective professional practice. Examples to findings from recent research that demonstrate the utility and relevance of values and valuation processes as guides to educational leadership are presented. These findings are used to reinterpret key values theories in ways that increase their relevance to school leadership practices. Specifically, the values typology of Hodgkinson is reconceptualized and informed by the accumulated findings of research on administrative valuation processes in schools conducted since 1988. This reconceptualization of theory also reflects efforts to integrate cognitive theory perspectives, together with experiences working with groups of school administrators in Canada, Barbados, Sweden, Australia, and Russia.

Authentic leadership may be thought of as a metaphor for professionally effective, ethically sound, and consciously reflective practices in educational administration. This is leadership that is knowledge-based, values informed, and skillfully executed. With these notions in mind, values are formally defined and
proposed as an influence on the actions of individuals as well as on administrative practice. A syntax of values terminology is then developed and grounded within the context of a single individual living among many in a social environment. Several persistent conceptual issues are given brief discussion. Finally, the seven arenas of administration are identified and their relevance to authentic leadership practice is discussed.

An initial conceptual image of authentic leadership

Appreciating the nature of authentic leadership begins with a thoughtful and rigorous analysis of leadership activity. This can occur through formal research, through personal reflection, but preferably both. Leadership by definition refers to practices that extend beyond the usual procedural context of organizational management. Authentic leadership implies a genuine kind of leadership – a hopeful, open-ended, visionary and creative response to social circumstances, as opposed to the more traditional dualistic portrayal of management and leadership practices characteristic of now obsolete and superseded research literature on effective principal practices (e.g., Leithwood & Montgomery, 1986). Traditionally management was viewed as mechanistic, short-sighted, precedent focussed and context constrained practices. An image of leadership and management that is more in keeping with current times is a values informed leadership – a sophisticated, knowledge-based, and skilful approach to leadership. It is also a form of leadership that acknowledges and accommodates in an integrative way the legitimate needs of individuals, groups, organizations, communities and cultures – not just the organizational perspectives that are the usual preoccupation of much of the leadership literature. The innovative dimension being proposed here is the adoption and application of a values and valuation process perspective to educational administration, which makes the objectives of leadership more understandable, compelling and achievable.

The nature of values

There is much inclination in recent years for educators, politicians and other publicly accountable individuals to speak in terms of lost values or declining social values rather than a perception of any sort of improvement in social values. Within our recent social history, many traditional values seem to have become threatened or at least fragile. To suggest that one does not have values implies a rejection of the formative experiences of family, community and society. Possessing values is generally viewed as a good thing, although a person could just as easily be imagined to hold bad values as good values. The real issue is who gets to decide which values are good and bad. Administrators, for their part, readily acknowledge the importance of values to leadership situations in organizations. It is their role to act as agents for the values of their society, and research suggests they usually employ such values most con-
sciously when they are encountering ambiguous, unprecedented, or time con-
strained problem situations, or when consensus is impossible to establish (Leith-
wood & Steinbach, 1995).

Other basic characteristics of values can be identified. Pirsig’s more recent
novel *Lila* (1991) incorporates a conception of the dynamic and static nature of
values which is instructive. Using the example of an individual who hears a
piece of music and likes it increasingly from day to day, Pirsig illustrates the
dynamic nature of a value. In time, the dynamic value of the musical piece
increases to the point that the individual must buy the recording so they can hear
it as often as they want. As time passes though, the dynamic value of the music
declines through familiarity and frequent play, and the piece of music assumes a
more subdued, but enduring static value. The dynamic value is gone or reduced.
Yet, the dynamic value may experience a resurgence when, for example, a friend
drops by who has not heard the tune and the owner of the recording vicariously
experiences it anew by playing it for the friend.

Where values come from is also a matter subject to debate. Are we born with
some values ‘hard-wired’ as part of our nature, or are they all socially acquired?
Conventional wisdom has it that most values are socially acquired. However,
empiricist scholars like Edward Wilson, author of *Consilience* (1998), attribute
human predispositions to things such as a fear of snakes to mankind’s evolution-
ary past. It is not that difficult to imagine how such instinctual values could
persist as a biologically fixed human condition. Other similar biologically fixed
human values might include the instinct to survive, a fear of death, and the drive
to reproduce. On the other hand, it is also clear that lots of values are socially
acquired. Many values are formatively accumulated, and an apparent, objec-
tively shared meaning can often be assigned to such values. By this, is meant
that people appear to share the same values even though the acquisition of those
shared values may have occurred in radically different ways from person to
person. Nevertheless, the opposite, more existentialist perspective is also pos-
sible. It is likely that individuals may also possess at least a few distinctly per-
sonal values. Some values have a rational, consensual or factual basis, but there
is evidence to also support the existence of non-rational and transcendental
values. The nature of God is an example that has meaning for many people.

These are complex matters to ponder, and language can be a significant
barrier to dialogue on these issues. Accordingly, a critical first step towards
exploring these matters more fully is being clear about what the term ‘values’
means and adopting a suitably comprehensive working definition.

**A working definition of values**

Values are a conception, explicit or implicit, distinctive of an individual
or characteristic of a group, of the desirable which influences the selec-
tion from available modes, means, and ends of action.

(Parsons & Shils, 1962, p. 395)
Conceptualizing values in this manner highlights their function in making choices. In administration, the making of choices is usually termed decision-making, problem solving or dilemma solving: activities familiar to most administrators. Willower puts it this way:

Because a significant portion of the practice in educational administration requires rejecting some courses of action in favour of a preferred one, values are generally acknowledged to be central to the field.

(1992, p. 369)

The Parsons and Shils definition expands the scope of the term *value* beyond the relatively narrow philosophical domain of the meta-physical (the study of first principles) to several other types of values relevant to educational administration. It includes: social ethics (e.g., Beck, 1990, 1993, 1999; Cohen, 1982; Frankena, 1973); transrational values (Hodgkinson, 1996), the rational moral domain of administrative decision making (Shapiro & Stefkovich, 2000; Strike, 1990, 1999; Willower, 1994, 1999); plus the realm of self-interest and personal preference (Begley & Johansson, 1998; Evers & Lakomski, 1996; Hodgkinson, 1996).

So, values are essentially a conception of the desirable with motivating force. However, further explication is required. Within the administrative context, it is possible, even necessary, to distinguish the values manifested by individuals from the more collective social values of a group, profession, society or organization. Doing so highlights the interactive relationship between the formation of personal values and social values, implying an answer to the question about which comes first. Values appear to be derived from both within the individual’s psychology as well as from the individual’s interaction with collective groups, organizations and societies. For this reason, it is important to establish a balanced appreciation of the relationships among personal values, professional values, organizational values, and social values. The bulk of the literature of leadership and management has not been helpful in this regard, as it reflects a predominantly organizational perspective, to the extent that individual and professional values are often ignored, assumed to be the same as, or fully subordinated to an organizational imperative. The current interest of many educators in ‘organizational learning’ stands as a shining example of this pathology. In the literature on this subject, the importance of the individual to the leadership process is usually acknowledged on the first page and henceforth lost to an unremitting collective perspective. During a time of heightened social awareness and environmental activism, it is easier to see why a profit-oriented corporate sector might not be allowed to dominate or to remain unaccountable to the broader interests of community and society. The same can be said of educational organizations and organized religion. Sophisticated administrators are wise to consciously distinguish among the arenas of personal, professional, organizational, and social values of their...
environments. A further discussion of these inter-related arenas of administration occurs later in this chapter.

Other semantic difficulties

There are other semantic difficulties that need to be acknowledged. Certain commonly used synonyms and closely related values terminology must be distinguished from one another for the sake of clear communications. Words like morals, values, quality and ethics are often used interchangeably in school leadership literature. Is there one overarching term within which the other terms can be subsumed? It can be illuminating to substitute one term for the other in a sentence or phrase. For example, substituting the word ‘value’ for ‘quality’ in the ubiquitous phrase, ‘total quality leadership’, produces ‘total value leadership’ or ‘value added leadership.’ These alternatives sound plausible, and the substitution actually works reasonably well in application. However, several troublesome questions may also be triggered. If one espouses ‘total value leadership’, one may then reasonably ask which values, and who decides which values? The procedurally preoccupied proponents of the ‘total quality’ movement may not examine such questions too deeply.

In the school leadership literature, and particularly among North American scholars of educational administration, there is a pronounced tendency to adopt the word ethics or moral as an umbrella term for anything values-related (e.g., Grogan & Smith, 1999; Sergiovanni, 1992). In contrast, other scholars, notably several Canadians (i.e., Begley, 2000; Campbell-Evans, 1991; Leonard, 1999), follow Hodgkinson’s lead (1996). They reserve the term ethic or principles for a particular and very special category of transrational values and employ the word values as a generic umbrella term for all forms of ‘conceptions of the desirable.’ Ethics represent a particular category of social/collective values of a transrational nature and research (Begley & Johansson, 1998) suggests they are employed under quite particular circumstances by educational administrators. For example, most administrators appear to avoid using ethics as guides to practice when they can (Begley & Johansson, 1998). This is not so much due to a character deficiency on their part or a lack of moral integrity; rather, it is a natural outcome of the particular accountability patterns associated with school leadership. Ethics are often culturally exclusive and they therefore can be a very troublesome category of values to employ as guides to action in our increasingly diverse societies. As a practical consequence, administrators naturally tend to opt for employing rational consequences and consensus grounded values as guides to action and decision making whenever that is possible.

A syntax of values terminology

It is now appropriate to conceptually situate values within the broader context of one person’s being. Basic questions might include the following: Where do
VALUES AND RELIGION

values fit in as a component of human nature? What is their relationship to the other dimensions of an individual’s or a group’s identity? What is the relationship of actions, speech, and attitudes to values? What is the relationship of values to psychological motivations? One of the simplest ways to illustrate the relationships among these terms is through the use of an onion figure which illustrates a syntax of values terminology. Figure 1 is an adaptation of a graphic found in several of Hodgkinson’s books (e.g., 1991; see also Chapter 13). When considering the figure, it is important to keep in mind that one person is portrayed; one individual, not a group or organization or collective social context.

Beginning from the outside, the first ring represents the observable actions and speech of the individual. This is the way by which one makes empirical attributions about the value orientations of any other person. Observed actions and speech are also the source of data used to generate research findings. There is nothing else that is empirically discernible. Accordingly, most people intuitively rely on the clues provided by the actions and attitudes of others to make predictive insights into the nature of values held by other people. This is a generally sound strategy, but it has the same limits to its reliability in day-to-day life as it does in a research context. As political leaders, principals, teachers, parents and children regularly demonstrate through their speech and actions, the observable actions they manifest may or may not be accurate indicators of the person’s underlying values, particularly when individuals articulate or posture certain values while actually being committed to quite different values. This implies the significant limitations associated with the reliability and validity of conventional research as a source of information about anything, as well as a cautionary note to us as we interpret day to day events.

The next ring or layer of the figure represents attitudes. Attitudes can be thought of as the thin membrane between values and the observable actions or speech of an individual, or the permeable boundary of personality that acts as the interface between the psychological and the physical world. Attitudes can be formally defined as the predisposition to act specifically as a result of values or values systems acquired previously and elsewhere. To elaborate, consider how the values acquired in one personal or social context can have a general influence on the relatively specific attitudes, and potentially the actions, of the same individual or collective group operating in another context. For example, school principals might discover that their attitudes towards children in the school change when they become parents and have young children of their own. Similarly, a person’s values as a teacher and principal might spill over into other social roles he or she carries out: army reserve officer, scout or guide leader, municipal politician and so on. The strength of this extended influence can be residual in nature, a significant spillover of effect, or intrude to such an extent that it overrides or neutralizes the influence of the second value or value system. Moreover, attitudes may be reflected in the body language of posture, gait, or unconscious muscular tensions. They are outward and visible signs of inward and invisible inclinations.
The next layer represents a domain, or conceptual placeholder, for the actual values held or manifested by an individual. For example, an individual might value chocolate over Australian red wines, a chat at the pub over reading, working independently over working with others, a monarchial system of government over a republican system. In the case of an educator, the individual might value phonics over the ‘whole language’ approach, relatively controlled approaches to delegating authority over more laissez-faire styles of distributed leadership, computer mediated instruction over workbook exercises, or doing what’s best for kids as opposed to a teacher-centered curriculum. In fact, with a modest amount of cooperation from a subject, it is relatively easy to catalogue a person’s values. However, it is important to emphasize that identifying these values is one thing, while knowing why they are held is quite another. This is because any specific value can be held in response to one or more in a range of potential motivations. For example, a person could subscribe to honesty as a value to avoid the pain of sanction for dishonesty, or manifest honesty because this is a shared professional or community orientation, or because the consequences of widespread dishonesty is social chaos, or because it is the right thing to do, or any combination of these basic levels of motivation. Furthermore, as suggested earlier, understanding the motivations of others becomes much more complicated when individuals deliberately or unwittingly manifest or articulate one value while being actually committed to another. To know the actual level of commitment, one must look two layers deeper into the ‘onion’ of Figure 1 to the motivations of the individual for manifesting a particular value. For example, the actual level of commitment to decisions by administrators that are tacitly justified on consequential (e.g., what produces the best learning out-
comes) or consensual (e.g., school district policy) grounds could just as easily be grounded in self-interest or personal preference (e.g., if I work this right I’ll get the merit pay and promotion), but also occasionally grounded in a transrational motivational base of will or in response to transcendental values of faith or duty. It is the innermost layers of the onion figure that provide the key to understanding the nature and influence of values on life in general and administration in particular.

Between the values layer and motivational base layer of the figure is a separate layer labelled ‘available knowledge’ or ‘understandings.’ The kinds of knowledge referenced here are acquired through life experiences, training and reflection, and provide the linkage between the basic motivational bases of the fifth layer, introduced in the previous paragraphs, and the specific values adopted and manifested by the individual. The contention here is that as a result of experience, training and/or reflection, an individual responds to basic motivations by adopting particular value positions that will support the fulfillment of that basic motivation in a specific way, and be operationalized through actions or speech selected by the individual to achieve the valued objective. People vary, of course, in terms of the skills and sophistication they can bring to bear on achieving their objectives, depending on the quality of the knowledge at their disposal. This is generally applicable to all aspects of human enterprise, and an infinite number of examples can be offered. However, for the moment consider how a skilful school administrator, consensually motivated as a professional to achieve a complex set of educational objectives, might employ a carefully orchestrated collaborative school improvement project to achieve those educational objectives. By contrast, a less experienced administrator, with the same consensual motivation, but responding to different knowledge or the absence thereof, might decide a memo is all that is required to achieve the same objective.

As argued in the preceding two paragraphs, the motivational base layer of Figure 1 provides the key to understanding the nature and function of values. This is the motivating force dimension behind the adoption of a particular value which, working out through the layers of the figure, shapes attitudes and potentially the subsequent actions. For the purposes of this chapter, and consistent with Hodgkinson’s original value framework, four basic motivational bases are identified. These are (see Figure 2): personal preference or self-interest, an inclination towards consensus, an inclination towards or concern for consequences, and an inclination to respond to ethics or principles. These four motivational bases are relatively broad and arbitrary distinctions and people can manifest a predisposition towards one or more of these motivational bases at the same time when responding to a given situation. As alluded earlier, our recent research conducted on the valuation processes of school administrators in several countries (e.g., Begley, 1999; Begley & Leonard, 1999) suggests that the normative motivational bases for administrative decision-making are the rational domains of consequences and consensus. Self-interest is infrequently acknowledged as a motivation, possibly because professional activity is
usually publicly accountable, and ethics and principles tend to be employed under special circumstances.

Hodgkinson (1996) argues that motivational bases are at the core of the being of individuals, and that values held by an individual reflect these motivational bases. This implies the limited utility of conducting research that merely describes or lists the values manifested by individuals whether they are administrators, teachers, students, citizens, neighbours, or members of the family. It may be interesting and much easier to determine what people value, but why they do so is often most crucial. Much of the early empirical research on values in the field of Educational Administration is descriptive of the values held and reveals little that is conventionally verifiable about motivation.

The final layer at the centre of the figure is the self, or essence of the individual – the biological self as well as the existential or transcendent self. There is not a great deal known or that can be said about this inner core of the individual. Some would describe it as the soul, the life-force or spark of life. It is included in the figure primarily as a conceptual placeholder for such matters.

To summarize the discussion in this section with a metaphor used elsewhere to illustrate the nature of values (Begley, 1996), the attitudes and actions manifested by individuals may be construed as observable ripples and splashes on the surface of a body of water. It is important to keep in mind that the intentions
behind these observable actions may alternately be transparently obvious, super-
ficial, or running deep to the core. They can also remain fully obscured below
the surface of the self, the organizational structure, or the society. Existing
research evidence (see Begley, 1999; Begley & Leonard, 1999) on the values of
school administration suggests that the non-rational motivational bases of per-
sonal preference and transrational principles occur much less frequently than do
the rational motivational bases of consensus and consequences. The relevance of
principles or ethics to a given administrative situation seems to be prompted by
particular circumstances where an ethical posture is socially appropriate (e.g.,
the role of the arts), where consensus is perceived as difficult to achieve (e.g., an
issue involving ethnic bias), or when urgency requires quick action (e.g., student
safety). Furthermore, it may be that the weak influence of personal preferences
on administrative practice can be viewed as a good thing. After all, principals
are, in the end, “agents of society” and accountable to society for their actions.
While values of personal preference are definitely evident as influences on some
administrative processes, Begley (1999), and Begley and Leonard (1999),
suggest they are less frequently articulated by administrators, probably because
of a prevailing social bias towards the rational value types. This rational bias is
perhaps an outcome of organizational socialization and cultural expectations.

The arenas of valuation: sources of values and value conflicts

Although much of the leadership literature is fundamentally organizational in
context and emphasis, the full environment of administration is actually much
more complex. Any school administrator who attempts to lead and manage
without reference to the broader environmental context will quickly encounter
difficulty. The values of profession, organization, community and society are not
necessarily consistent or compatible with each other. Figure 3 illustrates what
can be usefully termed the arenas of valuation. These are the interactive environ-
ments within which valuation processes and, by extension, administration occur.
There are also important dynamics that occur among these arenas. Seven arenas
can be identified to conceptualize the environment of administration.

The term arena itself is helpful in that it highlights the multiple domains and
functions of administration. Conceptualizing administration as something that
involves multiple arenas, each with potentially competing or incompatible
values, is useful for managers or leaders who wish to reflect on the appropriate-
ness of their own actions, the actions of others, and to begin to predict social
reactions to their actions. Within Figure 3, the individual is represented within
the centre ring as self. In a practical sense, this arena highlights the role of the
individual as an entity with a potentially unique influence within a social or
organizational enterprise. It also conveys the potentially intensified influence of
one individual when he or she is a leader. This highlights ‘the power of one’, the
capability of one person to have impact as a leader. Also acknowledged,
however, is the potential for influence on processes by individuals when con-
ditions of distributed leadership exist, or when leadership influence is exerted by individuals without vested authority in the less formal ways which Lindle (1994), for example, has termed micro-politics.

The second ring from the centre represents the arena of groups, collective entities of various types. This arena acts as a place-holder for collectives such as family, peers, friends and acquaintances. The third ring, profession, represents a more formal arena of administration that is closely related to the second ring, but is given special emphasis here because of its relevance to school administration. The fourth ring represents the arena traditionally of most concern to academics and practitioners in the field of educational administration, the organization. Indeed, much of the traditional literature of educational administration and most of the corporate literature are grounded within the organizational perspective. As such a degree of ‘over-weighting vividness’ (Leithwood & Steinbach, 1995, p. 202) is often attributed to this arena. Moving further outwards in the figure, one encounters the arenas representing the greater community, society, and culture. Within the last decade, school administrators have learned that it is necessary to pay a lot more attention than before to the community as a relevant administrative arena and source of influence on school leadership (Leithwood, Begley, & Cousins, 1992). The increasing diversity of our societies and a general trend

Figure 3 Arenas of administration.
towards globalization has similarly highlighted society and culture as relevant arenas of administrative activity. A final, seventh ring is included to accommodate notions of the transcendental — God, faith, spirituality. This is an arena of considerable importance to many people, even though it does not get a lot of attention in the literature of administration. Administrators who do not subscribe to a spiritual dimension as a relevant source of personal influence would do well to keep this arena in mind, if only because at least some individuals associated with their followership certainly do. The spiritual dimension can be a significant influence on valuation processes for many people and a leader who wants to understand the motivations of the followership will be sensitive to this potentially significant category of influence.

Figure 3 serves two important functions. It suggests the various sources of values, conveying how values can be derived from multiple external and internal environmental sources. Although some values may potentially be acquired through biology as well as existential processes, values are perhaps predominantly acquired from more collective sources: family, friends, peers, acquaintances, a profession, organizations and formal associations, the community, social culture, and through the transcendental. Figure 3 conveys these multiple sources of values, but also it suggests the sources of value conflicts. For example, although value conflicts can certainly occur within a single arena of administration, consider how the personal values of the individual might conflict with those of the community, or professional values might conflict with organizational values.

Tools for authentic leadership

The discussion and concepts presented here, especially the two onion figures, are offered as tools that will contribute to the conceptualization of authentic leadership practices by school administrators. This is perhaps an ambitious and idealistic view of administration, but not a new one. The innovative dimension being proposed is the adoption and application of a values perspective to make authentic leadership an objective that is more understandable, compelling and achievable. In a fundamental way, authentic leadership is living the examined life as Socrates advised so long ago. More recently, Hodgkinson added this corollary: “if the unexamined life is not worth living, the unexamined value is not worth holding” (1996, p. 8). The skills of authentic and expert leaders will extend beyond management. All leaders consciously or unconsciously employ values as guides to interpreting situations and suggesting appropriate administrative action. This is the artistry of leadership.

Note

1 This chapter is a revised and updated version of a paper originally presented at the Conference of the UCEA Centre for the Study of Values and Leadership, Bridgetown,
Barbados (Begley, 2000). It has also been previously published as an article in a special issue (Vol. 4, No. 4, pp. 353–365) of the *International Journal of Leadership in Education* (2001).

THE TRIUMPH OF THE WILL
An exploration of certain fundamental problematics in administrative philosophy

Christopher Hodgkinson

An incompetent leader—a value judgement
An impotent leader—an oxymoron

These semantics are instructive. Innumerable assertions, laudatory or pejorative, can be made about the executive, the administrator, the leader—but what cannot be said is that the office, the role, or its incumbent is without power. This drives home to us what we already know at the deepest level, even though it may take some semantic conjuring to raise it to the surface of consciousness. What is then revealed is the absolute necessity for power in administrative affairs. Power is the first term in the administrative lexicon.¹

Without defining, or confining, this primal concept of power, it may be said that it is the human analogue of the physical science term energy, that is, the ability to do work, to accomplish ends. But in administration, in human affairs as opposed to the simplicities of physics and mechanics, power is much more. It is above all else the ability to impose one’s will. Here the contrast with natural science is revealing. In physics power is equivalent to force and is measurable in quantitative terms such as watts, joules, ergs, or pounds per square inch. But physical events are not human events. At most they are only components of human events. In science one presumes a determinism, a mechanism, a law of causation—notwithstanding that at the quantum level of analysis (that is, subatomic particle physics) strange paradoxes and ‘irrationalities’ are observable that seem to defy our ordinary understanding of cause and effect. In human events a new factor appears. In addition to the mechanistic–deterministic laws of cause and effect to which human beings are themselves subject there is now introduced a concept of will or voluntarism. Thus the human agent in the total equation of determining forces is felt to possess a freedom of choice—whether that sense of freedom is illusory or whether or not it is an epiphenomenon, a psychological by-product of unconscious vectors that are the real
determinants. Administration cannot exist without either the reality or the illusion. And science itself stops short at the edge of voluntarism, at the frontiers of conscious choice. For this reason a distinction between administration and management is essential: the former opening upon the limitless horizons of philosophy, the latter upon the restricted field of vision right and proper to science and technology.

It follows that administration is a form of life in which wills enter into a complex domain of conflict, reconciliation and resolution. In other words, administration is politics: the creating, organizing, managing, monitoring and resolving of value conflicts, where values are defined as concepts of the desirable. In principle or in theory the accomplishment of administrative ends, goals, targets, aims, purposes, plans and objectives is no more than the imposition of a putative collective will upon the resistant and countervailing forces of matter, circumstances, materials, resources and contending wills. To be without will would be to be without power and, conversely, to have power is to have the ability to impose will. And here for the tender of heart and the already disaffected it may be allowed that ‘to impose’ can also be rendered as ‘to change’.

The will to power

At this point one may consider a deeper motivational concept: the will to power. This formulation is central to the philosophy of Friedrich Nietzsche although its origins can be traced through his mentor Schopenhauer (the will to life) back to Vedantic Indian philosophizing about the life-force and the eternal dynamic of creation, preservation and destruction. Less metaphysically and more simply, in administrative terms it can be said to refer to the primal maxim; self-preservation is the first law of nature. I have represented this elsewhere as the first of the metavalues.

How does the will to power bear upon administration? It does this in obviously fundamental ways. For example, inasmuch as administration is an attempt via organization to control the future, it is a philosophical activity:

\textit{Genuine philosophers, however, are commanders and legislators: they say, ‘thus it shall be!’ . . . With a creative hand they reach for the future, and all that is and has been becomes a means for them, an instrument, a hammer. Their ‘knowing’ is creating, their creating is a legislation, their will to truth is—will to power.}

Conway expands upon the theme in this way:

\textit{As commanders and legislators, they must introduce order and discipline into the formless economy of Nature, thus ‘correcting’ for Nature’s profligacy. Toward this end philosophers legislate a hierarchy of values}
that both promotes the flourishing of certain forms of life and excludes
other forms . . .

This point is directly relevant, we may note, to postmodern and politically
correct conceptions of inclusion. The will referred to here is of course, despite
the totalitarian nuance, the nomothetic will, the will of the collectivity. Corpora-
tions, organizations and nations can in this sense be said to be imbued with the
will to power.

But now the problem of will has ramified. It can be seen as deriving from the
individual, from the group and, as Weber made specific, from the environment,
culture and Weltanschauung. In essence Weber argues that, on the one hand,
the administrator takes cultural values as given and is, for example, ‘politically
correct’ in the contemporary sense. This would allow the administrator to
assume the mantle of self-righteous ‘responsibility’ and to steer a satisficing
course to given ends as per the doctrine of H.A. Simon. On the other hand, the
administrator may embody convictions (and commensurate will) towards ends
which may or may not be either cultural or those of the corporate entity he repre-
sents. This leads to the potential for ‘irresponsibility’ or bureauopathology, as
when the interpretation of orthodoxy (Weltanschauung) is appropriated by the
leader. Will to power here acts as an administrative countervailing force to the
downward impress of cultural and organizational dictates. Yet even in the case
of the administrative factotum—administrator as Simonian agent—will to power as a depth motivation is a powerful determinant in the overall
collective equation.

Grand assumptions

Granted that administration is the very business of power, that power is its pre-
eminent characteristic, it is somewhat curious that (with a few exceptions, notably
Machiavelli) the standard literature glides so smoothly and blandly over the prob-
lematics of power. Two very deep-seated assumptions seem to underlie this phe-

omenon; assumptions so entrenched and buried that they might be regarded as
meta-assumptions, or assumptions at the unconscious level that pass without
question, scrutiny or examination. Before we examine them, however, it should be
repeated that these are assumptions in the literature, in the theory of administra-
tion, in the conventional wisdom and orthodoxy. It should also be noted that the
assumptions selected for critique are only two examples of presumptive error in
administrative thought and praxis; others such as the naturalistic, homogenetic,
militaristic and excisionistic fallacies have been dealt with elsewhere.

The first of these meta-assumptions or presumptive fallacies is that ‘We are
all honourable men’ (and/or women, to satisfy the politically correct). The
second is that authority and leadership in and of themselves legitimate power.
Taken together these two unspoken assumptions effectively divorce the adminis-
trator from problems of ethics, morals, values, axiology or philosophy—leaving
in their place only problems of technique, of managerial efficacy and efficiency; problems in decision-making and implementation that can in principle be solved by the application of rationality and technology. Systems theorist MacNamara’s belated apologia for the Vietnam War is a case in point.14 Flowing from these assumptions is the concept of power as neutral instrumentality; a means to righteous ends (derived from outside the system) which means are also the professional property of a managerial elite. Thus honourable men and women pragmatically muddle through to resolve the ongoing problems of their particular organizational interest—making a profit, breaking even, delivering quality services, satisfying educational demands, winning the war against crime, or drugs—whatever it might be. Or else the same honorati apply the full force of rationality, systems theory, technocracy, bureaucracy and quantitative methodology to produce pro tem solutions that satisfy or satisfice the stakeholders and constituencies involved. Either way, ends are achieved and our leaders rise above their earthbound followers, escaping the bonds of gravity by means of their virtue, borne aloft on the wings of these grand assumptions, and falling from grace only with failure to maintain the proper altitude and attitude for airborne manoeuvring.

Alas! neither assumption withstands the light of conscious scrutiny. The first assumption can be rejected not on the grounds that fools and knaves assume the administrative mantle—fools and knaves know no boundaries of role or occupation—but on the simple logic of universal self-interest. Self-interest, when it takes the form of egoism, vanity and careerism, is often (but not always) antagonistic to the organizational and higher interests. But more subtle considerations compound the potential for pathology. For example, consider, as Nietzsche does, the feeling of power, the affective quality of power. Nietzsche’s analysis in the Gay Science dissects this in ethical terms:

By doing good and doing ill one exercise one’s power upon others—more one does not want! By doing ill upon those to whom we first have to make our power palpable […] By doing good and well-wishing upon those who are in some way already dependent upon us […] Whether we make a sacrifice in doing good or ill does not alter the ultimate value of our actions; even if we stake our life, as the martyr does for the sake of his Church—it is a sacrifice to our desire for power or for the purpose of preserving our feeling of power. […] Certainly, the condition in which we do ill is seldom as pleasant, as unmixedly pleasant, as that in which we do good—it is a sign that we still lack power […]15

This analysis hardly needs explication for the practising administrator. It is a matter of simple experience, even if that experience goes unscrutinized and unexamined. It penetrates and permeates the affective life and insidiously subverts the claim to honour. It is at the root of Lord Acton’s aphorism that power corrupts, and its little known corollary: ‘Great men are almost always bad men.’16
The second assumption, the assumption of formal legitimacy, falls even more calamitously and precipitously into the pit of decadence. This is because it is entirely a dependent function of a special perception, namely, the perception of the common good, the common interest, of, in a word, the commons. Before legitimacy can be assigned to the formal role of leader there must be agreement upon the collective purpose or the public interest or, simply, the larger interest. But what is this legitimizing interest in a neo-feudal, corporatist social structure where everyone is obliged to defend the parochial interest of some organization or subset of an organization, the interests of which may well be antagonistic to the whole? This is a system wherein the first duty of each administrator is to ‘fight his own corner’; where everyone and anyone is a ‘stakeholder’, and where devices for litigation and conflict resolution and power equalization (ombudspersons, equity and harassment officers, quotas, commissars for this and that perceived abuse) proliferate ad absurdum. In all of this is there somewhere a commons, a source of legitimacy, or has it nihilistically gone to the wall in the general pandemonium of postmodernism? Is it not fair to say that our present condition is one wherein the sense of commonality tends to dwindle to the vanishing point among contending ideologies? In this condition, paradoxically, the demand for conformist orthodoxy and political correctness frustrates the use of reason and speech and inhibits dialogue and dialectical examination of values. Surely any experienced academic or politician would vouch for the resultant bad faith and loss of community? Surely also every practising administrator knows the meaning of political expediency and has faced the choice between personal welfare and the common good on some occasion?

And yet the myth remains. The leader represents and embodies the good of the whole and thus has the authority and power of a legitimised will. L’état, c’est lui, c’est elle. But, despite the assumptions and presuppositions of the textbooks, administrative reality is less a field of honour than a battleground of wills, a domain of confused, confusing and conflicting values and, as often as not, a ‘darkling plain . . . where ignorant armies clash by night’.

Will, affect and circumstance

On the darkling plain victory is a function of will. Will and power, the will to power, these concepts are correlative, they are aspects of one another. In Nietzsche’s view, and he was as much psychologist as philosopher, there is nothing simple here. Willing goes beyond both feeling and thinking; it transcends the affective and the cognitive faculties. But it is essentially an experience of commanding—whether this be of others or of oneself.
What is called ‘freedom of will’ is essentially the emotion of superiority over him who must obey: ‘I am free, “he” must obey’—this consciousness adheres to every will, as does that tense attention, that straight look which fixes itself exclusively on one thing, that unconditional evaluation ‘this and nothing else is necessary now’, that inner certainty that one will be obeyed, and whatever else pertains to the state of him who gives commands. A man who wills—commands something in himself which obeys or which he believes obeys...

Here, it seems to me, Nietzsche is alluding to what I have elsewhere described as a Type I level of valuation. In the face of this charismatic quality of will, lesser individual wills are, as it were, psychologically disempowered. Resentfully or otherwise one either submits or, aligning with the leader, gains force from a psychological identification with the stronger ‘freer’ power.

. . . he who believes with a tolerable degree of certainty that will and action are somehow one—he attributes the success, the carrying out of the willing, to the will itself, and thereby enjoys an increase of that sensation of power which all success brings with it. ‘Freedom of will’— is the expression for that complex condition of pleasure of the person who wills, who commands and at the same time identifies himself with the executor of the command—who as such enjoys the triumph over resistances involved but who thinks it was his will itself which overcame these resistances.

There is enough in these enucleated Nietzschean insights to preoccupy the reflections of the thoughtful administrator for a long time but it must be noted that what they are pointing towards is the triumph of the will, not its defeat, nor its décadence. The healthy will derives its exuberance and its power from a clarity of interest and a commitment to values—whatever the content of those values. Technical competence or expertise doesn’t enter into it.

But the will, free or unfree, always encounters circumstance. For the most part we delude ourselves about the freedom of our will because we are not conscious of the extent to which we are mechanistically determined or programmed by external, subjective and objective, factors. Our capacity to shape events, for ourselves and others, is much less than we might think. Nothing new in this. The Romans said it: *Fata viam inveniunt*, things happen by themselves. In complex circumstances things just happen and consequently the honorific of leadership (or administration) is often falsely attributed to an actor who is simply in the right place at the right time. Fate has smiled upon him. His plan has worked out. His enterprises have been successful. All of which, pace Nietzsche, speaks nothing to either his virtue or his will.

‘Yes. But he brought this great matter to a successful conclusion.’—
That means something, but not enough; for we rightly accept the
maxim which says that plans must not be judged by results. The Carthaginians punished bad counsels in their captains even when they were put right by a happy outcome. And the Roman people often refused to mark great and beneficial victories because the qualities of leadership of the commander were inferior to his good luck. In this world’s activities we often notice that Fortune rivals Virtue: she shows us what power she has over everything and delights in striking down our presumption by making the incompetent lucky since she cannot make them wise. She loves to interfere, favouring those performances whose course has been entirely her own. That is why we can see, every day, the simplest amongst us bringing the greatest public and private tasks to successful conclusions.25

To sum up: will is one thing, affect is another, and fate and accident are always administrative parameters.

Malaise

Let us move now from the Renaissance and classical allusions to our own post-modern times. The practical wisdom of Montaigne has long since been forgotten. Nowhere are fate, accident, affect and will explicited or seriously discussed in the management literature of our day. The managerial technopundits have no vocabulary to comprehend or cope with such untidy concepts. In the dialectic between the philosophy of administration and the science of management the latter has achieved a salience unthought of or undreamt of in earlier epochs. Thus today the president of a Canadian bank can confidently assert that ‘The manager’s principal aim is to remove uncertainty.’26 And MacNamara in his apologia still maintains, ‘To this day, I see quantification as a language to add precision to reasoning about the world.27

Paradoxically this very modernist orientation occurs in a condition of post-modernity and questions arise as to whether it is a triumph or a failure of the will. Is it victory or defeat, affirmation or negation, health or pathology? Is this tacit administrative philosophy—one could call it managerialism—an aspiration towards the ultimate Apollonian ascendancy over the Dionysian forces of passion, violence and unreason which might threaten it?

To answer such questions or to try to is to engage in philosophy, more precisely, in axiology: the problem of values. Doing philosophy and doing axiology can be demanding—such efforts require will. The line of least resistance is to retreat into managerialism, to stick to the book and the numbers, to become a functionary, a factotum. To abdicate one’s will in the face of complexity is all too understandable, if not entirely forgivable.

This malaise or failure of the will is a pathology. Its therapy requires some understanding of the morphogenetics of value. The distinctive value dimensions bearing upon administration can be visualized as a series of concentric spheres
of influence. These descend from a cultural level (V₅) through subcultural (V₄), organizational (V₃) and group (V₂) levels to the irreducible level of the individual (V₁). This whole constitutes the morphogenetic field, a complex of value forces, an ecology of interests and will, which forms the axiological context of practical administration (praxis). This schema allows us to identify the central value conflict and source of contemporary malaise. It points to the hypothesis that the root conflict is not the conventional idiographic contest between V₁ and V₃ but rather a dual conflict. There is first the tension between individuals (V₁) and their organizations (V₃), the orthodox idiographic–nomothetic dissonance. Second, there is the conflict between the state as representative of (V₅) culture and its component corporate units (V₃), where the terms of interest conflict can be specified in economic terms: the greed of the parts being in opposition to the welfare of the whole. This in turn leads us to the idea of neo-feudalism.

As society becomes organizational, with large, complex, bureaucratic corporate entities increasingly dominant and increasingly international and global in scope, so the phenomenon of the individual deriving psychological identity from the organization which dominates that individual’s life as the source of livelihood becomes more and more the norm. Saul has defined ‘corporation’ as any interest group: specialized, professional, public or private, profit-oriented or not. The one characteristic assured by all corporations is that the primary relationship of individual members is to the organization and not to society at large. In a corporatized society the group replaces the individual and therefore supersedes the rule of democracy. In their own relationship with the outside world corporations deal whenever possible with other corporations, not with individuals. The modern corporation is a direct descendant of the medieval craft guild.²⁸

To whom then is one beholden as liege lord? The more one is beholden in a hierarchical structure, the more one is in the power of one’s immediate superiors, as well as one’s peers!

Such dependency throughout the working life is not necessarily to be condemned out of hand. This is exemplified by the Japanese experience but theirs, of course, is a culture of the East and Japan, we must acknowledge, can lay considerable claim to having been the modern world’s first police state. Neo-feudalism is also familiar to the West in all its forms of military organization. But its scope and ramification, its penetration of the public mind at the unconscious level, is a novel aspect of contemporary rational-legalistic, bureaucratized, scientific-technological mass society. Those who have such neo-feudal affiliations—that is to say, us—are the fortunate. Those without liege lords, the unemployed for example, are the unfortunate. Such ronin suffer economically but worse, they find no modality for self-identification, for self-worthiness, for life-meaning, save perhaps in so far as they can accept the label of victim and alleviate their resentment through political action.²⁹
In Saul’s view, corporatism represents the triumph of fascism over democracy; democracy in the romantic Athenian or practical Swiss sense, fascism in its proper original sense as a collectivity of \( \frac{1}{3} \) interests bound together by the State—the emblem of which was the bundle of sticks (fasces) bound together around an axe and carried before the Roman senators by the lic tors as a symbol and reminder of the common good. One can easily break one stick but the bundle of them is invincible. (It is interesting to see how Greece and Rome part company.) Examples of contemporary sticks (and feudal identities) are the professions, the bureaucracy, the corporations of industry, trade, commerce and entertainment. Rather thick sticks, one must admit, but by them we come to identify ourselves to ourselves not as individuals, as persons, but rather as doctors, or lawyers, or civil servants, or educators, or administrators. Thus we leach our individuality, our wills and our very consciousness into the roles provided by the organizational forms.

The administrative implication of this malaise is that it tends to exacerbate the imperative to fight one’s own corner, whatever that might be: the department or section or company or corporation or private practice. The larger good is always decided elsewhere and, increasingly, if at all. Our eyes are on the next prize and prizes are bestowed close to home. One is not rewarded for blowing the whistle in the greater interest. In this state of affairs our consciousness of ourselves is defined and limited by our roles and our wills are weakened by corporatist and subcorporatist myopia. What is good for General Tobacco may be good for the nation or not but it is certainly good for a GT chief executive officer. And as to democracy, with respect to the greater good of the commonwealth, what difference does one-man-one-vote make in a mass electorate? What is one vote among a million? What power attaches to a drop in the ocean? What is one will against the will to power?

Again, and at a larger level of generality than the organizational, there is a value impress stemming from the Zeitgeist, the spirit of the times. To this can be assigned the descriptor postmodernism. For administrative purposes, postmodernism can be described simply as that condition where a loss of value coherence typifies the overall culture. Its hallmarks are, variously: pluralism, relativism, nihilism, multiculturalism, bien-pensant liberalism, identity politics, anomie, alienation, victimology, eco-activism, terrorism, meaninglessness, ressentiment, political correctness. One merely peeks beneath the lid of the Pandora’s box before snapping it shut, remarking only that Nietzsche predicted such outcomes a century ago, not least as a consequence of his most famous utterance that God is dead. This selective catalogue may seem like a vision of hell and the worst of worlds but it must be remembered that it is simply a partial assortment of value ills associated with the postmodern condition and, in any event, it is ‘where we are at’. Each epoch has its own ‘worst of times’ and this is merely ours. Our concern here is not with the putative glories of our era, which are surely many, but with its malaise, with those aspects that confront the will to power and that dissipate and enervate the will to lead.

37
The point for administrators is that, to the extent that postmodernism constitutes a discernible condition of organizational context, they have the onus to become aware of the issues it entails, of the philosophical arguments and of the postmodern polemic itself. Failure to take up this onus again means loss of consciousness, loss of meaning, submission to mechanical determinism, failure of nerve, and weakening of the will to power. The outward manifestation of this weakening appears in the declension of leadership towards pragmatic mediation of interests, in pandering to designated minorities and vocal activists, in the compulsive search for consensus, in the reluctance or inability to say no, in the endless oiling of squeaky wheels, in meek surrender to group-think or politically correct orthodoxy. The postmodern administrator harbours a fear of violating any norm. In the words of the Comte de Mirabeau, ‘There go the mob and I must follow them for I am their leader.’

Recuperation

Restoration, reclamation of the will, the justification and recovery of power, consciousness: what can be done to achieve such aims?

First of all let us acknowledge the administrative–managerial distinction. It can then be asserted that in the preparation of administrators generally the managerial side of things is fairly well taken care of. We can even commend ourselves on this. Managerial science (or proto-science), systems theory, quantitative methods, rational problem-solving and inquiry, research methodology and so on, are with varying emphases well covered in the curricula of our professional schools. The administrative side is more open to critique but even here commendation is possible. Sampling only from the subset of educational administration there is a quite respectable endowment. One need only consider the highly sophisticated common sense of Willower and Sergiovanni or the highly sophisticated uncommon sense of Evers and Lakomski. To these can be added the ethnological work of Gronn and Ribbins and, of course, the radical insights into the social construction of organizational reality of the late T.B. Greenfield. One could of course go on and still leave many contributors to this side of the equation unacknowledged. Indeed the temptation is to say that, as compared with other disciplinary subsets, educational administration is in the van of curricular progress. In any rigorous comparison, however, the differential emphases of subsets would have to be taken into account. Nevertheless, what falls short generally, or at least what tends to receive cavalier treatment, is what might be called administrative philosophy, or the humanities in so far as they exceed or transcend conventional social science and social psychology. So-called human relations, group dynamics, personnel ‘management’ and the like are de rigueur. Even ‘leadership’ in a sort of redictio ad absurdum to anecdote or pencil-and-paper tests is often a required study. But what I have been talking about and reaching towards in this paper is conspicuously absent. By philosophy here I do not mean what goes on by and large in academic depart-
ments of philosophy but rather those aspects of practical wisdom, including logic and rhetoric, and focusing above all on the nature and problem of value, which are directly relevant to administration and leadership praxis. Such an administrative philosophy would also subsume every aspect of Realpolitik of bureauopathy, and of contemporary polemic. Begley has recently expressed in succinct and persuasive form the practitioner argument for axiology in leadership training and preparation. The case for the components of logic and rhetoric is equally cogent, while the case for the education of the will has, so far as I am aware, not even been thought of in any serious manner. Curricular change in these directions, while it cannot of itself bring about rebirth, or the rejuvenation of a flagging and failing will, could hypothetically provide a preparatory educational context that would be supportive of recovery, simply because its manifest function is to enhance and deepen understanding. The ability to understand and penetrate issues, to reveal fallacies and to lay bare faulty reasoning and indefensible sentiment is a prerequisite to the health of the will to power.

Yet in the end we are inexorably returned to V, the value-phenomenology of the individual, and to the character of the leader. This is the elusive central vital element in the entire complex of mysteries conjured up by the terminology of will, power, value, consciousness and leadership.

The education of the will

The will to power is an abstraction. Nietzsche himself refused to advance positive characterizations of the will to power. It was simply that which ‘resides at the most basic level of intelligibility’, in other words, the primal motivation. It becomes reality as it is embodied and manifested in the individual. Moreover it must be understood that, at the individual level, will (intention) is a faculty distinct from either thinking (cognition) or feeling (affect). What commonly passes for will is not that at all but simply an unconscious resultant of competing affective preferences or vectors (impulses) in which the strongest wins out and is thereafter rationalized (if it is thought about at the conscious level) as an ‘act of will’. Actually it is the act of an automaton. ‘Thus I chose’ could be translated ‘Thus it chose for me’. Let us discriminate then between apparent will and real will, between mechanical will and free will. The question before us then becomes: is it possible to acquire the free will, to become free? To put it another way, can one achieve self-mastery?

The general answer to this question is yes. But the education or training necessary to achieve this affirmative is unlikely to be found in the schools of leadership, management and administration in the West. The military disciplines of leadership training practised in officer schools of both West and East, while they clearly confront part of the problem through ego-submission techniques and anti-akrasia do not thereby educe freedom of the will. On the contrary, it could be argued that such education is moral programming or
conditioning rather than any inducement to Socratic examination of self or questioning of authority. With reservations, much the same might be said of elite schools of administrative preparation generally. Indeed, short of adopting Oriental, monastic or Zen principles of character development and training, all that can be reasonably said or done is to hypothesize the psychological sequence implicit in these more esoteric methods of training and offer them up for reflection and consideration.

The essential central and primary element in all such methods would appear to be introspection. In our society, the administrative leader, man or woman, is engaged continually in action, in affairs, in gossip, in the hurly-burly and the rough and tumble of politics, calendars, schedules, meetings, conferences and human contacts which, if not always abrasive, are always demanding of energy. In consequence, the psyche is drained. Any spare time is occasion for guilt that there is spare time. Such time is not generally conceived as retreat, as space for solitary reflection, or for the inward look of contemplation. (Vampires don’t like looking in mirrors either!) Such time is more generally regarded as an opportunity for well-earned egoistic self-indulgence (and possibly more wear and tear). Now from the standpoint of the emergence of true will I would like to plead that, whether action and contemplation are conceived of as being at opposite ends of a psychic continuum, or whether they are just plain dichotomous, either without the other is insufficient. I would go further and assert that the one without the other is a vanity and a futility.

Let us return to the hypothetical psychological sequence implicit in will development. Such an hypothesis would be verifiable not in the empirical scientific mode but in the sense of individual experience or personal experimentation. Reflection or introspection or self-observation is then assumed to lead to an inner understanding which is accompanied by increased awareness or consciousness of one’s being and of one’s actions. This sensibility is then directly transferable to others because it increases the capacity for Mitfühlung, for empathy and insight into the motivations of one’s fellows. One becomes a Menschenkenner; one senses or knows what makes people ‘tick’, and this knowledge is power. But power also comes from another direction, from the hypothesis that consciousness and will are correlative. The increase of the former creates at least the potential for a corresponding increase of the latter.

None of this is novel. It takes us back a very long way, to pre-Socratic times when the Delphic oracle answered seekers after power with the maxim, ‘know thyself’. This may be called the ultimate leadership imperative. It is quite safe because in truth we actually know so little of ourselves—we do not see ourselves as others see us, for example—and indeed we tend to avoid or shy away from such knowledge even if we firmly believe in the maxim that knowledge is power. The education of the will is then inseparable from the revelation of the self. The approaches to this have been alluded to above but, in the West at least, it appears to be something of a lost art.

At a minimal level any new curriculum with the radical objective of the
independence of the will would have to aim at self-discipline and self-mastery in the domain of emotion, particularly negative emotion. The assumption is that one can control one’s emotions, one can be detached, indifferent. In the vernacular, one can keep one’s cool, or as Kipling puts it so perfectly, keep one’s head while all about are losing theirs.43

Of course there is a great caveat here. In all of this there must be authenticity or else it is mere dramaturgy, and dangerous contemptible dramaturgy at that. Sartre, who had an exaggerated and in my view fallacious notion of the degrees of freedom in human will, nevertheless followed his existential logic through from a false premiss to a true conclusion.

Sartre emphasized that man must never disclaim the responsibility for his actions. Nor can we avoid the responsibility of making our own choices on the grounds that we ‘must’ go to work or we ‘must’ live up to certain middle-class expectations regarding how we should live. Those who slip into the anonymous masses will never be other than members of the impersonal flock, having fled from themselves into self-deception. On the other hand our freedom obliges us to make something of ourselves, to live ‘authentically’ or ‘truly’.44

To live authentically and truly would be to have acquired sufficient strength of will to be ‘unimpressed’ (literally so) by all value levels above V1. Such a degree of freedom does not mean that those levels would be disparaged but that the leader would use the levels V2–V5 to the end of the common or organizational good without being used by them. That is, the leadership agenda would be neither unconscious nor reactive. It would be a function of a value system which is itself a reciprocal function of will and consciousness. It would imply at least the embodiment of some Type I values in the leadership.45 Does this prospect distress the more managerial amongst us? Tant mieux! Such leadership may also be, is likely to be, politically incorrect. Again tant mieux! This follows because it is the manifestation of an authentic Socratic individualism; this kind of leadership would always be a challenge to social norms and hence it is not without risk. Ideally one could imagine a full comprehension and sensibility of the entire V2–V5 range, yet with an independent V1 interpretation which, while often held in restraint to subserve the consensus, nevertheless at its greatest moments becomes in truth a triumph of the will.

This is clearly what we do not have today and so the question is, can such an authentic integrity of will and praxis be taught? It probably cannot, save by osmosis and, perhaps, mimesis; by the coming into contact and communion with an exemplar. The education of the will may of course happen by chance; by some happy accident or through association with a mentor or patron or peer, or by some inherent personal quality of natural charisma that achieves this consummation autonomously. Such patterns are not only informal but they are improperly understood and far from being transparent in nature. They can as well have
outcomes contrary to the notion of freedom of the will: for example, in the crystallizing of a learner’s will in the image of the teacher or in the Christian and Islamic paradoxes of ‘In His service is perfect freedom’ and ‘Inshallah! (As God wants!)’ Once again it becomes important to remember the distinction between training and education. That these two pedagogical strategies can run at cross-purposes is always a hazard to any educative project of the will. If the will is free then it cannot be said to be trained, only to be educated. But are these strategies independent or symbiotic?

Even if these problematics remain intractable that does not mean that they are imponderable. Surely we can, and should, teach about them. Surely we could include them within the compass of our total research effort? Is not administration a specially important part of the general search for meaning? Axiology, value analysis, value auditing: all deserve a better place in the professional sun. The gods of passion also deserve to be restored to the administrative pantheon. Dionysus and Apollo are brothers after all.

What I have crudely sketched here is but a prolegomenon to potential years of labour in the academic vineyard. Such a tentative reconnaissance of the territory probably does not warrant any pointed conclusion. Nevertheless, in the spirit of the text one might essay a latter-day postmodern Nietzscheanism:

The Song of the Herd is
We shall overcome.
The Song of the Leader is
I have overcome . . .
Myself!

Dare one, could one, ought one then add the words ‘For them’?

Endlogic

The point of this exploration has already been made: to repeat the peculiar onus upon the leader to acquire self-knowledge and self-mastery. This is not an ethereal or impractical conclusion but rather an ultra-practical or even hyper-practical suggestion. That it is avoided as often as not is merely the mark of malaise, of the flight into reason rather than beyond it.

The more pedestrian practical inferences to be drawn can be summarized as follows:

1. There is never any shortage of leadership positions.
2. There is never any dearth of aspirants for those positions.
3. Therefore the problem is now, as it was in Plato’s time, curricular.
4. The administrative curriculum is lifelong.
5. The managerial side of this curriculum is currently adequate, the administrative or leadership side inadequate.
The inadequacies are axiological not epistemological.

6 Axiology is defined as:

The philosophical theory of value in general, embracing ethics or the philosophical theory of morality, but extending far beyond it to include aesthetic, technical, prudential, hedonic, and other forms of value. Any field of human discourse in which the general value-terms 'good' and 'ought' figure falls within the range of axiology, even that of scientific method with its principles about the degree of belief we ought to give to a hypothesis in the light of a given body of evidence.46

7 Hence, the emergent curriculum would include consideration of the problem of the will, the problem of the commons, Realpolitik, social critique and bureauopathology in all its forms.

8 At a minimum, the emergent curriculum would incorporate practical training in the arts of common-sense logic, rhetoric and polemic.

9 Administration proper is a high-risk, high-reward vocation.

Notes

Paper given at the Toronto Conference on Values and Educational Leadership, OISE Centre for the Study of Values and Leadership, University of Toronto, October 1996.

1 Christopher Hodgkinson, Towards a Philosophy of Administration (Oxford: Blackwell, 1982), prop. 6, p. 217.
4 Considering the administrative theorists’ concern with power, it is curious that Nietzsche is so rarely cited or referred to in the literature. A text in English exists—The Will to Power, tr. Walter Kaufmann and R.J. Hollingdale (New York: Vintage, 1968)—and it can be noted that this concept recurs throughout all the Nietzschean opus as a dominant leitmotif or threnody in his philosophy.
5 Nietzsche sees it as an ultimate driving force in the economy of life and nature going beyond merely human affairs: ‘Life itself is essentially appropriation, injury, overpowering of what is alien and weaker; suppression, hardness, imposition of one’s own forms, incorporation and, at its mildest, exploitation … Life simply is will to power.’ Beyond Good and Evil, tr. Walter Kaufmann (New York: Penguin, 1976), 211.

CONCLUSION: TOMORROW, AND TOMORROW, AND TOMORROW

A post-modern purview¹

Christopher Hodgkinson

Abstract

This chapter critically surveys the cultural and educational context of the period 1960–2020 and seeks to analyze the implications for educational leadership. Sources range from early contributions of Donald Willower to the latest prognostications of experts in Cambridge and the USA. Both general and special conclusions are drawn and a new test, the A3M3, is introduced as part of the presentation.

Tomorrow, and tomorrow, and tomorrow,
Creeps in this petty pace from day to day,
To the last syllable of recorded time;
And all our yesterdays have lighted fools
The way to dusty death
(Macbeth)

These words of Shakespeare seem to imply a deep despair or cynicism about the possibility of benevolent change in human affairs. They are surely the very antithesis of American optimism and progressivism. For organizations they bespeak drudgery, wage slavery, Dilbertian anomie, pathological compartmentalization, ennui. They deplore meaninglessness. But they refer not to some sort of Nietzschean eternal recurrence of the same but simply to the line of time each one of us inhabits, a line which never wavers and always runs from past through present to future.

As one ages (and there’s an absolute for you) one automatically has more past and less future. More behind, less in front. Less hope, more regret. And so the very natural tendency is to approach the future, as McLuhan once put it,
looking in the rearview mirror. I shall try to struggle against this tendency. To that end the bulk of this paper will deal with what is to come, with what might be and the lesser part with the past, with what might have been or seemed to be. But what of that past? It cannot be ignored.

**The way it might have been**

One of the aims of this chapter is to heighten our sensitivity about the cultural impress that is always determining, subliminally and subconsciously, our value orientations and judgments. We are always creatures of our times and the times themselves are a flood of events that are always somehow out of focus. In short my topic is what used to be called history but that word has fallen into contenttion and today is being displaced by exotica such as cultural anthropology, sociobiology, evolutionary psychology, and bio-genetics. Yet history or temporality conceived as the intellectual linkages between past, present, and future is the very province and substance of administration. Certainly it is the meat of leadership in that administration is the management of the future and its achievements become the legacy of the past. The conference for which this chapter was originally prepared hardly came about without past planning and a complex cascade of policy and managerial decisions, each of which was present in its own instance. Administration is also karma-in-action for the past comes back to haunt it. As an eminent management consultant recently put it, somewhat facetiously, ‘The leader knows the future and has agreed to share it with the company instead of using this awesome power to make a fortune gambling.’ But to comprehend or understand the future – the way things might be, it is logically necessary to understand the past – the way things were or, at least, seemed to be. As for the interim between these two things – the so-called present – let’s leave this for the moment; I’ll come back to it.

Shortly before my lamented and esteemed colleague Donald J. Willower sadly left us to join what he would call the Great Majority he gave me a now-treasured possession. This was an inscribed book he had edited, together with Jack Culbertson, back in 1964 (Willower & Culbertson, 1964). It is a chorus of voices from the past and serves to remind us, as Nietzsche put it, that ‘The living are only a species of the dead, and a rare species at that.’ Included in the contributors were such greats as Roald Campbell, Dan Griffiths, and Joseph Schwab. Also among them was a professor of medicine, George Miller. The book taken as a whole presents a vision of what educational leadership was seen to be and what the preparation of educational leaders might have been at the beginning of my survey period (c. 1960–c. 2020). These clearly were the days of a new dawn. A heady sense of the importance and virtue of our professoriate existed. The Midwest Administration Centre at the University of Chicago was the centre of the world. Nevertheless, the general tenor and gist, if not the explicit agenda of the work, was to establish the intellectual credibility and respectability of a new discipline, grounding itself if not in science and theory per se then certainly in
the social sciences and even in philosophy. Its place in the academy was formidably asserted. There was a distinct flavour of elitism and the development of the professorship in educational administration was favourably compared to its equivalent in medicine. Schwab, a ‘mathematical geneticist by training and a philosopher by choice’ (Willower & Culbertson, 1964, p. 48), felt it reasonable to commend to administrators ‘a sophisticated and cynical grasp of about a dozen separate and distinct bodies of theory’ (1964, p. vii). And even though the young Don Willower’s contribution was more down to earth, it too stressed the ideal and the philosophical components of our art. The field was to appeal to ‘the imaginative, inventive individual who wants to work in a profession which seeks to contribute to human progress and growth’ (1964, p. 150). He had already enunciated the theme he was to pursue throughout his career: a pragmatic reconciliation of theory and practice but with a marked stress on reflection and reflective methods concomitant with a commitment to educational ideals.

Dewey revividas. All in all it was an inspiring manifesto, both dignifying educational administration and projecting for it a future where, as once perhaps in the past, men of action were also men of contemplation, of wisdom, of passion and honour. Did all this what-might-have-been come about? You be the judge. Well, perhaps the timing was a little, out.

Recall the 1960s. Remember San Francisco where, then, one wore a flower in one’s hair. I was at Berkeley at the time. Momentarily it was the epicentre of a new revolution: the counter-culture. Wonderful as it all was in its beginnings things soon soured. In the end they even had to create concentration camps in California to hold some of the more exuberant dissidents. And the challenge to authority had slogans like ‘Burn, baby, burn’. Mao buttons were de rigueur, Minutemen and Black Panthers were lionized as were communes, long hair, and free casual sex. It was the time of Sharon Tate and the Manson gang. Vietnam. Drugs. Sex. Dionysus. (we’ll return to him later.)

In the end order was restored. But by then Thom Greenfield had fired the epistemological shot that was heard around the world of educational administration. The authority of science itself was now challenged. Reality was a social construct. Organizations were moral entities, or should be. Camps formed and camp followers lined up. In Canada Royal Commission followed Royal Commission, each more eager than the rest to overturn the traditional order. Change was equated with progress. Permissive lib-chic became the orthodoxy of the day. (It still is, only now crystallized into a non-permissive political correctitude. The University of Alberta extended its influence, via educational administration, to Australia while the newly formed Ontario Institute for Studies in Education became a world-class centre for our subject. This too still is. Heady times. Great debates: Greenfield-Griffiths, Greenfield-Hills, Greenfield-Willower. Back then only 6% of the population in Canada had a university degree. Now 90% of school superintendents have a master’s and 10% the doctorate.

VALUES AND RELIGION
The elusive present

Between past and future lies a mystery. The present. Now. ‘Now’ in logic is a very fuzzy term. Taken as the moment it doesn’t exist, in the same sort of way as it doesn’t make sense to talk of instantaneous velocity in the differential calculus. But the calculus works and our sense of time seems real enough. Yet subjective experience and inner attention are always a mixed-up blodge of the past (memory) and the future (hopes, fears, and expectations). Unless you want to go the Zen route and aspire to be like the samurai who can pick a mosquito out of the air with his chopsticks, ‘now’ would not be precisely meaningful. I fancy, however that most educators inhabit a permanent state of bell-ringing anticipation: blissful if it signifies the end of a class or a lecture, and the contrary otherwise.

Collectively the same holds true. ‘Today’s news wraps tomorrow’s fish’, ‘You can’t step into the same river twice’. Postmodernism, the label for our now, is a-historical and chimerical. Fuzzy logic writ large.

So ‘now’ does not mean right now. It means rather a blurry spread of contemporary events stretching back a bit and forwards a bit. In administration it may be fairer to say that it stretches back a lot and forward a lot for we stumble into the future hobbled by plans and commitments made in the past and our forward reach exceeds our grasp. As for the present as often as not there’s no ‘there’ there. For our purposes then it is sufficient to simply regard the now as the last decade or so together with the shadow it extends into the future. This historical sound-bite (sub specie aeternitatis) is increasingly recognized and classified as postmodern and postmodernism is something we must look at more closely. This NOW is, however, radically different from its predecessors. The following items are indicative of this difference: the pill (perhaps the most revolutionary technical advance since the wheel), the chip, the micro-chip, the PC, the global village, day-trading, cloning, genetic engineering, social engineering, E-commerce, E-everything, Mars orbiter, jumbo-jets, Concorde, neutron bombs, cell-phones, websites, quantum physics, astrophysics, astroturf . . .

All this and much more comprise the technological infrastructure of our present culture. All in the ‘now’. Technology has always been around but previous infra structural changes like the Industrial Revolution occurred over much larger sweeps of time. The present curve of change (and its learning curve) is, in comparison, exponential. All such changes affect the social superstructure or culture because they change context: the mise-en-scène. But there is a complication. Culture is dependent on science and technology but it is also autonomous. It’s not simply a matter of correlative dependency and interaction. The explanation for this is a logical difference between value and fact. Science speaks on facts but is silent on values. The humanities speak (or used to speak) on values but have to accept whatever facts are placed before them. The gulf between these two realms of discourse is radical. To try to get values from facts is to commit the naturalistic fallacy – a fallacy that has never been refuted. You can’t
get an ‘ought’ from an ‘is’. But you have to take the is’s into account. As Third Reich scientist Werner von Braun used to say, ‘I send the rockets up – Who cares where they come down?’ Worrying about where or when they should come down is not science, it’s administration.

For example, will the final mapping of the genome change human nature? No, but it will give us more power perhaps, and certainly it will add to the information overload that we have already. Great changes occur; the scientific sands are shifting underfoot. But the really interesting thing is that human nature changes very little. Crucifixion is out of fashion at the moment but a Roman soldier returning to earth today, after due wonderment at the technical changes about him and a sigh of despair at the state of the Colosseum, would soon feel at home. Genocides and holocausts, man-made events, are still around. On the other hand there has been no nuclear war (yet) and no world war since Hiroshima. (And no army used gas in World War II.) This emphasis on human nature is important because to be an educator is by definition to be a humanist, maybe even a classicist. Certainly there are two Greek gods we should get to know. Their names are Apollo and Dionysus. Apollo is blond and beautiful, impeccable, he is the god of the sun, of light, of reason. A worthy representative of science but also a bit of a fascist. Dionysus is dirty, dishevelled, wild, the god of orgies and sensuous destructive abandon; the god of all things irrational, against all order, for all chaos, all indulgence, a sort of über-hippie. These two gods represent a dialectic ever-present in human nature and human history. Very crudely put the post-Enlightenment period of modernism could be called Apollonian and the philosophical confusion that followed on Nietzsche’s lament of God’s death in the late Victorian era with its consequent cataclysm in 1914 – postmodernism in other words – can be called Dionysian.

This dialectic occurs at many levels in human nature. It is exemplified in our times as a psychological contest between reason and passion; desire for order and rebellion against restraint; the triumph of science and the naturalistic fallacy concomitant with the malaise of moral relativism and the malaise of totalitarian political correctness. You can apply this analysis to education for yourself and all of you have been exposed and are being exposed to the stress and tension which these two immortal archetypes, these two gods, create in our cultural fabric. Listen for a moment to Nietzsche commenting on the death of God:

... Are we not plunging continually? Backward, sideward, forward, in all directions? Is there any up or down left? Are we not straying as through an infinite nothing? Do we not feel the breath of empty space? Has it not become colder? Is not night continually closing in on us? ... God is dead. God remains dead. And we have killed him ...

Not too bad a description of the postmodern condition. But postmodernism is not merely relativistic about value it is also nihilistic about truth. Our Roman soldier could well ask Pontius Pilate’s famous question with even more justifica-
tion. What is truth? What is the truth about truth? (Anderson, 1995). That there is no truth. There are only Nietzschean ‘perspectives’ or ‘interpretations’; onlyLyotard’s ‘incredulity towards meta narratives’; only Derrida’s ‘il n’y a pas dehors-texte’—there’s only a text, and its only meaning is that provided by its reader.

This then is the structure of NOW. On the one hand hyper-rational bureaucratic legalistic complex organizations (school systems, multinationals, governments), on the other hand increasingly stressed individuals and small groups divested of, but searching for, meaning and value in an endless variety of ways from hedonistic materialistic consumerism to profound and authentic spiritual search and striving.

The Way it is becoming. What comes after postmodernism? Such a question invokes the great imponderable— the future— which, while it extends to infinity really only concerns us within the range of our immediate mortality. Soon we too will be part of the Great Majority. And, as always, there is a dialectic of opinion: the sun of Ecclesiastes under which there is nothing new and the river of Heraclitus into which one cannot step twice. Plus ça change, plus c’est la même chose . . . and yet the new forever being born. With this dialectical tension in mind let us look fleetingly at the short term ahead. To help us do this I have resorted to alma mater Cambridge. From those hallowed cloisters emerges a picture of post-postmodernity based on Cantabridgian expertise. This in very digested and kaleidoscopic form I now present for your consideration.5 But first a Persian thought, even a Caribbean one? . . .

Ah, fill the cup—what use is to repeat
How time is slipping underneath our feet
Unborn ‘Tomorrow’, and dead ‘Yesterday’,
Why fret about them if ‘Today’ be sweet!

Population

By 2050 two-thirds as much more protoplasm than we have today: 10 billion bodies. But food production efficiency outpaces population growth. Risks to the environment, however. ‘Better governance, better institutions, better markets, better schools’ will be necessary. But desire for progeny may decline.

Climate

Nothing really bad until at least 2050. Need to get rid of present type of cars, however. Scientific opinion is split. Hotter? Colder? We don’t know.

Water

Massive pipeline shifts, Canada to U.S. Also, dams don’t exist forever, they’re aging. Water will soon be metered like electricity. The poor already have a water crisis. A problem of equity rather than engineering.
VALUES AND RELIGION

Energy
Plenty of it but again the environmental problem. Correlated to living standards as one might expect. New cars needed. ‘Globality and 24-hour, hyperactive, inter-connected, e-mail fuelled, sleep-deprived’ new millennium is upon us.

Superpowers
Present condition an historical first (if one excludes Rome). Other powers on the rise, e.g., China and a revitalized Russia. And ethnicity a problem. Presently Pax Americana.

Trouble Spots

United Nations
Richest 20% have 86% of the world’s wealth. Poorest 20% have 1%. U.N. is aging now, too. Like the dams.

East and West
China’s tough line on population control has been a great contribution to humanity. Europe? Conflicting theories: Britain wants ‘community’, France ‘nations’, Germany a ‘state’. But all very exciting and Europe could become number one in 30–40 years time.

Money
Capitalism is ‘the permanent equilibrium state of human society. Everything else was a sideshow.’ ‘The motivation to compete, to own and acquire wealth is a fundamental fact of human existence, just like the need to eat or have sex.’ But the mixed economy form now well established and no more crises for at least 15 years.

Markets
Stock markets will be electronic and global. Big problem of regulation. Companies must grow or die. But double-entry bookkeeping will remain, as it has, since the 15th century.
CONCLUSION

Electronics

The symbol of the 1980s was the personal computer. The symbol of the 90s was the web. The next thing will be sensors. These will be low-cost, very high performance, and they’ll be everywhere, ‘from Macdonald’s fries to insulin delivery for diabetics’. We will soon have entire PCs on a chip. But information technology will be supplanted by biotechnology. The genome and all that.

Internet

This could be a liberating force in the Third World. Can also be cultural dumbing-down (Hollywood and porn). It’s an information toy but how long can interest be sustained?

Cars

Next big step the automated road: regulating vehicles in convoys. Sensors can make this a reality. ‘You would just pay a toll, couple your car into an electronic convoy and sit back to enjoy the ride’. Adelaide already has automated bus routes.

Aircraft

Flight has lost its glamour. Passengers are bored and uncomfortable. The aim will be speed. Airlines will either have to get you there faster or make flying more enjoyable. Fuel and turbulence set technological limits and problems.

Space

Lots of other planets but life on them may have been millions of years in the past or will be millions of years in the future, our time. So don’t bet on extraterrestrials.

Families

System breaking down in the West. Women can’t do it all: adopting a male agenda in life arguably only another form of submission. Smaller families and more childless families. Being a parent used to bring social status, it doesn’t now.

Ethnicity

Very complex. Very postmodern. ‘Identity’ will depend more on one’s set of values than where one comes from.
VALUES AND RELIGION

Crime
Up but more property crime than violent crime. Prison populations up.

Christianity

Islam
Growing West and East. Current modes (military and dynastic leadership) may shift towards democratic forms. Big problem remaining: fundamentalism.

English
World language for next half-century then shift to possibly Spanish. Chinese if they can solve the orthography problem. But English will fragment. Process well under way. English teachers jobs very secure. (Even in Quebec.)

Bodies
Twenty-five percent of the population will be over 60. But healthier. Cliché problem is to ‘add life to years’ rather than converse. Big educational implications.

Minds
Depression, dementia, stress, Alzheimer’s. Boomers already trembling. Four- and five-generational living families. Grandparents may be too busy minding great-grandparents to look after grandchildren.

Reproduction
Divergence between developed and developing regions. In the former sex for pleasure and conception for the laboratory. More test-tube babies, sperm and egg-banks. Chinese interventional experiments need watching.

Funding health
Seven percent of UK Gross Domestic Product presently goes to Health; 9% in Netherlands, 10% France and Germany. But outcomes very comparable. Probable shift from universal coverage to ‘top-up’ or ‘opt-out’ schemes; i.e., basics paid, user-pay for the rest. Even so higher taxes and rationing on the way. (Since
health and education compete for the public purse one can safely predict more stresses and strains in both systems.)

This is by no means all. It is only a sampling of the multiple facets of postmodern life as examined by the Cambridge experts cited but it is surely a peek at the shape of things to come. That shape, through a glass darkly, may disappoint – or it may excite – but futurology is perforce a very modest business since the future itself is a combination of the causal and the casual: of past determining forces which have yet to run their course and the totally unforeseen. So prophets had better be modest. Nevertheless what is glaringly conspicuous by its absence from the above forecasts, what is missing from all this arcana of tribal peoples, telecoms, film, even Judaism; what is totally lacking in this glimpse at the coming century is the category of *philosophy*. And this from the academic home of Russell, Moore, and Wittgenstein. This from the institution that gave an honorary degree to Derrida! Not a peep, not a peek. To the end of history must now be appended the demise of philosophy. But before leaping to this conclusion let us look at the view from our side of the water.

**The American view**

As part of the same millennial frenzy that inspired the Cambridge authors, a special issue of *Time* magazine was devoted to such questions as: Will we live on Mars?, travel in time? discover another universe? figure out the brain? get rid of cockroaches?, etc. Admittedly, the questions are scientific-technological, but they are carefully considered by the finest expertise in the respective fields, including many Nobelists. To make a short story even shorter the answers can be summarily summed as no time travel, no extra-terrestrial contact, no final ‘theory of everything’, no explanation of consciousness, no solution to the mind-body problem, no perpetual motion machinery, and no controlling the weather. Or cockroaches. And again *no philosophy* even though several commentators had inevitably to deal with issues such as mind, consciousness, and meaning. Granted the project was non-normative, rationalistic, and scientific-technological in the best tradition of the Enlightenment and the Age of Reason. And, come to think of it and if memory serves, *Time* has not devoted a special issue to philosophy for over thirty years. At which time it declared it dead, killed by the academicians. Even *Time* gets things right on occasion.

**General conclusion**

The values of the short-term future are implicit if not explicit. It is likely to be an unholy Apollonian-Dionysian mix of rationalistic legalistic bureaucratic scientific technological pragmatics and a reactive postmodern relativistic hedonistic narcissistic materialistic nihilism. For education this might imply a skew towards the digital, the mathematical, the marketable, and the meritocratic. That is to say, not the mindless but the meaningless. And all the consequent
Dionysian reactions of rage, resentment, ressentiment, and violence this might invoke. I hope these words are not prophetic and a product more of dimmer than of clearer sight. But I have long perceived with some empirical verification the cultural tendencies to valorexia and philosophobia: the twin diseases of loss of meaning and abhorrence of philosophy.

Of course we as educators must be concerned with literacy of all types, including the digital; of course we must attend to earning-learning of all the marketable kinds; but we must also restore our responsibility for general social decorum, even in postmodernity; we must hand down traditions and history even if they offend some multicultural persuasions; and we must have a concern with the larger purposes of being human. Failing this we are not educators but just another form of teaching machine: programmers, trainers, info-dispensers. Information may equate to knowledge but knowledge does not equate to understanding. None of this is to say we cannot joyfully embrace the future. *Amor fati* is always an option.\(^7\) That the questions which this admittedly disjointed and tumultuous sweep of time and events are always: what changes and what stays the same? Mark Twain’s remark is relevant, ‘History does not repeat itself. But it sure rhymes.’

Simply put what changes is context, what doesn’t change is human nature. But, as already mentioned, human nature just happens to be the essential raw material of education. More, it is also the essence of administration and leadership. (Think *character* instead of *characteristics.*) Moreover still, human nature and the human condition are the quintessential subject matter of real philosophy. John Dewey said, and our late colleague Don Willower endorsed this, that the whole of philosophy is the general theory of education. I would go further and assert that the whole of philosophy is also the general theory of administration.\(^8\) True, philosophy in the academic sense is largely remote from practical affairs but *administrative* philosophy is a discipline the whole aim of which is to inform practicality. And this sort of philosophy is the birthright of everyone. To make my point please take the following A3M3 test:

1. Do you really know how to tell right from wrong?
2. Do you really know how to tell good from bad?
3. Can you tell a sound argument from a fallacious one?
4. Do you know enough about human nature?
5. Do you know enough about the human condition?
6. Do you really know yourself?
7. Are your answers to the above questions adequate for your role as leader or aspirant to leadership?

**Special conclusion**

The test you have just been subjected to calls for some further words of comment. Contrary to what you might now modestly assume, it is possible to
score a perfect seven. At the very least it is possible to impute or ascribe such a score since the test may be extroverted and attributed onto unwitting targets. Thus, all the great charismatic leaders for good or evil might score a 7: Jesus Christ, Gandhi, the Lord Buddha on one side and Josef Stalin, Adolf Hitler, and Pol Pot on the other. I myself have known leaders who, for me at least, fit the 7 bill nicely: my mentor Sir Geoffrey Vickers for one and a certain university president for another – although both might well have been loath to acknowledge the ascription.

More importantly, the test implies an agenda for leadership preparation and research the component parts of which are already established and need only to be assembled. Essentially they suggest a shift in theory emphasis from epistemology to axiology; a short course in elementary logic and rhetoric; some exposure to the arts in the Greenfield tradition and due consideration of pathology (see Greenfield & Ribbins, 1993).

As for research the work already done in the leadership initiative of these conferences is one example. Credit must be given in this respect to the labours of Professor Begley. Analytical tools for value praxis already exist and the ethnological studies of Peter Ribbins in the United Kingdom (Ribbins & Sayer, 1998) and Peter Gronn in Australia (Gronn, 1999) provide examples of how insight can be gained into the administrative form of life. This curricular emphasis should supplement and complement rather than displace the current studies in social science.

In the A3M3 quiz the crucial question, which cannot be formulated so as to yield a precise answer, is of course number 6. Philosophers and non-philosophers alike may argue cogently and validly that it is unanswerable in any objective sense, short of mystical illumination or transcendental revelation. Nevertheless it is always possible to arrive at a tentative subjective judgment, and the question should always be held before us for if it is not asked then it is answered – in the negative. Not for nothing was the exhortation ‘Know thyself’ above the Temple of Apollo at Delphi in ancient Greece.

Finally, two lesser considerations: first, the test is subject to modification in that the rigid requirement for a dichotomous yes or no answer might be relaxed and, second, perhaps the test calls for a more innocuous and user-friendly title than the one temporarily assigned: Administrative Arrogance And Managerial Modesty Measure. I am sure that neither the A nor the M attributes exceed the limits of propriety in the present audience, and that the circle of what might have been can be closed into what yet still might be.

Notes

1 This chapter is revised and updated version of a paper originally presented at the Conference of the UCEA Centre for the Study of Values and Leadership, Bridgetown, Barbados. It has also been previously published as an article in a special issue (Vol. 4, No. 4, 297–307) of the International Journal of Leadership in Education (2001).
VALUES AND RELIGION

5 Direct quotations are indicated by quotation marks, otherwise paraphrase and commentary. The headings are those used in the source CAM No.28 Michaelmas 1999 and the authorities are respectively: ‘population’ (economist Sheilagh Ogilvie), ‘climate’ (Judge Institute’s Chris Hope), water (geographer Bill Adams), ‘energy’ (consultant Dan Yergin), ‘superpowers’ (Centre for International Studies’ James Mayall), ‘trouble spots’ (Guardian Editor Ian Black), ‘United Nations’ (former U.N. Under-Secretary Dame Margaret Anstee), ‘East and West’ (M.C. to King of Nepal Chiran Thapu), ‘money’ (Chief Economist of The Times Anatole Kaletsy), ‘markets’ (Judge Institute’s Richard Barker), ‘electronics’ (Silicon Valley Institute director Paul Saffo), ‘internet’ (Washington Post Editor David Ignatius), ‘cars’ (Professor of Engineering David Newland), ‘aircraft’ (Rank Professor of Engineering Shhn Ffowes Williams), ‘space’ (Royal Astronomical Society’s Jacqueline Mitten), ‘families’ (research psychologist Penelope Leach), ‘ethnicity’ (anthropologist, Sue Benson), ‘crime’ (Institute of Criminology’s Andrew von Hirsch), ‘Christianity’ (Bishop of Rochester Michael Nazir-Ali), ‘Islam’ (scholar and author Akbar Ahmed), ‘English’ (Director Research Centre for English and Applied Linguistics Gillian Brown), ‘bodies’ (Professor of Clinical Gerontology Kay-Tee Khaw), ‘minds’ (Director Research Centre on Aging Felicia Huppert), ‘reproduction’ (Head of Department of Biological Anthropology Nick Mascie-Taylor), and ‘funding health’ (Master of Sidney Sussex Sandra Dawson).
6 Time, April 2000
7 Nietzsche’s solution. But this depends on the degree of freedom and reality of the will. Which calls for another paper beyond this one.
9 Theoria, op.cit. note 4; and also Macmillan (2001).
10 From experience I can recommend Robert Thouless (1974). The elements of argument do not change with the fashions of the times and this was first published in 1930.
13 As for note 2.

CONCLUSION

Willower, D.J., & Culbertson, J. (1964) *The professorship in educational administration*. Pennsylvania State University: UCEA.
Managing moral purpose and change agentry is at the heart of productive educational change. It is necessary to take a closer look at each of them, and to make explicit their organic relationship.

**Moral purpose**

In their major study of teacher education, Goodlad and his colleagues found themselves being pushed deeper to the moral purposes of education in order to understand the basic rationale for teaching in post-modern society: ‘We came to see with increasing clarity the degree to which teaching in schools, public or private, carries with it moral imperatives—more in public schools, however, because they are not schools of choice in a system requiring compulsory schooling’ (Goodlad, 1990a, p. 47, my emphasis; see also Goodlad, Soder and Sirotnik, 1990). Goodlad singles out four moral imperatives:

**Facilitating critical enculturation**

The school is the only institution in our nation specifically charged with enculturating the young into a political democracy . . . Schools are major players in developing educated persons who acquire an understanding of truth, beauty, and justice against which to judge their own and society’s virtues and imperfections . . . This is a moral responsibility. (pp. 48–9)

**Providing access to knowledge**

The school is the only institution in our society specifically charged with providing to the young a disciplined encounter with all the subject
matters of the human conversation: the world as a physical and biological system; evaluative and belief systems; communication systems; the social, political, and economic systems that make up the global village; and the human species itself . . . (Teachers) must be diligent in ensuring that no attitudes, beliefs, or practices bar students from access to the necessary knowledge.

(Building an effective teacher-student connection)

The moral responsibility of educators takes on its most obvious significance where the lives of teachers and their students intersect . . . The epistemology of teaching must encompass a pedagogy that goes far beyond the mechanics of teaching. It must combine generalizable principles of teaching, subject-specific instruction, sensitivity to the pervasive human qualities and potentials always involved.

(PRACTICING GOOD STEWARDSHIP)

If schools are to become the responsive, renewing institutions that they must, the teachers in them must be purposefully engaged in the renewal process.

(Goodlad, 1990b, p. 25)

One of Goodlad’s colleagues, Sirotnik (1990, p. 298 ff) adds his list of moral requirements: commitment to inquiry, knowledge, competence, caring, freedom, well-being, and social justice. In his own words:

The implications of moral commitments to inquiry, knowledge, competence, caring, and social justice go farther than curriculum and classroom experiences. They go to the very heart of the moral ecology of the organization itself. This can be readily seen in the extent to which these commitments are reflected in the work environment of educators outside of classroom teaching per se. To what extent does the organizational culture encourage and support educators as inquirers into what they do and how they might do it better? To what extent do educators consume, critique, and produce knowledge? To what extent do they engage competently in discourse and action to improve the conditions, activities and outcomes, of schooling? To what extent do educators care about themselves and each other in the same way they care (or ought to care) about students? To what extent are educators empowered to participate authentically in pedagogical matters of fundamental
importance – what schools are for and how teaching and learning can be aligned with this vision.

(p. 312)

At a policy level, growing concerns about educational equity and economic performance mirror the more particular issues just described. The restructuring movement, in intent at least, places a renewed focus on the education of all students, ‘especially those who have been ineffectively served in the past’ and attempts to reorganize schools for that purpose (Murphy, 1991, p. 60). Poverty, especially among children and women, racism, drug abuse, and horrendous social and personal problems all make the equity and excellence agenda more serious and poignant day by day (Hodgkinson, 1991).

My main point, however, is not to consider these matters at the institutional level – at least not at this time. The building block is the moral purpose of the individual teacher. Scratch a good teacher and you will find a moral purpose. At the Faculty of Education, University of Toronto, we recently examined why student teachers wanted to enter the profession. We have a post-baccalaureate fifth year program which results in certification after one year. It represents a particularly select group because there is a great demand to enter teaching in Ontario. For 1992/93 there were some 7000 applicants for 1100 positions. We use as admission criteria a combination of two factors weighted equally – academic grades, and an applicant ‘profile’ designed to capture experience and reasons for entering teaching. Because of the emphasis on experience, the average age is 29. In a small study we drew a random sample of 20 per cent of those in the 1991/92 year (Stiegelbauer, 1992). We set out to derive from the written profiles, what student teachers said about ‘why they want to become teachers’. The most frequently mentioned theme was ‘I want to make a difference’ reflected in the following sample of quotes:

I hope my contribution to teaching, along with other good teachers’ contributions, will help result in a better society for our future. I care about children and the way that children are learning.

Education is an important factor which determines the quality of an individual life and the future of society as a whole.

No other profession enables one the opportunity to provide such a positive impact on a child’s overall development.

I want to effect positive change in students’ lives.

I’ve always thought that if I could go into a classroom and make a difference in one kid’s life . . . then that’s what I am here for.

I am not suggesting that the mere statement of purpose is a straightforward matter. We cannot automatically take these statements at face value (although
our day-to-day experience with student teachers provides ample corroboration of
this theme), and there are different motivations for entering teaching among any
cohort: But I am saying that we have a kernel of truth here. Many, many
teachers enter the profession because they want to make a contribution – they
want to make a difference!

What happens here-on-in – in teacher preparation, induction, and throughout
the career – is a different story. Those with a non-existent or limited sense of
moral purpose are never called upon to demonstrate their commitment. Those
with moral potential, however inchoate, are never developed. Those with a
clearer sense of purpose are thwarted.

Hargreaves and Tucker (1991) address the latter issues in their treatment of
teaching and guilt. They quote Davies (1989, p. 49) ‘at the centre of the feeling
of guilt is self disappointment, a sense of having done badly, fallen short, of
having betrayed a personal ideal, standard or commitment’. Hargreaves and
Tucker (1991) also suggest that aspects of moral purpose like caring may be too
narrowly conceived. They argue that there is more to it than personal caring and
interpersonal sharing: ‘Care . . . carries with it social and moral responsibilities
as well as interpersonal ones’ (p. 12).

The argument is somewhat subtle, so let me make it more directly. If con-
cerns for making a difference remain at the one-to-one and classroom level, it
cannot be done. An additional component is required. Making a difference, must
be explicitly recast in broader social and moral terms. It must be seen that one
cannot make a difference at the interpersonal level unless the problem and solu-
tion are enlarged to encompass the conditions that surround teaching (such as
the collaborative school, chapter 4), and the skills and actions that would be
needed to make a difference. Without this additional and broader dimension the
best of teachers will end up as moral martyrs. In brief, care must be linked to a
broader social, public purpose, and the latter if it is to go anywhere must be pro-
pelled by the skills of change agentry.

We now come to the integrative theme of the chapter: teachers are agents of
educational change and societal improvement. This is not as highfalutin as it
sounds. I have already argued that they are part way there on a small scale with their
aspirations for making a difference. And they are there ecologically with expecta-
tions of reform constantly swirling around them. In addition to making moral
purpose more explicit (thereby clearly declaring what business we are in) educators
also need the tools to engage in change productively. Care and competence, equity
and excellence, social and economic development are natural allies in this quest.

Change agentry

I will have more to say about change agentry later. Here I want to outline some
of its elements at the individual level. How to produce more of it, and under
what conditions it can be further developed and sustained are the subjects of the
remaining chapters.
I define change agentry as being self-conscious about the nature of change and the change process. Those skilled in change are appreciative of its semi-unpredictable and volatile character, and they are explicitly concerned with the pursuit of ideas and competencies for coping with and influencing more and more aspects of the process toward some desired set of ends. They are open, moreover, to discovering new ends as the journey unfolds. In chapter 3, the complexities of the change process and some of the insights and lessons arising from the new mindset will be explored in detail. At this stage the question is, what conceptions and skills should the teacher of moral purpose possess in order to become a more effective change agent.

I see four core capacities required as a generative foundation for building greater change capacity: personal vision-building, inquiry, mastery, and collaboration. Each of these has its institutional counterpart: shared vision-building, organizational structures, norms and practices of inquiry; focus on organizational development and know-how, and collaborative work cultures (chapter 4). For reasons that should be increasingly clear throughout this book we need a dual approach working simultaneously on individual and institutional development. One cannot wait for the other. And if they are not working in concert, in particular settings, it is necessary to work on them separately looking for opportunities to make them connect.

The individual educator is a critical starting point because the leverage for change can be greater through the efforts of individuals, and each educator has some control (more than is exercised) over what he or she does, because it is one’s own motives and skills that are at question. Moreover, working individually on the four capacities about to be described makes it inevitable that there will be plenty of intersection of effort. I am not talking about leaders as change agents (more of that later) but of a more basic message: each and every educator must strive to be an effective change agent.

I start with personal vision-building because it connects so well with moral purpose contending with the forces of change. Shared vision is important in the long run, but for it to be effective you have to have something to share. It is not a good idea to borrow someone else’s vision. Working on vision means examining and reexamining, and making explicit to ourselves why we came into teaching. Asking ‘What difference am I trying to make personally?’ is a good place to start. For most of us it will not be trying to create something out of nothing. The reasons are there, but possibly buried under other demands or through years of disuse, or for the beginning teacher still underdeveloped. It is time to make them front and centre. We should not think of vision as something only for leaders. It is not a farfetched concept. It arises by pushing ourselves to articulate what is important to us as educators. Block (1987) emphasizes that ‘creating a vision forces us to take a stand for a preferred future’ (p. 102); it signifies our disappointment with what exists now. To articulate our vision of the future ‘is to come out of the closet with our doubts about the organization and the way it operates’ (p. 105). Indeed, it forces us to come out of the closet with doubts about ourselves and what we are doing.
Says Block writing more generally about organizations: ‘We all have strong values about doing work that has meaning, being of real service to our customers, treating other people well, and maintaining some integrity in the way we work’ (p. 123). Teachers, as I have indicated, are in one of the most ‘natural’ occupations for working on purpose and vision, because underneath that is what teaching is all about.

Several points in conclusion. First, I cannot stress enough that personal purpose and vision are the starting agenda. It comes from within, it gives meaning to work, and it exists independent of the particular organization or group we happen to be in.

Second, personal vision in teaching is too often implicit and dormant. It is often expressed negatively (what people want to get rid of, or not see happen) or narrowly in terms of means (more time, smaller classes). We need also to have positive images as driving forces. Teachers do not have to wallow in hubris in realizing that they are in a strategic position. Teachers should be pursuing moral purpose with greater and greater skill, conceptualizing their roles on a higher plane than they currently do.

Third, once it gets going, personal purpose is not as private as it sounds. Especially in moral occupations like teaching, the more one takes the risk to express personal purpose, the more kindred spirits one will find. A great deal of overlap will be experienced. Good ideas converge under conditions of communication, and collaboration. Individuals will find that they can convert their own desires into social agendas with others. Remember, personal purpose is not just self-centered, it has social dimensions as well such as working effectively with others, developing better citizens, and the like.

Fourth, personal purpose in teaching should be pushed and pushed until it makes a connection to social betterment in society. This is what it is at the one-to-one teacher-student level anyway. It has greater scope and meaning, and calls for wider action if we realize that societal improvement is really what education is about.

Fifth, and an extension of the previous point, is the realization that personal purpose in teaching is a change theme. Gardner (1964, p. 72) quotes Petrarch:

By citizens, of course, I mean those who love the existing order; for those who daily desire change are rebels and traitors, and against such a stern justice may take its course.

Today, the teacher who works for or allows the status quo is the traitor. Purposeful change is the new norm in teaching. It has been bouncing around within teaching for the past thirty years. It is time we realized that teachers above all are moral change agents in society – a role that must be pursued explicitly and aggressively.

Finally, and paradoxically, personal purpose is the route to organizational change. When personal purpose is diminished we see in its place groupthink and
a continual stream of fragmented surface, ephemeral innovations. We see in a phrase, the uncritical acceptance of innovation, the more things change, the more they remain the same. When personal purpose is present in numbers it provides the power for deeper change:

Cultures get changed in a thousand small ways, not by dramatic announcements from the boardroom. If we wait until top management gives leadership to the change we want to see, we miss the point. For us to have any hope that our own preferred future will come to pass, we provide the leadership.

(Block, 1987, pp. 97–8).

All four capacities of change agentry are intimately interrelated and mutually reinforcing. The second one – inquiry – is to say that the formation and enactment of personal purpose is not a static matter. It is a perennial quest. One of the new paradigm writers, Richard Pascale (1990) captures this precisely: ‘The essential activity for keeping our paradigm current is persistent questioning. I will use the term inquiry. Inquiry is the engine of vitality and self-renewal’ (p. 14). Stacey (1992) puts it this way: ‘A successful, innovative organization must have groups of people who can perform complex learning spontaneously. Because in open-ended situations no one can know what the group is trying to learn, the learning process must start without a clear statement of what is to be learned or how’ (p. 112).

Inquiry is necessary at the outset for forming personal purpose. While the latter comes from within, it must be fueled by information, ideas, dilemmas and other contentions in our environment. The beginner, by definition, is not experienced enough with the variety and needs of students, and with the operational goals and dilemmas of improvement to have clear ideas of purpose. Habits of ‘questioning, experimentation, and variety’ are essential (ibid). Reflective practice, personal journals, action research, working in innovative mentoring and peer settings are some of the strategies currently available (see Fullan and Hargreaves, 1991). Inquiry means internalizing norms, habits and techniques for continuous learning.

Learning is critical for the beginning teacher because of its formative timing. But we are talking about more than this – lifelong inquiry is the generative characteristic needed because post-modern environments themselves are constantly changing. We are probably never exactly right in the first place, but in any case we need the checks and balances of inquiry because in changing times our initial mental maps ‘cease to fit the territory’ (Pascale, 1990, p. 13). Thus, we need mechanisms to question and update our mental maps on a continuous basis. For Pascale, the question is the answer: ‘Our quest isn’t just a New Management Paradigm of the Nineties but a way of thinking that is continually open to the next paradigm and the next and the next . . . ’ (p. 265). What could be closer to change agentry?
The relationship between the first two capacities – personal vision and inquiry – involves the ability to simultaneously express and extend what you value. The genesis of change arises from this dynamic tension.

The capacity of mastery is another crucial ingredient. People must behave their way into new ideas and skills, not just think their way into them. Mastery and competence are obviously necessary for effectiveness, but they are also means (not just outcomes) for achieving deeper understanding. New mindsets arise from new mastery as much as the other way around. Mastery then is very much interrelated with vision and inquiry as is evident in this passage from Senge (1990):

Personal mastery goes beyond competence and skills, though it is grounded in competence and skills . . . It means approaching one’s life as a creative work, living life from a creative as opposed to a reactive viewpoint . . .

When personal mastery becomes a discipline – an activity we integrate into our lives – it embodies two underlying movements. The first is continually clarifying what is important to us (purpose and vision). We often spend too much time coping with problems along our path that we forget why we are on that path in the first place. The result is that we only have a dim, or even inaccurate, view of what’s really important to us.

The second is continually learning how to see current reality more clearly . . . The juxtaposition of vision (what we want) and a clear picture of current reality (where we are relative to what we want) generates what we call ‘creative tension’. ‘Learning’ in this context does not mean acquiring more information, but expanding the ability to produce results we truly want in life. It is lifelong generative learning.

(p. 142)

It has long been known that skill and know-how are central to successful change, so it is surprising how little attention we pay to it beyond one-shot workshops and disconnected training. Mastery involves strong initial teacher education, and continuous staff development throughout the career, but it is more than this when we place it in the perspective of comprehensive change agentry. It is a learning habit that permeates everything we do. It is not enough to be exposed to new ideas. We have to know where new ideas fit, and we have to become skilled in them, not just like them.

Block (1987) says that the goal is:

(to learn) as much as you can about the activity you are engaged in. There’s pride and satisfaction in understanding your function better than anyone else and better than you thought possible.

(p. 86)
We also know that inquiry, learning, and mastery are intrinsically anxiety producing: ‘Almost every important learning experience we have ever had has been stressful. Those issues that create stress for us give us clues about the uncooked seeds within us that need attention’ (ibid, p. 191). This means that the capacity to suspend belief, take risks, and experience the unknown are essential to learning. We can be more selective in what we try (as distinct from accepting all change) but in exploring selected new ideas we must be patient enough to learn more about them and to look for longer term consequences before drawing conclusions.

Rosenholtz (1989) found that teachers in schools characterized by these ‘learning enriched’ habits, not only learned more and became better at what they did, but they became more confident. The more accustomed one becomes at dealing with the unknown, the more one understands that creative breakthroughs are always preceded by periods of cloudy thinking, confusion, exploration, trial and stress; followed by periods of excitement, and growing confidence as one pursues purposeful change, or copes with unwanted change.

Back to Senge (1990):

People with a high level of personal mastery live in a continual learning mode . . . personal mastery is not something you possess. It is a process. It is a lifelong discipline. People with a high level of personal mastery are acutely aware of their ignorance, their incompetence, their growth areas. And they are deeply self-confident. Paradoxical? Only for those who do not see that ‘the journey is the reward’.

(p. 142)

In order to be effective at change, mastery is essential, both in relation to specific innovations and as a personal habit. New competencies and know-how are requirements for better understanding and judging the new and are the route to greater effectiveness.

Collaboration is the fourth capacity. Aside from the power of collaboration which we take up in later chapters collaboration is essential for personal learning (Fullan and Hargreaves, 1991). There is a ceiling effect to how much we can learn if we keep to ourselves. The ability to collaborate – on both a small and large scale – is becoming one of the core requisites of postmodern society. Personal strength, as long as it is open minded (i.e., inquiry oriented) goes hand-in-hand with effective collaboration – in fact, without personal strength collaboration will be more form than content. Personal mastery and group mastery feed on each other in learning organizations. People need one another to learn and to accomplish things.

Small-scale collaboration involves the attitude and capacity to form productive mentoring and peer relationships, team building and the like. On a larger scale, it consists of the ability to work in organizations that form cross-institu-
tional partnerships such as school district, university and school-community and business agency alliances, as well as global relationships with individuals and organizations from other cultures.

In short, without collaborative skills and relationships it is not possible to learn and to continue to learn as much as you need in order to be an agent for societal improvement.

In summary, skills in change agentry are needed, because the processes of improvement are dynamically complex, and as we shall see, these processes are to a certain extent unknowable in advance. Chaos in a scientific sense is not disorder, but a process in which contradictions and complexities play themselves out coalescing into clusters (see Gleick, 1987, Stacey, 1992, Wheatley, 1992). Scientists talk about ‘strange attractors’ as forces that pull chaotic states into periodic patterns. Moral purpose is one of the change processes’ strange attractors because the pursuit and pull of meaning can help organize complex phenomena as they unfold. Strange attractors do not guide the process (because it is not guidable), they capitalize on it. Without moral purpose, aimlessness and fragmentation prevail. Without change agentry, moral purpose stagnates. The two are dynamically interrelated, not only because they need each other, but because they quite literally define (and redefine) each other as they interact.

I have argued that moral purpose and change agentry, far from being strange bedfellows, should be married. They keep each other honest. They feed on, and fulfill one another. Moreover, together they are generative in that they have an in-built capacity to self-correct and to continually refigure what should be done. Not only are they effective at getting things done, but they are good at getting the right things done.

I have also claimed that moral purpose and change agentry separately, but especially in combination, are as yet society’s great untapped resources for improvement. We need to make them explicit, and make them part and parcel of personal and collective agendas. We need to go public with a new rationale for why teaching and teacher development is so fundamental to the future of society. We need to begin to practice on a wide scale what is implicit in the moral purpose of teaching. To do so we need the capacities of change agentry. And we need to know a lot more about the complexities of the change process.

VALUES AND RELIGION

In common parlance we speak of organizations as if they were real. Neither scholar nor layman finds difficulty with talk in which organizations “serve functions”, “adapt to their environment”, “clarify their goals” or “act to implement policy”. What it is that serves, adapts, clarifies or acts seldom comes into question. Underlying widely accepted notions about organizations, therefore, stands the apparent assumption that organizations are not only real but also distinct from the actions, feelings and purposes of people. This mode of thought provides the platform for a long-standing debate about organizations and people. Is it organizations which oppress and harass people or is it fallible people who fail to carry out the well-intentioned aims of organizations? The debate continues on issues such as whether it is better to abolish organizations, to reshape them along more humane lines, or to train people to recognize the goals of organizations more clearly and to serve them more faithfully.

In contrast, this paper rejects the dualism which conveniently separates people and organizations; instead it argues that a mistaken belief in the reality of organizations has diverted our attention from human action and intention as the stuff from which organizations are made. As a result, theory and research have frequently set out on a false path in trying to understand organizations and have given us a misplaced confidence in our ability to deal with their problems. If we see organizations and individuals as inextricably intertwined, it may not be so easy to alter organizations, or to lead them, or to administer them without touching something unexpectedly human. More importantly, the view that people and organizations are inseparable requires us to reassess the commonly accepted claim that there exists a body of theory and principle which provides the touchstone for effective administrative action in organizations. The belief in the reality and independence of organizations permits us to separate the study of organizations from the study of people and their particular values, habits and
beliefs. The common view in organization studies holds that people occupy organizations in somewhat the same way as they inhabit houses. The tenants may change but, apart from wear and tear, the basic structure remains and in some way shapes the behaviour of people within. Studies have therefore focused largely on the variety of organizational structures and their effects upon people. These structures are usually seen as invariant over time and place, as universal forms into which individuals may move from time to time, bringing with them idiosyncrasies which colour their performance of the roles prescribed by the organization (Getzels, 1958, p. 156).

Organizational science and the profession of administration

The science of organization has found its way into studies of schools and influenced the training of those who are to administer schools. In this science, schools are a variety of the species organization which can be distinguished chiefly by the nature of their goals and their bureaucratic structure (Bidwell, 1965, pp. 973–4). The science of organization is, therefore, assumed to provide useful knowledge about schools even as it does about other kinds of organizations. Accepting this position, Griffiths (1964, p. 3) rejects “the opinion that educational administration is a unique activity, differing greatly from business, military, hospital and other varieties of administration” and endorses (p. 118) a “general theory which enables the researcher to describe, explain, and predict a wide range of human behavior within organizations”.

In a profession of administration based upon organizational science, the task of the administrator is to bring people and organizations together in a fruitful and satisfying union. In so doing, the work of the administrator carries the justification of the larger social order (Getzels, 1958, p. 156), since he works to link day-to-day activity in organizations to that social order. In schools, the administrator may be director or superintendent, principal or headmaster, department head or supervisor. Whatever their titles, their tasks are always the same. They bring people and resources together so that the goals of the organization and presumably of an encompassing social order may be met (Gregg 1957, pp. 269–70). No matter what circumstances he finds himself in, the administrator mediates between the organization and the people within it. The task is difficult; he needs help with it. As the argument runs, such help is fortunately to be found in the emerging science of organizations. Since organizations do have a human component, knowledge about organizations is usually described as a social science. But social or not, this science like all others is seen as universal, timeless, and imperfect only in its incompleteness.

The claims for a science of organization and for a profession of administration based upon that science have in recent times made a marked impact upon education. For over two decades now, scholars have attempted to improve education by applying organization theory to the conduct of affairs in schools and
by training educational administrators in that science (Culbertson and Shibles, 1973). Celebrating its emancipation from the press of immediate practical affairs (Griffiths, 1964), the field turned instead to discovery of the basic relationships and principles which underlie day-to-day concerns. The professor supplanted the practitioner as the source of valid knowledge about administration. If practitioners did not know or accept that they were no longer masters of the basic knowledge which underlay their craft, it did not matter. Even the scholar-practitioner, Chester Barnard, in introducing Simon’s classic writings claimed that it was the scholar’s knowledge of the “abstract principles of structure” rather than the practitioner’s knowledge of “concrete behavior” which leads to an understanding of “organizations of great variety” (Simon, 1957, pp. xlii–xlv). Things are not what they seem, in educational administration as in other realms of reality. We need the scientist and his theory to interpret them to us. His knowledge, though it may be incomplete and is certainly subject to improvement, has the virtue of universal applicability. Acting on this conviction, scholars in educational administration have sought to understand how organizations really work and to use this knowledge towards the improvement of educational practice.

A survey of representative writing in educational administration (see Campbell and Gregg, 1957; Halpin, 1958; Griffiths, 1964; Getzels, Lipham and Campbell, 1968; Milstein and Belasco, 1973) reveals that inquiry in this field has leaned heavily on the belief that a general science of organizations has provided the needed theoretical underpinnings for understanding schools and for the training of the administrators who are to run them. While a general theory of organizations provided the rationale for understanding schools, the sister social sciences provided the research tools and the “sensitizing concepts” needed to identify and resolve their administrative problems (Downey and Enns, 1963; Tope et al., 1965). Since this happy combination of theory and method yields an understanding of organizations as they really are, it then becomes possible to say how educational administrators may be trained to improve organizations and administrative practice within them (Culbertson et al., 1973). Although the claim is seldom if ever made explicitly, this line of reasoning, linking a general theory of organizations to the training of administrators, implies that we have at hand both the theory and method which permit us to improve schools and the quality of whatever it is that goes on within them. That change in schools proceeds without assistance from an applied organization theory, or indeed, in contravention to it (Fullan, 1972), usually fails to shake our faith in such theory.

It will surely come as no surprise to anyone who examines the references cited to this point that most of them are American in origin, since it was in the United States that the movement to conceive educational administration as a social science arose in the late 1940s. A decade later the movement had taken hold in Canada and some time later in Australia and Britain. As the concept of educational administration as a profession and social science gains ever wider recognition and acceptance, it becomes appropriate to examine the theory and
assumptions which underlie the field. In particular we need to ask whether the theory and assumptions still appear to hold in the settings where they were developed before they were recommended and applied to totally new settings. Such an examination is not only appropriate but essential in the face of an alternative view which sees organizations not as structures subject to universal laws but as cultural artefacts dependent upon the scientific meaning and intention of people within them. This alternative view, which stems from nineteenth-century German idealism (Deutscher, 1973, p. 326), bears the awkward name phenomenology (Phillipson, 1972), though it might with equal justification be called the method of understanding, as it is in the work of Max Weber (Eldridge, 1971, p. 28). What we call the view is not important. What matters is that there exists a body of theory and assumption which runs squarely at odds with that which has provided the ideological underpinnings of educational administration as it has developed over the past two decades. The ideological conflict between these views rests on two fundamentally different ways of looking at the world. One is the established view both in the study of organizations generally and in the study of educational administration. In this paper, I will outline the alternative view and recommend its application both in organization and administrative theory.

It is surely no accident that the alternative view has its roots in European philosophy and social science. And it is at least noteworthy that this view has a current flowering in Britain, where it is exerting a strong influence in both sociology (Filmer et al., 1972; Dawe, 1970; Brittan, 1973) and in education (Young, 1971; Cosin et al., 1971). I do not wish to drive the differences in the views to the point of a spurious contrast between American and European social science. The alternative view which I will outline has its supporters in the United States too (Garfinkel, 1967; Cicourel, 1964; Louch, 1966; Wilson, 1970). Two points should be made here. First, and of lesser importance, phenomenology has yet to influence the study of organizations in the United States despite the existence of a long-standing phenomenological tradition in some sociological schools of thought in that country. In Britain, both theory and research on organizations reflect the phenomenological perspective (Tipton, 1973; Silverman, 1970). Second, and more important since it relates to the heart of the issue, the existence of the two competing ideologies illustrates the fundamental contention of phenomenology that there are no fixed ways for construing the social world around us. These ways are products of particular settings and circumstances rather than expressions of universal ideals and values. Our concepts of organizations must therefore rest upon the views of people in particular times and places, and any effort to understand them in terms of a single set of ideas, values and laws must be doomed to failure.

The alternative view rejects the assumption, underlying much of organization theory, that organizations belong to a single species which behaves in predictable ways according to common laws. This view finds forceful expression in the work of Mayntz (1964), a European scholar of organizations:
Propositions which hold for such diverse phenomena as an army, a trade union, and a university ... must necessarily be either trivial or so abstract as to tell hardly anything of interest about concrete reality ... After all, the distinct character of an organization is certainly determined, among other things, by the nature, interests, and values of those who are instrumental in maintaining it.

If people are inherently part of organizations, if organizations themselves are expressions of how people believe they should relate to each other, we then have good grounds to question an organization theory which assumes the universality of organizational forms and effects. This argument suggests that organizations theorists have been so busy defining the forest that they have failed to notice differences among the trees—and worse, have ignored objects in the forest that are not trees at all. It suggests, too, that an academic industry which trains administrators by disclosing to them the social-scientific secrets of how organizations work or how policy should be made indulges at best in a premature hope and at worst in a delusion.

Two views of social reality

The conflicting views on organizations of which I have been speaking represent vastly different ways of looking at social reality and rest on sharply contrasting processes for interpreting it. These contrasts are summarized in Table 1 in which I have compared the two views and suggested how they differ with respect to a number of critical issues. Each of these issues has implications for the theory of organizations and for research undertaken in line with such theory. Necessarily then, these contrasts also have implications for a number of practical questions in the conduct of affairs in organizations. Some of these will be explored in the concluding section of this paper. Although there are no generally accepted names for identifying the two views contrasted in Table 1, it may suffice to note that the crux of the issue is whether social reality is based upon naturally existing systems or upon human invention of social forms. Social reality is usually construed as a natural and necessary order which, as it unfolds, permits human society to exist and people within it to meet their basic needs. Alternatively, social reality may be construed as images in the mind of man having no necessary or inevitable forms except as man creates them and endows them with reality and authority. In the one perspective, organizations are natural objects—systems of being which man discovers; in the other, organizations are cultural artefacts which man shapes within limits given only by his perception and the boundaries of his life as a human animal.

The systems notion posits an organizational force or framework which encompasses and gives order to people and events within it. The system—unseen behind everyday affairs—is real; it is the organization. The force of

“natural” in the descriptor is to evoke the view common in systems theory that organizational forms are shaped by powerful forces which in large measure act independently of man. The organizations so formed will be right and good, if the natural forces are allowed free play. Mayntz (1964, pp. 105, 115) has noted that such views in which an unseen organizational hand works for the greater social good are likely to be most congenial to scholars who share a faith in the ideals of the Western liberal democracies. In identifying organizations as social inventions, the alternative view identifies organization with man’s image of himself and with the particular and distinctive ways in which people see the world around them and their place in it. This view is the perspective of phenomenology. In it organizations are the perceived social reality within which people make decisions and take actions which seem right and proper to them. (Greenfield, 1973, p. 557). The heart of this view is not a single abstraction called organization, but rather the varied perceptions by individuals of what they can, should, or must do in dealing with others within the circumstances in which they find themselves. It is noteworthy that this tradition—the decision-making tradition (Cyert and March, 1963; Simon, 1964) in organization theory—is frequently cited in scholarly writing, but seldom followed in analyses of organizations. This tradition, culminating currently in the creative insights of James March (1972) into organizational realities, reaches back into the work of Simon (1957; March and Simon, 1958) and thence into the work of Max Weber (trans. Gerth and Mills, 1946) and the German philosophers and sociologists of the phenomenological tradition (Deutscher, 1973, p. 327; Silverman, 1972, pp. 184–5).

What are some of the particular issues involved in the contrast between the systems and phenomenological views? These are suggested in Table 1 where the two views are compared on a number of points. In the discussion which follows,
the phenomenological view is emphasized, since it is assumed that the foundations of the systems view are the more familiar of the two views.

**Philosophical basis**

The systems view assumes that the world is knowable as it is. Although the acquisition of such knowledge requires the intervention and help of scientists, theorists and scholars, there exists an ultimate reality which may be discovered by application of the scientific method and similar forms of rational analysis. In systems theory, the prevailing image of the organization is that of an organism. Organizations exist; they are observable entities which have a life of their own. Organizations are like people, although sometimes the image is more that of the recalcitrant child rather than the mature adult. In any case, the theory endows organizations with many human properties. They have goals towards which they direct their activities; they respond and adapt to their environments. Nor can organizations escape the fate of organisms ill-adapted to their environments. Indeed, the fate of organizations depends upon their ability to adapt to an increasingly complex and turbulent environment. Following the Darwinian logic inherent in their image of the organization, systems theorists (Bennis, 1968) see small, quick-witted, democratic organizations replacing the ponderous, bureaucratic forms now expiring around us. The fact that bureaucratic organizations appear as large, robust and formidable as ever does not appear to shake belief in organizations as living entities subject to stringent laws permitting only the fittest to survive. Indeed, our belief in the living organization is likely to be so strong that we fail to notice that the systems theorists have shifted from telling us about the way organizations are to telling us how they ought to be. “If only organizations were adapted to their environments,” the argument runs, “imagine how quickly these bureaucratic forms would disappear.” In thinking about the dazzling prospect of a world in which organizations were creatures closely adapted to a benign, well-intentioned environment, we forget that the role of theory is to tell us the way things are rather than how they ought to be or how we should like them to be. Our image of the organization as an entity, as a living entity, rests upon an analogy. But we fail to draw the conclusion (Willer, 1967, p. 33) that the analogy is useless when discrepancies appear between the image and the phenomena observed.

The phenomenological view of reality contrasts sharply with that of systems theory. This view has its origin in the distinction Kant drew between the noumenal world (the world as it is) and the phenomenal world (the world as we see it). For Kant, a world of reality does indeed exist, but man can never perceive it directly; reality is always glossed over with human interpretations which themselves become the realities to which man responds. And man is always learning, always interpreting, always inventing the “reality” which he sees about him. In popular form, the Kantian philosophy has been expressed as follows: “Man does not create his world, but he does make it.” It therefore comes as no surprise to the phenomenologist that people are killed by “empty” guns. But for the phe-
nomenologist, beliefs are always of greater consequence than facts in shaping behaviour. The bullet may indeed be in the gun, but it is the individual’s belief about an empty chamber which causes him idly to pull the trigger. Deutscher (1973) summarizes the phenomenological view as follows:

The phenomenological orientation always sees reality as constructed by men in the process of thinking about it. It is the social version of Descartes’ *Cogito, ergo sum*. For the phenomenologist it becomes *Cogitamus, ergo est*—we think, therefore it is!

[1973, p. 328]

**The role of social science**

The implications of the phenomenological view are of critical importance in shaping our views both of the social sciences and of a study of organizations founded on them, as may be seen in the contrasting positions taken by Weber and Durkheim (Bendix and Roth, 1971, pp. 286–97). For Weber, working within his “method of understanding”, “there is no such thing as a collective personality which ‘acts’”, only individuals acting on their interpretations of reality. In contrast, Durkheim, convinced of an ultimate, knowable social reality, sought to eliminate the perceptions of individuals and to find “the explanation of social life in the nature of society itself” (Bendix and Roth, 1971, p. 291). Thus Durkheim spent his life building a sociology around notions of “elemental” forms which provide the invariable units out of which social life is built. Weber, on the other hand, explored the ideas, doctrines and beliefs with which men endowed their organizations and which provided the motivation for action within them. Durkheim’s path leads to generality, abstraction and universality in the study of organizations; Weber’s leads to the particularistic, the concrete, and the experience-based study of organizations. Durkheim’s path leads to an ascetic study of organizations, Weber’s to one which smells of reality.

The phenomenological view leads to the concept of organizations as “invented social reality” (Greenfield, 1973, p. 556) and to the paradox that, having invented such reality, man is perfectly capable of responding to it as though it were not of his own invention (Silverman, 1970, p. 133). More basically, however, the phenomenological perspective questions the possibility of objectivity in what Weber calls “the cultural sciences”. While it is possible for such sciences to pursue inquiry within a logically rigorous methodology and for them to take into account certain basic social facts such as where people live and what they do, it is not possible for cultural scientists to give us “a direct awareness of the structure of human actions in all their reality” (Eldridge, 1971, p. 16). Thus the notion of discovering the ultimate laws which govern social reality becomes an ever receding fantasy which retreats as we attempt to approach it. Such bogus ‘laws’ as the law of supply and demand were, both for Weber and Durkheim, “maxims for action”, advice to people on how to protect their interests if they wished to be “fair and
logical” (Eldridge, 1971, p. 18). In Weber’s view, then, it is impossible for the
cultural sciences to penetrate behind social perception to reach objective social
reality. Paradoxically, this limitation on the cultural sciences is also their strength,
since it permits them to do what is never possible in the physical sciences: the
cultural scientist may enter into and take the viewpoint of the actor whose behavi-
our is to be explained.

We can accomplish something which is never attainable in the natural
sciences, namely the subjective understanding of the action of compo-
nent individuals . . . We do not ‘understand’ the behaviour of cells, but
can only observe the relevant functional relationships and generalize on
the basis of these observations .

While the cultural scientist may not discover ultimate social reality, he can
interpret what people see as social reality and, indeed, he must do so according
to a consistent, logical, and rigorous methodology (Eldridge, 1971, pp. 9–10). It
is such a discipline for interpreting human experience which provides the
science in the cultural scientist’s work, not his ability to discover ultimate truths
about social structure. Thus the purpose of social science is to understand social
reality as different people see it and to demonstrate how their views shape the
action which they take within that reality. Since the social sciences cannot pen-
etrate to what lies behind social reality, they must work directly with man’s defi-
nitions of reality and with the rules he devises for coping with it. While the
social sciences do not reveal ultimate truth, they do help us to make sense of our
world. What the social sciences offer is explanation, clarification and demystifi-
cation of the social forms which man has created around himself. In the view of
some (Dawe, 1970, p. 211), the social sciences may lead us to enlightenment
and to liberation from the forces which oppress man. In the phenomenological
view, these forces stem from man himself, not from abstractions which lie
behind social reality and control man’s behaviour within that reality.

Theory about what?
The two views give rise to opposing theories about the world and the way it
works, since each sees reality in different kinds of things. Each approaches
theory building from a point of view which is normative rather than descriptive.
In the natural systems view, the basic reality is the collectivity; reality is in
society and its organizations. Assuming the existence of an ultimate social
reality, the role of theory is to say how it hangs together or how it might be
changed so that it would hang together even more effectively (Merton, 1957;
Etzioni, 1960). Thus functional analysis—the theory associated with the systems
view—becomes a justification of the way social reality is organized rather than
an explanation of it. In this view, the theory becomes more important than the
research because it tells us what we can never perceive directly with our senses: it tells us the ultimate reality behind the appearance of things and it establishes a view which is essentially beyond confirmation or disproof by mere research.

The phenomenological view begins with the individual and seeks to understand his interpretations of the world around him. The theory which emerges must be grounded (Glaser and Strauss, 1967) in data from particular organizations. That these data will be glossed with the meanings and purposes of those people and places is the whole point of this philosophical view. Thus the aim of scientific investigation is to understand how that glossing of reality goes on at one time and place and to compare it with what goes on in different times and places. Similarly organizations are to be understood in terms of people’s beliefs about their behaviour within them. If we are to understand organizations, we must understand what people within them think of as right and proper to do. Within this framework we would certainly not expect people everywhere to have the same views. In fact, it is the existence of differences in belief structures which provides us with the key to interpreting them. People are not likely to think of their own views as strange. Indeed it is only in contrast to other views that we come to understand our own. Theory thus becomes the sets of meanings which yield insight and understanding of people’s behaviour. These theories are likely to be as diverse as the sets of human meanings and understandings which they are to explain. In the phenomenological perspective, the hope for a universal theory of organizations collapses into multifaceted images of organizations as varied as the cultures which support them.

The view of theory as arising from our understanding is expressed by Walsh (1972):

> The point about the social world is that it has been preselected and preinterpreted by its members in terms of a series of commonsense assumptions which constitute a taken-for-granted scheme for reference . . . In this manner factual reality is conferred upon the social world by the routine interpretive practices of its members. The implication of this is that every man is a practical theorist when it comes to investigating the social world, and not just the sociologist.

[p. 26]

Thus, the naturalist tries to devise general theories of social behaviour and to validate them through ever more complex research methodologies which push him further from the experience and understanding of the everyday world. The phenomenologist works directly with such experience and understanding to build his theory upon them. As Kuhn (1970) points out, our theories are not just possible explanations of reality; they are sets of instructions for looking at reality. Thus choice among theories and among approaches to theory building involves normative and—especially in the social sciences—moral questions. Choice among them is in part a matter of preference, but choice may also be
made on the basis of which theories direct us to the most useful problems and which provide the most helpful insights into them.

**Research and methodology**

In the systems view, research is directed at confirming theory. Theory, in this view, is something which scientists build, largely from the armchair, by thinking up what must be the ultimate explanation for the phenomena observed. Contrary to accepted opinion, Kuhn (1970, p. 16) has argued that such theory is never open to disproof and serves instead as a “consensual agreement among scientists about what procedures shall constitute scientific activity and hence which explanations will count as scientific explanations” (Walsh, 1972, p. 25).

From the phenomenological perspective research, theory and methodology must be closely associated. Theory must arise out of the process of inquiry itself and be intimately connected with the data under investigation. In this view, the aim of theory should be explanation and clarification. Thus research and theory which fulfils this aim must depend not only upon what is being explained but also upon to whom it is explained, and with what. Louch (1966) argues this view as follows:

> Explanation, in Wittgenstein’s phrase, is a family of cases joined together only by a common aim, to make something plain or clear. This suggests that a coherent account of explanation could not be given without attending to the audience to whom an explanation is offered or the source of puzzlement that requires an explanation to be given. There are many audiences, many puzzles.

[p. 233]

Research in the naturalist mode is prone to use experimental methods to establish relationships among variables. The research often substitutes mathematical models for the substantive theoretical model and is satisfied if statistically significant relationships are found among the variables of the mathematical model. The aim is to relate variables x and y, usually with a host of other variables “held constant”. Little effort is spent on determining whether x and y exist in any form which is meaningful to or has consequences for actors within a social situation. Nor is there much effort to ask whether holding one or more variables constant yields an interpretable result among those remaining. In physical systems, we can understand what it means to hold volume constant, for example, while we raise the temperature of a gas and observe the effect on pressure. But what does it mean when we come to a social system and speak, as some researchers do, of holding social class constant while we observe the effect of school resources upon achievement? Whereas the physicist manipulates materials and apparatus in specific, understandable ways, the social researcher frequently makes no intervention at all in the social system which he is attempt-
ing to explain. Instead, he does the manipulation of variables in his mind, or in the workings of his computer. Can we rely on the suggestion that if we manipulate variables in a social system, we will get the same results the researcher gets from his intellectual manipulation of them? The doubt is growing that we will not, as is apparent, for example, from critiques of school effects research (Spady, 1973, pp. 139–40) demonstrating that schools may account for a great deal or virtually nothing at all of pupil achievement, depending on which of several alternative but statistically acceptable procedures the researcher chooses for his analysis.

Phenomenologically based research, on the other hand, aims at dealing with the direct experience of people in specific situations. Therefore the case study and comparative and historical methods become the preferred means of analysis. These methods are perhaps found in their most developed form in the work Weber did in building ideal types for organizational analysis. These types should be seen as “characterizations or impressions of ways of thought and styles of living” which permit comparison and understanding of them (Louch, 1966, p. 172). What Weber did in building these ideal types was to worm his way into the heads of bureaucrats, clerics and commercial men in order to “discern logical connections among propositions expressing [their] beliefs about the world” (Louch, 1966, p. 173). The moral consequences of these beliefs may also be made plain and checked against “reality”. The close connection among theory, research and ethics thus becomes obvious.

Thus an organizational theory based upon understanding rejects the emphasis which much of contemporary social science places upon quantification, more complex mathematical models, and bigger number crunchers in the shape of better and faster computers. As Burns (1967, p. 127) has pointed out, better manipulation of numbers cannot substitute for the emptiness of the concepts to which they apply. This fixation on numbers without concern for the concepts they are thought to represent leads to a sickness of social science which Sorokin has called “quantophrenia” and which Rothkopf (1973, p. 6) likens to the Leerlauf reactions described by Lorenz. In these reactions, animals go through elaborate stereotyped performances for hunting or mating when no other living creature is there to see or respond to the performances.

If we move towards improved understanding in our research we might change our image of what constitutes the essential research tool and supplant the computer with Weber’s notion of the ideal type. An ideal type provides us with an image of a social situation at a particular time and place. We may then surround this image with others made of different organizations or of the same organization at other times. By looking at these images comparatively by seeing them almost as the frames of a motion picture, we begin to understand our world better and to comprehend its differences and the processes of change occurring within it. This direction in theory and research leads to an investigation of language and the categories it contains for understanding the world (Bernstein, 1971a; 1971b). It leads also to an investigation of the processes (Scheff, 1973;
Garfinkel, 1964) by which we negotiate with each other and so come to define what we will pay attention to in our environment and our organizations.

**Society and its organizations**

In the systems view, the problem of society is the problem of order. Without society and its organizations, chaos and anarchy would result. The social order is seen as a basically well-working system governed by universal values. In the phenomenological view, the organization as an entity striving to achieve a single goal or set of goals is resolved into the meaningful actions of individuals. Organizations do not think, act, have goals or make decisions. People do (Georgiou, 1973; Greenfield, 1973), but they do not all think, act and decide according to preordained goals. Thus the notion of the organization as a necessary order-maintaining instrument falls and the notion of organization as the expression of particular human ideologies takes its place. In this way, the problem of order becomes the problem of control (Dawe, 1970, p. 212). Or, to put the question otherwise, the problem is not whether order shall be maintained but rather who maintains it, how, and with what consequences. The image which this view calls to mind is the organization as a battlefield rather than the organization as an instrument of order. People strive to impose their interpretations of social reality upon others and to gain command of the organizational resources which will permit them to do so. The warfare in this battlefield usually takes the form of linguistic attack and defence, although the physical forms of warfare fit just as comfortably within the perspective.

Take as an example this exchange between a principal and a new social worker after the social worker had spent considerable time and effort counselling a student who had been persistently truant and tardy.2

P: It was really simpler and more effective in the old days when the truant officer just went straight to the student’s home and brought him back to school.

SW: Actually, I do the work truant officers did, but I do it a different way.

P: That may be so, but we used to get results more quickly. If the students wouldn’t come to school, we expelled them. They had to recognize our authority or quit school. That’s what I mean by simple. Now everything is complicated. Why can’t we deal with these cases without a lot of red tape?

SW: I prefer to see my work as treatment. The aim is not to wind up a case quickly but to keep the student in school and learning. And in any case, Mr. Principal, legally I am the truant officer and you need my backing to expel a student for truancy.

It is surely not hard to see in this exchange a battle going on over what the job of the social worker should be and behind that a struggle over how the school should define its responsibilities to students. The issue is how the job
of the social worker shall be defined and who shall control the school’s power of expulsion. Each of the protagonists is inviting (and threatening) the other to accept a particular definition of the situation and the way it is proper to act within it.

The conflict view of organizations thus links up neatly with the decision-making tradition in organizational analysis. In a recent significant contribution Perrow (1972, pp. 145–76) demonstrates how this tradition, developed brilliantly by March and Simon (1958), complements the insights of Weber. A major concern of Weber was for the way in which the power of bureaucracies would be used outside the organization. March and Simon demonstrate how power may be marshalled within the organization. As Perrow points out (p. 196), the supposed plight of professionals within bureaucracies is a minor complaint compared to what others have suffered from professionals who have been able to act out their ideological beliefs through their control of organizations.

We should also be grateful to Perrow (p. 90ff) for pointing out the contrasts between Barnard’s theory and his practice. For Barnard, (1938, pp. 46–61) organizations were by their very nature cooperative enterprises. In this respect, Barnard was a good systems theorist whose theory dealt with abstractions about organizations and not with the ideologies of those who ran them. In an astonishing case study, Barnard (1948) spoke to a group of the unemployed who had recently seen “police clubs flying, women trampled, men knocked down” (p. 64) in the following terms:

I’ll be God damned if I will do anything for you on the basis that you ought to have it just because you want it, or because you organize mass meetings, or what you will. I’ll do my best to do what ought to be done, but I won’t give you a nickel on any other basis.

[pp. 73–4]

In his commentary on this situation, Barnard makes it very clear that he realized he was in a position of conflict over ideology. But his theoretical concern lies not with the ideologies, but with his proposition that men under “states of tension” will do what is “utterly contrary to that which is normally observed in them” (p. 62). While he explains in detail how he won the ideological battle which gave him power to decide what the men “ought to have”, he makes no mention of his final decision. The content of decisions is not important in systems theory. However, Barnard does take pains to denigrate the ideology of the unemployed workers and their claims for better treatment. He also considers in a footnote (pp. 73–4) whether a person of “superior position” should swear in front of those of “inferior status”, and confides that “the oath was deliberate and accompanied by hard pounding on the table”.

In this example, Barnard as theorist merely adds the notion of “states of tension” to his earlier developed principles of cooperative action in organizations. Do these ideas tell us the significant aspects about organizational life
with Chester Barnard? The phenomenologist holds that Barnard’s ideology is the significant variable shaping the experience of many people in the organizations which he controlled. Without understanding the ideological issues involved in an organization, and in particular without knowing what ideology is in control, the general principles of organization mean relatively little in terms of what people experience in an organization.

**Organizational pathologies and cures**

The systems theorist looks for pathologies in the body of the organization itself. These stem from ill adaptations of the organization to its environment, to the ultimate goals it should serve, or to the needs of individuals. The solution to these pathologies is obvious: change the structure of the organization to improve the adaptation and thus the performance of the organization. The phenomenologist, on the other hand, sees structure as simply the reflection of human beliefs. If there are problems in organizations—and problems are certainly to be expected—they must therefore rest in conflicting beliefs held by individuals. Solutions to such problems cannot be found simply by changing structures. The root of the problem lies in people’s beliefs and the ability to act upon these beliefs.

Thus the argument that we must make organizations more liveable, more congruent with human values and motives, ignores the fact that it is one set of human motives and values which is in conflict with another set of motives and values. There is no abstract entity called organization which can be held accountable—only other people.

[Schein, 1973, pp. 780–1]

Our penchant for thinking about organizations as entities, as things with a life of their own, blinds us to their complexity and to the human actions which constitute the façade which we call organization. It leads us to believe that we must change some abstract thing called “organization” rather than the beliefs of people about what they should do and how they should behave with each other. The more closely we look at organizations, the more likely we are to find expressions of diverse human meanings. The focus of our efforts to improve organizations should not be, “What can be done to change the structure of this organization?” but, “Whose intentions define what is right to do among people here involved with one another?” and “How might these intentions be changed?” The task of changing organizations depends, first, upon the varieties of reality which individuals see in existing organizations, and second, upon their acceptance of new ideas of what can or should be achieved through social action. We know little about either, but it is clear we should understand the first before we attempt to direct the second.
Implications

Where do the ideas based on phenomenology leave the notion of “organization”? And what of the science that studies organizations? And where does a profession of educational administration which bases its practice on this science now find itself? In conclusion, let me briefly develop some answers to these questions and suggest some directions for future study.

1. Organizations are definitions of social reality. Some people may make these definitions by virtue of their access to power while others must pay attention to them. Organizations are mechanisms for transforming our desires into social realities. But the transforming mechanism lies within individuals. It is found in individuals striving to change their demands or beliefs into definitions of reality that others must regard as valid and accept as limitations on their actions. This notion of organizations as dependent upon the meanings and purposes which individuals bring to them does not require that all individuals share the same meaning and purposes. On the contrary, the views I am outlining here should make us seek to discover the varying meanings and objectives that individuals bring to the organizations of which they are a part. We should look more carefully too for differences in objectives between different kinds of people in organizations and begin to relate these to differences in power or access to resources. Although the concept of organization permits us to speak of the dominating demands and beliefs of some individuals, and allows us to explore how those with dominating views use the advantage of their position, we need not think of these dominating views as “necessary”, “efficient”, “satisfying” or even “functional”, but merely as an invented social reality, which holds for a time and is then vulnerable to redefinition through changing demands and beliefs among people. Where then may we go from here? Let me suggest some lines of development.

2. We should begin to regard with healthy scepticism the claim that a general science of organization and administration is at hand. Such theories carry with them not only culturally dependent notions of what is important in an organization but also prescriptive ideas of how study and inquiry into organizational problems should go forward. The movement toward international associations for the study of educational administration should be welcomed, but these associations should open windows on our understanding of organizations rather than propagate received notions of organization theory. If the movement can provide a comparative and critical perspective on schools and on our notions of how they should be run, the association will serve a valuable role. Since the dominant theories of organization and administration have their source in the United States, it is these ideas which should receive searching analysis before they are blindly applied in other cultural settings. In Britain, this critical examination of theory and its policy implications has already begun (Baron and Taylor, 1969; Halsey, 1972), though one is hard pressed to find similar critical examinations in other national or cultural settings.
3. Willy nilly, the world does seem to be shrinking towards the global village. Yet there are still strong forces which maintain vivid cultural distinctions within it. Despite these forces, the interests of the mass media, which the academic community seems all too ready to ape (Perrow, 1972, p. 198), direct attention more frequently to the symptoms of social problems rather than to their sources. While the mass media are usually ready with prefabricated solutions to these problems, students of organizations should doubt the utility of solutions which ignore their sources in the truly critical and powerful organizations of our societies. If we are unwilling to understand our own organizations, or if we regard acquiring such understanding as a trivial task, we should be aware that there are often others willing and waiting to apply their own preconceptions and answers to the tasks of defining the organization, identifying its problems, and prescribing solutions to them. Our own experience of our own organizations is a valuable resource. It is with this experience that the organization theorist must begin to understand the nature of organizations. Since an understanding of organizations is closely linked to control of them and to the possibility of change within them, the phenomenological perspective points to issues of crucial importance both to the theorist and the man of practical affairs.

4. The possibility of training administrators through the study of organization theory has been seriously overestimated. Such theory does not appear to offer ready-made keys to the problems of how to run an organization. Through credentials, such training does appear to offer sound prospects for advancement within administrative systems. While such training may increase social mobility, each society must decide whether it wishes to pursue this goal, and, if it does, whether this method is the most appropriate for doing so. If training of administrators is to serve its avowed purposes, then it seems clear that the nature of the training must move in virtually the opposite direction from that advocated in recent years. That is to say, training should move away from attempts to teach a broad social science of organizations-in-general towards a familiarity with specific organizations and their problems. That the training should continue to have critical and reflective dimensions should not conflict with this redirection of training programmes. It appears essential also for training programmes to develop a much stronger clinical base than is now common in most of them. In such training, both the theoretician and the practitioner must be intimately involved.

5. Research into organizational problems should consider and begin to use the phenomenological perspective. This redirection of research should awaken interest in the decision-making tradition of organization theory and in the institutional school of organizational analysis (Perrow, 1972, pp. 177–204) with its emphasis on the exposé and ideological analysis of specific organizations (Bendix, 1956). In methodology, research should turn to those methods which attempt to represent perceived reality more faithfully and fully than do the present highly quantified and abstruse techniques. And researchers should avoid
prescribing solutions to pressing social problems on the basis of prescriptive theory and research. For example, those who concluded on the basis of the Coleman study that the achievement of black students in American schools might be raised by integrating black and white students were dazzled by the naturalist assumption that a statistical relationship represents social reality. They therefore were led to the error of believing that social relationships may be manipulated in the same way in which variables from the research design can be manipulated. In doing so, they failed to reckon with the reaction of black students to greater integration as a “solution” to their problems (Carlson, 1972). Indeed researchers and social scientists might consider the cultural imperialism which is frequently inherent in their recommendations for solving social problems and strive first to understand (Bernstein, 1971b, Sarason, 1971; Holbrook, 1964) the social and organizational world for which they hope to prescribe solutions.

What is needed for better research on schools is better images of what schools are and what goes on in them. “Better” in this case means creating images of schools which reflect their character and quality and which will tell us something of what the experience of schooling is like. Since schools are made up of different people in different times and places, it is to be expected that images which reflect the experience of schooling must be many and varied. These images would be sets of “one-sided viewpoints”, as Weber called them, each throwing “shafts of light” (Eldridge, 1971, p. 12) upon social reality in schools.

As the natural systems have provided the dominating model for studies of organizations (Mayntz, 1964, p. 116), the image of the school as a unit of production has dominated investigations of schools (Levine, 1973; Spady, 1973). The production model of the school is a systems variant which sees the school as a set of roles and resources arranged to yield a product which conforms to predetermined goals. We are often so accustomed to this model that we fail to notice the enormous discrepancies between it and what typically goes on in schools. To begin with, most sets of official educational goals would justify schools doing virtually any good thing for the individual or the society in which he lives. Secondly, the products of school are nearly impossible to identify, if by product we mean something which is unmistakably due to the efforts of the school itself. The clearest measure of school product—the results students obtain on standardized and other kinds of tests—correspond poorly to the goals of education and are usually accounted for most readily by influences outside the school. Thus whether schools do anything to achieve a set of vague goals can never be determined within the model of the school as a unit of production.

If we shear from our image of schools the notion of overriding goals and visible products, what are we left with? The image is now that of pure process in which people strive to shape a social environment which is congenial to them and which they believe serves their purposes or the purposes which other people ought to have. The image of the school is now not the factory or the system but
the public utility (Pincus, 1974) which produces a service which people use for their own ends. It is not surprising in this conception of the school that people involved with it—teachers, administrators, pupils, parents, etc.—have strong feelings about what services should be provided and how they should be provided. Moreover, it should be apparent that experience with the school’s services leads to strong, though not necessarily universally accepted, beliefs about what kinds of service and conditions of service are good and bad and to convictions about which of them are effective and ineffective. However, lacking objective criteria to judge the relevance and validity of their claims, and lacking even a common basis of experience with the school’s services, people holding these beliefs and convictions are likely to clash with others having different but equally firmly held convictions. We learn to believe in our own experience of school process and to doubt the validity of others’ beliefs. In this way, the proposal model accounts both for the apparent stability of schools—their resistance to change—and for the continuing conflict about what schools are for and how they should be organized and run. It suggests as well that the path to understanding more about schools must lie through interpretations and analysis of the experience of people in schools, not through attempts to decide which structural elements of schools yield outcomes that best approximate their ultimate purposes.

6. The research advocated above and the rationale for it developed earlier in this paper do not imply only the description and analysis of subjective states. Weber is said to have advised researchers first to get the facts about the basic elements of social situations and then to move to a subjective interpretation of them (Eldridge, 1971, p. 19; Bendix and Roth, 1971, pp. 286–91). The “facts” Weber had in mind were such matters as wages, costs of materials, the people involved, and descriptions of them in demographic terms. These are the typical resource variables which are of frequent concern in analyses of the school from the perspective of the production model. The questions usually investigated are whether the school is making effective and efficient use of its resources in pursuit of predetermined educational goals. Answers to such questions are complex, contradictory and unconvincing, as Spady (1973) has demonstrated. The reasons for such unsatisfactory outcomes are obvious when pointed out, as Gagné (1970) has done. Children do not learn from “environments” from “resources” or from the “characteristics of teachers”. They learn from their specific involvement with people, things and events around them. Thus knowledge of the basic facts about a social situation is only the beginning of an understanding of it. What is needed beyond these basic facts is a knowledge of how people in a social situation construe it, what they see as its significant features, and how they act within it. Such knowledge can only come from the interpretation of particular experiences in specific situations.

In this respect, it might be useful to think of two kinds of variables in a social situation—outside and inside variables. The outside variables are those which lend themselves readily to quantification and which involve a minimum of interpretation. As has been suggested, these variables provide information about the
characteristics of the people and resources found in a social situation. The inside variables are those which may only be expressed through interpretation of experience. Both kinds of variables are important, though in most organizational studies of schools, emphasis has usually fallen exclusively on the former category.

It would be helpful to replace our usual notion of the school as a system with the idea of the school as a set. Where the system idea implies preordained order and functions in the school, the notion of set leaves completely open both the definition of the elements of the school and the description of relationships among them. Defining the school as a set leaves as a problem for investigation what the elements of the situations are and what the meanings of relationships among the elements are. With such a view of the school, we might recognize both external and internal variables; as follows:

**External variables.** Pupil characteristics: their age, sex, home background, individual abilities and previous learning. School characteristics: building design, facilities and equipment. Classrooms: number of pupils, subject of study, methodology. Teacher characteristics: training and length of service, personality, intelligence, abilities and interests.

**Internal variables.** What is the quality of relationships among teachers, pupils and others in the school? What experiences do they have in terms of (a) their expectations for the environment, (b) the opportunities and problems they perceive, (c) the efforts they make to learn, help or teach, (d) their feelings of accomplishment or failure? What decisions do different people in the school make and why do they make them? How are people and situations defined and evaluated?

The variables listed above are intended to be suggestive rather than exhaustive. The final point to be made about them is that both of these major dimensions are essential for describing and understanding schools fully. In fact, some of the most revealing analyses will arise from contrasts between the school seen in terms of external variables and the school seen in terms of internal variables. That organizational theory has too frequently directed attention to the external variables and that it has presumed rather than explored their relationships to internal variables are points which have already been made at length.

7. A continued study of organizations from the perspectives of the social sciences is certainly warranted. Schools as one of the most significant of our social institutions deserve particular attention. It seems appropriate, however, for students of schools as organizations to consider the meaning of their studies and to redirect them towards investigations which increase our understanding of organizations as they are before attempts are made to change them. Paradoxically, the efforts which promise to yield the most penetrating insights into organizations and the most practical strategies for improving them are those
efforts (March, 1972) which deal with the way people construe organizational reality and with the moral and ethical issues involved in these construings.

If, as the phenomenologist holds, our ideas for understanding the world determine our action within it, then our ideas about the world—what really exists in it, how we should behave in it—are of the utmost importance. And if our ideas about the world are shaped by our experience, then the interpretation of our experience is also of paramount importance. It is this process, the placing of meaning upon experience, which shapes what we call our organizations and it is this process which should be the focus of the organization theorist’s work. And unless we wish to yield to universal forces for determining our experience, we must look to theories of organizations based upon diverse meanings and interpretations of our experience.

EDUCATIONAL ADMINISTRATION
AS A HUMANE SCIENCE
Conversations between Thomas Greenfield and Peter Ribbins

Thomas Greenfield and Peter Ribbins

Scene setting
For students of educational administration, 1974 was an exciting year. It was the year in which the third International Intervisitation Programme was held. At the conference Thomas Greenfield delivered a paper which changed the face of educational administration as a field of study. To understand why it is necessary to locate the paper in its historical context.

Since the 1950s educational administration had been dominated by positivist thought in the form of the ‘Theory Movement.’ This envisaged the development of a general theory of human behaviour, within which the theory of administrative behaviour in educational contexts would be a sub-set. In this paradigm the natural sciences, especially physics, would provide the model (Griffiths, 1957, 388).

By the late 1960s doubts were being voiced. But as Griffiths (1988, 30) acknowledges, its ‘demise came at the 1974 meeting of the IIP in Bristol. . . . The coup de grace was delivered by Greenfield who made an across-the-board denunciation of every aspect of the theory movement’. Since then, Greenfield ‘has broadened and deepened his critique. In an impressive series of papers . . . he has sought to develop a systematic view of social reality as a human invention, in opposition to the systems scientific perspective of social reality as a natural system. He has constructed strands of argument on the nature of knowledge, on administrative theory and research, on values, on the limits of science, and the importance of human subjectivity, truth and reality . . . the magnitude of his undertaking and a corresponding elegance of argument make his work the
most important theoretical development in recent educational administration’ (Evers and Lakomski, 1991, 76).

Accordingly, his papers are eagerly sought in many parts of the world but are not always easy to get hold of individually or collectively. A solution is the publication of a collection and since 1990 we have been involved in producing one. We have done so in all the usual ways including spending several days together in Birmingham in June 1991. Some hard choices have had to be made in selecting ten papers to represent his thinking from among the sixty Greenfield has published since 1961 [Appendix 1]. Once this was done we have been involved in the equally demanding task of editing in a way that respected the integrity of individual papers but which minimized repetition in the text as a whole. With this under way two tasks remained – producing a foreword and writing a postscript. The former was straightforward – we had only to ask Christopher Hodgkinson.

The latter took more thought. We wished to enable the reader to locate the set of papers within the context of Greenfield’s personal and professional history as he saw it. This led us to a ‘novel’ approach. During the five days of our meeting in Birmingham we conducted a series of wide ranging discussions. These were taped and transcribed. Since then we have refined, revised and elaborated the text of these talks. They represent an unusually sustained attempt to explore with a scholar how and why his thinking developed as it did.

**Before 1961: towards the scholar’s life**

**PR:** Let us try and get some purchase on the development of your thinking over time. Partly by looking at your life, career and work. You were born in Saskatchewan?

**TG:** Into a farm family and I lived the first few years of my life on a farm.

**PR:** You didn’t enjoy farming much?

**TG:** I didn’t experience much of it but I remember from an early age having a longing for something else. That something else was the city. I can recall my mother telling me of cities and their various wonders.

**PR:** Most of your schooling was in city contexts?

**TG:** From the ‘Second Grade’ to my degree studies in English and German at the University of British Columbia.

**PR:** These studies were an influence you came back to later in your career and thinking?

**TG:** They certainly were. I fell into those choices of study, as many do, but it left a lasting impression on me. After finishing my degree I needed a job quickly and teaching seemed the easiest and most obvious thing, also my mother had been a teacher so perhaps there is that kind of influence. If I’d been more courageous or had more money I might have done other things.

**PR:** So you spent a number of years teaching in an elementary school?

**TG:** I was trained as a secondary school teacher and worked as one briefly and
was quite happy at it. But I was offered the job in Vancouver and they put me in an elementary school because that was where there was a shortage of teachers. Initially I found that difficult.

PR: Presumably you became reasonably good at it because from '58 to '59 you had a year as a Vice-Principal?

TG: Yes that’s right. I guess by the end of my teaching career I had some success. It was in an interesting school. Some of us were advanced and I was one of those.

PR: What were your responsibilities?

TG: Assistant to the head. That was my first insight into practical administration. The principal was the opposite of the previous one. He was very aggressive and direct whereas the other man had been incompetently *laissez-faire*. He was repressive with the children and indifferent to the teachers. I suppose that was when I first began to think about what administrators do.

PR: You had a year as a deputy principal?

TG: Then another happenstance from above. Someone in Edmonton contacted the BC Teacher’s Union and asked if they knew of somebody to nominate for a scholarship in educational administration. The thought of getting away for a year from that principal was attractive.

PR: Did you also want to research?

TG: My plan was simply to go for the year. I realised that if I did go I would probably be launched into an administrative career.

1961–1971: Objectivist years – from certainty to doubt

PR: In Alberta you studied Teacher–Leader Behaviour and Its Relationship to Pupil Growth. Why?

TG: The Department was just establishing itself. It had been going for only two years and there were two kinds of staff. Older people who had come to an academic position from a background of senior positions in administration and those, like the professor I worked with. He had some experience of education and then had gone to study in the University of Chicago, which is where the thrust of the Theory Movement arose. When I started my studies, I had a sense that the difficulties and complexities I had been introduced to in my study of the arts could be answered. They could be calculated, they could be resolved – exactly. I had a sense of turning my back on what I had understood to be knowledge for many years.

PR: That in comparison what you had known hitherto was sloppy, impractical, soft?

TG: That’s right, there was clarity, answers and certainty. As I understood more of the New Movement theory I saw it could bring discipline and knowledge to thinking in the field, to make it more useful.

PR: Was your Doctoral research a development of your Masters work?

TG: It was. My masters’ study focused on leadership, and I worked within a
pre-existing instrument designed to measure leadership. The standard thing to do was to take such measures and relate these to other variables. I related these to measures of output, in particular to measures of pupil growth. For my doctoral studies I tried to understand more of how these measures of output were related to organisational variables.

PR: This was very much within the positivistic frame?
TG: Oh absolutely!

PR: It relied on a good deal of number crunching?
TG: I did a great deal of number crunching. This was offered to us as the methodology. All problems in education were thought to be ultimately resolvable in this way. Of course we were drawing on the whole school of thought that is described as ‘Logical Positivism’.

PR: This was a time in which the Theory Movement and logical positivism were at the height of their influence.
TG: Logical positivism was powerful in the social sciences generally and pre-dominant in philosophy. We were not aware of this. These things were simply offered to us as part of the method we should use. We were aware there were problems to be solved in education and this was the means for understanding and resolving them.

PR: At a fundamental level it was taken for granted that tackling such problems raised technical rather than philosophical considerations?
TG: That was reflected in our training program. There were two kinds of emphases, the first and most important, was on quantitative method, the second was on an understanding of the social sciences. The social sciences were seen as a great repository of knowledge that would give us ideas and theories on which we would use our methods of quantitative analysis. We learned the social science of empiricist realism, that is the methods of logical positivism. We were also involved in studies that from the new perspective were seen as rather useless. We did a course in educational philosophy, which was taught by one of the old line scholars who had grown up in the tradition of Dewey. He took us through thinking on education, from Spencer onwards. We looked at thought right back to the Greeks. We had wonderful discussions and debates and being in that class re-awakened ideas that entered our heads as undergraduates. They certainly interested and challenged me. But when you walked out of that class you realised it didn’t really help at all.

PR: It was entertaining – but not really useful?
TG: It was simply self-indulgent, and didn’t address the great social issues of the day. I’d grown up in an environment of protest, a generally left-wing ideology. I was raised by my mother. She had a vivid sense of social outrage at the social injustices she suffered. I also had a sense of social mission, that there were great problems in the world that had to be set right.

PR: And that science was the way to do it?
TG: My first inclinations were towards the arts but I came to feel that was for
nothing and one ought to devote oneself to studies that could be socially useful.

PR: The serious citizen is a scientist? You published three papers in 1961.

TG: From early in my studies I could write well enough to put things clearly and forcefully, to draw people’s attention, to get good marks. Since then I’ve thought about my writing a great deal more. As Barnes says, ‘Mystification is easy, clarity is the hardest thing of all.’

PR: Your early papers use an essentially quantitative approach?

TG: They do. Within the systems metaphor that orders the whole thing. The school is a productive unit, there are distinguishable outputs, they are caused by effective process, all under the control of the administrator.

PR: And such thinking informs your Ph.D. study: ‘Systems Analysis in Education - A Factor Analysis and Analysis of Variance of Pupil Achievement’?

TG: A terrible title – but it displays the things I was proud of at the time. I cringe to think of it, a blaring trumpet advertising method, and no substance at all.

PR: Ideas derived from systems theory backed up by great technical skills in manipulating the numbers.

TG: I had a sense I was a possessor of a kind of arcane knowledge and had to display that in the title.

PR: You were an insider?

TG: I was inside, I could do a factor analysis, I could do an analysis of variance.

PR: And you felt comfortable with that at that time?

TG: Oh yes.

PR: When you finished your Ph.D., you became Research Director at the Canadian Teacher’s Federation?

TG: In Ottawa. I had gone to Alberta for a year, but had stayed four. I was too educated to return to the ordinary classroom. But there wasn’t an academic position available at that time in Canada. So I took an opportunity to get into research administration.

PR: To what extent was this a research role?

TG: My main role was as an advocate for research. There were interests the Federation wanted pursued with regard to the interests of teachers. They wanted salary scales, benefits and things of that kind examined. It was low-level survey research. There was also interest at that time in classroom research. I published several papers advocating that role for the classroom teacher in research.

PR: Did you hope for a ‘proper’ academic appointment?

TG: I went there happily but before long I became less happy. I found the position was that of tame scientist, in which you were hired because you could add a certain cachet to the proper opinions that my employers wanted to highlight. We were very much on display as scientists of education.

PR: Paid to find things you were expected to find or at least to find evidence to support such expectations?

TG: You could say what you wanted as long as you didn’t question certain sacred truths. I came to be very aware of that.
So there were frustrations in working in that context and when the chance came to get a post at OISE [Ontario Institute for Studies in Education] in Toronto you were interested.

I was very much imbued with the attitude that saw the typical role of the researcher as the creator of superior knowledge, so I did resent the political control that was put on me, even though it wasn’t all that binding. So when the university system began to expand I remember thinking long and deeply about leaving the Federation. But I had the opportunity to join the newly formed OISE. What decided me to go was the knowledge that my former Professor, John Andrews, was going to the Institute. That was a strong attraction. Also the thought of moving to a big city was very attractive.

Andrews was quickly promoted. In 1967 you became Head of the Department and held this post for the next four years. What was involved?

The chief thing was managing its growth. The Institute was growing very fast, money seemed to be no object. Every year there was a competition among the departments for the increased resources given to the Institute. Growth was seen as good in itself.

Presumably at that time you accepted this?

Oh I did, and we were growing also in terms of students and of the depth and complexity of the programmes we were offering.

How large was the Department by the time you completed your term?

We were twenty or more by 1970.

Good grief.

Good grief yes!

What was managing that growth like?

Appalling.

What kind of administrator were you?

I was proactive. I saw things to do and I did them. I didn’t feel badly about using my power, except sometimes, and I thought I was working for the greater good.

Did you see yourself as a consultative manager?

I didn’t mind overriding a decision that I thought needed to be overridden. I didn’t do that very often but I saw the need for it. I was keenly aware of the demands the Department was under, demands to expand both research and training. We had to meet our obligations, and this moved me to take risks. I pursued senior scholars, but not many of them came. So the salvation of the Department lay in recruiting new, untried talent. I appointed a woman to the faculty at the time when such an appointment was exceptional. I also took risks in the specializations I promoted and the greenness of the persons I recommended. I was pretty green myself.

How did your four years experience as an administrator shape your thinking as a scholar?

It shaped it a very great deal. When I finished my first term as Head, I was up for review for a second term and I felt that there was no question about
it. To my surprise one of the senior people came to me and said he wanted the job. I was just completely dumbfounded. He said he would get it and that the best thing I could do was to step down.

That was my first encounter with the Realpolitik of organisations and, of course, it rubbed me the wrong way. I might have been persuaded to leave and go back to doing what I really preferred. I decided he was wrong, that he didn’t have the power, and even if he did, I wasn’t going to go that way. The ensuing months were sheer hell. He was a consummate political animal and he was able to find enough resentment about things I had done and exploit this. It came to a vote of the whole Department, staff, students, support staff – everybody. I could see that to win by a small margin, which I did, was not enough, so I quit.

PR: So you went back to being a professor and ceased being an administrator. That experience must have been one you learnt from?
TG: During that time I was aware again that we were expected to be tame scientists.

PR: Even at OISE?
TG: We were an instrument of provincial government policy, and one of the issues was the amalgamation of schools and school districts. There was a belief that bigger was better. I saw that I was being used as a kind of strategic lever against popular opinion. I could see the complexity of the issues. I could see these were to do with values. I was there to build the technical argument, to give it credibility. But on more than one occasion people would listen and then say, ‘That may be true if you say it. We still don’t want to do it.’

PR: So the doubts which have dominated much of your work since then can be traced back to this period? And these doubts were wide ranging and fundamental, relating even to your understanding of the methods that you were using? This takes us neatly to the first of the papers in which you begin to express these doubts in a published form. ‘Critique of a Tradition’, in 1968 raises doubts concerning the ideas and methods of researching that had characterised your work in the past.

TG: My task was to review the research years at the University of Alberta, research using the instrument known as the Leadership Behaviour Description Questionnaire, the LBDQ. There had been much research of this kind. I looked at its outcomes and its implications.

As I did the paper, I came to realise the limitations of such theory and methodology. I said in a muted way that these methods were inadequate as a means for studying leadership.

PR: Were you also beginning to have doubts about the quantitative approach itself as a means of understanding things like educational leadership?
TG: I had to think things out, I had to understand them as deeply as I could. My arts training left me with the idea that the world was a mystery and that understanding of it was gained only with great difficulty, much scepticism.
and a lot of work. When I examined a body of findings based upon the LBQD, that scepticism returned.

PR: Unlike some who share your reservations about the quantitative approach you had a very good grasp of statistics. You spent a decade or more working with statistics. You were very comfortable with them but began to see their limitations?

TG: There are enormous subjective elements in these supposedly objective methods. I knew too that numbers opened up a whole arcane study which was immensely satisfying because of its apparent exactitude and closed logic. That such logic is comfortably abstruse and impervious to question by non-initiates is part of its attraction. It impresses by its apparent power while repelling questions, hiding the fact that it often has much less to say to the everyday world than it seems to. Numbers can be useless, but strongly addictive.

PR: What was it about the late ‘60s which began to make you doubt all this?

TG: I began to think through the nature of my science. Earlier I had become aware of the enormous subjective elements in these supposedly objective and quantitative analyses. There were problems with factor analysis, one of the prime tools, and also with multiple regression. With factor analysis, for example, there is no unique solution. Solutions are imposed by the researcher and what is interpretable becomes the decision of the researcher. In multiple regression, subjective decisions such as the order in which the variables are input significantly affects the result. In Coleman’s study of equal opportunity, for example, the order of entering the variables shifts the value of in-school factors from virtually everything to almost nothing. On one occasion when members of a Senate committee asked about the meaning of the beta weights that powerfully shape his findings, Coleman replied they were purely mathematical concepts which had no bearing on practical reality.

PR: Such an approach may manipulate quantitative data, see various pretty patterns and suddenly say ‘This pattern represents truth, life and reality!’

TG: That’s it exactly. Much later I came across a statement from Francis Bacon where he says, ‘God forbid that we should mistake a dream of the imagination for a pattern in the world.’ Many findings produced by the quantitative methods are dreams of the imagination asserted as truth.

For example, if statisticians find a relationship statistically significant, then all the variation in the display which does not reveal that pattern is called error.

PR: And is systematically set aside?

TG: You simply eliminate the error and everything looks better because you are dealing with it through a lens that draws you up close, and instead of seeing the whole of the aquarium you’re looking at a tiny little droplet.

PR: And then extrapolate to the whole phenomenon.

TG: In this context an objection often made against the qualitative researcher is
that he doesn’t understand the relationship between the regularities observed and a larger world, that inference and representation is impossible. That is exactly the problem: the quantitative researcher creates in eliminating error.

PR: Concern for such issues is evident in your 1973 paper ‘Social inventions’. When did you first begin to think in such terms?

1971–1974: Towards an alternative paradigm

TG: I saw these problems before the end of my formal studies. But I did not appreciate their full implications until I realised these matters touched upon the essence of the claim that science offered salvation for the social problems of the world.

This is first expressed in my 1968 paper, which ends with a series of questions. These questions and their wider implications were forming in my mind and between 1968–1972 they came to the fore. In 1971–72 they crystallised.

PR: Before we turn to this, let us first consider what you mean by ‘empiricism’ and ‘the empiricist approach’?

TG: It arises from applying logical positivism to the world. I first encountered this view in an aphorism from Spearman: ‘Anything that exists, exists in some quantity, and anything that exists in a quantity can be measured.’ This implies that anything immeasurable does not exist, not beauty, justice, or truth.

PR: Does Spearman’s claim self reference? How do you measure a claim? What of the hypothetico-deductive method itself? It does not necessarily derive from logical positivism or empiricism?

TG: No it doesn’t, except that there is an easy bridge between that view and mathematical physics.

PR: That reminds me of Griffiths’s point, made many years ago, that properly conceived the study of educational administration could replicate Kepler’s Laws of motion. It could produce general laws of human behaviour in social contexts.

TG: That’s right, and there is an enormous leap of logic and faith in such a claim. It is only in retrospect that you realise that what is being advocated is a view of the social world that sees it as a version of the physical world. The methods which enabled understanding of the physical world are exactly the methods that will bring us to an understanding of the social world.

PR: The argument advanced was that the objectivist approach had brought vast leaps of knowledge in physics so why should it not do so in the social sciences? But let us try and clarify your own epistemological position. Evers and Lackomski seem to claim you doubt objectivity in the physical as well as the social world.

TG: I don’t doubt the objectivity of the physical world. I do not question that,
their example, a door may be a better way of leaving a room than trying to
go through the wall, floor or roof. I would say that it’s not clear that the
door is the only way out – there may be a window – even if it is forty floors
up!

PR: As I understand it, what they want to do is to argue, following Quine and
others, that there are ways of choosing between competing theories which
are neither wholly positivist nor wholly subjectivist.

TG: They rely on something like an agreement among scientists.

PR: Perhaps a bit more than that – the criteria they propose are things like which
of two or more competing theories is the more economic, which explains
more, which leaves you with the fewest messy problems, which is related
better to what we already know.

TG: Yes and that a significant group of people accept it – which to me puts it on
a social basis. I think of the fate of Galileo and other heretics who were
right but forced to say their theories were wrong. Evers and Lakomski’s
arguments may best apply to the interpretation of the physical world,
although conundrums exist there too. It ends in mystery in that reality too.
The limits of both macro- and micro-analysis are found in emptiness, dark-
ness, the unexplained, the unfathomable. But Evers and Lakomski’s argu-
ment becomes shaky indeed when it is applied to the social world. There
truth is defined, as Szasz says, not by scientists looking into test tubes and
telescopes, but by ‘experts’ who go not to their laboratories to observe, but
to make judgement. As Szasz points out, whether schizophrenia is a disease,
a sin, or an acknowledgement is a willful and moral choice.

PR: The paper in which you first began to voice the concerns which have
dominated your subsequent writing was ‘Social inventions’ in 1973. Limita-
tions of space have excluded it from our book. Why did it not cause the stir
your 1974 paper did?

TG: Where it was known, it was as much a cause célèbre as the later one. I spent
much of the year following my resignation doing very little, just teaching
and licking my wounds, and then I had a leave. It turned out to be a very
important year.

PR: What did you do with it?

TG: I went to the University of Alberta, then to the University of British Colum-
bia and finally to Germany. I read and read, being drawn into the world of
Max Weber. And I had to write a paper on change.

PR: That was for AERA? [American Educational Research Association]

TG: Yes. I tried to use the new understandings. After that I went to Germany. In
going to Germany I was opening a door. I turned to things that had moved
me as an undergraduate student.

PR: What kinds of things?

TG: Generally the arts – art, language and philosophy.

PR: How long did you spend in Germany?

TG: Only four months!
PR: You didn’t go there to explore German thinking on the things which have characterised your later writing?
TG: No, I wanted to go through a door I had previously rejected. That turned out to be an important experience. I knew the fount of knowledge there. I encountered a body of thought that much of my critique rests upon. I lived in Germany in German, and that was difficult and stressful. We surround ourselves with our mother language, with the realities and assumptions of that language. To have that torn away and operate in a system that you suddenly don’t understand is hard. You don’t understand the social architecture.
PR: A hard existentialist experience.
TG: It is. That is a theme that comes back in my later writing, that we need that tearing away from our existing social reality to appreciate what it is.
PR: To see it in its strangeness and familiarity?
TG: And it’s mutability. We think of it as inexorable, it’s the water the goldfish never sees. I came to see German thought and history in a new context.
PR: It seems as if this experience confirmed rather than triggered your growing disenchantment with empiricism and your search for another way? What about the paper you wrote? What was the response to it?
TG: I don’t think it was remarked on much. It was just one of thousands of papers at AERA.
PR: Can we now turn to something that did cause a major stir – your paper to IIP ’74 in Bristol? How did you come to be asked to give the IIP paper?
TG: I knew George Baron. When he became the Coordinator of the IIP ’74, he asked if I would do a paper on leadership. I said, ‘I’d be happy to do that but I have to tell you that what I would say about leadership now would be rather different from what I said a few years ago.’ I sent him a copy of the 1973 paper and he wrote back saying, ‘Forget about leadership. Write some more of the new.’ He referred to the work of contemporary British sociologists he thought I might find interesting. One was Filmer. It was from Filmer I picked up ‘Phenomenology’.
PR: You must have known some of this work anyway?
TG: I did. I’d read Silverman and a good deal of German philosophy, sociology and history, centring in particular on Weber. Previously I’d used the ‘action framework’, a term Silverman draws from Weber. Filmer’s book drew my attention to phenomenology in contemporary analysis. My critics thought it was a mistake. I remember writing the paper easily. It was all there. It was all sensible and apparent. It all came together. George gave me the title and I recall sitting down and the whole thing just seemed to flow out.
PR: In retrospect, what were you trying to say in the paper? Is it possible to pick out the main themes?
TG: I pointed to the inadequacy of social science as science and to organization theory as a foundation for management science.
PR: In Griffiths’s memorable phrase, you were thinking yourself out of a paradigm? Was that painful?
TG: It was painful.
PR: How did you come to reject the paradigm? What objections were crucial for you? Were your objections essentially epistemological? Evers and Lakomski seem to think so and so also does Griffiths?
TG: I came to see there were complexities in the world other than those that the systems framework had led me to see. I was strongly aware of the existence of alternative realities. The systems perspective offers certainty and an ordered view, but I knew from my experience such a view of the world was only one. The more interesting questions often lay in the contestation between alternative perspectives, how some became dominant and others subordinate. Power was inadequately dealt with in the systems model.
PR: In so far as it was dealt with at all?
TG: This came to me with an absolute clarity. My year away solidified my views. It enabled me to return to my intellectual roots. I was returning to understandings I had been led away from.
PR: Into the more complex social world you discovered in the study of literature for example?
TG: Exactly.
PR: A world in which motive, interest and reason are important in shaping how people think and act. In your IIP paper you used words and made claims which some found difficult to cope with. Labels like subjectivist began to be attached to you and your views. Were you ready to accept such a label when you were writing the paper?
TG: Shortly thereafter I began to use the word subjectivist. I don’t know why I didn’t use it earlier, I can’t imagine that it wasn’t available to me.
PR: Subjectivism is implied in the paper but you don’t use it.
TG: I had a sense of working alone. I was still groping to understand. When I was in England, British sociologists like Beryl Tipton wanted me to become ‘structural’, but I always resisted the ethno-marxist or critical perspective. The people I talked to were books, some old, others new. I think, perhaps, I was subject to the error the solitary scholar is apt to fall into. I was unable to check things out by talking to other people, I did it mostly by myself.
PR: Were you aware in writing the paper that you were presenting an essentially epistemological argument?
TG: I didn’t set out to study epistemology. My key issue was ‘How are we to understand the social world?’ It is not known in the way the physical world is to be known. This was very clear to me. As was the notion that in some sense we construct the world around us.
PR: Which entails that it is different – in some cases significantly different – for each of us?
TG: And so science fails as a basis for rational social action. I saw the cultural differences between the world of educational administration as it then was and the things that I was reading. I saw the difference between those rules and the rules I had grown up with in undergraduate study. To an extent I
saw this as part of a general split between European and North American modes of thinking and understanding. I acknowledged that in the paper, without wanting to drive it home too far. What I tried to emphasise was not the geographical aspect of the cultural difference, though this seemed real enough, but the different sets of ideas which some people used to understand the world. I was most clear about the invalidity of a claimed universal science using the methods of logical positivism: I was sure that was wrong and said so.

PR: Evers and Lakomski seem to argue you’re a subjectivist with regard to the physical and the social world. Is that a correct representation of your views?

TG: No. We are grounded in physical reality. That we do not escape, cannot escape, but there are other kinds of realities built on that. Schumacher makes this point. He speaks of the great Chain of Being in which the world of self-consciousness is built first on consciousness, then both upon life, and ultimately all three on a fourth, the physical stuff of the world. Each of the links in the Chain is qualitatively different from, radically different from, the ones above and below it. The living body is not the dead one, though the physical reality of both may be virtually indistinguishable. Or as Lear says, carrying the dead Cordelia in his arms, ‘I know when one is dead, and when one lives.’ That is my position now: we exist in physical reality but we are not limited by it, much more we transcend it. After all, you can still enter the Lenin tomb in Moscow and see the body incarnate, as vividly as it was the day before Lenin died. This failure to recognise a hierarchical difference becomes a source of great error: a society congealed around a distorted and malevolent perception.

Evers uses the example that you exit by the door of your office. For the most part this may be true, but it is not the last word. I could exit by the window or I could refuse to go out at all. That I cannot walk through a wall is meagre knowledge compared with how I might construe it. Is it a Wall to be wept at and venerated? Is it a Wall men may weep and pray at, but not women? Or should I take a bazooka and blast it? The interesting questions about the physical world are how we construe it. Où sont les neiges d’antan? Auden writes of returning to a city

where Euclid’s geometry
And Newton’s mechanics would account for our experience,
And the kitchen table exists because I scrub it.
It seems to have shrunk during the holidays. The streets
Are much narrower than we remembered; we had forgotten
The office was as depressing as this.

Physical reality exists within a subjective reality. It’s a slippery slope we live on.

PR: You could take some quite simple alternative cases to the one they use
about a room. You could ask what a fine paintbrush means to me as opposed to somebody else? At a physical level it is the same for everybody. But someone seeing a paintbrush for the first time would not see it as I do. Nor, perhaps, would Michaelangelo.

TG: Exactly. There’s a wonderful dialogue in The Countesthorpe Experience, which is a commentary upon Countesthorpe College and the many controversies which surrounded its development. The dialogue is between Armstrong the head of social studies at the school and Professor Bantock of the School of Education, University of Leicester. They talk about the different ways people construe the world. At one point Bantock argues that Thomas Aquinas and the mediaeval peasant did not worship the same God, nor it might be added, did they worship in the same church. Quoting Blake, Bantock says, ‘The fool sees not the same tree the wise man sees.’ To me it is obvious that the realities we see are dependent upon what we think those realities are, and this includes our interpretation of the physical world.

PR: But the argument may be easier to make in the case of the social world than the physical world. Take the case of the roles people play. It is possible for two people to share similar roles but to interpret and enact them in very different ways. We make roles, we do not just take them. I suppose the issue we have to address as subjectivists is that if you push this argument too far it is hard to see what account one could give of the social world. Social life must at some minimal level be predicated on the idea that we can work together and share understandings about what we can expect of and from each other. The question becomes how do we work together if we see the world in different ways?

TG: You have slipped from talking about the physical world to the social. The two are quite different. One is a world of ‘is’ and the other of ‘ought to be’. Consider the differences of will. We manipulate the physical world, not create it. We do not ‘create’ the social. We assert ourselves, we want to control others. The social dynamic has no counterpart in the physical world. It is uniquely human.

Attempts to control others’ perceptions are never completely successful. They work, by and large, but there’s always the possibility of the renegade and the rebellious. Patterns of social life are all ultimately controlled by the action, will and intention of individuals. We can try to organise and shape this and we spend a great deal of effort in doing so but are never more than partially successful. In thinking about this I find R. D. Laing’s discussion of the confrontation between the twentieth-century mother and the Stone Age baby very telling; ‘After fifteen years what you end up with is a half-crazed creature more or less adjusted to a mad world.’

PR: The IIP paper has been described as an ‘across the board attack’ on the kind of thinking that had dominated conventional theories about organisations and their management. Is this the way you saw the paper yourself and did you expect it to be seen by others in this way?
TG: I didn’t go to Bristol to throw down a gauntlet. I went there having written out the dialogue that had been taking place in my own mind over the last few years. I went in the hope of inviting others to join the dialogue. I certainly saw the implications of the position I was adopting and I think I spelled these out clearly at the end of the paper.

PR: I am surprised to hear that? I’ve always read the paper as a kind of manifesto for a new paradigm. Has it not been interpreted by others in this way?

TG: I didn’t think in paradigms at the time but perhaps I thought what I had to say could be accepted as inquiry. I didn’t go to Bristol to cross the Rubicon, but as soon as I arrived I began to get intimations others would see things differently. The paper had been sent to the conference and distributed to participants. When I arrived a couple of days after the conference began, there was a kind of electric tension that burst out at the session itself.

PR: When I first read it the paper made a great impression on me. I had encountered some of the ideas it contained and these had begun to make me think hard about my own position which up to then was largely that of a conventional positivist. My first thoughts were ‘Great! Somebody has thrown down the gauntlet at last and has done so in an elegant forceful argument’. I thought it a crunching paper so I am surprised to hear you did not expect it to cause the stir it did.

TG: I think it was a kind of naïveté on my part. There were people there who were toweringly angry with me.

PR: Was there a respondent? What was his response?

TG: The respondent was Alan Crane. His response was largely to ignore the paper and to seek to repair the damage. Unfortunately his statement does not appear in the proceedings. As I remember it, his text affirmed the existing paradigm. He soon came to change his view.

PR: Who were the people who spoke forcibly for and against from the floor? What did they say?

TG: For the most part, the questions and comments were neither for nor against. They were exploratory, but the atmosphere again revealed the gulf, the audience behaving like schoolboys in an assembly where a visiting speaker has said all the wrong things, explored a forbidden topic, even under the eyes of the headmaster. Griffiths’s brooding presence was very much apparent.

PR: He was present?

TG: He was indeed, he challenged me from the floor, but not before there was a forest of hands and questions after my presentation and Crane’s response. I don’t recall anything hostile from that response, only keen interest, if not support. It was clear something rather extraordinary was happening. Even before the session the atmosphere was electric. It was like a time-bomb waiting to go off, and I walked into the session with many doubts and uncertainties. As the paper had been circulated, I didn’t read it or even summarize its main points. I don’t remember what I said, I just wanted to get
the ordeal over with. I’d presented my thing, said a few words, made a few points, and Alan Crane stood up, seemingly to calm the horses, and then there was an explosion. Everyone, it seemed, wanted to say something. I remember George Baron saying to me afterwards, ‘Well, it had a slow start, but once you got wound up . . .’ He recalled an incident where Griffiths interrupted me as I answered a question. I had been saying that the dominating theorists of the field were systems thinkers – I may have added most were Americans. Later the whisper campaign against me claimed that the point of my critique was no more than a cover up for my administrative incompetence, a fight against my American nemesis in the struggle that deprived me of the Departmental headship. In any case, Griffiths interrupted at that point. ‘Name one,’ he demanded in his stentorian voice, ‘Talcott Parsons,’ I shot back. I might have added ‘Daniel Griffiths.’ Baron said he was in admiration of that exchange. Certainly from that point on the gloves were off, I have come to be deeply grateful to Daniel Griffiths for his latter day views, but it was another case in the beginning.

PR: I think I’ve met about 400 people who have told me they were there. What happened after the session?

TG: The room was full but it was a moderate sized classroom, with about sixty present. Immediately after the meeting people came to talk to me. Griffiths was seething with anger, telling me ‘You are poorly informed’ I remember those words. He then turned on his heel and left after advising me to read more. I tried to talk to him later, but it was difficult. I felt I had betrayed something, stabbed Caesar. I had always stood in admiration of him – in awe even. It was painful. I felt alone and isolated. There seemed no community of scholars, no camaraderie. If there was support, it came from individuals who didn’t count, people from places on the periphery of the great world of theory and accepted thinking about it. Four years later when IIP ’78 was held in Canada, my colleagues ensured there would be no echo of the Bristol error. I was not invited to attend or make a presentation. I watched the IIP caravanserai as it passed briefly through Toronto.

PR: What happened after the conference?

After 1974: The subjectivist year – from Bristol to Edmonton

TG: Things went quiet. I knew in UCEA [University Council for Central Administration] circles the thing would come back as a cause célèbre, I was aware Griffiths was speaking out. I began to get invitations to write, some of my later papers are a reflection of that.

PR: From North America as well as in Europe?

TG: There were exchanges in the UCEA Review. I remember by that time feeling almost paralysed by it all. I had not anticipated the bombshell that broke over my head. I began to understand the way it was seen. It was inter-
interpreted as deliberately challenging, threatening and hostile, I had not thought of it like this. I simply wasn’t prepared to mount any platform in an adversarial way. It was just not me, I didn’t want to go through some kind of trauma or intellectual combat, and for some time I felt paralysed. I felt I was not doing good work at that time, it took me a long time to overcome that fear. To accept a burden I didn’t want, a kind of curse of insight. In those years I was unsure about my insights, unsure at least that I could invoke them again to defend the original vision. That’s how I felt about it, as a vision whose source I was unsure of, and could not command. In each subsequent paper I had a sense of struggling to draw again from the deep well of insight that moved the 1974 paper. To reach the Muse, as it were, was uncertain, an undertaking fraught with risk. And in those days, the overthrow of reason and professional authority that Allan Bloom describes so well in *The Closing of the American Mind* – all that made it hard to be a scholar of any kind other than one who upheld the new political orthodoxy. It dismays me to find how often my writings are seen by younger readers as support for academic fascism then and now, for that is what it is. I learned to listen to the depths, to alternative realities for inspiration. I began to feel like Winston Smith in *1984*, beset from both left and right. I learned to listen to the depths, to alternative realities for inspiration. Though argument helped I learned to tune into and hearken to the non-rational, to return to modes of knowing I knew from the arts and my other training.

**PR:** In Britain, *EMA* [*Educational Management and Administration*] published a series of papers which tried to take up the debate. ‘Self’ in 1977–78 was a response to that symposium. What were you trying to say in it?

**TG:** I knew the argument about the social construction of reality brings in very personal issues. I realised you couldn’t just march into an assembly, as I did at Bristol, and present the intellectual arguments for a radically different view of social life and not see the personal dimensions it entailed. I’ve never seen my arguments as *ad hominem*. I aimed only at the intellectual issue, but of course you cannot advance such arguments without, as I say in my paper, cutting into something unexpectedly human.

**PR:** Were you not trying to insulate what you do as a scholar from the account you were giving of what social life is like?

**TG:** There was an element of the sorcerer’s apprentice in what I was doing. It is one thing to get all those brooms moving and another to stop them. I soon realised once it had started there was no going back.

**PR:** Are you saying you assumed that the kind of social world you were depicting would not quite apply to you?

**TG:** I was quickly disabused of that – ‘Self’ begins the march towards that recognition.

**PR:** Can you elaborate on that?

**TG:** Where does the self belong in the study of organizations? That’s the point. There are reflections of my struggle in that paper and it acknowledges that
our ideas are very much connected to ourselves, to our personal constructions of the world, and to our values. That the assertion of one’s own self and values is apt to bring one into conflict with stronger dominating expressions of self.

PR: To some you might be the dominating . . .
TG: I definitely wasn’t then. The paper began to be talked about in unscholarly ways. I discovered something about my field: its pettiness, its calcified and limited vision, its conventionality, its hostility to dissenting opinion, its vituperativeness.

PR: The attack was personalised?
TG: The attack was personalised, it was by second-hand statement, innuendo – people who had not read the paper but claimed they knew what it was about.

PR: They attacked your motives not your arguments?
TG: Some put up the straw man ‘phenomenology’ saying I didn’t understand it, this was evidence of the inadequacy of my argument. I was aware I was being attacked unfairly in an unscholarly fashion, that people sought to explain the paper in personalised terms. They began to circulate stories about my administrative competence and the business about losing the leadership of the Department started to come up. I felt beleaguered and alone.

PR: Several of the EMA contributors were sympathetic.
TG: That was in England. The first person who extended the personal hand of friendship and support to me here was Chris Hodgkinson.

PR: You have not formally collaborated? A case of two people sharing a similar view of the world and learning together and sharing ideas as they learn together?
TG: He came to me at a time I was very vulnerable. This was about the time his book *Towards A Philosophy Of Administration* came out. He had sought me out. Chris’s style means there are no secrets with him, nothing you can’t talk about. We talked of the whole intellectual furore, my changing personal circumstances, my marriage dissolving. He would talk about everything, intellectual and personal, everything others avoided in disdain, disagreement, or embarrassment. He offered the steel of intellectual argument and the hand of friendship. There were no others like him. Everything was on the table, no averted eyes, no sham, no shame, no pitying condescension. No rejection. Acceptance, but also no-holds-barred disagreements when it came to that. But always understanding and support. The first time I met him, he said something like, ‘What’s this I hear about your taking up the vices of the ancient Greeks?’ And I probably replied something like, ‘I’m not just taking them up.’ He was, as I say, a great, friendly, and supportive hand, and there weren’t many then.

PR: Not even amongst your colleagues at OISE?
TG: Not in that way. There were not the people there that I could talk to intellec-
tually or personally. I always felt my Canadian colleagues waited to see how the show would play New York or Chicago before committing themselves. Well the ‘Phenomenology’ show is still getting mixed reviews in New York and Chicago, though fringe voices like William Greenfield’s *Organization Theory Dialogue* has invited my views, as is seen in ‘Phoenix’. My Canadian colleagues have now come around, too, though often they would rather put me on some kind of honour role than ask my views on anything. At one time however some of the colleagues closest to me virtually averted their eyes when they saw the fuss and furore. There were friends but not in a way that Chris was. I never felt with Chris a personal rejection although I did feel this with other people; a sense of being beyond the pale.

**PR:** How, and in what way did you begin to affect each others thinking? Had this begun to happen when you started to write ‘Truths’ in 1978?

**TG:** I had begun to take in what he said about administration as an act of will and choice, as asserting self, as dramaturgy. In the next paper, ‘Research in Educational Administration’, I cite Sir Geoffrey Vickers, after writing to him at Hodgkinson’s suggestion. Chris was in correspondence with Vickers, who was most generous with his time and thought, though he was old and ill. The correspondence between Vickers and Hodgkinson began after Vickers had written a critically appreciative review of *Towards a Philosophy of Administration*, a book that was admired everywhere but in educational administration, where it was ignored or misunderstood.

**PR:** So ‘Reflections’ in 1978 tries to work out some of the themes raised in the debates after 1974?

**TG:** I was trying to explain again what the 1974 paper was about, going over the same ground and speaking to the critics who had addressed it in print in the United States. I make reference to Hills, Griffiths, Kendell and Byrne.

**PR:** Who first criticised your use and understanding of phenomenology?

**TG:** Griffiths and Willower did, and much of ‘The man who comes back’, in 1980 speaks directly to them.

**PR:** How were you using ‘phenomenology’?

**TG:** Not in the way some American phenomenologists were using it. I suppose you might say that I was using phenomenology with a small ‘P’, Griffiths and Willower were using it with a big one. And they insisted that if I was not using their way I must be using it incorrectly.

**PR:** This debate was conducted in the American context and with the American scholars who were key members of the ruling orthodoxy and who had been notable in defending it against you.

**TG:** For a long time that’s what I did. I was invited to these events as an *enfant terrible* to come and say again and again those threatening and outrageous things.

**PR:** What of ‘Ideology’ in 1979? In it your concern begins to turn from epistemological to value issues.

---

**EDUCATIONAL ADMINISTRATION AS A HUMANE SCIENCE**

113
TG: Here I was able to get away from the old platform. I was at last able to look ahead again, to resume the dialogue I had begun with the 1974 paper. I was able to set aside the debate and get on with the thinking.

PR: Let us turn briefly to ‘Talk, Chance, Action and Experience’ of 1979. What do you mean by experience and chance in this context?

TG: The world of chance is one the statistical view seeks to do away with. In stressing regularities, statistics leaves out irregularities even though they may explain a great deal about how the world actually functions. What is vivid, individual, living gets left out. In this paper and in ‘Truths’ I ask the question, ‘Why are we afraid of the specific?’ The argument for chance is to bring in the specific, the individual, the reality of contingency and circumstance and to recognise the importance these things can have in organizations. To take this view, is to move towards a historical view of social reality.

PR: How important is it to be clear about the notion of experience if we are to understand social life?

TG: The word ‘experience’ echoes through many of my papers after 1974. We all exist within our own phenomenological reality, that is our experience. It is a great resource, it is irreducible and it is not to be summed up in statistical and general propositions. The important point about experience is what we think we know about it and how we come to understand it. In one sense our experience is irreducible but in another it needs explanation or rather it needs understanding. It doesn’t come ready-made to us.

PR: Some of the gurus of the Theory Movement have challenged the idea that the experiences of practitioners as seen and interpreted by the latter can be an important way of understanding organizations and their management.

TG: That puts the point well. In many ways natural science is a matter of building knowledge that goes against experience. Our experience tells us the sun rises in the east and sets in the west but natural science tells us this is false, that the sun doesn’t rise at all. Just about all natural science is a supplanting of immediate experience with better knowledge. That is the approach taken in much of the social sciences and in the Theory Movement. It amounted in practice to a belief that administrators did not and could not know what was really going on. They thought they experienced something but this had little to do with the reality of what was happening.

PR: They had to have their experience explained to them to understand it. They needed a theorist to do this?

TG: Against this I would argue that while experience may not in and of itself be sufficient to understand reality, it is a crucial building block for such an understanding. Any worthwhile explanations of social reality must not contradict that experience. It may reinterpret it but it must not contradict it. This is the perspective of phenomenology, the perspective of the first hand, the perspective of the subjectivist.

PR: Natural science can explain but not understand?
TG: More and more I used images from literature and art. In ‘Ideology’ I quote from William Blake. He asked,

What is the price of experience, do men buy it for a song?  
Or wisdom for a dance in the street? No, it is bought with the price  
Of all a man hath, his house, his wife, his children’.

One begins with the experience but there is more. You come to understanding through that bed-rock, through that thing that nobody can dispense with.  
We live in experience but what understanding are we to place upon it? A social science that assumes that experience must be obliterated or replaced is wrong.

PR: Can I have access to or learn from the experience of another?

TG: The only way we can gain access to another’s experience is in symbols of one kind or another, frequently linguistic symbols. We struggle with language to put names on our own experience, to understand better and to understand others. As Schumacher says ‘There must be an altruism, I must first of all believe that there is somebody else there who is sentient even as I am, whose experience is as valid as mine and which I ought to try and understand.’ That’s a moral principle.

PR: For what purpose should I do that?

TG: In the fundamental sense of respect for others, beyond the utilitarian sense of mutuality. In a deeper sense it has an ethical base: Love thy neighbour as thyself.

PR: ‘Research in Educational Administration’ of 1979 documents the continuing dominance of the positivistic, scientistic, empiricist paradigm in the study of educational administration in North America?

TG: I attempted to set out the credos of New Movement theory. Then I examine the research that flowed from it. I was trying to show its inadequacies in theory and research – attempting to lay out the alternative directions in which we might go.

PR: You talk a good deal of Andrew Halpin?

TG: I try to understand the genesis of the Theory Movement, and Halpin was very much involved in it. He was a founding father. I don’t think anybody has more penetratingly used Simon’s ideas – a brilliant mind. I find it interesting that in his earlier writings Halpin seems to have been clearly aware of the shortcomings of the idea of a Grand Theory. He was one of those who raised questions and did so right at the beginning. It has long surprised me why Halpin and others stopped asking them.

PR: I don’t know of a more evocative set of titles than ‘The Broken Icon’, ‘The Fumbled Torch’ and ‘A Foggy View From Olympus’. Is his concern in writing these papers the same concern he expressed at the beginning of the Theory Movement? Or rather is he arguing that it is the theorists who have failed the movement rather than the theory which has failed the theorists?
TG: What interests me are the doubts he expressed in some of his early papers. In ‘Ways of Knowing’ he ruminates on the idea that the way scientists know is not the way that administrators know. He recognises there are ways of knowing that are non-scientific. But later on, he put these doubts aside and becomes a committed convert to the New Movement. At the end he is saying that the Theory Movement failed because the following generation of researchers watered down and despoiled the pure and potent methodology, the vision the founding theorists handed down to them from Olympus. The methodology was not done the way it should be, the acolytes failed the priests. The rite became impure. So, I would question your statement that Halpin thought it was the theory the founders offered that was betrayed. Halpin was under no illusion that such theory existed. He complained bitterly about loss – the loss of the methodology. The rite – the methodology defined by Simon and in logical positivism generally – was no longer performed by knowledgeable and competent practitioners. Halpin went back to believing in pure positivist methodology, setting aside all his earlier doubts that it was adequate to the task set for it. It is those doubts I offer in this paper as foundation for a critique of the Movement.

PR: If this approach will not do, how and what should we research in educational administration? You begin to address these issues in the paper.

TG: I need to make an observation before I try to answer that question. We should ask ourselves why a flawed science persists. Why a science that does not work is still hailed as science. An answer can be found in the argument MacIntyre advances. There are strong reasons for believing in such a science, even if it doesn’t work. It offers a world in which there are answers to all problems. You must have been at sessions where the science of effectiveness is preached. It is a world of cheerfulness and certainty. The alternative is conflict-ridden and uncertain, opening up the pain that comes with recognising the different realities we live in, of confronting the value chasms that separate us. The Canadian government hires conflict resolution ‘experts’ from America to ease the acceptance of its proposals for constitutional change. We want to believe such a technology exists and that it works to remove the value gaps separating Canadians. Welcome to the world of management science and the relief managers or politicians feel as their responsibility for value choice is devolved into a technical, non-responsible realm where choice is a product of scientific analysis, not personal judgement. Choosing responsibility leaves one in an exposed and vulnerable position, and so science comes to the administrator’s rescue: science not the administrator makes the decision, thus absolving the administrator from responsibility, while giving strategic advantage over the choice.

To go back to your question, we should be studying decision-makers, how they make their decisions and what they decide. It is a conclusion I come to with assistance from Vickers and Hodgkinson: that a science of values is meaningless, that science cannot resolve value differences, though
for strategic purposes we may wish to say it can. Without science the administrator simply makes choices. The choices made may be good or bad, but someone is responsible for them. This is a hard road and one reason why it is difficult to be a manager and why managers look for help from science. And finally I would note the paper argues that the proper role of research in the face of these dilemmas is description.

PR: How do you justify the existence of scholars of education administration given the assumptions you have outlined? How can we help?

TG: We can help by enabling administrators to understand their experience better. One of the implications I drew at the end of my 1974 paper said the study of educational administration should use the social sciences as windows of discovery, windows into alternative perceptions, windows into alternative values.

PR: In thinking about the way in which we construct reality, how do you see the balance between reality as individually and socially constructed?

TG: What the social researcher is doing is launching out upon an inquiry into other people’s realities. I assume that the portrait can be of value not just to the researcher but to people within that social reality as well or to others who have interests in it.

I would also hope that enquiries into social reality make plain the contestation, the different visions of reality that people have, of how one prevails over another, of how power is used to sustain and propel certain views over others, and to ask what the consequences are. But I do not see this yielding the technology of control that management research seeks. The research I have in mind offers the hope of achieving insight into social realities. It is overwhelmingly descriptive and historical. It looks for insight, but first it is descriptive. It records decisions and points to their implications.

PR: Can it help to improve things?

TG: Maybe it can but not in an instrumental way. We are not looking at physical reality but at a chancy, value-driven cultural enterprise. All we hope for is a better vision beyond the shadows in which people will somehow rise to what is good to what is better. It can bring us to argument, to better argument, to an appreciation of people and their values behind the argument. That is my position: description first, followed by argument and ultimately, of course, prescription. While positivistic management science wants to shut down argument by calculating the answer, I want to open it by standing at the gulf that separates us, by recognizing the chasm that must be overcome.

PR: I know ‘The man who comes back’ of 1980 gives you satisfaction, not least because of those marvellous quotes from Francis Bacon in the beginning. Why is it significant for you?

TG: It’s a paper written after I had come to terms with my homosexuality, not that there are references to homosexual realities in it, as there are in some others, ‘Anarchy’ for example. But in this paper and for the first time I let a
part of myself that I had earlier suppressed speak freely. This paper comes from the heart, not just from the head. Here I began to use strength out of gay realities to say something about the world. I drew strength from myself, from newly understood experience, to call upon the Muse, and to let myself speak the truth I saw. From that special reality I gained strength. The horrible uncertainty of the past, the doubt that I might have something to say to the world was largely assuaged, if not completely exorcised. ‘The Man Who Comes Back’ is a paper where I address my critics, but also advance the argument. I look at some of the deepest conundrums of understanding social reality. In doing so I don’t think I ignore my critics. I am attentive to what they say, but at the same time, I speak past them, trying to build a framework of sound understanding.

PR: And it’s built around nine propositions?

TG: It ends with those nine propositions saying how we might understand organisations. It seemed to have no impact in the central academic institutions of educational administration in North America. To this day it goes virtually uncited, as is apparent in the record of the major American citation index. Though EAQ [Educational Administration Quarterly] is sometimes reluctant to publish my papers, the editors know they represented good business. Issues in which they appeared were good sellers.

PR: Can’t get a better quantitative test than that!

TG: I attribute this response to the interests of students and junior faculty who read my articles almost as a subversive activity. One colleague starting his academic career told me recently students were enthralled or profoundly troubled when examples of my writing were offered them.

PR: ‘Anarchy’ of 1983 sketches an anarchistic theory of organisations, but does not draw on traditional anarchistic notions.

TG: I am using anarchism here, in the sense of an awkwardness of things, of things that don’t fit, of an unwillingness to participate, of a non-intended, but ultimately conscious rebelliousness. At the end I talk of the anarchy that adheres in all thought. It’s a personal statement in many ways. I am no longer addressing critics, I am simply stating my position. I suppose in a lot of my work there is a theme of the individual versus the organisation. I am for the individual, I am for freedom, for independence.

PR: Some of these papers reflect a return to themes you touched upon at the beginning of your academic career. Themes to do with leadership. You appear to be trying, in part, to bring this up to date with your contemporary thinking?

TG: In ‘Non-Natural Order’ of 1984 I take up Halpin’s ideas about ways of knowing. There are ways of understanding and expressing knowledge that are powerful, satisfying and important, but non-rational – ways that are essentially cast within an artistic, literary, historical, philosophical even journalistic mode. A mode that is descriptive, withholding judgement, though moving towards it, moving to insight.
PR: You began to develop an approach to understanding leadership which entailed taking examples from literature which illustrates the analysis you want to make. In the paper there is a long section from *A House for Mr Biswas*. Why did you decide to use this?

TG: I found myself drawn to the book. It is powerful, evocative. Perhaps in it I saw something of my own experience. It tells us things about education which, narrowly conceived, the social sciences can’t begin to approach. It helps you to understand what education means, and what a painful process it is, if it works in a deep and fundamental sense. I found it a tragic expression in one sense and hopeful in another.

PR: What does it tell you about leadership?

TG: That leadership is more than an individual phenomenon; it is a cultural thing, that it’s embedded in whole lives, whole lives within cultures. The programme of education we see in *Biswa* is certainly not ‘implemented’. We see elemental cultural dynamics at work. There is a kind of leadership in what Naipaul describes, and Biswas is a leader too – he leads himself. ‘If you would be a leader,’ said Bethune, ‘first lead yourself.’ That’s anti-leadership, and I admire it, as I do this sentiment from Mackay, a Canadian poet: ‘Rend your heart and not your garments.’ Whatever the power or restriction of the wider culture, the person within it who thinks right, believes right is of ultimate importance.

PR: The idea of knowing yourself as a route to understanding educational management is a recurrent theme in your work. Along with the belief that the kind of excessively task-orientated approach to leadership development advocated in much of the literature is not a promising way to hope to achieve this.

TG: Technocratic approaches to leadership and technocratic approaches to literacy are empty. A text like Naipaul’s has more to say about illiteracy, say in the inner cities of England, than many of the technocratic studies that are talking about effective teaching. They do not begin to touch the power of insight Naipaul offers, insight into the importance of tradition. Mr Biswas moved from poverty in rural Trinidad to seeing his son embarking for Oxford. That is an awesome journey, but it is carried out within a tradition of knowledge, and reveals the dynamics that ultimately bring about change. These are not simple, technocratic variables, they are deep-seated attitudes towards knowledge. Biswas’s life tells us that all education is in one sense invasive of individual experience. What Naipaul lets us see is the shaping of the individual in line with cultural values.

PR: Coming to grips with these things has been a kind of twenty year odyssey for you. Who have been your guides as you struggled to think through the enormously complex issues that you have been trying to come to terms with? And are the old ones like Weber or Laing being supplemented by a very different set including Naipaul and Shakespeare?

TG: First a methodological point in terms of a question: ‘What represents the
world and allows us to understand it?’ The claim of empiricist social science of course is that we can know reality only through its restricted rules. This is dangerously wrong in that its representations of the world are both limited and impoverished. What I came to realise is that other modes of representing the world are not just a supplement, as some people would see it, to the stronger objective and powerful understandings of science, they are true alternatives to it. But of course, they do not lead to what science promises us – control. So we follow the narrow route of science because of the false promises it offers. It doesn’t offer control, or if it does, in a very spurious mode. There are more fundamental and powerful insights into reality. These are descriptive; they do not yield control. You look at the life of Mr Biswas and it doesn’t tell you what to do, it doesn’t tell you which variables are to be manipulated, but it does give you an understanding and appreciation. It gives you what Sir Geffery Vickers calls ‘appreciation’. There is that value-oriented stance again. A novel like Mr Biswas allows you to appreciate what was involved in the building of literacy. It has powerful policy implications but they’re not the kind that you deduce in the way that empirical scientists claim to do. The inference in empiricist science is supposed to be obvious and logical, I doubt they are. In ‘appreciation’ that obvious logic does not exist. One understands and comes to value. A look at Mr Biswas would incline you to evaluate education as a desirable end in itself – you certainly wouldn’t do it for a productive reason, you would do it for what it says about the maintenance of culture and what it offers the individual even though all individuals would not benefit from it. So the implications that I would draw there run against the kind of production-oriented, mechanistic, market-driven analyses that we have now. You invest in education in and of itself. But the power of that investment can be such as to transform the individual and – possibly, ultimately – the culture itself. That is how change comes about.

PR: I am trying to understand the way your thinking has developed, as opposed to where you are now. Can we consider this in three questions: First, ‘What can I know?’ Secondly, ‘How can I achieve such knowledge?’ and thirdly, ‘Who can help me to know?’ And in considering each of those questions, can you also say something about the sequence in which your ideas have developed? What came first, what next and what last?

TG: Initially, I was seduced by a methodology that, collapses the first two questions. The first becomes irrelevant and the second all-important. The argument I’ve been making is that logical positivism offers us a shrunken view of the world. It offers a methodology for manipulating reality so as to control it, a methodology that promises more than it actually delivers. It ends up hiding more than it reveals. In terms of the nature of knowledge, I’ve turned my back on the people who were my mentors in educational administration. I have found myself going back to ways of knowing and bodies of knowledge that I had encountered much earlier. On coming to
educational administration I concluded that my earlier knowledge was useless, or more exactly, valueless. This paper recognises that those other bodies of knowledge are relevant and may be powerful. That they are not just supplements to what social science lets us understand, but are truly unique insights in their own right. Partly because they are not paralysed by the only way of knowing recognised in positivistic social science.

PR: How does art relate to social science?

TG: I don’t think we should see art as another kind of social science, the two are quite different. There is a role for social science as social science. It’s a very complex role, and it is not the social science that is envisaged by logical positivism. The vital point is that the arts are not to be cast into the role of a lower level support to social science. Studies of the humanities and educational administration say, ‘To illustrate the principles established in social science, to colour them in with the tones of fleshy reality, one draws on literature and the humanities.’ You read *A Bell for Adano* or view *The Bridge on the River Kwai* to add weight and relevance to general principles, colouring in the laws of social science. Everything, including *King Lear*, can be brought into the service of social science. But for me the arts are not to be so easily dragooned to serve the propositions of social science by adding convincing evidence to support what such science has already established. Much more the arts speak to questions of how to live a life. People who make policy based on what social science tells them will need something more. They would do well to call on the humane vision that the arts can give.

In this view of the arts, they are not simply a parallel vision of scientific truth. Theirs is a starkly different vision, one in which moral questions are to the fore. Should Henry Kissinger weep at his desk before ordering the fire of napalm to be dropped on peasant villages, a question raised in Wallace Shawn’s play, *Aunt Dan and Lemon*? Would such weeping make it impossible to do what has to be done? As Northrop Frye has said, ‘We don’t go to *Macbeth* to learn about the history of Scotland, but to understand what it’s like to gain the world and lose your soul.’ Somebody who understands that is a better person, certainly a better person to be in a leadership position.

PR: But how does it help you with the identification and education of such leaders?

TG: I have proposed that leaders require a period of withdrawal and contemplation, that is what I would see as the role for training. Certainly there is a role in training for the provision of information, concepts and theories. But I think the most valuable form of training begins in a setting of practice, where one has to balance values against constraints — in which one has to take action within a political context. I think only somebody who has acted in that way is ready for true training in leadership. In that context I would be Platonic, not striving to make philosophers kings, but kings philosophers, or artists maybe. To make them more humane in any case, more thoughtful of their power, more aware of the values it serves or denies.
PR: Aristotle and Plato were not all that successful when they actually tried their hands at leadership?

TG: Which takes us back to the idea that the practising administrator may know something the philosopher and the theorist do not know, and vice-versa. I think we have to bring those things together. The ultimate training of a leader would be a kind of philosophical withdrawal to look at the larger issues in fresh perspectives. Perhaps they will return and administer as they were doing it before but with an added insight. That’s all I can see as a hope, that there is an added insight. A deeply clinical approach to the training of administrators is needed, as it is for teachers. Our training for both is disjointed, reflection is separated from action, thinking from doing, praxis from the practical. Why do we merely throw people at these jobs, expecting then to do well with almost no experience of them, offering them no analysis of their experience? The answer seems to lie in a virtually anti-intellectual bias, in the belief that experience alone, shored up by quick nostrums of science will turn the trick.

PR: There is a practical hope as well?, That they will be better leaders for it?

TG: I think there is. One of the things I have sensed in speaking to leaders in education, is how impoverished their real world is. They don’t see beyond a narrow horizon. They don’t see the problems of education, except in rather technological terms, or if they do see it, if they talk about it in larger terms, they are sentimental or platitudinous. We need leaders in education who can think about some larger issues, it’s the only thing that’s going to save it. It is interesting that the reports we get from Japan indicate that is the way they see administrative training. Junior officers entering government or business spend time just sitting and contemplating the beauty of the flowers. Senior people are expected to have a sense of history, of their own culture, of what is ultimately of value and they spend time on such things. Yet these things may seem non-productive, though of course the practical never escapes ultimate attention. It isn’t just navel-gazing or New Ageism. Can we expect our educational executives to think of larger but seemingly non-productive matters? I hope so, but it will be an uphill struggle to bring them to such contemplation. Perhaps we need different kinds of executives in terms of character and vision.

PR: There are examples within western culture which have looked back at such folk, they can sometimes be very nasty in practice as well.

TG: What are thinking of, the Mandarins?

PR: I was thinking of Cosimo de Medici. Machiavelli’s Prince is a highly cultured person with a great understanding of many things but would you like to have him as a role model for educational leaders?

TG: I’d rather have the Prince than the technocrats of today. Machiavelli helped him to understand what he was doing and why. I would prefer that to the people who are being swept over the precipice and don’t realise it.

PR: He understands politics and people. Is that not an intensely control-orientated vision?
TG: Not in the technocratic sense. It is control in the political sense, the lawful sense.
PR: Is that an important distinction?
TG: I think so. Certainly organisations are control orientated, but my theme is that they should not work through a mechanistic kind of control, but rather through a lawful, personal, responsible form. That is the point emphasised in the title of this paper, the idea of wilfulness and non-natural order. The idea that the organisation is not natural, it is created out of somebody’s intention, purpose and will, and the people who understand this and its implications for theory and practice are the ones who will control it. That is the nature of organisations. The people who run organizations ought to understand this. Therefore, I prefer the Prince even though he is selfish and egotistical. He does not pursue the best goals but he knows what goals he is pursuing and how to pursue them. Hodgkinson would say what we need is an amalgam of Machiavelli and Plato, a Prince with better ideals. We need a Prince who knows he is responsible, not one who thinks science removes his responsibility or who manipulates us behind the mask of a fraudulent science.
PR: Plato did not seem to have somebody like the Prince in mind as a model ruler in the Republic. He believes if you are egotistical and selfish you will become the most terrible prisoner of your own vices and desires. He propose a form of selection and training which would liberate his guardians from this danger but he was not too precise about how you might achieve this.
TG: I don’t think there is a technology for that. All we can do is work with the character of leaders. This is a distinction which Hodgkinson makes. Whereas studies of leadership in the positivistic mode have looked at the characteristics of leaders, what is important is their character. I think we look at the Prince and deplore his character, but how do you get people of good character into leadership positions in organizations? That would be the answer.
PR: But isn’t what Machiavelli proposed predicated on somebody who is like the Prince? Can you be other than the Prince if you operate in the kind of way that Machiavelli is proposing? Could Plato’s Philosopher Guardian operate as Machiavelli’s Prince is advised to do without becoming the Prince?
TG: We must hope it is possible. That is why I put emphasis on a withdrawal from the exercise of power so that leaders can examine what they are doing. The headlong pressure to act, to do, to be the leader militate against a reflective attitude – a stance that is needed for the growth of worthwhile values, of character. That is what I see as the ultimate in the nurture of leaders through training. It would be aimed at persons in power, fostering awareness of values and of the value choices that face them, and thereby perhaps assisting character growth.
PR: So the effort is not to make them effective leaders, but to make them good persons first?

TG: To make them good persons, yes. I’d remind you that in German, Machiavelli’s genre is known as *Furtenspiegel*, writing from the ‘mirror for princes’. Seeing himself in the mirror, the Prince is to be transformed.

PR: Even so what makes a good leader? What, for example, makes St Paul a good leader? Why was St Peter less effective as a leader than Paul? How do you help leaders to be better people *and* more effective leaders?

TG: Paul, is a perfect example. He receives a blinding vision on the road to Damascus with a new moral insight and thereafter he combines, what you might call political strategies with mystical experience. ‘For now we see through a glass, darkly; but then face to face.’ He shows us what it is to be a good leader. His combination of vision with untiring effort and endless recipes and advice for making things work, seeing where values require taking a stand on what matters, and working out their implications in practical reality. For example, his decision to make Christianity more than just another Jewish sect by his abandonment of the old Law and circumcision, opening the new way to *all*, to Gentile and Jew, to women, to men, to free-born and slave, the insistence that redemption was open to all. That’s leadership, and it has a political element woven with the visionary. He is filled with concern for the world as it is and how to change it and organise it but at the same time he is touched by, in this case, a transcendental vision. The role that I see for the arts is the one that gives us some insight into the larger values, and that I think leaders very much need.

PR: That is one thing the arts could do. They could also give leaders an insight into motive and intention and the operation of will and the relationship between each and all of these things and actions.

TG: One of the implications of accepting a world of multiple realities is that leaders need to appreciate the realities that they are overriding in the pursuit of those they seek to inculcate. Again this requires a kind of withdrawal from the immediate reality to understand the complexities and the alternatives. But the leader cannot contemplate forever, contemplation must stop sooner or later and action must begin. But there is no calculus for resolving a conflict of values, a conflict of separate realities, except through force, varying from psychic to physical.

PR: Can we examine ‘Critical Perspective’ of 1985. It offers an economical yet comprehensive account of your thinking on educational organisation.

TG: What it represents in terms of something new, is a study of the foundations of our field in the work of Herbert Simon and Chester Bernard, especially Simon. Here is where I began to consider how Simon built up a foundation and pushed the field in a mistaken direction.

PR: What do you see as the mistaken direction?

TG: He established logical positivism as *the* methodology of the field. In doing so he understood it could not deal with values: there is no science of
valuing. Simon recognised that. His solution removed valuing and purpose-
ing from the science of administration. His science came at the price of a
neutered administrative practice, deploring on the one hand that administra-
tors make choices out of their own values, creating on the other the adminis-
trative ‘moral cipher’ as the model for scientific action. In that sense, Simon
is worse than Machiavelli, much worse.

PR: He had a very technicist view.

TG: He scientised the field by eliminating the value choice questions. His whole
aim was to reduce decision making, to eliminate values in choice questions.
His whole aim is to reduce decision making to a calculable system. The only
way you can calculate this is if there are values established within it. So
Simon’s perfect administrator is a neutered cipher. Interestingly, he began by
trying to understand what he called the ‘psychology of human choice’. But
ultimately the thrust of his logic brought him to the study of artificial intelli-
gence, as is seen in his model for choosing a diet that was maximally nutri-
tious and of minimal cost, as though religious rules of diet were meaningless,
and as if food fads and fetishes had no force. The endpoint of Simon’s
thought is HAL of Kubrick’s 2001, the computer that is superrational, but
non-human and non-humane, making up for the deficiencies of human think-
ing by obliterating the human power to have values to choose.

PR: What of Chester Barnard?

TG: Barnard saw the task of the executive officer as building a moral order. That
is the nature of organisations – a moral order in action. The building of that
order is, as I see it and as Barnard saw it, a wilful thing. So if you put Simon
and Barnard together, you create the perfect combination. Barnard was
much concerned about purpose and the building of commitment through
communication. These were the foundations of his concept of administra-
tion, defining an administrator who was value-concerned and active on
behalf of them. All that Barnard’s administrator strove to create Simon
assumed as givens in the administrator’s world. Simon focused only on
what the administrator has to be to achieve the values handed to him and to
achieve them efficiently. But Barnard and Simon are not seen in a
complementary sense within much of the subsequent literature. Rather
Simon becomes a replacement for Barnard, as superior because he is scien-
tific. If you look at early editions of Simon, there is an introduction by
Barnard in which he says virtually the same thing. He too was dazzled by
the promise of Science.

PR: Even Barnard?

TG: Even Barnard. He speaks of Simon’s book as being the next wave, as some-
thing standing on the base of what he offered. I don’t think he saw that as
entailing a destruction of the base.

PR: To what extent is ‘Decline and Fall’ of 1986 concerned with similar issues?

TG: Very much. It takes up where the previous paper leaves off. It looks at what
Simon offered, at the difference between Simon and Barnard.
PR: Is there anything else in this paper that we should note at this point?

TG: I mention the classic work, *The Consolation of Philosophy* by Boethius, and this is to make the argument on the need for reflection. The story of Boethius is touching. He was a Christian who stood at the hinge between the Roman World and the Middle Ages. He is an administrator, one caught between the Emperor and the Pope, or as it turned out, the wrong Pope. He is condemned, and as he awaits his death he thinks back on his career and writes, thus bringing new insight to the administrative task. Few of us will face the horror that Boethius did, but I am convinced that potentially there is that same dimension in all administrative rule, a kind of horror. The wielding of power is terrible, and the more power, the more terrible it becomes. If there is to be a kind of humanising of that power a contemplative, philosophical dimension must and should be brought to it. Perhaps to do the thing at all requires the kind of withdrawal which I have advocated, and a need for a meditation on values.

PR: Some of your work has an epistemological focus some deals with aspects of value and its place in the study and practice of educational administration. Both themes are present in the last two papers. Both were written in 1991. The first is ‘Phoenix’ and the second is ‘Science and service’. They read, to an extent, as an *Apologia pro Vitae Sua*. Do you see it like this?

TG: I feel rather like Prospero, I guess, looking back on a career.

PR: Prospero voluntarily gives up the power of magic at the end of *The Tempest*?

TG: Shortly before I wrote this paper I retired. So this is a retrospective view of the controversy in which I have been involved for close on twenty years. I had these things that I wanted to say stored up.

PR: You try to look back over developments in the field as well as the debates in which you have been involved over the last two decades. You try to make sense of the field as a whole, but as you do that, new things come forward like the book from Evers and Lakomski.

TG: That’s right!

PR: Which is a new challenge, a rather subtler one philosophically than the some that had come before?

TG: I finished the paper knowing that it was not a final testament after all. The debate wasn’t finished. There’s a whole new phase, a new era of issues and controversy, but that makes me feel good. I like to think I had some part to play in what’s happening now.

PR: Certainly in this case, they much value your work.

TG: A surprise after all this time.

PR: I think *Knowing Educational Administration* is in many ways an exceptional book, But I can’t help thinking that Evers and Lakomski have been brave or foolhardy or both. The scope of their thesis is immensely broad. They have been pretty reckless in the potential enemies they might make given the range of critiques they present. But of all the critiques, yours is
the most understated. It is one of the longest in the book, but also one of the
most tentative. Whilst they acknowledge its strengths, they seem rather
more critical of Hodgkinson’s work. They are also critical of the critical
theorists.

TG: Perhaps they see Hodgkinson as the more dangerous opponent philosophi-
cally. His comment on the book was that the value–fact divide recognized
over 2,500 years of philosophy is not so easily unhorsed, that naturalistic
coherentism hasn’t done it. I take great satisfaction from what they have
said, not just because it is appreciative, although it is that, but because they
pay attention to the text of what I have written. They pay attention to what I
said, even though their view of it is rather selective. They don’t look at all
of my writing over the last twenty years and I wish they had looked at some
of the other things. But what they look at, they look at squarely and care-
fully.

PR: And they’re critical of others who don’t.

TG: Exactly. And that is something which has aggrieved me most over the
years. Too often I have been personally attacked rather than attacked on the
basis of what I have written. That has been a cross to bear over the years. So
it is satisfying at this juncture to find critics with whom I may disagree, and
I’m sure I will, but who understand what I’ve said and deal with it.

PR: Your work has often been associated with that of Hodgkinson. How have
you influenced each other’s thinking and what kind of intellectual debt do
you owe each other?

TG: The debt he may owe me is that mine was the initial breach in the wall. I
began discussion of contentious issues. This opened up the field and he has
marched through that breach. It was likely he would have done so anyway
but this breach was there to use and I think he used it. He has gone much
further with the questions of value than I did initially, and so what I owe to
him is a better understanding of the world of values, and perhaps he has
saved me – I’m not sure that I’ve been guilty of the relativism that some
people have accused me of. I don’t think I ever took that position, people
misunderstood the fact that I wanted to look with open eyes at the different
value positions that people live by, and to recognise where conflicts of
values exist. I don’t think this is to claim that there is no way of arbitrating
between them, but my task has always been to put description first. That’s
the message I have tried to leave – description first and prescription second.
And to emphasise that prescription does not logically follow from descrip-
tion, it cannot. I guess I largely set aside the question of how one is pre-
scriptive, although I recognised that one must be ultimately. Hodgkinson
has addressed such issues much more centrally and much more fully. There
is a difference: Hodgkinson has said to me I am the better writer – perhaps
or perhaps not. But I have been able to get attention that he does not. A kind
of interaction occurs between us; together we are a kind of reciprocating
intellectual machine.
PR: How are you alike in what you are trying to do?
TG: We’re alike in our opposition to positivism, we’re alike in our awareness of values generally. His appreciation of values tends to be more classical and philosophical, maybe Platonist. Whereas mine tends to be, perhaps ‘artistic’, because I draw upon roots to seek an understanding of value. I think it’s also the case that I acknowledge a spiritual tradition more strongly than he does, although it’s there with him as well.

Perhaps he draws on an eastern spiritual element whereas I am more likely to find it in Judaeo-Christianity. There is a religious or spiritual tradition in my work whereas this is less prominent in his other than in his references to the eastern religions. But even this he interprets in an almost secular way. But no one can read *The Philosophy of Leadership* with its orchestrated and plangent credos without knowing that this is a work of great moral architecture, profound and moving. There is a kind of flirtation in my work – an obsession even – with the religious, a sensitivity at least to the spiritual. Some readers have pointed out that Biblical imagery suffuses many of my texts, and these appeal strongly to those of a religious cast of mind. Even so I hope my work carries no stigma of a doctrinal emphasis, although in some sense it moves within the Western spiritual tradition.

What I have taken from Hodgkinson is his argument that a social science of organization can never replace an understanding of administration itself. He deals with the existential reality of the administrative act as virtually no other writer does. He is a fine philosopher, insightful, expressing the power of ancient and modern thought, revealing its essence in pungent human terms. His knowledge of the management literature is profound and he leads the way to deeper and deeper insights into it. He is relentless that technique, ancient or modern, can never supplant the wilfulness of human action or release human agents from responsibility for it. If there are ideas from Hodgkinson that have influenced me most, they are the irreducibility of value choice and the unavoidability of human responsibility for that choice. Free will in some measure at least, and that is where the struggle with Evers and Lakomski begins. They deny mind and free will, reducing everything to matter, arguing as Evers has said that it is easier to physicalise the mental than to mentalise the physical. In opposition to that dehumanizing proposition Hodgkinson and I are united.

PR: One sense in which I see you as somewhat similar is that you are both scholars in the traditional sense of the word. Neither of you is known now as a researcher.
TG: I accept that, but I would also argue that we ought not to draw a sharp line between non-empirical scholarship and empirical scholarship. I mean they are both enquiries, and one needs the other.
PR: I don’t deny that for a moment but you did much of your research when your thinking was influenced by the traditions you have now spent many years challenging.
TG: Yes, though I have done more beyond that than people recognise. But I cer-
tainly accept the judgement that I am not an active empirical researcher.
PR: I have tried to frame a series of questions reflecting the criticism that your
theories are invalid, since you have done little or no empirical research in
the light of them. Can we consider them?
TG: I travel this ground reluctantly, for I have been over it many times before,
most recently in ‘Phoenix’. Before taking on the individual questions, let
me suggest that they boil down to a single point: Why can’t Greenfield
abide by the rules of the game set down in the systems–empiricist paradigm,
which is after all the only rational and desirable one? That question consti-
tutes a strategic denial of my arguments, a strategy that rules them out of
order before they are even considered. Do I again have to cite opinions to
the contrary by Culbertson, Griffiths, Evers and Lakomski, and others? Do I
have to make a defence in a court ignorant of those judgements or at least
disseminate of them? Past pleadings in front of that court have been fruitless
and give ample evidence that those who pose the charge often fail to hear
the answers, let alone weigh them in balanced judgement.

The reason for this recalcitrance on the part of my critics is clear, as
Hodgkinson shows in his Foreword: ‘He touches the point with a needle’.
The implications of my work are seen as so threatening and revolutionary in
some quarters that the only defence against them is to deny that my posi-
tions carry sense or weight, to seek to invalidate them as having no empiri-
cal support. I am reluctant to push this analysis, but the recrudescence of
such criticism in ever new forms and from varied sources makes it all the
more important to address the issues again. And this, I know, is your argu-
ment. So let’s look at it again in the separate aspects you enumerate.
PR: Let me put the questions as five propositions. That theory is valuable only
insofar as it is useful in research?
TG: This proposition is cast within the assumptions of the systems–empiricist
paradigm. It refuses to see any other kind of enquiry as a contribution to
knowledge. As Schumacher says, even the slenderest knowledge of matters
of profound importance is of great value. If ‘adequate’ standards of inquiry,
as Schumacher describes them, are acknowledged, my work is a kind of
research. While not profound itself, my work ‘adequately’ addresses issues
that are. I hope it has yielded at least some slender knowledge of these
issues, knowledge that other methods cannot generate.
PR: That your work is not and has not been useful by this crucial criterion of
research as it is usually understood.
TG: Perhaps my work has not been useful by that criterion. But that is the heart
of the issue. The whole thrust of my argument is that there are other more
‘adequate’ criteria for building knowledge.
PR: That there is a failure by the missing research criterion is demonstrated by
the fact that to date not a single researcher has used your ideas.
TG: That no researcher has used the ideas I have espoused is true only if the
criteria and assumptions of the systems–empiricist paradigm are imposed as a Procrustean bed for the whole field. That those who live encapsulated within the systems paradigm do not use these ideas is hardly surprising. But it is false to claim that my work has influenced no researchers to take up new modes of inquiry. There has been a ‘sea change’ in the field and ‘turmoil’ as Griffiths and others acknowledge: part of that transformation, as these commentators recognize, is due to my blazing the path.

PR: That in any case, it would be difficult to undertake research on the basis of your ideas, since these change significantly from paper to paper and lecture to lecture.

TG: Surely it is not to be seen as a negative quality of my work that it has changed and evolved over two decades, that the critique has not sprung Minerva-like and fully formed from the head of Zeus. Instead it has come slowly and with some pain from a human being struggling for understanding over two decades of work. Surely recognition of this struggle is not to be taken as serious criticism of the effort over those decades. It is possible to see a thrust in the development of ideas in my critiques. If there are changes in that critique, they are not simply erratic and do not constitute abrupt or ill-founded changes to suit the ideological winds of the time. There are developing themes in the work and these have been identified most recently in ‘Science and Service’. You have noted the other side of this coin, the face of it that says, ‘You have tended to reproduce rather than advance significantly your ideas since the IIP ’74 paper’. That I must face the inherent contradictions of these twinned criticisms suggests to me that they come from those who are acutely uncomfortable with what I have written. Their response is less reasoned argument than a reflex that rejects or ignores what lies behind them. They have another agenda to pursue.

PR: That these criticisms go a long way towards explaining why your work is not much quoted in the United States, is not popular, and has not ‘caught on’ there.

TG: The observation about the ‘point of the needle’ is explanation of why my critique has not ‘caught on’ in the United States. It is unpopular wherever what Frye describes as ‘Mercantilist Whiggery’ prevails. Writings such as ‘Phoenix’ where I critique the ill-effects on education of such a world view are unlikely to be received with joy and gratitude in cultures that accept the excesses of technocratic–pragmatic, systems–empiricist, individualist values as received and unopposable truth. But it should be noted that ‘Phoenix’ was commissioned by an American group and presented first from an American platform to a small but appreciative audience.

On all of these points, a more balanced judgement will surely be possible after the results of the programme we are engaged in here appear in the Routledge collection. After its publication, I would hope to hear the opinions of those who may bring an open-mindedness to the issues and ulti-
mately a balanced appreciation of them. *De quistibus non est disputandum*. I am willing to let the matter rest with a ‘trial by what is contrary’, as Milton described the process of truth making. In such a trial, I ask only an opportunity to present my defence, hoping not to be ruled out of order for wanting to argue it.

PR: What of the final paper in the collection? Why did you write it and what were you trying to achieve with it? How does ‘Science and Service’ relate to ‘Phoenix’?

TG: ‘Science and Service’ was written six months after ‘Phoenix’, the two of them being a keystone in the arch of my writings. I did not set out to make them serve such a crucial role nor even conceived them as linked. As usual the papers arose from invitations. After word of my retirement spread I began to get invitations to write – anything at all, just write. The invitations to do these papers came early and as invitations to speak about issues that arose during the last two decades of controversy in administrative studies.

‘Phoenix’ is a synoptic statement revisiting the issues of the past two decades. It attempts to secure the ground that has been won and to extend the implications of the argument into new territory. I delivered ‘Phoenix’ not only at AERA in Chicago but in seminars at the Universities of British Columbia and Victoria. These presentations began the questioning anew.

‘Science and Service’ puts values central to its persuasive structure. It speaks from the heart, and in return has engendered strong reactions – for and against. It speaks to others’ hearts too. The fundamental issue in both papers is the same: what place can values have in a science of the social world, in purposive, administrative action within it? If ‘Phoenix’ did not answer that question, it had at least pointed the direction in which the answer lies. In beginning to write ‘Science and Service’, I knew I had to speak to the challenge from Evers and Lakomski, but I did not want to make it only a response to their work. That may come later. Rather ‘Science and Service’ does a march around Evers and Lakomski, it outflanks their fact-driven position by making values central to the whole argument – or rather by making the choosing of values central to that argument. In Evers and Lakomski’s argument, the choosing of values is reduced to a process that lies essentially outside human will: they solve the value problem by obviating it. As Evers says, their answer is to ‘physicalise the mental’. Values are genetically encoded, I suppose, and scientifically discovered.

When I presented ‘Phoenix’ at a seminar at the University of British Columbia, I was surprised by a question that asked me to clarify my values. I was taken aback. I thought I had done so, and listed the various value positions I had taken in the latter part of that paper. Later I realized I had not spoken to the heart of that question, how one values values.

In ‘Science and Service’ I bring the fact–value dichotomy into the existential reality of making a value choice out of facts. I take seriously the Weberian argument that rationality itself stands upon a non-rational choice. The paper offers a
leap, a leap upwards, a leap of faith perhaps. The argument shows what we must do if we are to avoid the Evers–Lakomskian trap. To be humane, to escape the fact-driven, calculable world, we must be human, reaching beyond our grasp, towards heaven, as Browning would say. And this of course takes us out of the limited world of fact and matter, out of synapses and programmed responses, into the world of culture, into true culture, a world that Evers and Lakomski deny, or accept only as an obverse of the physical. As I see it Evers and Lakomski’s great contribution is to remind us of the world of fact, of the error of valuing too much. My Contribution and Hodgkinson’s is perhaps to remind us of the mystery beyond fact, of the error of valuing too little. In ‘Science and Service’ I acknowledge contemporary problems in education where values inappropriately overwhelm the factual. One need not look far in education today to see many such problems: the view for example that all is to be discovered by the child pursuing its own needs, the conviction-driven exalting of the child-centred approaches that deny what we all know to be good and great teaching. There are facts in all of this that need more attention than they get, though I admit they are value saturated. All of this may leave us dismayed, overwhelmed even, before the fact–value gulf.

When I presented ‘Science and Service’ at a recent seminar at the University of Western Ontario, I was asked whether it represents a departure from previous relativist positions. My first response was to say that I hope there is not a single and even line of development through all my papers. They represent a groping towards understanding, not a uniform and logical line of extrapolation. But I also said I hoped that the position seen in ‘Science and Service’ is consistent with what has gone before, with positions that set out the realities of different perceptions of the world and that describes the realities of those views in conflict. Those differences are the basic stuff of the world, and much of my earlier work asserts them in the face of a mode of thought that would deny them or work them out in a flawed system that asserts technical progress is equivalent to moral progress. Such progress brings us to the world of authority and hierarchy, which my work has never denied, though I now see more clearly than I did where the redemption of authority and hierarchy must come from. I hope I have never taken the position that one value position is as good as another – the opposite indeed – though I have tried to show that looking at the world through the eyes of value holders reveals profound conflicts that reason itself fails utterly to resolve. I may have come close, but I never embraced the relativist horror. That’s clear in the bonsai image from Decline and Fall where the educator shapes pupils’ values even as the gardener shapes the bonsai tree. While I’m at it, I should say that I am dismayed at those who read my work as though it made nothing but a liberationist, egalitarian, and rights-of-the-individual argument, a position seen most vividly – and wrongly – in the stance of today’s deconstructors, post-modernists and radical feminists. I yield no more to values calculated out of science than to values taken for granted or ignored. While it might be easier to throw up one’s hands in the face of these difficulties, the way I have
reached finds that each culture offers its own road upwards. Salvation, peace and reconciliation, if they are to be found, are to be found on that road, and we cannot deny our own road. I began ‘Science and Service’ with deliberately religious metaphors in mind, and these connect with others that suffuse much of my work. I finished the paper with a sense that the great conundrum we face is still unresolved. But perhaps we know better now what it is and which way to look to face it.

In pushing that position a little further I would refer to a work I have just come to know. In the Massey lecture series titled, *The Malaise of Modernity* (broadcast on CBC and published by Anansi), Charles Taylor has argued what he calls ‘the view from Dover Beach’. In reference to Arnold’s far-seeing poem and in contravention to Lasch and Bloom, he defends self-fulfilment as a goal of individual action. He argues that the ethic of the ‘authentic’ individual, as first stated by Nietzsche, the presumed villain of the piece, does not destroy the truth of ethical limits on human action. It simply moves the consideration of such limits to a new context. Nietzsche himself never gave up the moral perspective, calling for a yea-saying, a yes to the world. How can it be otherwise if we are not to perish with the individual in self-defeating doubt, agony, and destruction? Taylor’s view is that the ebbing of the Dover tide is not absolute, it offers as much as it takes away. Hope lies at the bottom of Pandora’s box. There remain the possible errors of liberalism in Taylor’s argument. It must be made clear therefore that the authentic individual goes unredeemed – doomed within violence and self-destruction – without a sense of obligation, of altruism, of something beyond the individual. Taylor chronicles the trip the elite, modernist poets – Yeats and Eliot – took towards fascism, a charge that may be wrong at least in the case of Eliot, but who can deny the endpoint of individualism seen in Pound’s broadcasts from Italy during World War II? These were not just madness, as they were treated as being after the War, but the end development of a line of thought, a line still alive today in the vicious and death-dealing actions of the skinheads of today. The strength of the individual perspective is the pause it gives for questioning, for dialogue and its stimulus for the creative, for the new vision. It seems clear to me now that dialogue cannot deny a conversation with the ultimate. That must temper the excesses and destructiveness of the otherwise unrestrained individual. There must be a yea-saying to the world. Ultimately – and this may be the point of greatest importance – art must be descriptive, mimetic, of the world not just creative of it, otherwise art and human action itself ends in self-defeat.

The hundredth anniversary of the birth of Henry Miller and a renewed critical appraisal of his work give reason to look again at these issues. Miller called the *Tropic of Cancer* ‘a gob of spit in the face of art’, as he revelled in his experience of Paris. But even in the *Tropic* he had something to say: he praised one culture and criticized his own. He moved to the Big Sur, but deplored the New Ageism that followed him there, even as he deplored the spirit of the larger American culture. He was horrified that Linda Lovelace and *Deep Throat* could
be seen as justified by his art, yes by his *Art*. Another gob of spit in the face of *Art*, and he ended by defending what he knew he had never attacked. We should remind ourselves that great art is moral. It is an ethical statement about the world, and that is what makes it great. Gobs of spit may besmirch it, but not deny its message. Art and ethics are ultimately united. So too the individual and his understanding of the world are ultimately united with ethics. That is the position I have come to, and it is the position I began with. *Macbeth* and *Faust* are not just fine words spread over five acts. Great art – and great social science too – must always have a moral content. And we judge their greatness by that content. Describing the world as it is can hardly deny or controvert this position. Indeed it makes the position. That’s what I have been trying to do in my work: trying to describe the world as it is, and trying to contemplate the moral conundrums created thereby.

BUILDING AN ETHICAL SCHOOL
A theory for practice in educational leadership

Robert J. Starratt

During ordinary times, which are never ordinary, but especially during a period of school restructuring, educational administrators need to consider their responsibility to promote an ethical environment in their schools. This article develops three foundational ethical themes—critique, justice, and caring—as the pillars on which to build such a school.

The social sciences are undergoing a major shift away from a dogmatic positivism that relegates ethics and morality to a stereotyped realm of personal preferences, prejudices, and tastes unsupported by scientific argument, toward an acknowledgement of organizational and public life as a legitimate arena of moral striving and human fulfillment (Bellah, Madsen, Sullivan, Swidler, & Tipton, 1985; Jennings, 1983; Sullivan, 1986; Walzer, 1985). In the field of education, talk about ethics and morality tends to divide between public rhetoric and academic theory. In the public arena, some call for a return to a hypothetical time when people agreed on moral values, when teachers were not ashamed to preach morality in the classroom. Others worry that these proposals are simplistic attempts to impose “fundamentalist” definitions of right and wrong (supposedly with Biblical grounding) on everyone, to impose repressive attitudes about sex, spontaneity, and material enjoyments. The public rhetoric tends to frame the debate over morality in education in extreme and sometimes inflammatory imagery, but a more restrained shift has slowly been taking place among researchers and theorists.

Whether this shift is labeled as ushering in a “Post-Positivism” (Jennings, 1983), “Post-Structuralism” (Cherryholmes, 1988), or “Post-Liberal” (Bowers, 1987) era or as a reconceptualization of traditional categories of virtue and character and justice (MacIntyre, 1984; Purpel, 1989; Walzer, 1985; Wynne, 1982), there is clearly a movement away from an overly rationalistic approach, despite some rear guard action in defense of positivism (Lakomski, 1987). This
shift in educational policy formation and implementation, in organizational analysis, in program evaluation, and in curriculum theory, is toward an inclusion of human factors, expressly moral in nature, previously neglected.

The literature in educational administration similarly reflects growing concerns about moral and ethical issues (Foster, 1986; Greenfield, 1987; Kimbrough, 1985; Raywid, 1986; Sergiovanni & Starratt, 1988; Strike, Haller, & Soltis, 1988; Vandenberg, 1990). However, the literature may be yet a step away from speaking concretely enough to practitioners. The abstractions of moral philosophers and social theorists are difficult to translate into practical guidelines that influence everyday actions. Theory needs to approach close enough to practice so that it becomes a theory for practice, something the reflective practitioner can use in everyday encounters while walking about the school or the district (Schon, 1983; Sergiovanni, 1985; Starratt, 1990). A theory for practice does not imply a collection of generic recipes for moral choices, but rather a theory that helps practitioners frame moral situations encountered in practice so that their moral content becomes more intelligible and more available to the practical intuitive sense of the practitioner.

What follows is an attempt to bring ethical inquiry much closer to the workplace of educational administrators. It will not attempt to build an ethical theory, but rather to bring ethical themes developed by other theorists into a multidimensional construct that offers practicing administrators a way to think about their work and their workplace from ethical perspectives. The attempt will probably offend ethical purists because it borrows from ethical theories that seem incompatible with one another. On the other hand, the construct accepts the substantial conceptual tensions between the themes and highlights those tensions to illuminate the very ethical issues at stake. If the construct appears to offer useful, or even interesting, clarifications for the practitioner, then perhaps ethical theorists can follow up this attempt with a more foundational synthesis of their own.

What is suggested, in brief, is the joining of three ethics: the ethic of critique, the ethic of justice, and the ethic of caring. None of these ethics by itself offers an educational administrator a fully adequate framework for making ethical judgments; together, however, each ethic complements the others in a developmental context of practice. Each fills out an ethical perspective on policy choices. Because none of these ethics compels choice in every instance, one perfect choice does not exist; the three perspectives, however, enable one to make choices with the consequences more clearly delineated, to move toward the “best” choice under the circumstances, or to a choice that, although it favors one ethical demand, will probably be balanced later on by other choices.

The ethics of educational administration: building and administering an ethical school

The ethics of educational administration being advanced here is different from that offered by other scholars on the topic, such as Kimbrough (1985) or Strike
et al. (1988). They tend to focus on individual ethical choices of administrators regarding how to deal with individual persons or with individual situations. In other words, the ethics of educational administration from their perspectives is about the ethics of choices that administrators make in given circumstances. The position taken here is that the much larger ethical task of educational administrators is to establish an ethical school environment in which education can take place ethically. Individual choices regarding individual circumstances are seen as taking place in this larger ethical context. Hence the administrator who assumes that the educational environment, the organization, the system, the institutional arrangements (the curriculum, the daily and weekly schedule, the assessment and discipline and placement and promotion policies) enjoy a value neutrality, or worse, already embody the desirable ethical standards, is ethically naive, if not culpable.

Educational administrators are supposed to manage, not simply any old organization, but an educational organization. The educational program housed in that organization is supposed to serve moral purposes (the nurturing of the human, social, and intellectual growth of the youngsters). Hence, although educational administrators do many generic things common to all administrators (coordinate the scheduling of multiple activities simultaneously under one system, monitor budgetary expenditures, monitor health hazards, delegate responsibilities, and so forth), these activities are aimed at promoting the educational goals of the institution. The qualitative elements essential to educating give those administrative choices a different finality than choices made, for example, by hospital administrators, military officers, or corporate managers. Hence the ethical position taken here is that educational administrators have a moral responsibility to be proactive about creating an ethical environment for the conduct of education. They will no doubt be faced with individual ethical choices about whether to suspend a custodian for certain actions or whether to accept a gratuity from the parent who wants her son to make the basketball team. Those individual choices, however, do not constitute the ethical agenda of the educational administrator; they are a small part of the large agenda of building an ethical school.

Presently, the political climate is encouraging educators to restructure schools, which provides a certain opportunity for the building of ethical schools. Assuming that this means, among other things, a move toward school-based management, teacher empowerment, and participatory decision making, then schools will be freed from systemic, bureaucratic controls and enabled to exercise greater autonomy in their attempts to create a more humanly responsive environment. This implies that the school community will be engaged in an ongoing effort to govern itself, and that, in turn, implies pursing a moral purpose. From this vantage point, then, the educational administrator faces a difficult task. How is he or she to conceptualize the ethical task? This is where the ethical inquiry of this article begins.

Each theme will be developed consecutively. Although attempting to remain
faithful to the theory, or body of theory, from which the theme was selected, the exposition will be guided in equal part by the ethical demands of the educating context. Hence, if a distortion, bending, or thinning out of the force of the original theory seems to some readers to be taking place, they may be right; however, such interpretation is grounded in the effort to offer a larger synthesis in the service of practice. Underneath this synthesis, of course, are the irreducible assumptions and myths about what is valuable in human life in which every theory is grounded. A discussion of the ontology and epistemology behind this construct, however, would paralyze, I fear, the very attempt to develop the construct in this article. If the construct offers possibilities for ethical clarification and development, then subsequent debate and criticism can lead either to its further elaboration or to its rejection. In either case, the conversation over the meaning of ethics in educational administration may be enriched.

The ethic of critique

Because the historical moment appears to be one of transition and transformation, his article begins with the ethic of critique. Whether one begins from the less radical perspective of the recent proponents of school reform, such as Boyer (1983), Goodlad (1984), or Sizer (1984), or from the deeper critique of Freire (1970), Apple (1982), Bates (1984), or Giroux (1988), it has become increasingly evident that schools and school systems are structurally ineffective. Moreover, the awareness of the structural obstacles to renewal and change is taking on a historical dimension: The bureaucracy of school systems is coming to be seen as an enduring problem, not simply a contemporary phenomenon. Hence an ethic of educational administration appropriately begins with the theme of critique, a critique aimed at its own bureaucratic context, its own bureaucratic mind-set. As the school community, under the leadership of educational administrators and teachers, faces the possibility of creating an ethical school, it will also face the necessity of critiquing both the adversarial, contractual mind-set of the unions, as well as the hierarchically structured, impersonality of the administration of the school. Beyond that critique awaits the critique of the overly (if not exclusively) technicist approach to teaching and learning tied to narrowly conceived learning outcomes and simplistic, quantifiable measures of learning.

Because it goes well beyond the functional critique of contemporary reformers such as Goodlad and Boyer, the ethic of critique employed in this article draws its force from “critical theory,” that body of thought deriving from the Frankfurt School of philosophers and others sympathetic to their perspectives (Adorno, 1973; Habermas, 1973; Horkheimer, 1974; Young, 1990). These thinkers explore social life as intrinsically problematic because it exhibits the struggle between competing interests and wants among various groups and individuals in society. Whether considering social relationships, social customs, laws, social institutions grounded in structured power relationships, or language
itself, these thinkers ask questions such as the following: “Who benefits by these arrangements?” “Which group dominates this social arrangement?” “Who defines the way things are structured here?” “Who defines what is valued and disvalued in this situation?” The point of this critical stance is to uncover which group has the advantage over the others, how things got to be the way they are, and to expose how situations are structured and language used so as to maintain the legitimacy of social arrangements. By uncovering inherent injustice or dehumanization imbedded in the language and structures of society, critical analysts invite others to act to redress such injustice. Hence their basic stance is ethical for they are dealing with questions of social justice and human dignity, although not with individual choices.

Examples of issues confronted by critical ethics include (a) sexist language and structured bias in the workplace and in legal structures; (b) racial bias in educational arrangements and in the very language used to define social life; (c) the preservation of powerful groups’ hegemony over the media and the political process; (d) the rationalization and legitimation of institutions such as prisons, orphanages, armies, nuclear industries, and the state itself. The point the critical ethician stresses is that no social arrangement is neutral. It is usually structured to benefit some segments of society at the expense of others. The ethical challenge is to make these social arrangements more responsive to the human and social rights of all the citizens, to enable those affected by social arrangements to have a voice in evaluating their results and in altering them in the interests of the common good and of fuller participation and justice for individuals.

This ethical perspective provides a framework for enabling educational administrators to move from a kind of naivete about “the way things are” to an awareness that the social and political arena reflect arrangements of power and privilege, interest and influence, often legitimized by an assumed rationality and by law and custom. The theme of critique forces administrators to confront the moral issues involved when schools disproportionately benefit some groups in society and fail others. Furthermore, as a bureaucratic organization, the school exhibits structural properties that may promote a misuse of power and authority among its members. From a critical perspective, no organizational arrangements in schools “have to be” that way; they are all open to rearrangement in the interest of greater fairness to their members. Where unjust arrangements reflect school board or state policy, they can be appealed and restructured.

When an educational administrator confronts the structural issues involved in the management of education, such as the process of teacher evaluation, homogeneous tracking systems, the process of grading on a curve, the process of calculating class rank, the absence of important topics in textbooks, the lack of adequate due process for students, the labeling criteria for naming some children gifted and others handicapped, the daily interruptions of the instructional process by uniform time allotments for class periods, he or she discovers ethical burdens to all of them because they contain unjustifiable assumptions and impose a disproportionate advantage to some at the expense of others.
The ethic of critique poses the fundamental ethical challenge to the educational administrator: how to construct an environment in which education can take place ethically. The ethic of critique reveals that the organization in its present forms is a source of unethical consequences in the educational process.

Some would say that all organizations, of their very nature, precipitate unethical consequences. All organizations tend to make the rules and standard operating procedures the dominant force in organizational life, smothering initiative, instilling fear of not being promoted or approved by one’s superiors, severely limiting freedom of choice, reinforcing “groupthink” and the official rationalizations for the way things are. On the other hand, organizations, paradoxically, are the only places in the modern world where freedom and creativity can be exercised in any significant way (Eisenstadt, 1968). In the restructuring of human institutions to meet the human purposes for which they were originally designed one finds significant moral fulfillment (Starratt, 1990).

Thus educational administrators will face the continuing paradox of their institutional position in the school. On the one hand, they must acknowledge the tendency built into management processes to inhibit freedom, creativity, and autonomy, and to structure unequal power relationships to insure institutional uniformity, predictability, and order. On the other hand, they must acknowledge their responsibility to continually overcome that tendency to promote that kind of freedom, creativity, and autonomy without which the school simply cannot fulfill its mission.

Hence the ethic of critique, based as it is on assumptions about the social nature of human beings and on the human purposes to be served by social organization, calls the educational administrator to a social responsibility, not simply to the individuals in the school or school system, not simply to the education profession, but to the society of whom, and for whom, he or she is an agent. In other words, schools were established to serve a high moral purpose, to prepare the young to take their responsible place in and for the community. Besides the legal and professional obligations of the educational administrator, the moral obligation is to see that the institution of the school serves society the way it was intended. Hence the challenge to restructure schools is a moral as well as a technical and professional challenge.

The ethic of justice

One of the shortcomings of the ethic of critique is that it rarely offers a blueprint for reconstructing the social order it is criticizing. The problem for the educational administrator is one of governance. How do we govern ourselves while carrying out educating activities? The ethic of critique illuminates unethical practices in governing and managing organizations and implies in its critique some ethical values such as equality, the common good, human and civil rights, democratic participation, and the like. An ethic of justice provides a more explicit response to the question, even though that response may itself be flawed.
We govern ourselves by observing justice. That is to say, we treat each other according to some standard of justice that is uniformly applied to all our relationships. To understand the theory of justice that we employ requires an understanding of anthropology and epistemology. Socrates explored the basis of justice in *The Republic*; his search was to be pursued by a long line of philosophers up to the present day.

Currently, there are two general schools of thought concerning the ethic of justice. One school traces its roots to Thomas Hobbes and John Locke in the 17th century and finds its contemporary expression in the work of John Rawls (1971). In this school, the primary human reality is the individual, independent of social relationships; the individual is conceived as logically prior to society. Individuals are driven by their passions and interests, especially by fear of harm and desire for comfort. Individuals enter into social relations to advance their own advantage. Individual will and preference are the only sources of value. Therefore, social relationships are essentially artificial and governed by self-interest. The issue of social governance assumes a social contract in which individuals agree to surrender some of their freedom in return for the state’s protection from the otherwise unbridled self-seeking of others. In this school, human reason is the instrument that individuals use to analyze in a more or less scientific fashion what is to their advantage, and to calculate the obligations to social justice called for by the social contract. As Sullivan commented, in its more benign application, this theory conceives of social justice as “a social engineering to harmonize needs and wants” of self-serving individuals in society (Sullivan, 1986, p. 19).

Kant, however, wanted to ground morality in something more than the passions. Hence his philosophical search led him to postulate moral categories of obligation inherent in the practical reasoning of humans. However, the individual was still the source of moral activity. The obligation to act ethically came from the individual, not from society. Rawls (1971) attempted to explain this Kantian moral intuition as a reconstruction of the intuition of justice as fairness. He constructed a coherent context of general rules by which a moral community can reach agreement in much the same way that a community judges linguistically correct expression according to the rules to which all users of the language subscribe (Rawls, 1971). His development of fairness and fair play avoids some of the minimalist rationalizing of the utilitarians, although he continues to hold on to a kind of practical reason to work out individual instances of the universal fairness principle.

Kohlberg (1971) carried on this tradition, only he claimed to go beyond the traditional standoff between “is” and “ought” found in Hume and Kant. That is to say, Kohlberg claimed to have documented in his research an isomorphism between psychological development of moral reasoning and normative ethical theory (Schindler, 1986). His research indicated that as humans moved from one moral stage to a higher moral stage, they moved toward formal moral criteria of prescriptiveness and universality. (Kohlberg, 1971, pp. 224–225). Their higher moral reasoning conformed to what moral theorists from Kant to Rawls had
postulated as universal principles to guide ethical behavior. Once again, note that Kohlberg postulates the individual as the source of ethical judgment, and reason as the instrument of morality, although reason is now seen more in a developmental perspective.

The second school of thought on the ethic of justice finds its roots in Aristotle, Rousseau, Hegel, Marx, and Dewey. A contemporary scholar in this school, William Sullivan (1986), placed society as the prior reality within which individuality develops. Furthermore, through experience, through living in society one learns the lessons of morality. Participation in the life of the community teaches individuals how to think about their own behavior in terms of the larger common good of the community. In this school, freedom “is ultimately the ability to realize a responsible selfhood, which is necessarily a cooperative project” (Sullivan, 1986, p. 21). Ethics is grounded in practice within the community. The protection of human dignity depends on the moral quality of social relationships and this is finally a public and political concern. Citizenship is a shared initiative and responsibility among persons committed to mutual care (Sullivan, 1986, p. 22). From this perspective, a communal understanding of the requirements of justice and governance flows from both tradition and the present effort of the community to manage its affairs in the midst of competing claims of the common good and individual rights. That understanding is never complete; it will always be limited by the inadequacy of tradition to respond to changing circumstances and by the impossibility of settling conflicting claims conclusively and completely. The choices, however, will always be made with sensitivity to the bonds that tie individuals to their communities.

Kohlberg himself (1980) believed that moral reasoning and choices were best made in a communitarian setting (Blatt, 1970; Higgins, Power, & Kohlberg, 1984). He played an active role in the formation of “just community” schools. Hence it can be argued that an ethic of justice, especially when focused on issues of governance in a school setting, can encompass in practice the two understandings of justice, namely, justice understood as individual choices to act justly and justice understood as the community’s choice to direct or govern its actions justly. In a school setting, both are required. In practice, individual choices are made with some awareness of what the community’s choices are (school policies), and school community choices are made with some awareness of the kinds of individual choices that are being made every day in the school.

An educational administrator encouraging an ethic of justice will see to it that specific ethical learning activities are structured within curricular and extra curricular programs to encourage discussion of individual choices as well as discussions of school community choices. This may mean extensive faculty and student workshops on active listening, group dynamics, conflict resolution, values clarification, problem naming, and the like. Teachers familiar with Kohlberg’s stages of moral reasoning (Kohlberg, 1969, 1981), can more easily understand the general frame of reference students are using (e.g., instrumental hedonism, negotiation of the social contract, and so forth).
In a school that takes site-based management seriously, issues of the day-to-day governance of life in the school are inescapable. The ethic of justice demands that the claims of the institution serve both the common good and the rights of the individuals in the school. Ongoing discussions of student discipline policies, of faculty and student due-process procedures, of agreements about faculty time commitments, and so on are absolutely necessary. Furthermore, discussions about the curriculum, about appropriate textbooks, about a visiting speakers’ program, and the like will need to be carried on, not simply for their appropriateness for standardized tests, but for the moral questions they raise about public life in the community. Approaches to multicultural education should include not only the standard attempts to create better understanding of cultural differences, but also, and most important, discussions of historical and present social conditions that breed unjust relationships between people of different cultures and explorations of ways to alter those social conditions. Issues of grading and testing could be examined from the perspective of justice, with such discussions leading to the development of alternatives to present practices that benefit some to the disadvantage of others.

No doubt such freewheeling discussion of so many taken-for-granted elements of schooling will get messy and unmanageable. Most administrators dread such initial lack of definition. On the other hand, the debate is in itself educative. The only way to promote ethical attitudes and understandings about self governance is to engage in debate. Someone might object that there will be little time left for the business of teaching and learning if schools spend so much time restructuring the institution. Although that criticism betrays too narrow a view of teaching and learning, let us take it seriously. Then the question for the community to decide is precisely how to manage its time in such a way as to attend to the more traditional academic agenda while still carrying out its activities of self-governance.

Even this brief dusting off of the school’s involvement in promoting an ethic of justice points to the close relationship of the ethic of critique and the ethic of justice. To promote a just social order in the school, the school community must carry out an outgoing critique of those structural features of the school that work against human beings. Often the naming of the problem (critique) will suggest new directions or alternatives for restructuring the practice or process in a fairer manner. For example, the administration of a policy that provides a disproportionate share of resources to students in the upper decile of the student body results in inequities that affect large numbers of “average” students unfairly (Cusick & Wheeler, 1988). It raises questions about the responsibility of brighter students to share their gifts for the larger good of the community, perhaps in some peer tutoring activities.

Ethics of caring

One of the limitations of an ethics of justice is the inability of the theory to determine claims in conflict (Hollenbach, 1979). What is just for one person...
might not be considered just by another person. Hence discussions of what is just in any given situation, can tend to become mired down in minimalist considerations (What minimal conditions must be met to fulfill the claims of justice?). For an ethic of justice to serve its more generous purpose, it must be complemented or fulfilled in an ethic of love. Although earlier discussions of the incompleteness of the ethic of justice took place in a theological context (Niebuhr, 1935), more recent discussions have tended to ground the ethic of love and caring in a philosophy of the person (Buber, 1970; MacMurray, 1961). Scholars such as Gilligan (1977) and Noddings (1984, 1988) promoted these ethical directions from a vantage point of psychology, especially women’s moral development, in the current literature on the ethic of caring.

Such an ethic focuses on the demands of relationships, not from a contractual or legalistic standpoint, but from a standpoint of absolute regard. This ethic places the human persons-in-relationship as occupying a position for each other of absolute value; neither one can be used as a means to an end; each enjoys an intrinsic dignity and worth, and given the chance, will reveal genuinely loveable qualities. An ethics of caring requires fidelity to persons, a willingness to acknowledge their right to be who they are, an openness to encountering them in their authentic individuality, a loyalty to the relationship. Such an ethic does not demand relationships of intimacy; rather, it postulates a level of caring that honors the dignity of each person and desires to see that person enjoy a fully human life. Furthermore, it recognizes that it is in the relationship that the specifically human is grounded; isolated individuals functioning only for themselves are but half persons. One becomes whole when one is in relationship with another and with many others.

Educational administrators committed to an ethic of caring will be grounded in the belief that the integrity of human relationships should be held sacred and that the school as an organization should hold the good of human beings within it as sacred. This ethic reaches beyond concerns with efficiency, which can easily lead to using human beings as merely the means to some larger purpose of productivity, such as an increase in the district’s average scores on standardized tests or the lowering of per-pupil costs.

Administration based on an ethic of caring will attend to the “underside” of administration (Starratt, 1984), that is, to those motives that sometimes intrude, even slightly, on an exchange with a teacher, student, or parent. Sometimes those motives involve the desire to dominate, to intimidate, to control. Sometimes those motives involve racial, sexual, ethnic, and age stereotypes that block the possibility of honest communication. Sometimes the administrator feels insecure in the face of a strong and assertive teacher and feels the need to put that teacher in his or her place. Sometimes the administrator is not even aware of the power he or she has in the eyes of teachers and recklessly toys with the teacher’s insecurity by some light-hearted ridicule of a classroom activity.

When these underside issues dominate an administrative exchange, they block any possibility of open, trusting, professional communication. Mistrust,
manipulation, aggressive and controlling actions or language on the part of the administrator or the teacher or both can lead to a relationship that is hypocritical, dishonest, disloyal, vicious, and dehumanizing.

An administrative exchange can move beyond a superficial ritual to a contractual obligation to a relationship of caring when there is a deep attention to the unique human beings involved in the exchange and to issues of self-esteem, personal confidence, and ego anxieties. People who are fairly secure in their sense of themselves and in their professional role are not overly affected by these underside motives; few, however, are entirely free from them in every circumstance. If these motives are understood and acknowledged initially, they will not distort the exchange in excessively manipulative or negative ways.

The administrator who is concerned with nurturing the growth of teachers will have to ensure that teachers experience the relationship with the administrator as one of regard, mutual respect, and honest contact between two persons. Even though their traditional organizational roles have conditioned administrators and teachers to an antagonistic relationship (Blumberg, 1974; Starratt, 1990), in a school intentionally restructuring itself and concerned about issues of empowerment, it is possible to move toward a relationship based on caring. For relationships of caring to develop, administrators will initially explore with their teachers those conditions necessary to initiate and maintain trust, honesty, and open communication (Hoy & Kupwersmith, 1984).

Besides developing sensitivity to the dignity and uniqueness of each person in the school, the administrator can promote an ethic of caring by attending to the cultural tone of the school. Often the use of language in official communications will tell the story: Formal abstract language is the language of bureaucracy, of distance; humor, familiar imagery and metaphor, and personalized messages are the language of caring. Through reward procedures and ceremonies as well as through school emblems, school mottos, school songs, and other symbols, the school communicates what it cares about. When the school rewards academic competition in ways that pit students against each other, when the awards are few and go only to the top students in the formal academic disciplines, then the school makes a clear statement of what it values. Other ceremonies and awards that stress caring, cooperation, service, teamwork, and the like send different messages. Some schools clearly promote a feeling of family and celebrate friendship, loyalty, and service. Laughter in the halls, frequent greetings of each other by name, symbols of congratulations for successful projects, frequent displays of student work, hallways containing pictures of groups of youngsters engaged in school activities, cartoons poking fun at teachers and administrators—these are all signs of a school environment that values people for who they are. When youngsters engage every day in such a school community, they learn the lessons of caring, respect, and service to each other. With some help from peers and teachers, they also learn how to forgive, mend a bruised relationship, accept criticism, and debate different points of view.

For most educational administrators, a brief reflection on their own ethical
caring will occasion some embarrassment. By confronting their own flawed performance, administrators can discover, with a moment’s reflection, the subtle but constant intrusion of self-interest. Without excusing it, they learn to acknowledge it as a part of them. Recognizing their own failures will help them avoid the tendency to self-righteous judgement of others’ ethical mistakes.

The ethics of caring brings us full circle at this point. Knowing our own failures to care for others, our own immature ways of rationalizing moral choices, knowing our own reluctance to challenge questionable school arrangements, we are able to confront the general weakness in the human community. That weakness is part of being human. Despite our heroic ideals, we often act in distinctly unheroic ways. A sense of compassion is needed for one who would act ethically—compassion for himself and compassion for others. We have to extend our caring to forgiving. The forgiveness extended, we then go on with the business of making things right.

Summary

Two questions remain, the response to which may close out this inquiry into an ethical perspective for practitioners. The first question involves the legitimacy of combining themes derived from three different ethical theories, despite what some might claim are irreconcilable differences among the theories (Pateman, 1980). The second question deals with the practicality of the construct for the practitioner. Namely, does it offer the administrator a perspective that allows him or her to frame the most important ethical issues encountered in schools and to shape an environment that encourages ethical choice?

The answer to the first question deserves a lengthy development that space does not allow. For now, this author argues that the three theories are not irreconcilable. They can be grounded on both the essential nature of human beings and on the essential nature of human society. That is to say, one can argue for the necessary interpenetration of each theme by the others if one is to argue for a fully developed moral person and a fully developed human society. Even a superficial familiarity with the themes, which this article attempts to communicate, suggests that each theme implies something of the other theme. The ethic of critique assumes a point of view about social justice and human rights and about the way communities ought to govern themselves. The ethic of justice assumes an ability to perceive injustice in the social order as well as some minimal level of caring about relationships in that social order. The ethic of caring does not ignore the demands of community governance issues, but claims that caring is the ideal fulfillment of all social relationships, even though most relationships among members of a community function according to a more remote form of caring.

Moreover, each ethic needs the very strong convictions embedded in the other. The ethic of justice needs the profound commitment to the dignity of the individual person found in the ethic of caring. The ethic of caring needs the larger attention to social order and fairness of the ethic of justice if it is to avoid an
entirely idiosyncratic involvement in social policy. The ethic of critique requires an ethic of caring if it is to avoid the cynical and depressing ravings of the habitual malcontent, and the ethic of justice requires the profound social analysis of the ethic of critique, to move beyond the naive fine tuning of social arrangements in a social system with inequities built into the very structures by which justice is supposed to be measured. The response to the first question, then, is that the themes are not incompatible but, on the contrary, complement and enrich each other in a more complete ethic. Uniting themes from different theoretical foundations attempts to use the genuine strengths and the genius of each theoretical position in the interests of building a rich and pluralform ethical environment.

The response to the second question is likewise affirmative. An educational administrator’s day is filled with ethical situations and challenges. Sometimes those situations clearly call for a critique of unfair school procedures; sometimes they involve debate over school policy in an effort to balance the common good with individual rights; and sometimes they involve the demands of an individual person to be recognized and cherished for who he or she is. At other times, more complex problems require that the administrator examine the problem from each framework and perhaps balance the demands of all three ethics in his or her response to the problem. Given the proactive position of an ethics of educational administration advocated in this article, namely the building of an ethical school as an integral part of a national effort to restructure schools, the larger construct of all three ethical themes offers a more comprehensive and multidimensional foundation for such a reconstruction.

Figure 1 The multidimensional ethic.
Figures 1 and 2 offer a visual diagram of how the themes work together to provide such a multidimensional perspective.

This article has attempted to develop a tapestry of ethical perspectives, specifically for those involved with educational administration. That tapestry is woven of three themes: the theme of caring, the theme of justice, and the theme of criticism. An ethical consciousness that is not interpenetrated by each theme can be captured either by sentimentality, by rationalistic simplification, or by social naivete. The blending of each theme encourages a rich human response to the many uncertain ethical situations administrators face every day in their work. Furthermore, they offer complementary frames for thinking about building an ethical school during this time of school restructuring.

While the mainstream churches are being increasingly ignored as religious institutions in rapidly secularizing England, their schools survive and, in many instances, thrive. These schools, financed by public funds, are an increasingly important part of the English state schooling system. It would appear that their survival and expansion has been driven by increased societal emphasis on academic success, which, in the main, these schools provide. What are the implications of this in terms of social divisiveness and what is the response of the churches themselves in terms of their role in the communities they serve? While the arguments for and against are entered into by a small number of commentators, it is perhaps significant that the once politically sensitive area of church/faith schools is still left alone by politicians.

Introduction

Thriving religious schools in England are a phenomenon of our times. Much is written that may give the impression that the English schooling system is a uniform and a consistent whole. However, a closer examination of the state system, financed by public funds, shows that while all schools are operating within a centrally designed, directed, and inspected template of a national curriculum and OFSTED (Office for Standards in Education) scrutiny, many different types of school are present.

Religious, or as they are more usually called in England, church or faith schools, are one discrete group within the state system. While other faiths are represented, including Jewish and Moslem, they are, in the main, Church of England and Roman Catholic. In a seemingly fragmenting world that has moved or is moving beyond the usual religious traditions, the great narratives that post-
modernist thinking has identified as being left behind, the position and popularity of the church or faith school is not simply the concern or interest of a tiny minority. Why does their existence and public funding seemingly remain unchallenged? This article seeks to explore how various agents within the Church of England and Roman Catholic Church see the role of their schools in terms of the community and/or communities that they serve. It also seeks out oppositional views to these schools’ existence and/or their public funding.

The “secularized” context of the discussion

In July 1999, the American magazine *Newsweek* reported once again the death of God in Europe. It is possible to say, with a certain irony, that this is in contrast to many other parts of the world where He continues to flourish or where “religious thinking, practices and institutions” retain, in Wilson’s (1966) terms, “social significance.” Certainly, in England, intellectual explanations for the decline in religious belief are both fashionable and influential. The leading British sociologist Anthony Giddens (1991), in particular, has noted the existence of what he calls a post-traditional society. Such theory and its “close cousin,” postmodernism, is predicated on the acceptance that the “great narratives,” such as Christianity, that explain human existence in a comprehensive and consistent manner, no longer are relevant.

The Oxford-based theologian Don Cupitt (1997), who is influential in liberal Anglican circles, has written in stark terms of a major global cultural change in which the past is comprehensively left behind as people disengage with ethnic, religious, and moral loyalties. As with modern teenagers watching a dramatization of a Jane Austen novel, with its mannered existence, it is “difficult to reimagine what it was once like genuinely to believe such things and to follow such customs” (Cupitt, 1997, p. 79).

Membership figures that show a downward trend in membership of the Church of England, Roman Catholic, and non-conformist churches would seemingly support the conclusion that English society is moving irretrievably to secularization. (Though it should be noted that membership of the “newer” churches, such as the Seventh-day Adventist, is, in fact, increasing). Figures supplied by the Christian Research Association (as quoted in Brierley & Wraight, 1995 p. 240) show that for the two churches whose schools are the focus of this article, specifically, the Church of England and Roman Catholic Church (as discussed in Johnson, McCreery & Castelli, 2000), are shown in table 1.

In less than a quarter of a century, over half a million members have been lost by both churches. Other figures in this vein can easily be found. As an aside, to illustrate this point about the seemingly comprehensive loss of connection with these churches, it is possible to look at that important social event in all cultures, the wedding. It can be said that the style and venue of weddings say much about the current fashions, social attitudes, and values of a society. Thompson (1986) reports that twenty years ago, in 1979, there were more civil marriage
ceremonies than religious ones since Register Offices were established in 1837. More recent figures show that 59% of couples, who actually marry rather than simply co-habit, now go through a civil ceremony (Office for National Statistics, 1998).

However, argument about the exact nature of the secularization of society is not new (Wilson 1966, 1982). As Martin (1967) has pointed out, some care must be taken with the interpretation of statistics about church membership that may or may not have been accurately and consistently collected. Within such reservations comes also a warning about using them to make comparisons between “now” and “a golden age of religiosity,” which always seems to be just beyond living memory. Also, a distinction has to be made between formal church membership and regular attendance (in 1996 only 11% of British adults attended church once a week or more—ONS 1998, p. 228) and a residual loyalty and identification. Other figures published by the Office for National Statistics in 1998 showed that “many people consider themselves to belong to a religion even if they are not active members” (ONS 1998, p. 227). These figures (see table 2), though still showing a downward trend, are, in terms of the percentage involved of the British population (which is approximately 56 million), very different from those in table 1.

Over half the British population call themselves Anglican or Catholic (albeit mostly non-churchgoing). Thus, Cupitt’s assertions about “an extraordinary cultural upheaval” in which traditions are repudiated can be challenged. However, within these figures, there is no age breakdown. Thus, it could be that those people with a residual loyalty are older than those without. It could be that in Cupitt’s terms, these traditions are “going up in smoke,” but perhaps considerably more slowly than he argues.

Note

The dual system of church and state

Whether or not the case for society being “secularized” is fully and convincingly made, trends show an increasing detachment from active participation in the institutions and ceremonies of conventional mainstream Christianity. It is within
this context that the relationship between church/faith schools and the state in England is placed. State funding of church schools has had a comparatively long history; although, it must be noted that, initially, the British government was very reluctant to intervene in schooling for the poor provided by such voluntary activity.

It was in 1833, that central government made its first tentative steps in funding such elementary schooling through the payment of small grants to the non-conformist British and Foreign Schools Society and the National Society of the Church of England. (The latter was founded in 1811 to compete with the non-conformist churches for the loyalty of the urban poor.) So today’s dual system of church voluntary and state maintained schools had “its origins in the grants made in 1833” (Sallis, 1994, p.8). Sallis notes that today “The inclusion of church schools in the public system is thus a distinctive feature of education in this country [England].” This is significant when international comparisons are made. Elsewhere, in societies, with and without strong cultural links to England, a secularist view of state schooling is taken. Such a stance “has widespread public acceptance in Australia and New Zealand, Canada, the USA and most of continental Europe” (p. 8).

However, it must not be forgotten when Church of England and Catholic schools were included within the state system, not only religious leaders but also very senior politicians were involved in the considerable debate. In the face of furious non-conformist objections (about “Rome on the rates”), Balfour, the Prime Minister, had to defend the provisions of the 1902 Education Act that incorporated the Church of England and Roman Catholic church schools. In a noisy House of Commons, he argued that such a move was “not a relic of an ancient system permitted as a matter of compromise to remain . . . out of harmony with the needs . . . of a progressive community” (Munson, 1991, p.245). Balfour went on to see them “as part the normal . . . machinery for education” (p. 245); and at the beginning of the twenty-first century, part of this machinery they have remained.

Along with this historical sketch, it must be noted that subsequent developments throughout the twentieth century have given state funding to Methodist, Jewish, and, more recently, within the last three years, to the handful of Muslim, Sikh, and Seventh-day Adventist schools. Importantly, it is also necessary to

*Note*

remember when considering the other part of the dual system that the state-maintained schools, sometimes called county schools, are not secular. Interestingly, it is their religious and spiritual role that is controversial and has been subject to much recent debate, especially among the English teaching profession.

In 1988, “rather to the surprise of many, the Conservative Government . . . sought, in the Education Reform Act . . ., to reinstate the act of collective worship” (Davies, 1994, p. 10). It had once been part of every child’s daily experience in school, as stipulated by the epoch-making Education Act 1944. In the 1960s and 1970s, for a variety of reasons, including school size and head teacher and teacher disapproval, many schools had discontinued the practice. In startling contrast to the position in the USA, the Thatcher government went further to legislate “for the compulsory teaching of R.E. (religious education), in particular Christianity, described as the predominant religion in Great Britain, as part of the school curriculum” (p. 10).

Six years later, in 1994, Davies could report that “the law was being most determinedly resisted and most comprehensively ignored.” At the National Association of Head Teachers (NAHT) Annual Conference held that year, a survey was presented to the Conference that showed that “80% of head teachers wanted the law on religious education in school changed” (p. 9). David Hart, the NAHT General Secretary, accused John Patten, the then Secretary of State for Education (the governmental minister responsible) “of failing to recognize that moral values could be taught outside the context of religious assemblies and R.E. lessons” (Davies, 1994, p. 9). Davies also notes the widespread view among head teachers and teachers that “schools should not be mission stations . . . and that Britain was a multi-cultural society, in which no one religion should be given superordinate status” (p. 10). From this “professional” perspective, reliance is placed on the teaching of personal, social, and moral education in schools from a seemingly “neutral” middle ground. This stance is seemingly confirmed by a declaration by the National Curriculum Council, itself a governmental agency. In 1993, the Council stated that it did not consider the spiritual and moral development of children was or should be predicated on a religious or any other belief system: “. . . spiritual development has to do with relationships, with other people, and for believers, with God.” In this statement, “believers” are seen as a distinct group or community.

It is worth noting here that “community,” in itself far from an uncontroversial term, goes beyond the Shorter Oxford English Dictionary (1983) definition of “common character; agreement; identity.” It can be seen as a basic structure that can be located in the real world (such as the Amish in Pennsylvania). On the other hand, urban sociologists such as Pahl (1984) see “community” as less certain and infinitely more flexible. This is a term open to subjective interpretation. Whatever the definition, belonging to a community is a statement about the socialization that its members have experienced, and within that process, the values and rules that they have internalized to a point that behavior becomes
predictable and, to a greater or lesser degree, automatic. Clearly, membership of a community gives its adherents an identity that in some way can distinguish them from others and other communities in society. Thus, to belong to any community is per se an expression of difference.

Research method

So given overall trends of detachment from conventional institutional Christianity in society as a whole and opposition to the acceptance of “the superiority of Christianity” as a source of moral guidance and religious belief in county schools, why do church schools still exist, and in many instances thrive? How do they themselves define the community and/or communities that they are serving? In exploring these questions, data were collected from documentary sources. Data were also obtained from a series of semi-structured interviews with individuals within church-education societies and communities and from those in opposition to church/faith schools.

A first set of interviews were undertaken to find out how Church of England and Catholic head teachers (or school principals) saw their role in the development of their children’s spirituality, in maintaining a school culture consistent with the moral values of their declared belief system, and how this might contribute to the children’s spiritual development. To this end, an interview inventory was designed to cover both general environmental and “religious” issues (to put it at its widest) and specific operational issues that heads had to face, such as the design and content of school assemblies. All the interviews, which were based on the same interview inventory, took place in the schools, were tape recorded with permission of the heads. The intention of the interviews was to act very much as a “seek and find” exercise and so to act as a pilot survey to test out issues and ideas, arising from the literature, that could lead to a more detailed and more tightly designed study.

These semi-structured interviews were carried out with the heads of 13 primary schools in a south London borough, that has a varied ethnic and cultural composition. Some parts of the borough are predominately black, others mostly white, and others mixed. The borough has also received a large share of the influx of refugees from eastern Europe and other parts of the world, including those who have fled the war in Somalia. The borough has a reputation for being prosperous and “middle class”; however, every day, distressed people are found begging on its streets and in its underpasses. (The overall cultural and ethnic mix of those living in the London conurbation cannot be underestimated. It is possible to illustrate this diversity through the type and number of languages spoken. A recent article in the daily newspaper, the London Evening Standard (21 January 2000), was entitled “From Abe to Zulu, the 300 languages spoken by London pupils” and reported on research carried out in London schools that showed that London is now the “most linguistically diverse city on the planet . . . more so than New York.”)

All 13 schools were fully subscribed; most of the schools were expanding and
were, thus, in a position to select their intake. They were situated in the same type of areas. However, the Church of England schools were open to “all-comers”; whereas the intake of the Catholic schools was almost entirely Catholic. (Historical factors have led to Catholic schools being situated mostly in the English conurbations; the Anglican experience is, of course, very different, and so a strong presence in rural and usually mono-cultural areas is still maintained. Hence, it is easy to speculate that the issues facing a Church of England head teacher in, say, agricultural Lincolnshire, a county 120 miles from London, could be very different from those heads interviewed in this small study.)

All the head teachers gave most generously of their time and were seemingly open in their comments. Other sets of interviews were carried out with three officers of church educational bodies. They asked to be anonymous; but again, were very helpful.

Finding subjects to interview who are in opposition to church schools was much more problematic. As is reflected below, many of the 15 or so letters that were sent out asking for interviews from individuals or bodies likely to be in opposition were not answered. In the end, much of the data collected were taken from documentary sources, some of which are quite old. The journalist Polly Toynbee, however, responded very positively to a request for an interview. She rang the researcher back! A mutual date for a face-to-face interview within a reasonable time frame was not possible, so a telephone interview ensued. The Education Secretary of the Free Churches Council kindly allowed herself to be interviewed at the Council’s premises; as did the General Secretary of the National Secular Society.

Findings

In England and Wales, 2,000 primary and 450 secondary schools are in the Catholic, voluntary-aided sector that forms 10% of state provision. Currently, nearly three quarters of a million young people are being educated in Catholic schools (CES, 1996), and overall, the demand for places is increasing. The Church of England sector contains, as can be expected of the established church in England, many more institutions—4,903 primary schools and 225 secondary schools (Lankshear, 1992). As with the Catholic sector, the demand for school places is strong and increasing. The contribution made by Church of England and Roman Catholic schools is not minimal. Together these church schools make up over a third of state-schooling provision in England and Wales.

The declared aims of Catholic schools

The Catholic education community identifies such a role, if in a particular form, for itself and a partnership between the school, parents, and the local community, the latter being first the Catholic community and, increasingly, the wider community as a whole.
The importance of Catholic education has been stressed by church authorities from the mid-nineteenth century to the present today. The Catholic Bishops of England and Wales “have seen education as central to the mission of the Church” (Catholic Bishops’ Conference, 1997, p. 5). Education is a deeper and broader process than the mere preparation for an economic role, as pupils are to learn and understand that “God (is) creator, sustainer and ultimate goal of all that exists” (p. 50). The mission statement of a Catholic school should make it explicit that it conforms to Christian principles (Catholic Bishops’ Conference, 1996, p. 2).

The role of the head teacher or school principal is pivotal and not limited to a professional competence; for the Catholic head is also to be a personal example to the teachers in his or her school. It is also clear that Catholic teachers have their own role, inasmuch, according to Arthur’s comments on the Declaration on Christian Education (Second Vatican Council, 1965), it is “they who determine whether the Catholic school fulfils its aims” (Arthur, 1995, p. 254). Additionally, they “should integrate the Catholic faith and culture in their own person and that they should imitate Christ,” not only “by word but also by every facet of their behaviour” (p. 254). The Bishops, according to Arthur (p. 257), had emphasized in 1974 the need for schools governors to appoint Catholics to pastoral and management posts. Provisions about atheists and agnostics were dropped ten years ago, in 1990. However, in the face of the tenor of such advice, whether or not it is still current, it is interesting to note that the trend in the figures indicates a majority of non-Catholic teachers in Catholic secondary schools by the turn of the century (Arthur, 1995). Whatever the practical difficulties about staffing, it is clear that Catholic schools are unshakeable from their basic purpose—to be recognizably Catholic.

The declared aims of the Church of England school

As with many things concerned with the Church of England, the policy position adopted is less than explicit. The Durham Commission into Church of England schools that published its report in 1970 put it in these terms: “Only one thing is completely clear: on the subject of Church schools the Church of England has never had one generally agreed policy. It certainly has none today” (p. 217, quoted in Carey, Hope, & Hall, 1998, p. 50).

As an expression of its stated role as the established church, the Church of England school has traditionally been open to “all-comers,” both in terms of staff and pupils. There is no expectation that the head and members of staff should be practising Anglicans (or even practising Christians) and the pupils themselves are drawn from a variety of cultural backgrounds, some Christian, some not (Johnson & McCreery, 1999).

However, this “openness” is now being questioned within a debate about the nature of “community” that should be served. David Lankshean (1992, p. 18), the Schools Officer of the National Society, notes that within the Church of
England there are those who “would argue that the schools are provided by the Church and are a major potential asset in the Church’s work of evangelism and Christian nurture.” This clearly echoes the Catholic position. However, he goes on to note that others within the Church see “the key role of the Church school is to be a good school, run within the context of a Christian community” (p. 18).

Thus, some senior Church of England figures are seeing within the popularity of their schools an opportunity to “become more overtly Anglican” and to place a greater emphasis on serving its own domestic Anglican community. Others continue to argue for the usual “Anglican light touch” in the conduct of their schools through which the traditional Church of England role in serving the widest community, be it practicing Christians or not, is maintained. It is in the former that a “stronger” Christian position is taken, and the latter that seeks (echoing the National Curriculum Council statement discussed above) to promulgate a value system of tolerance and morality that is acceptable in a society increasingly both multi-faith and no-faith. Within this context, in an area that is gaining increased attention, the leading Anglican academic Leslie Francis (1993, 1994), among others, has argued cogently for church schools.

**Opposition to church schools**

Opposition to church or faith schools exists in many differing forms.

**Historic**

The non-conformist fury in 1902 about the incorporation of Church of England and Roman Catholic schools into the state system has been noted. Today, the Free Churches Council takes a more sanguine view. The Council no longer has a declared position on these schools, as one interviewee said: “It’s not really a live issue,” for the constituent churches that make up the Council. Of course, some individual church members object out of principle; but most “seem quite pleased that they (the schools) are there as a Christian presence in the educational system.”

**An anachronism in a secular society**

The National Secular Society, founded in 1866, retains its “fundamental objections to religious schools,” according to its general secretary. The Society has opposed religious schooling since that time, to quote its general secretary again, as it believes that

religion is a private matter for the family. . . . We are not saying that morality isn’t important, or that preparing people for life isn’t important . . . but morality doesn’t necessarily come from religion; . . . what we find objectionable is that (church schools) are state funded.
The general secretary of the National Secular Society also mentioned that he had appeared on television in 1998 to oppose, in 1998, the granting of state funds to Muslim schools: “This was not a racist thing . . . it is a matter of principle whoever is involved.”

None of the leading political parties address the topic of church schools in their declared education policies. The political sensitivities from 1902 that were still warm enough in 1941 for Churchill to advise Butler to leave the church schools alone still seem nearly a hundred years later to have sufficient heat for today’s politicians to “let sleeping dogs lie.” Educational organizations such as the Socialist Education Association, a body affiliated to the Labour Party, have argued in the past against church schools on the grounds they are an expression of religious privilege that promotes a divisive sectarianism that frustrates a truly comprehensive education system. (Given that Tony Blair the current Labour Prime Minister sends all three of his children to state funded Roman Catholic schools, the Socialist Education Association was contacted to see if its position remained the same. No reply was received.)

Recent open opposition to church or faith schools has not come from politicians but from journalists. In an article in the influential, liberal newspaper The Guardian (27 January 1999), journalist Polly Toynbee wrote of her disquiet about the unquestioned existence of church schools which she felt were essentially middle-class and socially divisive. (She ignored the fact that many church schools, due to historic factors, are located in areas of serious social and economic deprivation.)

In terms of an educational argument against church/faith schools, Hirst (1972, 1983) saw education in a sophisticated form as leading to self-direction or in a primitive form as simply passing on tradition and knowledge. He argued that church schools are concerned not necessarily with education in this sophisticated form but with the development of faith in terms of catechesis. However, since the introduction of the National Curriculum in 1988, concerns about a narrowness of a church school curriculum are no longer relevant.

Perhaps one of the more telling arguments against church or faith schools has been those expressed in the Swann Report in 1985 (and supported by the Commission for Racial Equality, 1990). The Swann Report concluded that although “ethnic minority religious groups have the legal right to establish their own schools, this would not be a desirable development” (CRE, 1990). The Report felt that “they would not be in (their) long term interest . . . and (its) basic philosophy of ‘education for all’ would be compromised” (CRE, 1990, p. 2). This has remained the strong position of many—that faith schools of all kinds are socially and racially divisive and undermine the possibility of a truly comprehensive education in which all share basic values of tolerance.

Interestingly enough, in terms of a cohesive multi-cultural society, articles have appeared in the press that argued public funds granted in January 1998 for Muslim schools would, in fact, enhance and support a multi-cultural society. Roy Hattersley, a former Labour Cabinet Minister, writing in the same newspaper as Polly Toynbee while taking an entirely different view (The Guardian,
12 January 1998), argued that “Muslims . . . will be given a new self-confidence” at the news of such Islamic schools. Darcus Howe, writing in the Labourite and progressive New Statesman (16 January 1998), argued that state funding for Muslim schools is a victory against Islamophobia.

Thus, the “multi-cultural argument” can be seen to have at least two strands: one that is against church or faith schools because, in the English context, they tend to exclude ethnic minorities; and the other, on the contrary, such schools when reflecting the faith and culture of minority communities help enhance their self-confidence and position in society. Thus, the liberal position on church/faith school is split.

How the popularity of church schools is perceived

While journalists such as Toynbee dismiss the popularity of church schools with parents as the exercise of class privilege, it is clear that there is little empirical evidence about such preferences. Interviews with church-school head teachers, both Church of England and Roman Catholic, that are reported more fully elsewhere (Johnson & Castelli 2000, Johnson & McCreery 1999), and with officers of church educational bodies sought information from those in the schools themselves. The head teachers discerned both a pragmatism and a deeper attachment, perhaps both cultural and emotional, to their Christian ethos in the parental liking of church schools.

In general, the head teachers reported that church schools are perceived by parents as being academically “good,” sometimes excellent. Church schools invariably occupy high positions in governmental league tables of examination results and favorable reports in popular guides to achieving schools (for example, The Sunday Times Guide to Excellent State Schools, October 1998). Also, most if not all head teachers interviewed, who worked in schools in multicultural south London, commented on the reputation that these schools have for “good discipline” and “order.”

Others commented upon the supposed secularization of society. In fact, one interviewee asked: “What secular society?” Others detect a feeling that parents “don’t quite want to detach their children from Christianity.” Still others spoke of “spiritual questions and needs that won’t go away.” One primary head teacher put it simply: “Parents still want their children to know the difference between right and wrong.” Thus, educational, cultural, spiritual, and moral issues were identified as a genuine, if sometimes not articulated, concern for parents.

Conclusion

Much has changed in the English schooling system since the election of the first Thatcher government in 1979. The Education Reform Act 1988 placed schools into a quasi-market, where state funding followed the pupil or student. As part of such marketization, parents were given the right to choose the school they preferred for their children. (This replaced, in theory at least, the allocation of
school places by the bureaucratic decision making of local government officers in the town or city hall.) Thus empowered, parents have been making choices.

Clearly, hard-headed pragmatism about academic excellence should not be underestimated in the parental choice of a church school. However, there are other factors. Real parental and general societal concern about certain trends in society (for example, high rates of drug and alcohol abuse, teenage pregnancies, and divorce) cannot be dismissed as mere moral panic. As one Church of England head, who was interviewed, has been quoted as saying: “Parents still want their children to know the difference between right and wrong.” But what “right and wrong” and whose? In a post-traditional, post-modern world that produces an intellectual position that recognizes many frameworks and gives no precedence, no superordinate status to any, what moral code should be taught?

The Catholic school, as has been seen, does not adopt a moral ambivalence or accept uncertainty. As fully part of the Catholic Church, it has a declared duty to promote Catholicism in terms of values, knowledge, and belief which are absolute and declared from the center. Hence, an identity, while it is sometimes questioned, remains recognizable by “everybody” and so offers a membership of a worldwide community.

The Church of England does not have such a centralized decision-making mechanism. In organizational terms, the structure of its communion is much “looser.” Thus, the Church of England head teacher has much greater direct influence on what values are transmitted and in what way. The Church of England heads, in their interviews, talked more in terms of the children’s behavior rather than belief and doctrine. This behavior is acted out not only in the formal setting of a school assembly or in the attendance of church services, but, they implied, more importantly in respect to day-to-day living and interactions in the school community and beyond.

Nevertheless, it should not be ignored that the Church of England school, whether or not much time is spent on formal religious practice, does offer access to the Anglican tradition. In this way, it can be seen that Church of England schools are essentially Protestant. Much is not or is understated and open to individual interpretation through the individual’s own moral framework. After all, Anglicanism is the established religion of the English, a people who have no written constitution and seemingly suffer no anxiety as a consequence. As recognized by the Hindu priest, who sent his child to a Church of England school (Johnson & McCreery, 1999), some sort of moral sense is offered to those children from within the Anglican tradition and from those without. The Archbishop of York (Carey, Hope, & Hall, 1998) wrote recently: “Those of other faiths do not actually thank us for being apologetic or unsure or uncertain of our own, or even attempting to play down the differences or distinctiveness.” (p. 17).

In the face of the social realities of the new millennium, is this distinctiveness an illusion or mere wishful thinking? It is possible to ask whether parents who seek a declared moral code and a cultural and religious identity for their children are “desperately trying to hold on to or restore their traditions but are finding to
their dismay that it cannot be done: the substance of tradition is melting away, slipping through their fingers even as they grasp it” (Cupitt, 1997, p. 79).

In face of this fashionable acceptance of the loss of the past, such parental choice of a church school could seem both futile and educationally unsound. However, other writers do not accept such a cataclysmic vision. Bennett (1998) for one offers this comment on the postmodernist thinker: “He sees history setting out on a new chapter even when objectively speaking, it may have only turned a page” (p. 23). Bennett recalls a phrase of Adorno, that such a view allows its thinker to “forget himself.” In so doing, his own culture, history, and the secure sense of self that is identity that is derived at least in part from his community is lost “out of sheer open-mindedness” (p. 23).

The discussion of the multi-faith and multi-cultural society is dense and many layered. A secularized society, state, and school could suggest a homogenized culture in which Christianity does not have a “superordinate position.” It could also be a host culture, in this context Christianity (either as an active religious faith or as a cultural residue), promotes a societal tolerance and acceptance of minority faiths and culture. As was seen in the reception of public funding for Muslim, Sikh, and Jewish schools, a new position would seem to be emerging where a faith and cultural self-confidence are encouraged for ethnic minority and religious communities. If this is the case, it would be illogical to challenge the continued existence of Church of England and Roman Catholic schools.

As was seen earlier, it was necessary for Balfour to argue at the very beginning of the twentieth century that church schools were not inappropriate with the needs and objectives of “a progressive community.” They were to be seen then as part of “the normal machine for education” in England (quoted in Barber, 1994, p. 41). It is also clear that at the beginning of this new century, while individual voices speak out against them, there is no organized, substantial challenge, either political or academic, to their remaining part of that machinery. However, it must also be noted that while other commentators and activists argue the case for a more overtly confident Christian stance by these schools, that the attitudes and demands of these schools’ customers, namely, the parents, seemingly remain, in part at least, pragmatic, and so problematic. Secularization of English society may mean that strong feelings, one way or another, about these schools have disappeared; on the other hand, they may be lying dormant to return in a recognizable or new form. It is perhaps significant that politicians in England, as with politicians everywhere, being sensitive to the electorate’s feelings, expressed and subterranean, continue to prefer to “let sleeping dogs lie” and do not engage in debate.

VALUES AND RELIGION

From Abe to Zulu, the 300 languages spoken by London pupils. Evening Standard (2000, January 21).
This paper seeks to offer an exploration of an appropriate methodology for the study of Muslim schools in England. For this matter, it focuses on the need for an extensive contextualisation and awareness of cultural subjectivities and identifies some commonalties and dissimilarities that may influence the collection of data concerned with the culture of Muslim schools in one northern European country. The primary focus is an attempt to register the complexity of investigating cultural issues and to propose some tentative steps towards qualitative research that will tell the story of a significant development within state education in England.

1. Introduction

In the diverse English schooling system, comparisons, whether explicit or implicit, made between schools and the roles of actors within them are likely to use culture as a fundamental concept. Culture itself is a ubiquitous and multi-layered term that demands caution in its definition. Its use as a tool of analysis and interpretation also raises important issues of bias and political vested interests, possibly, if not probably, in all parties to the project. In any study of Islam and Muslim schools, whether or not set in a western context, the seemingly automatic attitudes of some western observers have to be noted and considered in depth. This is necessary lest such observers unthinkingly adopt the stance of orientalism, which Edward Said (1978, 1997), amongst others, has discussed as the western style for dominating, restructuring and interpreting Islam on western terms.
While acknowledging Said’s argument, it is also important to note that Islam in the West is itself undergoing change. As part of this change, Muslim schools are engaged in creating an identity for the school, the students and the larger communities associated with them. Most Muslim schools in England are multi-ethnic and draw children from a wide range of social and economic backgrounds. Although mono-faith they portray diverse interpretations of Islam. While respecting and supporting the cultural diversity within their student population these schools are also preparing young people for contemporary English society. It would not be an exaggeration to describe their task as developing a kind of English Islam, which is new and is finding its way and its identity within this new context.

The focus of this article is to discuss the considerations that must be addressed when devising a methodology with which to study publicly funded Muslim schools in England. In this context, there is a shared language of public everyday usage, namely English. So, it might appear that any significant methodological concerns might revolve around the technicalities of operationalisation, specifically those of data collection. However, it could be that something more profound and complicated is also present. There is interaction between culture and the meanings people acquire and attribute to events. So though, a ‘shared language’ seems to imply ‘shared meaning’, it could be that the ‘shared language’ often taken for granted sometimes conceals the subjectivity of different cultures or leads to simplistic and sometimes inaccurate ‘translations’ from the studied culture to the one in which the research study is framed (Trautmann, 1987). This could be particularly so in a northern European context where certain religions and cultural traditions have only comparatively recently coexisted in a multi-culturalised context. So as a research project is progressed through the stages of designing of a methodology, collecting and analysing data about Muslim schools in England, the omnipresent challenge will be the need to be self-reflexive about the nature of the cultural subjectivity brought by all participants to the process.

The structure of this article is as follows. For the readers unfamiliar with the English schooling system, we say something about the English dual system and the place Muslim schools occupy in it (section 2). Next we consider the complexity of culture and especially focus on the relationship between culture and identity (section 3). The subsequent section (4), then, constitutes the core of this paper. It is here that we reflect on certain key-aspects of an appropriate methodology for studying Muslim schools. We end our discussion by drawing some conclusions regarding data collection and validity (section 5).

2. The English dual system

State funding of Christian schools has a comparatively long history in England. In 1833, the British government paid small grants to the educational bodies of the Non-Conformist churches and the Church of England. In 1902 Catholic schools were incorporated into the state system and subsequently, a small number of Jewish school and, more recently, in 1998, Muslim and Sikh schools.
This inclusion of church/faith schools in the public/state system of English schooling to create a dual system distinguishes it from the public systems of the USA, Australia, New Zealand and most of continental Europe (Sallis, 1994). Church/faith schools were once criticised for the narrowness of their curriculum (Hirst, 1972, writing specifically of Catholic schools) and, in some instances, for their poor educational standards. However, today, church/faith schools are as subject to the ‘central template’ of the National Curriculum and inspection by the government agency OFSTED (Office for Standards in Education) as any other school within the state system. Increasingly, church/faith schools (Anglican and Catholic schools in particular) are gathering a reputation for educational excellence and, despite some opposition, the present government is committed to increasing their number over the next few years.

Thus the Muslim schools in this research became part of the state system at a time when church/faith schools were enjoying some success. They were aware of this and aware also of the debate within the existing church/faith schools concerning church/faith values and the price of success within a state system. Research has shown (Johnson & Castelli, 2000) that church/faith schools see themselves as integral to the state educational system and, moreover, they feel they bring a particular educational philosophy that enriches and is enriched by this partnership. The two Muslim schools within this study share this commitment to the state system and are open to the dialogue that will ensue. The debate that has ranged around church/faith schools, and particularly Muslim state schools since the events in New York and Washington of 11 September 2001, has raised the question of the influence of Muslim schools upon contemporary English society. Within the Muslim community, both prior to and after 11 September, the debate has been around the compatibility of Muslim faith values and state values within schools. In this area they share common concern with other church/faith schools. How this intra-community and inter-community dialogue influences English society will be of interest to many.

3. The complexity of culture and uncertainty of identity

As was noted in the introduction, culture itself is a complex term, used by many disciplines, which has to be handled carefully. It can be seen in societal terms, as in Hofstede’s wide generalisations about cultural characteristics (Hofstede, 1980). The idea of a societal culture is a convenience that pinpoints a locale, a history, policies for the future and current salient operating characteristics of the educational system. But can it always be used so confidently? As Dimmock and Walker (1999) note, societal cultures are not homogeneous. In a contemporary British/English society that sees much of its past, and it would seem, its future in terms of a strong nation-state, recent Scottish and Welsh devolution have made the term ‘British’ now increasingly problematic. This has had a ‘knock-on’ effect on an English identity that has become a sharper, more specific, refreshed (and also problematic) cultural and national term within a society that has an
educational system that is distinctive from its immediate neighbours within the United Kingdom (Raffe, Brannen, Croxford & Martin, 1999). With such complexities and ongoing shifts in identity, it is clear that it is no simple task for researchers to explore and understand the full cultural hinterland that such national identities or labels represent. Hall (2000, p. 17) adds to the uncertainty by pointing out that “the concept of identity ... is ... not an essentialist, but a strategic and positional one.” He goes on to say that identity “does not signal that stable core of self ... the bit which remains always-ready ‘the same’, identical to itself across time.” A recent article in a liberal, British newspaper about young English Muslims (The Guardian, 29 December 2000) would seem to offer support for Hall’s argument. The views of Mohammed Omar, a twenty-five year old English-born Muslim are reported. He commented that many young Muslims who had thought themselves westernised were shaken by the Gulf war. Further on in the article he is quoted as saying:

I grew up in Hackney, where a lot of people said OK I’m black. I think it was a lot to do with peer group pressure because in Hackney there were a lot of people from Jamaica. There’s nothing wrong with that, but in the end it’s just a fashion statement (our italics).

This statement would suggest that identity cannot be used to claim total security and permanence; in fact, it would seem that identities fragment and multiply and are more a matter of a chosen position rather than an automatic inheritance.

On a more specific level, it can be said that “educational policies have altered following changes in the composition of British society” (Todd, 1991, p. 39). Todd (1991, p. 39) goes on to note that “… there is no consensus on how many distinctive approaches have evolved” in respect of education in a multi-cultural society that the post-colonial Britain and England have become. Accordingly to Mullard (1984, p. 7), such approaches depend on how specific conceptions of educational issues link with wider models of British society:

... all the racial forms of education that have scurried across the landscape of educational history over the last twenty years – immigrant, multi-racial, multi-cultural, multi-ethnic, poly-ethnic, and anti-racist education – stand and face each other in a relatively similar way. This is so because they draw upon different or slightly different perspectives and perceptions of socio-educational reality and objectives. In short, they all evoke positions on the nature of the social and educational; they all invoke their own set of decisions in respect to (preferred) definitions of the problem in society and education and hence (preferred) conceptions of social and educational objectives.

As these positions have evolved, it is interesting that a current policy approach in England has been in terms of structures. The creation of new faith schools
(and the continuance of the previously established Christian ones) is a phenomenon of our secularised times (Johnson, 2000). The multi-cultural initiatives and programmes, discussed by Mullard over seventeen years ago, that place an emphasis on ‘inclusiveness’ and ‘similarity’ are judged by some as having been replaced or at least overshadowed by these new schools that respond to the needs and demands of newly arrived immigrant groups. Such school openings can be seen, in Mullard’s terms of preferred definitions of a social problem or issue and preferred solutions, in a number of ways. Without exploring this area further, three ways that immediately come to mind are:

- church/faith schools can be regarded as a confident expression of a mature multi-cultural society;
- they (and the longer-established Christian schools) can be seen as socially divisive;
- or, in Apple’s terms (1996), can be seen, within the arena of cultural politics, as a project of cultural restoration.

Culture is also an important term at the organisational level and has been written about extensively in management literature (Handy, 1994; Pheysey, 1993; Morgan, 1997; Schein, 1992). Hoyle (1986, p. 3), writing of the educational institution that is the school, notes that “central to the concept (of culture) is the idea of value, that which is regarded as worthwhile by members of the group.” So, within any school and linked community it is likely, if not certain, that many sub-cultures will co-exist. Each will reflect different ‘worthwhiles’ that may or may not correspond with the mainstream culture, that in Apple’s terms (1996) holds hegemonic sway within the school or community or society as a whole. Such comments are seemingly self-evident but of great significance when samples are being constructed or interviewees selected. More mundanely, but without less significance, will be the personal values of individuals that may be expressed overtly in political, social or religious allegiances or more subtly, as Goffman (1969) would have it, in the ‘ordinariness’ of everyday behaviour and interaction. All these (individual and collective) ‘cultures’ will interact in ways that are both predictable and unpredictable.

4. Methodological reflections

4.1. Knowledge about the studied culture as a prerequisite

If researchers need to have self-awareness about their own culture, involvement in a cross-cultural study requires knowledge about the culture of those they are studying. Here again, an on-going management of this awareness is necessary; otherwise, researchers are at the mercy of stereotypes. (How do you typically regard Muslims? Do you have an ‘insider’ or ‘outsider’ understanding? On what is your ‘knowing’ based?) Common cultural stereotypes exist. They can be
accurate or a slander; they can be benign or malevolent; and they can be an objective statement or a patronising put-down. Stereotypes, collected on an anecdotal basis by these researchers, can be illustrated as follows:

1. From direct or indirect interactions with a range of others within across contemporary English society:

   About faith schools, in general:
   “Aren’t all faith schools fundamentalist or at best indoctrination shops?”
   “Do children receive a relevant, modern education in them?”
   “Aren’t children taught to believe rather than think?”

   About Islamic schools, in particular:
   “Don’t Muslim schools prevent children integrating into contemporary society?”
   “Do girls experience the same curriculum as boys?”
   “Are girls treated as the equals of boys? Are they hidden behind veils?”

2. From the researchers’ own feelings:
   “How will I be treated at the schools by the staff?”
   “Will I be regarded as a ‘woman’ rather than as an ‘individual’?”
   “Will I have to be acquiescent, bite my lip, let my colleague take the lead in the interviews and other social situations?”
   “What should I wear or not wear to visit an Islamic school?”
   “I really do not want to offend anybody by committing some dreadful social gaffe”.
   “These anxieties are likely to be ridiculous, but I must take notice of what I am feeling”.
   “How should I address female members of staff?”
   “It is permitted for me to shake hands with the head teacher or other staff?”

From these anecdotes, it is possible to see these apprehensions about the purpose of Islamic schools and social unease are based on a lack of knowledge and previous social interaction. (However, the gender differences cannot be too quickly dismissed. After all, they do exist).

Beyond anecdote, more profoundly, Karen Armstrong’s (2000, p. iv) sympathetic history of Islam outlines a common western view:

No religion in the modern world is as feared and misunderstood as Islam. It haunts the popular Western imagination as an extreme faith that promotes authoritarian government, female oppression, civil war and terrorism.

Exploring this fear, Said (1997, pp. xxix–x) talks not merely of Apple’s cultural politics but of a cultural war being waged against Islam, derived “from nine-
teenth century Orientalists of the British and French school, who saw in Islam a danger to Christianity and liberal values . . .”. The Palestinian-American scholar has called this the ‘grandest of all narratives’ and although orientalism can be considered as a general theory of representation of The Other, it can be regarded as applying more specifically to Islam and Muslims. Said (1978, p. 3) defines orientalism as “the corporate institution for dealing with the Orient . . . as a western style for dominating, restructuring and having authority over the Orient”. Thus, it is clear that orientalism must be faced head on and that there are important issues here for researchers about the achieving of an objectively informed position. This is even more apparent since the events in United States of America on 11 September 2001.

4.2. Adopting qualitative research techniques

Clearly positivist-based research that is concerned with the input and outputs of systems has a meaningful place in the social sciences and in the field of school and education management in particular. But as the preceding discussion on the complexities and subjectivities of culture and their impact on meaning has shown an approach that delves beneath the surface realities is required. The qualitative perspective offers a means by which some of the main themes of sociological thinking and theory can be addressed. These themes revolve around issues of power, ideology and, most importantly of all, subjective meaning. Weber (1978 [1921], p. 4) himself defines sociology as:

. . . a science concerning itself with the interpretative understanding of social action and thereby with a causal explanation of its course and consequences.

In this, the social sciences are conceptualised as “cultural sciences with a systematic intent.” Habermas (1990, p. 10) notes that in this definition Weber combines:

. . . methodological principles that philosophers had found in opposing types of sciences: the social sciences have the task of bringing the heterogeneous methods, aims, and presuppositions of the natural and cultural sciences into balance.

From this, Schutz (1964, pp. 269–270) states that:

. . . all scientific explanations of the social world can, and for certain purposes must, refer to the subjective meaning of the actions of human beings from which the social reality originates.

While there may be social constructions of reality that are governed by identifiable rules and regulations, contrary to the Durkheimian view, no objective
patterns of reality exist. Individuals have the capacity to make their own reality and so exercise a choice in deciding to act out this rather than that: “... the acting individual attaches a subjective meaning” (Weber, 1978 [1921], p. 24) to his or her own behaviour “be it overt or covert, omission or acquiescence.” Freire (1990, p. 61) summarises this view in a pithy fashion: “... no one can say a true word ... for another”. So, in practical terms, whereas quantitative research seeks to measure behaviour, qualitative research attempts to go beyond appearances to explore a deeper understanding of the meanings of the reality, within a particular situation, as offered by the situational actors themselves.

This approach has been successful in generating much reportage and vivid thick description about, in the main, urban subcultures. But how can the reader assess, whether implicitly or explicitly, its relevance to his or her situation, if no historical and/or structural contextualisation is attempted? Going beyond the what of culture and perception formation, how can the reader understand why it developed in such a manner? What can be surmised about the ideological and hegemonic pressures and influences on those views and perceptions, however individual? It could be argued that the ‘value-free’, theory-free, uncritical sociology that this approach seemingly produces, in fact, in some instances, conceals more than it reveals.

Hammersley (1992) has sought to synthesise the traditional, ‘Chicago perspective’ with a wider and broader view of the historical and structural context in which the perceptions of individuals are embedded. He states (Hammersley & Atkinson, 1983, p. 234): “... we have no grounds for dismissing the validity of participant understandings outright.” He takes the point further to argue that such ‘understandings’ “are a crucial source of knowledge, deriving as they do from experience of the social world”. However, they are not to be accepted unquestioningly and “they must be treated in exactly the same manner as social scientific accounts.”

In this vein, Jorgensen (1989, p. 18) argues for a position that allows both form and flexibility for the researcher, who, while perhaps having “a theoretical interest in being there”, has not made any definitive decisions about “... what concepts are important, how they are or are not related.” He concludes that:

... what therefore, is problematic should remain open and subject to refinement and definition based on what the researcher is able to uncover and observe.

This view allows the researcher a theoretical position, that he or she is likely to have, as long as it is not given precedence over the data that is collected in the field. This theoretical position itself is a starting-point that can and is likely to be modified (as is the original research design). The issue is perhaps how far from this starting-point is the end result. After all, as Powney & Watts (1987, p. 23) wryly comment:
There is a sense in which this must always be the case – that the researcher has explicit (or somewhat implicit) theoretical conceptions of the outcomes, otherwise he or she would not embark on the research in the first place.

With these provisos that attempt to distinguish a theoretical position from a cultural and or political prejudice, we now turn to consider the reflexive and ‘self-policing’ qualitative researcher.

4.3. The researcher as the instrument

The qualitative researcher’s own role in the research has been broadened out from the reporter of certain social phenomena and situations as seen by their actors. Thus, it is clear that certain ‘checks’ have to be built into the research design to assist the researcher to minimise bias and to maintain the balance between observation and theory in an authentic and meaningful way. Reflexivity is not primarily concerned with the arguing for the validity of the research to its readers, but with offering the researcher self-consciousness about how he or she designs, implements and interprets the research project. Ward-Schofield (1993, p. 202) suggests that at its core qualitative research has: “... the assumption that a piece of qualitative research is very much influenced by the researcher’s own attributes and perspectives.” She goes on to say that:

The goal is not to produce a standardised set of results that any other careful researcher would have produced ... it is to produce a coherent and illuminating description of and perspective on a situation that is based on and consistent with detailed study of the situation.

Clearly, reflexivity is more than a relaxed mulling over of what has happened today in school or in the office. According to Imel (1989), reflective practice is the integration of thought and action with reflection; and so is a more rigorous and demanding exercise. Reflective thinking can be structured:

... according to the mode of thinking or the process an individual progresses through to reach a level of reflection that complements both the context of the situation and the background the individual brings to the episode.

(Taggart & Wilson 1998, p. 2)

The evaluation and decision-making engaged is to be informed, logical and systematic – and may be conducted solely by the individual concerned or as a group activity with ‘critical friends’. But even in this, testing out the issue of cultural bias and/or ignorance is relevant once again. What should be the cultural
background of that friend or friends? Does the loop remain closed if their back-
ground is similar to that of the researchers? Or can communication be really
effective if the friends are ‘within their own, different culture’?1

5. Some general conclusions about data collection,
analysis, and validity

As has been seen, data collection from both documentary and other sources has
been considered, as has issues revolving around the objectivity of the researcher in
the emerging categories within the data in the subsequent analysis. From this it can
be seen that it is clearly necessary to embark on such a cross-cultural project with
some caution and careful though flexible planning. Though a qualitative approach
cannot be used in a slip-shod or casual fashion, it has been selected as it offers “a
means for inquiring into unsuspected connections within and across the levels of
individual, school, society, national and supra-national culture” (Johnson & Hill
2000).

Thus in order to collect data, relevant government, religious, and school doc-
uments might be examined to ascertain the purpose, structure, and mechanisms
of Muslim schools in England. This means that the two publicly funded Muslim
schools and other privately funded ones need to be approached for access and to
open up and widen comparative sources of data. In this way, misinterpretations
can be avoided or minimised. An interview inventory design has to be attempted
that is culturally aware and sensitive (since it is accepted that the likelihood of
devising one that is culturally free is impossible in the field of education, which
is, of course, concerned with culture).

As regards validity, the first concern will be description validity – the factual
accuracy of accounts. This is the essential of every qualitative study. As Geertz
(1973, p. 17) puts it, “behaviour must be attended to, and with some exactness,
because it is through the flow of behaviour – or, more precisely, social action –
that cultural forms find articulation.” Interpretative validity will be the next
concern. Beyond a valid description of places, behaviours, and reportage, atten-
tion must be paid to what they mean to the people involved with them. Interpre-
tative accounts will be grounded in the language and culture of the people
studied. In this type of research, then, generalising is limited to the community,
group, or institution studied.

Note
1 The role these ‘friends’ may play is illustrated by the following example. Through a
series of three preliminary interviews, we established an increasing rapport with a
subject who was himself a convert to Islam before studying the culture of Muslim
schools. This subject has travelled from one set of paradigms to another, and retained
the memory of the experience. Essentially, in Hall’s (2000) terms, he has proactively
chosen his identity. He has become both a critical friend and a guide for us, specifically
about the following:
The translation of language: recalling Trautmann’s (1987) comment about simplistic translation, our guide to cultural difference has explained the true meaning, for example, of *fatwa* as ‘struggle’, a term in the West that carries an emotional and political agenda but in Islam has a spiritual meaning:

**Non-Western sources on Islam:** he encouraged the researchers to move beyond Western writers such as Armstrong (2000) to read writers such as Seyyed Hossain Nasr (1996, 1987) who as Muslims write about their religion in English;

**Other sources of data and access to Muslim education:** he suggested, for example, the use of job descriptions in the delineation of the role of the Muslim head teacher and made access to them possible through IBEER (International Board of Education and Research);

**The difference between Classical Islam and Modern Islam:** he has shown to the researchers a breadth of Islam that is not evident in contemporary society. Modern Islam is vociferous, visible and ‘in your face’. There is in Modern Islam an iconic identity that is visible and exclusive. Classical Islam focuses on spiritual values and has a narrative identity that is eclectic and inclusive. Classical Islam can be seen historically in the diversity within Moorish cultural expressions. A contemporary English Islam will have to take account of both of these.

EMOTIONS AND GENDER
This page intentionally left blank
Examining the emotionality of leadership by exploring administrators’ recall of key junctures in their lives as leaders, this pilot study was designed to begin to investigate the associations between an individual’s philosophy of leadership and his/her experience of emotionality in leadership work. Employing an interview method, the study used stimulated recall of emotional experiences associated with leadership work. Interviews were transcribed and, along with researcher’s observation notes and participants’ written submissions, all data were subjected to analysis. An assessment of the situations that evoked emotions, patterns associated with the emotions themselves and some of the effects of the act of reflection, led to noteworthy conclusions which may hold important implications for further research in the sociology of emotions and educational leadership theory and practice. Emerging findings support the position that emotions may be fundamental to the intra and intersubjective realities of life in schools, in general, and of leadership work, in particular.

Teaching and leading are profoundly emotional activities (Fried, 1995). You would not guess this from much of the educational change and reform literature, however . . . If educational reformers ignore the emotional dimensions of educational change, emotions and feelings will only re-enter the change process by the back door.

The emotional experience of educational leadership has not been explored in sufficient depth to date in the Educational Administration literature. This pilot study investigated the emotions of leadership – their provocations, origins, qualities – and some of their effects on the working lives of educational leaders.
Researchers have identified a number of different styles and behaviours associated with leadership work (Burns, 1978; Kuhnert and Lewis, 1987; Leithwood and Jantzi, 1990). In the past ten to fifteen years, the widespread acceptance of the need for change in education and elsewhere has led to extensive reconsideration of ‘what is leadership?’ and ‘what are effective ways in which to lead?’ Struggling to define leadership, from the mutual exclusivity of management as ‘maintaining’ and leadership as ‘creating’ (Bennis, 1989), through to the suggested recombination of these dimensions in a composite blend (Fullan, 1991), characterizes the range of perspectives on how to define leadership and how to do it best.

Human emotions have been consistently marginalized in educational leadership research. However, in education, several writers and researchers do acknowledge emotions as relevant to teachers’ work (Acker, 1992; Blase and Anderson, 1995; Dinham 1995; Hargreaves, 1994; Jeffrey and Woods, 1997; Nias, 1989; Noddings, 1992; Rosenholtz, 1989 and others) in terms of themes that include morale, stress and burnout, motivation, empowerment, the self, change, deprofessionalization of inspection and emotions of learning to teach. The emotions of leadership are virtually unmentioned.

There are exceptions.

In a revealing narrative reflection of his own inner journey as principal, David Loader suggests we need “… a more balanced view of leadership … those who have researched the current educational writing have identified a gap … Little seems to have been written about the person of the leader and the emotions that person experiences while leading.” He offers many insights, like the following:

Leadership has its highs and lows, its successes and failures. Principals cry, laugh, dream and become suspicious. There are times when principals do want the fairy godmother to come and save them. While leadership is about courage, about creating the tomorrow of our choice, heroism does not come easily.

(1997, p.3)

His candor about his personal and professional self is exceptional in educational administration literature.

Criticisms of my school were taken personally, as criticisms of me. With this mind set it became very hard to have a private life … My personal failure was that I had no sense of myself as separate from the institution.

(1997, p. 147)

In her study of several principals and the ‘emotional labour’ of competing in the educational marketplace at the expense of shared collegiality, Blackmore found
the need for an increased appreciation of the emotional labour involved in educational leadership during times of severe fiscal restraint and aggressive educational reform.

As well, we find that for principals, there are some emotional implications for leaders who are learning to “let go” of control in shared governance of schools (Blase and Blase, 1997). Principals, mandated to implement distributed leadership in their schools, reported emotional and professional rewards for themselves and their teachers. However, the anxiety and fear that accompanied making the adjustment held them back and in some cases undermined their ability even to try to make the necessary changes.

In the educational administration literature, leadership behaviours that have emotional implications are repeatedly recommended: lending support, exhibiting moral integrity, providing safety, fostering collaboration, offering intellectual stimulation, encouraging organizational learning and practising consultative and shared decision making. Optimally, it is theorized, these features combine to create cultures in schools that generate and sustain the energy necessary for change and transformation. Csikszentmihalyi might call this ‘finding flow.’ The emotional causes and effects of so many conditions an effective leader might try to create, remain under explored. The emotional processes of the leader her/himself remain virtually uncharted territory in educational research.

The emotions have been treated, if they are mentioned at all, as little more than pesky interlopers, distracting us from a higher, rational purpose.

Analysis of political and cultural forces that condition emotional experience across time and space is neglected [while] emotional processes are treated as separate from other kinds of subjectivity such as thinking and somatic experiences . . . As a result, emotional and cognitive orientations are viewed as competing perspectives . . . [and] little has been done to unravel the complex manner in which emotion, cognition and the lived body intertwine.

(Ellis and Flaherty, 1992, p.3)

This dualist paradigm continues to pervade our consciousness harkening back to the age of enlightenment and obfuscating a more complete view of the human mind – body continuum. As Davies (1992, p.67) warns, in the context of examining cultural narrative,

The binary pairs male/female, mind/body, reason/emotion, light/darkness, fact/fantasy take their meaning not only in relation but in hierarchical opposition to each other. Our new stories must rework the element of these dualisms, such that both sides are equally valued, their meaning is no longer part of any oppositional binary form of thought, and both become necessary elements of each person’s subjectivity. In the meantime though, personal identities have been (are being)
constituted in terms of those very dualities we are in the process of challenging.

(Davies, 1989c)

The hierarchical relationship between reason and emotion has particular implications for life in organizations – for leaders and for followers – in that it is often characterized as one of mutual exclusion. The power position in the hierarchy may be ritually reasserted through strict emotional control or repression in an attempt to appear exclusively and dominantly rational. There is a constant enactment of the notion that optimally, saner heads prevail and that sane is synonymous with unemotional. However, this may be the antithesis to the way people are really feeling. Reason itself is not free of emotional foundation, and even in the purest of intellectual moments, emotions are present. The mind is actually a seamless blend of thinking and feeling (Damasio, 1997). Traditional educational administration research’s consistent exclusion of the emotions, therefore, is limiting, for it distorts our theoretical understanding of human experience. Problem solving, strategic planning, and even reflective practice are considered from an exclusively rational standpoint. Educational administration research can no longer afford to treat the emotions as peripheral if we are to explore fully the way we are and can be.

Despite their apparently “unpleasant” or “dangerous” qualities for researchers because of their capacity to “contradict so much of the rational actor world-view on which mainstream sociology is premised” (Ellis and Flaherty, 1992, p.1), subjective experiences are fundamental to our notion of reality. The emotional dimension of our subjectivity has a foundational role to play in the development of our socially constructed reality. Lived experience then, may be more appropriately treated as “an interpretive story, rather than a causal one” (Ellis and Flaherty, 1992, p.5). An interpretive story “lives willingly with plurality, embracing the power of language to make new and different things possible; ... focuses on how we talk about the world and tries to deal with it; ... recounts improvisations, changes, contradictions, ambiguities and vulnerabilities” (Bochner, 1990, pp.5–6). We need to study the stories of emotional subjectivity in this spirit.

This thesis is therefore grounded in a new paradigm of the human mind, one which recombines the previously polarized cognitive and affective domains and is based on a vision of the ‘whole body as mind’ (Pert, 1998). With this image of the whole mind in mind, we may begin to pursue lines of research which could lead to a more meaningful understanding of people whose realities are largely defined and whose values are heavily influenced by their emotions. Research into the emotional dimension of the total human experience then, may complement cognitive and behavioural emphases that have gone before, giving us a closer look at some of the less considered parts, and moving us nearer to a fuller appreciation of human beings as whole persons.

It is not only the educational research community which has excluded the emotions. Emotions are political. Within the culture of schools themselves, there
is the tacit expectation that ideal ‘professional’ demeanour is primarily rational and, for the most part, emotionally controlled if not repressed. This is especially the case in terms of emotional display rules among adults in schools. Unfortunately, in attempting to retain appropriate professional decorum, the continual denial or suppression of the emotionality of our experience can create an artificiality to organizational life that is energy depleting and even unhealthy.

Typically, in organizations, people suppress ideas and feelings about ongoing problems at work, behaviour often viewed as politically useful and adaptive. Paradoxically, successful efforts at organizational change and development rely upon participants’ genuine expression of feelings and ideas. Nevertheless, sincerity may challenge the political nature and defensive strategies that characterize most work relationships. Resistance to change is therefore inevitable. (Diamond, 1993, p.117)

This denial of the emotionality of experience may also be limiting the potential for professional renewal and synergy that can only occur when the whole self is safe to grow and to discover in collaboration with trusted colleagues (Barth, 1988; Little, 1993). Perhaps leaders themselves need a forum of trust and safety within which to examine and reflect upon the emotionality of their experience. (Fineman, 1992; Osterman and Kottkamp, 1993). There is, for example, for teachers, a connection between the emotions of feeling safe and secure, and authentic collaborative professional learning, creative risk taking in shared hierarchical leadership (Beatty, 1999a). However the relationship between teachers’ emotional experience in this context and that of the leader, may be one of inverse proportionality. In other words, the more secure and empowered the teacher, the more threatened, insecure and anxious the leader (Blase and Blase, 1997). This ‘either or’ relationship between leaders’ and teachers’ emotional security is a central to the inner workings of educational stasis and critical to our understanding of the possibility for educational change. It is important to note however, that we find teachers’ willingness to make voluntary commitment to extracurricular duties is not necessarily dependent on the extent of their perceived empowerment (Blase and Roberts, 1994). Closed and open, authoritarian and tranformative: leaders with various styles get results. Thus there may be other more elusive qualities to the effective leadership connection with teachers. Could these be emotional qualities? The characteristic emotional intersubjectivity of an organization is a measure of its energy system and its openness to learning, growth and change.

Some models of the learning organization are based on empowerment and shared decision making. Schools that have succeeded in fostering a truly collaborative culture report a self-generating creative synergy and commitment (Blase and Blase, 1997). However, despite much rhetoric about the desirability of a horizontal organizational structure characterized by shared decision making and
authentic collaboration, our present system is still typically hierarchical and exclusionary. The hierarchical regime is often characterized by centralized control, favouritism, and highly restricted information flow (Blase and Anderson, 1995). Thus, the processes whereby leaders experience their emotional capacity, or lack thereof, to provide the necessary impetus for optimal personal and organizational change are worthy of our consideration. The emotional attachment of leaders to their values of power and control, for example, may be the source of the seemingly irressippressible, self-replicating power of hierarchy. Thus an emotional link may be partly responsible for the corresponding loss of opportunity to energize the system. Or worse, in the highly controlled, closed regime, wherein authoritarian or even emotionally damaging leader restricts the possibility of transformation, there is the danger of entropic depletion of personal and organizational energy. Importantly, therefore, the shaping and maintaining forces in the culture of educational leadership, and the underlying emotionality that is associated with these forces, are worthy of closer examination.

Much has been written about transformational leadership styles, theoretically facilitative and fostering of shared growth and organizational change. However, even the most well intended leader is subject to her/his own transrational values (Hodgkinson, 1990) and, I would argue, the emotions that sustain them. The leader whose need for power and control exceeds his/her intellectual acceptance of the desirability of a heterarchical distributed leadership may be faced with an obstacle to organizational success that is essentially an emotional one. A better understanding of the emotions of leadership could be used to build, or alternatively, may continue to undermine our capacity for learning and change in schools. Further research is needed therefore, in order to discover the intra, inter, social, micropolitical and structural factors that contribute to, create and sustain the emotional processes underlying our attachment to stasis, at a time when embracing change may be essential to survival. Thus, this study was born out of the need to research the emotional reality of life in organizations, especially schools. Its particular focus is the emotional experience of educational leaders.

**Context**

At the time of this study, the ongoing need for organizations to become places that are safe, dynamic, learning, evolving, adaptive and creative existed concurrently with the increased momentum of a new external political reality. Increasing demands for fiscal restraint and professional accountability created pressures for change and improvement with little money to support these initiatives. Thus, there was an increasing demand on human resources at a time when there were few supports to facilitate human adjustment and more importantly, real deep organizational change or transformation.

The need for transformation was beginning to be felt keenly in the education milieu. Educators were aware of the need for change. They were not however,
informed, prepared or supported in these changes. For instance, making the transition from having exclusive control over what students will learn, to joining them as fellow learners in an information flooded world is, like the principals learning to share leadership, an emotionally challenging feat. Importantly, it is the teacher who is encouraged to be a life long learner, looking inward as well as outward for growth, who can best exemplify this most potent lesson for students. However, it is usually the teacher who is emotionally safe to take the necessary risks who becomes such a model (Beatty, 1999a). The ability of the leader to foster such a safe environment, to promote and perhaps exemplify such a learning model is in part an emotional capacity (Loader, 1997). At the time of this study the emotional self-awareness and capacity of the leader was a little researched link in the chain of professional growth and organizational change.

Decades of study have been devoted to ‘Educational Change,’ ‘Learning Organizations,’ ‘Transformational Leadership,’ ‘Leadership Behaviours,’ ‘Values in Education,’ and other attempts to understand the inner workings of life in schools with a view to effecting educational improvement. Nevertheless, theory, policy and attempted implementations have been largely ineffective in bringing about deep meaningful change.

To discover why change has been so difficult to effect, some have sought answers by trying to reconfigure elements within the various organizational and leadership models that have been developed to try to describe the ways leadership occurs in different kinds of schools (Leithwood et.al., 1999, in press). However, these models are characterized by a heavily cognitivist and behavioural perspective. Leithwood et.al.’s summary of clusters of leadership concepts gleaned from educational administration journal articles since 1988 are useful, offering the categories of ‘instructional’, ‘transformational,’ ‘moral,’ ‘participative,’ ‘managerial’ and ‘contingent.’ But the emotions get scant attention. They are considered as indirectly related to motivation, highlighting the desirability of “emotional arousal states” the leader may attempt to create in others. However, their chapter entitled “Emotional Balance” is actually a treatment of emotional exhaustion among teachers as synonymous with burnout. Focussing on the emotions the leader stimulates in others, there is no mention of what the emotional states of the leader her/himself might be. A comprehensive study of the subtle interplay among cognitive and affective processes responsible for allowing and preventing change, processes which may be far more emotionally based than has been fashionable to acknowledge, is needed.

The marginalization of affectivity has led to a kind of subversion of the emotions in the research and practice of educational administration. The emotions are undoubtedly present but they go unacknowledged. Furthermore, the absence of research into emotions of leaders themselves represents a significant gap in the literature.

This study was undertaken at The Ontario Institute for Studies in Education, Theory and Policy Studies – Educational Administration Department, as a “Field Research” component of the Education Doctoral Programme.
Research question: How do leaders experience, express, reflect upon and understand the emotionality of their work?

Sub questions

1. What are leaders’ inner experiences of emotion as associated with their work: intrasubjective emotionality and the ‘self.’
2. How do leaders experience the emotionality of the ‘other’: emotional intersubjectivity?
3. How do leaders recall and make meaning from influential experiences in the theoretical and practical evolution of their leadership?
4. How do gender and micropolitics play a role in the emotional experience of leaders?
5. What other understandings of the inner world of the educational leader might emerge from the data of this study?

Theoretical framework

Emerging from the analysis of the data were confirmations of the relevance of several concepts. These include the following:

1. The concept of ‘self’
as ‘I’ and ‘Me’ experienced relative to the ‘Other’ as introduced by Mead (1932) and discussed by Heidegger (1927/1962, p.275, as cited in Denzin, 1984) and explored later by others, notably Nias (1989).

*Emotionality is a circular process that begins and ends with the transactions and actions of the self in the social situation interacting with self and others.*

The internal experience of emotions by leaders often results in felt implications for the leader’s sense of self. The felt emotions are referred to here as emotional intrasubjectivity. As Nias advises, the “substantial self” seeks internal and external congruence. The cognitive dissonance that occurs in situations that clash with our “beliefs” and “values” about our substantial self, demands a “strongly protective and sometimes far from optimal change of view or action” (p.16), a fragmentation of the professional self, which would presumably be associated with some manifestation of emotionality. Through stimulated recall, participants gained some access to these aspects of their experience.
2. Intersubjectivity

as explored by Denzin (1984) is helpful in considering the emotions of the leader in conjunction with the emotions of others.

If emotionality is conceptualized as a process of self-feeling, then it can be seen as arising out of the self-interactions that individuals direct toward themselves and out of the reflected appraisals of others, both imagined and real.

(Sullivan, 1956, as cited in Denzin, 1984, p.54)

Denzin (1984, p.146) reminds us that “As recurring fields of common interactive experience, organizations provide the contexts for the preperforming, co-performing, and reperforming of those social acts that underlie all emotional understanding.” His examination of forms of emotional intersubjectivity is useful. Feelings in Common, Fellow-Feeling, Emotional Infection, Emotional Identification, Emotional Embracement, and Spurious Emotionality constitute the range, kinds and levels of emotional understanding in his construct. Presumably, for leaders and led, interpretations of emotional understanding bear on their lived experience in work. The ways leaders, who remain more isolated than many others in the organization, handle their emotional understandings and apply these in their practice is of interest in this study.

3. Micropolitics

Blase and Anderson’s (1995, p.18) treatment of leadership styles as relatively open or closed, transactional or transformative provides a useful construct with which to consider power and emotions in leadership. Leaders in this study described their self-definitions of what leadership should be. These then could be compared to feelings associated with instances involving themes of power, influence, control and other aspects of leadership. Emerging patterns could be identified. Perhaps, for instance, certain emotions whether pleasant or unpleasant, can be linked to particular leadership practices and examined for their interrelationship. The notion here is that the emotions of the leader are likely to be fundamental to her/his practice, even if they are not displayed, or perhaps even acknowledged at the time. Authoritarian and adversarial leadership styles were noted for their provocation of “anger, depressive, anxiety, resignation and satisfaction” states in teachers. The latter, “satisfaction,” was mixed with “concern for ethics” and “feeling sorry for those who were not” among the favoured group (Blase and Anderson, 1995, p. 40–41). Leaders gained access to these and other kinds of micropolitical interrelationships between power and emotionality through stimulated recall and focused reflection.
4. Gender

Work by Gilligan (1982), Noddings (1984), Hochschild (1983), Blackmore (1996), Shakeshaft (1989) and others, suggests there are gender distinctions with the emotions. Gilligan sees the female sense of morality as socially constructed in ways that are distinctive, indicating a contrastingly high value on connectedness, integration and continuity. All of these have significant emotional implications and play out in the daily social interaction of organizational life. Noddings positions the role of caring as central to our lives. Associated with the classically feminine role of nurturing, it is at the root of receptivity, relatedness and responsiveness in many realms including education. Examining the leader’s feelings about his/her role as caring, (an inherently emotional experience I would argue,) and the associated moral and ethical implications, is assisted by her work. Hochschild introduces the notion of emotional labour, required when in the line of your work, you feel one thing but think you are expected to feel another. Leaders’ work seems well described as emotional management of self and others, involving significant amounts of emotional labour. Blackmore contributes a case study of several principals whose emotional labour requires them to abandon the comforts of professional collaboration in deference to a new policy of competition between schools for students and funds. Clearly her work may bear directly on educational leadership in the present political and economic context in Ontario. Also, Shakeshaft’s noting of women administrators’ distinguishing characteristics and different experience of the culture of power and control lends credence to the argument in favour of considering gender as highly relevant to the research of the emotions of educational leadership. When being known means being known for one’s authentic self, and one’s authentic (female) self is inherently marginal to the dominant organizational culture, the resulting potential for cognitive and emotional dissonance is worthy of consideration. Leadership’s stricter codes of emotional display rules may intensify this aspect of the leadership experience for females, who may be encouraged to undergo more extensive reshaping of the self. Together, all of these feminist perspectives provide significant insight into some of the universal processes involved in learning and interacting, in schools and in life.

Design/method

Data collection/sources

A. Each participant shared in 35–45 minutes of focussed reflective conversation. Interviews moved loosely through all or most of the following:

1. Clarification of “leadership” and what it means to the participant.
2. “Leadership” as it has been part of the participant’s life, from early experiences of other leaders or in being a leader.
3 A recollection of a specific occasion of a meaningful association between emotion and leadership; i.e., “What associations have you experienced between emotions and leadership?”

4 Additional probes to develop and elaborate on the ideas offered in response to #3 to identify the emotions themselves, the provocations, the inner emotionality and the emotional intersubjectivity of any occasion or incident being discussed.

5 Depending on whether the selection in #3 & #4, was about a relatively pleasant or unpleasant experience, the second type would be solicited here.

6 The participant was asked to recall a time which epitomized his or her sense of leadership, perhaps a turning point in understanding. He or she was asked to revisit the experience, with a particular emphasis on its emotional dimensions.

B. Written reflections about the interview process or content were invited.
C. Researcher’s observation notes.
D. Transcriptions of all interviews: 25,000 words of typewritten data.
E. Analysis of data for patterns and relationships:

1 Kinds of emotions: pleasant and unpleasant;
2 Kinds of situations that provoked emotions;
3 Emotional intrasubjectivity of leadership experiences;
4 Emotional intersubjectivity of leadership experiences;
5 Leadership: emotions, micropolitics and gender.

F. DISCUSSION Patterns emerging from the data: the emotional work of leadership
G. CONCLUSIONS Theoretical implications of findings.

Participants

The five participants were actively involved in leadership/administrative positions in public education, private education, higher education or health care in various locations in Canada. Ages ranged from 35–49. Two were under forty and three over forty. All were in the middle years of their professional lives. Each had fairly extensive experience in leadership ranging from eight to twenty years in designated leadership positions. There were four females: Joan, 35, University professor and administrator; Linda, 49, Superintendent with the Ministry of Education; Carol, 36, health care administrator; Sue, 43, Vice Principal in a private school; and one male, John, 46, elementary school principal. Participants were selected on the basis of their willingness to participate.
Findings

1. Kinds of emotions and their provocations

Positive emotions

In this section the positive emotions and the kinds of situations associated with them are summarized.

‘FLOW’ THROUGH EMPOWERMENT AND COLLABORATION

Among the emotions selected by leaders to describe experiences that were positive and pleasant were a number associated with creative flow (Csikszentmihalyi, 1997). “Passion,” “excitement,” “determination,” “confidence,” “satisfaction of letting go,” “relief,” “joy,” “high” “adrenalin rush,” were terms used to describe situations where the leader felt challenge, and focus, where people were working together and accomplishing things. For instance, for one leader, initiating a major new project was exciting and included some stress, but good stress. For another, the “synergy of bringing important people together” in a “meeting of the minds” led to “satisfaction, togetherness, feeling included and letting go of control” associated with great “relief” at having learned to share responsibility and credit with others. A third leader reported that in collaborative problem-solving, “finding the way through” caused “joy, validation and satisfaction.”

SUPPORT

Leaders also needed the emotional support of validation. They felt “affirmed, sustained, sheltered and liberated” by sharing responsibility and credit as facilitator of a committee. Shared decision making and authentic collaboration also evoked these kinds of feelings. Being allowed and encouraged to grow as a leader made one woman feel “supported, secure, and able to risk.”

BEING KNOWN

Sharing an important update with subordinates and being appreciated in the feedback led to feelings of “adrenalin rush, excited, supported, known.” While after being emotionally candid about feelings associated with a conflict of interest as a committee member, one leader felt “relief, affirmed, seen, caring, happy and real.” Showing her real feelings caused one leader to receive feedback that made her feel “genuine, proud and happy.” When “truly collaborating” several of these leaders enjoyed feeling “connected.”
SELF-AFFIRMATION

The leader’s self is challenged in the line of work and when his/her values, capacities, and abilities are sufficient to accomplish a difficult task it is, not surprisingly, an occasion of affirmation. Positive emotions were associated here. Affirming her values in the balance between justice and care was helpful in an altercation with an extremely pushy parent. The successful interaction boosted this female vice principal’s confidence.

Negative emotions

In this section the negative emotions and the kinds of situations associated with them are summarized.

DISEMPowerMENT

Leaders who felt pressure to succeed but not the support or empowered autonomy to accomplish their objectives found the leadership role emotionally difficult. They were “overwhelmed, insecure, questioning, discouraged, fearful, anxious” and experienced a sense of “loss of control.” A leader who, believing she must be perfect and that she should have total responsibility and control over her subordinates’ success, characterized these as times of “anxiety and fear.” Later, when she learned to share responsibility and success with others, to empower them, she reported feeling much “relief,” and could “relax and enjoy the process.” These leaders reported feeling “resentment and frustration” when being controlled and limited “from above.” They suffered for lack of their own empowerment and suffered when they failed to empower others and share the burden and the glory.

THREATENED SELF

A critical, threatening and limiting boss was described as the provocation for feeling “insecure, anger, resentment, nervousness, hesitant.”

CONTROL AND EMOTIONAL DISPLAY

A defiant aggressive accusatory parent who was very upset confronted and insulted this leader causing “anger, frustration and hurt.” She learned not to let the attacker know how much she was affected in order to retain power and control. Becoming “emotionally shut down” was the answer for this leader, learning to take control of an emotionally charged situation by refusing to participate. In other words “this interview is over.” One leader’s worst memory of an unpleasant emotional experience was a loss of control and subsequent embarrassment about having engaged in a yelling match with a student. She never did this again.
IT’S A DIRTY JOB …

Sometimes the work itself was responsible for creating the emotionally unpleasant situation. One leader was required to serve on a committee to help eliminate some of the jobs of her subordinates. She felt deeply conflicted, and great “sadness, resistance and worry.” A vice principal, finding that her principal was embezzling, had to turn him in. She felt “fearful, grief, sorrow, and sadness.”* Having empathized with her well respected boss and found it very hard to do the dirty work of turning him in. However, in the process, their superintendent began to accuse her of impropriety, as if she had turned her boss in as a kind of lover’s spat. Wrongfully accused, her empathy for his plight was instantly eclipsed* by “anger, defensive, aggressive” feelings.

DISILLUSIONMENT WITH THE SYSTEM

The unpleasant emotions experienced by finding the politics of the system diluting the outcome of a major project led this elementary school principal to decide that the system discourages passion of purpose. This experience caused him long term “frustration and disappointment.” He had lost his faith in trying to make a difference at the board-wide level, and retreated to focus his energies locally in his school.

2. Emotional intrasubjectivity of leaders

All participants described their inner experience of emotionality with a sense of sureness. It seems that although leaders don’t talk about their emotions much, when they do, they expect themselves to know what they feel. Even so, all participants had to struggle to find just the right words, to accurately describe emotions associated with particular experiences. The vocabulary of the emotions was not readily available to them, although they persevered with confidence and determination.

Gender

No participants showed any difficulty remembering times of emotional intensity or the feelings and emotions. However, female participants seemed more at ease with verbalizing and revisiting particular moments and their associated emotionality than the male. This was indicated by the frequency of times probes were used to encourage further depth, and the success of the probes in evoking depth and specificity, as well as the apparent immediacy of the reexperience. Fewer probes led to more depth and specificity in females. Female participants seemed to be able to return to the situation in their mind’s eye and to reexperience the whole situation with their emotions in recall as they were speaking about it. All of the women used many different ‘emotion words,’ going into great detail and striving to sharpen and clarify what it was they were trying to render. All the
females were quite successful at this. The male participant referred to a total of only five different ‘emotion words,’ even though the word “passion” was used repeatedly to refer to most strong feelings related to his work. The reason for his limited choice of vocabulary was not apparent. It would seem that “passion” was one of the emotions he could feel comfortable acknowledging. Some of the others not mentioned may not have been as easy to acknowledge. A highly cognitivist analysis of the role of emotions in his leadership life characterized a clear distinction between his interview and that of all four of the women, who were musing, pausing, intuiting and reexperiencing as if reliving the experiences, and were expressing emotional intensity in the form of volume, gesture, voice tone, facial expression – a kind of replaying for the interviewer of what it was like at the time of the experience being described. In contrast, this immediacy in reexperience was not apparent in the male who exhibited a tendency to shift away from specific details and emotional nuances, preferring instead intellectual speculation and distancing generalizations. It would seem that a safe distance from the scene of the emotional experience was repeatedly sought. This stood in somewhat ironic juxtaposition to his clear commitment to the “passion” he felt about his work and his lamentations about education being an emotionless organizational culture. All of these perceptions by the researcher would be well served by having the time to confirm them with the participants, a design feature that will be built into the larger study.

Age

Three of the participants were over forty. Two were under forty. The under forty participants chose examples which were project-specific to illustrate the pleasant and unpleasant experiences as well as those which epitomized leadership. In contrast, the over forty participants selected process oriented examples, preferring to emphasize for instance, “synergy” and “sharing” and “collaborating” in committees as opposed to particular projects that yielded “satisfaction,” “pride” or personal and professional “affirmation” by their completion. There was some indication that the older, perhaps more mature leader had come to see the meaning of emotions in leadership experiences in terms of larger ongoing processes, a kind of metacognitive and emotional reflective blend.

4. Emotional intersubjectivity of leadership

In addition to references to their own emotions, in a few instances, participants spoke about the emotions of others in conjunction with their work.

Emotions of others impact feelings of affirmation

Carol spoke of the emotional effect of her work on others, bringing them satisfaction and motivation of which they spoke to her, and from which she drew a
sense of being appreciated and supported. Her analysis of a problem boss who
would not select her to participate in committee work despite her repeated offers
was that he was threatened and thus his emotions were preventing him from pro-
viding her with creative and leadership growth opportunities. This caused her
much disappointment and anger. Although she handled it by becoming resigned
to something she said you “can’t control.” What may be of note here is that the
emotional reason inferred by Carol for her boss’s behaviour and attitude was
deemed to be unchangeable, as if the emotions are waters too deep to navigate.
Whether this was the reason for her boss’s way of acting toward her or not,
Carol’s interpretation of his emotional predisposition toward her made this for-
bidden territory, something she might just as well accept as unchangeable.
Oddly enough, the emotions are highly changeable, in fact. Personal interactions
can quickly change perceptions and feelings we have about each other. Yet this
was territory Carol chose not even to contemplate exploring. It would seem that
the exploration of emotional territory is well overdue for leaders.

 emotional display of others leads to detachment

Sue used the words “desperate” and “distraught” to describe her boss when he
was caught juggling the books. She felt the “loneliness of this man” and
described her associated feelings of “compassion, grief and incredible sadness.”
She also described students’ fathers who try to take control with “power” and
“anger” and her own response of simply “shutting it down” and “refusing to be
intimidated.” Mothers, on the other hand, would cry in desperation in her office,
and she found it was important to distance herself from their feelings in order to
keep a “balance of justice and care.” Thus emotional detachment is perceived as
an essential part of leadership, for maintaining control and power.

Leader’s emotional responses to perceptions about others’ emotions and lack
thereof, shape leaders’ behaviours and attitudes. Leaders are human!

John referred to the “hostility, defensiveness” and “lack of passion” in
others as sources of great “frustration” to him. John had withdrawn from the
larger board level forum as a result of his feelings about some of these experi-
ences which were draining his energy with no observable reward. The leader’s
emotional response to the feelings of others is a distinguishing feature of
her/his leadership style. Blase and Anderson (1995, p.133) refer to facilitative
leadership styles as simply supporting teacher autonomy and professionaliza-
tion. In contrast, democratic/empowering styles go further, to achieve a sup-
portive environment for critique and voice, a kind of emancipatory discourse. It
would seem that for John, an elementary principal, the emotional feedback of
others was highly influential, having caused him to withdraw. Clearly emo-
tional intersubjectivity has a bearing on the availability to the organization of
individual voice for critique. Shared emotional understanding in leaders war-
rants further research, especially in light of its powerful relationship to capacity
for change.
Discussion: How do leaders experience, express, reflect upon and understand the emotionality of their work?

Emerging patterns in the data

What are leaders’ inner experiences of emotion as associated with their work: intrasubjective emotionality

1. Passion and peril: Leadership is a matter of mixed emotions

The passion and excitement of being able to realize the opportunity and potential for growth are sustaining and inspiring to leaders. However, perils accompany passions.

- Passion of purpose and determination are key to providing the emotional drive and force necessary to lead even when you are the only one who can see the goal line.

Joan characterized some of the emotional aspects of leadership:

... things I was passionate about because I saw ... there was an opportunity and I was excited by the opportunity or the thought of growth and being able to make that happen ... I wouldn’t think excitement was the whole thing. Determination, I don’ know if that’s an emotion ... Determination helped me go through the emotional fluctuations, because sometimes, sometimes you’d be excited and energized by the way it was going and other times you’d be overwhelmed because you’d wonder, why am I taking this battle on when no one else has?

- Sustaining passion is often intertwined with troubling anxiety associated with vulnerability and need for approval and success.

Carol referred to these mixed emotions:

adrenalin ... kind of like there was a lot of anxiety. They’re kind of mixed though. It’s like a big ... Well it’s kind of all intertwined ... it’s one day feeling excitement about it and thinking, great I can do something about it, and the next day feeling sort of anxiety you know and also feeling in the organization that there’s some conflict there, so it’s also saying I’m sticking my neck out here and even in terms of a supervisor maybe not appreciating me going for that, so there’s mixed feelings.
EMOTIONS AND GENDER

• The passion of purpose in the leader may exceed that of others in the organization creating an emotional dissonance between the individual leader and her/his environment.

John spoke fervently of his passion as the driving force in his work and his sense of frustration at the lack of passion in others.

I’m passionate about what I do in my profession and I have, I guess, I feel I have a high degree of integrity about my work. And in many respects I guess the organization and some of the expectations of the organization either conflicts with my professional intensity or my integrity about my work, and that stuff may have conflicts and certainly it’s a conflict between my passion for my work and what I see as a lack of intensity in my, in many of my colleagues and in the organization itself as it expresses itself as an organization or as a culture of the organization.

2. Control of self and others and learning to share responsibility

Control of self and others and learning to let go of control present challenges to the leader.

• The handling of the fear of loss of control can be a significant part of the emotional experience of a leader. It is illustrative of the leader’s emotional coping strategies and indicative of the style of leadership ‘in use.’

John describes her feelings associated with the sense of loss of control.

Who says that what I came up with is the right way and what happens if it fails? . . . [I feel] insecure, but probably messy. You don’t have any control over where you’re going to go even though you’re taking everybody there. Sort of like going on a bus trip but not remembering to get enough gas, so you’re not sure if you’re going to make it. That kind of feeling, so it can be a little intimidating.

Linda, who considers herself an empowering leader, offers her working knowledge of emotions and the control-empowerment continuum:

It’s such a downward spiral because the more you control and the less you share, the less people support and feel they have any ownership, and so then you become more and more isolated. It’s hell I’m sure. You see if you must have control and people withdraw their support over time because you don’t trust and give them control, it’s a spiral . . . I don’t know if anybody breaks free of it is that’s their style. I learned the
power of collaboration and empowerment of others by sharing in the responsibility.

Sue shares her beliefs about emotional control and leadership:

I personally have found that it is important to control emotions, that the few exceptions when I have become very very angry with a student, angry with a parent, angry with a faculty member, that things are said that are not in the best interests of anyone, that it’s better to stay rational. That to be able to express your emotions of frustration at times through tears, or sadness, is okay, but to feel anger is one thing but to express it, I question the appropriateness of it, and have not found it helpful.

Managing others’ emotions is seen as essential to leadership

Sue illustrates her way of keeping control of a situation by managing her emotions and those of others:

I had a parent who did the attack. I was hurt. I was visibly hurt. I let this person have the power to hurt me. With experience, if a person is going to take that tack, is going to attack me personally, I will shut it down: “I don’t think this is a healthy conversation. I am not going down that road with you.” . . . I do not have to carry on a conversation with a parent just because they’ve come through the door.

Sue offers perceptions about attempts at emotional control taking by others:

Many Moms in my office in tears, and feeling very desperate about what the next step is with their children. Fathers are interesting. With more fathers than moms I’ve dealt with anger, and they do a power anger thing, thinking that I’ll intimidate her and she’ll back down, and I don’t.

Sue on control and connectedness:

It was very important for me to work with others and yet be in control. So connected with others and yet in charge of my own . . .

The importance of a leader being given sufficient support and autonomy by superiors - feeling safe in order to take risks.

Sue:

I worked with a principal at the time who said “make this thing fly.”
You know carte blanche. So it was important to establish myself as a leader within the subject area . . . Wonderfully supportive people that I worked with, within the school, very professional staff, did more than any other staff that I have worked with . . . You felt very safe. You could take risks. They’d do anything for you.

Linda:

I think frustration is when you’re dealing with authority that is controlling, and uh there’s only one way to do things and so whatever you do is either right or wrong, and it’s frustrating when you don’t know the whole agenda and you only see one little piece of it.

- Display rules: playing by them exemplifies ‘appropriate leadership demeanour’.

Most participants demonstrated fairly traditional views of emotional display rules (emotional self-control) in leadership, with some notable exceptions. Emotion is, regrettably say some participants, something to control and keep out of the way. John shares concerns about his own display of passion and his observation that this can become problematic:

 Often [I am] responded to by the fact that I’m being too personally aggressive about the issues and interpersonally I’m being too forward with people sometimes and yet I see and view it very much as simply expressing my issues with passion and rather than the issues becoming the focus of the concern or the context, it becomes personalized that it’s myself that is responded to or attacked or whichever, not the issues that I raised.

John on emotions and conflict resolution: feel but don’t show emotions.

Well, conflict resolution I think is something, that requires that the person who is mediating the conflict resolution be very unemotional. . . . I’m a firm believer in removing emotions from behaviour management and conflict management. It’s usual that I remain calm and . . . I try to remain very neutral and objective about the situation and assist in the process while calming people down is involving a process of just timing out too . . . I already developed a sense of self control and that’s an internal thing as well.

Asked if too much emotional control might create a gap in emotional authenticity and be perceived to always give him the upper hand in terms of the power dynamic, John responded

Yeah but . . . Yeah.
FEELING LIKE A LEADER

Carol, on the importance of openly displaying emotions, emotional authenticity as helpful to her as a leader:

When I’ve shown that, sharing when I’m happy; I genuinely cried; I’ve shown that I’ve cared by sharing my own personal incident . . . I took the time to listen and share that I was there emotionally. It wasn’t just words, because those are the kinds of things that let people see that you are real.

Sue on display of anger and joy:

I think it’s okay to verbalize. It’s how it’s expressed is that “I feel angry when you do this” is very different from losing it and speaking out of anger. Sharing a student’s joy with hugs is okay.

3. Internal emotional management system is important to sustaining confidence and commitment.

Managing emotions means generating certain emotions and restraining others.

• True grit and determination epitomize leadership.

Joan’s image of the emotional power of determination:

It’s like you’re going on a marathon or a long run. You know how you sort of get that second wind; you don’t know where it comes from but it’s going to get you there. I don’t know what emotion that would be . . . part of it would be past experience, part of it is just determination that if you keep running, if you keep going you’re going to get somewhere.

• Depersonalizing and detaching are favored techniques.

Linda, describing her system for problem solving in an emotionally challenging situation – isolating the issues and removing the personal element.

Okay, so I’m confronting a director with a staff member that is sabotaging an assignment and it normally wouldn’t be my role to discuss with [her] staff that are not doing their job. But in this particular role, other agencies around the table saw it as my role as a leader of this group to carry this forward. I was the leader of the group. [animated, emphatic] So! What I had to do was this. I had to isolate the issue, remove it from the person, describe the situation, and then let the director do what she had to do.
Reframe the perspective to separate issues from people and emotions from cognition.

Linda, having felt frustrated and somewhat anxious about how to deal with the situation, reframed her perspective, diffusing the emotional intensity of it. She did this by considering the problem person who was “dropping bombs” on her meetings, “sabotaging the agenda” as follows:

The real issue was that he didn’t understand the broader picture and so he would focus on the little bit that he could that had a relationship to him.

*Repress, deny or remove emotions.*

John tells of learning to ‘remove’ his emotions as an internal coping device:

I arrived at the idea that I had to remove my emotions from my work and my passion for change from my work because the emotional energy I was expending was enormous and was affecting me in terms of draining me emotionally and it was also having a very negative and reactive result in terms of the kids. . . . so I became a lot more controlled in terms of managing my emotions better and stated dealing with kids more neutrally and objectively.

*Pragmatism is a way of understanding human experience to manage the emotional power of disappointment over a thwarted intention or preempted passion.*

John shares his formula for internal management of otherwise debilitating disappointment.

[Pragmatism] is just a way of understanding human experience. I think human experience is contextual. I think human emotions are contextual. So in terms of contextualizing your understanding of life I think pragmatism is one aspect of understanding life experience . . . a good balance for passion.

4. Emotional management systems external to the leader contribute to the emotional quality of organizational life

The information withholding leader causes frustration while the sharing leader reduces frustration in subordinates and creates a support system for herself.
FEELING LIKE A LEADER

• Sharing the way you see and feel about things creates emotional as well as rational understanding.

Linda’s story:

If I have frustration it’s with the people I work for. Once you understand the big picture then it’s not so frustrating . . . if everybody has a piece of it then it will work.

Carol speaks of feeling supported by her subordinates for having shared her emotional conflicts with them.

What also helped me was hearing from some of them, the fact that we know why you’re on the committee and we know that you may not be able to change the decision and I think that was comforting and I felt some relief . . . They said we know that you’re going to do the right thing, and that was reaffirming for me and I just felt like whew. I just felt good about that.

• Significant others

Joan speaks of a personal relationship beyond the organization as vital to her emotional well being within the organization.

I can probably get three quarters of the way through it but probably only with my spouse, turn to him to get the rest of the way. I can do it on my own determination because I haven’t always had him around but it’s easier. It helps you reflect and see things more objectively.

5. Emotional conflict of interest

Intrinsic conflicts of emotional interest characterize a central challenge for the creative transformational leader. Dissonance in selves and relationships to others creates discomfort and makes heavy demands on the leader.

• Reconciling conflicting personal, professional and organizational needs places heavy emotional demands on the leader

Carol:

I just felt it’s one thing if you’re responsible for your own actions and you know what the outcome can be. But when you have the burden of others as well and knowing that some of them are single parents and they’ve got all this anxiety and they’ve lost their job, you just feel all
that and it’s very hard to separate caring for them as individuals and also realizing how much everyone cared about their job.

• Working beyond the comfort zone: –out of my jurisdiction, pushing the envelop –is an emotionally challenging, often thankless part of leadership, requiring creativity and courage.

Linda speaks of working beyond her mandate as creating emotional discomfort, but recognizes this is the stuff of real leadership.

It was uncomfortable because I wasn’t . . . I was clear on what my leadership was within the group but this was outside of the group, and I had a different relationship outside of the group.

John, on challenging the status quo: I tend to be somebody who is passionate and so I tend to challenge the status quo and challenge the system to improve itself . . .

• Emotionless organizational culture is dysfunctional to the individual and to the organization itself.

John, on the conflict between the norms of emotion in organizational culture and personal and professional intensity/passion.

I think that the organizational culture, personally, I feel it is very repressive, and it is very repressive to the honest expression of emotions, whether it is personal emotions or professional emotions about issues that we’re involved in education. And as a result, you have a very clinical or scientific model of organizational management that still persists in school systems and in education and it’s a fairly emotionless model. So people with passion or with drive and excitement and interest for projects or ideas are not encouraged or supported or reciprocated at any level of the organization. And I think that’s a big roadblock to the passion of education and achieving goals in education. The organization itself operates in a way that represses or suppresses emotion in our work and I think that’s a really negative aspect of our work and I think that’s really a negative aspect of organizational culture.

Conclusions: theoretical implications

Emotional intrasubjectivity and the self

Among the leaders interviewed, clearly the protection of the self from emotional hurt which might undermine confidence, was of paramount importance. Emotional
well being was associated with the ability to do the job even when it was a dis-
tasteful task. This emotional well being was fostered by sharing and collaboration.
In contrast, leadership styles that were controlling and perfectionistic were associ-
ated with high anxiety, fear and reticence to risk. The evolution toward letting go
and sharing responsibility and credit was described as a personal awakening
accompanied by satisfaction and relief. Being known, acknowledged, seen, able to
be real, feeling included, understood and accepted were all important to the self of
these leaders. Self-control was central to each leader’s story of the nature of the
job. Essential to the nature of leadership work, were the ability not to feel emo-
tions or ‘emotional’ and certainly the ability to avoid showing them. This theme
was held in common by all participants. Some spoke matter-of-factly about this as
a necessity, while others lamented the need to deny or repress emotions. Clearly
these leaders’ work requires the authentic emotional self to be heavily guarded and
carefully hidden at most times. The need to control others, something that is not
possible, led to feelings of insecurity and anxiety. Living with ambiguity was
threatening to the self of the leader if the self was controlling and perfectionistic.
The antidote seemed to be a distributed leadership and collaborative synergy
enjoyed in group projects. Learning not to take things personally was a first step in
effective problem solving and conflict resolution for these leaders. This was a
demotionalizing process, requiring a kind of rational overdrive. The only male
participant spoke adamantly about the emotionless organizational culture as dys-
functional to change and achieving goals in education. This, he offered, was a
function of the repressive culture’s effect on the individual’s self.

Intersubjectivity

Authentic collaboration was a successful anxiety reducer and optimizing strat-
 egy. A recurring motif among the stories, shared emotional understanding,
achieved through communicating openly, held distinctive, highly valued, and
intensely recalled pleasure for these leaders. Assumptions about what others
were feeling were more often made than shared emotional understanding
through communication. A more thorough application of Denzin’s (1984) con-
struct is warranted in further research as the quality of the emotional understand-
ing is strongly associated with some of the most emotionally pleasurable
experiences of these leaders. Distanced, disconnected, misunderstood and unap-
preciated leaders, who did not feel they could do other than theorize about a
superior’s troublesome attitudes and motivations, characterized some of the
most emotionally unpleasant experiences chosen. It would seem that leaders and
led benefit from access to sharing about emotional realities among the indi-
viduals in the organizations. The culture of communication about feelings as
well as thought would support such sharing. The current culture of emotional
repression and control, generally, does not. These leaders chose most often to speak
of interactions with superior or parents as examples of unpleasant interchanges.
They spoke of interactions with peers or subordinates with pleasure.
**Gender**

Distinctions between the one male and the collective of four females did emerge, that suggested a stronger capacity to use language and reexperience the emotions of the self and others in recall in the women. It was very difficult to get the one male to speak about any particular occasion, person, event or feeling in specific detail. Rather, there was a preference for generalizations about his passion for his work and some frustrations and disillusionment about the system. A larger sample and a more extensive exploration of the apparent gender distinctions and a cooperative inquiry into the underlying causes, that may or may not be gender related, is warranted in order to make any theoretical application of these findings. However, the accessibility through recall of these women was consistent throughout the sample, supporting findings of Shakeshaft and Gilligan about the distinctive experience of women. It may or may not be that the emotionality of experience is inherently different for men and women at the time. Rather, differences may lie in assimilation, memory, recall, or articulation of remembered emotionality of experience.

The women spoke predominantly about connections and associations with particular others in various contexts and situations. The one male spoke in generalities about feeling different and disconnected. This would concur with Gilligan’s construct of the feminine paradigm.

**Micropolitics**

To describe leadership styles and use of power, one may use Ball’s “Four Styles” of leadership: Interpersonal, Managerial, Political-adversarial and Political-authoritarian (1987, p.87); or Blase and Blase’s four quadrants measuring leadership style as relatively Open or Closed and relatively Transactional or Transformative (1995, p.18); or Leithwood’s “Instructional, Transformational, Moral, Participative, Managerial and Contingent” (1999, in press p. 7). In any case, the emotions of leadership are present. Clearly the emotions caused by having a leader exercise ‘power over’ or even ‘power through’ you, are not as closely shared and mutual as ‘power with.’ Effective involved teachers work in regimes of every variety. They report feeling intensely unpleasant emotion states in association with adversarial authoritarian styles (Blase and Anderson, 1995, pp 40–41). However, the emotions of the leaders themselves, associated with their preferred leadership styles are just beginning to emerge. Consistent with Blase and Blase (1997) these leaders felt anxious and afraid at losing control, until they developed a new view of shared responsibility. This reframing of the risk as borne by all seemed to characterize a significant source of comfort and enjoyment for these leaders. Being highly controlling was anxiety-inducing for the leader, complementing what we already know about the emotional effects of these leadership regimes on teachers. One reason these styles persist can be inferred from the unanimous acceptance of the need to heavily mask emotions in
order to retain power and control when threatened. This pseudo rationality, the stock-in-trade of the experienced traditional leader is something that would have to be unlearned in order to begin to redefine leadership. As Diamond argues

The contribution of mastery in communications to organizational change may rest on the development of linguistic and interpersonal competence for sending and receiving affective messages. Communication of feelings rooted in, but not exclusive to, organizational experience presents the opportunity to alter activities and relationships that cause errors, distortions, demoralization, and ineffectiveness at work. The aptitude for transmitting affective messages within institutions and among participants is essential to organizational change and long-term effectiveness.

(1993, p.118)

Among the participants in this study, while emotional authenticity was special and pleasant, it was rare. In the educational setting, the freedom to communicate openly at work about their own emotions had been all but eliminated, replaced by a repertoire of more emotionally managed techniques. This was a matter of reluctant resignation for some and lamentation for others, but ultimately it was accepted by all participants as the way power and control is maintained in leadership. Whether in leadership it is better to be, or not to be this way, remains a question for another day and another research project.

FEELING LIKE A LEADER

This article, the first empirical study of its kind, presents findings from a larger qualitative study of teacher perspectives of principal mistreatment. A grounded theory method was used to study a sample of 50 U.S. teachers who believed they were subjected to long-term mistreatment from school principals. The authors briefly discuss descriptive, conceptual, and theoretical findings about principals’ actions that teachers define as mistreatment. The harmful effects of such mistreatment on teachers psychologically/emotionally and physically/physiologically as well as on classroom instruction and relationships with colleagues are more fully discussed. Implications of study findings are discussed for administrator and teacher preparation, professional educators, and further research.

During the past decade and a half, researchers have produced a strong stream of “bright side” empirical studies in the field of educational administration focusing on the considerable contribution of exemplary school principals to schools in general (e.g., Blase & Blase, 2001; Blase & Kirby, 2000; Good & Brophy, 1986; Hallinger & Heck, 1996; Leithwood, Thomlinson, & Genge, 1996; Murphy & Louis, 1994a, 1994b) and teacher development and student learning in particular (e.g., Blase & Blase, 1999; Heck, Larsen, & Marcoulides, 1990; Heck & Maroulides, 1993; Joyce & Showers, 1995; Sheppard, 1996). Notably, this knowledge base provides ample theoretical and empirical evidence that effective principal leadership can have important effects on student learning (Wang, Haertel, & Walberg, 1993). Specifically, effective principals develop positive relationships based on mutual trust, respect, openness, support, and understanding (Blase & Blase, 1998, 2001; Glickman, Gordon, & Ross-Gordon, 2001; Lambert et al., 1995; Sergiovanni, 1996; Walton, 1990); develop learning communities of professionals and constituents able to openly communicate, make decisions, solve problems, and resolve conflicts (Schmuck & Runkel,
THE DARK SIDE OF LEADERSHIP

1994; Wald & Castleberry, 2000); maintain a collaborative focus on teaching and learning (Fullen, 1997; Joyce & Calhoun, 1996); and encourage teacher reflection, peer coaching, and shared critique and inquiry (Blase & Blase, 1998; Calhoun, 1994; Joyce & Showers, 1995; Schön, 1987). The importance of related leadership skills and corresponding attitudes and values to the development of strong, positive relationships between principals and teachers cannot be overemphasized; indeed, respectful, constructive relationships between principals and teachers are essential for school improvement (Boyer, 1995; Cotton, 2001; Hoachlander, 2001; Schlechty, 1997; Senge, 2000).

In stark contrast, no empirical studies have systematically examined the “dark side” of school leadership, in particular principal mistreatment/abuse of teachers, and the extremely harmful consequences such forms of leadership have on life in schools. This article is based on a larger qualitative study of school principals’ mistreatment/abuse of teachers and the subsequent destructive effects on them, from the perspectives of teachers themselves. It focuses on the effects of principal behavior that teachers perceive as abuse or mistreatment (teachers in our study used both terms synonymously), that is, effects that teachers experienced as seriously harmful over the long run. The principal behaviors teachers defined as abusive are also briefly described. In reporting the findings of our study, we recognize that the principal mistreatment phenomenon may be a function of problematic interactions provoked by both principals and teachers. We also acknowledge that different reference groups have different perspectives on the same problem (Blumer, 1969); in fact, we expect that the perspectives of the purveyors of mistreatment (i.e., principals) differ significantly from the perspectives of the victims of mistreatment (i.e., teachers) (Baumeister, 1996). However, given the degree to which people in public schools routinely suppress conflict (a point we discuss below), it is not possible to obtain “objective” measures of the mistreatment problem.

To date, two long-standing avenues of research in education (i.e., teacher stress studies and micropolitical studies of the school principal-teacher relationship) have produced only glimpses of how principals mistreat teachers. A number of stress studies have linked elements of principals’ leadership style and behavior (e.g., nonsupport, assertiveness) to significant stress and burnout in teachers (Adams, 1988; Barnette, 1990; Blase, 1984; Blase, Strathe, & Dedrick, 1986; Diehl, 1993; Dunham, 1984; Dworkin, Haney, Dworkin, & Telschow, 1990). Micropolitical studies have yielded richer descriptions of some aspects of principal mistreatment; these studies describe, among other things, principal favoritism with regard to appointments, promotions, enforcement of rules, evaluation, and recognition and rewards (Blase, 1988). Other micropolitical studies have examined principal behaviors including sanctions, harassment, lack of accessibility, and manipulation as well as teachers’ response to such behaviors (Ball, 1987, Blase, 1990, 1991; Blase & Anderson, 1995). Taken together, these two areas of research provide provocative clues to the principal mistreatment problem and its destructive outcomes for teachers; however, such studies
are few in number and have generated only limited understandings of the range of abusive principal behaviors; how such behaviors interact to form a “pattern” of abuse in a given situation; and the damaging effects such behaviors have on teachers, teaching, and schools.

Undoubtedly, the failure of both academic and professional educators to study principal mistreatment of teachers, applying the same rigorous research protocols we use to investigate other educational problems, has resulted in incomplete, naïve, and even false understandings of how some, perhaps a noteworthy percentage of, school leaders and teachers experience their work (Hodgkinson, 1991). Moreover, this failure allows mistreatment to continue without challenge and without hope of improvement (Keashly, Trott, & MacLean, 1994; Robinson & Bennett, 1995). As a first step, this study provides an inductively derived knowledge base and initiates an area of inquiry essential to developing a constructive approach to a deeply disturbing problem in American public education.

**Workplace abuse: a conceptual, theoretical, and empirical review**

**Terms and constructs**

Internationally, systematic research on the problem of workplace abuse, notably nonphysical forms of abuse, has increased significantly during the past two decades in countries such as Sweden, Norway, Germany, Austria, Australia, and the United Kingdom. Several of these countries have also enacted legislation against workplace abuse, and private organizations have been created to help victims of abuse (Björkvist, Österman, & Hjelt-Bäck, 1994; Davenport, Schwartz, & Elliott, 1999; Keashly, 1998; Namie & Namie, 2000). For most of this same period, organizational scholars in the United States have largely ignored the problem of work abuse. In recent years, however, scholars have begun to address the problem; indeed, the emerging national literature suggests that workplace abuse may lead to serious deleterious consequences for both employees and organizations (Baron & Neuman, 1996; Davenport et al., 1999; Hornstein et al., 1995; Keashly, 1998; Keashly et al., 1994).

In addition, organizational scholars have developed a variety of empirically
grounded constructs to define the workplace mistreatment/abuse phenomenon.
To illustrate,

- Andersson and Pearson (1999) conceptualized *workplace incivility* as “low-
intensity deviant behavior with ambiguous intent to harm the target, in vi-o-
lation of workplace norms for mutual respect. Uncivil behaviors are
characteristically rude and discourteous, displaying a lack of regard for
others” (p. 457).
- The construct of *mobbing* (or psychical terror), the most common term used
in Europe, refers to “hostile and unethical communication that is directed in
a systematic way by one or a number of persons toward one individual. . . .
These actions take place often . . . and over a long period (at least six
months) and, because of this frequency and duration, result in considerable
psychic, psychosomatic, and social misery” (Leymann, 1990, p. 120).
Mobbing consists of humiliating, intimidating, and abusive communication,
committed directly or indirectly, to confuse, discredit, intimidate, and
isolate an individual, to force the individual into submission or out of the
workplace (Davenport et al., 1999).
- Einarsen and Skogstad (1996) defined *bullying*, a term commonly used
in the United States and Europe, as “harassment, badgering, niggling, freezing
out, offending someone . . . repeatedly over a period of time, and the person
confronted . . . [has] difficulties defending him/herself. It is not bullying if
two parties of approximately equal strength are in conflict or the incident is
an isolated event” (p. 191).
- Ashforth (1994) developed a measure of tyrannical behavior that consists of
six dimensions. He defined a *petty tyrant* as “an individual who lords his or
her power over others . . . , acts in an arbitrary and self-aggrandizing manner,
belittles subordinates, evidences lack of consideration, forces conflict reso-
lution, discourages initiative, and utilizes noncontingent punishment” (p.
772).
- *Abusive disrespect*, a concept developed by Hornstein et al. (1995), is made
up of eight behavioral dimensions of disrespectful supervisory behavior and
specifically refers to “transgressions” by bosses that include deceit (i.e.,
lying), constraint (i.e., controlling subordinates’ actions outside of work),
coercion (i.e., threatening excessive or inappropriate harm), selfishness (i.e.,
blaming and scapegoating subordinates), inequity (i.e., favoritism), cruelty
(i.e., harming subordinates through name calling, personal attacks, disre-
gard), disregard (i.e., being unfair and unkind, displaying an obvious lack of
consideration), and deification (i.e., conduct that communicates a “master-
 servant” relationship to subordinates).

From a comprehensive review of the workplace mistreatment/abuse liter-
ature, Keashly (1998) developed the concept of *emotional abuse* that subsumes
elements of the constructs defined above. Emotional abuse emphasizes the “hostile verbal and nonverbal behaviors . . . directed at gaining compliance from others” (p. 85). Keashly identified emotional abuse with the following: a pattern of abuse (not a single event), behaviors that are unwanted by the target, behaviors that violate norms for appropriate conduct or an individual’s rights, behaviors that are intended to harm the target (as perceived by the target), behaviors that result in harm to the target, and power differences between the abuser and the target of abuse.

In addition, empirical research has generated a handful of models of mistreatment in the work setting. Baron and Neuman (1996) constructed the three-factor model of workplace aggression, which includes expressions of hostility, obstructionism, and overt aggression. Expressions of hostility include verbal and symbolic behaviors such as facial expressions, gestures, staring, dirty looks, silent treatment, ridicule, unfair evaluations, and gossip. Obstructionism refers to actions that are often passive aggressive in nature, such as withholding a resource or behavior. Some examples are not returning phone calls, refusing to provide needed resources or equipment, and failing to warn an individual of imminent danger. Overt aggression, the third factor, refers to threats or acts of physical violence and theft or destruction of an individual’s work equipment.

Ryan and Oestreich (1991) produced a model of abrasive (i.e., less harmful) and abusive (i.e., more harmful) categories of boss behavior, with behaviors (listed from less to more harmful) including silence, glaring eye contact, abruptness, snubbing or ignoring, insults, blaming, discrediting and discounting, controlling others aggressively, making threats about the job, yelling and shouting, making angry outbursts, and threatening physical harm. Ryan and Oestreich contended that any behavior may have greater impact on individuals depending on timing, place of occurrence, and level of repetition.

**Theoretical work**

Theoretical work in the general area of workplace mistreatment/abuse is very limited. Existing theories discuss the causes and consequences of mistreatment as well as relationships among personal factors (e.g., Type A behavior pattern, hostile attributional bias), interpersonal factors (e.g., provocation, frustrating events), and environmental (i.e., situational) factors (e.g., restructuring, organizational culture) (e.g., Hoel, Rayner, & Cooper, 1999; Neuman & Baron, 1998). Andersson and Pearson’s (1999) theoretical ideas are particularly useful in understanding how aggression could evolve between individuals in nonhierarchical relationships in organizational contexts.

In addition to general theories of workplace mistreatment/abuse, several scholars have specifically developed theories of boss abuse of subordinates. Hornstein et al. (1995) constructed a theory of supervisory disrespect that draws heavily on symbolic interaction, organizational justice, and the psychological and stress literature. These authors argue that people’s feelings of both self-
worth and security are affected by how respectfully others treat them; and feelings of self-worth and security, in turn, affect one's mental health and well-being. Hornstein et al. established validity and reliability for the Boss Behavior Questionnaire (BBQ), which uses measurable constructs of respect and disrespect to examine eight domains of supervisory disrespectful behavior described above. Among other things, these researchers differentiated between a “demanding boss,” that is, a boss who is rigorously task-oriented (i.e., focused on production), and a disrespectful boss. As well, Hornstein et al. demonstrated that disrespectful behavior is always inappropriate, regardless of conceivable circumstances that exist in organizations, because it violates a person’s dignity and generates loss of self-esteem and generalized distress (i.e., anxiety and depression).

Ashforth (1994) developed a model of the antecedents and effects of tyranny on subordinates. He contended that petty tyranny is an interaction between superordinates’ predispositions (i.e., beliefs about organizations, subordinates, and self and preferences for action) and situational facilitators (i.e., institutionalized values and norms, power, and stressors). Ashforth argued that tyrannical management causes low leader endorsement and high frustration, stress, and resistance; high helplessness and work alienation; low self-esteem and poor work performance; and low work unit cohesiveness. He emphasized that such affects could trigger a vicious circle that sustains the tyrannical behavior. For example, the exercise of power may induce a manager to do the following: attribute subordinates’ success to himself or herself, develop an inflated sense of self-worth, create greater psychological distance from subordinates, and view subordinates as objects of manipulation (Kipnis, 1972). Likewise, subordinates’ responses to tyrannical behavior, such as helplessness and low commitment, may contribute to managers’ already negative stereotypes toward subordinates (e.g., lazy, untrustworthy), which further justifies coercion. To the extent that such tyrannical behaviors reduce leader endorsement and incite resistance, the vicious circle becomes complete. Ashforth explained that this is why managers may persist with an ineffective management style, supported by defensive attributions and self-fulfilling attitudes and behaviors. They may not recognize the role their attitudes play in the genesis of the very behaviors they are presently trying to prevent. Also, tyrannical behavior may produce short-term subordinate compliance, which may seduce a manager to discount longer term, more serious disruptive effects of tyrannical behavior. Ashforth noted that this vicious circle results in the “tyrant’s paradox” (p. 771)—the means used to gain control undermine the viability of that control.

Studies of workplace mistreatment/abuse

Studies disclose a wide range of nonverbal and verbal/behavioral forms of workplace abuse. To illustrate, nonverbal behaviors include aggressive eye contact (e.g., staring, “dirty looks,” snubbing or ignoring, “the silent treatment”) and
physical gestures (e.g., violations of physical space, finger pointing, slamming objects, and throwing objects). Some examples of verbal behaviors are sexual harassment, angry outbursts, yelling and screaming, put-downs, lying, public humiliation, threats of job loss, physical harm, name calling, excessive or unfounded criticism of work abilities or personal life, unreasonable job demands, stealing credit for another’s work, blaming, exclusion or isolation, initiating malicious rumors and gossip, withholding resources or obstructing opportunities, favoritism, dismissing an individual’s feelings or thoughts, unfriendly behavior, not returning phone calls, and behavior that implies a master-servant relationship (Björkvist et al., 1994; Davenport et al., 1999; Harlos & Pinder, 2000; Hornstein, 1996; Keashly et al., 1994; Leymann, 1990; Lombardo & McCall, 1984; Namie, 2000; Namie & Namie, 2000; Neuman & Baron, 1998, Robinson & Bennett, 1995; Ryan & Oestreich, 1991).

Furthermore, according to the research, abuse in the workplace is associated with a host of serious adverse effects on an individual’s physical well-being, psychological/emotional well-being, work performance, and social relationships. Examples of effects on physical well-being include sleep disorders (e.g., nightmares or insufficient rest), headaches, backaches, fatigue/exhaustion, illness, hyperactivity, weight changes (e.g., significant increases or decreases), irritable bowel syndrome, heart arrhythmia, skin changes, ulcers, substance abuse (first-time use), and suicide. Some psychological/emotional effects of abusive workplace behavior are depression, anger, rage, helplessness, powerlessness, cynicism and distrust, self-doubt, guilt, shame, embarrassment, insecurity, disillusionment, poor concentration, lowered self-esteem, aggression or revenge, hypervigilance, panic attacks, and post-traumatic stress disorder (PTSD). Effects on work performance include reductions in job effort, extra effort, commitment, and satisfaction and morale plus increases in absenteeism, turnover, and attrition. Social effects noted in the literature are isolation and loss of friendships (Björkvist et al., 1994; Davenport et al., 1999; Harlos & Pinder, 2000; Hornstein, 1996; Keashly et al., 1994; Leymann, 1990; Lombardo & McCall, 1984; Namie, 2000; Namie & Namie, 2000; Northwestern National Life Insurance Company [NNLI], 1993; Pearson, 2000; Ryan & Oestreich, 1991).

Examination of the research on abusive bosses (versus coworker abuse, for example) has revealed a number of disturbing findings. First, abusive conduct by bosses is commonplace in a wide range of both profit and nonprofit organizational settings. Second, studies indicate that bosses (e.g., superiors, managers) are more frequently workplace abusers rather than an individual’s coworkers; in various studies, bosses have been identified as engaging in abusive conduct toward subordinates between 54% of the time and 90% of the time (Björkvist et al., 1994; Einarsen & Skogstad, 1996; Hornstein, 1996; Keashly et al., 1994; Namie, 2000; Namie & Namie, 2000; NNLI, 1993; Pearson, 2000; Rayner, 1998). Several scholars have persuasively argued that they expect abusive conduct by superiors to increase given organizational changes such as the
growth in diversity, a decline in unionization (Yamada, 2000), and increases in electronic monitoring (Hornstein, 1996).

Third, studies of workplace mistreatment have demonstrated that male and female bosses are equally likely to engage in abusive conduct (Harlos & Pinder, 2000; Keashly et al., 1994), although abusive male bosses tend to use explosive behaviors more frequently than female bosses (e.g., Harlos & Pinder, 2000). In addition, both men and women are victimized by such behavior; however, men are abused primarily by men, and women are abused by both men and women (Campaign Against Workplace Bullying [CAWB], 2000; Leymann, 1990). Research has also demonstrated that women experience significantly more harassment than men (Björkvist et al., 1994; CAWB, 2000). Finally, Keashly et al. (1994) found that gender does not influence a victim’s perception of the degree of abusive behavior.

Fourth, the research on abusive bosses indicates that victims of this type of abuse seldom have viable opportunities for recourse. Studies emphasize that because of organizational culture (e.g., a “macho culture”) and off-putting management practices (e.g., a cavalier attitude about abuse, attempts to justify abusive conduct), victims’ complaints about abusive bosses usually result in (a) no action (i.e., no response) from upper-level management/administration and departments of human resources, (b) efforts to protect an abusive boss, and/or (c) reprisals against the victim for registering complaints (Bassman, 1992; Davenport et al., 1999; Hornstein, 1996; Keashly, 1998; Keashly et al., 1994; Leymann, 1990; Namie, 2000; Namie & Namie, 2000; Pearson, 2000; Rayner, 1998).

**Theoretical framework: symbolic interactionism**

Although there is some significant scholarly work on the problem of workplace mistreatment/abuse, there is no conceptual, theoretical, or empirical work on the school principal mistreatment/abuse problem and, in particular, none drawn from the perspectives of victimized teachers themselves. Symbolic interactionism served as the theoretical framework for this study. This perspective on social inquiry rests on three major premises: (a) Individuals act toward things and people on the basis of the meanings that things have for them; (b) the meaning of such things are derived from, or arise out of, the social interaction that individuals have with one another; and (c) these meanings are handled in, and modified through, an interpretive process used by individuals to deal with the things and other people they encounter (Blumer, 1969). This theoretical perspective recognizes that although structural factors (e.g., organizational, cultural) influence action, the interpretations and meanings that people attach to such factors account for action. In other words, people’s capacity for reflexivity has more influence on action than structural factors. The symbolic interaction perspective views the individual as a social product who is influenced by others but also maintains distance from others and is able to initiate individual action (Blumer, 1969; Mead, 1934).
In contrast to some qualitative applications, the Blumer-Mead (1969 and 1934, respectively) perspective on symbolic interactionism emphasizes the examination of human subjectivity. In short, it examines perceptions and meanings that people construct in their social settings (Bogdan & Biklen, 1982; Lofland, 1971; Morse, 1991; Schwandt, 1994; Taylor & Bogdan, 1998; Tesch, 1988). According to Meltzer, Petras, and Reynolds (1975), symbolic interactionists who employ this approach study "what goes on inside the heads of humans" (p. 55). They stated,

Human beings are defined as self-reflective beings. . . . The behavior of men and women is “caused” not so much by forces within themselves [e.g., instincts] . . . or by external forces impinging upon them . . . but [by] what lies in between, a reflective and socially derived interpretation of the internal and external stimuli that are present [p. 2]. . . . Perception functions as a meditative experience for the individual in the relationship between himself/herself and the social environment.

Consistent with the Blumer-Mead (1969, 1934) approach, this study employed an open-ended theoretical and methodological perspective designed to focus on the meanings teachers constructed from long-term mistreatment/abuse experiences with school principals. The purpose was to create a substantive model of principal mistreatment/abuse behaviors and their effects—that is, an inductively derived model constructed entirely from the empirical world under investigation. Therefore, the model we present contains no concepts from the relevant extant literature and no logical elaboration (Glaser, 1978, 1992, 1998; Glaser & Strauss, 1967).

Research method and procedures

Clearly, the study discussed in this article is extremely sensitive and even incendiary in nature. To actually conduct our study in a variety of school settings, we would normally be required to identify principals responsible for long-standing abusive conduct as well as the teachers they have targeted. However, we assumed that school districts would not grant permission to conduct on-site interviews with teachers victimized by principals and that teachers would not volunteer to participate in a research project of this nature (even if it were authorized) given the potential risks of doing so.

We employed a snowball sampling technique that requires others to recommend teachers who they believe have experienced long-term, significant abuse by a school principal. Snowball sampling techniques are especially useful in grounded theory research that attempts to draw samples from a variety of settings. This technique maximizes variation in the database to generate a large number of categories that describe the phenomenon under study (Bogdan &
Biklen, 1982; Glaser, 1978, 1998; Strauss & Corbin, 1998; Taylor & Bogdan, 1998). Therefore, we contacted professors as well as school administrators and teachers for referrals. We explained the nature of our study to referring individuals and asked them to discuss participation in our study with a victimized teacher.

We then contacted (by telephone) teachers who had expressed an interest in participation, explained our study, addressed questions and concerns, discussed our backgrounds, and generally got to know the teacher. Four teachers were excluded from the study, 2 because their abuse was not long term and 2 because the teachers felt that it would be too emotionally trying to discuss the abuse they suffered. Only teachers who had experienced long-term and significant abuse (i.e., 6 months to 9 years) by their school principal were included in our study. In this way, we identified 50 teachers in the United States and Canada who believed they had experienced significant principal mistreatment/abuse.

As expected, teachers were very fearful of possible disclosure; however, several safeguards seemed to alleviate their fears and promote trust and rapport. We explained to teachers that their identities would remain anonymous. Teachers were informed, per our agreement with the Human Subjects Committee at our university, that our entire database (i.e., audiotapes, typed transcripts, official and personal documents, and other related materials) would be destroyed upon completion of our analysis. We also indicated that all identifiers (including teachers’ gender and grade level) would be redacted from any materials used in any presentation of our findings. This, of course, required using pseudonyms for the names of people and places. Finally, we shared our general research questions and asked teachers to think about their abuse experience in preparation for the next interview.

As noted, trust and rapport are essential to conducting successful interviews with research participants (Bogdan & Biklen, 1982; Fontana & Frey, 2000, Taylor & Bogdan, 1998). Because we were primarily using telephone interviews, we expected that achieving both rapport and trust would be uniquely challenging. Surprisingly, this was not the case; in fact, teachers spoke quite freely and in detail about their abuse experiences, despite the deeply disturbing nature of their experiences. (In about 25% of our interviews, teachers were so emotionally overcome during the retelling of their experiences that the interview had to be stopped briefly or rescheduled.)

Discussions with participants indicated that several factors account for the rapport and trust developed. These factors extend beyond our promises of anonymity and destruction of raw data: By asking meaningful questions, listening attentively, expressing our deep-felt empathy for their suffering, and in general, treating participants respectfully, we were able to gain their trust and thus openness about their experiences. Indeed, we found that “to learn about people, we must remember to treat them as people, and they will uncover their lives to us” (Fontana & Frey, 1994, p. 374).

Three additional factors enhanced teachers’ trust and willingness to share
their experiences. First, our initial contact occurred through a trusted friend or colleague or both. Second, and perhaps most important, our study held special significance for teachers who participated; as painful as the interviews were, they strongly believed that the problem of principal mistreatment should be made public and, as one put it, “This study might crack open the door of hope and eventually change the world of education.” Third, teachers indicated that telephone interviews, conducted in the safety of their homes over an extended period of time, added to their sense of comfort, security, and trust in the researchers.

In total, 50 teachers participated in our study over a 1½-year time period. The sample consisted of male ($n = 5$) and female ($n = 45$) teachers from rural ($n = 14$), suburban ($n = 25$), and urban ($n = 11$) school locations. Elementary ($n = 26$), middle/junior high ($n = 10$), and high school ($n = 14$) teachers participated. The average age of teachers was 42; the average number of years in teaching was 16. The sample included tenured ($n = 44$) and nontenured ($n = 6$); married ($n = 34$) and single ($n = 16$) teachers. Degrees earned by these teachers included B.A./B.S. ($n = 7$), MED./MA ($n = 31$), Ed.S. ($n = 11$), and Ph.D. ($n = 1$). The mean number of years working with the abusive principal was 4. Forty-nine teachers resided in the United States and 1 resided in Canada. Fifteen of the teachers we studied were with an abusive principal at the time of this study; most others had experienced abuse in recent years. Teachers described both male ($n = 28$) and female ($n = 22$) principals.

It was noted earlier that the research question, interview guide, data collection, and analyses were based on the Blumer-Mead (1969, 1934) approach to symbolic interaction theory. Consistent with this perspective, specific theoretical ideas from the literature were not used to control data collection. Instead, we used only a few sensitizing concepts such as principal mistreatment/abuse to focus our study. Sensitizing concepts provide “a general sense of reference and guidance . . . [and] merely suggest directions along which to look” (Blumer, 1969, p. 148). Thus, teachers are less likely to be influenced by researchers’ preconceived ideas about a topic of study (Bogdan & Biklen, 1982; Glaser, 1978, 1992, 1998; Glaser & Strauss, 1967; Taylor & Bogdan, 1998).

Accordingly, we used an open-ended format to investigate the following broad question: How do teachers experience significant long-term mistreatment/abuse by school principals? Interviews are required in qualitative research that focuses on the determination of meanings from the participant’s perspective (Bogdan & Biklen, 1982; Glaser, 1978, 1992, 1998; Glaser & Strauss, 1967). We developed an interview guide rather than a pre-determined schedule, consisting of a set of topics to be explored, a “checklist of sorts” relevant to the topic at hand (Lofland, 1971, p. 85; Taylor & Bogdan, 1998). Specifically, we used two primary questions to gather data from teachers involved in our study:

1. What principal behavior/conduct do you define as mistreatment/abuse?
2. How did such behavior/conduct affect you, if at all,
   a. psychologically/emotionally?
   b. physically/physiologically?
   c. with respect to your involvement/performance in the classroom?
   d. with respect to your involvement/performance in the school?

Between two and four interviews were conducted with each of our research participants; these interviews consisted of unstructured and semistructured questions. To avoid premature conceptual/theoretical analyses and to produce full descriptions of each teacher’s experience of mistreatment/abuse, we used the same initial set of questions with all 50 teachers who participated (Lofland, 1971; Noblit & Hare, 1983). We spent about 135 hours interviewing teachers; this procedure generated about 4,000 pages of transcription for analysis.

We discovered that in conducting in-depth telephone interviews with each participant, we could efficiently and unobtrusively make notes and draw diagrams that identified emergent categories and relationships between categories; we were also able to probe categories in great depth during each interview (Fontana & Frey, 2000). This generated a level of descriptive detail beyond what we had ever achieved in other studies using face-to-face interviews (Fontana & Frey, 2000). Put differently, categories emerged and became saturated quickly and efficiently.

Given the limitations of using computer software for grounded theory research, especially for conceptual and theoretical work (Charmaz, 2000; Glaser, 1998; Taylor & Bogdan, 1998), we analyzed all of our data line by line and by hand. This is consistent with a Blumerian emphasis on meaning in symbolic interaction studies (Charmaz, 2000). This procedure, although very time-consuming, allowed us to keep teachers’ perspectives on mistreatment/abuse at the center of our research and to generate robust descriptions of each participant’s experience (Fontana & Frey, 2000). Subsequent interviews with our participants were used to “fill out” emergent categories, clarify areas of ambiguity, and explore relationships between and among emergent categories (Bogdan & Bilken, 1982; Glaser, 1978, 1992, 1998; Strauss & Corbin, 1998; Taylor & Bogdan, 1998).

We also requested personal documents from teachers (e.g., letters, diaries, journal entries) and official documents (e.g., administrators’ letters, law briefs, faculty meeting minutes) relevant to their mistreatment/abuse experiences. Personal documents were especially useful in deepening our understanding of the meaning of teachers’ mistreatment/abuse experiences (Bogdan & Biklen, 1982; Glaser, 1978, 1992, 1998; Glaser & Strauss, 1967; Taylor & Bogdan, 1998). It should be mentioned that examination of the personal and official documents submitted to us and reports from those who had worked with and referred us to the veteran teachers we studied suggest that they were highly accomplished, creative, and dedicated individuals. In most cases, such teachers had been
consistently formally recognized by their school and district not simply as effective teachers but also as superior teachers; in many cases, such recognition for their exceptional achievements as public educators extended to state levels.

As noted above, our primary interest in conducting this study was to describe and conceptualize the teachers’ perspectives on reality, that is, the “meanings” teachers associated with their experience of mistreatment. Thus, this study conformed to general guidelines for inductive exploratory research that emphasizes meanings as well as descriptive and conceptual results. We used constant comparative analysis to produce descriptive categories and conceptual and thematic analyses from our data. One of us analyzed the entire data set independently, and the other examined the results of this analysis independently (Bogdan & Biklen, 1982; Charmaz, 2000, Lofland, 1971; Glaser, 1978, 1992, 1998; Glaser & Strauss, 1967; Strauss & Corbin, 1998; Taylor & Bogdan, 1998). Both researchers met to resolve questions that arose. Upon completion of numerous cycles of analysis, we also made comparisons with the extant empirical and theoretical literature on workplace abuse as a check on the viability of our descriptive and conceptual findings. However, we made no changes in our analysis at any level as a result of this last procedure. To be sure, careful collection and line-by-line comparative analyses of the data reduce the probability of inappropriate borrowing of concepts from the literature (Charmaz, 2000).

Although interview-based protocols are essential to qualitative studies that focus on meanings (Bogdan & Biklen, 1982; Glaser, 1978, 1992, 1998; Glaser & Strauss, 1967; Strauss & Corbin, 1998; Taylor & Bogdan, 1998), interviewees may present idealized versions of themselves and their situations. To address this and other issues related to trustworthiness and reliability of our findings, we used an inductive-generative approach to data collection and analysis. Specifically, we used no a priori concepts to control data collection, developed rapport and trust with our participants, conducted multiple interviews with each participant, audiotaped and transcribed all interviews, probed for detailed responses, examined data for inconsistencies and contradictions within and between interviews for each participant as well as across participants, compared interview data with available personal and official documents, searched for negative or disconfirming evidence, generated low-inference descriptors, and checked for researcher effects. Finally, as a supplemental validation of our findings, we made comparisons with the existing literature on workplace abuse (Bogdan & Biklen, 1982; Glaser, 1978, 1992, 1998; Glaser & Strauss, 1967; Strauss & Corbin, 1998; Taylor & Bogdan, 1998).

In accordance with guidelines for inductive analyses, all of the categories of findings discussed herein were derived directly from our data. This article focuses on teachers’ perspectives of principal mistreatment/abuse and, in particular, the effects such behavior has on teachers. Given space limitations, principal behaviors teachers defined as mistreatment are only briefly described. By and large, our database consists of victimized teachers’ experience of mistreatment/abuse. However, at times, teachers also discussed the mistreatment/
abuse experiences of others in their schools. Occasionally, these data are presented as well. Relevant theoretical and empirical literature are presented in the Summary and Discussion section of this article for interpretive and comparative purposes and for supplemental validation of emergent findings (Bogdan & Biklen, 1982; Charmaz, 2000; Glaser, 1978, 1992, 1998; Strauss & Corbin, 1998; Taylor & Bogdan, 1998). Additional descriptive, conceptual, and theoretical findings, particularly with regard to principal behaviors teachers defined as abusive, will be presented elsewhere. Excerpts from the database are included to illustrate selected ideas.

Findings: a model of principal mistreatment

In essence, we have organized the principal behaviors derived from our database according to level of aggression: Level 1 Principal Mistreatment Behaviors (indirect, moderately aggressive; e.g., discounting teachers’ needs, isolating teachers, and withholding resources), Level 2 Principal Mistreatment Behaviors (direct, escalating aggression; e.g., spying on, overloading, and criticizing teachers), and Level 3 Principal Mistreatment Behaviors (direct, severely aggressive; e.g., threatening teachers, giving unfair evaluations, preventing teacher advancement) (see Table 1). Please note that this model does not imply that individual Level 1 behaviors always resulted in less harm to teachers when compared to Level 2 or Level 3 behaviors; to the contrary, the degree of harm related to any single aggressive behavior varied from one victimized teacher to another, as one would expect. Moreover, our study focused on long-term mistreatment (6 months to 9 years); therefore, each teacher discussed the “cumulative effects” of a multiplicity of principals’ continued, systematic mistreatment/abuse as described within any or all three levels of our model.

Level 1 Principal Mistreatment Behaviors: indirect and moderately aggressive

Indirect forms of principal mistreatment, as described by teachers in our study, included nonverbal and verbal principal behaviors. This category of principal behaviors was considered generally less abusive as compared to Level 2 and Level 3 behaviors, and this finding is consistent with studies conducted with the general population (e.g., Keashly et al., 1994; Neuman & Baron, 1998; Ryan & Oestreich, 1991). At the same time, the frequency of occurrence; timing; amount of negative affect; nature of the location in which mistreatment occurred (e.g., public versus private); association with other, more severe, behaviors constitutive of a pattern of abuse; and the generally hierarchical, “power over” nature of the principal-teacher relationship—a factor consistently discussed in the workplace mistreatment literature (e.g., Keashly, 1998)—contributed considerably to the degree of harm teachers experienced from Level 1 behaviors. Level 1 Principal Mistreatment Behaviors include (a) discounting teachers’ thoughts, needs,

and feelings; (b) isolating and abandoning teachers; (c) withholding resources and denying approval, opportunities, and credit to teachers; (d) favoring “select” teachers; and (e) offensive personal conduct. Such behaviors were always a part of a more extensive pattern of mistreatment/abuse. The reader should keep in mind that this is a study of the teachers’ perspectives only; such a study cannot determine principals’ intentions, although teachers typically inferred negative intentions because individual principal behaviors occurred within the context of a larger pattern of mistreatment.

Discounting teachers’ thoughts, needs, and feelings (including verbal and nonverbal behaviors)

Teachers reported that when mistreatment occurred through face-to-face interaction, principals usually displayed offensive nonverbal behaviors. One of the most common forms of nonverbal behavior was repeated ignoring or snubbing a teacher, especially in public places.

I went to introduce the principal to my husband. She looked at me, turned around, and just walked off. She was flat out rude. I couldn’t believe that someone would stoop so low. If we passed in the hall she would turn and walk the other way or she would give me a dirty look. She even snubbed me in the store. I remember saying, “Hi,” and she turned and walked off. I feel like I am dealing with a middle schooler.

Teachers described many abusive principals as extremely insensitive to personal matters, even illness; they also viewed stonewalling as a form of discounting.

Isolating and nonsupport of teachers

According to teachers, abusive principals frequently attempted to isolate them by preventing their contact with others, especially colleagues.

She threatened all of us from day one not to talk during our planning period with other teachers. . . . She said, “It promotes gossip.” She didn’t even want us in the lounge during our planning period. She would say, “You don’t need to say anything to your friends.” You couldn’t say anything negative about the school. It was just a control thing.

In addition, teachers indicated that abusive principals frequently failed to support them in confrontations with problematic students when, in their view, such support was clearly warranted by the circumstances (“She always told us, ‘I am going to support the children, not you.’ ” In all cases of nonsupport with
students, teachers reported that principals were “shamelessly unfair”; they not only failed to properly investigate problems, but they often blamed teachers for the problems, gave them written reprimands, and verbally mistreated them in front of students. In addition, teachers reported that abusive principals typically failed to support them in conflicts with parents who, in the teachers’ view, were clearly at fault; blamed teachers for problems with parents; and reprimanded teachers in the presence of parents.

She would say that you were the person with the problem and not the child . . . that you were making the child have low self-esteem and act out in class. It was your fault. I wasn’t even in the conference with the parent and the principal asked, “What exactly is it that you were doing to her child?” She accused me in front of the parents without even investigating. When the parents left, the principal said, “I know that you didn’t do anything wrong.”

Withholding resources and denying approval, opportunities, and credit

Abusive principals mistreated teachers by withholding necessary resources and denying approval. The experiences of a music teacher who had resources withheld and approval denied over a number of years were particularly destructive:

She moved me and my classes into the gym lobby with no place to store my students’ instruments. The bathrooms had that old urine smell, the heat didn’t work, and there was no air conditioning. She denied all my requests to play at the hospital or to go to the symphony, and all requests for funds for the music program. She wouldn’t repair instruments. She denied my requests to create a fund-raiser. She cut rehearsal time. She did this to let me know that she was the boss, she was in charge of the school and I jolly well had better learn that. It gets worse. I was placed in a closet, 8 feet wide and 30 feet long. This storage closet was my orchestra classroom. The parents said, “Look this situation is just awful.” I was in the closet for 5 months.

Our data reveal that some abusive principals undermined teachers’ efforts to initiate and involve themselves in professional development opportunities:

I had this idea to initiate professional growth plans that focused on trying to discover ways in which teachers can help each other grow. It was meaningful professional growth. . . . I certainly was aware that people had been victimized by this principal, and I had observed people being embarrassed publicly. I had even cradled people who were crying and angry and disenfranchised . . . and damaged by this principal. . . .
She said, “Forget it [professional development].” She hid behind saying that people were too burdened. She didn’t want to come out clearly as abusive. I felt that this was abusive because she is the one who told me to try it. She [also] criticized what I was doing [to other teachers] to make sure it became an unacceptable and undesirable thing for teachers to do.

Furthermore, all of the teachers we studied indicated that their principals withheld or took credit for work-related achievements. In fact, principals were often seen as “conspicuously” withholding recognition and praise.

I asked him, “Why did you sign the grant that I wrote?” He said, “Well, central office would question it. As long as you are my employee your work is my work and I get the recognition.”

Favoring “select” teachers

All teachers we interviewed attributed the practice of favoritism to their principals. According to our findings, favoritism refers to “inequitable” treatment of faculty; “select” individuals are rewarded whereas others are punished and/or neglected. Some examples of rewards to favored teachers include being released from attendance at meetings, being assigned better students and classrooms, receiving positive evaluations, receiving support for advancement, being placed on “good” committees, and receiving public recognition. Clearly, favoritism toward others exacerbated teachers’ feelings of mistreatment.

Moreover, favored teachers supported abusive principals directly and indirectly, which reinforced the principal’s domination of targeted teachers and intensified their sense of mistreatment; the favored teachers encouraged others to comport with the principal’s agenda, demonstrated their appreciation for the principal publicly, criticized other faculty, represented the school with external evaluation agencies, and colluded with the principal on decision making.

Offensive personal conduct

Two mistreated teachers complained that their abusive principals displayed offensive personal habits (e.g., belching, uninhibited flatulence); such habits and conduct negatively affected school morale and school climate. Several teachers reported that their abusive principals were also generally unprofessional in their conduct: “He spent a lot of time doing personal things during the day. He had some kind of machine in his office where he polished rocks. It was his hobby.”

And,

He’d always corner me and give me mean, really mean looks. I was very intimidated. He was my principal, my boss, and my superior. He
would shrug a lot, blow, and like just breathe heavily. He would stand real close to me.

Other teachers noted that several abusive principals had “affairs” with their colleagues: “There was one teacher in particular who spent so much time with him, like hours in his office. She would just leave her classroom unmanned.”

**Level 2 Principal Mistreatment Behaviors: direct and escalating aggression**

This section describes some of the direct and escalating aggressive forms of mistreatment analyzed from our data. Level 2 behaviors include spying, sabotaging, stealing, destroying teacher instructional aids, and making unreasonable work demands, as well as one of the most prevalent types of mistreatment: unfair and harsh private and public criticism of teachers’ work and abilities (see Table 1).

**Spying**

Most of the teachers who participated in our study accused their principals of personally spying on them. Some abusive principals ominously situated themselves in hallways near teachers’ classroom doors; others surreptitiously used the intercom to listen to classroom activity. Several teachers reported that their principals monitored their telephone conversations. Most of the teachers we interviewed indicated that abusive principals also solicited the services of other, favored teachers and/or parents to spy on them.

**Sabotaging**

Teachers disclosed that principals manipulated other faculty to sabotage efforts designed to benefit students or colleagues:

> When I was awarded a grant for a project she did everything she could to sabotage the project. . . . The principal said that no one was supposed to help me and she made sure no one did. . . . The grant I got was wasted.

**Stealing**

Several abusive principals were accused of stealing (e.g., personal journals, food) from teachers.

> The principal said, “I hope you didn’t mind but I sold my pickup truck yesterday afternoon and the only way that I could sell it was if I threw your air conditioner in with it.” It was a new, very expensive air
conditioner! I was shocked but I was afraid to say anything. My husband had a fit.

Destroying teacher instructional aids

Some abusive principals literally destroyed classroom instructional aids and/or ordered teachers to remove them from their rooms. The experience of one highly recognized veteran was especially poignant.

I had a beautiful loft in my room with pillows and a huge bookshelf that you could convert into a stage. It was great. The principal ordered it destroyed. But I went over his head—a bad thing, according to him. I asked the county ware-house people if they had to take the loft. They said no. So, I wanted my husband and some men to dismantle it so I could store it in my basement. When I came back one day after lunch, the warehouse people had axed the reading loft! The principal also ordered me to move a shelf from under the blackboard, which was so convenient for the children. Everything that I have ever learned about math and teaching supports using concrete objects. He said the solid oak desk in my room was really a piece of junk and we are going to get rid of it. . . . I had a guinea pig and he made me get rid of it. He said that it was unhealthy and dangerous; if a child was bitten, we could be sued. [Reading from her journal,] “He stripped away everything that made my room unique, that makes teachers special, sets one teacher apart from another. . . . I was a teacher who had a special style of teaching. But everything that made me special has been done away with. Circle meetings were stopped. The Friday workshops were ceased. I was told I needed to control [students] rather than making learning a joint venture. I became a teaching box—filling up heads with information so that they could pass the test. . . . I was Teacher-of-the-Year, sponsored the educational fair, won first place in other competitions, and was nominated for teacher of excellence. But all that was me is gone now. I want out.”

Making unreasonable work demands

Some teachers were consistently subjected to unreasonable work demands (i.e., overloading); indeed, one teacher’s workload, described as “too difficult and excessive,” was a dominant form of one principal’s mistreatment that spanned several years. Other teachers were subjected to “nitpicking” with regard to time.

At that point he started clocking me to make sure that my class ended exactly on time and that I had 5 minutes between classes. He was outside my door many, many, many, times to make sure that I ended at exactly at 10:11. It wasn’t even an even number, 10:11.
Criticism: the ubiquitous form of Level 2 Principal Mistreatment

All the teachers we studied indicated that their principals unfairly and routinely criticized them. Teachers reported several types of private criticism (i.e., stigmatizing and pejorative labeling, intentionally vague criticism, use of an informant’s information, gossiping, soliciting others) and public criticism. More important, criticism was, according to teachers, based on false or “manufactured” information and was thus considered grossly “unfair.” Principals were perceived as failing to conduct proper investigations (or any investigation) of the issue at hand before “attacking” the teacher; in other words, “accusations without investigation” were commonplace.

PRIVATE CRITICISM

Teachers explained that they were privately and routinely criticized for a wide range of issues. Principals’ criticism was usually conveyed with strong negative affect, both verbal (e.g., yelling) and nonverbal (e.g., pounding the desk); it was also considered false or extremely exaggerated and therefore “unjustified.” To illustrate, principals directly criticized teachers’ instruction and planning:

He would bring teachers into his office and intimidate them. You could hear him pound on his desk and yell at them for all kinds of things. He took my plan books every week and graded them in red ink. He’d write ugly comments. He would leave little notes in teachers’ boxes about things that weren’t true, like “Your class was noisy.” He would sit in your classroom and later leave a note that would say, “I was disappointed in your English lesson today.” He would just make things up!

For instance, principals privately criticized teachers for what they defined as “messy” classrooms (a teacher reported that the principal yelled at her because “one piece of paper was on a shelf”), the way teachers conducted department meetings (the principal could not provide reasons for his criticism), the color of ink teachers used, and being pregnant. One teacher described how her principal overreacted when she had used a particular color of ink on a form:

One morning I found a note in my box that said I had signed my report cards with the wrong color ink, blue instead of black. The principal pulled me out of class into the hallway and said, “You were told this was the way it was to be done and you have not followed those directions!” I apologized twice but he kept berating me. The next day I got a reprimand in my box. I was totally humiliated as a professional.

Another teacher discussed how the principal criticized her colleagues for being pregnant:
A teacher said she was thinking about starting her family but she wanted to wait and see if the principal would retire, because the principal had previously confronted people about being pregnant. That’s against the law! The principal would say, “What poor timing. How dare you think you can have a baby at the beginning of September!” One of the teachers miscarried; she was devastated. She said she thought it was from the stress at school.

Not infrequently, unjustified principal criticism of teachers was nonspecific; it consisted primarily of pejorative labeling such as accusing individuals of being “negative”:

As the union representative, I wrote a letter to the principal saying there was no educational substance behind his approach and that my students weren’t learning anything. He wrote back, “You are just being negative and unwilling to change. Your attitude is the problem and you are undermining the staff and morale.” He circulated the letter to the whole staff. I filed a grievance that forced him to back down. After that, it’s been a cold war.

In other cases, teachers reported that principals’ criticism was intentionally vague and based on unfounded criticisms they claimed a third party, “a snitch” (e.g., teacher, student), had initiated or reinforced. Nonattendance at an assembly, having a negative attitude, and yelling at students are but a few examples of the actions principals falsely attributed to teachers. Frequently, principal criticism was indirect and took the form of gossiping to other teachers and sometimes parents. One teacher disclosed that a principal tried to solicit the help of others to disparage her.

PUBLIC CRITICISM

Our data indicate that teachers were also publicly criticized and humiliated by principals and that such criticism was based on fallacious or distorted information and was accompanied by strong negative affect and offensive nonverbal behavior. Teachers described abusive incidents by principals that occurred, for instance, in the front office area of their schools, at faculty meetings, in their classrooms (with students and others present), over the intercom, in the hallway, in the lunchroom, and in the parking lot.

She would yell at teachers quite often on the PA as well as in person, and in the lunchroom lobby in front of all the students. . . She pointed her finger about 3 inches from one teacher’s nose and was just blasting him right there in front of the entire lobby. She said he was not being professional, he should not joke around with students and he should
keep his voice down because he was irritating. A hundred students were present. I was standing there, too. I can remember thinking if that were me I would just die.

My principal and I had an agreement that I could leave 5 minutes early at the end of the day because I teach a pullout program in the morning. The first time I walked out of the building 5 minutes early the principal started running after me and yelling at me, “Where are you going! It’s not time yet! Get back in the building!” Even if I had been wrong, I don’t think screaming would have been the way to handle it. I was very shaken.

**Level 3 Principal Mistreatment Behaviors: direct and severely aggressive**

From the foregoing, it is apparent that principals who abuse teachers do so in a variety of verbal and nonverbal ways and that such abuse includes Level 1 (indirect, moderately aggressive) and Level 2 (direct, escalating aggression) behaviors. As devastating as these levels of mistreatment are, collectively, for teachers, principal mistreatment includes even more aggressive forms of abuse—Level 3 behaviors, glimpses of which have been seen in Level 2 behaviors.

According to our data, victimized teachers believed that most of the principals they described “intended to harm” and even “destroy” them and that many such principals were quite aware of the damage they caused. For instance, in addition to the repeated nature of abuse over long periods of time, most principals failed to investigate issues before “attacking” the teacher. And when teachers confronted abusive principals about their conduct and its destructive effects on them, such principals typically denied all allegations, blamed the teacher, and engaged in further reprisals against them. Most Level 3 forms of principal mistreatment were strongly associated with various forms of deception and included lying, explosive behavior, threats, unwarranted reprimands, unfair evaluations, mistreating students, forcing teachers out of their jobs, preventing teachers from leaving/advancing, sexual harassment, and racism (see Table 1).

**Lying**

Most of the teachers we studied identified principal deception, in particular “blatant lying” (i.e., intentionally false statements) as a common form of principal mistreatment. Lying was attributed to principals when they repeatedly made statements that conflicted with the teachers’ direct personal experience regarding an issue. Lying was associated with other forms of abusive behavior already discussed, such as nonsupport of teachers in conflict with parents and students, unfounded criticism as well as behaviors to be discussed (e.g., unfair formal evaluations), and forcing teachers out (“You can expect principals who
do bad things to lie to protect themselves”). Lying was also associated with countless issues including placement of children, faculty voting outcomes, teacher termination, reimbursement for in-service, library responsibility, authorization, and stealing funds.

**Explosive behavior**

When principal mistreatment occurred through face-to-face interaction, principals frequently escalated and became explosive and engaged in particularly nasty behaviors:

He would address us at meetings by yelling, pounding his fist, and carrying on at length until his face was scarlet and the veins stood out on his neck. No meeting with this man was complete without our usual verbal beating. I believe this man thought that it actually helped us. Quote, “The beatings will continue until morale improves.”

**Threats**

Not surprisingly, teachers defined all abusive actions by principals as implicitly or explicitly “threatening.” That is, teachers experienced such conduct as putting them “at risk,” in “danger,” and in a state of fear. In addition, teachers reported that abusive principals, with few exceptions, directly threatened groups of teachers as well as individual teachers. Our data indicate that threats were usually overt, but at times they were implied. Teachers explained that principals threatened groups of teachers to stop the spread of rumors about the principal, for making negative statements about the school to a review committee, for losing games, and numerous other issues:

She came to a staff meeting one time with a pack of transfers and said, “Anybody that doesn’t like it here, you can just get one of these. I have got plenty of them.” She said, “The thing that I want to get straight is I am here for the children. I am not here for you,” meaning the teachers. . . . She also said, “It is going to upset your evaluation.”

Individual teachers were threatened for a wide range of reasons, for instance, to coerce a teacher to change a student’s grade, for expressing opinions that disagreed with the principal’s, for confronting a principal for his conduct, for making a request to central office for needed resources, for use of personal days, and for having to miss a parent-teacher association (PTA) meeting due to serious medical reasons.
Abusive principals threatened teachers with unwarranted written reprimands. Teachers described the use of reprimands as “grossly unfair,” “irrational,” and based on false accusations. Principals “wrote teachers up” for stealing a video camera (stolen by a student), use of the intercom (the teacher was answering an intercom call from the office), and for being in a storage closet during class. The teacher who was forced into a closet by her principal disclosed,

I was constantly intimidated and harassed. He sent me letters of reprimand, delivered during class, and filled with false accusations. My students witnessed my reaction. I was not able to teach effectively. Once he cornered me in a closet and discussed inappropriate [sexual] topics to which I would not respond. I then received a letter of reprimand for being in the storage closet.

In all cases, teachers worked in school districts that required principals to complete “objective” teacher evaluations. These consisted of classroom observations, usually several per year, as well as conferences with the teacher. Such evaluations were described as important to the school district as well as to the teacher; in fact, most of the teachers in our study defined one negative evaluation as “seriously damaging” or “career ending” in their respective districts.

Our data show that teachers who were victimized by principals worked in a constant state of fear about unfair evaluations. (“She would come in at any time and decide that she didn’t like things. She did it to me, and I saw her do it to others.” “We are always in a state of fear, and I am the bread winner in my family.”) In all cases, teachers stated that principals included flagrantly false information on their evaluations.

Teachers’ fear of unfair evaluations were exacerbated by their belief that no viable recourse existed to overturn such evaluations. (“As far as evaluations go, there is really nothing you can do. It doesn’t matter what you say; it is there on paper, and you just sign it.”) It is important to mention that with the exception of beginning teachers who had not worked with other principals, all but one experienced teacher reported that they had, before mistreatment began, consistently received superior evaluations from former principals and even from their abusive principals.

Teachers also reported that principals failed to give legitimate reasons, or any reasons whatsoever, when requiring them to submit to extended or special evaluations. Several teachers indicated that abusive principals intensified their use of unfair evaluations when they were consumed by personal life tragedies.

When my father was dying . . . he comes to do an evaluation. I felt like a whipped dog; I didn’t have any energy to get up and dance. He wrote
a bad evaluation, and within 2 days he came back for a second one. . . .
The third evaluation came right after Dad died in April.

Mistreating students

Our data indicate that principal mistreatment of students had harmful effects on both students and teachers. Such treatment was considered an aspect of principals’ authoritarian-abusive approach to school leadership. Generally, students were mistreated for what a principal defined as “misbehavior.” Many were special education/behaviorally disabled students.

The principal and advisor of special education programs brought a child to my room fighting, struggling, kicking, and screaming. They held him down in the middle of the room by his arms and put their legs over his legs to restrain him. Both of them were White and he was a little African-American child. When his mother came, the child called her a bitch. . . . He told me to suck his dick. The two male administrators snickered; they thought it was funny. I shut up. . . . Eventually, the child got angry and called the principal, who was White, a “cracker.” Immediately, the principal called the child a “nigger.” . . . They struggled and the principal wound up hitting him in the mouth . . . his hand slipped. His lip split open and he was all bloody. I was sick to my stomach. I thought, “This is child abuse.” I stood there frozen.

Forcing teachers out of their jobs (reassigning, unilaterally transferring, terminating)

Most of the teachers we interviewed stated that they were subjected to a variety of abusive actions by their principals such as unfair reassignments, forced transfers, and termination. In unilaterally reassigning teachers, principals changed their teaching locations and/or professional responsibilities.

The principal said to this teacher, and I quote, “You have got yourself knocked up [pregnant] and you are out.” She gave her a traveling remedial position between four classrooms. It was awful to watch somebody torture her, it wasn’t physical, but it sure was mental. This teacher had been the principal’s favorite. But the principal would turn on people unexpectedly and they would just fall apart. The principal would smile, be nice, and all of a sudden, attack. She is sadistic.

Preventing teachers from leaving/advancing

Also frequently reported were principals’ attempts to obstruct transfers of teachers, both within a teacher’s district and to other districts. Routinely, abusive
principals wrote unjustified negative letters of reference to other school administrators in response to queries about teachers.

He said that he would not recommend me for a teaching position. I said, “You’ve got to be kidding!” He said, “What I will say is that you are an excellent teacher and you are wonderful with children, but you are a troublemaker.” He said, “I don’t care if you think this is right or not.” I didn’t get the transfer. He wanted me to leave, but he didn’t want me to leave for the school of my choice.

In several cases, principals assured teachers that they would give them positive references; however, their assurances proved false. Abusive principals also used negative letters of reference, even when prohibited from writing such letters by union agreements, to undermine teachers’ attempts to obtain new teaching positions in other school districts, in some cases, for years.

Sexual harassment

Several female teachers accused their principals of isolated episodes of sexual harassment; others accused principals of ongoing sexual harassment. In one case, the harassment occurred over a period of 9 years. Teachers viewed the principal’s sexual harassment as obvious assertions of power and control.

I had problems with him calling me to his office. He would close the door and say, “Does this make you nervous to be in here with me by yourself?” Then he would tell me inappropriate jokes. He was very flirtatious and very controlling and he knew that he was making me nervous; the jokes were sexual. Once, he said, “I want you to come over here and stand behind the desk with me.” He tickled the backs of my legs and said, “I have been wanting to do that all day.” I got out of his office. The secretary was aware that he was harassing me and would look at me like, “I am so sorry.” Once, he came by my classroom and poked me right under my arm, not a very good place to be poking a female. He just kind of laughed.

Racism

Teachers defined six principals, three African Americans and three Caucasian, as racists; they reported that racism resulted in poor school morale and poor school climate.

He was definitely a racist. He didn’t want to hire Black people. He said that he had been made to hire a Black teacher before and he had to hire two this year but he didn’t want to. He never put Black teachers in
charge of prestigious committees. We never had a Black teacher-of-the-year. The Black teachers were very strong, but didn’t stay very long; the stress was too much for them.

**The adverse effects of principal mistreatment of teachers**

Workplace bullying can have serious, even devastating, effects on targeted individuals. Psychological effects include stress, depression, mood swings, loss of sleep (and resulting fatigue), and feelings of shame, guilt, embarrassment, and low self-esteem. More serious effects can include Post-Traumatic Stress Disorder, which, left untreated, may cause an individual to react violently against either the bully or anyone else who happens to be in the vicinity. Physical effects include reduced immunity to infection, stress headaches, high blood pressure, and digestive problems.

(Yamada, 2000, p. 483)

Here, we explore some of the seriously damaging effects of long-term patterns of mistreatment on the teachers involved in our study, mistreatment that lasted from 6 months to as many as 9 years; some of the teachers’ initial emotional responses to abusive principals as well as some far-reaching effects on teachers and schools are discussed. Other research on workplace mistreatment (i.e., described in the introduction to the article) conducted in a large number of public and private work settings, both nationally and internationally, has generated findings consistent with those that follow.

**Early psychological and emotional problems**

According to our data, teachers’ early emotional responses to principal abuse included feelings of shock and disorientation, humiliation, loneliness, injured confidence and self-esteem, and being corrupted and guilty (see Table 2).

*Shock and disorientation.* Teachers experienced a strong sense of shock, disorientation, and confusion as a result of mistreatment. Teachers used words such as bewildered, confused, shocked, disoriented, helpless, stunned, and mystified to describe feelings associated with early “attacks” by their principals.

It always bothered me that I never knew how to react or correct the problem; that was because I didn’t know what the problem was. I kept chalking it up to her being in a bad mood. I didn’t make the connection between the fact that I had disagreed with her and the things that she was doing to me. I was real frustrated. Then I woke up and realized it wasn’t just a bad day.
Teachers’ sense of disorientation was not short-lived; nor was it merely an initial response to the sudden, “out of the blue,” nature of principals’ actions against them. To the contrary, for most, such feelings persisted throughout their mistreatment experiences, in part because they were unable to understand why they were targeted and in part because they were unable to identify any course of action to resolve their situations.

I couldn’t understand what I had done to provoke this. I felt a loss of power, loss of center, loss of balance. I felt reduced, like when you have a parent who has turned on you. Our school was like a dysfunctional family and I was the abused child. I lost my confidence. I was becoming dysfunctional in my personal life. I had bad dreams. It is very painful, devastating. I felt sad, betrayed, angry, indignant, outraged, disoriented.

HUMILIATION

Our study also demonstrates that principals’ mistreatment provoked, early on, strong feelings of humiliation and embarrassment in teachers, especially when such treatment occurred in public places.

I had been waiting for the principal in the office area, doing a good deed, trying to help the secretary. When the principal arrived, I jokingly said, “I

236
am glad you finally got back.” She flew into a tirade, saying, “I don’t care how long you have been waiting. What do you think I have been doing, standing around the corner picking my nose?!” It was awful. I was so embarrassed. Everybody had the same dumbfounded look on their faces. I froze. I was in shock. She had these kinds of incidents with other teachers . . . bawling them out in front of their students and coworkers. It was embarrassing. I was disappointed and hurt. It was a public reprimand.

LONELINESS

During the early periods of mistreatment, many of the teachers we interviewed received some support from other faculty; however, many of the targeted teachers reported that individuals, and sometimes groups of teachers, began to ostracize them, typically because these teachers also feared principal reprisals for association or because they were “taking the principal’s side” in the ongoing ordeal. Teachers experienced feelings of profound loneliness throughout their mistreatment experiences.

I went to my friends, my confidants, and said, “This is miserable, this is terrible.” They looked at me as though I had obviously done something wrong and deserved what was happening to me. Their loyalty was to the principal. They were afraid about being mistreated too. They knew to play it safe, and they knew they had better stay away from me. They also didn’t want to talk to me because they didn’t want to know about it . . . it might make them feel badly.

INJURED SELF-CONFIDENCE AND SELF-ESTEEM

Most teachers reported that from the beginning, principal mistreatment seriously harmed their self-esteem. Specifically, both veteran and beginning teachers developed substantial self-doubt and loss of confidence in their ability and competence as teachers. Many teachers actually internalized, in varying degrees, principals’ negative views of them, usually for years.

I had been given a program to work on because of my professional reputation and my skills in technology. Then, I was pulled out without notice and told things weren’t working. I felt I was not successful, that I had no talent and I wasn’t worth trying to fix. Then I was transferred to another school to teach in an area I was not qualified to teach and in a school I did not want to be at. It was quite a blow to my self-esteem . . . [I] felt like I was a person of no value. I began to doubt that I could do the job anywhere.

I was put down and getting the shaft. I felt I constantly had to justify myself. I felt worthless, useless, like I couldn’t meet expectations. I lost
EMOTIONS AND GENDER

respect for myself because I didn’t stand up to him. I was afraid and I knew it. I wondered why he picked me out. . . . Did he see me as a weak person and feel like he could manipulate me? He affected my self-worth.

CORRUPTED AND GUILTY

Teachers felt “corrupted” and “guilty,” for example, by being “forced” to change a student’s grade, to violate district policy, and to remain silent about such matters. Our data also indicate that the principal’s negative modeling influenced other teachers’ behavior negatively and set in motion a host of dysfunctional behaviors on the part of others and thus corrupted teachers and students in a given school. To illustrate, in one case, some teachers imitated the racism of their abusive principals. In other cases, teachers disclosed that students were forced to comply with the unethical demands of abusive principals; principals used students politically, coaching them to make false statements against victimized teachers.

In the following section, we examine additional devastating effects of principals’ mistreatment of teachers. In addition to feeling shocked and disoriented, humiliated, lonely, beset by low self-esteem, and corrupted, teachers discussed long-term effects such as chronic fear and anxiety, anger, depression, physical/physiological problems, and adverse effects on schools (i.e., damaged relationships, damaged classrooms, and impaired decision making) (see Table 2).

Long-term (chronic) psychological and emotional problems

FEAR AND ANXIETY

Fear is essentially an awareness of psychological distress; it is also considered the most toxic of all human emotions (Tomkins, 1962). Moreover, fear has “a profoundly noxious quality that compels efforts to change the situation that elicited the emotion” (Izard & Youngstrom, 1996, p. 35). In contrast to other primary emotions (e.g., joy, anger, and grief), fear “is the emotion of avoidance of a consciously recognized, usually external, imminent danger” (Bartley, 1994, p. 12). Fear is associated with escape and avoidance; however, when such actions are thwarted or blocked (e.g., as in an uncontrollable situation and when one feels constant uncertainty about a potential danger), fear is transformed into anxiety, a state of arousal following the perception of threat (Epstein, 1972); this involves “a cluster or pattern of emotions that may motivate both approach and avoidance” (Izard & Youngstrom, 1996, p. 35).

Fear, because of its unavoidable links to the body, has particularly injurious effects; it subtly and profoundly degrades human perception, cognition, and action. Fear “reduces working memory, increases superficial cognitive processing, generates cognitive bias, and tends to put indelible traces in memory” (Izard & Youngstrom, 1996, p. 12). Even more serious, a generalized anxiety/fear dis-
order can evolve into post-traumatic stress disorder, into phobias, and finally, at the top of the diagnostic hierarchy, into a panic disorder (American Psychiatric Association, 1987).

Our study revealed that intense and chronic fear and anxiety were among teachers’ primary long-term responses to principal mistreatment. There were several reasons for this: First, teachers viewed the various forms and patterns of principal mistreatment as extremely threatening and punishing, and they perceived themselves to be particularly vulnerable. Second, teachers tended to internalize their fears, and this provoked a chronic state of anxiety, apprehension, obsessive thinking, and hypervigilance regarding the possibility of further mistreatment. Third, fear of mistreatment provoked an array of powerful secondary fears, for example, fear of losing one’s job, losing one’s reputation, being ostracized by colleagues, expressing one’s opinion, receiving poor evaluations, lack of support from the central office, and failing one’s students instructionally and socially. Fourth, fear was experienced as pervasive: It permeated all aspects of a victimized teacher’s work life; for many, it also profoundly and adversely affected the quality of their personal and family lives. Said differently, fear dominated teachers’ entire “sense of being” for long periods of time ranging from several months to many years. Some terms that teachers used to denote chronic fear and anxiety states were fear, scared, panic, dread, and paranoid.

I take it day by day. It is the only way that I can get through it. I am apprehensive, fearful. He is not on my case everyday, but he has set the tone. We did a unit on food and fruits, and at one time I would have taught my students the song about sipping cider, but I wouldn’t want him to be walking by and not get the connection. I hated to see this happening, and I dreaded going to work. . . . I was always fearful of repercussions . . . the uncertainty of the day. I was in constant fear and would cry because he would accuse me of things. I was worried . . .

I felt worthless, intimidated. I said to him, “You make me shake.” When I knew that I had to meet with him, I became fearful. I knew what the outcome what be. If he came into my room. I would get edgy. I felt I constantly had to explain, to justify. I felt like I couldn’t go to him for help because he [didn’t] value my concerns. I felt angry with myself because I took this treatment for years. I ate lunch in my room and went to my mailbox once a day. I would try to get there by a quarter ‘til 7 to avoid him. I would stutter and stammer. . . . I knew what was coming and what he was going to do to me when I saw him. I felt defeated. I dreaded going to school on faculty meeting days. I hated it. I would sit in the back of the room at faculty meetings.

Many teachers we interviewed indicated that principal abuse was sufficiently extensive among faculty at their schools to create what one described as a
“culture of fear.” Fear affected entire schools, fostering a situation in which most teachers were afraid to express their opinions and concerns under any circumstances; silence was the pervasive response.

There is a very strong culture of fear and caution. You best keep your head down, say as little as possible, and stay away from the front office. A teacher told me, “If you try to make any changes around here you will be her victim. Every year she has at least one and as many as three or four, maybe five or six people, whom she victimizes in order to demonstrate her power and control.” I had bad dreams about it. If I were called to the office my heart would absolutely race. I now feel apprehensive about going into administration given how much pollution goes on there. One fear I have is that she may begin to try to infiltrate or pollute or poison my doctoral program. . . . It takes a lot to stick your neck out. Most teachers simply stop championing new creative ideas because the reward is punishment. It is a pretty deep culture of fear. The self is at risk when you are trying to do your thing.

Most of the teachers we studied were so thoroughly traumatized that they generalized their fear of their abusive principals to other school administrators (“I vowed that I would never work under another woman and I never have”). Some teachers experienced this fear of administrators, sometimes years later, in different schools and with good principals.

ANGER

Also considered a primary human emotion, anger is a more or less primitive response to “being either physically or psychologically restrained from doing what one intensely desires to do” (Izard, 1977, pp. 329–330). Hence, anger motivates individuals to prepare their bodies for real or imagined battles and to defend themselves with vigor and strength. Ekman and Friesen (1975) stated that the major provocation to anger is “frustration resulting from interference with [one’s] activity or the pursuit of [one’s] goals” (p. 78). They noted, “anger will be more likely and more intense if you believe that the agent of interference acted arbitrarily, unfairly, or spitefully” (p. 78). Indeed, Averill (1982) asserted (as did Aristotle) that anger involves an appraisal that another person has intentionally and unjustifiably wronged one. Such were the thoughts and feelings of the teachers in our study, many of whom described intense feelings of anger/outrage and indignation toward their abusive principals; in addition, they felt angry with themselves for their inability to confront and/or successfully curb their principal’s mistreatment. Martin (1986), after an extensive review of the relevant literature, concluded that individuals tend to accept unjust treatment from authority figures without responding.

All of the teachers we interviewed expressed strong feelings of anger, both
explicitly and implicitly. For most teachers, anger was chronic; it was a dominant emotion throughout their mistreatment experiences and, for many, continued long after mistreatment ended. As mentioned, teachers’ anger always included strong feelings of indignation, a form of anger due to the unjust and unfair nature of their victimization by principals. Teachers used many strong words such as *bitter, hate, furious, angry, enraged, outraged, appalled, disgusted, despise, resent,* and *hot* to convey the intensity of their anger.

Principals would call me up and say, “Would you go down and open the school?” or do a tournament or some chaperoning? I built up a great reputation in the district. “Who is this guy to come in and treat me like dirt?” You give your sweat, blood, and tears, and what you get back is, “Thank you, but get out of our way!” Some administrators just don’t appreciate the sacrifices the individual makes for the system. I get incensed about injustice!

It is awful to say, but I hate this person. I have never felt that way before. It bothers me that I feel such a strong dislike for another human being.

A handful of teachers also expressed strong feelings of revenge, another form of anger rooted in the emotion of “moral outrage” or a “sense of injustice” (Bies, 1987, p. 293). After carefully studying the phenomenon of moral outrage in organizational life, Bies (1987) wrote, “When people feel harmed wrongfully, or witness others enduring such an injustice, they are likely to become morally outraged” (p. 290); and this often leads to “the sympathetic reaction of outrage, horror, shock, resentment, and anger, those affections of the viscera and abnormal secretions of the adrenals that prepare the human animal to resist attack” (Cahn, 1949, p. 24).

He could have been on the show, *In the Heat of the Night.* He was a complete redneck idiot. I hated him. I was extremely angry. I was just as hateful toward him as he was toward me. I hated his guts. . . . If they were to do a buyout tomorrow I would take it. I wouldn’t teach again. I am disgusted that he thought I would respond positively to sexual harassment. I am angry that he knew he had the power to get away with it. This is a sick puppy. . . . I would have sabotaged him if I could for what he had done. I was extremely furious!

**DEPRESSION**

Depressive states refer to pervasive, absorbing, and chronic feelings of being out of control. As described above, anxiety is a kind of “mobilization” response to a future threat that may be developing or coming and that, one hopes, can be avoided. On the other hand, depression is a “demobilization” response to a loss,
a “static or unlikely-to-vary situation that can no longer (with any hope) be avoided because it has already developed or come to pass” (Riskind, 1997, p. 687).

Most of the teachers who participated in our study reported being chronically depressed throughout their mistreatment experience. In describing feelings of depression, teachers used terms such as depressed, futile, helpless, hopeless, devastated, beaten down, paralyzed, broken, worn out, defeated, disoriented, distraught, trapped, isolated, sad, down, and despair. Clearly, for most victimized teachers, going to work as well as being at work was a “constant struggle to survive each day.”

The feelings dogged me every time I thought about it. It made me half sick. I turned it into depression. You turn it against yourself and you start asking yourself, “What is wrong with me?” I didn’t trust my own judgment. I felt beaten down. I don’t like conflict. I don’t like verbal abuse. I just felt really tired all the time. I really did look 10 years older. I was so tired that I couldn’t sleep. I would go in tired in the morning and come home tired at night. I dragged around a lot. My energy level became very low.

By the end of the 3 years, I would sit on the edge of the bed in the mornings and just cry. One morning my husband was rubbing my back and said, “You know what, darling? I don’t care if you have to work at Burger King. You don’t have to go back there next year, no matter what.” Twenty-two people left the school that year. All the stress had accumulated; I almost had a breakdown. I broke down at least once a week the 3rd year.

Many teachers’ depression was so severe that they sought counseling or psychiatric care for therapy and medication.

I would wake up in the middle of night thinking, going over the same thoughts, over and over again. I went to the doctor and I had blood work ups. I ended up seeing a psychiatrist and being diagnosed as having clinical depression. I couldn’t see the good side of anything anymore. I had diarrhea and I couldn’t eat.

In addition, feelings of isolation, being trapped, and feeling unmotivated were strongly associated with feelings of depression.

**Feeling Isolated** To avoid further mistreatment, teachers usually withdrew both emotionally and physically (when possible) from social and professional activities (e.g., faculty meetings, committee work, sponsorship of student activities, professional associations). They refused, for example, to volunteer for committee work and sponsorships; when required to attend certain events, they
did not participate. According to our findings, teachers’ protective actions may have inadvertently exacerbated their feelings of isolation and depression. Other factors typically associated with principal mistreatment—showing favoritism, being ostracized by other teachers, and lack of viable opportunities for recourse (e.g., from central office, unions)—also contributed to a targeted teacher’s sense of isolation.

I never had lunch with the teachers. I stayed in my room. The only time that I was out of that room was to go to the bathroom. I am pretty social and pretty funny, but I just completely withdrew. I felt alone. I was very alone but I had to protect myself. I had to get through the day. I think if I talked about it [the mistreatment] at school, it might have made it worse.

I dropped every professional organization except two that I had been very active in. These were organizations that helped me to be productive in the classroom, but I didn’t feel motivated anymore, so I closed myself down. Then he began to freeze me out. I felt very isolated. I went to as few faculty meetings as I could and I was never chastised, which indicated to me that he didn’t mind. I cut my connection to the building.

Feeling Trapped Feeling trapped in a classroom or a school, with few or no avenues for escape, was also associated with teachers’ feelings of depression; such feelings were characterized by a lack of control and not knowing where to turn or what to do to resolve a situation. Feelings of being trapped were, as teachers reported, “like being in prison,” “damned if I complained, damned if I didn’t,” “in an iron cage.” These feelings were a direct result of principals’ threats of reprisals for requesting transfers, for unsuccessful attempts to transfer, the prospect of negative letters of reference, unresponsive central office personnel, and weak union representation, among others. It was clear that chronic fear and depression and related responses (e.g., fatigue, self-doubt, and lowered self-esteem) reinforced teachers’ feelings of being trapped, as did personal life factors (e.g., being a major or the sole breadwinner in the family, having children in the school district).

She said, “Maybe you shouldn’t be in this business.” That was a direct quote. I had been afraid to ask for a transfer because she tends to blackball people who ask for transfers. She made us turn in transfer requests to her first, before they went to the county office. She belittled one teacher who asked for a transfer and had another teacher’s transfer interview canceled.

Feeling Unmotivated We found that long-term mistreatment and chronic feelings of depression and fear/anxiety were strongly interrelated with teachers’ motivation to teach.
My first 8 years of teaching, I thrived on the challenge. . . . But I gave up my special vision. By the end of those years with her, I had lost a lot of my motivation. I was going through the motions. It had taken the heart out of me.

*Physical and physiological problems*

We found that mistreated teachers suffered a range of physical/physiological problems. Like psychological/emotional problems, physical/physiological problems were typically chronic; they began with the onset of mistreatment and usually ended when mistreatment terminated. In a few cases, problems persisted for several months and even several years later. The seriousness of these problems appear to be related to the longevity of teachers’ mistreatment, at least in part. Roughly two thirds of the teachers we studied sought medical treatment for their problems. The most frequently identified physical/physiological problems were chronic sleep disorders (e.g., insomnia, nightmares, obsessive thinking), chronic fatigue, stomachaches, nausea, weight gain or loss, neck and back pain, and headaches or migraines.

I gained 50 pounds. The final year was the worst year. I would come home with my neck and back in knots. It would lead to a headache. I had headaches all the time. It affected my sleep. I would toss and turn, and I would scream in the middle of the night. I had bad dreams about fear, like someone was after me. I was always exhausted. Now I have a new life and my health is great.

I would go home with headaches and tense upper back muscles. I would get colds, headaches, stomachaches, and anxiety. I had headaches to the point that I went to my gynecologist, who put me on medication, saying that it was stress. I would take medication quite often. The headaches would last for days. I would come home and turn off the lights and stick my head underneath a pillow just to get still.

Examples of other severe physical/physiological problems teachers experienced included diarrhea, high blood pressure, blurred vision, nausea or vomiting, respiratory infections, hives, vertigo, heart palpitations, gum disease, auditory impairment, chest pains, and frequent colds and allergies.

My doctor put me on a combination of a beta-blocker to correct my heartbeat and Valium. I went in once a week so that he could help me with the stress. He was my counselor, too. Every evening I had an upset stomach, every single night. I had lost a bunch of weight. I was down to 91 pounds, which for me is pretty skinny. I still have the erratic heartbeat. Every time I get upset now it comes right back, I have had it while we have been talking. As soon as the principal left, my heart problems stopped.
My physical reaction included blurred vision. My blood pressure was 180 over 120, which is stroke level. My body was suffering tremendously because of the stress. I am now on blood pressure medicine and I can’t sleep well. I don’t sleep more than 2 or 3 hours. I gained probably 25 pounds; I am much bigger than I was before. I have many more headaches than I used to.

Our data indicate that in addition to the psychological/emotional problems discussed earlier, individual teachers simultaneously experienced, on average, at least four of the physical/physiological problems described here throughout their mistreatment experience.

DAMAGED SCHOOLS

Over time, principals’ mistreatment resulted in far-reaching, destructive effects on schools, particularly with regard to relationships between and among teachers, their instructional work in classrooms, and collective decision-making processes.

Damaged Relationships Historically speaking, most of the experienced teachers we interviewed reported that throughout their professional careers and in their work with former principals, they had been “totally” involved in their schools and, in fact, frequently provided the leadership necessary to initiate innovative arrangements among faculty focusing on student development. Our data demonstrate that abusive principals severely undermined the development of innovative and collaborative structures among faculty as well as teachers’ overall level of involvement in their schools. Consequently, in addition to ostracism by colleagues, mistreated teachers typically withdrew from all discretionary involvements, such as committee work, schoolwide events, special projects, and staff development. When involvement was considered mandatory, such as faculty meeting attendance, teachers minimized their participation and, in general, maintained silence. Briefly, teachers indicated that such extreme responses on their part were designed to protect themselves from further “attacks” by abusive principals. These teachers became “islands,” support from others was limited and was often given only “secretly” because, as one teacher stated, “friends were afraid that they could become a target of mistreatment, guilt by association.”

There were a lot of little cliques. There was no sharing among the faculty, no sharing of ideas or methods, no getting together and looking at students or doing assessments, none of that. Committees were few and far between and generally composed of her little pets. That is how all decisions were made. No one else wanted to be on the committees under these circumstances. We supported each other. I spent a lot of time on the phone with a really good friend . . . having a good long
gripe session. She and I would make popcorn and just talk. Sometimes I would cry.

She had some pets, her stoolies, and you knew right fast who the stoolies were. She would praise them. You were very careful whom you talked with. People would gripe all the time. It was a mass exit at checkout time, a real indication that people are not happy. Teachers would push each other to get out of the view of the video camera in the hallway so they could chat about what they had heard about her that day.

The extent to which many teachers withdrew from former social and professional commitments is noteworthy:

I withdrew from all professional organizations, except two. I just withdrew. I closed myself down. Before all this started, I was the Teacher of the Year. I truly enjoyed teaching. I loved it. I thought that I would teach forever. I would come home happy every day. . . . I have always believed that we need to put a lot into our profession, that we need to work extra with other teachers and students. Before, I sponsored the science club, academic debates, the scholars bowl team, and students against driving drunk. I was senior class sponsor; I sponsored the class—all four committees at the school and county level. . . . I just withdrew from all of that. I was not going to put time and effort into a system that treated me that way.

Although teachers directly targeted by principals significantly withdrew from schoolwide involvement, as described, our data also point out that principal mistreatment, particularly when it was widespread in the school, occasionally resulted in greater social cohesion among faculty; however, this was usually limited to a “defensive” banding together for social support and protection: “When teachers got together, they would share their complaints, get angry and share frustrations. She treated everybody badly. It became a gripe session—everybody felt the same way about her leadership.”

Repeated attacks and reprisals against teachers appeared, at times, to be a function of favored teachers, teachers who served as informants or spies for principals. Thus, abused teachers were typically alienated from others, their relationships damaged, and they had to rely on the social and professional support of only a handful of trusted colleagues.

**Damaged Classrooms**  
With one exception, principal mistreatment had serious deleterious consequences for all major aspects of classroom life, including the quality of instruction and social relationships with students. In general, teachers described feelings of stress, paranoia, insecurity, fear, dread, and self-doubt with regard to classroom teaching.
My emphases and my thoughts went away from the curriculum as I wondered where the principal was. I was paranoid. Was he coming to my class, what was going on? ... I have avoided new ideas that I would have implemented in class because they would have involved the principal’s support. I felt vulnerable. I knew the principal would not back me. My relationship with students became stressed.

More precisely, teachers disclosed that abusive principals forced them to employ traditional methods of teaching that they viewed as “rigid,” “authoritarian,” “dated,” and “ineffective.” Such methods emphasized lecture, rote and recitation, drill, and worksheets and were associated with significant reductions in teachers’ motivation, responsiveness to diversity, risk-taking, creativity and innovation, planning, preparation, and variation in the use of instructional strategies and materials. Furthermore, teachers described the increased use of authoritarian, control-oriented, “impersonal” methods of classroom discipline, an expectation of most abusive principals. Important adverse effects were also discussed for teachers’ social relationships with students; reductions in teacher caring, patience, tolerance, and humor were apparent:

I was less motivated to try new things or even ask for advice on how to implement a new instructional unit and methods in my classroom. I was constantly angry at the students, but I couldn’t show it. I had to internalize my anger to prevent trouble from students or parents because I knew that the principal would not support me. My authority in the classroom had been undermined; so I was very uncomfortable about how to deal with the students and the class. I did not try as hard or put forth the effort toward my classroom duties. Every teacher was guarded in the classroom and in discussions and conferences with parents. Eventually, coming to school and to class was a dreaded event. When I received letters of reprimand during class, my students witnessed my reaction. I was not able to teach effectively at all. At first, I tried to ignore the negative environment, but eventually I became withdrawn. I taught straight from the book. I put in as little time as possible. I didn’t get very close to the students. My motivation for teaching became zero. I was constantly on edge. My nerves were shot and I would sometimes treat students in a negative manner because of the principal’s abuse.

In my teaching, I was hesitant to try anything new. I didn’t do anything different that would draw attention to me, especially anything that might not work the first time. ... I have passed kids who failed just to avoid conflict with the principal. ... In a strange way, I almost started treating children like he was treating me. I never berated them, but, when I would give directions, if a kid would ask about it, I would say, “You know what I just said!” I had no patience. I felt like I had to
control the environment because, if I didn’t, he would get me. I had kids with bracelets on their ankles, kids out of mental institutions and jails. They needed special service referrals. But I knew I couldn’t do anything to set the students up for a referral, because the principal looked at that very negatively. Everything had to look good.

Impaired Decision Making  Typically, teachers used words such as autocrat, tyrant, dictator, authoritarian, despot, and control freak to describe the leadership approach of abusive principals. Our data suggest that with regard to school governance and decision making, principals were overtly authoritarian or covertly authoritarian; in both cases, abusive principals were extremely coercive and control oriented, decisions were made unilaterally and, often, arbitrarily. Furthermore, in both cases, communication was one-way and intimidation was used to secure teachers’ compliance to decisions and decision-making processes. However, principals who used an overt approach to schoolwide governance frequently employed a direct, “in-your-face,” “make-my-day” approach to leadership. Teachers’ comments illustrate how overtly authoritarian-abusive principals approached faculty meetings and schoolwide decision making.

You don’t ask the principal anything, because he is just going to yell. If he knows the answer, he is not going to tell you. Faculty meetings were crazy; they didn’t accomplish anything. He would read a typed written agenda to us; it was just a joke. If you said something and he didn’t agree with it, then he would respond, “Did you understand what I said? Well, we are going to do it this way, because I am the principal.” We just sat there and wrote notes like, “Can you believe we are sitting here?”

Teachers also described overtly authoritarian principals’ approach to faculty committees.

Committee members were appointed by her based on whom she liked and whom she didn’t like: favoritism. She ran some of the committees. She just told you what to do; she didn’t participate. We knew that you couldn’t do anything to the contrary of what she would want, so the meetings went something like, “What do you think she wants us to do? Okay, let’s do that.” She had her spies. There was no way to discuss anything. There was no professional discussion. Everything was an order, and you just followed it and hoped to dodge criticism.

Indeed, all abusive principals used thinly veiled manipulative techniques to control teachers, such as negative comments (“We have done that before, it won’t work”) and pejorative labeling, vetoing faculty decisions, inviting dissenting faculty to “private” meetings, limiting time, and limiting agendas to particu-
lar topics to control faculty. However, covertly authoritarian-abusive principals attempted to maintain a veneer of shared decision making:

She said, “I will tell you how much shared governance there will be, what you can do, and the topics you can consider.” She is an absolute dictator. She has displayed, many times, that she didn’t care for people to express their feelings. Anybody who dared to speak up was not chosen to be on the committee to talk to the accreditation team. She put the wealthy Whites on committees, but she put Blacks, the “sucker uppers,” who do what she says, on committees as chairs. At one of those prep meetings, she said, “This is what you are going to say” and if we spoke up about anything negative, that was grounds for dismissal. We had shared leadership supposedly, but the principal was head of the leadership team. She made all the decisions.

Leaving one’s job

Most of the teachers we studied had been recognized as exemplary educators throughout their careers, and they reported that they “loved children.” For them, teaching remained a deep and enduring commitment, notwithstanding the chronic feelings of fear, anger, and depression that dominated their lives. Their decisions to leave the schoolchildren they loved and the schools in which their mistreatment occurred could be viewed as a form of final withdrawal from the profound pain and suffering that permeated their personal and professional lives. (“Every minute of every day I thought, ‘Please get me out of here.’”) (“I struggled with the idea of quitting. A lot of teachers just walked out and didn’t return.”) Other teachers were prepared to leave teaching altogether if they could not find employment in another school.

Before the end of the first year there, I thought that I made a horrible mistake. I knew that I couldn’t stay in that county. If I hadn’t been forced to stay, I would have quit—I would have gotten out of education. I just couldn’t do it another year.

Summary and discussion

Although this article has briefly described our findings related to what teachers perceive as abusive principal conduct, the deleterious effects of such conduct have been emphasized. A review of our findings points out that abusive principals, like abusive bosses in general, engage in similar behaviors. However, in contrast to the existing literature on boss abuse, we have conceptualized abusive conduct in terms of three levels of aggression. Such behaviors and related patterns of conduct are consistent with studies of abusive bosses conducted throughout the world in both profit and nonprofit organizations (Björkvist et al.,

Although we used no particular theoretical framework of workplace mistreatment/abuse to control data collection (Blumer, 1969; Glaser, 1978, 1992, 1998; Glaser & Strauss, 1967; Taylor & Bogdan, 1998), a comparison of our findings with Keashly’s (1998) definition of emotional abuse—constructed from a comprehensive review of the workplace abuse literature—indicates that teachers’ experiences of abuse and, in particular, the conditions under which teachers define a principal’s behavior as mistreatment or abuse, are consistent with what appears in the available literature. According to Keashly, individuals will tend to define a superior’s behavior as abusive if there is a pattern of verbal and nonverbal abuse, behaviors are unwanted, behaviors violate norms for appropriate conduct or an individual’s rights, behaviors are intended to harm as perceived by the target, behaviors result in harm, and there are power differences between the abuser and the target of abuse.

We also found that the effects of such mistreatment are extremely harmful to teachers’ professional and personal lives; like many thousands of workers represented in the extant literature—a number that has been extrapolated to be multimillions of workers—abused teachers experienced the same devastating effects. Beyond the teachers’ responses of shock and disorientation, humiliation, loneliness, and injured self-esteem, principal mistreatment seriously damaged in-school relationships, damaged classrooms, and frequently impaired all-school decision making. In addition, principals’ abuse of teachers resulted in severe psychological/emotional problems including chronic fear, anxiety, anger, and depression; a range of physical/physiological problems; and adverse personal/family outcomes (with respect to our findings, this last result is discussed in Blase & Blase, 2003) also discussed in the general empirical literature on boss abuse (Björkvist et al., 1994; Davenport et al., 1999; Harlos & Pinder, 2000; Hornstein, 1996; Keashly et al., 1994; Leymann, 1990; Lombardo & McCall, 1984; Namie, 2000; Namie & Namie, 2000; NNLJ, 1993; Pearson, 2000; Ryan & Oestreich, 1991).

In addition, we found that teachers victimized by abusive principals seldom had viable opportunities for redress. This is consistent with other research that had demonstrated that victims’ complaints about abusive bosses typically result in (a) no action (no response) from upper management, (b) efforts to protect abusive bosses, and (c) reprisals against victims who complain (Bassman, 1992; Davenport et al., 1999; Hornstein, 1996; Keashly, 1998; Keashly et al., 1994; Leymann, 1990; Namie, 2000; Namie & Namie, 2000; Pearson, 2000; Rayner, 1998). In fact, according to our findings, teachers rarely complained to district-level administrators because they expected “no help” and because they “feared” reprisals.

Furthermore, our findings point out that teachers were often unable to leave a
school in which they were abused, at least in a timely manner. Several factors of considerable importance frequently result in strong feelings of being “trapped,” for example, district policies prohibiting transfers; the high probability of negative letters of reference (and blackballing); weak unions; need for a job and health insurance; and the chronic effects of long-term abuse itself, that is, chronic fear, depression (self-doubt, feelings of helplessness), and fatigue, all factors that diminish one’s ability for proactive action, particularly in difficult circumstances (Izard & Youngstrom, 1996).

Finally, we reiterate that, consistent with Namie and Namie’s (1999) finding that workplace abusers often targeted “the bold, best and brightest,” the veteran teachers we studied were highly accomplished and dedicated individuals; these teachers had been recognized at the school, district, and frequently at the state level for their exceptional achievements. Such individuals, Namie and Namie speculated, might be threatening to administrators dominated by feelings of inferiority. Others have ascribed the problem, for example, to narcissism, an aggressive disposition, or a controlling disposition (Kets de Vries, 1989).

Theoretically speaking, our data indicate that principals employ a wide variety of indirect and direct verbal and nonverbal actions over the long term against targeted teachers that range from moderately to severely aggressive. For a given teacher, such actions constitute a unique pattern of mistreatment with regard to the types of actions (behaviors) employed and the frequency with which such actions (behaviors) are employed. In addition, teachers experienced all individual patterns of action (behavior) as seriously coercive, threatening, critical, deceptive, self-serving, and fundamentally unjust. Principal mistreatment is predictable inasmuch as teachers, once mistreated, believe that additional mistreatment is likely to occur, such actions are unpredictable in the sense that they could occur “anywhere, anytime . . . for any reason.”

Long-term patterns of principal mistreatment tend to dramatically, adversely, and comprehensively affect the teachers’ professional life. Regarding the former, principal mistreatment tends to result in substantial damage to teachers psychologically/emotionally and physically/physiologically, to classroom instruction, to relationships with colleagues, and to schoolwide decision making. Teachers’ early responses to principal mistreatment (e.g., shock, disorientation, confusion, humiliation, self-doubt, and lowered self-esteem) seem to increase the teachers’ vulnerability to additional mistreatment by an abusive principal by reducing her or his ability to cope with such mistreatment. These responses, in conjunction with the cumulative effects of long-term stress, tend to result in chronic fear and depression. Such psychological/emotional states, together with adverse physical/physiological states, as well as adverse professional (e.g., poor classroom instruction) and social states (e.g., damaged relationships with colleagues), combine to create significant “life-altering” experiences for teachers.
Implications for administrator and teacher preparation and professional educators

Most prospective administrators have been teachers and, as such, undoubtedly have experienced, observed, or heard about abusive conduct with regard to colleagues. Clearly, many are aware of its effects on victimized teachers and on schools as a whole. Nevertheless, preservice (e.g., university-based programs in educational leadership and teacher preparation programs) and in-service programs (e.g., those provided per school district policy, by union contracts, and within staff development opportunities) seldom directly address the “dark side” of school leadership and, as such, fail to equip prospective and practicing administrators and teachers with an understanding of and ability to deal with this incredibly destructive problem (Hodgkinson, 1991).

Interestingly, a survey of more than 300 school administrators and teachers about the practical value of studying the mistreatment problem (J. Blase & J. Blase, 2003) demonstrates the critical importance of this topic to administrators’ and teachers’ development as school “leaders.” One participant wrote,

The most important thing for me as I develop as an educational leader is to guard against behaving in an abusive way. After seeing the video and participating in class discussion, I reflect back to 2 years ago when I feel I was a victim of mistreatment by a varsity coach under whom I worked. I remember how vulnerable I was and how naïve I was going into the newly-acquired, sought-after position. My boss consistently snubbed me, called me out in front of the other players, and made me feel inferior and foolish. I feel like I am a very strong person but the effects of his position and his mistreatment had me questioning myself on a daily basis. I felt I was “asking” for the treatment I received; I constantly asked myself what on earth I was doing to upset this man so much that he would treat me in this fashion.

Social learning theory (Bandura, 1977, 1982) and theories of self-regulations and internalization (Vygotsky, 1978) point out that people often derive their most profound learning from a reflective understanding of social and linguistic life experiences (Tharp & Gallimore, 1998). Studies have confirmed this conclusion with respect to school leadership in particular (Blase & Blase, 1998; Ginsberg & Davies, 2001). This, of course, further signals the importance of vigorously addressing the mistreatment problem at both the pre-service and in-service levels, although the latter may be the safer place to address this problem, at least for the foreseeable future. To this end, university-based programs and field-based professional development programs can examine the phenomenon of principal mistreatment of teachers and consider questions such as the following:
• What conduct by school principals do teachers and administrators perceive as abusive?
• What is it about a school’s context, the principal’s role (e.g., negative role modeling by superiors, conflicting role expectations, unreasonable district policies), and those who occupy this role that can result in abusive conduct?
• What effect does such conduct have on teachers (e.g., What are the emotional and physical consequences for teachers, and how does such conduct affect teachers’ classroom instruction and student learning?)?
• What are the consequences of abusive conduct by principals on school climate and school culture?
• What coping strategies are efficacious for mistreated teachers?
• What actions can mistreated teachers take to deal with the problem?
• What actions can school-based administrators, school district office personnel, and school boards take to help principals deal with this problem (e.g., providing opportunities for principals to consider ways they encourage or discourage a respectful and supportive climate in the school, ways to become more aware of the impact of their behavior on teachers, and ways to deal with teachers’ concerns about being mistreated)?
• What policies and procedures can school personnel develop to protect teachers and provide relief from mistreatment?
• At what point should district office personnel move beyond counseling, guiding, and providing performance reviews of principals who mistreat others and move to disciplinary action or discharge?

All concerned with public education should work to create awareness of factors potentially related to the problem of abuse. For example, areas for study and action include gender issues, power issues, work stress, crisis management, conflict resolution, labor laws, development of positive psychological and social work environments, development of mission/vision/values statements including how employees should be treated, development of norms conducive to respect and caring in the workplace, friendly and respectful collegial interaction, and effective administrator and teacher orientation programs that include standards of professional ethics and codes of conduct.

Implications for further research

This study of principal mistreatment is the first study of its kind, and as such has generated new descriptive, conceptual, and theoretical knowledge in the general area of workplace mistreatment. It also contributes to the well-established micropolitical and leadership literature, for example, by describing in detail and for the first time the behaviors associated with abusive-authoritarian forms of school leadership as well as the serious adverse effects of such leadership on teachers and their work with students. As well, our study contributes directly to the teacher stress literature by providing detailed descriptions of the effects of mistreatment on teachers.
This article is the first empirical report of the experiences of abused teachers, that is, what, in teachers’ perspectives, constitutes principal mistreatment and its common effects on teachers’ work. Yet although we have begun to illuminate this problem, it nevertheless requires much more investigation. For example, principals’ mistreatment of teachers is contingent on a multitude of internal (i.e., personality) and external (i.e., organizational) factors (Hornstein, 1996). We would argue that as the call for educational reform and accountability become even more deliberate, the job of principal will become more complex, challenging, political, and stressful; this, in turn, may provide an even more fertile ground for the emergence of abusive conduct on the part of principals. (In fact, we have already heard numerous stories of principal mistreatment of teachers linked to new accountability measures.) Useful research could focus on the relationships between abusive principals’ personalities, preparation, and school contexts. Studies focusing on race, gender, and ethnicity of school principals and victimized teachers would be valuable. Studies of school district office personnel’s and boards of education’s perspectives and actions vis-à-vis the mistreatment problem would also be valuable.

In addition, quantitative studies using random samples of teachers are critical to understanding the pervasiveness of the principal mistreatment problem in our nation’s schools and elsewhere. Qualitative studies can provide descriptions beyond those provided here (i.e., beyond forms of abuse, effects, and how abuse is perceived by victims) to include the extent to which abusive principals recognize the effects of abuse, abusive principals’ intentions, how and under what contextual conditions abusive relationships evolve, victims’ interpretations of abusive principals’ behaviors, the degree to which victims may contribute to the abuse, when and how victims are willing to challenge abuse (i.e., Why does a teacher, who works in a professional culture wherein workers assiduously avoid conflict, ultimately decide to confront abusive treatment?), the effectiveness of district policies designed to stop abuse, and the exorbitant costs of abuse (e.g., related to investigations of complaints, teachers’ time, legal fees, union representation, health insurance claims, hiring, training, and teachers’ performance and productivity [Field, 1996]).

Knowledge of the principal mistreatment problem has special significance for school reform and restructuring efforts. Recent studies have found that principals’ use of manipulative and coercive types of power in school-restructuring initiatives (designed along collegial/democratic lines) has drastically undermined such efforts (e.g., Blase & Blase, 2001; Malen & Ogawa, 1988; Murphy & Louis, 1994a, 1994b; Reitzug & Cross, 1994). More research is necessary to fully understand how and under what circumstances school principals both consciously and unwittingly subvert school reform outcomes. Also, as noted above, our study is timely and useful in the field of education given recent research interest in schools as “caring” and “just” communities (Beck, 1994; Bolman & Deal, 1995; Glickman et al., 2001; Katz, Noddings, & Strike, 1999; Noddings, 1992) and the recent emergence of themes such as “organizational justice” in the
general organizational literature (Bies, 1987; Cropanzano, 1993; Enomoto, 1997). Educational researchers should consider studies of schools grounded in such perspectives.

Finally, it should be mentioned that school districts will undoubtedly be reluctant to grant researchers access to conduct studies of the mistreatment problem; it is not surprising that a majority of studies of general administrator abuse have been conducted outside the workplace (Hoel et al., 1999). This may mean that for the foreseeable future and until educators recognize this problem, future research will have to be conducted in limited ways and in places outside of schools.

Conclusion

As professors of educational leadership, we have spent decades researching and teaching about school leadership. We are aware that school principals are confronted with what seem to be insurmountable challenges and pressures: Their work is characterized by long hours and inadequate compensation (Olson, 1999) and they now face an explosion of demands and pressures related to school safety and violence, drugs, diversity, inclusion, site budgeting, aging teaching staffs, and unresponsive bureaucracies (Rusch, 1999) as well as new responsibilities linked to school reform including new power arrangements, collaborative planning, evaluation, and accountability (Murphy & Louis, 1994a). We are also aware that principals are confronted with unique challenges associated with the retention of quality teachers, inadequate facilities and instructional materials, and discouraged and disillusioned faculties (Steinberg, 1999). Moreover, we recognize that such challenges can result in dramatic emotional experiences for principals (Ginsberg & Davies, 2001); feelings of anxiety, loss of control, disempowerment, insecurity, anger, and frustration are not uncommon (Beatty, 2000; Evans, 1996). Indeed, we cannot adequately express our appreciation and respect for the women and men who meet such challenges with professional integrity, courage, and ingenuity.

Nevertheless, we are convinced that all of us, professors and professional educators, have failed to address the destructive problem of principal mistreatment of teachers. We believe that university and public school settings are frequently dominated by cultures in which conflict is strenuously avoided—a predictable phenomenon in that “conditions of conflict and ambiguity . . . are not merely irritating; in persistent and extreme form they are identity destroying” (Kahn, 1964, p. 6). Furthermore, avoiding a problem is a common way to ignore the difficulty inherent in working toward a genuine solution (Argyris, 1990; Owens, 2001); although such an approach consumes no time and energy, it fails to solve the problem that led to the conflict. Unfortunately, even small, avoided conflicts, derived, for example, from insensitivity in interpersonal relationships or from mere misunderstandings, often escalate into huge, debilitating crises. Indeed, lingering, hidden, unresolved problems constitute “conflict traps” that
may ultimately elicit strong, explosive, negative reactions (Boulding, 1964). The study discussed in this article provides the first step necessary for addressing and overcoming the mistreatment problem in constructive ways.

Now, more than ever before, school reform efforts require that principals and teachers at the school level work together collaboratively to solve educational problems. Such collaboration is successful when school principals build trust in their schools; trust, in turn, serves as a foundation for open, honest, and reflective professional dialogue; problem solving; innovative initiatives; and more directly, the development of the school as a powerful community of learners willing to take responsibility for and capable of success. All principals need to work toward these ends, and all individuals and organizations associated with public education should willingly confront the kinds of administrative mistreatment that, most assuredly, undermine such possibilities.

EMOTIONS AND GENDER

THE WORK OF EDUCATIONAL LEADERS IN BUILDING CREATIVE AND PASSIONATE SCHOOLS AND COLLEGES

Chris James

Introduction

It is a truism that all institutions – those organisations that have a specific purpose for the society in which they exist – are under the influence of emotions. Schools and colleges, as significant institutions in our society, are no exception. Although, educational institutions may appear to be rational places that function logically to achieve reasonable goals, which are intended to improve individual and societal well being and advancement, the reality is very different. Schools and colleges are heavily influenced by non-rational forces especially emotions, which can both enrich and disrupt their work. The emotional nature of the work can be overwhelming, taking those who work in schools and colleges from feelings of intense pleasure and satisfaction to the depths of despair, from feeling that teaching is the best job in the world to the worst, from facing the day in excited anticipation to one of fear and dread.

Although we may wish to remove emotion, dismiss it or even rationalise it – to de-emotionalise our work, it is ever present in educational leadership and management and always accompanies apparently rational processes. The very interesting point to be made in saying that is not what is being asserted but that it needs to be asserted at all. Such is the problematic nature of emotions – gate-crashers at the party, pesky interlopers, unexpected visitors who outstay their welcome, however you want to image them – that we seek to ignore them, wish them away or dismiss them as a display of weakness, frivolity or naivety. Unfortunately, emotions cannot be dismissed or set aside but need to be worked with using very different approaches.

So, the key question is: ‘How can leaders work with the emotional experience of their institutions to create them as places where creativity and innovation are
welcomed and where there is a passion for the work of educating young people? I hope in this paper to make a contribution to answering that question.

In this presentation, I will first explore some basic premises, so you are aware of the perspective I am taking. I will then briefly explore the nature of educational institutions as locales of high levels of emotion and anxiety and will describe some of the defences that are frequently put in place to defend against the emotional experience of leading, managing, teaching and learning in educational institutions. I will then will consider how emotions can be worked with to release the creativity and passion required to build transforming institutions that can generate, embrace and sustain new ways of working.

The basic premises

In this section, I outline some of the basic premises, that is, the ideas, concepts and aspects of theory, which underpin my thinking about the emotions, educational institutions and educational leadership and management.

**Emotions may be experienced both consciously and unconsciously and may be the consequence of phenomena important to us in our external and internal world – they are systemic processes.** Many of these phenomena, such as sexuality, rivalry and fear are deep and archaic and have an almost instinctual presence within us and in the worlds in which we live. They are therefore very powerful. Other forces, perhaps the consequence of other influences and experiences, started when we were born and perhaps began before then.

In educational institutions, emotions and the feelings they engender flow back and forth – sometimes dangerously. Emotions move between and within individuals, groups and institutions – throughout the whole system. Emotion is how power is experienced and interpreted within the system. Hence the very close link between emotion and politics. Emotion is inextricably linked to the micro-politics and macro-politics of the system. Over time, the continual flow of power and the experience of emotion create ways of working. In this way emotions have a significant impact on the culture of the institution – ‘The way we do things around here’ – and the culture of the individual – ‘The way I do things round here’. This emotional experience can create in the mind an institution that is stable, permanent and enduring. The dynamics of these emotions and the defences that are put in place to protect against them can compel the institution to work in certain ways. They can entrap those who work there and block the creativity and neutralise the passion required to undertake good educational work. The emotional experience, which is essentially abstract and untouchable, becomes reified and made real. Such institutions can be very resistant to change.

**The unconscious is a significant influence on our conscious behaviour and can help to explain why actions that have surface rationality and validity may at the same time have an unconscious and hidden meaning.** The unconscious contains our secret hopes, fears, desires, anxieties, urges and terrors and by definition we are not aware of them. We can never gain direct access to
the unconscious. So, whilst it is very helpful to have the emotional terrain or the geography of teaching and educational leadership mapped out in the way that Andy Hargreaves and others have, it is only a partial picture. To continue the earth science metaphor, the geology is at least as important if not more so. The emotional geology – the unconscious – has a very significant influence on what we do in institutions – especially educational ones. It shapes the surface layout, has enormous and uncontrollable power, and is unpredictable. We have some sense of its fault lines, but the reality is, the underlying structure is known only through occasional eruptions when it breaks through to the surface, and by occasional tremors and eruptions when it lets us know it is there.

Rational understandings, procedures and techniques may be helpful but emotions are not handleable in that way. So, while it may be helpful to attempt to ‘know emotions’, to understand them and to manage your own emotional state, it is not sufficient. Being ‘emotionally intelligent’ is not enough. The value base of emotional intelligence, what’s acceptable emotionally, and the purposes of those who advocate emotional intelligence are all open to question. Moreover, it is in experiencing emotions that the unconscious can come into play in unpredictable ways that can derail any emotionally intelligent behaviour. Likewise, to be emotionally literate, to be able to describe how one is feeling and to have a vocabulary through which to articulate one’s emotional experience is important. But we also need to make sense of the turmoil when we are inside it, which is of course, the worst place to be for emotional sense making. We may be unable to clear our heads of the emotional disturbance because emotions do stop us from thinking straight. And of course, it is one thing to be able to describe the profound comfort or discomfort that emotions can bring but quite another then to understand how to move forward from that place. Finally, it is also very helpful to have some skills and techniques for dealing with our emotional experience although on their own those capabilities are not sufficient. How we communicate, interact and relate to others of course has an emotional component. So, if we can improve those processes so that negative and perhaps unhelpful emotions are not generated, our emotional world is likely to be more comfortable. The problem is that those techniques can in themselves become tools for manipulation, defences against unwanted emotion and the tricks can be easily seen through and worked against.

The concept of the boundaries is helpful in understanding social systems. The boundary essentially separates that ‘which is part of a phenomenon’ from that ‘which is not’. This rather open definition is in a way helpful because it opens up the possibility for exploration rather than limiting those possibilities. The management of boundaries is a key aspect of institutional leadership. The notion of the boundary is usually used in connection with open systems theory and here are some specific points about the system boundary and leadership.

- The boundary separates the core of the system from the environment.
- Management of the boundary ensures that the core has the resources it requires to do its work, that resources in the core are not lost.
Management of the boundary ensures that the outputs of the system are appropriate for the environment.

Those responsible for boundary management have a sense-making role, interpretive, meaning-making role.

Occupying a position on the system boundary is not only the task of the boundary manager, but occupying that role enhances their authority.

Leaders need to occupy a position on the boundary of the system boundary.

Those in the core will attempt to pull the system leader off the boundary. It is a form of attack on the leader’s authority.

There is a good case for arguing that anxiety is the dominant emotional force in many educational institutions. Anxiety, which has very primitive roots, is present in its own right and can be closely connected with other emotions and instinctual drives. For example, a person may be anxious about experiencing unpleasant feelings such as sadness, sorrow and dismay. There may also be anxiety associated with pleasurable feelings. What price might one have to pay in the future for feeling good now? Anxiety can also drive the generation and expression of feelings. Having feelings of any kind relieves the anxiety that one’s existence is empty and apparently meaningless. Anxiety may be difficult but anxiety in the right amounts may be a key motivator and driver of creativity – more of that later. So, anxiety and emotion are inextricably inter-twined, with anxiety having a central and crucial place.

Schools are locales for high levels of anxiety and emotion. For number of reasons, schools are places of high levels of anxiety.

1 The special nature of the primary task of educational institutions. The primary task of schools, enabling pupils to learn, will carry anxiety, as do all primary tasks. However, it is a primary task centrally concerned with change. So, the primary task of educational institutions carries additional anxiety.

2 Learning is associated with risk and uncertainty. Almost every aspect of learning – the imperative to learn, the learning process and the outcomes of learning – are associated with risk and uncertainty and therefore anxiety.

3 The process of teaching. Teaching is likely to be associated with anxiety. It is a complex, inter-connected, and inter-personal activity, which has a history and the many different facets to it, which have to be coped with publicly and at the same time. All these characteristics are potential instigators of anxiety. Also, teachers may be the recipients of the projection by society of the troublesome feelings associated with any national failure, deficiency or decline.

4 The nature of relationships in educational institutions. Relationships in schools, which are continually changing, can invoke strong feelings and desires that can potentially cause anxiety.

5 New models of professional practice. New understandings of professional
practice, such as reflective practice, place responsibility on teachers to improve their practice through reflection on their actions. These models can convey a message that teachers are to be condemned to a professional life of unending change driven by a fear that they will never be, and can never be, ‘good enough’.

6 Curriculum and management changes. The level and extent of imposed change in recent years have increased levels of anxiety for teachers and educational leaders and managers.

7 Changes in the external environment. Recent changes in technology and in society generally are changing the nature of education and increased accountability in education and eroded the *ex officio* professional authority of teachers.

8 The centrality of education. Educational institutions are about the management of processes that are central to society in general and to every person’s life. ‘Education’ therefore carries a high emotional content and the education system is likely to be the recipient of projected anxiety from the rest of society.

9 The continual re-creation of ‘the school’. Although schools may seem to be machine-like in the way they run – with the term dates set, the school diary organised for this week’s meetings, everyone’s timetable in place, the bell ringing absolutely on time, in fact they have to be created from scratch continually by those who work there. This continual process of re-creation is an additional source of anxiety.

We try to protect ourselves against the pain associated with unpleasant and difficult emotions and seek out pleasurable emotions. These protective patterns of behaviour are called social defences. They may have been learned over a long period and their origins perhaps date back to the earliest stages of an individual’s or institution’s life. Social defences are important because of the way they protect against the pain linked with strong feelings.

The different types of social defence are listed below.

*Resistance*. This social defence is the maintenance of the *status quo* by opposing change. In this way, the anxiety associated with the change is reduced. Importantly, resistance, especially when it is given a gloss of rationality, also reduces the anxiety associated with revealing that a response to the proposed change is essentially emotional and not rational.

*Repression*. When recollections, urges and feelings are too anxiety provoking they are assigned to the unconscious by a process known as repression. For example, the professionally and personally unacceptable feelings of sexual attraction that teachers may have their students may be repressed in order to give protection from the anxiety that such feelings provoke.

*Regression*. When events at work carry a great deal of emotion and/or anxiety, individuals may resort to behaviours that have been learned earlier in their lives in order to limit the pain associated with those feelings. These behav-
iours will include those learned in the earliest stages of a person’s life and therefore may be very child-like.

**Covert coalitions.** As a way of coping with the emotions of working, members of an institution may make recourse to familiar relationships that have protected them from anxiety and emotional pain in the past. This defence can be viewed as a particular form of regression. To gain relief, individuals regress to the kinds of relationships in which they and the colluding other or others are well versed.

**Identification.** Individuals may seek to limit the anxiety associated with enacting their own behaviours by identifying with others. In a school, heads of department may seek to identify with the headteacher in order to gain protection from the anxiety associated with their managerial work. For this reason and others all leaders have to ‘re-create the new’, that is to change and adapt themselves regularly and frequently. In this way, the followers do not become limited and restricted in the expression of their full potential by what is, in effect, the object of their envy.

**Reaction formation.** Occasionally, individuals will gain protection from the complexity of organisational life by the process of reaction formation. Working life is full of contradictions and unresolvable paradoxes. These can cause an inner tension and anxiety. Protection from this anxiety is gained by over-emphasising one of the pair of contradictory characteristics rather than holding them all in balance. So, a headteacher may find it hard to hold in mind that all his staff have both valuable and not so valuable qualities but seek to idealise the behaviour of some at the expense of others. These others are consigned to the not-favoured category.

**Denial.** The process of rejecting and putting aside any unacceptable aspect of the external reality is termed ‘denial’. These aspects may be thoughts, feelings and emotions which are too difficult to cope with largely because they are too anxiety provoking. They are pushed out of conscious awareness and into the unconscious. For example, a teacher in a primary school may deny that a forthcoming inspection is likely to be a cause of anxiety and real concern. Denial may on occasion be confirmed through negation. In negation, an individual may persistently and repeatedly reject a particular idea when that idea does not need to be disavowed so overtly. The teacher anxious about inspection may consistently assert that there’s really nothing to worry about and that the impact of inspection is always over-estimated.

**Organisational rituals.** The term ‘ritual’ is used to describe an established procedure or aspect of practice that has no apparent connection to a rational understanding of experience. These reified practices are probably the most durable and externalised form of defence against work-related anxiety. For individuals in a work institution, including teachers, these rituals can give structure, security and a sense of order to a potentially unstructured, insecure and chaotic working life.

**Splitting and projection.** A very common protection against anxiety and
emotion is a process whereby difficult feelings that give rise to internal conflicts are split into their differentiated elements. The process of splitting is often accompanied by projection where difficult elements are located in other individuals and objects rather than in the individual themselves. This condition of splitting and projection is known as the paranoid-schizoid position. The alternative to the paranoid-schizoid stance is the integrated position. With this approach, which is called the depressive position, the individual gives up the security and simplicity achieved through splitting and projection and faces the confusion, paradox, inconsistency, incongruity and conflict created by the mismatch between internal and external realities. Splitting and projection is a very common social defence in institutions.

The transformation of anxiety and emotion into creativity

Whilst some social defences are useful they can have a very negative effect organising in institutions and institutional change.

Their purpose and value to the individual – and the institution – is to protect from reality by blocking contact with it. They can prevent the members of the institution from realising that change is required. They can hinder meaningful engagement with the work of the institution. They can prevent the consequences of actions being known, understood and reflected upon. Very importantly they impede learning.

Because of their important purpose and the fact that they do their job very effectively, they are often repeated in response to new anxiety-laden situations. They become part of the scripts on which individuals and institutions base their lives. Moreover, and very significantly, social defences can be very resistant to change. There is a case for arguing that the more anxiety-laden an institution, the more it is likely to resort to defensive behaviours.

The excessive presence of social defences and the creation of a ‘defensive’ institution can make change very difficult in educational institutions and brings into play the ‘double whammy of educational change’. A change to a social defence of any kind, is like any change, a source of anxiety. But it will be a change to a process the purpose of which is to protect against anxiety. So the change is likely to increase anxiety levels. We therefore get double the dose of anxiety when changing social defences.

So, leaders in educational institutions need to minimise social defences in their institutions and manage the high levels of anxiety that result from educational change. Educational leaders have three important and linked tasks in this work: Boundary management, containment and acting as a transitional object.

Boundary management

The emotion-laden nature of educational institutions can disrupt the boundary management of those who work in them causing them for example, to take on
too much (boundary too permeable) or to becoming very defended and cautious (boundary impermeable). Leaders of schools and colleges need to work on boundary management in three important ways.

1. Managing the boundary between the internal experience and the external reality of those who work in the organisation and ensuring that defensive behaviour is not preventing meaningful contact with the external world.

2. Managing the boundaries between roles. The basis of this is clear definition of job responsibilities, encouraging others (individuals and groups) to find appropriate roles, to make appropriate roles and to take appropriate roles.

3. Managing their own boundaries so they are not prey to the emotions that are inevitably projected towards them in their leadership role.

**Containment**

Containment is a term first coined by Wilfrid Bion in the context of psychoanalysis. It is primarily concerned with providing the conditions that facilitate effective and authentic receptiveness and reflection. The secure framework provides a holding environment in which the emotions and anxieties of experience can be surfaced and worked with. It contrasts with a controlling environment where emotions and anxieties are restrained, held back and not allowed to become apparent. In a controlling environment, emotions and anxieties have to be dealt with in other ways and because they may be painful may need to be defended against. Controlling environments may therefore call up social defences.

Here we can see again the important part that leadership capability throughout the institution (or shared or distributed leadership) can play especially when it complements leadership capability at the head of the institution. Leadership that emerges and is part of the processes of organising – organisational leadership – within the institution helps in the process of containment. The container is strengthened by the cross-links that leadership throughout the institution can provide and of course the more widely it is spread the more secure that containment function becomes.

**Acting as a transitional object**

Elsewhere, I have argued that educational leaders have a role in being the temporary (ideally) recipient of difficult feelings that others in the institution cannot manage themselves (James and Connolly 2000). These feelings need to be acted out somewhere.

For example, where better (sic) than in the headteacher’s office or in the department office ‘sounding off’ to the head of department. In this role as a holder of difficult feelings, which many leaders will recognise, the leader’s role
may simply be to hear the feelings of others, rather than respond to them, and importantly, to ‘take them on’ rather than ‘take them in’. The danger with taking them in (introjecting them) is that they can then become a burden and source of stress to the recipient. Furthermore, it is usually unwise to act on the basis of projected emotion. The action may be out of proportion, imagined or itself be the response of the projections of others.

But I want to extend that role, the holder of difficult feelings, to one of acting as a form of transitional object. Winnicott first used the idea of the transitional object to explain the part that articles such as teddy bears and comfort blankets can play in an infant’s development. The transitional object, as the first ‘not me’ object (Davis and Wallbridge 1981), can create and occupy a mental space that is neither subjective nor objective. This space is a transitional zone that is retained throughout life in the intense experiencing that belongs to art, imagination and creativity (Winnicott, 1951 p 242).

So, leaders have a role with others in containing anxiety and emotion and developing and sustaining the transitional zone, thereby transforming anxiety and emotion into creativity. This work involves:

- managing boundaries particularly between subjective and objective worlds to ensure that there is a continual interplay and free movement between the subjective and the objective worlds because that is the zone of creativity;
- ensuring that boundary between the subjective and the objective is not blocked by social defences;
- providing a containing environment that allows emotions and anxieties to be experienced and held and not projected out into the external world or retained in an internal world but are held and worked with.

How might leaders make this happen in practice? Here are some examples.

- Providing a secure framework within which the work of the institution can take place
- Continual explanation of what might really be going on – especially in times of change – in terms of internal and external realities.
- Modelling – ‘walking the talk’, not falling prey to their own emotional mismanagement.
- Learning to identify defensive behaviours – their own and others’.
- Spotting and rectifying anti-task behaviour.
- Talking to people about their experience rather than their defences.
- Encouraging colleagues to talk about how they feel.
- Facing up to and resolving conflict.
- Checking out that their feelings are theirs and not the introjected feelings of others.
Releasing passion in educational institutions

We are all driven by psychic forces – for which Freud coined the term ‘libido’. These forces may be predominantly sexual, Freud’s termed the life instinct ‘Eros’, or may be a desire for death withdrawal and return if you take Freud’s death instinct, ‘Thanatos’. Although Freud used the term instinct to describe these forces, ‘drives’ may be a better term. The ‘drive’ concept has been broadened by other theorists. Drives may be the forces within us that give us ambition, a desire to make some kind of difference, or to lead a good life, however we configure that. At a fundamental level, they are about sex, aggression, and rivalry. At a more learned and acquired level, they might be about narcissism, a desire to control, to please people and to be well thought of, to achieve, to be perfect, to repair inner damage, or a desire for security and safety.

Some of these forces are very strong – so strong that we may wish to conceal them or to hope they are not there. They can become pathological and then very dangerous. They can combine to become fetishes and significant disturbances. There is a good case for arguing that they are seen simply associated with the typically male oriented agentic behaviour, but that is a narrow view of what they are. Whatever, in a ‘civilised society’ some of these forces can be seen as difficult. But they are very important and of course, they are the wellspring of passion and I would argue that it is important to be passionate.

Some important issues

Drives are of course very important; they are what push us to do what we do. It is important that they are recognised and worked with. Leaders of institutions need to be aware of them, to work with them and enable the institution and its members to become passionate about their work.

A degree of narcissism can be helpful. There’s nothing wrong with having a sense of justifiable pride. But in extreme, such people become virtually unmanageable, all problems are of others causing and they attract passivity and subservience in others who are prepared to collude with their delusion.

Passions and drives are crucial but they can very easily become distorted, mis-directed or come to dominate action over reflection and other more thoughtful processes.

Importantly passionate energy can be mis-directed into defensive behaviour so that people work harder dissociating themselves from the outside world than engaging with it with their full energy.

The sexual energy of working with colleagues to whom we are attracted is important in schools and colleges but it is often underplayed. It disappears as part of the de-emotionalisation of work in schools.

The aggression needed to undertake difficult work can spill over into a sense of anger and negativity towards others.

Rivalry can become a competitive urge that can distort the rationale for
achieving the primary task. Do the teachers in a school work hard to be seen to be the best in the eyes of the headteacher, a kind of re-worked sibling rivalry, or are they motivated by wanting to do good educational work with their pupils? Is a headteacher driven by wanting to be the head of the best school or by being the head of a school doing the best that it can in the way that it wants? The key question is ‘What you are really competing for and what you want to be doing?’

The desire to control – monitoring, checking, ensuring things happen are important management activities, but if that is all you do then the organisation feels restrained, repressed and held in check. And of course an excessive desire to control can make delegation more difficult which may have many unwanted consequences.

A desire to please and to be well thought of is of course very useful. Such colleagues can be great to work with. But all too often it can lead to role overload, a lack of focus and can be a cause of stress and burn out.

A desire to achieve again can be very valuable quality but if achieving is all that counts it can drive out collaborative and enabling ways of working, which are essential in good leadership, can lead to an obsession with doing at the expense of being and reflecting (and therefore learning) and can narrow the focus at the expense of seeing the bigger picture.

Being a perfectionist can also be very helpful. It is good to have things done well but if it becomes obsessive then nothing is ever good enough, jobs don’t get completed and job may not be started because to do it perfectly becomes a monumental task.

To repair inner damage or to undertake what Melanie Klein called reparation can be a very important drive. It may be what drives headteachers to turn around failing schools. By doing so they create an object of beauty in the way that artists may seek to repair inner damage through their work. However, over-identification with the object that has been created can cause difficulties in succession and in enabling continual change.

A desire for security can be of value. To be standing on secure ground can be very helpful but if that desire becomes excessive so that much needed change is blocked, then that desire has become unhelpful.

**Some thoughts about working with passion**

Passion, just like anxiety and emotion needs to be continually worked with for example, as follows.

Don’t address the distortion; address what people want to do, to achieve, to become.

Reflect together – schools need to be communities of leaders. If leaders are going to lead together, they must learn together. Organisational leadership needs organisational learning.

The pathway of development in this way is not a straightforward one. The process ‘zigzags’ – sometimes forward to a new place, sometimes backwards in
regression, sometimes sideward to a different perspective. That is the nature of development of this kind. Give space for the energy to emerge and time for reflection and renewal.

The resolution of the distortions of energy can result in a sense of authenticity and the notion of ‘flow’ that is “being totally, and positively, absorbed in what one is doing: a deep sense of rightness, goodness, engagement or being” (Fineman, 2003 pp23).

So, what happens when creativity and passion are released? That is when schools can move to a new place in their development, that of transformation. Importantly, by integrating passion and creativity, they can move beyond recognising the importance of sustainability in educational change and work to achieve generativity (Gutmann 2003).

The notion of generativity

The concept of generativity was first explored by the psychologist Erikson, who has made a significant contributor to our understanding of ego development and identity. Essentially, Freudian in perspective though critical of Freud’s work in many ways, he sees development, for which he borrows a term from embryology – epigenesis – as an organised or stage-wise process of acquiring essential “qualities of strength” or “virtues” (Erikson, 1964 p113). Each stage of the development process has a “time of ascendance and crisis, yet each persists throughout life”. Each part exists before “its decisive and critical time normally arrives . . . and remains systematically related to all others . . . so that the whole ensemble depends on the proper development in the proper sequence of each item” (Erikson, 1982 p29). The virtues may be passed on from generation to generation and each preceding stage has both the seeds and the remnants of the other stages and each preceding stage sets the conditions for the subsequent ones.

Erikson describes eight stages from birth to death, which are characterised by a dialectic, the resolution of which creates a virtue. So, for example young adulthood is characterised by the Intimacy-Isolation dialectic, which, when resolved, yields the virtue of fidelity. Virtues to emerge include hope, will, purpose, competence, and fidelity in early adulthood, and love, care and wisdom in later adulthood.

In the period of adulthood that spans the late 20s to the late 50s, the crisis is represented by Generativity versus Stagnation. The resolution of this crisis yields ‘care’, which is a concern for obligations “generated by love, necessity or accident” (Thomas, 1996, p146). The goal of this stage is development of productivity set in the context of a wider contribution to society at a higher level than individual achievement, and key accomplishments include the passing on of knowledge and skills, training of the next generation and becoming a leader in their organisation. In these middle adult years, Erikson considered that a person might come to realise that “I am what survives me”. According to McAdam and de St Aubin (1998) who
have explored the notion of generativity, it is a new definition of success. Highly
generative adults see their lives as filled with redemptive sequences where negative
events give way to a positive ones, which redeem the initial negative experience.
Erikson argued that to be generative people must have a “basic belief in the
species”. They must have faith that despite suffering and setback and despite evil,
human beings are potentially good, and human life can be good for generations to
come. It is this belief that sustains most of our generative efforts. Holding out hope
for ultimate redemption gives us faith that our legacies will be good and that things
may work out in the long run.

Schools and generativity

Of course, in so many ways these schools have a generative purpose. They care
for the next generation and seek to pass on skills and knowledge to that genera-
tion. But how must schools be to be generative in their work. Generative schools
and colleges and those who work in them and lead them:

- have within them the virtues of hope, will, purpose, competence, fidelity,
  love, and wisdom, very importantly, they are caring institutions
- are creative and value creativity in all aspects of their work
- are passionate about their work, their passion is grounded and their work
  has meaning and significance to them
- work to enhance their change capacity – their capacity for re-generation.
- are effective and efficient in all aspects of their work – they have determina-
tion (a ‘will’), direction and an idea of the ‘destination’ (that is, they have a
  sense of purpose)
- recognise, value and develop uniqueness and individuality (not do so would
  be not to care).
- are inclusive (again, not ‘to include’ is a manifestation of a separation – a
defence, and would deny the obligations “generated by love, necessity or
  accident” that are the essence of care).
- are transforming institutions where there is continual learning, creation,
  continuance and extension. They embrace their responsibility to develop
  those with less experience or expertise – not just the pupils.
- are conscious of succession and continually look to develop the capability
  that will sustain the institution in its transforming state.
- are generous with what they give to others.
- are led generative leaders who recognise that they are but ‘temporary custo-
dians’ of the institution, who must endeavour to ensure that they hand on
the school or college to others as an established, purposeful and dynamic
institutions capable of sustaining transformation.
Concluding comments

So, in conclusion, I have briefly explored the nature of educational institutions as locales of high levels of emotion and anxiety and described some of the defences that are frequently put in place to defend against the emotional experience of leading, managing, teaching and learning in educational institutions. I have also considered how emotions can be worked with to release the creativity and passion required to transform schools and colleges into generative institutions. Such institutions can generate, embrace and sustain new ways of working and are of course led by generative leaders. Perhaps the next step is to start exploring the characteristics of generative leaders.

EDUCATIONAL LEADERSHIP
A feminist critique and reconstruction

Jill Blackmore

We now have fewer women heads of educational institutions than we had in the first two decades of this century. . . . When women move into male areas, they remain clustered at the lower levels, marginally represented at the middle levels and absent from the top other than the occasional deviant, nonconformist, articulate, pioneer. On a national scale there are fewer than 3% women heads of mixed institutions in education.

(Byrne, quoted in Sampson, 1983, p. 52)

The structural barriers can be seen in the cultivation of young male teachers in appropriate administrative and organisational tasks, while in the first five years of teaching, many women teachers concentrate on child centred tasks. In this way, authority in schools becomes linked with masculinity and leadership in education takes on a masculine image.

(Sampson, 1983)

This chapter constitutes a marking out of territory which has significance for education and educational administration. Leadership is a concept central to theories of how organizations such as schools and educational bureaucracies work since, historically, schools have been organized in hierarchical ways. Authority is seen to be legitimately accorded to the principal, generally a male. Increasingly the ways in which schooling and school knowledge are defined and organized have been contested. The implications of the gendered and hierarchical division of labour within education for pedagogy and organizational life have been recently theorized about and questioned (Connell, 1987; Apple, 1985). Similarly organizational theory, the source of many central concepts of educational administration, has only begun to be criticized for its gender-blindness (Hearn and Parkin, 1983). Emphasis in this criticism has been on the masculinist
model which has been assumed to portray all experience. The assumption of the
universality of the male experience has been the consequence of a privileging of
positivist knowledge claims and research approaches. It is this positivist
research paradigm which has informed the liberal interventionist policies of
equal opportunity during the 1970s and early 1980s. Premised upon sex role
socialization theory, such policies sought to facilitate individual women taking
on ‘leadership roles’ in schools in order to create a more equitable gender
balance, and in so doing establish role models for girls and other women as
‘leaders’. But the reduction of women in such positions over this period suggests
that the issue is more complex than merely a matter of numbers.

This paper argues that whilst the conceptualization of leadership in education
is seen to be unproblematic, there is little hope for education becoming a site for
emancipatory change. A particular view of leadership premised upon liberal the-
ories of abstract individualism and bureaucratic rationality, and supported by
positivistic theories of knowledge which privilege universal laws of administra-
tion and human behaviour, has become dominant in educational administration.
The universal individual central to this perspective of leadership is modelled
upon men’s experience. Hierarchical relationships are considered to be the
‘givens’ of ‘rational’ organizational life. Leaders display attributes and behav-
iours, possess moral virtues and principles, which are generally associated with
‘masculinity’. It is a view which has effectively displaced women in educational
thought, and therefore rendered women invisible in administrative practice
(Martin, 1984). Currently it is epitomized in the view of school principals as
corporate managers.

It is necessary, therefore, to reconstruct a view of leadership which counters
the emphasis on individualism, hierarchical relationships, bureaucratic ration-
ality and abstract moral principles. I propose, therefore, elements of what would
constitute a feminist reconstruction of the concept of leadership. These would
include a view of power which is multi-dimensional and multi-directional.
Leadership is seen as being practised in different contexts by different people
and not merely equated to formal roles. Leadership looks to empower others
rather than have power over others. Such a view assumes a relational view of
morality in which moral practice is rational within given contexts and social and
political relations and not according to abstract moral laws or principles. Leader-
ship is concerned with communitarian and collective activities and values. Thus
the process of leading is both educative and conductive to democratic process,
and, one would hope, consistent with education.

Problems and explanations: the liberal interventionist
approach

During the last fifteen years federal and state governments have introduced affir-
mative action and recognized the principle of equal opportunity through both
legislative and policy initiatives. Despite this, the number of women in ‘leader-

278
ship positions’ in education in Australia, Great Britain and the USA has
decreased (Yeakey, Johnson and Adkinson, 1986). In the state of Victoria,
Australia, in the period 1971–1983 the percentage of female principals in the sec-
ondary system fell from 20 to 11 per cent, whilst the percentage of female
teachers increased from 45 to 52 per cent of all teachers. In the adjoining state of
New South Wales the percentage of female primary principals decreased from
28 to 19 per cent of all principals (Sampson, 1987). This phenomenon can be
partially explained as a consequence of the declining school population, the
reclassification of staff appointments, and major educational and administrative
restructuring in most state systems since the early 1980s. Opportunities for
advancement in the promotional stakes are often reduced in a contracting
system, particularly for latecomers, as many women are, to long-term careers.
But economic conditions and structural impediments alone are inadequate expla-
nations of another feature of what is a re-emerging pattern of masculine domi-
nance. This second feature is the tendency for many women who have the
qualifications, expertise and aptitude often not to apply for positions of leader-
sip in schools as principals. Furthermore, those women who do apply indicate a
‘preference’ for more democratic styles of school organization and administra-
tion (State Board, 1986). This ‘problem’ is the focus of this chapter.

There are a number of conventional explanations which have dominated the
social science research over the past two decades which suggest reasons for
this ‘failure’ of women to possess those aspirations, behaviours and attributes
for leadership so readily displayed by their male counterparts. Women, it
would be construed from such research, ‘fear’ success and lack ‘self-esteem’,
are passive and non-aggressive. These explanations, it will be shown later,
imply a female ‘deficiency’ in terms of ‘leadership’ skills, attributes and
vision. At this stage I wish to suggest that there will be little change in the
historical dominance of males in educational administration whilst policy-
makers and many liberal feminists merely look to increase the numbers of
women in educational administration, in what I call the ‘liberal interventionist’
approach. It is necessary to ‘go beyond the numbers game’, in which gender
equity is assumed to result purely from the better ‘representation’ of women in
positions of authority, and to question the very concept of leadership itself,
how it is portrayed in the literature, and how it is perceived by women and the
community in education. It is the continuing association of masculinity with a
particular view of leadership, especially in education where women constitute
over half the occupation, which is problematic. How the particular notion of
leadership dominant in educational administration has been socially and
historically constructed in a way that connects so-called ‘masculine’ character-
istics to leadership will be a theme of this paper. The deconstruction of
this ‘masculinist notion of leadership’ will largely be at a theoretical and
conceptual level, in laying out and displaying the assumptions underlying the
dominant notion of leadership, although the policy ramifications will not be
totally ignored.

279
Whilst I would argue that liberal feminism, in supporting this ‘interventionist approach’, has only achieved ‘success’ for the few, largely middle-class women by not challenging the norms, institutions and structures of masculine dominance in education, this is not to be dismissive of the achievements of liberal feminists during the past decades, or denigratory of liberal reforms as merely co-option of feminist discourse. It is necessary to record, analyze and account for the discrepancies, contradictions and failures of this period in order to create the basis for more radical change. Much of the valuable work on women in educational administration has mapped out the patterned discrimination against women, analyzed why and how it has been historically constructed and reproduced, indicating the structural, psychological and social factors influencing women’s opportunities (Adkinson, 1981). Strategies have been developed and undeniably affirmative action policy has gone some way in removing the structural impediments in particular to the progression of women into ‘leadership positions’ (equating them at this stage with formal bureaucratic roles), whilst enforcing at least superficial change to the sexist attitudes pervading state controlled educational institutions. But it is necessary to go a step beyond having women ‘represented’ in administrative positions, and undertake a more radical critique from a feminist perspective of the very nature of educational administration and leadership.

Feminism as critique

First, let me discuss my intentions in mounting a feminist critique. Although I talk of a feminist critique, it is necessary to remember that there is no single feminist theory, but rather a body of theories which take on different political hues ranging from liberal feminism to radical separatism. Furthermore, there is a high level of scepticism amongst some feminists about the need for theory at all because of the feminist emphasis on personal experience and understandable distrust of intellectualism. Some radical separatists urge that feminist theory must necessarily reject all that is masculine and set up a theoretical framework in opposition. I would reject both views in favour of the stance that all world views are theory-ridden. The issue is whether these theories are made explicit or not, and the level of theoretical generalization (Gatens, 1986, p.14). Nancy Hartsock expresses it well:

We must understand that theorising is not just done by academic intellectuals but that theory is always implicit in our activity and goes so deep as to include our understanding of reality . . . we can either accept the categories given us by capitalist society or we can begin to develop a critical understanding of our world. If we choose the first alternative, our theory may forever remain implicit. In contrast, the second is to commit ourselves to working out a critical and explicit theory.

(Hartsock, 1979, p.57)
It is necessary to critique the established social theories of politics, economics, philosophy and psychology in order to understand what, how and why the feminine perspective has been obliterated from social theory, and more specifically in this paper from what is construed to be ‘leadership’. Barbara Johnson describes what such a critique would involve:

It is an analysis that focuses on the grounds of that system’s possibility. The critique reads backwards from what seems natural, obvious, self-evident, or universal, in order to show that these things have their history, their reasons for being the way they are, their effects on what follows from them, and that the starting point is not a (natural) given but a (cultural) construct, usually blind to itself. . . . Every theory starts somewhere; every critique exposes what that starting point conceals and therefore displaces all the ideas that follow from it.

(Johnson, 1981, p.xii–xvi)

Such a critique raises epistemological, moral and political and not merely methodological questions. At the same time that social theory is reworked from a critical perspective, theory can act, in the Foucauldian sense, as a working tool, a strategy through which to critique instances and historical moments intent on reconstruction rather than construction of an alternative theoretical perspective (Morris and Paton, 1979, p.57). In constructing a ‘feminist critique’ of leadership in education I will be undertaking a critical analysis of and reflection on how women have been displaced from or submerged in both organizational and political theory, and how much of this invisibility of women has permeated the everyday commonsense notions of ‘leadership’.

Before commencing this critique, a further consideration must be acknowledged, although it will not be developed here. Problematic to both stating theory explicitly and critiquing social theory is the nature of language and text. Sarah Fildes asserts that the traditional invisibility of women in theory can be explained partially by the conceptual language and terminology which have implicit masculinist values and models which must be questioned (Fildes, 1983, p.62). The use of certain concepts often sets the agenda and boundaries of a discourse (whether in theory, practice or policy), which in turn determines the direction and force of the final analysis. An essential aspect of feminist theory and feminism, therefore, is to question all that is ‘given’, to question what is not included in the discourse as much as what is, and what has been reinterpreted in a manner which displaces women’s interests. Such a questioning can often commence from the dissonance between personal experience, commonsense knowledge and theory. This is the position implicit in the liberal interventionist model, which assumes that if more women can and do become ‘successful’ leaders, then societal behaviour and attitudes will change when personal experience ‘bumps up against’ myths about females in leadership roles. As to whether the success of women such as Thatcher in the particular mode of
leadership I will be critiquing — that which focuses upon hierarchy, authority, individualism and claims of rationality — is desirable for women is another matter. Similarly, in a period of rampant corporate managerialism in education, whilst the rhetoric centres on notions of efficiency, skill, hierarchy and control, leadership takes on particular forms and encourages particular approaches (Ministry of Education, 1986). In this sense discourse itself is a form of ‘power over others’, of masking conflict, of being deployed to reinforce consensus, of constraining action and prescribing behaviours. Power therefore infuses discourse. But discourse can be an instrument of either domination or emancipatory effort (Elshtain, 1982, pp.127–9). This particular point will be elaborated in the last section, in which new elements and parameters for an alternative feminist discourse on educational leadership are offered.

Therefore, essential to a critical feminist perspective of leadership is a critique of the central concepts in the bodies of theory which inform educational administration and which control the parameters of the discourse — concepts such as rationality, individuality, competence and merit. Such a critique undermines the gendered historical and social construction of the relationship between social structures which are construed to be ‘given’ and ‘neutral’, such as bureaucracies and organizations, and the individual. Secondly, it challenges the particular views about the nature of human activity and potentiality implicit in such theories. Finally, such a critique analyzes the particular epistemological underpinnings of theories of leadership. These aspects of social structure, human agency and epistemology are interrelated and mutually reinforcing, and will be dealt with accordingly.

The next section addresses the ways in which traditional views of leadership have dominated educational administration and how leadership has been socially and historically constructed in a manner which looks to characteristics of ‘successful’ masculine leaders as those constituting leadership. The following section attempts to develop a better understanding of how liberal political theory has encouraged this hegemonic masculinist view of leadership, which is premised upon particular interpretations of rationality, morality, organization and individualism, and is typical of Western societies. In turn, other social, economic and political arrangements such as the dominance of a positivistic epistemology in social science, together with the bureaucratization of social life have supported this particular leadership perspective. The ‘liberal interventionist’ approach underlying many equal opportunity policy initiatives is derived largely from within this tradition. Next the notions of individual competitiveness, bureaucratic rationality and abstract morality are discussed as central to the traditional, masculinist construct of leadership. Finally, an alternative feminist perspective of leadership will be presented; one that takes into account the historical and social construction of organizations and knowledge, and which presents a view of leadership which is essentially relational and communitarian.
Leadership in organizational theory: a masculinist construct

To return to the initial question, how has the underrepresentation of women in formal leadership positions been explained in the conventional literature on leadership? Women have been cast in organizational theory as being deficient in terms of leadership skills and attributes. Theories of leadership developing within a positivistic epistemology have relied upon empirical studies of those who are or have been in formal positions of leadership; that is, men. Historical accounts of ‘great men’ merely substantiate what is already seen to be self-evident. The behaviours, traits and characteristics displayed by men in formal positions of authority have become the ‘givens’ of leadership. Therefore, leadership in organizations has been historically associated with particular characteristics which are more frequently depicted as ‘masculine’ than ‘feminine’ — aggressiveness, forcefulness, competitiveness and independence. Positivistic social science in general, and organizational and administrative theory in particular, have construed that what is masculine experience is universal across time, context and gendered subject. Theoretical work on the social construction of sexuality, from both functionalist and feminist perspectives, has rarely been related to organizational processes or theory (Hearn and Parkin, 1983, p.231).

This ‘masculinist’ characterization of leadership is common across the main approaches to leadership in organizational theory, whether they be trait model, the charismatic/behavioural model or the situational/contingency models of leadership central to educational administration. (For examples of such theories in a standard text in educational administration see Hoy and Miskel, 1978. For a critique see Watkins, 1986, and Foster, this volume). Whilst trait theory considers leadership qualities or skills to be inherent attributes of the individual, the behaviourist model allows appropriate leadership behaviours or styles to be learned. More recent situational/contingency theories tend to perceive a ‘match’ between the individual attributes or leadership styles (innate and learned) and particular situations or contexts.

Although the ‘trait’ theory model of leadership has been denigrated in organizational literature for its failure to differentiate between effective and ineffective male leaders, it has been duly resuscitated as an explanation for why women are not found in leadership positions. Given that the ‘traits’ associated with leadership have been defined and prescribed in a gendered stereotypic manner, women are in a double bind. If a woman displays the culturally defined traits of ‘femininity’ (being emotional, passive, dependent, nurturing, intuitive or submissive), she is perceived to be a ‘poor’ leader. If she acts according to the male role definition of a leader (being aggressive, achievement-oriented, self-confident, forceful or competitive), she is condemned as being ‘unfeminine’ (Chapman and Luthans, 1975). More specifically, the literature on women in management focuses on three sets of personality traits: aggressiveness/dominance, emotional control/sound judgment; self-confidence and self-esteem. Women’s apparent
lack of such ‘traits’ as perceived in their behaviour is seen to make them unsuited for leadership (Bannon, 1978; Brown, 1979).

Let us consider these ‘myths’ in more detail. Firstly, there is little empirical evidence to support the connection between certain ‘traits’ and good leadership. The literature is unable to substantiate the connection, for example, between aggressiveness and various ‘management’ skills seen to be essential to leaders in organizations and schools, such as tackling challenges, setting achievable goals, planning, organizing, persuading, conciliating and conveying enthusiasm. The second myth that women are unsuitable leaders and decision-makers because they are too emotional and subjective is equally unfounded, both theoretically and empirically. Theoretically it assumes that decision-making is rational, logical and objective, when increasingly the irrational, subjective and illogical nature of decision-making is the basis of current revisionist theorizing within the traditional organizational research paradigm. It is increasingly accepted that decision-making is value ridden and theory laden, ideologically prescribed, generally based on inadequate and even incorrect information and consequently emotive. Therefore the dominance of a particular ‘scientistic’ view of what leaders do when they make decisions (as being rational and objective) and what ‘traits’ are required to lead (non-emotional) cannot be upheld. Ironically, more recent studies of leadership, in an attempt to produce a more balanced conceptualization of leadership, look to these very ‘feminine’ qualities of emotionality, sociality and caring values which traditionally imparted connotations of weakness (Sergiovanni and Carver, 1980, pp.306–26). Likewise school principals are required to become facilitators, not dominators (Chapman, 1985).

The third myth, that leadership is associated with a high level of self-confidence and self-esteem, is again highly suspect. The literature portrays women as lacking these ‘qualities’, whether learned or innate. For example, Antill and Cunningham’s Australian study, ‘Self-esteem as a Function of Masculinity in Both Sexes’, argues that men have higher self-esteem than women (Antill and Cunningham, 1979. For a critique of ‘self-esteem’ see Putnam and Heinen, 1976; Kenway and Willis, 1988). Since 1968 a dominant theory as to why women have not gained more representation in higher levels of decision-making is that of ‘fear of success’ (Horner, 1972; Condy and Dyer, 1976). This ‘fear’ explains why women are more ‘anxious’ than men in leadership positions and why they lack the desire to ‘take on’ leadership responsibilities. Women are seen to fear success because of the negative consequences which derive from succeeding in competitive situations — social rejection and perceived loss of femininity (Sassen, 1980). Or perhaps it was fear — more of being perceived as being deviant from role models by taking on masculine behaviours (Moore and Rickel, 1980; Greenfield et al., 1980). Ironically, studies which replicated the ‘fear of success’ model on male subjects found that men also admitted to the same fears (Carlson, 1972, p.21). More recently the ‘fear of success’ model has been reinterpreted to argue that women were not so afraid of ‘success’, just more prepared than the male subjects to admit to the negative or ‘other side of

EMOTIONS AND GENDER

284
competitive success’ generally ignored in the literature — the alienation, loneliness and conflict (Carlson, 1972). The effect of this research was inevitably to blame the victim. Notions of success and esteem are socially constructed and context bound. The underlying theoretical paradigm, the trait approach to leadership, therefore emphasizes innate rather than learned psychological differences between males and females, ignores the ways in which certain behaviours are developed through experience and positive reinforcement, and portrays leadership as a set of individual characteristics without regard for how behaviour is both learned and situation specific.

Whilst the trait approach assumes innate difference, the behaviourist perspective accepts the notion of learned behaviours which are gender stereotypic. The political effect is the same as that of trait theory in justifying observed behaviours as proof of difference. There are particular sets of learned behaviours which are perceived as being appropriate leadership behaviours or styles. The dominant theory to explain the lack of women in administration and leadership positions is socialization and sex role stereotypes (Adkinson, 1981). This argues that gender differentiation is constructed by the internalization of certain gender role behaviours imparted through such agencies as schools, family, work and the media (see Marshall, 1979, for an example of the argument on the need to ‘socialize’ female educational administrators). Thus boys learn to be rational, logical, objective and to suppress their feelings. They are encouraged to be aggressive and dominant in social situations. Girls learn to cultivate their emotions at the expense of their rationality, and are therefore more subjective. Their role is to be more dependent, nurturing and passive. This prepares each sex entrance into the public and private spheres of life, since these were the attributes required in each domain respectively. By imparting such significance to socialization, the behaviourist model assumes the passivity of the individual male and female who are ‘socialized’ into particular roles. At the same time this behaviourist model ‘allows’ women to acquire the necessary attributes. But in so doing it casts women into a deficit position in that it blames the victim when ‘socialization’ does not occur; it ignores resistance or the notion that an individual’s socialization is partial and selective. It implies the need and precondition for women to take on masculine attributes of leadership (rationality, aggression, the ability to control and dominate) in order to succeed; it accepts the hierarchical relationship in schools and state educational bureaucracies as necessary and given; and it defines success/relevant experience in male terms (occupation, hierarchy, expertise). Ultimately particular sets of observable behaviours are valued more than others.

Finally, the recent emphasis within the traditional organizational research paradigm has been on situational or contingency theories of leadership, best represented by the work of Vroom and Yetton, Blake and Mouton and Fiedler (see Fiedler, 1978; Hoy and Miskel, 1978, for a summary; for a critique see Watkins, 1986). These theories argue that there is a package of leadership skills and behaviours ranging from democratic to authoritarian which can be learned,
selected and used according to particular definable situational factors and contexts. Leaders must acquire the skill to recognize, diagnose and select the appropriate style of leadership to ‘fit’ the situation. No specific leadership style is given preference or more valued because of its intrinsic good. Each ‘style’ is selected as a means to achieve a particular organizational end most efficiently. By implication, although the gender issue is never confronted in these models, such theories assume that leadership styles and administrative contexts are gender neutral, and that such skills are context and content-free to be freely applied across a variety of ‘categorizable’ organizational situations. That is, any individual can assume an appropriate style provided she or he possesses this baggage of leadership skills and is able to diagnose the situation correctly. Such models ignore research from within the positivistic research paradigm on small groups and organizations (Jenkins and Kramer, 1978). Regardless of the ‘appropriateness’ of leadership style adopted by females, female leaders are judged differently by their colleagues and subordinates from men in like situations. Firstly, their competence is judged according to whether the task itself is perceived to be ‘masculine’ or ‘feminine’. Success by a female at a ‘masculine’ task (such as leadership) is more often attributed to luck than competence by observers, whereas success by a male at a masculine task is attributed largely to competence. Thus there is different recognition for similar performance. In other words, ‘what is skill for a male is luck for the female’ (Deaux and Emswiller, 1974; Bayes and Newton, 1978). Secondly, the legitimacy of an action is generally associated with the legitimacy of the actor who performs it and the role he or she occupies. Since leadership is perceived largely to be a masculine role, this gives some reason why within such research paradigms there is systematic variation between males and females in similar situations (Borman et al., 1978; Walker and Fennel, 1986, pp.270–1). Even the definition of task and skill, merit and competence in work situations is an historical construction which is gender biased (McNeil, 1987; O’Donnell and Hall, 1988).

Such conclusions are not surprising given the nature of the empirical research upon which the traditional construct of leadership has been premised. Because such research has focused largely upon leaders in formal positions of organizational authority, on male occupations and the achievements of men, and within a psychologistic framework, inevitably leadership attributes are perceived to be masculine attributes (Sherif, 1979; Kellerman, 1984; Sayers, 1986). Accordingly findings about male behaviours are generalized to females. Furthermore, research on women in positions of leadership is largely confined to stereotypic areas of women’s work. Even when research is in comparative fields, male characteristics are more highly valued than female characteristics in linking them to ‘good’ leadership. Women who enter male dominated careers are therefore seen to be stigmatized as they are seen to be ‘disabled, deficient or deviant’ (Marshall, 1985). In such contexts rationality is seen to be a better signifier of leadership than emotionality. Consequently there is a built-in male bias in the
research methodology in its assumption of homogeneity and universality of experience (Stewart, 1978; Hearn and Parkin, 1983). But it is more than a matter of methodology, since underlying such methodologies is a set of epistemic assumptions which will be discussed later.

Finally, the research in support of the various organizational theories of leadership, and some could say the ‘theory movement’ in educational administration per se, is inconclusive. In this field of study Foster points out the state of disarray because leadership is a ‘slippery concept’ (Foster, 1986). What is not disputable is that organizational and leadership theory neglects the significance of gender. Rather, it discusses authority, power and the division of labour in organizations as being both essential and neutral. It fails to recognize that there exists a gendered division of labour in organizations which historically defines women’s position in a negative manner. Such divisions are justified by notions of rationality, expertise and merit. Kanter refers to how the ‘masculine ethic’ of rationality is found in the image of managers and in the social science models of organizations in a manner which elevates the traits assumed to belong to men with educational advantages to necessities for effective organisations; a tough minded approach to problems; analytic abilities to abstract and plan; a capacity to set aside personal, emotional considerations in the interests of task accomplishment; and a cognitive superiority in problem solving.

(Kanter, 1975, p.43)

Performance is judged in gender biased contexts. Burton cites research which suggests that the effort of women in organizations is ‘perceived as diagnostic of men’s ability and compensatory of women’s lack thereof’ (Button, 1987, p.429). She suggests that ‘definitions of what is meritorious can undergo change depending upon the power of particular groups to define it . . . skill is a direct correlate of the sex and power of those defining it, an ideological category rather than an economic fact’ (Burton, 1987, p.430).

Likewise, success can be conceived in different ways, just as self-esteem is evident in ways other than a display of uncaring aggression, competitiveness or dominance in particular social situations. Because women may value different types of success and achievement, success and actions are interpreted in negative terms for women. The construction of success is elaborated upon by Markus.

. . . in contemporary society the organisational and technical changes in work make it increasingly difficult, if not impossible, to evaluate individual achievement, but at the same time, the work organisations and society at large, are increasingly in need of maintaining the disciplinary and legitimising function of the achievement principle. This means, then, that the evaluation of ‘performing capacity’ has to be accomplished symbolically. That is, based on ‘extrafunctional’ attitudes and
ascriptive criteria of different sorts rather than effective achievement . . . as Offe points out . . . the ‘achievement principle’ has been transformed from an ethical attitude into ‘one of the important forms of class-based power-games that rewards loyalty to dominant interests and forms of life’, perpetuated cultural divisions and legitimised the existing organisational and social hierarchies.

(Markus, 1987, p.104)

The manner by which authority and power in organizations are perceived and exercised is significant for women in that many do not measure their ‘success’ by the same external or symbolic criteria. Markus’ research on female engineers in managerial positions indicates how they formulated their notion of success as being basically private. Job satisfaction was connected to internalized concrete achievements gained through personal experience (overcoming some difficulties, maintaining double roles, helping others in their work) rather than external social recognition. It was a form of success she called ‘vicarious achievement’ — success resulting from the contribution of the subject to the achievement of some other person. This privatized conception of success in a public arena which rewarded outward achievement (formal status, position of authority) through uniformization of success standards is thus read as indicating that women lack motivation to succeed and has the ironical effect of maintaining the inequity of their work situation (Markus, 1987, pp.101–2). They are labelled for not ‘planning their careers’, or ‘keeping their eyes open for the next step to promotion’. Markus indicates how this is seen to be a problem particular to women, ‘given the observable switch in the basic hierarchical advance within different work organisations increasingly obtained not through internal promotions, but rather through external recruitment to higher positions’, as in, one could argue, the case of local selection of school principals (Markus, 1987, p.105). Thus the cultural association of masculinity and authority, of maleness and management, is reproduced by those in power who do not wish to disturb this ‘natural’ arrangement. Authority in organizations is judged by external and overt symbolic signs of power such as salary, space and titles rather than ‘complex staff positions that involve significant discretion’ (Burton, 1987, p.431). Organizations, as are all workplaces, are socially constructed along gender lines (Acker and Van Houten, 1974).

Thus the social science model utilized in organizational theory assumes that organizations such as schools are value-free, and that the social organization of schooling is neutral. It also assumes that relatively complete explanations can be found about individual behaviours within the organizations themselves and in the public domain of paid work. Little consideration is given to the private domain of human activity and how it connects to organizational situations or paid work. This distinction between the public domain of the rational and the private domain of the emotional and affective is critical to ongoing power relations in that it allows the perpetuation of the invisibility of class or gender rela-
tions in organizations (Stewart, 1978; Shakeshaft and Hanson, 1986). Furthermore, any collective activities by women to alter the ways in which organizations are structured must challenge the masculine ethic of leadership premised upon individuality, rationality and hierarchy. It is this collectivity that sociologists have failed to identify (Hearn and Parkin, 1983, p.233).

It is therefore necessary to undermine the theoretical paradigm dominant in administrative theory, which assumes that conflict is pathological and a problem to be controlled by administrators. Whilst the notion that conflict is abnormal is legitimated by administrative theory, a feminist perspective will be marginalized, controlled or dismissed as irrelevant. O’Brien aptly comments, ‘The central defects of the liberal social science is that they do not treat patriarchy as an essential component of exploitation but as an accidental aberration’ (O’Brien, 1986, p.96). The next two sections look to the historical contexts from which the above ideas about leadership emerged, and the political and epistemological traditions which supported and informed such a perspective.

Liberalism, bureaucratization and the subordination of women in education

So far I have laid out some of the conceptual approaches towards leadership dominating traditional administrative and organizational theory, and since the 1950s the theory movement in educational administration. The last section has indicated how organizational theory has made women ‘invisible’ or ‘deficient’ as leaders. This section examines why the particular view of leadership portrayed in administrative literature has come to be considered applicable to education. It suggests that the social formation of bureaucracies (as in education) was informed by liberal political theories which conceived of a relationship between the individual and society in a way which influenced and promoted hierarchical and individualistic views of leadership, and in turn justified patriarchal dominance in education. This is not to argue that there is necessarily some causality between bureaucracy and liberal democratic or capitalist states, as Pateman points out in her analysis of the parallel bureaucratic formation in communist states (Pateman, 1970). Rather, it is to try and understand why in liberal democracies such a view of leadership has become dominant.

The displacement of women in organizational theory is derived from their invisibility in social and political theory in general. Thiele argues that social and political theory has practised three forms or typologies by which women have become invisible: exclusion, pseudo-inclusion and alienation. Exclusion exists, for example, when Hobbes, in discussing his initial State of Nature, states that all men and women were equal, that women had natural authority over children. Yet in the civic society envisaged by Hobbes (and Locke) the Commonwealth is entirely inhabited by men. Rousseau, in his notion of the social contract, takes women into account in a pseudo-inclusive fashion, but marginalizes them by making women a ‘special case’. ‘What is normative is male’ (Thiele, 1986,
Alienation occurs when women are included as subjects, but the experience and parameters of women’s lives are distorted by being ‘interpreted through male categories because the methodology and values of the theorists are androcentric’ (Thiele, 1986, pp.33–4). Thus Marxist theory is both pseudo-inclusive and alienating of women in arguing that women’s inequality will disappear once women enter the paid labour force. Ultimately women’s perspective is rendered invisible in political and social theory firstly, by the decontextualization or abstraction of real events and people from their situation in order to make generalizations or universal statements, and secondly, by the creation of dualisms between nature/culture, public/private, mind/body, rational/emotional, which cast women into the private sphere of emotionality and men into the public, civic sphere of political and economic activity. This process of decontextualization and conceptual dualism is characteristic of liberal theory, and is focused in the notion of individuality. As Carole Pateman points out, the abstraction of the individual had unfortunate consequences for women. ‘In order that the individual could appear in liberal theory as a universal figure who represents anyone and everyone, the individual must be disembodied’ (Pateman, 1986, p.8). The public individual, the universal man, was masculine. He possessed the material and symbolic interest which invested his political status with power.

Hester Eisenstein, in her analysis of contemporary feminist thought, traces the dilemmas created by the connection between the parallel growth of feminism and liberalism because the roots of both lie in the emergence of individualism as a general theory of social life. Both feminism and liberalism have conceived in some way of individuals as free and equal beings, emancipated from the ascribed, hierarchical bonds of traditional society. Feminism in the late nineteenth and early twentieth centuries was, Eisenstein argued, merely making claims for an extension of these liberal principles to women. In attempting to universalize liberalism across gender, it inevitably challenged it because of the essential separation between public and private spheres in liberalism, which excluded women from public roles and which perceived of the family as a natural given. The contradiction which emerged centred on the issue of participation and equality when feminists were to claim equal rights to participate in the public sphere in terms of the vote (Eisenstein, 1985, p.xv).

Feminists turned to more radical and socialist demands for equal economic rights in the workplace — equal opportunity in access to education and occupation and equal rewards in terms of pay — on realizing the ‘hollowness of political liberalism without the economic means’ to achieve its promises (Eisenstein, 1985, p.xvi). But the failure of Marxists to explicate the alliances of interests which have acted to maintain the masculinist ideological hegemony continues to, and in fact has exacerbated, the sexual division of labour and existing power structures in capitalist societies (Stacey and Price, 1981). As with liberal feminism, socialist feminism has tended to perpetuate the private/public dichotomy, and thus fails to produce an adequate theory of social change which can lead to
radical social action. Both theories look to universal categories of ‘individual’, ‘worker’ and are

sexually particular, constructed on the basis of male attributes, capacities and modes of activity. . . . The ‘individual’ is masculine, but because he appears to be universal and because the categories of liberalism and socialism appear to hold out a universal promise, it seems either (for liberals) that the task of feminism is to make good this promise and incorporate women into existing institutions as equals, or (for socialists) to carry out the class revolution which will bring true universalism into being.

(Pateman, 1986, p.7)

Liberal political theory has thus reified the notion of the abstract individual, freely making choices, autonomous and motivated by external rewards. At the same time liberal capitalism has spawned another form of organizational life — the bureaucracy.

Ferguson traces the links between liberalism, the bureaucratization of social life and the ‘feminization’ of the lower ranks of educational bureaucracies since the late nineteenth century (Ferguson, 1984; Hansot and Tyack, 1981). The significance of the bureaucratization of education for women in education lies in the embeddedness of the hierarchical relationships, the division of labour premised upon expertise and notions of bureaucratic rationality. It is best exemplified in the gendered and hierarchical distinction between administration and teaching as categories of work based on expertise, for example, rather than as inextricably dependent and within the same field of practice (Blackmore, 1987). Such hierarchies reinforce existing power relations and the ways in which femininity and masculinity are socially constructed and reproduced in schools. The emphasis on authority as being legitimately and rationally imparted through neutral organizational or bureaucratic means renders the gender relationships which co-exist in bureaucratic life non-problematic. Thus

bureaucratic control . . . operates through denial that there is discrimination. It is asserted that gender is irrelevant, that women can make it the same as men, that all will be rationally and fairly evaluated according to the same criteria. This ignores . . . the way the world is structured around men’s norms.

(Game and Pringle, 1983)

Mary O’Brien considers the epistemological and political implications of this unsteady co-existence of liberalism and the bureaucratization of social life.

Liberal statism has spawned an administrative mode — bureaucracy — in which crass indifference to the much vaunted rights of individuals is
passed off as ‘objectivity and efficiency’. Objectivity too is the myth on which liberal theory and research thrive, forming the intellectual — or preferably scientific — basis of liberal perceptions of knowledge. As liberal statism has grown and flourished to the point of bloat, the attenuated epistemology of liberalism and the notion of state organization and control of knowledge and/or ideology have been central to liberal strategy for the maintenance of political power. Further, the major strategic achievement for liberalism — the vitiation of democracy by the political party system — ensures the limitations of women’s political power . . . liberal aspirations to epistemological sophistication and the development of scientific, empiricist and structuralist research models probably owe more to the capitalist political economy than to the development of liberal philosophy.

(O’Brien, 1986, p.96)

The irony remains that the expansion of bureaucracies which increasingly regulate all aspects of social life has been accompanied by modern political theory centring on individual freedom and autonomy (Ferguson, 1984, p.31). ‘Educational institutions generate and reflect both the course of bureaucracy and the roles and events that recruit individuals into bureaucracies’ in that the bureaucratic discourse seeks to promote individual merit and bureaucratic rationality (Ferguson, 1984, p.42). In this sense leadership is ‘earned’ by those with merit. Meanwhile, corporate capitalism leads to the fragmentation of work and the productive process, which has meant ‘the withdrawal of aspirations from the workplace into private goals, the disruption of indigenous networks of support and mutual aid’ (quoted in Ferguson, 1984, p.48). Individual happiness has come to be identified with success in organizational life. ‘Hence parents seek upward mobility for their children increasingly looking to education, not simply to provide access to a better job at a higher salary, but to supply an institutional linkage to an established occupational hierarchy’ (Ferguson, 1984, p.45). Bourgeois individualism so promoted this bureaucratic means of organization to the extent that children have come to appreciate and understand the workings of hierarchical organizations at an early age. They do not distinguish hierarchy as characteristic merely of organizational life but of social relationships generally (Ferguson, 1984, p.46).

Thus the tenet of liberal, bourgeois individuality has done little to alter the gendered division of labour in work, school or at home. Instead, liberalism has advocated equality for women as articulated through the notion of individual merit and success, the autonomous, universal individual making rational decisions. The upward mobility of individual, generally middle-class, women through affirmative action and the institutionalization of equality as conceptualized in the liberal state have been illusory in that the rhetoric is not matched by the reality of what is occurring in the organization and structuring of education (particularly state education). Walkerdine indicates how class and gender within the liberal paradigm have continued to be the main structuring factors:
Females may cross over on to the side of masculinity in so far as they are permitted to enter into these practices. Similarly, given it is bourgeois individuality, possessed of rationality, which is taken as the key to normality, the working class can in principle become ‘bourgeois individuals’ by dint of those liberal practices which provide that possibility. However such an individuality and autonomy is produced at a price. Playful rationality is made possible through work, the hidden work of servicing, manual labour and nurturance. Here the ultimate irony is to be found in the position of the middle-class male, whose powerful position is guaranteed by the trap of reasoned argument.

(Walkerdine, 1985, p.235)

The unfortunate consequence of the adoption of the liberal tenets of individualism is that feminist values are incorporated, appropriated and submerged. There is little opportunity to question the fundamental nature of organizations, to challenge relationships premised on hierarchy or individualistic competitiveness or the privileging of scientific knowledge upon which it is premised.

**Positivism and the rationalization of administrative work**

Nineteenth century liberalism was imbued with a worldview well suited to capitalist economic structures and work ethic. By the mid-twentieth century positivistic social science offered predictability, universality and certainty to the policy-makers of the developing liberal bureaucratic state. Thus many tenets of liberalism, individual merit and expertise, for example, found justification in positivistic epistemology. Positivistic theories of knowledge hold that all genuine human knowledge is contained in the boundaries of science, that is, the systematic study of observable phenomena that can be explained by scientific laws. Social science, in emulating the physical sciences, also made claims of prediction and control, thus giving privilege to its knowledge claims of objectivity and universality over other forms of ‘subjective’, non-observable, particularistic or experiential knowledge. The implications for women have already been addressed in the discussion of how positivistic social science constructed a masculinist model of leadership.

Educational scholars and practitioners alike, by claiming status for educational administration as a science in a period when both progressivist and conservative educational traditions valued social efficiency, sought to gain both professional and public legitimation in the first decades of the twentieth century (Hansot and Tyack, 1981). Since the 1950s the theory movement in educational administration has taken as its own the industrial metaphor central to administrative theory, and applied the industrial model to schooling (Griffiths, 1979). Implicit in the functionalist view of education was the epistemological assumption that scientific knowledge, gleaned through observation and empirical studies, was objective; that knowledge derived through scientific method could be generalized across
situations, time and gender. In this way positivism and liberalism shared like views about the abstraction of the individual in order to universalize experience.

In this framework organizations such as schools were considered to be value-free contexts, in which organizational objectives could be stated and adhered to; in which individuals were treated as autonomous beings whose interests and objectives could be moulded through the gentle direction of their leaders to those of the organization or school; in which consensus was the norm and conflict regarded as aberrant behaviour by those in authority; in which power was not confused with notions of authority and control. Organizational control was legitimately invested in formal institutional roles. Power was ignored as having connotations of being manipulative, political and devious. Administration in schools thus came to be conceived as a neutral practice carried out by experts in a scientific and rational manner. Decision-making was seen as a rational and a linear procedure, not a matter of values or subjective opinion. Means were separated from ends, fact from value. Valerie Walkerdine comments:

The investment of reason in the sexed-body, as the foundation of modern western scientific rationality, not only locates self-control in rational argument, but also places it at the centre of an omnipotent fantasy of control over the workings of the universe. Mastery and control of the ‘real’ are centrally located in claims to truth and therefore to possess knowledge. In this sense mastery, control and bourgeois masculinity are conjoined in that uncertain pursuit of truth.

(Walkerdine, 1985, p.235)

What are the consequences of this privileging of positivism in educational administrative theory? External factors (family, relationships, politics, etc.) have come to be seen as merely disruptive to productive organizational relationships (Stewart, 1978; Shakeshaft and Hanson, 1986). When women’s subjective experience does not fit this ‘reality’ of scientific management, it is treated as an aberration, non-relevant and deviant. Jan Grant suggests that women’s incorporation into masculine domains in organizations has been at a cost. It often requires women publicly to reject and submerge their definition of self as women (Grant, 1985). Such co-option is because women’s subjugated knowledge or subjective experience is not valued as a resource or valid alternative worldview. Conversely, it means that radical action or opposition by women in organizations such as teachers (predominantly female) to employers has been interpreted by sociologists and political scientists primarily as a male search for professional status rather than a female rejection of the values implicit in a systematic and dehumanizing control by men of women. Women’s activities are thus cast more as ‘submission’ than ‘subversion’, but in neither case legitimate (Markus, 1987, p.98). This is not to suggest that male teachers do not value other than occupational success, or are not motivated by humane values, or that women do not aspire to occupational mobility or status, but rather that dominant
explanations for particular attitudes and activities are framed by narrow and limiting masculinist perceptions and experience of what is problematic. Likewise, the dominant definition of educational leadership has been historically constructed in a manner which ignores, reinterprets or denigrates feminine values and experience.

The positivistic epistemology underlying conventional organizational and administrative theory has undergone an attack from within its ranks since the early 1970s for its naive scienticism which separates fact from value, and assertion that administration is a value-free science (Hodgkinson, 1981; Greenfield, 1986; Codd, 1988; Bates, 1986). This ‘intellectual turmoil’ in educational administration has not ruffled the calm of masculine domination in education at either the theoretical or practitioner level. The inability to incorporate a theoretical explanation for continued masculine domination, despite increased sensitivity to gender issues, has been excused on the grounds that ‘organisational theories have been based on the perspective of executives’, the emphasis being on the disempowerment resulting from the emphasis on social control, hierarchy and bureaucracy rather than recognition of the reproduction of gendered dominance as a set of power relations as a significant phenomenon of educational organizations (Griffiths, 1979, pp.43–65). The interpretivist perspective of educational administration which has emerged maintains as its essence the individualism of liberal political theory and the fact/value distinction of positivistic epistemology (see Greenfield, 1984, 1986). That there may be some shared experience of particular social groups who have a different way of seeing from their position of non-control at the base of male dominated, hierarchical organizations is only implied. Perhaps women share certain common organizational experiences through their patterned subordination and powerlessness as women, and not merely in their commonality as subordinates. The issue is one of control, but by whom, over whom, and on what basis?

Both the positivistic and interpretivist traditions which have dominated approaches to educational administration have come under attack from the perspective of critical theory for their common epistemological assumption of the distinction between fact and value, which effectively excludes moral commitment and ignores the historical, political and personal nature of organizational relationships (Codd, 1988). Such critiques tend to presume that discussions of domination and subordination, of power relations and the significance of ideology, necessarily include women as objects of subjugation. But there has been little attempt overtly to connect this powerlessness to matters of the social construction and reproduction of gendered power relations in educational organizations (see Fraser, 1987). Depending upon whose interpretation of the Frankfurt school is taken to portray their position best, there would appear to be some convergence of feminist approaches and that of the critical theorists. Salleh discards the view that critical theory is ‘drenched in a Freudian inspired nostalgia for patriarchy, an obsession with the “ideal bougeois” family, a static and cynical brand of individualism’ (Salleh, 1981, p.5). What is evident, she argues, is the shared concern for
the merging of theory and practice, the moral commitment to social change, the ongoing critique of all ideologies (including that of critical theory itself), and an historically materialistic analysis which displays a sensitivity to subjectivity without neglecting structural constraints, a dimension ignored or exaggerated in positivistic and interpretivist approaches respectively to educational administration. Salleh suggests that critical theory in fact contributes to the radical feminist problematic in that its analysis rests upon a ‘more profound materialism than that of the “mode of production”’, that perceives that social change must have a biological and psycho-social basis and which has an epistemology which does not split consciousness from the act of knowing (Salleh, 1981, p.12).

Lather and Fraser share similar optimism when considering how critical theory, and the work of Jürgen Habermas in particular, can contribute to feminist theory. Lather suggests that critical theorists and feminists share the desire to transform the production and dissemination of knowledge, a commitment to more democratic forms of governance which empower disadvantaged groups, a view that looks to the sociality rather than the autonomy of individuals as the guiding force of practice (Lather, 1984). Whilst Fraser is happy to extrapolate from Habermas what she perceives as the gender sub-text, she is still conscious that Habermas fails to theorize ‘the norm mediated character of late capitalist official-economic administrative systems . . . the systemic, money and power-mediated character of male dominance in the domestic sphere . . . nor the gender-based separation of the state-regulated economy of sex-segmented paid work and social welfare. Ultimately, he also seeks to universalise experience’ (Fraser, 1987, p.55). Yet critical theory and feminist theory would appear to share common concerns. The extent of this commonality needs to be explored further.

So far I have elaborated upon the ways in which gender-biased educational structures, organization and practice have been justified as necessary and rational. The gendered and hierarchical division of labour in educational administration, for example, has rested at various times upon notions of natural, psychological and social difference. It is further legitimated by theories of knowledge which are supportive of notions of rational and hierarchical forms of administration as givens or technical necessities. Leadership has thus been portrayed within liberal political theory and positivistic theories of knowledge as an individualistic enterprise essential to the given hierarchical arrangements and premised upon notions of technical expertise.

**Individualism, rationality and morality**

A feminist critique of educational organizations and the ways in which educational leadership has been conceptualized would therefore involve a reconsideration of the concepts of the universal individual, abstract morality and bureaucratic rationality central to liberalism and positivism.

Carol Gould sees the starting point of liberalism as the assumption that ‘human individuals are essentially solitary, with needs and interests that are
separate from, if not in opposition to, those of other individuals’ (Gould, 1983, p.24). It has already been illustrated how social contract theory, upon which liberal polemics is based, specifies the interests of the individual as protection of life, civil liberties and property as exemplified in the autonomous, abstract individual. The emphasis on the individual’s interests in liberal political and positivistic organizational theory has many consequences. In particular it denies the individual’s need for collective action and sociality. Elshtain argues:

The problem with a politics that begins and ends with mobilizing resources, achieving maximum impacts, calculating prudentially, articulating interest group claims, engaging in reward distribution functions and so on is not only its utter lack of imagination but its inability to engage the reflective allegiance and committed loyalty of citizens. Oversimply, no substantive sense of civic virtue, no vision of the political community that might serve as the groundwork of a life in common is possible within a political life dominated by self interested, predatory individualism.

(Elshtain, 1982, p.141)

Liberal theory also produces an instrumental interpretation of rationality which assumes that the individual has a set of interests and preferences which are known and constant, and that individuals are motivated purely out of a desire to maximize these preferences. The state merely facilitates this process and protect the individual’s preferences. Rational behaviour is therefore depicted as when individuals (as organizations) act to maximize their own interests. Gould refutes this assumption, arguing that humans must live in social groups, and that ‘human interdependence is thus necessitated by human biology and the assumption of individual self-sufficiency is plausible only if one ignores human biology’ (Gould, 1983, p.24). At the same time she is not advocating biological determinism, but rather recognition that ‘interests’ (whether self-interests or altruistic interests) must take into account the material situation of people and their relationships with others — that is, community. A rational person in Gould’s perspective values her abilities to empathize and connect with particular others by recognition not ignorance of social interdependence. It is a notion which is both materialist and non-deterministic. This requires turning liberal theory upon its head. Instead of community and cooperation being problematic in liberal theory, the existence of egoism, competitiveness and conflict, which liberalism sees as endemic and natural, would be the puzzle.

Thus feminists argue that the notion of the abstract individual so implicit in liberalism ignores the essential interdependency of human beings. Sandra Harding suggests that notions of abstract rationality expressed by Kohlberg, Kant and Rawls exemplify a modern liberal ideal not only of the individual as a citizen but also an abstract, transcendental view of morality which is ahistorical (Harding, 1983, pp.40–50). In their view the resolution of moral problems in a
‘rational’ manner requires abstract judgments arrived at through abstract principles. Harding points out that such a view of moral reasoning does not take into account the contextual and inductive thinking characteristic of taking the role of the particular other. In so doing it creates an opposition between reason and affectivity. Furthermore, the hallmark of this moral reason is impartiality.

Impartiality names a point of view of reason that stands apart from interests and desires. Not to be partial means being able to see the whole, how all the particular perspectives and interests in a given moral situation relate to one another in a way that, because of its partiality, each perspective cannot see itself. The impartial moral reasoner thus stands outside and above the situation about which he or she reasons, with no stake in it . . . .

(Young, 1987, p.60)

This causes a problem which Adorno has called ‘the logic of identity’ in that it looks to order and describe particulars of experience, to create unity, to eliminate uncertainty and unpredictability. It requires the reasoner to treat all situations alike according to a set of rules, in effect to universalize.

as a consequence of the opposition between reason and desire, moral decisions grounded in considerations of sympathy, caring, and an assessment of differentiated need are defined as not rational, not ‘objective’, merely sentimental. To the extent that women exemplify or are identified with such styles of moral decision making, then women are excluded from moral rationality.

(Young, 1987, p.63)

This dichotomy between reason and desire, we have shown, appears in political theory as the distinction between the public realm of the civic and the state and the private realm of needs and desires (Young, 1987, p.63).

What are the implications of such a stance for leadership? Such a view does not require the impartial reasoner to acknowledge other subjects’ perspectives, since they are incomplete. Thus impartiality often results in authoritarianism, in that one claims authority to decide. Furthermore, it is argued that the impartial reasoner has a holistic view, able to abstract himself or herself from self-interests in the interests of the unity (organization). Chris Hodgkinson in his books, *A Philosophy of Leadership* and *A Theory of Educational Administration*, exemplifies such an approach. Hodgkinson calls for a new form of moral leadership in which he posits a hierarchy of values giving priority to cognitive reason over emotive preferences. Thus conflict and self-interest are seen as a debasement of human activity. Throughout his analysis he assumes Plato’s view of a leader as a philosopher-king, a rational individual able to abstract himself from value judgments embedded in specific situations but based upon universal principles.
Hodgkinson, 1981). Such a position assumes a notion of transcendental morality which is ahistorical and ignores the sociality of humans. Such a view invests this capability for superior moral reasoning in the occupants of formal institutional positions, and would divest all others of the moral potential to take decisions which are rational. Hodgkinson does not tell us how to learn or acquire such superior moral powers or how they are recognized. In effect, the consequence would be to reassert the hierarchical relationships premised upon a concept of moral rationality and impose them upon organizational reality in a manner which is detrimental to certain types of valuing and reasoning which are other centred, affective and caring.

Thirdly, in educational administration, as in organizational theory, the dominance of a science of administration has legitimated power relations in schools and maintained a myth of bureaucratic rationality and individualism. Administration is value-free, hierarchy is technically rational and domination legitimate. Urban talks of this bureaucratic rationality ‘as a mode of thought, which can be understood as an expression of power relations in the social world, on the one hand, and a mystification of those relations on the other’. Furthermore, ‘the defining element of relations inside a bureaucracy is hierarchy, itself another word for domination. Given the worldview of technical rationality, however, bureaucracy does not appear as a structure of domination; on the contrary, the bureaucratic hierarchy manifests itself as a technical necessity (to co-ordinate the subdivided tasks), as a rational organisational arrangement for the accomplishment of collective ends’ (Urban, 1982, pp.23–4). The hierarchical arrangements in organizations such as schools are thus premised upon such notions of individualism and rationality. Rizvi has elsewhere developed the ways in which this notion of bureaucratic rationality has particular political implications. He suggests that the traditional notion of administrative leadership reifies the role of the principal as a leader. Principals are seen to be effective only when they are ‘in charge’ or ‘in control’. This encourages manipulation and control of subordinates by principals, generally not conducive to mutual benefit (Rizvi, 1986). He suggests that if schools are seen in terms of individuals and their position in hierarchies, then ‘leaders will always be set apart from followers’, ‘relationships will be one-sided’ and mediated through bureaucratic definitions of role (Rizvi, 1986, p.39).

Ferguson criticizes this bureaucratic mind set in which the ‘interaction with others is debased and the self is created as a rationalised commodity’ (Ferguson, 1984, p.20). In her view bureaucracy rests on assumptions of scientific rationality, the generalized other which is apolitical and ideologically invisible (Ferguson, 1984, p.16). Women are thereby a marginalized group who possess ‘subjugated knowledges’ located low down the hierarchy. At the same time women are both active creators and passive victims because their experience is more continuous with than in opposition to others. That is, women are neither purely self-interested nor purely altruistic and self-sacrificing. Rather, self and other can be seen to be attached and continuous, making human sociality a fundamental component of the individual. Because women tend to assume
responsibility for taking care of others as defined by traditional roles, they tend to pass judgments that are based on contextual rather than abstract criteria, focus more on process than outcome. In management terms this has been recognized as women’s tendency (and failure) to be task- rather than organizationally oriented (Ferguson, 1984, p.25). This is not to deny that men live in families and women work, but the traditional public-private dichotomy means that the members of each gender carry the worldview of their own domain with them into the other realm, and must consciously put it aside to succeed in the other world on its own terms (Ferguson, 1984, p.27).

The masculine image of leadership in education is therefore historically constructed and maintained by its ideological underpinnings of dominant theories of a value-free science and liberal political theory. Leadership is justified on the grounds of rational necessity, individual behaviours and opportunities, and technically necessary hierarchical social arrangements. Founded upon a positivistic epistemology which separates the body from the mind, which extracts feeling and emotion from the material, leadership is defined to be a rational, cognitive process. Because expressive behaviours are denigrated as irrational, it is possible to argue that gender relations are unproblematic and are not a substantive issue in the culture and structure of organizations. The lack of women in higher positions can be excused within such a theoretical framework as a consequence of women’s irrationality, subjectivity and emotionality. They choose not to aspire for such positions, or are excused on the grounds of their moral inadequacy in not being able to make the ‘hard’ decisions in the interests of the organization. The question remains, how then can feminist theory not only deconstruct these dominant epistemological and political perspectives but also reconstruct an alternative which opens up different ways of seeing educational leadership. What then would constitute a feminist perspective of leadership?

The elements of a feminist reconstruction of leadership

Feminist theory does not ask merely to include women as objects in the patriarchal discourse, in which sameness is emphasized rather than difference. It rapidly becomes evident that it is impossible to incorporate or ‘add on’ a feminist perspective. Rather, a feminist critique ultimately leads to the need to reformulate the methodologies, criteria of validity and merit and ultimately the political and epistemological commitments underlying the dominant notions or discourse. Feminists demand not just equality, but that they become the subjects and objects of an alternative, autonomous discourse which chooses its own measures and criteria. It is necessary not only to explain the pervasiveness and persistence of gender divergence and gender subordination (which are not the same thing) but also to provide an explanation that avoids a rigid universalism and provides a way of understanding cultural and historical difference. It is also essential that theory provides the basis for a politics directed towards changing this subordination, a politics of change (Thornton 1982, p.53).
A feminist alternative to the view of leadership criticized in this chapter would consist of a number of elements including the central concepts already discussed, concepts which are common to most feminist perspectives. Such a view would focus on the relationship between the individual and a more egalitarian notion of community and civic participation which does not adhere to abstract principles of rational judgment or morality outside specific contexts. Harding, for example, calls for a more practical, contextualized notion of rationality. Perhaps a more politically universal conception of human rationality would refer to normative conditions as personhood and human good in a relational morality which emphasizes attachments and responsibilities to others as well as to self. This suggests that ‘interest’ should not be regarded as either total self-interest or altruism. A relational view of morality and judgment recognizes the interdependence of people, and sees moral judgment as not being predicated upon some abstract universal morality or individual rights, but upon concern and responsibility consequent upon the relationships of self to others within specific contexts. In this sense administration as moral judgment would need to be aware of the context of the judgment and the responsibilities of the actors. In effect, it is arguing that the relational bias in women’s thinking, which has been seen to compromise their moral judgment in the past and impede their moral development, in fact has significant moral value for all. Gilligan has argued that this relational morality should not be regarded as the deficit model, but that it merely reflects a different social and moral understanding — a different set of interests (Gilligan, 1977, pp.481–2).

I do not take the stance that women’s worldview or perspective is either biologically determined or premised on an essentialism which perceives female morality, interests or behaviours as being superior to those of males. Rather, I adhere to the view that at a specific historical moment, traditional patterns of behaviours prescribe certain roles to which individuals, males and females, partially conform to differing degrees. For example, women’s centrality to the family and as principal child rearer is not greatly challenged in practice, and is therefore a dominant part of women’s identity, value systems and needs. That is, women’s ‘interests’ are associated with caring and commitment to others. Carol Gould argues that ‘a dialectical conception of human biology sees human nature and the forms of human social organisation as determined not by biology alone but rather a complex interplay between our biological constitution, our physical environment and our forms of social organisation, including our level of technological development’ (Gould, 1984, p.22). Within this framework feminism would not expect that everyone be treated exactly the same, since responsibility and relationships have specific temporal and historical contexts.

Such a perspective would mean a reconstitution of the public sphere in what Markus calls ‘the more or less fluid self-organisation of a public committed to principles of equality, plurality and democratic forms’ (Markus, 1986, p.9). This is not to return to the Enlightenment ideal of civic public
which excludes the bodily and affective particularity as well as the concrete histories of individuals that make groups unable to understand one another. Emancipatory politics should foster a concept of public which in principle excludes no person, aspects of persons’ lives or topic of discussion and which encourages aesthetic as well as discursive expression. In such a public, consensus and sharing may not always be the goal, but the recognition and appreciation of difference, in the context of confrontation with power.

(Young, 1987, p.76)

It is also time to consider why it is that women’s accounts of power differ so systematically from those of men. Men see in power domination, whilst Hartsock argues that women take a more emancipatory perception in that they see ‘power as a capacity of the community as a whole’. Women tend to characterize power over others as domination and illegitimate, without questioning why there are systematic relations in which some have more power over others. Individual power (or leadership) is often treated with scepticism. This comes largely from Arendt’s formulation, when she treats individual actions outside community with contempt, as non-political. Hartsock warns that in so doing power is described in terms that emphasise the submersion of the identity of the individual in the community, thereby falling into a form of female pathology of loss of self, a fluidity that may submerge individual identity. . . . It is better to have an understanding of power for the individual which stresses both its dimensions of competence, ability and creativity and does not lose sight of the importance of effective action . . . in part defined by its sensuality and its variety of connections and relations with others in the community.

(Hartsock, 1983, pp. 253, 256)

Rather than condemn the notion of leadership as anathema to democratic community, it is essential to reconceptualize a different type of leadership in a caring community, to recognize that at particular instances individuals can and do act in a powerful manner but with good intention for the community, whilst laying themselves open to communal scrutiny (Noddings, 1985).

An adequate theory of power, according to Hartsock, would give an account of how social institutions have come to be controlled by only one gender; it would locate where and how the points of conflict between men and women are generated; and it would make clear the specific relations between individual intentional actions and structural constraints (p.254). Such an approach would necessarily subvert the hierarchical structures of social institutions such as bureaucracies. Ferguson argues that women already offer an alternative construct to the dominant bureaucratic discourse in which ‘women’s lives constitute a submerged voice’. She continues:
The traditional experiences of women in our society shed light on bureaucracy in two ways — by revealing persistent patterns of dominance and subordinance in bureaucracy that parallel power relations between men and women, and by suggesting a different way of conceiving the individual and the collective that reflects the caretaking and nurturant experiences embedded in women’s role.

(Ferguson, 1984, p.x)

She suggests that a feminist discourse in organizations would therefore encourage the caring and reciprocity central to a relational worldview which gives prior concern to others, which would recognize both familial and friendship connectedness and acknowledge the civic as well as the personal importance of friendship. It would also be committed to participatory democracy, whilst being aware that the sharing of power, language and knowledge critical to participation can assume gendered formations which must be constantly analyzed.

Given the attack on abstract individualism and organizational hierarchy implicit in feminism, an alternative conception of leadership emerges. It is suggested here that leadership can take other forms than having power over others and that leadership ‘skills’ can be used in a different way. Rather than privileging the individual who is often already in a position of status and power because of the possession of specialist knowledge, capacities, skills or role allocation, expertise can, in a cooperative environment, empower the individual and the group. Leadership, and the power which accompanies it, would be redefined as the ability to act with others to do things that could not be done by an individual alone. Leadership, therefore, would be a form of empowerment and not of dominance or control (Ferguson, 1984, p.206; see also Burbules, 1986). Hartsock takes up this point when she claims that ‘to lead is to be at the centre of the group rather than in front of the others’ (Hartsock, 1983, p.8).

Authority based on skill and knowledge (both of which are imbued with power) would be, according to Hartsock, ‘compelled persistently to demonstrate its force to those concerned in terms which they can grasp and, by dint of being so compelled, be made in some real measure responsible to them’ (Hartsock, 1983, p.10).

It is suggested that women have been alienated by the masculinist portrayal of leadership and organizational life which emphasizes control, individualism and hierarchy. The false dichotomy between fact and value, ends and means, derived from the positivistic assumptions of the traditional ‘science of educational administration’ has political repercussions in the sense that it is exclusive of women’s experience by rejecting all that is affective or experientially-based. It casts particular groups as ‘others’, and privileges certain types of knowledge, experience and expertise over others. Furthermore, organizational theory has assumed and maintained the dualisms derived from social and political theory which have portrayed women’s experiential and knowledge claims to be in opposition, and thus peripheral or insubstantial. This has been exacerbated in
practice by the historical and social construction of the gendered division of labour in schools and educational administration.

What does this mean in practical terms and policy in educational administration? Educational leadership as portrayed in the conventional literature may have little to attract women. That is, the perception of what constitutes leadership is problematic, not women. If administration is no longer treated as separate from teaching, if leadership is not merely equated to formal roles and responsibilities, if what is worthwhile knowledge and experience is not restricted to formal qualifications or institutional experience, then it calls upon a new set of informed judgments which must be brought to bear on the valuing of people’s activities in educational organizations. What counts as administrative and leadership experience and skills or potential could therefore include community activities, teaching, curriculum development and child rearing, which recognizes what difference can bring to education. This would go some way towards recognizing women’s experience in the ‘private’ sphere, and imbuing it with equal status to male experience in the public sphere. It may challenge what Jan Grant describes as the way in which organizations reproduce themselves in the masculine view via ‘homosocial reproduction’ (Grant, 1985).

It would also require a shift to be made from the individual to a collective focus in terms of what is meant by leadership. This would require going against the renewed push towards more masculinist notions of leadership embedded in corporate managerialism, the impetus for current restructuring of secondary and tertiary education, which equates efficiency and effectiveness with organizational rationality and hierarchy (Blackmore and Kenway, 1988). While administration and leadership are premised upon conventional theories which reify hierarchy, rationality and individualism, which are perceived to be masculinist attributes or behaviours, women’s experiences and values will continue to be displaced. To conclude, Hartsock suggests that ‘. . . it would raise for the first time the possibility of a fully human community, a community structured by its variety of direct relations among people, rather than their separation and opposition’ (Hartsock, 1983, p.262).

THE FEMALE SECONDARY HEADTEACHER IN ENGLAND AND WALES

Leadership and management styles

Marianne Coleman

Summary
This paper reports on data relating to management and leadership derived from a survey of all the female headteachers in England and Wales. The quantitative data presented here are complementary to previous research on gender in education which has tended to be qualitative. The use of the Gray paradigms in the research instrument has allowed an empirical redefinition of the ‘feminine’ style of management, but the research confirms that the majority of the female heads use a collaborative and ‘people-oriented’ style of management. In addition, the key values promoted by the headteachers are related to achievement and respect for all. The headteachers generally make themselves available to staff and spend a considerable proportion of their time in school outside their office. They tend to encourage staff development, often through individual consultation, but only a minority make special provision for the development of female teachers. Male resentment of female leadership was found to be relatively prevalent and the majority of the women felt they had to ‘prove their worth’ as a woman manager. Despite the difficulties encountered, once the women had achieved headship, they were aware that there were advantages in being a woman headteacher. They reported the ability to defuse ‘macho’ behaviour, the benefits of being unusual and therefore singled out and the fact that girls, mothers and female teachers found them approachable. The relative disproportion of female secondary headteachers raises issues of equity. However, in view of the effective management style of the majority, the question is also raised of the potential loss of leadership to our schools.
The study of women in leadership and management in education is relatively rare. Hall (1996), when researching female headteachers, makes the point that:

I found it difficult at first to avoid using men’s behaviour as educational leaders as a yardstick for describing women in similar positions . . . Putting the picture straight by changing the subject from men to women does not involve saying women are different or better. My purpose is rather to explain how they are in this role (headship), in this context (schools), in this period of time (1990s).

Theories of leadership and management have often been based on assumptions derived from the male discourse (Shakeshaft, 1989; Blackmore, 1989), but in relatively recent years the female manager in education has been studied in her own right (Adler, Laney and Packer, 1993; Ouston, 1993; Ozga, 1993). The disproportionate number of female secondary headteachers, only 24 per cent in 1996 (GB. DFE, 1997), also raises issues of equity. Evetts (1994) studied 20 secondary heads of whom ten are male and ten female, making gender an important variable in her study, and Grace (1995) included a chapter on women in educational leadership. Studies of individual headteachers have included a balance of male and female heads (Ribbins and Marland, 1994; Hustler, Brighouse and Ruddock, 1995; Ribbins, 1997). The present author has conducted interviews with five women headteachers (Coleman, 1996) and, most notably, Hall (1996) has undertaken an in-depth study of six female headteachers of whom three are secondary and three primary. Elsewhere, Hall and Southworth (1997) point to the fact that research into headship is the weaker for largely ignoring the variable of gender:

Using a gender perspective creates new possibilities for exploring the lives of men and women who teach, manage and lead in education. As researchers into headship we have both concluded that educational leadership is firmly rooted in professional identity. Gender, in turn, is a crucial component of that identity. Future research into headship that fails to take this and the gendered nature of schools and colleges into account is likely to be incomplete.

However, research on the management and leadership of women in education has tended to be qualitative in nature.
Survey of female headteachers in England and Wales

In summer 1996, the present author undertook a survey of all the 670 female secondary headteachers in England and Wales covering their leadership and management styles, and their career progress to headship. The response rate of 70 per cent, well above normal response rates, gives an objective measure of the interest that the headteachers had in the area. Comments included on the returned questionnaires and accompanying letters showed the measure of this interest and indicated the relative isolation that was felt by many of the respondents. Female headteachers have not previously been surveyed separately as a group, although gender as a variable was included in the survey research of Weindling and Earley (1987), Jones (1987) and Jirasinghe and Lyons (1996).

The survey data reported here are those relating to the management and leadership styles of the headteachers, including the values that they were promoting in their schools. In addition, this paper covers aspects of their experience of management and leadership, including the ways in which they relate to their staff and their professional development. Finally, data relating to the perceived difficulties and the advantages of being a woman headteacher are reported.

Approximately half of the headteachers were aged between 40 and 49 and half between 50 and 59, with very few under 40 or over 60. More than two-thirds of the headteachers were married, with marriage more popular amongst the under than the over 50s. Just over half of the heads had a child or children, but childlessness was more common amongst those under 50. Just over two-thirds of those responding were heads of coeducational schools, the remainder were heads of single sex schools. Of these, only three individuals were heads of boys’ schools.

The management and leadership styles of female headteachers in England and Wales

In analysing management and leadership styles, there are certain qualities that are identified with a ‘feminine’ or a ‘masculine’ style of management. Both of these styles may be adopted by men or by women, although the expectation is that men might adopt a style that is predominantly masculine and women one that is predominantly feminine. The lists of qualities identified by Bem (1974) and by Gray (1989, 1993) are both attempts to identify such a paradigm or ideal type. In the survey, the headteachers were presented with the masculine and feminine qualities identified by Gray (1993) and asked to indicate which of the qualities they felt applied to them. These qualities are derived from work associated with the training of headteachers, and are not based on empirical research. Their use in this questionnaire was intended to provide a possible redefinition of the paradigms. The qualities were not identified in any way as ‘male’ or ‘female’ in the questionnaire.

Six of the adjectives and descriptions that are included in the feminine para-
digim (see Table 1) were identified by 59 per cent or more of the headteachers. More than three-quarters of them judged themselves to be ‘aware of individual differences’, ‘caring’ and ‘intuitive’. However, there were also four adjectives in the masculine paradigm which were identified by over half of the headteachers as applicable to them. Although the characteristics identified most often were from the feminine paradigm, those chosen by more than 50 per cent ranged across both paradigms (see Table 2). The qualities listed in Table 2 present an empirically based alternative to the feminine paradigm identified by Gray (ibid.).

Overall, it would appear that there is a strong identification with most of the feminine traits on the part of the headteachers, and a weak identification with most of the masculine traits. However, there are a number of masculine traits, specifically ‘evaluative’, ‘disciplined’, ‘competitive’ and ‘objective’, which are identified by 50 per cent or more of the respondents, and which therefore temper the picture of a pure feminine paradigm of management style amongst the female secondary headteachers of England and Wales and indicate a more androgynous style of management.

Note
(f) = feminine and (m) = masculine in Gray’s (1993) paradigm.
Key words to describe the headteachers’ style of management

Open-ended questions included in the survey were intended to allow the headteachers to express their own perceptions of their style and of the values that they are trying to promote in the school. The headteachers were given the opportunity to list three separate words that describe their style of management. This question appeared in the survey before the question involving the list of masculine and feminine paradigms, so it is unlikely that these adjectives had any influence on the free choice of the three words. No guidance whatsoever was given, to allow them to provide unprompted responses. This led to there being a large range of adjectives offered. However, it was possible to group them, and establish some idea of the prevalent styles of management that the female headteachers considered that they adopted. The themes that were identified are listed below, with the percentage of the total number of adjectives in each group:

1. A collaborative style of management
   – e.g. consultative, open (38.5 per cent)
2. A people-oriented style of management
   – e.g. team-related, supportive (23.8 per cent)
3. An autocratic/directive style of management
   – e.g. decisive, firm (14.9 per cent)
4. An efficient style of management
   – e.g. focused, planned (11.7 per cent)
5. A values style of management
   – e.g. visionary, fair (11.1 per cent).

There is a clear indication that the single most popular style of management was that termed ‘collaborative’. However, it is notable that most of the headteachers use terms like ‘consultative’, ‘open’, ‘collaborative’ and ‘participative’ rather than ‘collegial’ or ‘democratic’. It appears that the majority of the headteachers adopting this style of management reserve the right to make the final decision. The potentially overlapping ‘people-oriented’ style of management was also strongly indicated by the choice of adjectives grouped within that theme. The range of adjectives chosen is very wide, but the styles of management that are indicated in the majority of responses are consistent with the adjectives most often chosen from the female paradigm – i.e. ‘aware of individual differences’, ‘caring’, ‘intuitive’ and ‘tolerant’.

Certainly, the identification of the collaborative and people-oriented style of management with the way that women manage is in accord with a range of earlier findings. Research on female headteachers and principals in the USA, the UK, Australia, New Zealand and Canada appears to indicate that female managers are likely to work in a cooperative style, empowering their colleagues and characteristically making use of teamwork (Blackmore, 1989; Adler, 1994; Hall,
This generalization is borne out by research findings from outside education (Ferrario, 1994).

The author’s survey of all female secondary headteachers in England and Wales thus largely endorses earlier research, but although it is clear that the preferred management style of female headteachers is collaborative, there appears to be a minority of the heads for whom this is not true. Although the collaborative and people-oriented styles were endorsed by a majority, there were a considerable number of adjectives offered that were grouped as either ‘autocratic/directive’ or ‘efficient’. This represents a proportion of headteachers who, through their choice of adjectives, identified their style of management as probably more akin to the masculine paradigm than the feminine. This style of management might be identified with some of the ‘male’ adjectives, such as ‘disciplined’, ‘evaluative’, ‘formal’ and ‘competitive’.

In the above analysis, the adjectives were considered singly. When considering the adjectives in their groups of three, it was rare for all three to be grouped within the same theme. For example, ‘efficient’ adjectives might be combined with either ‘people-oriented’ or ‘autocratic’ adjectives. However, a dominant style was considered to be where at least two of the three adjectives came from either collaborative and people-oriented or from the autocratic/directive and efficient categories.

For those headteachers aged 49 or under, about ten per cent chose at least two of their three words from the autocratic/directive style of management combined with the efficient style of management, but the proportion of those 50 or over doing so was just over 20 per cent. The tendency to be more collaborative may be linked with ‘youth’, and this appeared to be the case in earlier research with headteachers (Weindling and Earley, 1987). Alternatively, a difference in style of the younger heads may be linked to a change in the expectations of what is required in headteachers in the last years of the twentieth century. Several of the heads interviewed by Hustler et al. (1995) indicated that their management style had moved towards being one of collaboration in keeping with: ‘a reformulated idea of the leading professional’ (Thompson in ibid., p. 90). Hall (1996) comments on the need for a different style of headteacher to cope with the demands of the post-1988 reforms, and identifies that all six of the women heads she studied are different from their predecessors whether male or female. In addition, a more ‘collegial’ style of management is now generally considered to be normatively superior to other styles (Wallace, 1989; Bush, 1995), at least in Western cultures.

The final group of adjectives, termed ‘values driven’, represents a strand of thinking that is probably not separate from the others, but identifies the values that may well underpin the management style of many headteachers. The most common category of adjectives within this group referred to being ‘visionary’, the second to being ‘fair’ or ‘honest’.

Overall, there appears to be a range of management styles indicated by the lists of adjectives provided, with one side of the spectrum occupied by the majority of the headteachers who adopt a ‘collaborative’ and ‘people-oriented’
style of management and the other side of the spectrum occupied by a minority of the headteachers operating an autocratic/directive style of management often linked to choice of the more ‘efficient’ adjectives. The ‘values-driven’ style may well underpin any or all of the other styles (see Figure 1).

Key values promoted in the school

The headteachers were also given an opportunity to indicate a free choice of the key values that they are trying to promote in the school. The respondents tended to indicate phrases, rather than individual words. The sentiments that are included in the value statements can be divided into four areas.

1 Academic excellence and educational achievement

Many of the value statements mentioned academic achievement, sometimes in association with caring values:

‘academic achievement in a caring community which develops all pupils for their own potential.’

‘The pupils’ learning is central.’

2 The importance of every individual achieving their potential

These statements are often linked to the importance of hard work:

‘everyone committed to the success of each student.’

‘everyone has the potential to achieve, but you must work hard to succeed.’

3 Respect for self

There was awareness of the need to promote:

‘high self-esteem for all.’

‘the importance of self-worth, and valuing others.’
Respect and caring for others

There was awareness in these statements of the need for:

‘respect for individual differences; valuing others [pupils and staff]’

and that:

‘students should aim high, with compassion for those around them.’

The achievement of academic excellence could be considered an objective that is innate in the purpose of almost any school. This value is very much in accord with the key quality of strategic direction and development of the school outlined in the National Standards for Headteachers (TTA, 1998), in terms of the creation of an ethos and vision which will secure achievement by pupils. However, the remaining values identified are related to the qualities of caring and respect for individuals that the headteachers have already identified within the Gray (1993) paradigms, where the four most popular qualities – ‘aware of individual differences’, ‘caring’, ‘intuitive’ and ‘tolerant’ – were all drawn from the feminine paradigm.

The words listed in Table 3, are those that were mentioned most in all the statements about values from the headteachers. These words indicate the importance of both achievement and respect as key values – achievement sometimes, but not always, specifying learning, and respect including respect for self and for others, both individuals and the community.

Aspects of educational leadership can be seen very clearly in the key values that the headteachers in the survey were trying to promote in their schools, and these aspects also endorse the idea that women are particularly concerned with

the teaching and learning aspects of their role in comparison with administrative or other responsibilities. There is no doubt that the two key value words used most frequently: ‘achievement’ and ‘respect’, are in keeping with the concept of educational leadership, and very much in line with existing research on the ways in which women in educational management operate (Gross and Trask, 1976; Shakeshaft, 1989, 1995; Hill and Ragland, 1995; Richl and Lee, 1996; Grogan, 1996; Gold, 1996; Kruger, 1996). This research was concerned only with female secondary headteachers, and it may be that a survey of male colleagues would reveal that men too are moving towards a ‘feminine’ style of management and share many of the key values identified by the surveyed female headteachers.

**Management in action**

The headteachers were asked a limited range of questions relating to the practicalities of their style of management. In particular, they were asked about their availability to staff, and the amount of time they spent out of the office when in school. They were also asked about the ways in which they encouraged all teachers to develop their careers, and if there was any special way in which they tried to encourage the careers of female teachers.

The majority of headteachers seem to make themselves available to their staff whenever possible (see Table 4). The headteachers also appear to be visible in the school for quite a large proportion of their time (see Table 5). In answer to the question ‘while you are in school, what proportion of your time do you spend out of your office?’, approximately 80 per cent claimed that they spent between 10 and 50 per cent of their time in the school, but out of their office.

Most of the headteachers report that they spend a considerable proportion of their time out of their office. They were not asked how this time was spent, but presumably some of it would be in teaching and some would involve ‘management by walking about’. When coupled with the information about the availability of the majority to talk to teachers, there would appear to be some evidence to

support the dominant management style indicated by the majority of the headteachers. It seems that a large proportion of the headteachers consider that they operate in an open way and are highly involved with their staff and the operation of the school.

**Encouragement of all teachers to develop their careers**

Headteachers sought various ways to encourage teachers to develop their careers. Courses, appraisal and mentoring were the most often cited means, but ‘other’ ways were written in by 52.9 per cent of the respondents (see Table 6). Of those who indicated ‘other’, most stated that they were encouraging one-to-one meetings for all members of staff to discuss career planning. The meetings either took place with themselves as headteacher, with another member of the senior staff, the INSET coordinator, a consultant or an unspecified person. The general feeling was that it is:

‘very important to find time to have one-to-one conversations about individual strengths and needs.’

Other possibilities mentioned were career development opportunities inside and outside the school, and other, generally practical, means of encouragement such as practice interviews. The development opportunities included specific interventions:

‘departmental monitoring, work shadowing, teacher placement.’

There was some indication of encouragement of development through means other than promotion:

‘Involvement in teams to develop projects.’

‘Opportunity for role rotation, being given support to lead initiatives (curriculum and pastoral).’

One headteacher specified the development opportunity that was available in a largely female school:

Taking on “acting” responsibilities during our frequent maternity absences.

Since a minority of headteachers in England and Wales are women, they present important role models for other female teachers. The heads were asked if they particularly encouraged women teachers in their career progress. The largest single group responding to this question indicated that they did not treat women differently from men (see Table 7).

Some of the headteachers indicated more than one way in which they encouraged female teachers. The large proportion indicating ‘No special ways’ is actually greater than 46.6 per cent, since some of those commenting in the ‘other’ category reiterated that all staff were treated equally in their school (18.6 per cent) or that staff were all treated according to the equal opportunities policy (4.2 per cent). A further 6.7 per cent stated that they pursued the same policies that they had indicated for the staff as a whole.

In addition, some of the headteachers of girls’ schools commented in the ‘other’ comments, that the question of treating female staff differently does not really arise for them, since the majority of their staff are women. Such comments accounted for about ten per cent of those in the ‘other’ comments.

It is therefore likely that the majority of headteachers do not have any special policies with regard to the encouragement of female teachers. However, over 20 per cent do state that they encourage women through women-only courses and a similar proportion through mentoring. In addition, the largest proportion of comments written in as ‘other’ referred to specific encouragement of women. This encouragement often included the headteacher’s own importance as a role model and, in some cases, referred to the doubts and lack of confidence evidenced by their women staff:

‘Personal conversation: I always encouraged competent women, from being a scale 1 teacher onwards, making sure they see themselves as possible runners, and boosting their confidence.’

‘Individual discussion, also with male staff, but I find many women, although very good, do not have confidence to put themselves forward for promotion. Three examples in my school spring to mind . . .’

The encouragement of women through being a role model was seen to be important, particularly in the context of the domestic role of women:

‘I talk to them about the issues, making it clear I have children, etc. – i.e. trying to be a role model.’

There was also awareness of the need to overcome stereotyping:

‘There is a high percentage of female role models – SMT, heads of science and maths, etc.’

Finally, some of the encouragement specifically addressed to women was associated with issues such as the handling of maternity leave, and more radical suggestions to help women such as job-sharing:

‘Being flexible about moves between part-time and full-time. Job shares (though not yet at present school).’

‘finding opportunities for responsibility in a variety of ways – particularly important for returners. Enhancing the role of positive women in whole-school issues.’

‘Flexible return to work after maternity leave.’

Whilst there is a commitment to staff development as a whole, it would appear that a substantial minority of the headteachers are aware of a need to separately foster the career progress of women. However, it is only a small minority of the headteachers who have moved beyond courses and mentoring to actively encourage female staff in practical ways such as job-sharing and flexible work practices.

**Male resentment of female leadership**

Over half of the surveyed heads reported experiencing sexist attitudes from their male colleagues. This experience was reported more by those under 50, and those who were married and had children, in comparison with those who were single and childless. Similarly, the heads of girls’ schools were less likely to report sexism from their peers than the heads of coeducational and boys’ schools (see Table 8). These differences are statistically significant. It would appear that women who are married and who have children, particularly those working in coeducational schools, may be identified more strongly with a domestic stereotype and implicitly considered less able to lead and manage.

Once established as headteachers, they were strongly aware of the fact that men found difficulty in dealing with female leaders. Being patronized and feeling isolated were two common features of the experience of headship. The female heads also reported examples of stereotyping linked to their sex. Many comments express: ‘difficulties with the concept of women as a boss’; some were more specific:
‘I inherited a school with a good number of staff who didn’t want a female head. The secretary and caretaker threatened to resign, some male teachers made it clear they didn’t want a woman telling them what to do.’

Occasionally, the resentment is linked to disapproval of management style that is not seen as ‘traditional’:

‘Some staff wanted as head a “big man who shouted” – I’m the opposite.’

There was also expectation that females would manage in a certain way:

‘The assumption was that you will be a female stereotype – keep changing one’s mind, can’t handle difficult male pupils, etc.’

Whilst the stereotype of the woman as a ‘soft’ manager predominates, there is evidence of a different range of stereotypes associated with women:

‘the suggestion that career women are cold, hard and single-minded.’

‘more a question of little bits of prejudice against single-woman role. Rumours seemed to vary: I’m assumed to be either a promiscuous heterosexual or a latent homosexual.’

The majority of the headteachers (62.7 per cent) stated that, as a woman, they had felt the need to ‘prove their worth’ in a management position. There was little difference in the proportion of women who felt this amongst those of differing age-groups, but some differences between those of different marital status and those who headed girls-only schools, compared with the rest. The need to ‘prove your worth’ is felt more strongly by those with children, and less strongly by the single and heads of girls’ schools. This difference may well be linked with the tendency to stereotype married women who are mothers with the domestic role, which was particularly evident in responses relating to discrimination linked to promotion. The largest category of responses to the question of

the need to ‘prove your worth’ related to combating the range of stereotypes that are held about women in management.

Despite the range of stereotypes relating to female leadership, much of the resentment was linked to the softer, more participatory style of management of the female heads on the part of subordinate males who were used to a more decisive, autocratic style. The present research appears to replicate the findings from qualitative research in the UK (Hall, 1996) and quantitative work in the USA (Riehl and Lee, 1996) and Israel (Goldring and Chen, 1994), that there are considerable difficulties for some men in adjusting both to working for a woman and adapting to the preferred management style of most women.

The advantages in being a woman headteacher

The majority of the group surveyed have been successful in terms of a traditionally male career path, and some have adopted the norms associated with a career that takes little account of family life. Only 10 per cent identified ‘being a woman’ as a reason for success. By far the most frequent reason for success quoted was ‘hard work’, with support from others being the second most important reason. Both of these tend to indicate the difficulties that a woman may face in reaching a position of leadership, particularly when the leader is stereotypically expected to be a man. However, there are benefits in being a woman once headship has been achieved. Nearly two-thirds of the headteachers reported that they had found it an advantage to be a woman headteacher (see Table 9).

The most mentioned advantage was in terms of being able to defuse macho behaviour on the part of males: students, teachers and parents. In this case, the fact that men feel the need to be aggressive with other men, and that aggression is not associated with females, acts to their advantage. A number of the headteachers quite consciously acted up to the stereotype of femininity and played on the susceptibilities of males, such as governors or local authority personnel, who were likely to perceive them first and foremost as women.

Table 9 Advantages of being a woman headteacher
Another advantage quoted by the headteachers was ‘being noticed’. Since they were a relative rarity as a female, they tended to be offered opportunities, particularly by the local education authority. It is possible that a rise in the number of female headteachers, which would lead to a reduction in such opportunities, might therefore not be entirely welcomed by some of the heads.

The headteachers were positive about their gender in terms of their approachability. They felt that people, particularly girls, mothers and female members of staff, could approach them more freely than they might a man. In addition, they considered that they had the freedom to empathize with families and be sympathetic in a way that most men could not. Although the general assumption that the leader and manager is male may prove a handicap for the female manager, there is the other side of the coin, namely the freedom of the female manager to behave in a way that is not constrained by the normal stereotypes associated with leaders. It may be that being a woman in management allows some freedom (Hall, 1996) and gives the opportunity to the female headteacher to develop in fresh ways that are unencumbered by the perceptions of others. In addition, Grogan (1996) refers to the life experience of women, as wives and mothers, moulding them as administrators – the experience making them different from males in the same positions.

Conclusion

The survey of the entire population of female headteachers in England and Wales has contributed in a number of ways to the understanding of the management and leadership of women headteachers in the 1990s. The high response rate to the survey gives confidence in the validity of the findings and allows the possibility of some generalizations to complement existing and future qualitative research.

One of the major findings emerging from the research is the continuing discrimination that has been faced by women who are now senior managers in education. The experience of isolation and instances of sexism from peers, recounted by the headteachers, indicate that they are operating in a context which may be inimical to success unless women are prepared to adapt to the prevailing values. These might include opting for a single state, childlessness or working harder and longer than any competitors, male or female.

Many of the headteachers in the survey reported on their experience of resentment, on the part of males and some females, at being subject to female leadership. However, the majority also identify ways in which being a woman leader frees them from the stereotypes of male leadership. Both of these factors exemplify the differences in the context within which male and female headteachers operate, indicating the relevance of gender to the study of leadership and management.

The research strongly endorses the view that most women manage their schools in a way that can clearly be identified as consultative and people orien-
The majority of the headteachers, particularly those under 50, chose adjectives that identified them as collaborative and caring. The choices also endorsed the importance placed on teamwork and on ‘power to’ rather than ‘power over’. However, they do not claim to be democratic, rather they say that the final responsibility for decisions rests with them. In reviewing effective management in schools, Bolam et al. (1993) commented that the headteacher of an effective school ‘has consultative “listening” style; is decisive and forceful but not dictatorial; is open to other people’s ideas; and is easily accessible to staff’ (p. 119).

The headteachers’ choices of adjectives to describe their management style and values generally reflected and endorsed the findings of previous research. The predominant management style was collaborative and people-centred. However, there is a small proportion of the heads for whom this is not true. About 15 per cent of the heads may be adopting, consciously or unconsciously, a style of management and leadership that may have more in common with elements of the more stereotypical ‘masculine’ style, which involves a more directive way of operating. The survey also endorses the tendency for women to be educational leaders, placing stress on the learning of their students rather than on the importance of administrative tasks. The values that the headteachers chose were indicative of the values of educational leaders, ‘achievement and respect’.

Whilst the quality of leadership may best be judged within the context of the individual school, the majority of the surveyed heads operate in a manner that largely coincides with concepts of effective leadership in education. It was noted in the introduction that the under-representation of women in senior management in education constitutes an issue of equity. Since women tend to operate in a collaborative manner that is likely to empower others and endorse values of educational leadership, their under-representation also indicates a loss of potentially effective leadership in schools.

THE FEMALE SECONDARY HEADTEACHER

CHANGING THE DEAFENING SILENCE OF INDIGENOUS WOMEN’S VOICES IN EDUCATIONAL LEADERSHIP

Tanya Fitzgerald

**Abstract**

The critique of western ethnocentric notions of leadership presented in this paper is informed by debates on issues such as gender and educational leadership that have produced meta-narratives that explore and explain women and men’s ways of leading. One of the troubling aspects of western leadership theories is the claim that the functions and features of leadership can be transported and legitimated across homogeneous educational systems. Despite changes that have been made in definitions and descriptions of educational leadership to provide a focus on gender, there is the implicit assumption that while educational leadership might be practised differently according to gender, there is a failure to consider the values and practices of indigenous educational leaders. Thus, the construct of educational leadership needs to be more broadly theorised in order for knowledge of indigenous ways of leading to emerge.

**Introduction**

There are now considerable theoretical and empirical studies on women and educational leadership that have emerged predominantly from the USA (Chase, 1995; Grogan, 1996; Shakeshaft 1987), Britain (Adler *et al.*, 1993; Coleman, 2001; Ozga, 1993), Australia (Blackmore, 1999; Limerick and Lingard, 1995) and New Zealand (Court, 1995, 1998; Strachan, 1999). These studies have fundamentally contested claims such as those expounded by two of the “fathers” of educational administration theory, Hodgkinson (1991) and Sergiovanni
[144x655](1992) that top-down “visionary” leadership is possible and permissible and that issues of social class, gender, race and ethnicity are unproblematic. In their critique, feminist authors have argued that the primacy of positional and propri- etorial leadership is a contested domain and that there can be no unitary explanation of what it means to exercise educational leadership. While the literature on educational leadership is expansive, conclusions that theorists posit pinpoint their concern with determining and defining the nature of educational leadership. Just who might be leaders and how circumstances of social class, location, ethnicity and cultural world view might underpin their work and identity is not fully discussed and disclosed. Essentially while these discourses of “masculinity, rationality and leadership” (Blackmore, 1999, p. 4) and the search for a normative theory of leadership (Duke, 1998) remain gendered, they also remain raced. That is, considerations of race and ethnicity are not uncovered to examine ways in which these trajectories impact on the exercise of educational leadership.

The reform of educational administration that was widely experienced in the late 1980s and 1990s has produced new images and understandings about the nature and role of educational leaders. In essence, good (male) leaders are portrayed as visionary, multiskilled, self-regulatory, facilitative, goal oriented, entrepreneurial and service oriented (see Duke, 1998; Marsh, 2000; Senge, 1990). In a subliminal and subtle way the literature popularises women’s leadership in oppositional ways and suggests that they might exercise traits characteristically described as flexible, supportive, nurturing, collaborative, collegial and socially just. Values such as openness, trust, empowerment and compassion provide a relief map for charting ways in which women inevitably exercise leadership in schools. In the process, debates centred on the common theme that “gender matters in educational leadership” (Blackmore and Kenway, 1993; Hall, 1999; Shakeshaft, 1987) have produced discourses of privilege. That is, women as educational leaders have been theorised about as if they are an homogenous group and considerations of circumstances such as ethnicity/social class/location and beliefs have been discounted. Or, at the very least, distinctions between and among women have collapsed in the attempt to provide a meta-narrative that describes and defines women’s experiences and practices as educational leaders. Against a backdrop of the contested and continuing reform of educational administration, discourses that universalise the complex participation of women and “women’s leadership” have produced universal and somewhat troublesome narratives that privilege “feminine” values. In this way categories of “woman” and “educational leader” have become fixed and the possibility for substantive diversity among and between women does not appear possible. And in particular, whiteness becomes a privileging construct that is played out differently across gendered lines.

This paper will examine literature relating to educational leadership and critique assumptions concerning the homogeneity of this construct and the apparent invisibility of indigenous leadership models and discourses within
these narratives. Despite the shared rhetoric about what it means to simultaneously occupy positions such as “woman” and “educational leader”, silences surrounding indigenous women and educational leadership are deafening.

**Educational leadership in a reform framework**

Since 1988, educational administration and the nature of educational work in the western world has undergone widespread reform that was predicated on the need to re-conceptualise education as a market commodity (Smyth, 1993; Thrupp, 2001). One of the direct consequences is that schools and their leaders have been required to shape their policies and practices according to the stated (and at times not stated) demands of their stakeholders (Glatter, 1999). Conservative and competing demands for parental choice and participation, school autonomy, cultural diversity, educational standards, core curricula, teacher accountability and leadership have radically altered the educational environment that teachers, students and educational leaders occupy (Court, 1998). Despite differences in location, identity and (social and educational) structure, countries such as Australia, New Zealand and Britain have exported and imported educational policy solutions to rectify and resolve these complex educational problems (Thrupp, 2001).

One of the survival mechanisms that schools in New Zealand have adopted is the shift towards entrepreneurship. In an attempt to simultaneously retain a financial and competitive advantage, schools have actively recruited fee-paying international students, sought corporate sponsorship (and in some cases have incorporated the corporate brand within the school name) and focused on image management (Ball, 1994). Schools that are able to offer well-resourced and comprehensive programmes that produce high performing students are deemed to be “good schools” with (presumably) “good leaders” (Education Review Office, 1998). Coincidentally, these schools are often situated in highly sought after residential areas (Gordon, 1994) and are most likely to be led by white, middle class and well educated men (Blackmore, 1999). This is primarily problematic as discourses centred on the conceptualisation of what constitutes a “good school” have been closely connected with models of “good leadership” that associate masculinity with rationality, accountability, efficiency, line management styles and practices, entrepreneurship and the requisite political and administrative expertise (Blackmore, 1999). In this way educational leadership is re-constituted as a “technology of the masculine” as Marjorie Theobald (1996, p. 174) has suggested. This is perhaps a partial explanation for the numerical dominance of men in leadership positions in schools and a central reason to interrupt orthodox educational leadership knowledge and practices in raising questions regarding the apparent silence of women’s voices and, more specifically, indigenous women’s voices.
Debates about gender and leadership are, in the main, raised by women for and about women as evidenced in bibliographies provided by writers such as Jill Blackmore (1999), Diane Dunlap and Peggy Schmuck (1995) and Charole Shakeshaft (1987). What is needed therefore is gender to be located at the centre of debates on leadership, not at its periphery where it is largely ignored. For this to be achieved a redefinition of educational management and leadership that “provides an appropriate stage for giving gender not only a speaking part” (Hall, 1999, p. 156) should be sought. In this way, persistent masculine images of leadership and educational leaders can be contested and questions can be raised concerning taken-for-granted-assumptions surrounding the gender neutrality of these images and discourses. Alternative possibilities for thinking about leaders and leadership may then be possible.

While systems that educators work within are hierarchical and centrally determined and controlled, this is not to suggest that individuals might exercise leadership in a variety of valid ways. What is being called for is a discourse of leadership that does not seek to privilege gender but opens up opportunities for women and men to exercise leadership in non-exclusive ways. In order to achieve this we should begin with an understanding of the systematic inclusion of masculine discourses in the definitions and descriptions of educational leadership and management and pinpoint reasons for the perpetuation of privilege based on gender.

Recent claims by Duke (1998) that a normative theory of leadership is possible exemplify the probability that educational leadership is exercised in a linear, rational and uniform way and predicated on masculine forms of leadership. Kerfoot and Knights (1993, p. 672) have variously described this as strategic or competitive masculinity that “privileges men vis-à-vis women, ranks some men above others, and maintains the dominance of certain forms and practices of masculinity”. In this way, women’s ways of leading are defined in oppositional ways.

Blackmore (1999) has identified ways in which power relations are reproduced and maintained within schools. These power dynamics have created assumptions regarding the normative role and position of the male leader and reinforced causal hegemonic links between masculinity, hierarchy and leadership. The “other” side of the picture is the inference that qualities such as nurturing and caring are necessarily feminine and that these qualities are in some way inferior to “normal” leadership traits. It is reasonable to suggest therefore that the pedagogy of leadership is constructed as “normally” the domain of men and the pedagogy of teaching as essentially the work of women. This form of hierarchical managerialism (Codd, 1993) is a privileging construct. The resultant emphases on technical, task-oriented responsibilities and accountabilities have been pinpointed as one of the central reasons why women predominantly occupy the lower level of workforce hierarchies (Court, 1998; Dunlap and Schmuck, 1995; Ozga, 1993).
For women leaders the emphasis on hierarchical leadership that is embedded within a managerial framework creates tensions and uncertainties about what constitutes effective leadership. As Jill Blackmore (1999) has argued unitary theories that explain ways in which women lead and experience leadership are problematic; women leaders are neither the binary opposite of male leaders nor can there be a model of the “natural and strong” female leader. Although accounts exist that explore the complex and contested educational work of women leaders (Strachan, 1999), further work needs to be completed on the interplay between gender, ethnicity and educational leadership. In particular I am concerned that indigenous voices are heard; not as a harmonious choir but as a cacophony of voices that celebrates distinctiveness within an indigenous framework.

**Indigenous educational leadership**

Discussing differences and distinctiveness within the scope of educational leadership is contested and dangerous terrain. Partially this is because these discourses are outside of my own territory as a *Pakeha* (white) academic in Aotearoa/New Zealand and because I neither wish to “add-on” difference nor theorise to produce an homogeneous discourse of indigenous voices.

There is a growing body of literature on cultural diversity and leadership (Bajunid, 1996; Gunew, 1994; Henry and Pringle, 1996; Jones *et al.*, 2000; Pringle and Timperley, 1995) that conceptualises and constructs theories that value and recognise indigenous ways of knowing, acting and leading. Significantly, the literature seeks to document ways in which leadership is experienced and exercised within a multicultural framework yet does not offer an understanding of strategies used to navigate dual cultures. This points to the possibility that for indigenous leaders they face the dilemma of double consciousness as they struggle to interpret, negotiate and survive in two distinct cultural worlds – one *Pakeha* (European/white) and one indigenous. For indigenous women in particular trajectories of ethnicity and gender present a tension-ridden and deeply problematic dichotomy that has the capacity to shape and determine patterns of social interactions, relationships, mobility and life choices. There is a need to formulate indigenous and non-western theories of educational leadership that are grounded in research that account for and explain indigenous women’s ways of knowing and leading.

This is not however a call for the “adding on” of indigenous women to current narratives about educational leadership. We need to challenge debates concerned with gender and educational leadership to ensure that the role and position of *Pakeha* women is not placed at the center of our theorising, thus re-locating indigenous women to the margins and in redundant positions. Furthermore, given location and family/whanau circumstances, we cannot unilaterally assume that the experience of one indigenous woman can provide a universal understanding of the interests and positioning of all indigenous women. The
effect of discourses of sameness is paralysing and constrains indigenous women to work in particular ways. A further difficulty is that the politics of gender and ethnicity define women in general and ethnic women in particular as problems. Categorical definitions render women as a female problem and race as a minority problem. As Sue Adler et al. (1993) have pointed out these categories allow non-indigenous women to identify themselves as women, not as white women. In this way, whiteness is the taken for granted norm that is deemed to be stable, unified and homogeneous. Difference is therefore expressed as a corollary of whiteness. This therefore has the potential to create a monoculture of the powerful that is expressed in gender and race specific ways as Penny Tripconey (1995) has documented.

One further criticism of the limited literature base is that indigenous women and women of colour are considered in unproblematic ways (Yeakey et al., 1986). That is, all women of colour are labelled as one group thereby negating their distinctiveness based on ethnicity, family, geographical location, language, social and familial relationships, knowledge, spirituality, philosophy and aspiration (Moreton-Robinson, 2000, p. xviii). A further difficulty is the double bind that indigenous women face (Blackmore, 1999, p. 199). While indigenous women represent their communities, they are implicitly expected (by Pakeha administrators) to work as change agents to simultaneously challenge existing power structures in their educational organisations.

In order to uncover the complexities and contradictions that women of colour face as educational leaders, it is imperative that a conscious attempt is made to understand the historical, social, economic and professional circumstances of indigenous women’s lives. It is feasible that such an understanding will permit indigenous women leaders to define their own realities and contest prevailing notions of the “universal educational leader”. One possible way is through a focus on bicultural life stories that examine the interplay of ethnicity and the interrelationship of the individual and her environment. What is being called for therefore is an indigenous theory of educational leadership that places indigenous women at the centre of the narrative. This might reflect or be a sharper, more radical critique of the perpetuation of power and authority within traditional hierarchies that questions the pedagogy of leadership and which centralises differences. I would like to focus this critique on Aotearoa/New Zealand and propose a framework that offers a possibility for indigenous leadership within a bicultural framework.

A framework for indigenous leadership in Aotearoa/New Zealand

In 1989 the administration of New Zealand education was reformed. Although the focus was improving the quality of teaching and learning through the decentralisation of school management based on a partnership model between the school and its community, the net effect of these reforms was the demand for
schools to be fiscally efficient and publicly accountable (Codd, 1993; Thrupp, 2001). This changing legislative and administrative environment and the resultant industrial relations framework impacted variously on women’s participation as leaders and managers in schools. In particular, the legislative imperative to hire individuals identified as belonging to minority groups (including women, Maori, Pasifika) has satisfied specific institutional needs. Yet these demands and the intense level of scrutiny placed on minorities within a minority setting (Konrad and Pfeffer, 1991) have not been fully accounted for in explanations of educational leadership. Furthermore, as Yeakey et al. (1986) have argued, minority school leaders are frequently appointed in urban areas where the majority of students are of colour. This has contributed to a legalised form of urban segregation based on residential patterns and the idea that “minority school systems are the appropriate places for minority administrators” (Yeakey et al. 1986, p. 124). In Aotearoa/New Zealand experiences and challenges faced by Maori women school leaders (as a numerical minority) cannot be articulated or explained in terms of similarities with and differences to the leadership of Pakeha (white) women (Bowkett, 1996; Smith, 1992).

Studies such as those conducted by Marian Court (1995) in New Zealand, Margaret Grogan (1996) in the USA and Marianne Coleman (2001) in England and Wales have uncovered similarities in women’s social, economic and educational backgrounds, career progression, family circumstances and leadership styles. However, there has not been a conscious attempt to theorise how power is exercised and differentiated in gender and race based ways. While some studies have provided evidence of “black women in educational management” (Blackmore, 1999; McGee Banks, 2000; Ozga, 1993; Shakeshaft, 1987; Slack and Cornelius, 1995) a glance at these texts suggests that this knowledge has been organised in a marginal way. Invariably it is the latter chapters of these texts that focus on the problematic nature of educational leadership and women of colour. It is not a case of arguing whether gender and ethnicity are relevant to debates surrounding the nature of educational leadership, but why the case for their centrality to our understanding still has to be made. In other words, educational leadership needs to be subject to a process of redefinition to ensure that the voices of indigenous women and their experiences are conterminously theorised and legitimised from their worldview.

Western views of leadership have placed primacy on the role of individuals (Sergiovanni, 1992), the organisation (Senge, 1990) and notions of excellence and individual success (Glatter, 1999). Ways in which women exercise leadership (Blackmore, 1999) and the interplay of gender and ethnicity have not been fully considered (Henry and Pringle, 1996). In the case of Aotearoa/New Zealand ways in which Maori women have experienced and acted as leaders have been subject to constraints of gender, ethnicity and colonisation (Smith, 1992).

It is often and erroneously assumed that Maori leadership is primarily exer-
cised by Maori men and that Maori women are subordinate to the authority of men (Henry and Pringle, 1996; Smith, 1992). This is a colonising assumption that rests on the predication that leadership is exercised by an individual and that the individual is “naturally” male. In traditional Maori society both men and women were necessary components of the collective whole and both formed part of the link through whakapapa (genealogy) to the past, the present and the future. All people were part of a collective identity and their survival rested on the collective responsibility of the group to value and respect each person for his/her skills, strengths and attributes. One of the more powerful indications of the gender-neutral way in which the Maori world operated was that there are no personal or possessive pronouns in the Maori language that signify a hierarchy of sex. In terms of stories, proverbs and language, women are spoken about in positive terms. For example, women are referred to as whare tangata (the house of humanity/people); hapu refers to a pregnant woman as well as the wider family group; and whenua means both land and afterbirth (Bishop and Glynn, 1999, pp. 11–25). The interrelationship between women, men and the life-sustaining land is evident in the phrase “he wahine, he whenua, e ngaro ai te tangata”, the interpretation of which is commonly cited as “by women and land, men are lost”. Without the nourishing influences of women and the land, survival is not, and was not, possible.

Traditionally it was the whanau family that provided women with their source of strength. Maori women were not considered the chattels of their husbands; they identified more strongly with their own family and property was not transferred on marriage. Although a woman might live within her husband’s whanau, their role was to ensure she was protected; she always remained a part of her own whanau. This form of social organisation did not confine Maori women within a nuclear family structure. Because of the extended nature of the family unit, child rearing was a communal task and this enabled women to perform a wide range of roles, including leadership roles (Smith, 1992).

Significantly, women played an important role in the maintenance and transmission of oral histories that ensured the survival of the history and identity of the iwi tribe. Missionaries who arrived in the 1820s brought with them culturally specific understandings of the role and status of women. This produced a shift in emphasis away from the powerful female influence and the emergence of the male warrior as the primary leader. One of the direct concerns of the missionary groups was to rescue and reclaim Maori women who they considered in danger of sexual exploitation by men (Fitzgerald, 2000). As Linda Smith (1992, pp. 48–9) notes:

Maori women were perceived either in family terms as wives and children, or in sexual terms as easy partners. Women who had “chiefly” roles were considered the exception to the rule, not the norm . . . Maori women were considered attractive in the absence of a pool of white women. Their autonomy was interpreted as immorality and lack of
discipline. Christianity reinforced these notions by spelling out rules of decorum and defining spaces (the home) for the carrying out of appropriate female activities.

One of the ways in which the colonisation of Maori women continued to occur was through the domestication of Maori women’s knowledge and status via the curriculum that was offered in the mission schools (Fitzgerald, 2000). These schools trained Maori women to inculcate the values of nineteenth century Christian and Pakeha society that rendered women subordinate to men as wives and mothers located within the domestic arena of the home.

While the impact of colonisation led to debilitating changes in the role and status of Maori women, leadership was still exercised by Maori women albeit in public ways within broader Maori society. Historical evidence points to the leadership roles of Maori women in Te Kotahitanga (Maori Parliament), the suffrage movement and the Maori Women’s Welfare League (Rei, 1993). In the Native Schools system, established in 1867 and disbanded in 1967, Maori women were head teachers in many of the schools as Simon and Smith (2001) have documented. This therefore raises two vital questions. In the first instance we need to question why it has become the norm to assume that leadership in Maori society was traditionally a male domain and that female roles are of less value than male roles. Second, why has the perception developed that Maori women leaders are conspicuously absent? This is, as Smith (1992) argues so poignantly, the colonised reality of Maori women’s lives. We must look beyond discourses that suggest that Maori women’s relative absence in school leadership roles is problematic to question why leadership theories are deeply problematic and demand serious critique as they fail to provide a forum for multiple indigenous voices to be heard, understood and theorised. This is not an easy task.

In more general terms, there are a number of central issues to be considered in the search for an understanding of “indigenous educational leadership”. In the first instance, it may not be possible to construct a unitary definition of indigenous leadership particularly as leadership may be exercised in multiple ways in a variety of settings as the previous discussion on leadership in Maori society has indicated. Second, personal qualities, skills and knowledge that contribute to “indigenous leadership” cannot be articulated as differences between indigenous and non-indigenous leadership, yet relationships within indigenous communities and relationships with non-indigenous communities are inextricably linked (Bishop and Glynn, 1999). This therefore points to the possibility that two layers of leadership may exist within indigenous communities: (traditional) community leadership that is derived from an indigenous worldview that recognises skills and knowledge according to the mana (authority, respect) of an individual; and leadership as advocacy between indigenous and non-indigenous communities: “indigenous leadership often requires people to be able to walk confidently and with influence in two worlds” (Australian Institute of Aboriginal and Torres Strait Islander Studies, 1998, p. 16).
In Aotearoa/New Zealand the official rhetoric of the State espouses the primacy of the *Te Tiriti o Waitangi* (1840) as the founding document of the country that acknowledges Maori as *tangata whenua* (the people of the land) and the affirmation of their sovereignty. The three principles that underpin this treaty are partnership, participation and protection. The expectation was that these principles would guide all aspects of public and civil activities. In terms of the provision of education and its delivery by all educational institutions, Maori were guaranteed a share in decision making (partnership), the mandate to define, guard and treasure their knowledge and language (protection) and the benefits of involvement in education at all levels (participation) (Bishop and Glynn, 1999, p. 199). While *Te Tiriti* (the Treaty of Waitangi) provides a measure of legislative compliance, accountability lies at institutional level for the implementation and institutionalisation of the three principles.

Institutions of the state, such as schools and universities, are obligated to publicly state their commitment to the principles embedded in this treaty. This raises further questions concerning how this partnership might be constructed, articulated and legitimated and by whom. The suggestion could also be forwarded that the principles on which *Te Tiriti o Waitangi* is based provide an opportunity for institutions to recognise the sovereignty of their educational leaders and students. This is both difficult and deeply problematic. Therein lies the challenge of partnership, protection and participation within a framework of indigenous (and non-indigenous) leadership.

In considering how, if at all, indigenous leadership might be described, the work of Bishop and Glynn (1999) is insightful. While the model developed by Bishop and Glynn (1999) is directed at asking questions about power relations in education, it is a useful framework for conceptualising educational leadership that accounts for indigenous worldviews. There are a number of similarities with conclusions similarly drawn in the 1998 research report of the Australian Institute of Aboriginal and Torres Strait Islander Studies (1998, pp. 15–16). Both studies indicate the primacy of the following values:

- initiation of the role of the leader and authority to speak and represent indigenous communities;
- benefits and connectedness to indigenous communities by their leaders and wider benefits through interaction with non-indigenous groups;
- representation and articulation of issues for and within indigenous communities and links with non-indigenous groups;
- legitimation of authority from indigenous communities as a core credential for leadership; and
- accountability to indigenous communities for the actions and activities of leaders.

The following model has been adapted as an organising concept to incorporate the five values listed above (the vertical axis) and provide a possibility for con-
sidering the three principles of *Te Tiriti o Waitangi*, partnership, protection and participation (the horizontal axis) as a metaphor for advocacy and leadership (see Table 1).

This model is not an attempt to offer a unitary model; rather a framework that recognises and respects multiple voices (representation) that are authoritative (legitimation) within a partnership where there is mutual accountability from the beginning (initiation) and the protection of what is valued and important.

**Conclusion**

The central troubling aspect of western leadership theories is the limited and traditional way in which the work of school leaders and managers has been constructed and conceptualised. In suggesting that a normative theory of educational leadership is possible, the assumption is tendered that leadership is an absolute and rational activity that can be exercised in culturally-specific ways. We need to sincerely question whether these forms of leadership are relevant for the twenty first century. I would suggest not. It is impossible to create conceptualisations of leading and managing without taking into account issues of gender and ethnicity. One of the ways this can be partially achieved is through the authentication of indigenous women’s voices and an understanding of ways in which background, ethnicity, religion, gender, family circumstances and other identities serve to transform and shape their educational work. What is needed is for multiple voices to be heard and a multi-voiced approach to educational leadership and management to be adopted. One of the ways this might be achieved is the adoption of a framework that positions indigenous ways of knowing and leading at the centre of practice and theory.

Tracking down the invisible issue

Accompanying the invitation to contribute to this anniversary edition of the EMA journal was the suggestion that I should begin by reviewing the journal’s treatment of gender and education management over the last 25 years. The editor was right in assuming that the task would not take long. Gender only began to emerge as a discrete topic after 1980 and, since then, has hovered in the wings like a wallflower at a party. The first clarion call to its serious consideration was in Hough’s article which highlighted, but did not attempt to account for its previous scarcity (Hough, 1988). Prior to Hough a few writers (mainly men) had included gender as a factor in their exploration of education management issues. It must be assumed that the failure of women to raise these issues in this context (since gender is seen to be about women, even though it applies to both men and women) can be attributed to their more lowly positions in academic and professional life. Even Hough’s article concludes by acknowledging a woman colleague as having carried out all the empirical work. She is not, however, shown as joint author.

The articles by Johnston (1986) and Gray (1987) suggest men taking gender seriously. Johnston looked at differences in teachers’ preferences for primary school leadership styles. He did not, however, question the bias of the instrument he used—the Ohio Leadership Behaviour Description Questionnaire— which was based on studies of ‘head men’ in mainstream formal organizations. He found that men and women had different conceptions of their ideal man and woman headteacher and concluded that women managers in primary schools would run into difficulties if they tried to imitate men. The parallel question of whether men primary heads would have trouble if they imitated women was not raised.

In contrast, Gray (1987, 1989 and 1993) aimed to keep gender on the agenda, particularly as it applies to the development of men as education managers. He
notes the difficulties men face in engaging in personal change, whether in what he describes as the more ‘nurturing’ environment of the primary school or the more ‘macho’ culture of secondary schools. Like Johnston, he sees women managers under pressure to adapt to ‘the machismo of much school organization’ (Gray, 1987: 41). His proposals about differences between men and women’s management styles are based, however, not on research but on his experiences of running training programmes for educational managers. Later he writes of the challenge to management development to enable men to open up and develop a wider range and a new language of feelings (Gray, 1993).

At this stage, gender is still segregated from other issues, rather than integrated into our understanding of the behaviour of men and women in education management. The seeds sown by these writers bore little fruit, though there was a brief flowering in the summer issue of the EMA journal in 1989, when four articles appeared (Jayne, 1989; McBurney and Hough, 1989; Weightman, 1989; Gray, 1989). The then editor summarizes them as being on the theme of ‘gender characteristics of management’. His phrase is vague enough to ensure that the articles appear so loosely coupled that they cannot be seen to constitute a serious attack on knowledge. Given the editor’s expressed concern with the difficulties faced by ‘chaps’ at the top, he missed an ideal opportunity to suggest that we all (not just women) might learn something by looking at women in management, few though they were and continue to be.

Articles referring to gender continued to maintain a token presence, with minimal impact on the journal’s dominant discourse. Drawing on their research on headteachers new in post, Earley and Weindling (1988) conclude that there were no apparent differences in the experiences of or responses to men and women and therefore gender was not a significant variable (p. 13). Martin’s (1993) closely argued case for the necessity of a masculine orientation for administrative positions adds fuel to the ‘management as masculine’ debate. Using the Bem Sex-Role Inventory, she found the masculinity scores of women administrators were similar to those of their male counterparts and higher than those of women teachers not interested in an administrative position. She interprets the women administrators’ higher masculinity score as a ‘coping strategy’. Coleman (1996), on the other hand, in a small empirical survey of female headteachers, tentatively concludes that the headteachers were androgynous, able to select from a wide range of qualities. Both studies fail to explore the implications of their gender-based findings for both women and men in education management. This token presence was in spite of Shakeshaft’s influential review of women in educational administration, which raised issues about the ‘different world of women administrators’ (1987). Hitherto gender and educational management were mainly discussed in terms of why women were underrepresented in senior positions in every sector’s management hierarchy: primary, secondary and tertiary. While this remained the main focus of discussion it was unlikely that the debate would ever become central or include men. Shakeshaft’s (1987) review set the agenda for a wider range of questions needing to be researched, if
knowledge about gender and educational management is ever to challenge or support a reconceptualization of theories of educational management.

**Changing ways of knowing**

A scrutiny of the changing discourse on educational leadership as reflected in the *EMA* journal over the past 25 years pays further testimony to the marginalization of gender perspectives. From Hughes’s (1972) account of school headship in transition to the intellectual jousting of Hodgkinson, Greenfield, Gronn and others, the frameworks and language for understanding educational leadership have shifted radically, in ways that parallel evolving ‘ways of knowing’ emanating from the tradition of feminist research. The word ‘feminist’ on the pages of this journal may, Medusa-like, turn many readers to stone. Of course not all research about gender is feminist but it would be unrealistic not to acknowledge the influence of some feminist research methods on the questions and data-collection methods that characterize much research into gender issues. It is precisely in the commonalities of the discourse on gender and that of new approaches to understanding educational leadership (e.g. Ribbins and Sherratt, 1992; Gronn, 1996) that the potential for integration rather than segregation becomes apparent.

Looking for the new ‘phoenix’ in administrative studies, Greenfield (1991) described his sense of ‘putting one’s self in jeopardy’ as a result of challenging others’ profound convictions and bias (p. 201). His experience is not far from that of senior women academics who risk their professional reputations by pursuing gender issues (Acker, 1994; Delamont, 1989; Hall, 1996). Indeed, it is easy to see those studies in the 1980s, which looked for differences in the behaviour of men and women managers or sought to establish the superiority of one approach over another, as falling into precisely the technicist trap that Greenfield attacks. Where his critique comes together with the concerns of many of those exploring gender and educational management in the 1990s is in Hodgkinson’s vision of administration as a ‘moral art’ (Hodgkinson, 1991). Its pursuit and the research methods needed to understand it, in Greenfield’s words, ‘need courage and resolution . . . for it entails clear-eyed observation of the realities, dilemmas, difficulties and defeats of life’ (p. 215). Taking gender into their theoretical stances puts researchers and theorists through the same painful process that Greenfield quotes Perrow as describing; that of thinking oneself ‘out of a mainstream paradigm that one had lived with and even contributed to’ (quoted in Greenfield, 1991: 205).

Whether the issues discussed in this paper can encourage engagement with that painful process will depend on the acceptability and seductiveness of the gender perspective on educational management I describe. I aim to show how the shift in our attempts to understand educational leadership and management, represented in seminal papers in the *EMA* journal over the last 10 years, reflects and is strengthened by the questions raised by gender perspectives on these issues. My purpose in presenting some of the key findings from my own study
of six women headteachers (three primary and three secondary) is to propose a modern version of educational leadership that does three things. It confronts the demands of educational change, it is both (or neither) ‘masculine’ or ‘feminine’; and it contributes ideas to the educational management agenda that result from the rejection of a narrowly defined androcentric view (the ashes from which Greenfield hoped his phoenix would rise). The discussion is organized around four themes: gender perspectives and research into educational leadership; becoming a school leader; being a school leader; and an alternative view on the debate about educational leadership as managerialist or emancipatory (Smyth, 1989).

**Background to the research**

Much literature on gender and educational management focuses on the barriers to women’s career progression in schools and colleges (see Hall, 1993, for a summary). There is less research-based evidence about their performance once in senior positions. Hence there continues to be a mystification about what it is like to be a woman at the top in education, a leader as well as a follower. Two years’ research funding from the Leverhulme Trust enabled me to explore the experiences of women in senior positions in schools in England, through interviews and observation. They were women who had broken through the ‘glass ceiling’, to become successful leaders in schools. They had circumvented the barriers that traditionally stand in the way of women seeking career advancement in organizations. In Beck and Steele’s (1989) words, they had gone ‘beyond the great divide’ and taken up leadership positions, with the implied possibilities of power and influence. This differentiated them from women in other sectors, where few are in positions of significant corporate power. It differentiates them too from other women teachers who either choose not to, or fail to, achieve promotion within the school or college system.

**Power, culture, gender: using a triple metaphor**

The book that details the research, *Dancing on the Ceiling*, shows women leading the management dance and making the dance floor their own. As a study of school leadership, as experienced by women, it challenges ideas and assumptions about leadership in schools, particularly those written by, mainly about, and implicitly for men. Some male writers (e.g. Fullan, 1991; Hargreaves, 1994; Grace, 1995; Southworth, 1995) have called for more evidence about effective educational leadership that considers gender, but the field continues to be dominated by women (e.g. Shakeshaft, 1987; Ozga, 1993; Ouston, 1993).

The four themes addressed in this paper each show how a gender focus (on women and men) can contribute to our understanding of the appropriate skills and attributes needed for quality leadership as we approach the year 2000. In a study (with Mike Wallace) of Senior Management Teams in secondary schools

---

**EMOTIONS AND GENDER**

---
(Wallace and Hall, 1994) we developed a dual power-culture perspective as a lens through which to view and interpret the phenomenon. Gender was included as a factor for consideration but not a specific focus for our observations of the teams’ operations. The project on women headteachers provided a further opportunity to use the power-culture metaphor; this time gender was added as a significant factor. The new triple metaphor provided an orienting frame for negotiating the territory of headship and gender and identifying the questions that data collection needed to address. A combination of the three perspectives (culture, power and gender) provided lenses for contrasting the ways in which the women heads interpreted and used power, and their impact on the school’s culture as, through their leadership, they worked towards changing the school in order to improve students’ educational experience.

The proof of the pudding is in the eating. For many, a triple metaphor is indigestible and reduces the impact of individual flavours. Yet the study of women headteachers showed how a triple metaphor of power, culture and gender to examine women’s performance as school leaders provided insights that any one perspective might have failed to yield. It showed how men and women’s interactions in schools are influenced not only by their different uses of power and allegiance to particular cultural norms, but by contradictory gender expectations. Daily interactions were simultaneously an expression of the use of power, cultural norms and gender expectations. Though the details might vary, the patterns of these triple influences on interaction are unlikely to have been different had the study been of men.

**Women on their own terms**

I would not, however, want to lose sight of the fact that the study was of women. A primary intention was to show how women behave as school leaders and school leadership as done by women. They combined entrepreneurial characteristics with a value framework (particularly about relating to people) and a repertoire of behaviours that differed from those often associated in other research with men as managers. Conceptualizing education management by studying women on their own terms constitutes a challenge to both men and women practising, researching and writing in the field. I believed, and the belief was confirmed, that the art of headship (particularly as a moral art) has its roots in childhood and educational and career experiences that cannot be divorced from an individual’s gender identity, whether man or woman. Some of our understanding of individuals as school leaders must include an understanding of them as women or men. Understanding leaders and managers in education means understanding them as people. Understanding education management means appreciating the values that underpin management choices about goals and ways of behaving in the job.
Confronting the taken-for-granted

Most texts on research methodology stress the need for researchers to examine and publicize their biases that may affect the validity of the data they collect. Yet research on headteachers is replete with assumptions about what it is and is not important to address, and what is and is not worthy of comment. For example, most studies of women at work assume that an understanding of their workplace behaviour must take account of their lives away from work. This presumption stems from a recognition of the different and difficult choices women face as a result of conceptions of their role in contemporary western societies. Where women managers are concerned, the constraints on seeking or being offered promotion are shown to arise from the conflicting expectations of work and family responsibilities and the failure of organizations (including schools) to take account of their different needs, as well as their workstyle preferences (Marshall, 1984 and 1995). These same assumptions about the symbiotic relationship between men’s personal and professional needs and their impact on their workplace behaviour are rarely addressed.

In his plea for ‘a new world order in the study of headship’ Gronn (1996: 25) asks for:

more and better leader-watching or on-looking: longitudinal, naturalistic and biographical investigations, particularly the latter, to better enrich knowledge of where leadership comes from and to ascertain what leading and following look like when scrutinised in any depth.

Similarly, the interviews with headteachers conducted as part of the 1995 BEMAS conference included a focus on the heads’ early lives, although Ouston (1995: 1) notes that, of the eight men and women interviewed, ‘it is the four women interviewees who present their personal and professional lives as crucially entwined with each other’. Recognizing that this might be the outcome of mainly same-gender pairs of interviewers and interviewees, she asks whether female interviewers are more likely to elicit personal information.

Implicit in her question are two important pointers for future leadership research, particularly if it takes the road advocated by Greenfield (stressing values) and Gronn (stressing biography). First, men researchers need to subject their relationship to their subjects or co-enquirers to the same gender analysis as women researchers do. If, as many women researchers claim, some of their understanding of their women interviewees come from their shared experiences as women (see e.g. Coleman, 1991), then this is also likely to be true of men interviewing men. Unless this influence is recognized, the picture can be biased in unacceptable ways. Yet, in Wolcott’s (1977) classic study of the man in the principal’s office, the effects of ‘man researching man’ on the conclusions about school leadership are not questioned. Southworth (1995) acknowledges himself as a male researcher and Ron as a male headteacher but does not explore further
the implications of this shared gender identity for his findings. Ribbins and Marland (1994) and Grace (1995) comment on their women heads as women but not the men heads as men.

What then is the status of information relating to personal lives in educational management theory? Holistic research focuses on private worlds of family and emotions as much as public worlds of career and reason (Marshall, 1984), regardless of the research subjects’ gender. The accounts in Headship Matters (Ribbins and Marland, 1994) are all the stronger for paying attention to all these factors, although they are less evident in the interpretations. They show how the paths to headship of both men and women and their performance as school leaders must be understood in the context of their past as well as their present contexts. My study found that the women heads shared a commitment to young people’s education and to teachers as professionals which was fundamental to their conception of the job. Once on the teaching path, their commitment to the central purpose of their work kept them on track. In this respect they differed from women managers outside education whose career trajectories are more likely to include moving between different services and different products (White et al., 1992). More research into men’s career trajectories in education is needed if we are to know what drives men towards school leadership positions.

Working with the same sample as Ouston, McMahon (1995) was struck by similarities between the values of the headteachers interviewed, whatever their gender. In the 1980s such similarities would be taken as evidence that gender was not a significant factor for understanding headship (as in the Earley and Weindling article referred to earlier). In contrast, I found a specific focus on gender revealed the numerous subtle ways in which the women heads dealt with expectations that the person in charge would be a man. Taking over a new school has to be done within the constraints of existing organizational structures and cultures. Gender is a component of both of these, particularly when the new head is a woman. The people with whom she works will have expectations of her as a head that will be influenced by their relations with her predecessor and their experiences of and attitudes towards women in leadership positions. Margaret Thatcher’s thirteen years as prime minister did little to enhance the image of women as leaders in most people’s minds. What do we know about the constraints in the early years of headship on a man taking over from a woman?

**Becoming a headteacher: looking for natural histories**

In order to understand how these women arrived at their headship positions, I traced their experiences from family of origin, through school, college and early work experiences to family, educational and career experiences as adults. These experiences are set within the context of values about power, culture and gender that played a part in the choices made, and provided a basis for future leadership action. The study traces the relationships between the formation of personal identity (who you are), career decisions (what you want) and subsequent leader-
ship behaviour (how you act). I assumed that, at different stages of their lives, starting in childhood, women who had become headteachers had made choices about the relative importance they would attach to the following behaviours:

- being academically successful at school,
- being a leader at school,
- gaining higher education qualifications,
- having a career,*
- whether and/or when to marry,*
- whether and/or when to have children,*
- seeking promotion,
- becoming a school leader.

I argue that the choices they made were influenced and at times constrained by factors that in turn created dilemmas at different points in their careers. The influences and constraints included

- social class and parents’ educational background;
- division of labour in the household and expectations regarding men and women’s public and private roles;
- sibling relations;*
- the availability of role models at school, college and work;
- other non-family members’ influences;
- type of career chosen;
- type of support available from husband or partner where applicable;*
- other types of support;*
- number and ages of own children;* and
- demands of the job.

Some of the features shown in this list are evident in other research into school leadership; but those asterisked are less likely to appear in research with men school leaders. Then, they are either taken-for-granted or considered unimportant. Their potential for understanding what drives men as well as women as school leaders is lost.

Individual responses to the dilemmas faced in choosing a lifestyle are important components of learning to lead. As Kegan (1994: 182) shows in his discussion of ‘the mental demand of public life’, increasing mastery over one’s work: ‘is not merely time on the job or promotion to increasing responsibility, but the psychological capacity to find (or, really, to invent) one’s own way of “doing it”’. Within Kegan’s stage theory of development, the transformation of consciousness after adolescence or the personal unfolding of ways of organizing experience are not simply replaced as we grow but subsumed into more complex systems of mind (p. 9). Central to the transformations that occur are the processes by which individuals create meaning: of themselves, of others and of
the world. If we are to understand the meanings that leaders and other make of their work in education, we need to understand the totality of their meaning frames. As people progress through their careers they are trying out ‘possible selves’ i.e. their ideas of what they might become, would like to become and what they are afraid of becoming (Markus and Nurius, 1986: 394). This concept is not unfamiliar in discussions of women and work where ‘fear of success’, absence of positive role models in public life and poor self-image are common themes. It is less familiar in discussions of men at work, yet the concept of possible selves is relevant to both sexes. From Kegan’s perspective, the first issue any management training oriented towards transformation has to address is what the person has to manage psychologically. He aligns the ability mature individuals have to take an overview of the self and see how the parts hang together, with the same capacities required of leadership, management and administration (p. 167). Stoll and Fink’s (1996) summary of their research on school improvement lends support to this view through their advocacy of ‘invitational leadership’ as the appropriate leadership style. They describe leadership as ‘communicating invitational messages to individuals and groups with whom leaders interact in order to build and act on a shared and evolving vision of enhanced educational experiences for pupils’ (p. 109). In order to invite others, ‘leaders must first invite themselves, physically, intellectually, socially, emotionally, spiritually’ (p. 111).

Levine (1989) draws on these psychological theories of adult development to ask about the degree to which a principal’s own developmental level influences her or his ability to lead and support others. She hypothesizes a relationship between high ego level and the capacity to create a supportive and nurturant environment. In order to be effective in a helping role, leaders need to be at a point in their own development which she characterizes as ‘Autonomous’ (p. 193):

Autonomous adults are able to transcend concerns for their own immediate experiences, becoming more realistic and objective about themselves and others. This last tendency is especially useful in helping [a principal] understand teacher’s needs and concerns independent of [her] own. The fact that individuals at the Autonomous stage can be both intimate and independent affords them the capacity to identify and empathize with others as well as maintain a sense of distance and personal integrity.

Reaching this level of autonomy is not gender-specific, although Levine notes the relationship shown in research between effective leadership and individuals who demonstrate this high level of awareness, as well as an ability to integrate masculine and feminine tendencies (p. 192).

Sceptical readers may be asking whether this justification of a gender perspective is merely a back door to ‘psychologizing leadership’, for many an
unacceptable and already well-trodden path. I would argue that, combined with a gender perspective, it allows for the systematic ordering of biographical data that Gronn (1996: 19) identifies as the basis for ensuring the integration of agency and structure in a ‘leadership career framework’.

As I traced the women heads’ paths to headship, a set of themes emerged relating to school leadership that highlighted the centrality of the self-concept as an organizing feature of the heads’ leadership styles. In summary they included the value placed by heads on:

• an inner as well as an outer journey to school leadership,
• developing an inner locus of control,
• being authentic,
• being consistent,
• self-presentation, self-management and self-efficacy.

None of these had emerged as explicit themes in other analyses of headship which include men, with the exception of Levine’s (1989) case studies of principals’ own and support for others’ professional development; and Southworth’s (1995) research-based study of a single primary school headteacher. Both Levine’s conclusions about the relationship between adult growth and learning, and Southworth’s about the power of the head’s self-concept in shaping his professional identity, meshed with my own observations of what is involved in becoming and being a school leader.

The relationship of self-concept to professional performance is more readily identified in other studies of women. For example, Dillard (1995) shows how Natham (an African American urban high school principal) derives much of her leadership style from her own experiences of growing up black in the United States. In spite of a relatively affluent childhood, her shared experiences of racism with fellow African Americans led her to negotiate race relations and combat racism in the context of her school principalship through reinterpreting her responsibilities to those circumstances within her own African American framework. She is fully aware that her appointment related to this shared identity: ‘As the school population returns to being predominantly “white” again’, she says, ‘I’ll be reassigned somewhere else. The community, the teachers, they will want a white principal again’ (p. 547).

We still know little about how the life experiences of teachers and headteachers, both men and women, from ethnic minorities in the British context shape their approaches to the job. Dillard calls for ‘narratives of the principalship from those whose voices have much to tell us about relevant issues of leadership through diversity’ (p. 541). The same idea is reflected in Ribbins and Marland’s advocacy of ‘a natural history of preparation for headship’ (p. 12). They include an interview with Elaine Foster, an Afro-Caribbean head of a girls’ comprehensive school. For her, values supersede ethnicity and gender as explanations of her behaviour as a head. At the same time, she recognizes ways into manage-
ment ‘as a big issue for women, and a big issue for black women and black people in general’ (p. 105). In the same tradition of understanding headship by allowing heads to speak for themselves, Mortimore and Mortimore (1991) include Vasanthi Rao’s account, as the first Asian headteacher in Birmingham. Rao vividly describes how ethnicity features in her own and Asian/Afro-Caribbean colleagues’ relations with staff, parents and pupils (p. 81): ‘I had to work hard—doubly hard to prove that I was a good headteacher. I felt I was in a glass cage all the time, being watched.’

A dominant theme arising from my own study of women headteachers’ career paths was their development of an inner locus of control. This can be defined as having high self-efficacy beliefs which are reinforced by successful performance, leading to a further belief that success is contingent on behaviour in the job and not luck or fate or ‘who you know’. If crucial factors in the formation of ‘manager’ or ‘leader’ identities derive from life experiences, then any discussion of organizational life must take account of how men and women, as individual employees, have arrived at their conceptions of appropriate workplace behaviour.

When the women heads’ experiences of family life are compared with those reported in the Ribbins and Marland and Ouston surveys, there appear to be as many similarities between men and women as between men or between women. Two examples of similarities will suffice. Women heads often referred to the pleasure they took as children in playing at schools; they were inevitably the organizers, whether their pupils were other children or dolls. Peter Downes, in Ribbins and Marland’s study, also recalled always wanting to be a teacher (p. 16):

As far back as I can remember I never wanted to be anything else. My parents told me that I played at being teacher very early on in my life. When other children were playing cops and robbers or mummies and daddies, I was playing schools.

What a shame the interviewers did not explore further with him the form his ‘playing at teacher’ took. It might have contributed to an understanding of how he sees headship now. The desire of parents of the immediately post-Second World War generation to encourage their children to take advantage of educational opportunities they had missed out on, was another common feature in the accounts of both men and women heads.

These similarities are not surprising since it is now commonly acknowledged in the literature on women that there are as many differences between them as similarities, yet another reason why the ‘differences’ literature needs to move on. Differences between men as men have always been taken for granted. All these accounts, including my own, show the different influences of each parent. My focus on women, however, leads me to suggest that women may be exposed to a more diverse set of role options than men, as a result of the different
conceptualization of men and women’s roles in society. The women’s accounts gave the impression of families in which tasks and roles were clearly differentiated along gender lines. Just one of the heads had a mother who worked full-time outside of the home and she, together with a working grandmother, constituted a powerful influence on this head’s attitudes to having a career. Marshall (1984) suggests that women who positively value their mother’s role within the private world of the home (which these heads did) develop an appreciation of their own feminine strengths and abilities that does not depend on male approval. None of the heads, either as child or adult, felt the need to be more like a boy or man in order to progress or win approval. However, as has been shown in other research (e.g. White et al., 1991), deciding to follow a different lifestyle and career path from their mothers was the result largely of their father’s influence. It therefore appears that women take both parents as role models. This provides them with the potential for a broader range of behaviours on which to base their own actions, particularly at work, in later life.

In contrast, research into ‘becoming a man’ suggests that, at the age of 6, boys:

... make clear distinctions between the concepts of male and female and begin no longer to model their mother, who in most cases has been their most nurturing parent. At that point they have to figure out how to act like men and start modelling the behaviour of the men they admire.

(Harris, 1995: 42)

Harris describes this narrowing of role models to almost exclusively men (‘the messages men hear’) as presenting a picture ‘of emotional tragedy’. Strong words indeed, but they have their echoes in Gray’s concern (described earlier) of many male heads’ reluctance to engage in personal exploration as a basis of professional development. Unfortunately Ribbins and Marland (as men) do not offer their own interpretation of their seven heads’ accounts. There remains a task still to be done to see whether and how the leadership repertoires of men are inhibited by their need to behave in men’s ways.

The family constitutes one of the first arenas for learning about power. There is a general consensus in the literature (e.g. Astin and Leland, 1991: Cantor and Bernay, 1992: Adler et al., 1993) that many (not all) women in leadership positions use power differently. Some, though not the authors just cited, explain this in terms of innate female characteristics: a shaky argument that divides rather than integrates new approaches to understanding leadership behaviour. I would argue that, as a result of the continued legitimacy for girls to take both mothers and fathers as role models, they may have access to a wider range of strategies for using power and influence (in the sense of ‘transformative capacity’, Giddens, 1984) than boys. My study showed that, when this is translated into leadership behaviour in adulthood, ‘power for’ is preferred to ‘power over’. The heads were ever vigilant against the possible abuses of the power that came with
their position. Unlike many men colleagues, their reluctance to take power for granted made them sensitive to its components and consequences.

Where does this discussion of men and women’s paths to school leadership take us? It shows how we need to ask different questions about how women and men learn to lead. If an inner locus of control is indeed a characteristic of effective headship (whatever the context), then its identification and development or sustenance are important tasks for those responsible for selecting and developing school leaders. The research suggests that women who make it to the top demonstrate this characteristic. Yet, in education, professional success cannot and is not measured exclusively in terms of career success. Its true measure is successful outcomes for students’ learning. A woman (or man) leading a school that is failing its students cannot be called successful. Being a successful manager in education entails having strongly held values about the central purpose of the enterprise.

**Being a school leader: professing and doing**

Ribbins and Marland talk of procuring and professing a headship. The problem with professing is in its relationship to doing (other than for professors in universities where the professing is the doing). What does school leadership look like from what Ribbins and Marland (1994: 6) call ‘a contextualised perspective in action’ i.e. one that explores what school leaders say in the context of what they are observed and seen by others to do? Interview data must be complemented by observational data if the relationship between espoused theories and theories in action is to be identified. As those responsible for assessing applicants for senior management posts in any sector know only too well, candidates can articulate their values forcefully on paper or in interview but fail to demonstrate them (or call on different ones) once in post. In interview the women heads, for example, described the high value they gave to being consistent in their behaviour in the job. I observed this consistency in action across a range of situations and their concern on the rare occasions when they acted out of character. Demonstrating consistency of behaviour and consistency between values and behaviour was the women heads’ basis for giving credibility to the role models they provided for others.

McMahon’s (1995) interviews also reveal the declared importance to men and women heads of modelling desired behaviour in the school. I observed in action the strategies the heads used to lead their school in desired directions and to influence the organizational culture they considered appropriate for achieving the school’s goals. They prioritized self-knowledge as a basis for action (hence their willingness to engage in the intense scrutiny to which the research subjected them), thereby offering cogent role models for women and men’s development as managers and leaders. As Hodgkinson (1991) has proposed, leadership as a moral art depends on the leader’s willingness to ‘know thyself’.

The relationship between their self-perceptions and performance was crucial.
to understanding their symbolic leadership behaviour, manifest in the simple daily routines that communicate important messages. For example, they aimed to create schools characterized by trust, openness, involvement and a sense of self-worth: goals that probably most school leaders would profess. In order to do this they had to be trustworthy, open, willing to share power, attentive to people’s needs and confident. This included avoiding the ‘wheeler-dealer’ strategies they associated with some male colleagues; or being ‘political’, which they saw as illegitimate behaviour.

Particularly evident was their continued vigilance in managing themselves as leaders and as women. Their self-management strategies (of self-presentation, self-organization and self-development) were honed to enable them to demonstrate self-control as a legitimation of their claim to be in charge of the school. Any interactions involving them were inevitably influenced by contradictory norms about being a school leader and being a woman. The operation of these contradictory norms is difficult to establish empirically, since they happen at ‘black-box’ level and, in the context of education where at least-lip service to equality between the sexes exists, the box is tightly sealed. Gender also influences interactions between male school leaders and others. The difference is that the norms relating to being male and being a leader are not usually contradictory. Both men and women followers accept their congruence. In contrast, many of the women heads’ ‘political’ energies were directed towards establishing the legitimacy of their authority as heads without damaging their acceptability as women. At different times I observed them subtly adjust their behaviour, either to strengthen their influence as leaders (by playing down being a woman), or to remove any discomfort men and women might feel because they were a woman. In these respects they confirmed their awareness of what other research has found: that the expectations others have of school leaders vary according to whether they are a woman or a man. The women heads paid continual attention to the semantics of self as headteacher, as evidenced in how they dressed, talked, moved and organized their day. Their priority was to show that they were in control of the situation and themselves. They had thought much about the messages communicated by how they spoke, looked and moved, as well as what they did, with whom and to what effect.

In search of Florence Wayne and John Nightingale?

I have described some ways in which women heads seek to structure a domain for discourse in which what women value in communication is as legitimate as what men value. This conception of their influence on the domain of discourse takes me to my fourth and final theme: school leaders’ responses to educational reforms, particularly in the context of self-managing schools. This section’s somewhat quirky subheading derives from Schein’s (1989) critique of androgyny theories that are based on innate socialized differences between men and women. For her: ‘The same sex role stereotyping that often excludes women
from managerial positions can now be used to enhance their opportunities. Florence Nightingale meets John Wayne and together they lead us into the sunset of greater leadership effectiveness’ (p. 155). It is clearly not a partnership she finds attractive. It also misses the point. Identifying management as androgynous can open up possibilities for both Florence and John to extend and discover new dimensions of their repertoires. I take androgyny to refer to the mainly comfortable integration of qualities which, although not in themselves exclusively masculine or feminine, are commonly associated with one or other gender. As Bem (1975: 6) says:

The concept of androgyny contains an inner contradiction, and, hence, the seeds of its own destruction . . . Androgyny necessarily presupposes that the concepts of masculinity and femininity will cease to have such content and the distinctions to which they refer will blur into invisibility. Thus, when androgyny becomes a reality, the concept of androgyny will have been transcended.

One stimulus to studying how women manage and lead schools was to provide an empirical base for supporting or refuting claims that ‘management is masculine’. This belief has often been cited as an explanation of why women are reluctant to apply for promotion (Al-Khalifa, 1989: Evetts, 1990). It derives from the indisputable fact that in most societies men dominate numerically the higher echelons of almost every management hierarchy in the public and private sectors. The ‘masculine’ organizational culture that results from this domination reproduces to women’s disadvantage as employees the gender relations that characterize the wider society. The concept implies too a requirement of managers to operate in ways that are rational, bureaucratic and technicist: the effective utilization of staff takes precedence over their involvement through communication, motivation, development and teamwork.

The effect of describing management as masculine is to create obstacles to women’s promotion, implying that is antipathetic to the qualities that draw people in to teaching and, in its association with managerialism, possibly immoral. In the context of locally managed schools in New Zealand. Strachan (1995) finds management and the delivery of social justice inequitable. In Australia, Meadmore et al. (1995) take a more moderate line. Pointing to the paradoxes of devolution, in which accountability and surveillance sit uneasily alongside school-based autonomy, they ask how much space a school leader has to coopt managerialism into her own way of doing things. In the wider context of a Conservative government’s education policies in Britain, Evetts (1990) argues that the changes brought by recent reforms in the British education system require managerialist approaches that present cultural dilemmas for women headteachers. In her view, heads have to become tough, aggressive, competitive, directive and autocratic if they are to deal with the pressures created by the reforms. School management thus becomes an unsuitable job for a woman and women who aspire to and achieve headship are in a Catch 22
position. Demonstrating that they can do the job well, particularly by being successfully entrepreneurial, means they fail the critical theorists’ test by not challenging the effects of entrepreneurialism on educational values: and the feminists’ test for seemingly acquiescing to ‘masculine’ values. Yet is there any evidence that some successful education leaders are not also producing more efficient and equitable schools? Grace’s (1995) study shows that there are many men heads (and presumably deputy heads of both genders) who are unhappy with what is now expected of them in their role. The statistics on the reasons for the greater number of headteachers taking early retirement and the lower number of deputies applying for headships have their own story to tell.

The picture that emerged from my study failed to justify either of these disappointments. On the contrary, the women heads challenged the implicit fatalism of theories associating management and masculinity, first by going for and achieving headship: second, through their behaviour once in post. They had enough confidence in their own beliefs and values to use power in ways that they wanted to. This confidence led them to reject the need to become ‘masculine’ in management and question whether power was inevitably ‘political’. They resembled Marshall’s ‘creative individualists’ who have integrated their femininity into their sense of identity and learned how to combine individual power with structural constraints. The reforms were welcome as a way of providing them with the tools and opportunities to move their schools in directions both they and others associated with the school desired.

From observing their performance, a fundamental flaw in the ‘management as a masculine’ argument became apparent, as it applies to education. It implicitly divorces education from leadership. In education, every teacher is both a manager and a leader in the context of the students for whom they are responsible. However powerful the government’s pressures towards reformulating schools as profitable mini-businesses, the women’s approaches to headship demonstrated an interpretation of management that included leadership and the assurance that management acts can have a moral base.

In his own attempt to situate a study of school leadership in the context of critical perspectives, Southworth (1995: 192) supports the association between emancipatory leadership and gender. He concludes: ‘An emancipatory view of leadership is worth pursuing since it addresses both objections to power being understood as power over and the male bias of management theorizing.’

Gender thus becomes entwined with critical theories of education and leadership that condemn education management practice that controls rather than liberates and prioritizes efficiency and means over ethics and morals. Such leadership is seen by many (e.g. Bottery, 1992: Mac An Ghaill, 1994: Grace, 1995) as antipathetic to educational values and an attempt to replace them with the values of the market-place which encourage technicist, rational solutions to human problems. Yet, in common with the heads in Headship Matters and some of those in Grace’s (1995) study, they relished the opportunities the new reforms brought to practice ‘practical educational leadership’.
Blackmore and Kenway (1993) have suggested that organizations advocate ‘feminine’ characteristics to bolster continuing male privilege. Organizational recognition of what women have to offer that is different from men is, in their view, pragmatically rather than ethically grounded. As critical theorists they associate entrepreneurialism with masculinity: both men and women who are successful in taking their schools forward within a market-led education system are, within this perspective, failing. Women are failing doubly if they also appear not to challenge equity issues, particularly as they relate to gender, within their schools. This is rarely noted in the mainstream literature as a failing of men school leaders. Unlike other studies of women leaders (e.g. Adler et al., 1993: Astin and Leland, 1991; Strachan, 1995), the women headteachers in my study did not claim to be feminists. Like their women colleagues in Grace’s study, they rejected it as an explicit social label that would identify them with unwelcome stereotypes. ‘I am a personist, not a feminist’, said one head. Their conception of being a professional included taking care not to discriminate against or in favour of either men or women. It might be argued that, unlike men, their shared experience as women at least made them aware of the possibilities of discriminating on the basis of gender and keen to avoid it.

How far, then, can a gender perspective contribute to alternative conceptions of educational leadership? Inevitably, since my study was of women, I have concentrated on what we can learn from how they lead schools. Yet the lessons of both the research framework (with its triple metaphor of gender, power and culture) and the findings are equally relevant to women and men in education management, as well as those responsible for appointing and supporting them. The women heads provide an example of school leaders dismantling and then recreating images of headship, as they make sense of their new roles and forge their personal and professional identities in a new context. Their attempts to be positive role models for men as well as women may be overambitious. Harris argues (1995: 193) that men need role models of other men who have courageously challenged the assumptions of patriarchy. The characteristics embodied in this role model include self-nurturing, conscious choices about how to live their lives, being able to parent self and others, admitting mistakes, listening well and expressing feelings. Yet Gray (1993: 114) concludes from his work with headteachers that women’s awareness is greater than men’s (regarding gender and sexuality) and men fail to understand themselves. In his view, as heads become more aware of the importance of gender issues in schools, there will be a change in the way men and women think about each other and how teachers think about children. Florence and John may not walk hand in hand but they will at least talk to each other about their starring roles.

What I have aimed to show in this paper is that an understanding of the impact of gender on life in schools and colleges is an essential component of our ways of knowing about educational leadership. By essential I mean it is taken for granted that it should inform all our enquiries. This unquestioning acceptance is of a different order from the one I described earlier as conventionally
characterizing our approaches to understanding educational management. Using a gender perspective creates new possibilities for exploring the lives of men and women who teach, manage and lead in education. It requires researchers to look at their own assumptions as and about men and women and the effects of these on their findings and interpretations. Making gender figure rather than ground in studies of school leadership contributes to a more comprehensive picture of current practice. It raises questions about the relationships between home and work, family and career, early socialization and later performance. Educational leadership is firmly rooted in professional identity. To understand one, we must understand the other.

Introduction

A growing number of feminist accounts assert that gender matters when we examine leadership styles in schools and other educational establishments (Adler et al., 1993; Al-Khalifa, 1989; Grogan, 1996; Hall, 1996). In this paper we critically evaluate some of this recent feminist writing on gendered styles of management alongside more mainstream literature on educational management. We discuss some of the contextual aspects of educational management before tentatively exploring a range of other issues that we suggest might also influence women’s contemporary management styles. We recognize that the term ‘management’ covers a wide spectrum of posts, with access to very differing degrees of power and leadership possibilities. In this paper we focus specifically on school headship as a management post which includes both power and leadership. Put simply our argument is that a number of feminist texts on management and gender work with essentialized notions of femininity in which homogenizing conceptions of what it means to be female depict women as uniformly nurturant, affiliative and good at interpersonal relationships. In contrast, we suggest that gendered identities are in context more fluid and shifting than they are depicted in such texts. There are many different femininities and the form they take is powerfully shaped by the roles women undertake and the context within which they perform these roles. As a result, female leadership in practice frequently appears to be both more multi-faceted and more contradictory than the idealized depictions in some feminist texts. Finally we draw on research data from two ESRC funded studies in which a small number of female headteachers were interviewed. These data exemplify a number of the problems involved in depicting female management as essentially different from ‘male’ ways of managing.
Management means men

Patriarchal and male power has shaped the construct of leadership, its culture, discourse, imaging and practice for centuries. Alternative conceptions of leadership have to attempt to legitimate themselves against the pervasive influence of these established models.

(Grace, 1995: 187)

As Grace points out, female managers are operating in a context of male hegemony. The history of leadership to which Grace refers has resulted in the conflation of traditional male qualities with those of leadership. As a result management is commonly conceptualized as ‘masculine’, concerned with ‘male’ qualities of rationality and instrumentality (Blackmore, 1993; Blackmore and Kenway, 1993; Weiner, 1995). This would suggest that women, as well as men, promoted to senior management positions will aspire to ways of managing which draw on styles widely perceived to be masculine rather than feminine. Judi Marshall asserts that ‘leadership characteristics and the masculine sex role correspond so closely that they are simply different labels for the same concept’ (Marshall, 1984: 19).

This conflation of leadership with masculinity has significant implications for women headteachers and the ways in which they can, and do, manage and this is evidenced in various empirical studies. Morrison (1987) found that the psychological profiles of women who succeed in positions of executive leadership may be more like those of their male counterparts than they are like those of women in general, while Schein (1973, 1975) found that female senior managers were often ‘more like men than men themselves’. Meta Kruger found in her study of 98 paired male and female headteachers in Holland that women were no different to their male counterparts in terms of ‘internal communication’ and ‘personnel management’. She also researched whether women were ‘more involved with others and less task orientated than men’ and found that they were not, concluding that ‘Women heads hardly differ from their male colleagues in the way in which they experience power’ (Kruger, 1996: 454).

The feminist writing on management is a much needed riposte to mainstream tendencies to conflate management with masculinity. At the same time feminist accounts rarely explore women’s power over others, instead preferring to focus on power as something that is exercised in relation to, rather than by, women. In keeping with this general tendency, feminist texts on women and management often seem to operate with a notion of ‘the universal feminine’ which is frequently posited as an unmitigated good (Grundy, 1993). To ignore the ways in which the wielding of power modifies and reconstructs both men and women’s sense of self and their relationships with others is to overlook the shifting nature of gendered identities. As already noted, there is evidence that women in positions of power display the same characteristics as men, regardless of whether or not men are there to influence them (Fillion, 1997).
Psychological studies such as those of Snodgrass would support the view that, as women achieve power, qualities normally associated with femininity are modified. She found that women were not more sensitive than men overall when status was taken into consideration. Sensitivity varied according to status not sex, with lower status people being significantly more sensitive to the feelings of higher status people than vice versa (Snodgrass, 1985, 1992). In contrast, feminist work on women managers has repeated the oversights of mainstream feminisms, largely ignoring the impact of power and status on the construction of the femininities of powerful women.

In an effort to counter mainstream male conceptions of management a number of feminist writers appear to have played down the contradictory conjunction of femininity with power in the labour market. They work instead with an idealized model of femininity in which the assumption of power over others has little or no impact on female behaviour. Contrary to such idealized depictions, Kanter (1977) has argued that many of the so called gender differences in organizational behaviour stem directly from gendered differentials in opportunities and access to power. This would suggest that the acquisition of power within organizations results in women playing out their gendered identity in significantly different ways to those realized in normative, socially subordinate femininities. Indeed, female headteachers have to deal with, and act out, a number of contradictory and competing tendencies due to the conjunction of a gendered socialization which prepares women for relative powerlessness and a current occupational location invested with power.

Holding power continues to be an ‘extraordinary’ situation for women in a British labour market where only 4 percent of senior managers are women (Davidson and Cooper, 1992). And the constitution of this 4 percent has its own particular characteristics. The literature on women managers typically fails to address the constitution of this 4 percent in terms of class, race, culture, ethnicity, age and sexual orientation. Women who become senior managers in any sector of the British labour market cannot be deemed to be representative of women in general. They are largely recruited from a very specific group of women: white, middle or upper class, and in most cases by definition highly credentialled. Furthermore, in addition to particularities of class and ethnicity, exercising power for women is possibly influenced in significant ways by the particular variant of gender socialization experienced in childhood, the culture and ethos of the workplace, earlier role models, personality and political and philosophical perspectives. In her study of female headteachers, Valerie Hall (1996) identifies an interesting theme in all the women’s personal histories, namely that they identified with their fathers rather than their mothers, suggesting perhaps that the masculine traits associated with leadership could be more acceptable for them than they would be for women whose main identification is with their mothers. The socially disembedded nature of much of the research on women managers means such issues have been ignored in the rush to essentialize.
Despite the recent trends in management theory which celebrate a ‘feminized’ management style, the practice of management, especially in educational institutions, remains a paradoxical context for women. While it may be that these style trends have had some impact on some aspects of management behaviour, it is patently unrealistic to argue that there has been a major transformation in management practices and culture, especially not in educational institutions. Indeed, as we go on to argue, the major transformation that has taken place in educational and other public sector organizations, that is, the introduction of the market form, has had the effect of legitimating and encouraging assertive, instrumental and competitive behaviour.

As a consequence there remains an inherent paradox in women occupying the upper echelons of any public sector profession because such a positioning confounds and contradicts traditional notions of femininity. To be a successful professional near the top of an institutional hierarchy involves at the very least the performance of a markedly different femininity to that inscribed in traditional (or radical) notions of being female (see Tseelon, 1995). Within a wider social context in which femininity continues to be denigrated while masculinity is still frequently elevated as manifesting a superior form of development (Archer, 1989; Nicolson, 1996), it would be surprising for women managers to uncomplicatedly valorize feminine ways of working. The inherent tension between being female and being a leader invariably results in adaptations and adjustments and the assumption of a femininity that is more congruent with leadership than traditional variants of femininity which are grounded in positions of relative powerlessness. Efrat Tseelon’s study of the construction of femininity in Western society found that traditional conceptions of the woman continue to frame women in contemporary society. Femininity for most women is lived out through paradox in which they are ‘simultaneously socially invisible while being physically and psychologically visible, an object of the gaze’ (Tseelon, 1995: 54). As social visibility is intrinsic to leadership, women in leadership positions inevitably have to develop more masculine ways of interacting in order to be seen as authentic leaders. Recent research by Kitch (1994) found that senior women rarely call themselves feminists and often take a male view of behaviour and knowledge for granted.

Policy and discursive influences on educational management

Any analysis of gendered differences in management styles needs to take account of the policy and discursive contexts within which educational management is operating. Styles of management, administration and professionalism change and evolve over time. Discourses of leadership in schools have shifted towards understandings in which ‘the good head’ is conflated with strong leadership rather than ‘being a team player’ (Grace, 1995). The new managerialism, celebrated in the school effectiveness literature, has given prominence to qualities such as ‘effi-
ciency, accountability, ambition, striving and competition’ (Evetts, 1990: 183) and has led to a culture in which both male and female heads are expected to demonstrate particular kinds of effectiveness and leadership qualities. In this sense the new managerialism can be considered ‘to be an indication that a new form of patriarchy is emerging wherein the perpetuation of traditional masculine values is more important than the gender of the social actors whose actions reflect those values (Hopton, 1999: 76). Management goals are increasingly preoccupied with measured outcomes rather than organizational processes, and yet it is in the processes that relationships with others can be emphasized. There is more attention given to monitoring of work, to speedy decision-making, to corporate culture and responsiveness to the customer; but arguably less to democratic decision-making, consultation and participation.

Nonetheless, Valerie Hall talks in terms of women heads’ use of power ‘as transformative capacity’ (1996: 141–2). For them power was about empowering others. She describes her female headteachers’ understandings of power as:

being able to make things happen by distributing the resources, interacting in ways which left others confident in their actions, enabling others to do things, being thoroughly organised and prepared, having a vision and shaping a culture.

(Hall, 1996: 145)

Embedded in such a definition are tensions between empowering others and the images of directive leadership that ‘having a vision and shaping a culture’ conjure up. Women and power have always been an uncomfortable, problematic coupling in which women find it difficult to deal with the distance from other women that leadership positions bring. This unease is evident in the text of one of Hall’s female headteachers:

I had to be tough and say it was staying but it’s not something I did comfortably, even though I felt justified. I see myself as an equal and don’t want to set myself apart as something different because I’m a headteacher.

(Hall, 1996: 144)

Maybe, in part, what we are seeing here is (a) that Hall is convinced by the ideology of new management and its discourse of individual empowerment, autonomy and devolution, and (b) that in relation to this she is persuaded by the heads’ self-serving accounts of their style and behaviour through which occasional contradictions and difficulties peek.

Paula Nicolson comments that ‘much has been said in favour of women managers and female management style, relying on the assumption that it is fairer and more democratic’ (Nicolson, 1996: 84). However, there exists a conundrum, even for those women who consciously aspire to operate in democratic, cooperative
ways of working in the labour market, that is whether, in practice, maintaining
caring, collaborative ways of working is consistent with career progression in
management. Despite the rhetorics of ‘new management’, we suggest that in
order to obtain professional success many women at, or near the top of, institu-
tional hierarchies have had to modify some, if not all, of the qualities tradition-
ally associated with femininity (see also Billing and Alvesson 1994). Arguably,
career success may be seen as part of a distancing process from normative femi-
ninity. Such a thesis is supported by Tanton’s description of women attending a
workshop on developing women’s presence in senior management. She found
that the focus of the group was on positioning women generally as ‘the other’ to
the characteristics of a male norm with which they themselves identified. Tanton
concludes that their complicated positioning

   could be seen as a measure of the depth of the entrenched values within
   society that even this group of women concentrating their attention on
   the issue of women’s development approached it from the perspective
   of the ‘centred male’.

   (Tanton, 1994: 9)

There are further limits to the possibilities of either feminist or feminine man-
agement. Colin Riches highlights the role of sponsorship and mentoring in any
individual’s propensity to rise through occupational ranks, pointing to extensive
evidence of the importance of sponsorship in managerial advancement (Riches,
1990). In education, no less than other occupational spheres, promotion is prob-
ably dependent on the sponsorship of more senior male colleagues (Davidson
and Cooper, 1992; Evetts, 1990; Woodd, 1997). Both men and women who
make it to the top of organizations have typically been sponsored along the way
and because of the gendered nature of institutional hierarchies their mentor has
invariably been a man. The result is that, for both men and women, role models
for exercising power are primarily male. But there are more subtle and perva-
sive consequences. Adjusting and adapting to what senior male colleagues want
can generate difficult contradictions for women: ‘Those women who accept the
rules of the promotion game are likely to experience personal stress as they
attempt to cultivate personal identities which are acceptable to their male col-
leagues’ (Evetts, 1990: 179–80). They are also not immune from acculturation
into ‘the way things are done here’ (Marshall and McLean, 1987), which means
increasingly operating with male frames of reference (Van Velsor and Hughes,
1990).

Conforming or challenging? Women and power

Anne Gold (1997) raises an important issue in relation to management, gender
and power. It is not simply a question of having previous experience of being
located as relatively unpowerful. Rather:
If those people who came from less powerful positions than those privileged by our society reflected on the effects of their lack of access to power they would work differently with power when they had it from those who have never had to engage in such arguments.

(Gold, 1997: 6–7)

Reflexive awareness of the potential damage of power imbalances then, just as much as gender, influences whether individuals conform to, or challenge, orthodox ‘masculinist’ ways of managing in the contemporary educational marketplace.

Concomitantly, there is the possibility that achieving a position of power as a woman is the end product of a process of conformity and collusion with, rather than challenge to, prevailing power dynamics. This is not the same as presenting male power as an unproblematic social positioning. Both female and male headteachers are far more likely to have assumed the role of ‘conformist’ rather than ‘subversive’ within organizational structures prior to promotion (Ganderton 1991). As Helen Gunter (1997) points out, invariably it is compliance and conformity that are rewarded by the powerful across different contexts. Women who challenge organizational views, including orthodoxies around the ‘best way to manage’, are unlikely to be promoted to the position of headteacher. Reinforcing such a thesis, Grace raises interesting issues around silences in both male and female headteachers’ accounts in his research. Women heads were relatively silent on gender relations of educational leadership and management, and both they and the male heads were relatively silent on issues such as racism and the political and ideological nature of government education policy.

We need new ways of reading leadership which move beyond simplistic notions of meritocracy and viewing promotion as a straightforwardly positive process in which merit and excellence are rewarded. It would be unsurprising if the promotion process for both males and females did not comprise a difficult balancing act in which conformity, collusion, acceptance of the status quo and self-promotion jostled with conflicting ethical stances, criticisms of the organization and the ways in which it operates, and desires to be part of a collectivity. As Grace (1995: 190) concludes: ‘Patriarchal domination of school leadership positions had not been seriously threatened by the promotion of these women headteachers. They had been accommodated in what remained a largely enduring culture of male leadership.’ In a similar vein, Patricia Hill Collins (1998) has written about mastering the distortions and her own struggles as a black woman to gain acceptance within a white patriarchal system. However, as her terminology implies, it is inevitably a process of assuming dominant male ways of working.

In the review symposium of her book Dancing on the Ceiling Valerie Hall highlights a continuing dilemma, not only for herself but for all feminist studies of female management. The desire to make women’s as well as men’s contributions to educational history visible can often conflict with a commitment to
critical perspectives which challenge the failure of those in power to question the status quo (Hall, 1999: 101). Hall’s women headteachers seldom questioned the prevailing educational status quo and although she writes in terms of ‘the possible transformations of formal power when it is held by women’ (Hall, 1996: 203), this has to be set against the discursive context of educational leadership in the late 1990s. The prevailing discursive status quo threatens to conscript both men and women into very particularistic models of headship in which strong leadership, individual competition, autocracy and manipulation are increasingly the prime characteristics (Grace, 1995). Thus Wilfred Carr and Anthony Hartnett describe the viewing of junior staff as ‘subjects’ to be manipulated and controlled rather than as autonomous moral agents as one of the main features of new managerialism (Carr and Hartnett, 1996: 180). New management translates into ‘fellow followers’ and ‘my people’, a humanistic subjectification. As compliance with institutional values is often a requisite for promotion, it is arguable whether many of the women or men who succeed in becoming headteachers are able to challenge and stand out against expectations that they manage according to contemporary orthodoxies. There are exceptions but rates and patterns of early retirement among headteachers suggest that, despite the rhetorics of teamwork and flat hierarchy, collegial methods of power sharing fit uneasily into the 1990s competitive, individualistic educational market-place. The question remains whether women who move into positions of power in the new context of disciplines and incentives and its ‘debased’ moral environment are able to resist its influences and maintain their existing values. It seems likely the powerful in society, regardless of their sex, share more in common with each other than they share with relatively powerless members of either sex.

Women’s ways of working: contextual influences

Context matters greatly in eliciting traits traditionally associated with women (Epstein, 1988; Rhodes, 1992). It has been suggested that women are more often able to behave in supportive, caring ways at work because they are locked into low-paid, low-power jobs (Hansot and Tyack, 1981). Such jobs, for example nursing and child care, rarely require competitive ways of operating. Studies of women in high-level management posts across the labour market report that they frequently adopted a career orientation more traditionally associated with men rather than women (Cox, 1996; Evetts, 1990; Fogarty, et al 1972; Schmuck, 1996). While we are not positing any uniformity in the femininities performed by women leaders, we do argue, on the basis of the research studies cited here, that on a continuum of femininity and masculinity the femininities they take up and play out as leaders have characteristics in common with those of male peers as well as female subordinates. The possibilities for the realization of particular femininities differ according to position, context and moral environment. Williams (1986) has written about the North American berdache, men who
assume the tasks and roles of a woman and thus come to be seen within their Native American culture as a third gender categorization, stressing how the performance of gender influences the ways in which it is symbolically constructed. The point is that, when women managers take up the tasks of the new role and bring gender identity and behaviour to bear, there is no simple, essential playing out of fixed gender behaviour and relations but rather a process of accommodation and mutual acceptance. However, the conventional position is rooted in binaries which militate against seeing how both changes in roles and performativity result in new evolving gender identities which transgress normative gender divisions.

Researchers like Hall tend to highlight the play of femininity within the performances of women teachers, but give less attention to the acquisition and display of male characteristics. Some feminist writers on gender and headship (Adler et al., 1993; Ozga, 1993; Shakeshaft, 1987, 1993) do argue that female heads adopt a more caring, less hierarchical style of leadership than their male counterparts. However, we may be talking about a matter of degree here, being slightly less directive than a male counterpart does not constitute democratic, power-sharing ways of working. As Jenkin points out, Hall’s women headteachers’ discomfort with the language of power politics did not deter them from ‘politicking through bargaining, negotiating and moments of outright assertion of power (Jenkin, 1999: 108). Jirasinghe and Lyons’s (1996) study of 255 headteachers, 113 men and 142 women, found that there was no difference between male and female headteachers in their propensity for directive leadership. While women heads described themselves as less competitive, they also saw ‘themselves to be just as controlling in managing their schools as their male colleagues in directing and organising others, issuing instructions and in taking charge of situations’ (p. 60). Jirasinghe and Lyons point out that this is in direct contrast to the general population, where their research showed directive leadership was far more common among men than women.

There are clearly enormous difficulties in translating what are traditionally perceived to be ‘women’s ways of working’ into senior management contexts, especially when, as research demonstrates (Hansot and Tyack, 1981; Snodgrass, 1985, 1992), such qualities are highly context specific. They may be more realizable in certain schools, in certain locations and at certain points in time. More generally, we would also suggest that they are more likely to be supported in some historical periods rather than others. The late 1990s, when capitalism is reinventing itself and is beginning to generate workplace cultures characterized by competition, insecurity and rampant individualism, is not a period conducive to ‘caring, sharing’ ways of managing by either women or men (Gee et al., 1996). Although, in the new human organization, it may be that ‘feminine’ styles accomplish a more subtle, individual and totalizing form of control, continually conscripting their ‘followers’ to the survival needs of the organization and its corporate culture. Hall emphasizes the development of power-sharing teams as being a distinctive characteristic of her women headteachers’
management style, indicating their preference for ‘power for’ rather than ‘power
over’ more junior staff. However, Sally Power argues that:

The growth of these kinds of management teams is a widespread phe-
nomenon that has been observed in many educational organisations as
they are forced to respond to the increasingly diverse and often contra-
dictory demands of the state and the market.

(Power, 1999: 115)

As Jenkin asserts, power-sharing teams are an essential part of any head-
teacher’s repertoire in the late 1990s. While many staff perceive them as participa-
tive and empowering, for the headteacher they are also about gaining broader
support for an initiative and assistance in getting it developed (Jenkin, 1999:
109).

The primary role in which women occupy a powerful position in society is as
mother. It would be unsurprising either for female senior managers to assume a
maternal role or for their subordinates to treat them as a maternal figure. The
position of mother has often been idealized and is invested with mythical qual-
ities no less than that of the woman manager in feminist texts (Daly, 1979).
Mothering is routinely conflated with caring yet traditionally involves censor,
discipline and control alongside listening and comforting (James, 1989). Being a
mother involves training and guiding as the person ‘who knows best’. There are
insufficient analyses of the complexities of power for both men and women in the
existing literature, but, in particular, the extent to which assuming the role of
mother is a powerful subject position women senior managers can draw on in relation
to subordinates has been insufficiently analysed and discussed. It seems likely
that at least some of the women promoted to powerful positions would draw on
the symbolic power invested in one of the most powerful female roles in society.

Assuming a maternal role may help to mitigate the greater difficulties relative
to men that face women promoted to positions of power. The endemic sexism
which continues to permeate the labour market results in female senior man-
gers having to confront a complex mix of contradictory expectations from both
subordinates and male peers. Women managers have to juggle disparate con-
flictual subject positionings in order to survive in what are primarily male cul-
tures. In one sense they are subject to both harsher judgements and greater
expectations than male peers. As Hall’s woman head implies, they are expected
to lead and still remain an equal; to be tough and simultaneously kind and nurtu-
rant. Pragmatic adaptation inevitably follows. This brings us back to women
drawing on a subject positioning as ‘mother’ in order to be seen as ‘authenti-
cally, acceptably powerful’ and this may work to sift out women more clearly
displaying feminine styles or those committed to feminist ideologies.

Far from being intrinsic and fixed we have argued that a lot of so-called
‘female’ qualities vary according to differentials of power and that it is
extremely difficult to disentangle those qualities which develop specifically out
of women’s position of relative powerlessness in society and those which women retain regardless of how much power they acquire. While the oppression of women by men is still intrinsic to many contemporary feminisms, the issue of women oppressing other women still remains relatively marginal to feminist theory. The possibility that domination and instrumentalism can shape women’s relationships with other women has long been a silence in feminist writing and research.

However, recent work within black and ‘working class’ feminisms has begun to address this issue (see Brah, 1994; Mahony and Zmrocek, 1997; Mirza, 1997; Reay, 1998a). Yet, as we have argued, the contemporary educational market-place conscripts headteachers of both sexes into goal-orientated ways of working that position all subordinates as means to senior management ends.

More specifically, a market culture has brought with it identifiable shifts in values within the schooling sector (Gewirtz et al., 1995) in which subordinates are increasingly viewed as means to management ends (Reay 1998b). Within such a context working in feminist ways would appear to be extremely difficult to realize and female ways of managing may turn out to have more similarities to than differences from orthodox (male) ways of managing.

### Women headteachers: shifting femininities in play

In this section we draw on a set of case studies of schools, focusing upon a small group of female headteachers in order to exemplify some of the issues we have raised around gender and management. Using transcripts of interviews conducted in four London comprehensive schools we discuss the leadership styles and methods of their women headteachers. We argue that prevailing market conditions in the educational sector inhibit the development of innovative power-sharing forms of management, whether feminist or otherwise. Rather, on the basis of this material, it appears that female heads are conscripted into competitive ways of operating in a prevailing ethos that encourages schools to view themselves as in competition with each other. We begin with Mrs Carnegie:

I think she likes to think of herself as hawkish . . . she likes to get people competing against each other in different areas of the school and it works . . . certainly within the school I’d say that applied very strongly . . . and in the first few years it was idiotic really . . . some of the things people felt they had to get up to. . . . I think Mrs Carnegie would prefer a much harder sell on the school than actually happens. (deputy head of year)

Far from attempting to ameliorate the impact of market forces, Mrs Carnegie’s response to an increasingly competitive educational field has been to install hierarchically structured internal systems of accountability which ensure both the regulation of teachers’ work and the institutionalization of the values of a
performance-driven market (Gewirtz, 1997). But Mrs Carnegie’s enactment of leadership is not of a piece. Women managers are always drawing on a range of subjectivities, at times as a maternal figure, at times as stereotypically female, but at other times constructing an identity as a powerful person which cuts across and conflicts with other historically derived aspects of feminine subjectivity. These varied feminine positionings are assumed at different times in different contexts and in relation to different agendas by Mrs Carnegie. A senior teacher, describing Mrs Carnegie’s reward system of ‘tiger stickers’ for the senior management team, presents her as a powerful mother figure: ‘I mean Bill used to put them on his wall . . . I’ve got 6 and then somebody would get 7 . . . the proliferation has gone down but she still gives them . . . they’re more scarce so you actually do take . . . it’s she’s noticed, mummy noticed.’

Overtones of both ‘feminist’ and feminine styles of management can, on other occasions, be seen to ameliorate what is normally a hard management line:

She has kind of a split personality, one extremely businesslike and quite often very difficult to meet, will put you on the spot, will get very angry and so on which is juxtaposed with this personal thing where she suffers everything and will listen to you and is terribly interested about everybody.

Mrs Carnegie herself describes the quintessential ‘new manager’ when discussing her own practice. And her account has a generic quality, her management appears to have no specific educational characteristics:

He thought that my style is quite similar to that used by a top Civil Servant, and that . . . I hope he meant it in the best sense, he says that what he thinks that what I do a lot is to set targets and make sure people are coming up to those targets and that’s a rather formal way of doing it, but I think it is a hallmark of my style. . . . I have a very, if you like, I don’t think it’s fair to say hierarchical, but a very systems based management style. I like to be aware of where the boundaries are, that people are working within their boundaries, hitting their targets but not actually poaching on other people’s ground . . . and I think that’s necessary for a large institution.

The key words in Mrs Carnegie’s text are ‘targets’, ‘formal’ and ‘systems based’; hardly a lexicon for people-centred management. At different points in the same interview she also refers to ‘my institution’, ‘my team’, ‘my heads of cluster’. As Hargreaves points out, ‘my vision’, ‘my teachers’, ‘my school’ are proprietary claims and attitudes that suggest an ownership of the school and of change which is ‘individual rather than collective, imposed rather than earned, hierarchical rather than democratic’ (Hargreaves, 1994: 250). Hargreaves goes on to comment that this ownership is more often male ownership in which
power is exercised over women. However, such proprietary attitudes are clearly evident in Mrs Carnegie’s text.

Mrs Carnegie, like the two female headteachers quoted below, manages through a model of pragmatic adaptation to the marketization of education rather than out of any feminine or feminist principles. Also in line with our contention earlier that female managers adopt ‘masculine’ alongside ‘feminine’ traits, in the excerpt below, she places herself on a continuum of femininity and masculinity at the point at which ‘the feminine and the masculine dovetail’. But, crucially, she defines the feminine perspectives of her junior colleagues as ‘unprofessional’:

We advertised one head of year, we didn’t advertise two, because the second one came up a week later, and colleagues were saying here well . . . if we’d known there were two we wouldn’t mind applying, cos we wouldn’t then have to apply against another colleague . . . and my reply was that I thought that that was a very feminine way of thinking and really an unprofessional way . . . if a job was there you should go for it and in a way I was doing down women and I think that perhaps . . . that’s the Margaret Thatcher side of me . . . that my management style is, I don’t know that you would differentiate it from a man . . . but it’s very focused on women’s achievement. I like to think it’s not so much feminine or male, I think I would like to think I was the feminine end of the male spectrum to be honest, which I do regard as a thinking, civilised, cultured end. I loathe extremes, I loathe the macho male or the woman who plays the feminine thing so somewhere in the middle and perhaps that is, as I say, where the feminine and the masculine dovetail.

The interviews with Mrs Baxter, head of Overbury display similar themes to those with Mrs Carnegie, in particular the prioritizing of market imperatives over democratic, collegial ways of managing: ‘I introduced a meeting for parents to meet their children’s form tutors and class teachers which was resisted . . . strongly resisted by the staff but I did it anyway.’ Talking of a previous culture of collaboration between heads in the same LEA, she commented:

My job is to keep the school full even if it flies in the face of what other colleagues want from me so I’m much less likely to adhere to a corporate decision of the heads now and much more likely to serve this school’s interests and if these interests fly in the face of what is corporately judged to be best then I shall pursue what’s best for the school.

Market and institutional imperatives are reshaping both male and female headteachers’ management styles emphasizing accelerated decision-making and the prioritizing of parental rather than teachers’ interests. Democratic forms of man-
agement are at risk of becoming associated with inefficiency and inertia in the
developing market culture if they appear to stand against, and work in opposition to, market imperatives.

Mrs Anderson, the headteacher of Trumpton, also describes a hard-hitting, interventionist style of management:

When I arrived part of my analysis was that the school was complacent and it was . . . and that needed shaking . . . and actually having to stand up for yourself is incredibly good for staff . . . and I hit them hard with it that year I have to say and that year everybody worked quite hard. I intervened on every front you can think of and some you couldn’t. I ran this school like some sort of demented gnat. Then the following autumn for the open evening I pulled out all the stops with the staff, I really ginned them up and by god they worked for that and I think the combination of that and other various odds and sods that we had done during the year was what made the difference . . . and it was I think discipline which I altered substantially. I upped it hugely, uniform then the curriculum and we hammered those things.

Mrs Anderson’s account of her first year as head at Trumpton combines themes of strong directive leadership, accelerated decision-making and a conception of staff as means to management ends with traces of coerciveness; few signs of soft nurturant management here.

When I came here I discovered that money was being spent like water, and not any of it in the right place I thought . . . so I put them on a strict diet immediately. So it was all rather harsh. But the biggest joke was we provide teas for parents’ evenings for the staff cos they work right through so it’s actually not totally unreasonable to give them a crumb or two and I stopped the sausage rolls so they just had a sandwich and a cake and I only did it for fun actually . . . I was actually pulling their legs and it caused absolute riotous fun.

Although Mrs Anderson does not specify, it caused ‘absolute riotous fun’ for herself and the senior management team, not the staff who are the objects of their derision. Underlying this ‘harmless joke’ are traditionally masculinist ways of operating which permeate her text. The market becomes a means by which she can ‘hammer’ reluctant staff, ‘shaking’ them out of their complacent dependency. However, at other times, like Mrs Carnegie and Mrs Baxter, she mobilizes a softer approach to management more in line with conventional views of feminine practice. The methods and lexicon of feminine management are part of an extended repertoire, a bilingualism (Clarke and Newman, 1992), which may be deployed at ‘appropriate’ or ‘useful’ moments but they do not appear to be the defining characteristics of these women managers.
The fourth female head, Ms English, is the only one quoted here to openly espouse the label ‘feminist’. In her text she struggles with the conflict between feminine modes of management and the prevailing new managerialist ethos:

I think LMS has changed how people can manage schools and I think that links directly to the gender thing. I’m not saying all women managers have a—what I would call a more feminine style of management—they don’t obviously—but it’s much more difficult under LMS, and if you are a woman, to be open and consultative and less hierarchical. It’s much more difficult than it used to be. And all those important decisions about money and people’s jobs and so on—it’s really hard. And it’s the kind of thing a lot of women don’t want to go into management to deal with.

Yet, rhetorical distancing from the practices of new managerialism does not translate into either feminine or feminist ways of working. The prevailing staff view in Ms English’s school was that she was both autocratic and unsupportive of staff. Despite her stated opposition to authoritarian management she still talks in terms of having to act in an authoritarian manner. This returns us to an earlier theme: the pervasive sexism surrounding female managers results in them having to confront a complex mix of contradictory expectations from both subordinates and male peers.

Conclusion

These examples of female management in practice have been included to underpin and illustrate some of the themes we discussed in the first part of the paper. An important focus of many of the feminist texts on gender and management is on the agency of the individual. In this emphasis on how women heads shape the job of being a headteacher, the extent to which context shapes individuals’ actions and perspectives is downplayed. One consequence is that ‘any discussion of how women headteachers may act as tools of the state in terms of their practices, knowingly or unconsciously, becomes muted’ (Reynolds, 1999: 112). Instead, such accounts rip the headteacher out of the context of politics and policy and present their practices as though it were the simple realization of a set of idealistic aspirations. The power of women to change structures is emphasized at the cost of failing to understand how structures change women. As Jill Blackmore (1999, 156) points out: ‘One cannot talk about “women’s ways of leading” therefore, without being aware of the structural constraints and discourses shaped elsewhere that undermine leadership committed to such notions of feminist practice’.

The notion of a continuity and inevitability of a ‘female’ self across time and space which is embedded in much of the writing on women and management is difficult to sustain in the light of empirical evidence. Kenway and Epstein (1996) have highlighted the impact of marketization on the formation of identities and
relationships within the sphere of education. Complacencies about feminine or feminist ways of working ignore the masculinist mode of the market with its technicist emphasis on systems and outcomes at their peril. We would not want to argue for a simple determinism in understanding the realization of leadership styles, as there clearly is always some room for manoeuvre for most heads in most schools. At the same time we are going to need something more than women in positions of power to change prevailing market orthodoxies.

THE CHALLENGE TO PROFESSIONALS FROM THE NEW PUBLIC MANAGEMENT

Implications for the teaching profession

Mike Bottery

Abstract

Many teachers, like professionals in other state bureaucracies in the UK and elsewhere, realise that they have common interests and challenges through casual conversation, or through coverage in the media. Yet even then, they may fail to realise how similar their dilemmas are. This paper suggests that part of the similarity of the issues which teachers and other professionals face stems from the nature and effects of their management and supervision, which has changed radically over the past 15 years; but part of the similarity also stems from the similar nature of the debate on the role and function of the professional. Using examples and practice from the work of teachers, doctors and police in the UK, this paper will examine both of these issues, and suggest that a successful negotiation of the future by the professional will be by an acknowledgement and debate about them both.

Introduction

It should not be too surprising if many professionals in the UK see government legislation, and their own functions, in rather selective terms. This can be explained partly in terms of time, partly in terms of interest, and partly in terms of culture. In a society highly (and necessarily) differentiated occupationally, backed up by a value system which prizes specialisation, there is little encouragement to move beyond one’s own field. In a world of such differentiation, only when people are occupationally or personally affected are the full implications of such changes likely to be appreciated.
Nevertheless, if teachers, like those in other occupations, fail to see the professional forest for their individual trees, they fail to realise that the same issues affect them all. Professionals, and particularly those in the public sector in the UK, have much to learn from examining the experiences of each other [1]. This is true in two areas in particular at the present time. The first has to do with the way in which they are managed and its attendant effects; the second has to do with their conceptions of themselves. Each will be dealt with in turn.

**Definitions**

One of the problems with attempting to write about ‘professionals’ is that at least 17 different criteria have been claimed at one time or another as describing their behaviour (Bottery, 1994). However, much of the debate has centred around three concepts: those of expertise (the possession by an occupational group of exclusive knowledge and practice); of altruism (an ethical concern by this group for its clients); and, finally, autonomy (the professional’s need and right to exercise control over entry into, and subsequent practice within, that particular occupation). More recently, writers like Collins (1990) have suggested that one needs to look beyond such characteristics and instead concentrate upon how the power exercised by occupations enables them to exercise ‘occupational closure’, thereby increasing their ability to influence matters in society with regard to their practice, and, not unimportantly, to increase their financial remuneration. There is, of course, no reason why the two orientations should be incompatible, but it seems significant that the advent of a more sceptical literature occurs at much the same time as the advent of the ‘new public management’ (NPM), (Hood, 1991).

It is of further interest to note that within the former literature, occupations like teaching and the police have only been accorded the role of ‘semi’-professionals (Etzioni, 1969), for they failed to meet a number of criteria derived from an examination of the ‘accepted’ professions, such as lawyers, and doctors. Yet, as Torstendahl (1990) points out, there is a considerable degree of undeclared presupposition here, for on what basis are lawyers and doctors accorded such a title, and others excluded, save that this is how one chooses to define ‘professionalism’. It is probably this arbitrariness of designation which has led many writers on professionalism (e.g. Freidson, 1984; Lawson, 1990) to declare the soil increasingly exhausted.

Within this article the term will be used fairly liberally, firstly because of the different views regarding the characteristics which are needed for an occupation to qualify as a ‘profession’, and secondly because of the variety of opinions as to whether specific occupations qualify for the characteristics proposed. Nevertheless, in making particular reference to three occupations within the public sector in the UK—teachers, police and doctors—the possible objections which their use may raise are recognised. They do, however, illustrate the range of jobs which may claim professional status. Moreover, if as this paper argues, changes
in what constitutes professional practice need to occur, and are occurring, such occupations may be at the vanguard of such redefinitions.

The management of professionals

Teachers and doctors have liked in the past to think of themselves as what Handy (1985) calls ‘Dionysians’—professionals working within organisations built to facilitate the display of individual expertise, rather than as team members working towards some corporate goal. The police are much less easily classified individually as such, but have still attempted as a group to cultivate an independence from government corporatism. In all three cases, however, one can see the classic antagonism between bureaucracy and the professional; and within it one might locate what Lawn & Ozga (1987, p. 52) call the ‘proletarianisation’ of occupations, a process rooted in the scientific management of Frederick Taylor, within which a formerly skilled occupation is analysed, systematised, and routinised such that the autonomous and non-standard application of expertise comes to be seen as neither necessary nor, indeed, desirable.

This antagonism continues today with what Hood (1991) describes as one of the most striking trends in public administration over the past 15 to 20 years, the rise of NPM [2]. He suggests (pp. 4–5) that this has seven elements:

- ‘hands-on’ professional management in the public sector;
- explicit standards and measures of performance;
- greater emphasis on output controls;
- the break-up of monolithic into smaller manageable units;
- shifts to greater competition in the public sector;
- the stress on private-sector styles of management practice;
- the stress on greater discipline and parsimony in resource use.

Hood (1991) points out that not all seven elements will be equally present in each area of practice. One should perhaps also add that NPM will exhibit different forms in different sectors: teachers and police will be managed differently from doctors in hospitals because they do not have the same management/doctor cultural divide with which hospitals operate. Further, there is general agreement that NPM does not have one single intellectual underpinning. Hood (1991, pp. 5–6) suggests that in fact NPM has two different sources. One source is underpinned by the key word ‘choice’, and is built upon ideas of contestability, user choice, transparency and the greater use of incentive structures. The other is underpinned by the key word ‘manage’, and is built upon a transference of business managerialism into the public sector, undergirded by ideas of the elevated status of ‘professional managers’ over the technicians/professionals within the organisation, managers with wide discretionary powers, free to manage and to build distinct organisational cultures. Both of these trends are reflected in education. Devolved financial management, open enrolment, the emasculation of
Local Education Authority power, and the creation of grant-maintained schools and City Technology Colleges, can all be seen as issuing from a commitment to a more market-driven system. Further, the hugely increased powers of the Secretary of State since 1988, governmental approval of the use of managerial perspectives from the private sector in education, financial inducements to increase the management component of in-service provision, and the flood of books on educational management throughout the 1980s and early 1990s, all bear testimony to the belief that strong hands-on management is a vital component for delivering educational quality.

However, as Hood points out, there is nothing necessarily compatible between these two ideas: being free to choose is not the same as being free to manage. The former relates more to the consumer, the latter more to the manager; and if criticisms of professionals in the past, and teachers in particular (e.g. Friedman & Friedman, 1980; Green, 1987) have been that public services like education have tended to serve the producer rather than the consumer, necessitating a move to a ‘free to choose’ culture, an emphasis upon being ‘free to manage’ does not necessarily move a service any further in the direction of choice.

Hood is right to draw out the managerial and competitive aspects of NPM. However, he might have drawn out as an equal influence and third major source, that of economic considerations, rather than reducing it merely to one of seven elements. Indeed, there is good reason to believe that considerations of costs may have been the dominant influence in the rise of NPM. Rhodes (1994, p. 44) suggests that the major thrust of this managerial change is precisely in terms of the ‘3Es’: economy, efficiency and effectiveness. This should not be too surprising: much of the history of the UK welfare state, for instance, has been a story of limited resources having to try to match accelerating demand.

The UK welfare state as a whole also suffered from a factor common and current in most western economies, that of long-term recession and diminished growth. In such circumstances, questions of cost-savings come very high on the agenda of any government of whatever political persuasion. Both other sources for the development of the NPM fit well with this economic imperative. The first source, a hands-on managerial imperative, is in tune with a need to know how much is spent, and what can be saved where. It may then appear as an essential arm of delivering a high-quality, effective, and efficient service. The second source, a free-market philosophy, not only has the (apparent) virtue of choice; it also argues that it is the most efficient means of delivery as well. The three sources may then cohere into a very aggressive management philosophy. Teachers, and indeed virtually any occupational group within the UK welfare state, will recognise all three in their day-to-day practice.

**Implementing the NPM philosophy**

The strategies of NPM are described in Figures 1, 2 and 3. Each takes the case of a particular professional occupational group in a state bureaucracy: teachers,
Figure 1 Teachers’ autonomy in the New Public Management philosophy.
Figure 2 Doctors’ autonomy in the New Public Management philosophy.
Figure 3 Police autonomy in the New Public Management philosophy.
police, doctors. Each takes as its specific focus the issue of that professional body’s autonomy, even if, as argued above, concern about that professional body’s autonomy may not have been the major reason for the legislation. What is clear from all three is that, despite differing cultures, differing values and differing practices, the same three strategies are applicable to each—in terms of management styles, in terms of proposals for competition, and in terms of scrutinies on costs. Perhaps even more interestingly, it is also possible to see the same basic policies in use with each of the three kinds of institutions within which the three professions work.

Thus, in terms of cost scrutinies, all three areas of the welfare state within which these professional groups practise have been the subject of retrenchment, in which reduced budgets have meant that cost-savings have had to be made at the unit level; all three have been subject to cost improvement programmes, in which those activities defined as ‘non-core’ (such as laundry, catering, cleaning, grounds maintenance, etc.) have been contracted out or made subject to tender; all three have been the subject of resource management, in which those not previously involved in the planning of budgets are now given such responsibilities. Finally, external audits, either by the Audit Commission, the National Audit Office, HMIC, or by local authorities and OFSTED, have all generated increased scrutiny on costs in education, health, and policing, whilst at the same time generating comparative information on their efficiency.

In terms of management approaches, attempts at the imposition of new contracts in all three areas can be seen as policies aimed at redefining the power relationship between professionals and managers in favour of managers. In terms of content control, all three professions have seen an increased attempt at the usurpation by management either at institutional level, or civil servants or politicians at national level, of the definition of what is to count as areas of work. These are most clearly seen with respect to the imposition of a National Curriculum on teachers; with respect to the setting of key policing objectives by the Home Office; with respect to the specification of areas of treatment by District Health Authorities, and by GPs to hospital doctors in terms of referral, and by government in terms of priorities. Finally, individual appraisal, whilst varying in the degree to which it is conducted though peer review in all three areas, still has the potential in all areas to act as a stick with which to beat the practitioner.

Other specific policies tend to be generated by a combination of management concerns and issues of competition. The policies invariably are concerned with the generation of facts, essential to both closer managerial control and more informed competition. Managers/politicians cannot control without reference to figures comparing professional performance, and consumers (including managers or other professionals in purchasing institutions) cannot choose without access to figures which provide them with comparative information on the content and quality of the service being offered. Thus, for example, the drive for performance indicators is common across all public ser-
services, whether it be in terms of examination results and truancy rates in schools, the percentage of files proceeded with by the Crown Prosecution Service, or the numerous clinical, financial and staffing indicators in hospitals. Similarly, diagnosis related groups (DRGs)—the classification of groups of patients by diagnostic characteristic—is a health exercise designed to provide comparative information on clinical costs and charging, and therefore greater accountability. The same kind of exercises, driven by needs for greater information and accountability, are seen with the police, whereby 85 key functions have been categorised for examination as to who should be doing them, and in education with the classification of groups of students by such things as Standard Attainment Tests (SATs). Finally, increased interest in matters of quality assurance, through such initiatives as Total Quality Management, is in actuality another pressure on professionals both to listen to what customers want, and to make their own practice more accessible to both ‘internal’ and ‘external’ customers, and to managerial scrutiny. In so doing, they provide information on which comparisons can be made between their and other professionals’ practice.

A common response

If teachers are not alone in facing a lack of trust, and an attack upon their professional autonomy, it would seem to make sense to look at what kind of common response can be made with other professionals. This is possible by a number of different strategies, of which I shall mention six.

(a) Quasi-markets and central control

Firstly, an awareness of the common ethos, in terms of cost-cutting, competitiveness, and managerialism, such as has been demonstrated in this paper, must be a necessary beginning, and should lead to a joint evaluation of quasi-markets and centralised control. As Rhodes (1994) suggests, it is not possible to argue completely for either: the question is rather where the one makes better sense than the other. However, if quasi-markets have been given their head over the last few years, the problems which ensue with the fragmentation of services need to be pointed up, and the question asked whether such fragmentation is compensated for by the merits of competition. Fragmentation can after all cause inefficiencies (through the necessary duplication of services and materials between competing bodies); it can cause poor coordination (which can result in poor provision, as well as further inefficiencies); and it can produce a reduced central capability, which will be necessary to some degree in any system which believes in the requirements of strategy. LeGrand & Bartlett (1993) have begun this process well, setting up as they do the concepts of efficiency, responsiveness, choice and equity as the four criteria by which to assess such quasi-markets. From them stem such questions as:
• do markets increase competition?
• does competition improve efficiency?
• do markets improve quality?
• do markets depress labour costs?
• do markets maintain equity of provision?

Much of the information on quasi-markets is restricted to the US, and consequently has to be treated with great caution. Nevertheless, the findings do suggest that quasi-markets are not an unqualified benefit, indicating as they do that competition has a tendency to decrease as time goes on, that transaction costs can be hugely inflated, that all forms of contracting have some kind of irresolvable problem attached to them, that salaries tend to inflate and increase in degree of variation, and that equity is very hard to maintain (see Culyer et al., 1990; Propper, 1993, on health; Moore, 1990, on education).

However, it should be noted that even if these findings are generalisable, in themselves such criticisms will not necessarily provide sufficient ammunition for greater trust and autonomy for professionals. As noted above, ‘free to choose’ and ‘free to manage’ are neither necessarily compatible nor dependent upon one another: the market-driven aspects of educational policy, for instance, could be replaced by more monopolistic ones, and managers could still be left to manage aggressively. Such evaluations may weaken part of the claims of NPM: they do not necessarily indicate that the alternative should be greater professional power and freedom.

(b) From ‘defy’ to ‘embrace’

If one kind of response by professionals is an examination of the intellectual underpinnings and pragmatic application of quasi-markets in the public sector, another kind is at the other end of a theory-practice continuum. Teachers, like all other professionals, need to consider their attitude to new legislation, the manner in which they will initially approach it, the way and degree to which it will be implemented. This needs to be flexible rather than doctrinaire, yet principled rather than opportunistic, and may run all the way from ‘defy’ through ‘subvert’ to ‘ignore’, on to ‘ridicule’, then to ‘wait and see’, to ‘test’, and in some (exceptional) cases to ‘embrace’, but needs to be underpinned by a clear sense of institutional purpose and professional ethics. In this regard, Fullan’s (1991) work on managing change in education has huge implications for other sectors as well—perhaps most notably in the assertion that if change is to work, then it has to be altered by, and tailored to, practitioners’ values and needs. If it does not, it will fall still-born.

What seems certain, though, is that long-term outcomes are not predictable. It is still quite possible that the kind of situation described four decades ago by Gouldner (1954) will re-occur, where a ‘punishment-centred bureaucracy’ is instituted. With this, those charged with improved ‘production’ resort to increased supervision and bureaucratisation through more detailed rules and regulations, but which only has an ‘apathy-preserving function’ on the ‘workers’,
which locks the organisation into a vicious circle of repression, subversion, and further repression. Nobody wins; neither managers, nor professionals, nor clients. So the modification of legislation, in one form or another is essential either to make it implementable, or at least to neutralise it if poorly conceived; subversion should not be the only means considered by professionals.

(c) The human costs

A third possible defence is the well-publicised evidence of their early retirements, of extra days off sick, of depressive illnesses and suicides by professionals. [3] Undoubtedly this adds to the sympathy felt by the general public for them, but it is doubtful if it adds substantially to the arguments for revision of such lack of trust and reduction in professional autonomy. Indeed, it might well do little more than suggest that whichever strategy were to replace NPM, it should be more considerate of professional work overload.

An effective defence will only come about by directly addressing the assumptions upon which NPM rests. It will be recalled that three major assumptions were suggested:

1 The economic assumption: that the economic situation of Western economies demands that the best is made of the finances available.
2 The choice assumption: that state bureaucracies have been characterised by a self-regarding, rather than other-regarding attitude by the professionals working within them.
3 The management assumption: that an aggressively hands-on management is needed to dictate strategy to those professionals working within them.

The economic assumption would appear to be, at one level at least, uncontestable. Even if it were not the case that economies like those of the UK were facing prolonged economic difficulties, this would still not be an argument for financial profligacy. After all, as Culyer (1989) points out, to squander resources in areas of public benefit is ethically as well as economically unsound, for it prevents the provision of the best possible services to those in need. On this basis, then, teachers and other professionals may be better directing their attention at the other two assumptions. If they do so, the crucial questions become ones of:

- What is the effect on clients and society of this kind of managerial approach?
- How do professionals like teachers acquire a better reputation for being other-regarding?

(d) The missions of the public and private sectors

Thus, a fourth line of defence might be to suggest that the transfer of private sector management into the public sector is inappropriate because of the very
different natures and missions of the two arenas; and that in so doing, the nature and mission of public sector management is distorted or even destroyed. This is one of the lines which Rhodes takes when he argues that another problem with fragmentation in management is the lack of accountability. His own example of the all-purpose local authority being bypassed by non-departmental public bodies and other kinds of special purpose agencies illustrates this well. As he says:

Under the Greater London Council (GLC), ratepayers paid their rates to four bodies. After abolition of the GLC, they pay taxes to 17 bodies, two-thirds of them unelected.

(1994, p. 148)

The same kinds of comments have also been made in education, of grant-maintained schools (Bush et al., 1993) with the non-representative nature of their governing bodies, as well as in the National Health Service, of Trust Hospitals (Baggott, 1994), with the essentially political nature of the nomination of their boards.

The argument, however, can be extended further, and be made to make a much wider point. Ranson & Stewart (1989), for instance, argue that private and public sector institutions differ from each other in terms of the nature of their work, which has far-reaching implications for society as a whole. Their orientation is summed up when they say (p. 5) that ‘a concept of organisation that encompasses citizens differs from an organisation that knows only customers.’ This means that the public sector organisation and its management have activities and concerns

implicitly defined as outside the concern of (private sector) management: protest, politics, public accountability, citizenship, party conflict, elections, public debate, inter-authority co-operation, and civil rights.

(Ranson & Stewart, 1989, p. 5)

Grace (1989, 1994) provides this argument with a distinctively educational context when he argues that a private, free-market approach to education necessarily encourages the pursuit of individualistic, selfish motives, precisely because this is what the market is set up to do (with, of course, the belief that it will lead to a better outcome overall). Such an approach, however, cannot appreciate that there are some areas of human activity which need to be seen as public goods, and not merely as private activities. A public good is one where a society acknowledges the need for provision of a service for all, even for those who cannot afford it, because its provision is seen as essential for the well-being of that society as a whole. As Grace argues:

Might not education be regarded as a public good because it seeks to develop in all citizens a moral sense, a sense of social and fraternal
responsibility for others and a disposition to act in rational and co-operative ways? The ultimate foundation for democracy ... and for a truly participative and intelligent political process ... depends upon the education of its people and the extent to which they can articulate and feel confident about the rights of citizenship. Insofar as education provides the basic conditions for making democracy possible, it has an immediate claim to the status of being a public good ...  

(Grace, 1989, p. 214)

Bridges (1994) makes a similar point when he distinguishes between positional and non-positional benefits in education. The former are provided for a child when a school provides a child with a better opportunity for university entrance or the job market, which does not benefit the wider population at all; non-positional benefits, on the other hand, such as 'insight, understanding, stimulus to interest, imagination, reflection and creativity (p. 76) are, Bridges argues, the hallmark of an educated culture and which all ultimately benefit. The end result is that

... the more a system of schooling offers the opportunity ... to secure positional advantage, the more [parents] will (quite rationally) exercise their custodial responsibility to secure that advantage for their children and the less they will concern themselves with ensuring that the system provides non-positional benefits to all.

(p. 77)

His prognosis for society is pointed:

The richer, educative and universally beneficial purposes of schooling will become subordinate to the narrower, self-interested function which can benefit some only at the expense of others.

(p. 77)

The arguments by Grace, Ranson & Stewart, and Bridges, that the public domain is a necessary focus for the promotion of collective life, as opposed to merely individual interests, is a striking difference, which suggests that its reduction to the personal and private could do untold damage to the fabric which holds the garment of society together. The effects upon managers’ perspectives, and the development of citizens would then be clear to all:

Managers in the public domain who assume a role based on a private sector model can easily perceive comment, challenge and the search to participate as interference with their real work of management. If, however, managers perceive their real task as working within and enabling a political institution, then, the many perspectives of active
citizenship are part of that institution and essential to the enabling task of management.

(Ranson & Stewart, 1989, p. 20)

Moreover, I have argued elsewhere (Bottery, 1994) with particular reference to education, that there is an increased isomorphism of the public and private sectors, particularly with regard to their management, and that it is not as clear as it once was that many of the demands of public sector management can still be considered as beyond the concerns of private sector management. For example, the concept of stakeholder management (Schein, 1966; Carroll, 1989) suggests an increasing acceptance by writers and practitioners in the private sector that what they do affects other people, who should then have some say in the running of private sector organisations. If this is the case, then there may be much that the private sector can learn from the public sector.

The difference in perception of managerial role may then be crucial to the orientation of the institution. It should, of course, not be too surprising to reflect that the NPM movement came to fruition under a prime minister who is on record as saying that ‘there is no such thing as society’. But it should be vital to the kind and quality of institutions a society wants and needs, that a professional’s orientation is considered, valued, and protected. Within such a picture of participatory citizenship, the professional, in both the public and private sectors, rather than being the instrument of managerial strategy, becomes much more one of several stakeholders in a societal exercise. In education, teachers, at all levels of a school’s hierarchy, assert that education for citizenship really means something, because it forms part of the very fabric of the way in which their institution is run. By promoting this kind of picture, then, teachers not only assert the value of professional opinion and judgement, they place it within a shared context.

(e) A sociological appreciation of practice

Much of what has been written in the previous section can be summed up here: that professionals, and teachers in particular, to be able to defend themselves better, have to understand themselves better. Part of this comes from an understanding of their practice, and what would make it more successful; this will be dealt with in the next section. But part of this also comes from an understanding of themselves vis-à-vis the society in which they live. For teachers specifically, it involves such questions as:

- What were perceived to be their original purposes upon inception?
- Do these inheritances affect their practice, and others’ reaction to that practice?
- Which aspects of occupational closure are defined and justified (a) historically and (b) in terms of expertise?
• What relationship have they had/do they have with the state?
• What have been the primary motivations of their representative bodies vis-à-vis legislation?
• In what major respects does their situation differ/is their situation the same, as other occupational groups in the welfare state?
• How does the situation of teachers differ from that of teachers in other countries? Why does it differ?

Such self-knowledge allows professionals to assess their weaknesses and strengths that much better. It allows them to appreciate that some justifications are valid; others are little more than rationalisations for historical accident. It allows them to place themselves within a wider picture, and see that sometimes (perhaps often) legislative change may not be aimed at them specifically, but has a wider or different target, and that they happen to be in the way. It gives them the opportunity to see that they do not necessarily occupy the centre of any occupational universe, but are part of a much more complex ecology of occupations. Professional action can only be enriched by such understandings.

(f) Redefining the role of the professional

If one aspect of knowing oneself better is the ability to reflect upon one’s place and function in society, another aspect is the ability to reflect upon and come to a better understanding of the implementation of that function. A sixth and final response by the professional can therefore be made by stepping up present debates upon the conception of professional practice.

This debate is driven by the realisation that because professionals live in changing times, the nature of their work must change with it. Three (simplified) examples will illustrate the point. Doctors, in an age when problems of health stem much less from disease as much as from life-style, poverty and social grouping, must increasingly change their perceived role from one of simple biomedical intervention to considering issues of educative prevention and health pressure group involvement. Police, in an age of diminished resources but increased demand, must move the understanding of their role from that of crime detection to emphasising that of crime prevention and community policing, of teaching the public how to make themselves more secure. Teachers in a rapidly changing world cannot be content with teaching a fixed body of knowledge, but must be rather more concerned with teaching pupils to learn how to learn, to ask rather than to accept.

This means a change of role in a number of ways. Firstly, it means in all cases a move to the pre-arming of the client: rather than being the expert in solving the problem, the professional increasingly must move to the role of being the expert in empowering the client to solve the problem themselves when it arises. The teacher cannot predict precisely what the pupil will need to know in 20 years, so the skills of acquisition are more important than any one body of
knowledge. The doctor (and the nurse, for that matter) cannot afford to wait until the patient develops a health problem: he or she must have helped the client to implement a healthier lifestyle beforehand. The police cannot be expected to detect all crime: far better if the individual can institute changes and adopt practices, the consequence of which is that the criminal is deterred before he or she even begins. Such a move coheres well with the argument above for the professional role being one of individual to individual, for there is a personal exchange in the educative role which cannot be reduced to a set of pedagogic formulae.

If a first change in role is in a move from solver to educator, a second move must come from the reflection upon what an educator does. An educator of the kind described above cannot act as the disseminator of unchallengeable information, and this for two main reasons. The first is because in most situations which the professional encounters, the solution is not readily apparent, but must be constructed. Bittner (1974, p. 35) describes the central police role of order maintenance as ‘a solution to an unknown problem arrived at by unknown means’. In the medical world, there is ample evidence that many ‘conditions’ are constructed by the medical profession, rather than waiting to be simply seen, recognised and treated (see Helman, 1990, on this). In education, many learning problems are socially or culturally constructed by teachers and society rather than simply recognised and ameliorated. This was the principle insight of M. F. D. Young’s seminal book (1971), and has underpinned most of the subsequent writing on the hidden curriculum of schools (for example, Whitty & Young, 1976). This is why writers like Schon (1982) and Svennson (1990) suggest that the activity of the professional is fundamentally misconstrued if such a disseminatory approach is adopted. What professionals are normally faced with is the initial problem of deciding what the problem is, as presented by the client. This will involve the professional in the framing and re-framing of the situation until a ‘fit’ occurs which does justice to the situation. In such situations, the education of the client to articulate the problem, and thus contribute to its solution, is going to be in most cases essential.

The second and equally important reason in the re-definition of professional practice is that the professional cannot be certain, even now, what is fact and what is still opinion in their spheres of expertise. The teacher need look only to the question of what is an historical fact (Carr, 1982) or what is a scientific fact (Chalmers, 1982) to realise that his or her teaching should be underpinned by the contestability of materials, not by an attempt to transmit their unchallengeability. The professional in the health service is only too well aware of the doubt surrounding the efficacy of most treatments. The police officer should similarly be aware of debates surrounding the research evidence on the effectiveness of techniques like fingerprinting and DNA profiling. For professionals, to then attempt to portray themselves as experts above and beyond challenge is to invite censure and cynicism from a public becoming increasingly aware of professional frailties. As noted above, the academic literature has anticipated this by at least three decades, and since the 1960s has moved from a study of professional-
ism based upon a hagiography of élite practitioners, to an increasing interest in
the manner by which occupational groups maintain their status and income by
occupational closure. The result is an increasing distrust of professionals, which
has to some extent been invited by a self-imposed status of unchallenged expertise
which by any epistemological standards is unjustified.

If professionals attempt to remain upon this pedestal, they may find they have
denied themselves their best defence against an unthinking managerialism.
Thus, for example, the most effective reply by health professionals to the insensitive application of protocols is to argue that to opt for a protocol or the costing of a Diagnostic Related Group assumes that the best treatment is obvious. The same applies to teachers with respect to judgements over the value of different teaching methods, to the police with respect to methods of detection. The truth is, of course, that in many cases such things are by no means so obvious, and a considerable degree of caution is advisable. Yet an insistence on professional infallibility inhibits such claims, and may well result in rigidified practice and the discouragement of experimentation. In such circumstances, and with such practice, it should not be too surprising to find that professional autonomy is restricted, and trust is not forthcoming.

Yet an acknowledgement of epistemological uncertainty does not suggest a lack of technical expertise; the professional is much further down this road than the client. But he or she must also recognise that there are other roads to be travelled in the framing of the problem, and that the client may have gone further down these. What such a change in conceptions of ‘professionalism’ suggests is that professional practice is enhanced by exchanging information with the client; that the expert, as well as the client, benefits from such exchanges. The client will learn through this educative relationship how better to cope with the presenting problem, and how to cope better in the future. The professional will, as Schon (1982) suggested, through inviting the opinion of the client, gain a wider frame of reference by which to understand what the problem is. Increased communication and education are essential if clients are to learn to help themselves; in terms of the defence of professional practice they are also essential, but only if professionals can accept the change in their conception of themselves and of their function. Undergirding their practice, then, will be five essential ethics:

1. An **ethic of truth disclosure**: which must override personal advantage.
2. An **ethic of subjectivity**: for each individual must recognise the limits of his or her perceptions, the individuality of his or her values.
3. An **ethic of reflective integrity**: as each professional recognises the limits of personal perception, of the need to incorporate many understandings of a situation.
4. An **ethic of humility**: as each professional recognises that such subjectivity means that personal fallibility is not a failing but a condition of being human.
An ethic of humanistic education: of the duty of the professional to help the client help themselves.

A final change is one which must suffuse these ethics, and relates back to the need for a sociological appreciation of practice. Public sector professionals need to consider the nature of their role not only within their organisation, but within a societal context as well, precisely because the public domain is a necessary focus for the promotion of collective life, as opposed to the prosecution of individual interest. Teachers need to be aware that the character of their practice has crucial implications for the development of citizens, in that the manner of teaching and school organisation has long-term effects upon pupils’ belief in their capabilities and rights to decision-making (see Bottery, 1992). Doctors need to appreciate the implications for health of poverty and social class, and be prepared to speak out on such inequalities. Police need to feel able to speak out on the efficacy and appropriateness of particular crime control measures without being tied to any particular political party’s skirts. Professions, then, are part of a wider societal occupational ecology, and the manner of their function has extensive implications for the welfare of society as a whole. The public sector professional must have an acute understanding of the political, social and ethical implications of the impact of their practice, and of changes to it: and this must be built into both their practice and their training.

Conclusions

As noted above, an immediate response by professionals to the legislation over the past decade or so has been an attempt to mould it to their own particular culture, to emphasise some aspects, and to delay, or subvert others. In institutions where there has always been a distinct administrative or managerial population, such as in hospitals, one is seeing an increasing number of management positions taken by senior clinicians. In institutions like schools where the professionals have traditionally run the institutions themselves, an increasing number of those promoted have begun to develop, or have been selected because they possess the characteristics of NPM managers. Such adaptations may be helpful in the short to medium term, as they at least provide a bridgehead between managerial and professional cultures.

However, the long-term prospects of a profession such as teaching are more likely to be improved by an ongoing process of reflection upon practice, the replacement of exclusivity with one of communication, client education and empowerment. If the professional image of infallibility and unchallengeability continues to be replaced by one of an expert much more prepared to communicate, educate and to learn from the client, the likelihood is that professionals will secure a firmer foundation for their practice and for the trust of the public. Such a change in role will be threatening to many, used as they may be to not having to explain or to justify, to not having to admit the need for the client’s perspect-
ive. Such a change will be similarly threatening for many clients, used as they may be to a role of dependency.

Nevertheless, such movement would ultimately generate public trust and provide accountability for professionals like teachers, doctors and the police, addressing and counteracting as it does the three sources of the NPM movement. For, firstly, economic considerations will be seen to be addressed by professionals, as clients (however these are defined) are educated through a more open display of professional practice. At the same time, teachers and other professionals, through their educative practice of these clients, can assemble powerful arguments to show that requirements of efficiency need to be carefully balanced against questions of quality and equity. Secondly, clients will be able to see that an ultimate aim of choice—the improvement of quality—is better achieved through the development and maintenance of long-term relationships between themselves and the practitioner, rather than through the use of legislative mechanisms which, rather than enhancing choice, may actually do little more than facilitate the movement of disgruntled clients between practitioners. Finally, practitioners of the NPM will find it much harder to pursue an aggressive style of management, as professionals increase public confidence in their practice through their openness, their efficiency, and their greater trustworthiness. Professionals such as teachers, who work in state bureaucracies, may have to change their spots to survive, but it will be a much healthier and more productive existence.

Notes
1 One example is that of professionals and public opinion. Teachers have for some time been one of the least successful groups in bringing public opinion on to their side. This is in part due to their inability to form into one body, and to prevent creating in the public’s mind an image of squabbling unions (see special edition of Journal of Education for Teaching, 1995). Both the police and the medical profession have lessons here from which teachers could learn. Thus, Reiner (1992) describes how the police force in the UK, through strong opposition to its inception, has, throughout its history, developed an approach which involves forging an identification between the public and the police force. It is interesting to note that the ‘law and order’ policy of the late 1970s and early 1980s, in line with the confrontationist politics of the prime minister of that time, Margaret Thatcher, but completely counter to the 150 year-old philosophy of policing, has now been tempered by chief constables who have stressed the ‘service’ nature of the job rather than the ‘force’ element (see Stephens & Becker, 1994). In like manner, the medical profession has always been adept at generating public commitment to the cause of the doctor. Part of this is without doubt a genuine ethical commitment to saving lives; but part is certainly down to the good fortune of having such an occupation to promote, which the medical profession has done assiduously.
2 Laughlin & Broadbent (1994) go so far as to date the first clear and definitive depiction in the UK to September 1982, when the White Paper ‘Efficiency and Effectiveness in the Civil Service’ (Cmnd 8616) was published. However, this would seem to be too short-sighted, but rather the beginning of another campaign in a much longer war.
3 For example, The Guardian, 24 April 1994 reported that the number of teachers in the UK who retired on grounds of ill health was 4897 in 1992–93, as compared with 2551
in 1987–88, during which time teaching numbers had hardly altered. A BBC 2 docu-
mentary on 21 April 1994 suggested that many GPs were working 70–80 hour weeks,
and at least three in the previous year had committed suicide. The gruelling work
schedules of junior doctors in hospitals is also well documented, and individual cases
suggest real stress arising from this. Finally, in one police authority (Humberside) days
off through illness increased from 16,418 in 1980 to 28,149 in 1993, with little dif-
ference in force numbers.

4 ‘There is no such thing as society. There are individual men and women and there
are families.’ Margaret Thatcher in Women’s Own, 31 October 1987.

CHALLENGE TO PROFESSIONALS FROM PUBLIC MANAGEMENT

TORSTENDAHL, R. (1990) Essential properties, strategic aims an historical development:

403

Both practitioners and theorists regard administration as an essentially rational process. Although the current emphasis on contingency theory recognises that effective patterns of administration are relative to the contexts in which they are to operate, there remains the fundamental assumption that if plans are well-conceived, clearly set out, and adequately communicated, then systems can be improved. Yet everyone working in organisations is all too well aware of their often idiosyncratic, adventitious, unpredictable and intractable nature when every day brings a new organisational “pathology” to disrupt well laid plans. This uncertainty occurs at the highest levels of policy-making and implementation. In his much cited work on the Cuban missile crisis Allison (1971) showed that what had been interpreted as the outcome of carefully-considered and rationally-enacted policies could be viewed as the result of actors within a highly uncertain situation bargaining within their own camps as well as across national boundaries. In an interview, Zbegniew Brzezinski, President Carter’s adviser on national security stated: “My overwhelming observation from the experience of the last four years is that history is neither the product of design nor of conspiracy, but is rather the reflection of continuing chaos. Seen from the outside, decisions may often seem clear and consciously formulated . . . but one learns that so much of what happens . . . is the product of chaotic conditions and a great deal of personal struggle and ambiguity” (Urban, 1981). Policy-makers and administrators in the less lethal field of education will recognise the aleatory dimension of the institution – described by Kogan (1975) as “pluralistic, incremental, unsystematic and reactive” – as they attempt to improve the service in conditions which appear to be perennially turbulent.

Evidence of the quirky and idiosyncratic nature of social institutions could lead one into a consideration of fundamental questions about the nature of the social sciences. However, this path will not be taken in this paper. The question to be considered is whether social scientists have explored sufficiently all dimensions of institutions as a source of explanation of what, within the prevail-
ing paradigms of social science research, appears to be irrational, adventitious and peculiar to a unique setting at one point in time. It is the purpose of this paper to suggest that there is one dimension of organisations which has been largely ignored in administration and organisation theory. We can refer to this as the “micropolitics of organisations”. It is an organisational underworld which we all recognise and in which we all participate. We acknowledge it when we speak of “organisational mafias”, “hidden agendas”, “playing politics” and “Machiavellism”. It is a dark side of organisational life which provides the source of much staff gossip. Ironically, micropolitical activity is engaged in by the very administrators who profess a rational theory of administration. Yet it is very rarely made the focus of academic study. For enlightenment on micropolitics and for enjoyable confirmation of what we know of this dimension of organisations, we got to television serials, films, plays and novels:

“Wilt” does more than Weber can
To reveal the FE world to man.

There may be good reason for the academic neglect of micropolitics. It is perhaps considered slightly unrespectable, or too self-indulgent (“the cute school of organisation theory”, Ouchi, 1981), or a threat to conventional administrative theory – which it is, or as having no practical application – which it may not. Or it may be that it simply is not a single dimension of organisations at all but a range of different processes each best handled separately through existing bodies of theory and research.

The purpose of this paper is simply to put the issue of micropolitics on the agenda. The sections which follow deal with the hypothesized domain of micropolitics, reasons for its omission from the major approaches to the study of organisations and their administration, the approaches to organisation and administrative theory which deal to some degree with micropolitics, and implications of micropolitics for the training of administrators.

The domain of micropolitics
Micropolitics embraces those strategies by which individuals and groups in organisational contexts seek to use their resources of power and influence to further their interests. The cynic might well say that this is simply a definition of administration. It is true that the relationship between administration and micropolitics is symbiotic in that in practice they are inextricably linked, but it can at least be hypothesized that there is some measure of independence. Administrative theory focuses on structures and the associated processes of power, decision-making, communication, etc. But the space between structures is occupied by something other than individuals and their motives. This “other” consists of micropolitical structures and processes. It is characterised more by coalitions than by departments, by strategies rather than by enacted rules, by
Politics is inevitably concerned with interests. Administrative theory often underestimates the plurality of interests in organisations because it tends to be attuned to organisational goals as determined by the leadership. That there are interests other than those of organisational effectiveness has of course long been taken into account by most administrative theories, but they nevertheless tend to be treated as recalcitrant, a suitable case for leadership, or socialisation or coercion. It is beyond the scope of this paper to offer a taxonomy of interests, but any classification would at least include personal, professional and political interests. Personal interests would include autonomy, status, territory and rewards. Professional interests involve commitments to particular forms of practice: curriculum, pedagogy, organisation and so forth. Political interests involve a commitment to certain macro or party-political policies. It is easily seen that, taking these three areas of interest alone, it is difficult to disentangle the personal, the professional and the political at a substantive level. The tendency is perhaps for personal or political interests to be presented in terms of the professional, since normatively this is the most “respectable” form of interest in education. Thus a proposed innovation which threatened the territorial interests of a teacher might well be resisted by mobilising “professional” arguments against it. Similarly, political interests can be presented as professional interests. However, it can be seen that here even the conceptual distinction is very difficult to sustain. In institutions other than education the distinction between personal and political interests is blurred. The conceptual difficulties are particularly acute when one considers “the micropolitics of macropolitics”, where the question is whether X is espousing a political interest per se or as a means of pursuing a personal interest in a political career. A large part of the fascination of Crossman’s Cabinet diaries (Crossman, 1975, 1977) is his revelations about micropolitics within the Cabinet and the ambiguous relationship between personal and political interests.

Interests constitute the content of micropolitics but it can be seen that the area is fraught with conceptual and methodological difficulties. It is perhaps for this reason that those who have addressed themselves to micropolitics have tended to focus on strategies rather than content.

Interests are pursued by individuals but frequently they are most effectively pursued in collaboration with others who share a common concern. Some of these may have the qualities of a group in that they are relatively enduring and have a degree of cohesion, but others – which are perhaps best referred to as
interest sets – will be looser associations of individuals who collaborate only infrequently when a common interest comes to the fore. Some interest groups will be coterminous with formal organisational groupings, e.g. departments or teams. These will be particularly strong. Others will transcend formal boundaries and will form when a common interest has to be pursued. The basis of group or set association may be age, sex, professional interests, politics, union activity, etc. Burns (1955) distinguished between cliques which are committed to sustaining the status quo and cabals which are committed to organisational change.

Coalitions have been the focus of attention of a number of writers. Selznick (1957) has made a sociological contribution to their study. Bacharach and Lawler (1980) review the major socio-psychological theories of coalitions before offering their own theory which is essentially a sociopsychological approach to the political dimension of organisations. They define a coalition as “a grouping of interest groups who [sic] are committed to achieving a common goal”. In turn, interest groups are defined as “groups of actors who are aware of the commonality of their goals, and the commonality of their fate beyond simply their interdependence with regard to the conduct of work”.

Some interest groups will be permanently mobilised; interest sets will mobilise as and when their interest becomes salient. Components of the formal structure will remain the most powerful set of groupings in an organisation, but there is at least a case for viewing an organisation in terms of the alternative structure of shifting interest sets which, in fact, interpenetrate with the formal organisation at many points.

Power is one of those social science concepts which refer to an important social phenomenon but about which there are theoretical and empirical disputes which are likely to remain unresolved. Given the libraries of works on power produced by political scientists, philosophers, sociologists and social psychologists, it would be impossible to review the complex theoretical and methodological issues involved in this short paper. Thus the remarks made will be those of particular relevance to micropolitics.

The distinction between two major aspects of power are important. Authority is the legally supported form of power which involves the right to make decisions and is supported by a set of sanctions which is ultimately coercive. Influence is the capacity to affect the actions of others without legal sanctions. The distinction is conceptually important but difficult to sustain empirically because, since authority can be latent, it is difficult to establish when control is exercised through influence or through latent power. However, the distinction between authority and influence remains potentially useful since the power deployed in micropolitics frequently takes the form of influence since interest sets will draw on resources other than those of authority to achieve their ends.

Administrative theory tends to focus on authority which has its source in the hierarchical structure of the organisation. Micropolitical theory would give greater prominence to influence. Influence is derived from a number of sources,
e.g. personality (charisma), expertise, access (especially to information) and resources (material or symbolic). Influence differs from authority in having a number of sources in the organisation, in being embedded in the actual relationships between groups rather than located in an abstract legal source, and is not “fixed” but is variable and operates through bargaining, manipulation, exchange and so forth.

The headteacher in Britain has a high degree of authority; but his exercise of this authority is increasingly modified as teachers’ sources of influence through expertise, access to symbolic resources, etc., increases and thus involves the head in a greater degree of exchange and bargaining behaviour (Hoyle, 1981). These are the aspects of power which are the appropriate focus of micropolitics.

Micropolitics takes account of the strategies used by interest sets to attain their ends and gives these greater attention than formal procedures. Organisational politics has been insufficiently studied to yield a systematic taxonomy of such strategies although there are good individual studies. For example, Pettigrew (1973) identified four strategies used by a group of programmers to protect their interests: norms which denied the outsider’s competence, protective myths, secrecy, and control over recruitment and training. Handy (1976) discusses a number of protective strategies such as the distortion of information, the imposition of rules and procedures, the control of rewards, etc. There is so little discussion of micropolitical strategies in educational organisations that it is perhaps appropriate to invent some examples: an FE college may have a “collegial” structure, but the principal, caught in the dilemma of all who would manage pluralistic organisations, i.e. the reconciliation of legal authority and the expectation of participation, may indulge in micropolitics in order to cope with this dilemma. Thus he may attempt to handle situations by: “losing” recommendations from working parties by referring them to other groups in the hope that they will disappear or become transformed, “rigging” agendas, “massaging” the minutes of meetings, “nobbling” individuals before meetings (“I’m glad you see it my way. I hope you’ll make your views known at the meeting”), “inventing” consensus (“Well, we all seem to be agreed on that”) when consensus has not been tested, “interpreting” the opinions of outside groups (“The governors would never accept it”. “The LEA wouldn’t finance it”) and so forth. As Noble and Pym (1964) discovered, “collegial” organisations are characterised by a “receding locus of power”. The course of power is difficult to identify in a collegial organisation. The principal can draw on his resources of legal power, but other members of staff have their own resources.

Thus micropolitics involves a study of interests, interest sets, power and strategies. These are intimately related to the more formal aspects of an organisation which is the main focus of much administrative theory, but the political dimension of an organisation constitutes an alternative focus for understanding organisational processes. However, from the brief discussions of these four components in this section it can be seen that it is likely to be a conceptually and methodologically complex area of enquiry.
The neglect of micropolitics

Theories of organisations and administration are relative, i.e. products of their place and time, partial, i.e. in adopting one theoretical perspective others are inevitably excluded since a total perspective is not a possibility, and normative, i.e. to a greater or lesser degree they are infused with values.

The dominant paradigm in organisational and administrative theory is one in which political aspects do not easily fit. Although it is a great over-simplification to group all prevailing theories within one paradigm, and although it is impossible to do justice to the diversity of existing theories, some broad points can be made in order to illustrate the reason for the neglect of micropolitics.

Current organisation theory has two origins: Weber’s theory of bureaucracy and early theories of management. These two strands converge and diverge at many points in the development of theory. Sociological theory in the Weberian tradition is potentially concerned with understanding organisations; management theory is potentially concerned with improving them. However, theories of management need to be based on understanding if they are not to be merely recipe theories, and organisation theory has not retained a detached purity since its protagonists have also been concerned with improving organisations in various ways: their efficiency, the quality of life of participants, and, hopefully, both. Hence they share a common paradigm which can be termed the maintenance paradigm.

It is impossible to give a detailed account of this paradigm let alone the variations within. Nevertheless, the following are its major lineaments: its metatheory assumes that the social world is to a greater or lesser degree, rational, amenable to scientific study and predictable. Its perspective on organisations follows from this in emphasising the centrality of structure, the legal authority inherent in that structure, a relatively high degree of integration and systemness, participants who will continue to be committed given an appropriate mix of rewards, and conflicts which are either “creative” or arise from some malfunction of the structure or leadership. The associated management theory is concerned with the effective use of resources, maximising the fit between organisational goals and personal needs, and an organisational responsiveness to contingent conditions in the environment. The theory of change inherent in the model is essentially that of planned change whereby adaptation to a changing environment is handled by structural changes and the retraining and re-socialisation of participants. Overall the paradigm views organisations in a top-down manner.

The operation of the maintenance paradigm in education can be – again in a gross over-simplification – summarised as follows: Educational organisations – schools, colleges, polytechnics and universities – have to cope with changes in their environment: cultural, technological, economic and political changes of various kinds. Political changes are initiated at the macropolitical level and tend to focus on the allocation of resources, legal enactments and overall structure with rather less focus on matters of curriculum and pedagogy. It is assumed that
practitioners will interpret these external changes in an attempt to keep in balance the interests of society and the interests of clients. Hence the expectation is that innovation will be professionalised rather than politicised. In order to equip institutions and practitioners to cope with the professional demands of innovation, programmes of professional development, organisational development and the development of inter-personal skills have emerged. The appropriate strategy of change, within the coercive strategies of national and local government, is considered to be a mixture of rational and re-educative approaches.

A major alternative is the *action* paradigm which again has a complex history and embraces a wide range of perspectives so that to bring them together under one heading is to oversimplify. Nevertheless the lineaments of the action paradigm are as follows: its metatheory holds that the social world is nothing other than the construction of the minds of men and hence has no objective reality “out there”. Social life is sustained because men, through their daily interaction and their language, create intersubjectively shared meanings. These meanings may be relatively persistent and perhaps come to have the appearance of objectivity but, in fact, as men continue to solve the problems of their daily lives, they can voluntarily construct new meanings. It follows then in strict terms there can be no action theory of organisations since organisations are not “objects” but social constructs, and the meanings attached to them, will differ according to one’s perspective. The action theorist is interested in activities within what are conventionally termed organisations because he is interested in how participants construe organisations and their processes. He treats as “problematic” the organisational structure and administrative processes which organisational theorists take for granted. As there can strictly be no organisation theory, there can likewise be no theory of management since management is only a constructed label for a group of organisational processes dominated by those who have resources of power which tend to become problematic only if treated phenomenologically. It should follow that an action perspective is neutral in relation to change since it is a paradigm more concerned with understanding the world – or, more precisely, understanding others’ understanding of the world, than with initiating change. Its active contribution to the change process is the assumption that social theorists of this persuasion should work with practitioners at any level of the organisation helping them to clarify their own perspectives, helping them to question what had previously been taken for granted which then becomes potentially amenable to change. Thus it generally encourages an “active” stance on the part of participants. This sounds rather like the process consultant operating within the maintenance paradigm but whoever the process consultant is, however independent of management he may profess to be, ultimately he is concerned with improving organisational functioning in relation to the goals of management. The action theorist tends to be orientated towards enabling the lower participants to perceive the possibility of reconstructing the organisation in
ways alternative to that perceived as “effective” by management. In short, action theory, like maintenance theory is relative, partial and normative. Yet there is more potential within the action perspective for focusing on micropolitical activities since these are actions which can be made the strict focus of enquiries and not treated as pathological or deviant activities.¹

What can be termed the radical change paradigm has political activity at its centre. It is concerned with understanding the social world in order to change it in accordance with a set of political beliefs. This perspective is strongly Marxist in orientation. Again, at the risk of great over-simplification the following are some of the main characteristics of this approach: the metatheory may, according to the particular view of Marx taken, share the same view of the world as the maintenance theorists, in that it is taken that there is an objective world out there which is amenable to scientific understanding and control via the manipulation of structures and the socialisation of individuals, or of the action theorists. Essentially it is not an organisation theory but a broad socio-political theory in which organisations are seen as arenas in which occur the clashes between the prevailing ideology and the alternative radical ideology. Thus the political transformation of organisations is a necessary step towards transforming society. This is captured in the phrase about “the long march through the institutions” which became prevalent in the late 1960s. Thus there is no management theory as such, only a theory-in-waiting. Current theories of management are held to be simply theories supportive of the capitalist hegemony. There are theories about using “the organisational weapon” in the period of transformation but only when the transformation occurs can a radical, egalitarian and democratic theory of organisation – “management” is perhaps a tainted word – emerge. Although this perspective certainly has political concerns, organisational politics are subsumed within macropolitics, with micro-political activities which do not obviously contribute to the political transformation of the organisation being regarded as pathological.

Approaches to micropolitics

The chief elements of micropolitics: power, coalitions, strategies and interests have been the focus of studies in a number of social science disciplines. In social psychology there has been considerable study of interpersonal power particularly in group settings. However, the socio-psychological study of organisations has been largely concerned with problems of leadership and communication and is clearly located within the maintenance model. Weick (1979) is an exception to this trend in that he has concerned himself with the “negotiation” of organisational order, but the focus has not been directly upon the micropolitical. The concern of political theorists has been games, choice and coalitions (Brams, 1975; Laver, 1980). They have tended to be concerned with establishing formal theories rather than with understanding political activity in vivo.² There are a number of sociological approaches which, though not focusing directly on
micropolitics, are nevertheless concerned with relevant issues. Of particular significance there is exchange theory which is predicated on the assumption that many aspects of social life are explained in terms of the implicit and explicit bargains struck between groups which, though they may be different in relation to the degree of relative power which each has, necessarily needs to reach an accommodation with the other in order to serve their mutual interests (Homans, 1958; Blau, 1964). Other sociological theorists of organisation, particularly Selznick (1951, 1966) and Gouldner (1954a, 1954b) attended to the “dysfunctional” elements in organisations which were often the outcome of the pursuits of group interests rather than organisational interests via what we are here terming micropolitics. However, neither has pursued the implications of this in the direction of making micropolitics central to his analysis. Selznick resorted to classical functionalism and although Gouldner was to come to adopt a radical view of social institutions, this was developed within a Marxist rather than a micropolitical framework.

In decision-making approaches to organisation, Simon’s (1964) notion of “bounded rationality” is concerned with the boundary between rational and non-rational aspects of social behaviour. The “non-rational” – which we would now, in these post-phenomenological days, refer to as “alternative rationality” – relates to the activities which we have referred to as micropolitical. However, in the theories of March and Simon (1958) organisational analysis remains well within the maintenance framework in noting these aberrant behaviours as evidence that organisations do not in fact function according to the rational model.

Three organisational theories which are more directly concerned with micropolitics can be noted.

The first is the later work of March who now appears to have brought what was earlier considered to be “non-rational behaviour” in the decision process, i.e. micropolitics, to the centre of the stage. In *Ambiguity and Choice in Organisations* (March and Olsen, 1974) he and his colleagues concentrate less on how decisions ought to be made if they are to conform to canons of rationality, than on how in fact they are made. What is described is how decisions, which are rarely the clear cut events usually described, emerge out of a complexity of micropolitical activities. They advance what is now their well-known “garbage can” model of decision making:

“Although choice opportunities may lead first to the generation of decision alternatives, then to an examination of the consequences of those alternatives, then to an examination of the consequences in terms of objectives, and finally to a decision, such a model is often a poor description of what actually happens. In a garbage can situation, a decision is an outcome or an interpretation of several relatively independent ‘streams’ within an organisation.”

They consider four streams which might go into the “garbage can”: 
Problems: These are the personal problems of participants as they relate to such matters as pay, status, promotion, personal relationships, families and even the problems of mankind.

Solutions: They reverse the normal view of solutions and see them as sometimes preceding problems. They cite the installation of a computer in an organisation which may represent a solution to problems not yet conceived. In the educational context one could conceive a new curriculum or a plan for school-focused in-service training generating new problems rather than solving existing ones.

Choice opportunities: These are occasions such as those when a new member of staff is to be appointed or where a responsibility allowance is to be allocated which generate behaviour which can be called a decision.

Participants: Individuals come and go and their different attributes will shape the outcomes which are termed “decisions”.

The rates, patterns of flow and confluence between these four streams shape certain organisational events which come to be labelled as “decisions”. March and Olsen write of organisations “running backwards” in the sense that organisational events are the outcome of bargaining, negotiating and exchange and only after they have occurred is their history “re-written” by managers to give them the appearance of having been the outcome of a rational decision-making process.

Michel Crozier (1964) has long been interested in how power and influence operate in organisations and has developed the view that organisational processes are best understood by focusing not on formal organisation and power as a commodity but on the games which individuals and groups play in order to solve problems, and in which power is treated as a bargaining relationship. He argues for a change in paradigm. Thus the research problem is to explore how different systems of games can solve the problems which organisations face. He believes that the way forward is to learn more about current games in all forms of organisation and the forms of regulation inherent in these games. This will be best approached by case and comparative studies at the present time with the prospect of formalisation and measurement left until the future. He has written (Crozier, 1975):

“The dominant paradigm revolved around the basic question concerning the structure: how contextual variables determine the basic structural features of an organisation and how these features command the behaviour of the members and the performances of the organisation. The new paradigm emerges first around the idea that the contextual features of the organisation should not be considered as variables determining the structure of the organisation, but as problems to be solved,
and second around the idea that structure is not the necessary nodal point of the organisation, but that the games with their rational mathematical features as well as their human parameters will be a much more concrete and rich focal point.”

Bacharach and Lawler (1980) set out their concerns as follows:

“An understanding of organisational politics requires an analysis of power, coalitions and bargaining. The power relationship is the context for political action and encompasses the most basic issues underlying organisational politics. As the primary mechanism through which individuals and subgroups acquire, maintain, and use power, coalitions crystallise and bring to the foreground the conflicting interests of organisational subgroups. Through bargaining, distinct coalitions attempt to achieve their political objectives and protect themselves from encroachments by opposing coalitions. Power, coalitions, and bargaining, therefore, constitute the three basic themes in our theoretical treatise on organisational politics.”

They review the existing literature and argue that in sociological studies there has been too great an emphasis on formal structure and power and that the traditional social psychology of organisations has tended to focus on motivation, leadership and so forth and have thus ignored the political nature of organisations. They therefore focus on the activities of work groups, e.g. departments, interest groups, i.e. groups of actors with common goals which are not necessarily coterminous with work groups, and coalitions, i.e. groups of interest groups who engage in joint actions against other interest groups. On the basis of a detailed analysis of power, authority, group formation, and bargaining, they develop a formal theory incorporating over 100 hypotheses.

In sum, there have been a number of approaches to the study of micropolitics, but at the present time they cannot be said to constitute a coherent body of theory. The question is whether such a coherence is likely to be achieved and, if so, what its contribution to the study of educational administration might be.

Empirical studies of micropolitics are extremely rare. Some exceptions are Thompson (1967) in the US and in this country Pettigrew (1973) and Mangham (1979) but none of these studies was conducted in educational organisations.

The prospects for micropolitical studies

This paper is based on the assumption that a considerable gap exists between the organisational world which is presented in theory and research and the organisational world which we all experience. This gap is acknowledged by administrators who perhaps gain little help from administrative theory because it is not of their world, or at least it relates to a rather sanitised version of the world in
which they function. The gap is also increasingly recognised by theoreticians and researchers who have become somewhat disenchanted with the prevailing paradigm but are not wholly happy with the action and radical change alternatives. Thus the importance of the micropolitical world is existentially acknowledged.

The question is: can it be captured by the theories and methods of the social sciences and, if so, will what is learnt be of value to practising administrators?

The answer to the first of these questions must remain tentative. There are two basic levels of answer. One relates to the fundamental problem of the social sciences of whether in principle a knowledge of the social world can be attained by the methods of objective enquiry. This is no place to rehearse the arguments yet again, except to note that of the three broad positions: a knowledge of the social world is in principle impossible, that it is possible only through an understanding of the meanings which actors ascribe to situations, and that the social world is in fact, knowable by the procedures of the natural sciences. If we make the assumption that it is, in principle, knowable, then we have to ask how it might be knowable. It could be argued that the micropolitical world is so ideographic, idiosyncratic, contingent and volatile that in practice it cannot be grasped. It could be further argued that it is indeed of this character but it can be grasped in its particular concrete setting via a detailed case study, but that generalisations are very difficult to achieve in practice. Or it can be argued that the micropolitical world is amenable to study by the methods of the social sciences which permit generalisation.

If one takes the latter position, then two things have to be said. One is that “the real stuff” of micropolitics is particularly elusive. As we have seen, different approaches focus on different components of micropolitics, so the interactive nature of power, coalitions, interests, and strategies is unclear. However, if studies to concentrate on one or other aspects in an effort to clear the way towards formal, testable theory, then the configuration disintegrates. Thus we are left, as we often are in the social sciences, with a choice between case studies providing rich data and formal studies providing – hopefully – generalisable findings. And one inevitably comes to the familiar conclusion that both approaches should proceed, if, indeed, it is worthwhile pursuing at all the study of micropolitics in education. It may be that it is not a viable area of study as a whole and that its components are better pursued independently.

If one concludes that it is worthwhile getting to grips with the micropolitics of educational organisations, by whatever method, one has to ask whether the outcome is likely to improve the practice of educational administration. Would it, in fact, provide theory-for-understanding or theory-for-improving? It would appear more likely to provide theory-for-understanding. Studies of micropolitics could well bring the area much more into the arena of open discussion, but it isn’t easy to see in what ways this might improve the quality of administration or the quality of life in educational organisations for participants. It is even more difficult to see how the outcome of the study of micropolitics would feature in
courses for practising administrators other than as a general mirror-raising component and as theory-for-understanding. In what sense could it contribute to improvement of skills? It could form the basis of various forms of simulation and games, but the degree of transfer from gaming to practical decision-making contexts must be somewhat dubious. And even if it were possible to teach micropolitical skills to practising administrators, this would – to say the least – generate some obvious moral issues.

It is clearly the case that micropolitics is difficult to embrace within the conventional theory, research and training patterns of educational administration since administrative theory is normatively oriented to rationalising order and control and eliminating the alternative world of micropolitics. This paper offers no solutions. As stated at the outset, its purpose has been to put micropolitics on the agenda.

Notes
1 Perhaps the best known protagonist of an action or phenomenological approach to educational administration is Greenfield (1975). For a recent interesting exchange between the relative merits of a phenomenological and a flexible system approach see Greenfield (1981), and Willower (1981). More generally on the potential of one action approach see Silverman (1970) and the same writer’s more thoroughgoing phenomenological approach (Silverman and Jones, 1976). For a good review of current organisation theories see Burrell and Morgan (1979).

2 The dramaturgical approach of Goffman (e.g. 1969, 1971, 1974) is difficult to classify but the personal strategies which he identifies are those of the micropolitical actor.

Reappraisal

The problems and prospects of studying the micropolitics in reforming schools

Hanne B. Mawhinney

Abstract

This analytical paper examines the themes and issues of current research and literature on the study of micropolitics in the context of leadership in educational reform. The implications of a dissociation of research and policy making on systemic reform from research on micropolitics are discussed. In particular the problems arising when macro directions meet micro realities are described as a rationale for reexamining what can be learned from the study of micropolitics. I make a case for reexamining some of the conceptual orientations that have been taken including organizational theorizing from control, natural and interpretive systems perspectives. The predominance of an emphasis on conflict rather than consensus in micropolitical studies is noted. I describe the similarity of concerns of micropolitical research with the conceptual challenges confronting those who are rethinking organizational theory who examine problems associated with macro-micro links, and those related to notions of agency and interest. I argue that the conceptual pluralism evident in the range of orientations taken in research has both enriched and limited our understanding of micropolitical effects. As a point of departure for this collection of reflections from academics and school leaders from around the world, I conclude that there is a need to both clarify the conceptual dimensions of micropolitical analyses of schools, and to examine what school leaders involved in reforming schools can tell us about micropolitics.

Introduction

Among the dialogues running through current research on the organization of schooling, are two focused on the problems and prospects of changing schools
that cross and occasionally bump into each other. One dialogue dominates educational research on the systemic requirements of reform. Themes in this dialogue are captured by the titles of recent articles on North American educational reform such as ‘What is the system in systemic reform?’ (Cohen 1995), ‘Structural reform in educational practice’ (Elmore 1995), and ‘Turning systemic thinking on its head’ (Fullan 1996). The dialogue has been variously labeled: restructuring, re-invention, and more recently, ‘systemic reform’. This most recent version of the dialogue has been preoccupied with orchestrating systemic coherence through: developing unifying visions and goals for all students, creating coherent instructional policies aligned to support common goals, and restructuring the systemic of governance and resource allocation so that the greatest authority and discretion for instructional decisions rest at the school site (O’Day & Smith 1993).

The second dialogue focuses on the micropolitics which swirl in and around schools, often constraining the systemic efforts at changes which challenge taken-for-granted practices. Micropolitics, whether or not addressed explicitly in the dialogue on educational reform, pervade the organizational lives of those involved with schools: students, parents, teachers, administrators and support staff, who must act jointly to respond to the uncertainty and controversy generated. Micropolitics are inevitable where disagreements emerge over the direction of such action. That is not to say that reformers have explicitly recognized the micropolitical conundrums posed by systemic change efforts. Indeed, although the influence of a systemic vision of reform is evident in current educational policymaking, observers like Fullan (1996) and Sykes (1996) remind us of the need for continued dialogue on associated problems. They include those micropolitical effects which are associated with the ‘implementation dip’ that occurs when reforms attempt to guide practice. Fullan (1996: 421) argues that ‘there is no reason to assume that the debate about systemic reform has added one iota of clarity to the confusing picture faced by the majority of teachers’ who are overloaded by the continuous stream of planned and unplanned changes which often work at cross purposes in schools. Teachers, students, parents and administrators confront the problem of overcoming the disagreements which inevitably arise over the direction of reform. If the goals of systemic reform are to be achieved, members of the school community must find ways of resolving conflicts which ensure that decisions made command enough respect that they are widely accepted.

Resolution of controversy is not the only challenge confronting reformers. Restructuring the organization of schools is not a simple task when reforms generate uncertainty as well as controversy. Structural alignments will only occur, according to Fullan (1996: 421) ‘when greater clarity and coherence are achieved in the minds of the majority of teachers’ who experience reforms as fragmented, disjointed and incoherent changes. Sykes (1996: 467) similarly observes that ‘schools and classrooms are the vessels into which a torrent of new ideas pour ... [and] teachers must shift through and select among the many
competing ideas for change’. Ideas about systemic reform comprised of an amalgam of critiques of current practice and implication drawn from research on school change efforts, may work well ‘in the ongoing rhetorical battle over American education’, however, they may be of little help as guides to practice for teachers.

In recent years research into the micropolitics of life in schools confronting change, has provided some insight into the forces at play when macro initiatives are buffeted by micro realities. Unlike the reformers of schooling currently engaged in direct and often public dialogue on the merits of different avenues to promote systemic change, those who have sought to speak truth to the power of organizational micropolitics have done so largely in monologues. As a result the distillation of conceptual problems and prospects we see in the debates over the merits of systemic reform has not occurred in micropolitical analyses of schooling. Sticky problems such as the organizational tensions generated in schools as macro-micro forces collide, have not been adequately addressed. The conceptual boundaries set out by those who have undertaken micropolitical analyses of schools are not clear, rather they have encompassed almost any phenomenon which could be construed as political. In her review of the state of micropolitics of education research, Malen (1995: 159) was prompted to observe: ‘if micropolitics is about much ado about everything, is it much ado about anything?’

**Conceptual diversity: embedding frameworks of micropolitical lenses**

Micropolitical research has emerged as one of the new thrusts in understanding the complexities of organizational life in schools. During the past decade researchers in the UK (Hoyle 1986; Ball 1987), Canada (Townsend 1990), and the US (Blase 1991; Iannaccone 1991; Marshall & Scribner 1991; Willower 1991; Anderson & Herr 1993; Bacharach & Mundell 1993; Lindle 1994; Blase & Anderson 1995; Malen 1995) have explored the conceptual dimensions of a micropolitical lens for analyzing school administration. The micropolitical perspective was first applied to educational organizations by Iannaccone (1975) who examined the interactions of administrators, teachers and students in California schools in the early 1970s. Iannaccone defined micropolitics as being concerned with the interaction and political ideologies of social systems of teachers, administrators and pupils within school buildings. These may be viewed as internal organizational subsystems. Micropolitical analysis is also concerned with external system issues such as those arising in the interaction between professional and lay subsystems.

Like others who have followed a micropolitical line of analysis of schools in the two decades since he first called attention to this thrust, Iannaccone was influenced by developments in organizational thinking. We find in current research on micropolitics in education traces of at least four different models that have captured the attention of theorists. Although various metaphors have been
attributed to them, they are widely recognized as depicting organizations as control systems, natural systems, political systems or interpretive systems. For example, the view of organizations as political systems implied in Iannaccone’s definition of micropolitics emerged in the 1960s in studies of public administration and management. At that time theorists began to rethink the robustness of the models of organizations as control systems, or as natural systems which dominated thinking about organizational questions (Hault & Walcott 1990). The control systems model which we can find traces of in current micropolitical analyses of schooling, emphasizes authority but neglects power in organizations. Organizations, are seen as rational tools for achieving maximum predictability of actions and outcomes.

Challenges to this view of organizations as largely self-reliant, closed and ‘mechanistic’ systems has come from those who attribute ‘organic’ features similar to those characterizing natural systems. The natural systems model which underscores the imperative of organizational survival in a larger environment can be found framing current micropolitical research on the responsiveness of schools to imperatives to reform. It depicts environmental forces as shaping goals, structures and activities in a way which stresses the functional inter-relatedness and harmony within organizations.

Both control and natural systems models posit a highly integrated view of organizations where questions of human purpose, and of conflicting goals arising from the exercise of that purpose are largely ignored. In recent years both models have been criticized as being biased toward technical rationality and failing to account for complexity, instability and conflict within organizations. Critics conclude that rational control and natural systems models tend to ignore the values, ideologies, choices, goals, interests, expertise, history and motivation of individuals in organizations.

In previous decades these limitations led organizational theorists like Burns (1961) to call for a new focus on organizations as political systems. Burns was one of the first organizational theorists to argue against consensus models of organizations and to propose examining both co-operative and conflictual behaviour. He viewed political behaviour as a central impetus for social change in organizations. Other theorists like Cyert and March (1963) examined decision-making in organizations and found that it occurred within a framework of disparate goals where coalitions may emerge to achieve political ends. Similarly Pettigrew (1973) suggested that decision making can’t be explained without understanding political power and the strategies used by individuals and groups to gain such power. The tension between individual and collective strategies were examined by Mangham (1979), who concluded that opportunities for individuals to exercise strategic choice will inevitably create conditions of goal conflict within organizations. Although negotiation among individuals to reach goal consensus will call forth techniques of politics, such as persuasion and bargaining, Mangham argued that these strategies could ultimately be the impetus for the creation of shared meaning among individuals and groups within organizations.
In recent years other organizational theorists have acknowledged the role of dialogue, debate, and coalition formation in forging a sense of collective meaning among organizational members. These notions have been elaborated by Bacharach and Lawler (1980) who have argued that victory in debates generally goes to the strongest coalition. This line of micropolitical organizational theorizing has had an important influence on educational researchers. The approach taken by Bacharach and Lawler is distinguished by an emphasis on group-level coalition politics over individual action, and particularly by the ‘tactical use of power to retain or obtain control of real or symbolic resources’ (1980: 1). Their structural perspective focuses on systems of authority and control carried in various organizational roles, which influence the outcome of bargaining. They conceptualize organizations as political bargaining systems dominated by networks of coalitions of stakeholders all seeking to further their partisan interests. Furthermore, Bacharach and Lawler suggest that the tactical use of power by coalitions to retain or gain control of real or symbolic resources is fundamental to the politics that occurs in organizations. Similarly Pfeffer (1981: 31) argues that organizations can be seen as political arenas where ‘shifting coalitions and interest groups’ become winners and losers in their struggle for power and come into conflict.

Bacharach and Mundell (1993) extended this pluralist perspective into their analysis of organizational politics of school life. Their explicitly pluralist orientation seeks to explain the conditions which provoke interest groups to mobilize, to act separately, or to form coalitions in order to achieve a desired organizational outcome. Power, from this pluralist perspective is manifest through the overt actions of coalitions seeking to influence decisions. Political action involves the acquisition and exercise of influence, authority, control and power.

Other researchers have taken a less pluralist orientation in their use of the political arenas model to analyze the micropolitics of life in schools. These analysts question whether all organizations reflect a plurality of interests. They argue instead that the expectation of pluralism common in many North American efforts to apply a political model of organizations to the study of school micropolitics obscures larger truths, such as the fundamental class cleavage between management and labor. Ball (1987), for example, views schools as arenas for struggle rife with conflicts because they are poorly coordinated and ideologically diverse arenas of conflicting interests.

This more critical perspective to organizational analysis is found in the interpretive approaches to organizational analysis. Although several interpretive approaches found in micropolitical research in education have in common a focus on an actor’s perspective, they have taken different orientations toward the nature of cultural systems in organizations. Some interpretive approaches view organizational cultures as integrated entities. These approaches emphasize processes of gaining organization-wide consensus through developing shared values and cognitions. The assumption that members of an organization can share the same taken-for-granted interpretations has typically been adopted by
those focusing on the role of leaders and managers in typifying policy, inducing commitment to it, building organizational community and, thus, coherence.

Other interpretative orientations acknowledge the lack of consensus that commonly exists across organization’s sectors. Their focus is on the conflicting cultural understandings of different subsystems of actors within organizations. Discrepancies among these understandings leads researchers taking this orientation to use a critical-conflict perspective to analyze their findings. They share this tendency with those who adopt a third interpretive orientation, one which embraces ambiguity as the endemic condition in all organizational cultures. Whereas the unity view of interpretive systems assumes consensus is the fundamental order in organizations, the ambiguity view sees consensus as fluctuating across issues. This negotiated order view assumes that organizational actors perceive structures as defining their lived experiences. Anderson and Herr (1992) take this perspective in arguing that the theme of student invisibility:

... has become a popular metaphor in educational writing as more researchers are viewing schools as consisting of multiple realities in which some realities are ‘defined out’ of the dominant social construction.

(59)

While Anderson and Herr (1992) are correct in observing that educational research has taken an interpretive turn in recent years, it is also the case that micropolitical analyses have been particularly eclectic in their conceptual borrowings. Organizational theorizing from control, natural and interpretive systems perspectives and cross-perspective dialogue and debate has enriched the body of literature from which educational analysts interested in the organizational dynamics of schools are now able to draw. Educational analysts have taken advantage of the diversity offered by these conceptual perspectives to such an extent that those who have examined the state of micropolitical research conclude that it is currently best described as a ‘disparate field of inquiry’ where ‘conceptual boundaries and distinctive features await definition’ (Malen 1995: 159). Indeed, the accumulated micropolitical research, best characterized by a conceptual pluralism framed from diverse perspectives, offers insights on inter-relationships among dimensions of organizational structures, decisions, sources of power, goals, values, purposes and strategies. Marshall and Scribner (1991: 350–353) capture this diversity in their analysis of themes found in current research on dimensions of micropolitics of school administration. They identify seven focuses in micropolitical research. One common focus of research is on the ideologies and values of subsystems of teachers and administrators in schools. Other micropolitical studies examine the negotiations of boundaries and turf between administrators and teachers. A third theme in micropolitical studies is that school site actors often assert bureaucratic rationality for political ends. A fourth theme in micropolitical studies is that street-level bureaucrats such as
teachers often revise and remake policy during implementation to fit their site. Studies also document the mobilization of bias in organizational life. Bias is often taken for granted or ignored. Often the dilemmas arising from conflicts among the common goals of education—equity, choice, efficiency and quality are subverted by micropolitical processes. Perhaps the most powerful form of mobilization of bias occurs through reality creation in organizations. Those who have the power to determine which issues and questions are seen as relevant and critical and which will be viewed as irrelevant and illogical play the most powerful micropolitical games. Finally, micropolitical studies document the privatization of conflict within the school walls, or within one subgroup on the site.

Research on these dimensions of the micropolitics of school life have given us a new understanding of organizational dynamics. The problem is that these insights are weakened by their dissociation from each other and from the developments in the broader field of organizational theorizing. The result is an accumulation of ad hoc analyses of individual cases of micropolitics from unique perspectives that do not generate much overall theoretical insight into organizations or tell us a great deal about how to inform policy-related thinking about systemic reform. In order to address these limitations, micropolitical analysts must, at the very least, lay out the model of organizations and the associated assumptions which frame their research. This will not in itself do a great deal to inform problems of systemic reform unless researchers also cut to the core of the organizational dilemmas posed by restructuring proposals and efforts. In the interest of responding to these challenges I turn now to discuss two of the problems bedeviling systemic reformers which could be informed by micropolitical analyses: the problem of macro intents and micro realities, and the problem of agency and interest.

**Revisiting the problem of macro perspectives and micro realities**

Putting aside the issue of perspective diversity, micropolitical research has been largely framed outside the dialogue on reform which dominates educational discourse in academic and policymaking arenas. The problem of reforming the organization of schools taken up in these arenas has taken a decidedly systemic orientation (see O’Day & Smith 1993; Cohen 1995; Elmore 1995; Fullan 1996) which has been largely set aside by current micropolitical research in education.

The general abstraction of micropolitical analyses from the larger and more dominant dialogue on educational reform in North America has not gone unnoticed by critics. Townsend (1990), for example, challenged the robustness of a micro analysis of political phenomena divorced from the macro forces which frame demands for far-reaching reforms of schooling. Viewed from the systemic perspective which has dominated politics of education scholarship in North America, Townsend’s criticism applies to much of the micropolitical research that has been published in recent years.
Similar issues are raised by Malen (1995) in her review of the state of micropolitical research. Malen captures the extent of the unresolved conceptual problems this poses. She concludes that questions about macro-micro political tensions remain unanswered. She asks of micropolitics:

How does it differ from macropolitics?
Or does it? Is ‘micropolitics’ defined by the size of the arena? The level of the system?

(159)

Malen’s question deserves our attention, because we know from the past decades of research that micropolitics is not wholly concerned with internal politiking that occurs within organizations. It also focuses on the interaction of organizations with their environments. Micropolitical analyses have not always assumed a deterministic stance, rather many depict organizations as manipulating and influencing their environments. At the same time, as Townsend (1990) points out, micropolitical research has tended to focus on the local level, sometimes emphasizing teachers’ conflicts to the exclusion of the political tradeoffs among larger political and societal purposes.

Other studies confirm that macro level factors (or factors external to schools), significantly influence the micropolitical character of schools (Blase 1991). The impact of formal legislation on school-based structures, the impact of district-level policy mandates on the relationships among teachers, the impact of community values and beliefs expressed through parental demands on the school, the influence of school district ideology on principal behaviours, and the impact of community demographics on the interactions between administrators and teachers documented in many studies show the how external influences impinge on school micropolitics.

The problem of agency and interest
Despite the recognition of macro forces, the nature of macro-micro links are not well understood. These links pose a conceptual challenge for researchers seeking to understand the micropolitics of organizational life in schools. Educational analysts are not alone in examining this problem. The concern forms the basis of the notions of agency and interest that cut across conceptual perspectives as diverse as those taken by organizational ecologists like Aldrich (1992), and those who follow Foucault’s (1979) post-structural frame of analysis of governmentality and the problem of the micro dimensions of power. These approaches set quite different directions for analysts of the micropolitics of educational reform.

Macro-micro links pose a problem for organizational theorists like Aldrich (1992) who are struggling to define the levels of analysis of organizational change. Aldrich posits a nested system where the units of analysis are the constituent components and the agents of change. He suggests that:
The types of relations between units that are relevant to social change differ across levels: at the group level, we examine relations between individuals; at the organizational level, relations between groups; at the population level, interorganizational relations; and at the community level, relations between populations . . . Agency, then arises from the collective actions of interested parties (individuals, groups, organizations, populations) at each level.

Those who have taken up Foucault’s (1980) direction offer a contrasting view of collective action, one that depicts power as shifting, inherently unstable expressions of relations evident in networks and alliances. This view is captured by the notion of governmentality, and implies that there is no discontinuity between the macro and the micro practices of power. In this context the concept of governmentality, means ‘something like a form of activity designed to guide, or to shape or to affect, or to change the conduct of some person or persons’ (Marshall 1995: 373). The dissolution of macro-micro discontinuities suggested by Foucault offers a view of power operating through a set of technologies and mechanisms rather than through levels: ‘it is diffused throughout society’ (Fiske 1993: 11). Conceptions of micropolitics focus more directly on strategic dimensions of power when people are viewed as social forces, as consisting of ‘varied and changing social allegiances’ (11). Of course this notion is not new. Machiavelli has a great deal of offer those who take this view of social interactions.

Problems in studying the micropolitics of organization of schools

The various perspectives on the link between macro-micro forces raise some of the emerging problems defining the nature of school organization. The models of organization which have informed our understanding of micropolitical phenomenon reflect two basic orientations. One sees organizations as 'social systems sustained by the roles allocated to their participants', and the second views organizations as 'associations of self interested parties, sustained by the reward the participants derive from their association with the organization' (Aldrich 1992: 27). These views are not mutually exclusive, but they do reflect some of the themes we find in reform proposals, and in micropolitical analyses.

Current dialogues on systemic reform illustrate the embedded assumptions about the nature of organizations. We can find them in the challenges I noted at the beginning of this article to creating coherence faced by systemic reformers who call for structural alignments to enhance the capacity for school change. The problematic issue of this macro reform perspective encountering micro realities has been a preoccupation of educational policy analysts at least since the Rand Change Agent study first concluded that local implementation choices dominate outcomes, and that what matters most to macro policy outcomes are local capacity and will of
teachers. In a retrospective analysis of the Rand Change Agent study which anticipated the themes in current dialogue on systemic reform, McLaughlin (1990: 13) affirms the earlier finding that the presence of teacher motivation to embrace policy objectives ‘is essential in the generation of the effort and energy necessary for a successful project’. McLaughlin concludes, however, that the motivation and will of individual teachers is significantly constrained by local level capacity and variability and by organizational micropolitics.

Nevertheless, like reformers relying on a more systemic than associative model, she views school organizations as relatively coherent, stable entities. Like others sharing this orientation, she emphasizes socialization and other processes that make the transmission of shared meaning easier. For example, McLaughlin argues that factors which enable changing teaching practices are engendered through decidedly micro-level systemic conditions:

\[\ldots\text{productive collegial relations, organizational structures that promote open communication and feedback, and leadership that ‘manages’ opportunities for professional growth and nurtures norms of individual development.}\]

(15)

Many of those who have taken up the analysis of micropolitics of schools in recent years would find the assumption of stability and coherence problematic. Their concern lies more with issues of agency and interest, and with questions such as: Who or what is responsible, and who benefits? These are concerns not only of researchers like Bacharach and Mundell (1993), who adopt a pluralist orientation to micropolitics, but also of those who have taken an interpretive approach. Interpretive analyses, based on conceptions of organizations as associations of self-interested parties, recognize that different, and conflicting views on what constitutes legitimate action often coexist. Micropolitics reflects the organizational dynamics that occur in schools where conflicting views exist for the legitimate direction of change.

Blase (1991) suggests, for example, that micropolitics is concerned with power and how people use it to influence others and to protect themselves. Power relationships are established by individuals and groups to manage potential or real conflict and to enforce a dominant agenda of action, and to maintain order and regulate behaviour both formally and informally through influence and authority. Defined from an associative view of organizations, micropolitics is about conflict, and how people compete to get what they want in the face of scarce resources. Conflict arises when groups and individuals seek social domination. Some theorists have examined the darker side of organizational life, by studying the non-sanctioned means used to gain power. Others like Hoyle (1988) emphasized the strategies adopted by individuals and groups to use authority and influence to fulfill their interests. In many studies micropolitics focuses on competition for support of a coalition’s position through strategies
such as persuasion, compromise, bargaining, and destabilization. In Townsend’s (1990: 208) words micropolitics is ultimately about the ‘conflictive interests that swirl around schools’.

This view of organizations as associations of self-interested parties does not deny the potential to attain a more integrative state. Many agree that there is also a need to broaden the focus of inquiry into the micropolitics of school life from the current extensive emphasis on conflict to the exclusion of consensus. Blase (1991) observes, for example, that micropolitics is also about cooperation, and how people build support to achieve their ends. Townsend (1990) calls for a new micropolitical research agenda that recognizes that cooperation is as important as conflict. This research agenda would focus on the nature of both in the context of choice and control, state and class. It would examine both power for coordinating collective purposes, and power as individual coercion. Others support this research agenda by reminding us that it is really a refocus on the traditional thrusts taken in micropolitical research on school administration which examine power, control, ideologies, interests, conflicts, consensus and negotiation (Willower 1991).

**Conclusion: organizational theory in the postmodern era**

Problems of agency and interest and macro-micro links are among the bundle of conceptual challenges faced by those who are rethinking organizational theory. In a postmodern era marked by a move away from orthodox consensus on the definition of an organization, and on the nature of the practice of organizational analysis, this thinking is characterized by the pluralistic diversity we see in research on the micropolitics of schools. Its diversity carries the potential for diffusing the kind of focused dialogue among researchers needed to enhance our understanding of the effects of current initiatives to reform the deep structures of schooling. Nevertheless, it is unlikely that we can return to the unitary construction of organizational problems of earlier eras.

The challenges to the rational/systems orthodoxy are part of a broader recognition that the wide range of organizational forms emerging cannot be accommodated within this model. The turn to micropolitical analysis can be seen as part of a growing interest in social rationalities and the power struggles through which they are formulated, implemented and contested. This interest further signals a shift in emphasis from the earlier study of organizational forms towards a concern with ‘the dynamics of change and the “logics” through which it proceeds’ (Reed 1992: 7). The challenge cannot be met by only refining Weberian conceptions of a logic of action as Bacharach and Mundell (1993) have done. Researchers of micropolitical phenomenon must grapple with the discontinuities between organizational perspectives which stress the logic of institutional change and those which emphasize the centrality of social construction and action. As Gergen (1992) points out in his exploration of organizational theory in the postmodern context of diversity, plurality, uncertainty and fragmentation, micropolitics can only have conceptual meaning for the organi-
zational analysis of schools if it allows us to simultaneously challenge the taken-for-granted and open new departures for action.

It remains to be seen whether or not the path of micropolitical analysis of school life first set out in the 1970s by students of politics within organizations like Iannaccone (1975) allows us to do either. Despite current educational research activity there is little consensus about what defines phenomena as uniquely micropolitical and distinct from those which are ‘macropolitical’. The unit of analysis used in much micropolitical research is underspecified and conceptually weak. Much that is now defined as specifically ‘micropolitical’ is hardly distinguishable as uniquely ‘political’ human interaction.

These observations suggest that although the study of micropolitics is an emergent enterprise, it is also one that draws from some of the familiar concerns of educational leadership and management. What remains unclear are the implications of micropolitical analyses of schools for proposal to reform schools. In order to inform policymaking to restructure schools, we need to clarify the conceptual dimensions of a micropolitical inquiry. As Townsend (1990: 220) concludes such a goal is also grounded in the clarification of a normative framework ‘that takes a stand on basic issues about how schools should work—both within themselves and in relation to the larger and increasingly politicized environment in which they exist’.

At the same time, we also need to examine what the study of micropolitics contributes to the practice of leadership in reforming schools. In the following sections we do so from the perspectives of academics and school leaders in Canada, UK, Australia and the US. The themes and issues raised by these contributors are discussed in a concluding section by Eric Hoyle, whose important work in the 1980s has helped set the direction for the research on micropolitics that I have reviewed in this introduction. We hope that our reflections on the study micropolitics will contribute to the practice of leadership in reforming schools.

The publishers have made every effort to contact authors/copyright holders of works reprinted in *Educational Management: Major Themes in Education*. This has not been possible in every case, however, and we would welcome correspondence from those individuals/companies whom we have been unable to trace.
Part 4

THEORY
This page intentionally left blank
Though misconceived and misdirected, the quest for a behavioral science of educational administration continues. Despite the revolution brought about in natural science by Heisenberg’s uncertainty principle and by relativity and quantum theory, the scientific model propagated by mainstream theorists of educational administration is still firmly rooted in Newtonian physics. Despite the acknowledgement of philosophers of the impossibility of eliminating evaluative judgments from the interpretative frameworks within which facts are both sought and understood, mainstream theorists of educational administration continue to declare the incommensurability of fact and value. Despite the social theorists’ large-scale abandonment of the quest for a value-free science of society, the mainstream theorists of educational administration still pursue positivistic attempts to develop generalizable laws and principles which will explain the structure and dynamics of organizations.

Perhaps the most outstanding example of this conservative and anachronistic approach to educational administration is the highly developed view of educational administration as rooted in the “theory moment” of the 1960s. Those who persist in this view remain blissfully unaware of the widely acknowledged revolutions in science, philosophy, and social theory mentioned above. The literature of this era, for example, is noticeably lacking in its attention to unique characteristics of educational organizations and to other contextual matters such as contemporary educational issues. The tendency of educational administrators to separate administrative issues from educational issues and to ignore the latter has been noted previously by Callahan (1962) in his discussion of the cult of efficiency. It is as though the administration of schools and school systems consists entirely of processes of motivation, leadership, decision-making, and communication conducted by professional bureaucrats who are responsible for organizational climate, effectiveness, and change. Readers may search in vain
for reference to a single educational idea. There is, for instance, deafening silence concerning the fundamental message systems of schools: curriculum, pedagogy, and evaluation (Bernstein, 1975).

The pathology of such an approach to educational administration is surely indicated both by its neglect of contemporary science (Bates 1980a), philosophy (Hodgkinson 1978), and social theory (Tipton 1977), and by its exclusion of educational concerns (cf. Boyd and Crowson 1981). A theory of educational administration that divorces fact from value, theory from practice, rationality from common sense, and education from administration is unlikely to be capable of guiding the administrator’s hand (Greenfield 1981).

**Organization, culture and praxis**

Greenfield, among others, has argued for some time now for an essentially phenomenological view of organizations. This view sees organizations as accomplishments, as consequences of human action directed by individual will, intention, and value which provide contexts for the negotiation and construction of meaning, moral order, and power. As such, organizations are essentially arbitrary definitions of reality “woven in symbols and expressed in language” (1980, 44).

Such a perspective does not deny the facts of organizational reality but interprets them within a wider context which sees them as “structures of consciousness as well as features of face-to-face settings” (Brown 1978, 365). Thus rationality, for instance, is seen not as a property of organizations or as an abstract standard by which behavior may be judged but as an achievement: “... rationality neither instructs us as to what action to take, nor is it a property inherent in the social system as such. Instead, rationality emerges in interaction and is then used retrospectively to legitimize what has already taken place or is being enacted” (Brown 1978, 369).

From such a perspective, rather than organizations being entities whose internal and external interactions are determined by the causal laws of behavioral and social science, “formal organizations are essentially processes of organizing enacted by persons” (Brown 1978, 371). Thus, “the study of reality creation in organizations is a study of power, in that definitions of reality, normalcy, rationality and so on serve as paradigms that in some sense govern the conduct permissible within them (1978, 371).

Moreover, as with scientific paradigms, organizational paradigms are not only formal structures of thought but are also constituted by the language, rhetoric, and practices of the organizational community. The power of such paradigms lies in their ability to define what shall be included or excluded from discussion, practice, and therefore consciousness (Brown 1978; Giroux 1981).

Paradigms, however, are both constructed and contested. They are subject to periodic overthrow or supercession. As with scientific communities, formal organizations construct defenses and mechanisms of suppression in order to
protect and sustain dominant paradigms. These mechanisms are essentially sym-
bolic, communicated through the language, rituals, and metaphors that define the
nature and meaning of the organization and celebrate the purposive intentions of
organizational life. In short, organizations are cultures rather than structures and
it is the maintenance and contestation of what is to constitute the culture of
organizational life that provides the dynamic of rationality, legitimation, and
motivation in organizations. This dynamic is the praxis of administration.

The cultural analysis of educational administration

have all argued the necessity of constructing a cultural analysis of educational
administration as an alternative to the inherently sterile pursuit of a deterministic
behavioral science. This is not solely because the dynamics of organizations can
better be understood through such a perspective but also because educational
organizations, above all, are committed to the maintenance, transmission, and
re-creation of culture. Culture is, in fact, the prime resource of educational prac-
tice (Bates 1981b). Thus a theory of educational administration that ignores this
central preoccupation can hardly be counted as a theory of educational adminis-
tration in any very serious sense.

It is culture that gives meaning to life. The beliefs, languages, rituals, know-
ledge, conventions, courtesies, and artifacts – in short the cultural baggage of any
group, are the resources from which the individual and social identities are con-
structed. They provide the framework upon which individuals construct their
understanding of the world and of themselves. Part of this cultural baggage is
factual. It is empirical, descriptive, and objective. Another part of this cultural
baggage, perhaps the greater part, is mythical. It is concerned not with facts but
with meaning, that is, the interpretative and prescriptive rules which provide the
basis for understanding and action.

Malinowski, for instance, argued that “myth fulfills in primitive culture an
indispensable function: it expresses, enhances and codifies belief; it safeguards
and enforces morality; it vouches for the efficiency of ritual and contains the
practical rules for the guidance of man” (1948, 79).

At the other extreme, as Bailey points out, Sorel’s definition is equally
acceptable: “... men who are participating in a great social movement always
picture their coming action as a battle in which their cause is certain to triumph.
These constructions ... I propose to call myths” (Sorel 1908, in Bailey 1977, 16).

While it is unlikely that many of the myths that give meaning and purpose to
schools’ activities approach the apocalyptic vision of a second coming or
Marx’s revolution, it can readily be seen that myths are not confined to great
social movements but are a fundamental feature of everyday life in schools as
elsewhere. Consequently schools, alongside other public institutions, are battle-
grounds in which contending mythologies compete for the holy grail – control of
the future.
Myths are, then, an important cultural resource in schools – they alone can give meaning and purpose to schools’ activities. They are intimately built into the day-to-day life of schools and in an important sense they constitute the groundwork of belief, morality, ritual, and rules within which social and personal identity are managed. Any adequate theory or effective practice of educational administration must necessarily, therefore, be concerned with the nature of the myths that guide the organizational life of schools and with the characteristics of interpersonal life through which such myths are perpetuated and negotiated.

Three key aspects of the cultural myths of schools are particularly important: metaphors, rituals, and negotiations. These are the aspects of life in schools that provide the means through which individuals and groups attempt to manage the cultural reality of the school and shape it to fit their vision of the future. Administrators need to be sensitive to this process and aware of its importance in the processes of rationalization, legitimation, and motivation involved in schooling.

**Metaphors and the management of meaning**

It was Wittgenstein (1953) who spoke of the bewitchment of our intelligence by the means of language. He also spoke of the need for liberation from such bewitchment – the need for the fly to find his way out of the fly bottle. The directions for escape, he insisted, were not to be found in the dictionary but in the world of real experience where the meaning of words is revealed in their use. The language we use and the way in which we use it are the keys to our particular bewitchment.

We are often unaware of the associations that crowd in on us in our use of particular phrases. The images they conjure up may be common-place; alternatively, the metaphors we employ may be, or may once have been, vivid. Nietzsche (1968) argued that the use of metaphor is basic to the intellectual processes we use to establish truth and meaning. Moreover, this impulse toward the formation of metaphor, linked as it is with the processes of categorization, classification, and association is identified with the “will to power” (Nietzsche 1968; Bowers 1980). Metaphors allow us to structure and create meaning out of experience. They may also act like fly bottles, to keep us trapped in invisible prisons. They can, moreover, mislead us when we apply inappropriate metaphors to situations better understood in other ways.

Shifts in the use of metaphor are not always trivial. They may, as Kuhn (1962) suggests, be basic to the nature of scientific revolutions and involve a major shift in world view. For instance, the shift from an animistic view of the universe to a mechanistic one brought about by Newton and his philosophical colleagues, Bacon and Locke, involves a major shift in attitude toward nature which became for the first time viewed as accessible, knowable, and controllable. The metaphor involved, that of the machine, allowed not only a transformation of production but also a transformation of society which could now be viewed as a mechanical system.
As Hamilton (1980) has shown, the metaphor of the machine or the mechanical system was rapidly applied to education. In this process the work of Adam Smith and his harmonization of the ideas of individual and collective self-interest through the metaphor of the invisible hand was crucial in the development and legitimization of simultaneous instruction. Such instruction was a key practice in the development of mass education.

Shifts in the fundamental metaphors which we use to explore and interpret the world of nature and the nature of society have far-reaching repercussions. The metaphor of the machine is frequently used in education and forms the basis of much of the language of systems engineers who use the metaphor in much the same way as Adam Smith. “Systems in many respects resemble machines. . . . A system is an imaginary machine, invented to connect together in fancy those different movements and effects which are already in reality performed” (in Hamilton 1980, 4).

Smith’s legacy is still with us in the contemporary language of cybernetics. “Today the spokesmen for cybernetic systems theory argue that formal organizations are (or are like) a giant computer with its input and output, its feedback loops, and its programs. This machine – the organization – is in turn guided by a servomechanism – the techo-administrative elite” (Brown 1978, 375).

Such metaphors profoundly, and often unconsciously, determine our attitudes toward the world, people, events, and action. Teachers and administrators and their pupils use metaphors continually to represent relationships and to define the power structures which organize behavior. Metaphor is a major weapon in the presentation of self and the management of situations. Such metaphors not infrequently obscure the interests of dominating elites and present particular partisan views of the world as uncontestable descriptions of the way things are. Positivistic and mechanical accounts of social structure and process are frequently of this kind. Phenomenological or critical analysis however allows us to see this (cybernetic) imagery as a thing made, as a symbolic artifact rather than as the fact. (It allows us) to reject it as a literal description of how the organization “really” is and to unmask it as a legitimating ideology. By doing a close textual analysis, we can make it clear that in the paradigm of cybernetics the vocabularies of personal agency, ethical accountability, and political community have atrophied. In their place, the organization, initially conceived as serving human values, becomes a closed system directed by elites and generating its own self-maintaining ends.

(Brown 1978, 375)

A critical analysis of the metaphors that articulate (if indeed they do not constitute) our beliefs and actions is, therefore, one powerful way of ensuring that we do not remain trapped within the evidently transparent prison of the fly bottle.
Metaphors not only intrude on the processes of educational administration in a grand fashion as in the language of cybernetics, they also directly affect our negotiations and relations with each other at the most personal level. In the common, everyday language of schools metaphors about children and metaphors about schools exist and compete. They are frequently varied, contradictory, and powerful. Metaphors of the child as flower, enemy, cog, machine, chameleon, miniature adult, psychopath, gentleman, lady, or reasoner, are common currency in staffrooms as are our metaphors of the school as factory, clinic, or bureaucracy. The nature, occurrence, and emphases of such metaphors are vitally important to administrators for the “tone” or “climate” of the school has a lot to do with the metaphors employed and the relationships they bear to the reality of interpersonal relations. Parents and pupils are, for instance, particularly scathing in their evaluations of schools which use one metaphor (community) in their rhetoric and another metaphor (factory) to guide their activity.

Such conflicts of metaphor are sources of great debate and tension within educational systems and schools. But the tension is not simply a semantic one. The metaphors which people use are often representative of the kind of future – the social movement – to which they are consciously or unconsciously committed. Such cultural commitment is frequently passionate and contains views of man, society, and education which are closely related to the meaning and identity of the individual.

Metaphors carry both personal identity and social commitment. Schools are instrumental in the support or denial of such identity. They are, therefore, important cultural artifacts and the struggle to shape them is closely related, as Greenfield reminds us, to the values that are central and meaningful in people’s lives.

The relationship between educational metaphors and individual and social identity is clearly and powerfully illustrated in the work and ideas of Paulo Friere. His work relies on a series of opposing metaphors: cultural domination versus freedom; the culture of silence versus cultural action; education as banking versus education as praxis. In each of the metaphors education is related to social organization. On the one side education as banking, the conspiracy of silence, and cultural domination are related to forms of social oppression of militarist, sexist, racist, class kinds. On the other side education is praxis, liberation, autonomy, cultural action for freedom. The form that education takes in schools is, he argues, intimately bound up with the personal and social identity of individuals (Friere 1972).

Friere’s view is clearly developed within the context of Third World countries. The relationships between views of man, society, education, and the organization of learning do, however, apply to our contemporary society, for any systematic organization of learning incorporates into its structure not only content but also forms of relationship built on the metaphors which encapsulate our view of society and people.

Education systems are then, in a sense, a physical working out of the cultural
metaphors and myths held by educators and administrators. Many of the metaphors we employ are, for instance, ritualized in the forms of organization, ceremony, and interaction which are typical of schools. Jackson (1968), for instance, shows how the organizational structure of schools emphasizes and demands certain kinds of relationships between teachers and pupils. The facts of crowdedness, praise, and power provide an essentially coercive environment in which relationships between teachers and pupils are ritualized. The metaphors of child as cog, machine, are translated into cultural reality through the rituals of classroom interaction.

Again Dreeben (1968), following Parsons (1959), argues that the organization of the school is devoted to creating social and psychological situations that encourage, when compared with the family, activities leading to the development of independence, achievement, universalism, and specificity in children. These metaphors or norms are constructed by the social organization of the school. The organization of time, place, and relationships shapes the consciousness of individuals through their structure and the treatment accorded to particular groups.

Jean Anyon (1980) has argued this position in more detail showing how the ways in which pupils’ “work” is treated in schools – in terms of the content of their work, their relationships with teachers, the products of their activity – can be differentiated according to social class. The nature of the metaphors which are interpreted and enforced through the school’s organization are different for different children. Moreover these differences apparently relate to the kinds of work relationships found in different occupational groups. Thus, for working-class children, conflictual relationships are predominant – child as inferior, child as enemy. This form of relationship in school is also borne out by the work of Willis (1977) and Birkstead (1976) among others. Middle-class children tend, however, to meet bureaucratiﬁed relationships in the school – child as cog, child as machine – and be subjected to rituals of evaluation, classiﬁcation, and certification (Cicourel and Kitsuse 1963). Upper-class schools, Anyon argues, tend to deﬁne work relationships in terms of negotiation and symbolic capital where the dominant metaphors are those of manipulability, adaptability, and effectiveness – child as reasoner, child as adult. Thus, the metaphors we use to classify and interpret the world are translated into work structures which relate to wider social relations and to structures outside the school.

It would seem therefore that a critical practice of educational administration would necessarily involve observation, analysis, and reﬂection on the metaphorical currency negotiated and exchanged within the school. It might also on occasion involve the negotiation of a different currency.

Administration, ritualization, and control

Along with metaphors, rituals are a potent mechanism of control. Although the meaning of rituals may be redundant (i.e., no longer explicit) the relationships...
represented in those rituals are frequently both metaphorical and practical specifications of intergroup power. Ritualistic acts revivify the relationships which constitute particular forms of order in social situations. Schools are saturated with rituals. The management of ritual in schools is an important element in the maintenance of order for rituals celebrate both unifying and differentiating features in the social structure of the school (Bernstein 1975).

Rituals can often be so powerful as to take on a life of their own. Conformity to rituals may be so complete as to govern movement, place, time, language, sequences of activity, participant’s response, and the use of artifacts. Their shape, the metaphors they utilize, and the symbols that guide responses are powerful means of control. These ritual structures of communication are rather obvious in churches, rallies, television interviews, cafeterias, and football games. They are also obvious to outsiders describing what goes on in schools. They are not always obvious to those who participate more or less permanently in the rituals of schools. Because the form and meaning of the rituals are so well known, their impact can be underestimated. Even the effect of new forms of social organization or innovation in curriculum structures and communication structures can be constrained by the habits derived from ritual.

For example, there are numerous instances of curriculum innovations being “turned” to fit the preexisting structures of schools’ activities (Whiteside 1976). Even when not only curriculum but the whole organizational structure of the school is reformed through the introduction of an alternative technology, the capacity of schools to maintain their own ritual structures is very strong (Popkewitz 1981; Popkewitz, Tabachnik, and Whelage 1980).

This seems to happen despite the intentions of individual teachers or school administrators (Shipman 1974). Part of the reason for this is the threat to those ritualized forms of action and meaning which form a background to learning. As Shipman puts it, “Every change in routine is a threat to teacher-pupil relations and standard of work” (1974, 176). Routines as ritualized relations are both redundant and powerful. Redundant, because they are not consciously thought about, because they are accepted without examination or question. Powerful, because they are unconsciously followed and unquestionably accepted. Rituals and routines in fact facilitate the direct focusing of attention on learning. They are the major constituents of the hidden curriculum of schools.

This hidden curriculum and the metaphors it ritualizes in everyday, commonsense activity and understanding is in essence an administrative curriculum. The links between language, metaphor, and ritual and their celebration of particular social ideals or myths form the essential administrative culture of the school. The culture is a translation of myths into action and relationships.

A critical practice of educational administration would involve a reflective analysis and an active intervention and reconstruction of such ritual structures so that they celebrate the intended educational purposes of the school community rather than the redundant purposes of a previous administration.
Educational administration and the language of negotiation

Administrative intervention in the metaphorical and ritual performances which form the texture of school life must, therefore, be conducted through the means of language. Language is not only a tool of critical reflection through which we may demystify our world but also the medium of action through which we shape it. As Gron suggests, “The administrative setting is a speech milieu which organization members enact in their talk with one another.” Thus talk is “an instrument for accomplishing administrative control” (1982, 1). But, as Gron points out in his analysis of a school principal’s administrative talk with his staff; this talk is by no means simply directive on the part of the administrator nor automatically compliant on the part of the staff. Indeed as Gron reports, “Contrary . . . to the image of the administrator in much of the management literature as ‘directing,’ ‘commanding,’ ‘planning,’ etc., as if administering is a unilateral and unidirectional action performed on a set of anonymous employees, here is an administrator seemingly caught in a mesh not of his own making. Prior to the staff meeting he is being controlled rather than being in control” (p. 15).

What emerges in the course of the administrative performance is a negotiation in which language, territory, and status are employed by the principal to gain advantage and shape agreement and consent over decision. Gron’s analysis presents us with a picture of administration far removed from the tidy conceptual schemes of positivistic, behavioral, and managerial science. Indeed neither place, nor time, nor metaphor, nor language seems predictable.

Administration can take place anywhere. It is timeconsuming and it observes no set time schedule. It follows no set order or format for it can arise out of a chance meeting and can include all kinds of matters that might be routine, spontaneous, trivial or highly eventful in character. The school principal free-wheels. He is a classic drifter moving in and out of different locations and areas, in and out of relationships and encounters . . . the dynamics of this activity show it to be antithetical to the obsession with order and precision evident in (writings on) scientific management.

(1982, 21)

The dependence of administrators on the use of language to shape and determine action is the third major aspect of administrative culture. It is a dynamic process that bears some relationship to the organizational structure of the school but also has a degree of autonomy from it. This autonomy is a result of the necessary processes of negotiation that occur between groups or individuals who proclaim differing mythologies and who represent contending interests. One common example of such negotiation results from the widespread conflict between those holding representative and participatory views of democracy.
The representative view is readily compatible with forms of bureaucratic, centralized control. It is also compatible with banking education and with certain forms of social control. The participative view is often opposed to centralized, bureaucratic control and decision-making and embraces a liberationist, activist, constructivist view of learning and the learner. It is a view which argues, as Greenfield does, that only through participation in the struggle to shape institutions in their own image can people find purpose and meaning in their lives.

These ideas are both “large” ideas in that their opposed myths form the ideological structure of much contemporary political and economic debate and “small” ideas in that the myths are incorporated one way or another in the structure of our daily lives. An interesting illustration of the conflict and negotiation of these competing views is found in Hunter’s (1980) discussion of the administrative culture of a secondary school and its conflict with the politics of participation. In particular Hunter’s discussion is interesting because of its analysis of the headmaster’s role in the negotiations which shows the way in which the power to determine the forms of negotiation, the rituals that will be adopted, allows the incorporation or exclusion of the myths held by other groups in the school. The backstage culture and the up-front culture of teachers are markedly different. Why? Because of the administrative ritualization of the negotiations and the acceptance of particular forms of power and authority as “natural.”

Hunter’s paper is an attempt to show how various differing definitions of participation and democracy operate alongside each other in schools and how partial negotiations of the conflicts between these definitions occur. It is also an attempt to show how administrative power affects such negotiations by excluding various groups from effective participation, and defining alternative proposals as technically impossible. This example is a paradigm case of the use of a technical definition of administration to exclude debate and discussion over normative issues. The power to define situations in particular ways is, then, not the least important attribute of administrative control. In particular, the power to define the ways in which culture is presented and structured in the school is of paramount importance.

These illustrations indicate that the third major component of a critical practice of educational administration revolves around the use of language as a mechanism of control in negotiations over action. The comparison of the use of language in the discourse of negotiations in the administrative context of the school with the conditions of ideal discourse outlined by Habermas (1971, 1973) may well prove very revealing of the ways in which certain forms of domination are imposed via the language of administering. A critical educational administration would be in part directed toward the clarification, examination, and redirection of such discourse.

Conclusion

Culture, as Bourdieu suggests, is the most important resource available to the school. The interiorization of cultural patterns is the most profound effect that
the school has on both teachers and pupils. But culture is not a static set of values, beliefs, and understandings; rather, “it is a common set of previously assimilated master patterns from which, by an ‘art of invention’ similar to that involved in the writing of music, an infinite number of individual patterns directly applicable to specific situations is generated” (1971, 192). Thus the myths, metaphors and rituals of the school contribute to the reproduction of ways of thought in the individual. “Every individual owes to the type of schooling he has received a set of basic, deeply interiorized master patterns on the basis of which he subsequently acquires other patterns, so that the system of patterns by which his thought is organized owes the specific character not only to the nature of the patterns constituting it, but also to the frequency with which these are used and to the level of consciousness at which they operate” (1971, 193).

The fact that differing definitions of culture – competing myths and ideologies – exist in the school makes the determination of what is to count as culture in the school problematic. Which mythology is to prevail is not altogether a matter of reason but also a matter of social, moral, and political commitment and, most importantly for administrators, a matter of power and control.

Very little work has been done which explains the impact of administrative processes on the culture of schools. But the impact of administrative processes on the master patterns which are reproduced through schooling is obviously an area of great importance. As Bantock argues, “The basic educational dilemma of our time is a cultural one and affects the nature of the meanings to be transmitted by the school” (1973, 166). Moreover, administrative control of the central message systems of the school – curriculum, pedagogy, and evaluation (Bernstein 1975) – as well as processes of training and professionalization (Smith 1979) and the allocation of physical resources (Young and Whitty 1977, Grace 1978) ensure that constraints exist on the definitions of culture which are able to be reproduced through schools. These constraints, as Waller argued in 1932 (1967), ensure that schools act as conservative agencies of social control through their control of the cultural definitions of situations.

The schools may be viewed as an agency for imposing preformed definitions of the situation. Education, as has been truly said, is the art of imposing on the young the definitions of situations current and accepted in the group which maintains the schools. The school is thus a gigantic agency of social control. It is part of its function to transmit to the young the attitudes of the elders, which it does by presenting to them social situations as the elders have defined them . . . From a fact that situations may be defined in different ways and by different groups arises a conflict of definitions of situations and we may see the whole process of personal and group conflict which centers about the school as a conflict of contradictory definitions of situations. The fundamental
problem of school discipline may be stated as the struggle of students and teachers to establish their own definitions of situations in the life of the school.

(Waller 1967, 296)

The culture of the school is therefore the product of conflict and negotiation over definitions of situations. The administrative influence on school language, metaphors, myths, and ritual is a major factor in the determination of the culture which is reproduced in the consciousness of teachers and pupils. Whether that culture is largely based on metaphors of participatory democracy, equity, and cultural liberation or on metaphors of capital accumulation, hierarchy, and domination is at least partly attributable to the exercise of administrative authority during the negotiation of what is to count as culture in the school. A critical practice of educational administration would, necessarily, be reflective concerning such negotiations, placing them within the context of a critique of domination and a commitment to struggle in the interest of a better world.

CRITICAL PRACTICE OF EDUCATIONAL ADMINISTRATION

EDUCATIONAL ADMINISTRATION, LEADERSHIP AND MANAGEMENT
Towards a research agenda

Ray Bolam

1. Introduction
The tasks of re-thinking and reviewing research in this field from a British perspective have been carried out at roughly ten year intervals since the 1960s when Baron and Taylor (1969) edited what proved to be a seminal text on educational administration and the social sciences. Subsequently, Baron (1980) produced a major survey of research for the first BEMAS research conference and Saran and Trafford (1990) edited the first book on British research in education management and policy following the 1988 BEMAS research conference. Now, ten years on, the papers from the 1997–98 ESRC Seminar Series, many of which are in the present book or the special issue of the journal Educational Management and Administration, confirmed that, although we have undoubtedly moved on a great deal, we continue to wrestle with several important issues which have been of concern from the outset.

The next part of this chapter attempts to deal with, if not resolve, some of these apparently intractable dilemmas by offering a series of propositions about the broad field of educational administration together with some proposals for the theoretical part of a research agenda. It should also be read as an attempt at ground-clearing for the third part which proposes a thematic framework for a research agenda and priorities on school leadership with particular reference to teaching and learning. The conclusion outlines some strategic ideas about how this agenda should be carried forward. Contributions to the ESRC Seminar Series are used to illustrate the argument.

2. Towards a conceptual map
The tasks of building a research agenda and identifying priorities would be greatly facilitated by easy access to a conceptual map. Unfortunately no such
map exists at present, in part because its potential scope is so broad. What follows is a contribution to the important meta-task of developing this map, a task which will have to be ongoing to take account of contextual changes.

**i What’s in a name?**

First, we should recognise and act upon the fact that three terms – educational management, leadership and administration – are in common usage and that the differences between them are far from clear, still less agreed. My own view is that the case for defining administration as the superordinate category continues to have considerable pragmatic force: it is consistent with the conceptualisation and terminology which are widely accepted internationally; it enables us to adopt a broader concept of the field, and thus to embrace policy studies as well as institutional management; and it enables us to be inclusive rather than exclusive in building a research agenda. In adopting this approach, however, we ought always to make clear which aspect of the field is under scrutiny at any one time by offering a stipulative definition from the outset.

So, in this paper I use ‘educational administration’ in a broad, generic sense to cover educational policy, leadership and management activities at all levels; I take ‘educational leadership’ to have at its core the responsibility for policy formulation and, where appropriate, organisational transformation; I take ‘educational management’ to refer to an executive function for carrying out agreed policy; finally, I assume that leaders normally also have some management responsibilities and that both leaders and managers must take due account of their governing body and wider context.

**ii What is it?**

Second, I regard educational administration as a field of study and not a discipline. Like teaching and teacher education, it is essentially a practical activity and, in deciding how it should be studied and researched, we may profitably adapt the approach used by Hirst (1966) who argued convincingly that education does not have the logical characteristics of a discipline; rather, it is a field of study which draws upon several forms of knowledge and a range of disciplines. Thus, I take educational administration to be a field of study which draws upon several disciplines, mainly but not exclusively in the social sciences (e.g. sociology, political science, philosophy, history, law and psychology), and forms of knowledge (e.g. economics, general management studies, education and training and andragogy).

A second ongoing meta-task is to evaluate the usefulness of each of these disciplines and forms of knowledge for researching and understanding specific problems in educational administration.
Third, we need to address some of the dilemmas and tensions around the question: what are the fundamental purposes of study and research in educational administration? Some of these have arisen because, in discussion, we often conflate and confuse our own roles and activities as members of a scholarly community whose purposes include, but are not confined to, research. I suggest that we engage in four separate projects, each with its distinctive rationale, mode of working and target audiences.

a. The knowledge for understanding’ project

The immediate aim of this project is to understand the nature and processes of educational administration, via theory building and basic research. Researchers, and lecturers, in this tradition use mainly social science-based, theory and research methodology to describe, analyse, explain and criticise. Researchers are usually funded by a research council or their own university. Typical questions are: what happens and why; and what are the most appropriate theories and methodologies for answering such questions? The outcomes are targeted mainly at peers, i.e. other theoretical researchers, applied researchers and lecturers, and outcomes are communicated mainly in reports for the funding agency and via articles in international, refereed journals, academic books and also, to a lesser extent, in professional journals and books. Although the ultimate aim may be to improve educational administration, this aim is not always ‘up front’ and, in any case could only be achieved indirectly by working through other people via the other projects. Lecturers engaged in this project design and teach on ‘traditional’, social science-based Masters and Doctoral programmes. The aim of a distinctive sub-group is to offer a critique of practice and policy:

The point of theory and of intellectual endeavour in the social sciences should be, in Foucault’s words, ‘to sap power’, to engage in struggle, to reveal and undermine what is most invisible and insidious in prevailing practices.

(Ball, 1995, p. 267)

b. The knowledge for action’ project

The immediate aim here is to inform policy-makers and practitioners about the nature, processes and effectiveness of educational administration in order to promote its improvement. Researchers in this tradition are often funded by a government agency, may be based in a university and pursue various forms of applied research including survey, development, and evaluation research. They, too, describe, analyse and explain for understanding but, in addition, make evaluative judgements and
recommendations for action. Typical questions are: how effective are various interventions and which one is most appropriate to the problem in hand?. Their proximate aim is usually to improve educational administration by working through others. Hence, the outcomes are targeted mainly at policy-makers and educational administrators, at other ‘knowledge for action’ researchers and lecturers and at ‘instrumentalists’. Lecturers engaged in this project design and teach on ‘traditional’ and ‘new’ Masters and Doctoral programmes and on some continuing professional development (CPD) courses. Written outcomes are communicated in technical and evaluation reports and via articles in professional journals and books.

c. The Instrumentalist’ project

The immediate aim of this project is to improve the practice and effectiveness of education managers via training and consultancy, often by providing structured schemes and practical instruments or methods. Examples include preparatory and training schemes for headteachers, often competency-based; individual-focused methods like mentoring and coaching; organisation-focused consultancies (e.g. Total Quality Management and Investors in People); and some ‘new’ Masters programmes, especially those with a work-based component. These training and consultancy activities are usually funded by the participants or clients themselves or by their employers. They are directly aimed at change for improvement, often utilise practitioners’ experience, possibly supplemented by, but not usually rooted in, theory and research which is selected from a range of sources (e.g. social science, industrial management training, occupational psychology, adult learning), and concentrate on activities for the development and enhancement of participants’ skills. A typical question is: how can this be improved? But, equally typically, it is often implicitly assumed that the trainers and consultants already have an acceptable answer to this question and so they offer prescriptive solutions, instruments or methods from the outset. The activities are targeted directly at practitioners although some outcomes, including ‘training trainers’ courses and published accounts in professional journals and books, may be targeted at other trainers and consultants.

d. The reflexive action’ project

The immediate aim of those engaged in this project is to improve their own, their team’s or their organisation’s, performance and effectiveness via action research, survey feedback, self-evaluation for school improvement, team building and other variants on experiential learning, reflective practice, organisation development and evidence-based practice. It is, in many ways, similar to the ‘instrumentalist’ project with which it shares several characteristics. Its distinctive status derives from the fact that it is self-directed and that it has now developed its own body of theories and procedures, not always entirely compatible one with another (e.g. Kolb, 1975; Schon, 1987; Schmuck and Runkel, 1985; Argyris et al., 1985;
Elliott, 1991), although many of its exponents operate atheoretically and without incorporating systematic research in their action processes. Moreover, it is seen as being consistent with current initiatives to promote evidence-based practice in classroom teaching and, by extension, in school management (Cordingley, Chapter 17) although not by everyone (vide Eraut, Chapter 9).

These distinctions and labels are unavoidably arbitrary but the four ideal-typical projects and the typology should be judged on the basis of their utility as a heuristic. Most members of the educational administration academic community probably engage in more than one of the projects. However, each project has its own rationale and involves different activities and role requirements. The first two projects clearly involve basic and applied research, mainly social science-based, whereas the third does not. The fourth project is more problematic. Where it is implemented in an instrumentalist fashion, then it does not constitute a research activity; where it is theory-based, rigorous and open to peer scrutiny, then it does. Moreover, it also offers considerable potential for innovative research.

I suggest that research in educational administration is mainly located within the ‘knowledge for understanding’ (or basic) and ‘knowledge for action’ (or applied) projects. I propose, further, that we should continue to work on critical studies of a policy sociology kind but that, in addition, greater emphasis should be given to ‘knowledge for action’ research which focuses on activities within the instrumentalist and reflexive action projects and that we should explore the potential of research within the reflexive action project itself. These proposed priorities are unexceptionable if, as researchers, we are content to seek funding from a range of agencies. However, a great deal of work will be needed if proposals in the ‘knowledge for action’ and the ‘reflexive action’ projects are to be funded by the, hitherto unreceptive, Economic and Social Research Council, and thus to carry weight in the Research Assessment Exercise as it is currently structured.

iv Theory for practice or theory for research?

We ought also to be clearer about the different purposes of theory in the practice of educational administration on the one hand, and in research into educational administration on the other. Following Aristotle, Hodgkinson (1991) distinguished between three modes of action: theoria, theory which abstracts and generalises by induction, deduction and hypothesis; techne, technique or technology which applies and interacts with theory; praxis, purposeful, ethical action in a political context. He went on:

Praxis . . . clearly applies to all administration . . . [and] . . . suggests the conscious, reflective intentional action of man as opposed to mere reflex or mechanical responses to stimuli.

(p. 43)

and concluded that praxis is at the core of educational administration.
Researchers engaged in the first two ‘projects’ are clearly concerned with *theoria*. They see theory as an essential foundation for, and as integral to, the research process. Those engaged in the instrumentalist project are concerned with *techne* and so, too, are practitioners like heads, inspectors and key decision-makers. They take an essentially pragmatic view of theory: they want it to inform, and preferably to underpin, practice and, by extension, they want research findings to fulfil the same purposes. Those engaged in the reflexive action project are involved in *praxis* and, like the instrumentalists, take a pragmatic view of theory.

Thus, it is unsurprising that, although organisation and leadership theories designed for *theoria* or research purposes have deepened our understanding, they have provided little practical help either for school managers or their trainers (*vide* Hoyle, 1986). A research agenda should, therefore, address these two parallel problems regarding the role of theory by:

- dealing with the continuing fall-out from the presumed failure of the so-called ‘New Movement’ which sought to use positivist social science as the basis for research and practice in educational administration (*vide* Griffiths, 1988; Strain, 1998). This would require more explicit consideration of the appropriateness for research in educational administration of particular paradigms (e.g. positivist or interpretive) and their implications for research design and methodology, using, I suggest, ‘fitness for purpose’ as the main criterion;
- exploring the role of different types of theory in the instrumentalist and reflexive action projects, particularly in relation to evidence-based practice.

### Levels and topics

A conceptual map of educational administration would also explicate two further components:

- Potential levels or units of analysis, for example: individual roles (e.g. teacher/lecturer, head of department, headteacher/principal/vice-chancellor); organisations (e.g. pre-school, nursery, primary, secondary and special schools, independent schools, adult and community education, youth and careers services, tertiary and FE colleges, universities); organisational sub-units (e.g. departments and teams); local education authorities and agencies; unions and professional associations; consultants and private agencies; national agencies (e.g. DiEE/WO/DENI, OFSTED/ OHMCI/NII); political parties and politicians; international organisations and agencies (e.g. OECD; World Bank, EU).
- Major topics, topic areas and research questions, for example: the impact on educational leadership and management of personal factors (e.g. values;
gender; training); major policy changes (e.g. the national curriculum, assessment, inspection, LMS, centralisation and ‘new managerialism’); contextual developments (e.g. work and labour markets; governance and accountability within a democratic context; social exclusion, inclusion and justice); changing strategic tasks (e.g. the management of induction, CPD, performance management and the use of value-added data).

vi Comparative studies and alternative futures

Finally, the map would highlight the possibilities for informing research and practice in educational administration via comparative studies across countries, sectors and alternative futures. Thus, McEwen (1997) reported that because of administrative tasks generated by marketisation and other Northern Ireland reforms, secondary headteachers had difficulty in exercising their professional knowledge and skills, were often reluctant to delegate major leadership tasks and concentrated on low and middle order priority tasks. Crowther et al. (1997) reviewed research on educational leadership and site-based management in Australia, concluding that efforts to re-conceptualise leadership must take account of the complexity of site-based management and the maturity of the teaching profession in any one country. Karstanje (see Chapter 3) pointed to increasing decentralisation in many European countries, especially those in the former Soviet bloc, as the major influence on the role and training needs of school leaders and outlined a comparative analytic framework, based on three degrees of centralisation and regulation, for researching the national and local contexts within which school headteachers in various European countries operate. Hart (1999) reviewed changes in the USA in the nature of the knowledge base and the preparation of educational leaders, concluding that we could learn from each other in clarifying and re-defining theory and re-assessing its utility for research and practice. The Seminars also included contributions focused on experience in other sectors, notably further education (FE) colleges, higher education institutions (HEIs) and private sector business which, albeit incidentally, illuminated issues in school management. Wallace (see Chapter 10) combined two theoretical perspectives – cultural and political – to analyse and explain the management strategies used by an LEA in a major reorganisation of its schools, together with the associated staff re-deployment, across the authority. Bottery (1999) argued that research should aim to help us understand and deal with future global challenges to educational management.

3. A framework for research in educational leadership

It is against the background of this embryonic conceptual map that the following framework for a research agenda is proposed. It deals with only one part of the field, focusing exclusively on educational leadership and management in
primary and secondary schools and, more specifically, on the management of teaching and learning, or pedagogy. It is organised under three thematic headings.

   i The management of teaching and learning

The management of school improvement and, more directly, of teaching and learning, emerged as key themes in the Seminars. Ouston (1999) was doubtful as to whether the emphasis on the role of the headteacher in school effectiveness and school improvement was warranted whereas Hallinger and Heck (see Chapter 14) argued that principals do contribute to student achievement, that the effect is indirect and small, though statistically significant, concluding that future research should concentrate on explaining the means whereby principals exert such influence.

   Turner and Bolam (1998) used a provisional model, based on contingency theory, to analyse the role of heads of subject departments in improving teaching and learning in secondary schools, together with the factors which influence them. Cordingley (see Chapter 17) used her central concept of ‘teaching as evidence-based practice’ to pose a series of research questions about the role of education managers in promoting it, and proposed that education managers, too, ought to engage in evidence-based practice. She summarised her arguments thus:

   current priorities for the education management research agenda should be shaped by and accede priority to work which takes pedagogy as the starting point and which explores the capacity of education management and leadership to contribute to the improvement of teaching and learning.

   (p. 228)

As a priority, the research agenda should focus on the distinctive core processes of educational leadership, i.e. its linkages with, and its effects on, teaching and learning, and should explore directly the extent to which research in educational leadership can and should be carried out by practitioners and have evidence-based leadership as a desirable goal. In so doing, account should be taken of the ESRC’s ‘Teaching and Learning’ programme (BERA, 1999) and the policy outcomes of the Green Paper proposals (Secretary of State for Education and Employment, 1998) on performance management.

   ii Individual characteristics and contextual pressures

Several papers dealt with the influence of individual characteristics and contextual pressures on heads’ tasks and performance. Hall (see Chapter 12) argued that we should recognise the centrality of gender. Levačić et al. (see Chapter 2) analysed the impact of external requirements that heads should
adopt a rational-technicist style. Four common themes emerged from Southworth’s study of the impact of recent policy and legislation on primary headteachers: intensification of work; increased accountability; an emphasis on school development; a range of feelings of satisfaction and dissatisfaction (see Chapter 4). Bell (see Chapter 5) concluded that, in spite of the pressures, an educational market has not fully evolved in primary schools. McMahon found that much CPD now took the form of short workshops and courses aimed at the national agenda and that, as a result, it was now extremely difficult for headteachers to use CPD to promote sustained professional learning and growth (see Chapter 8). Simkins (1999) argued that the impact of recent and current policy changes on educational management should be researched using managerialist and bureau-professional models of organisations.

It is essential that the biographies and characteristics of individual heads should continue to be researched. In a dynamic and changing national context, it is also essential that the impact of policy changes on educational management tasks and roles should be studied and that such research should recognise the interdependence of policy and practice in the provision of a public, democratically accountable service. As an illustration, strategic research questions are generated from the ways in which four sets of external change processes – the increasing centralisation of power to government and its appointed agencies, the redistribution of power amongst organisations which influence schools, the widespread adoption of ‘new managerialism’ style techniques and a quasi-market model of schools – impact on, for example:

- the values, vision and behaviours of educational leaders;
- organisation design, structures and procedures;
- professionalism, teachers’ work and how these are managed;
- accountability and boundary management;
- leadership and management strategies and methods.

In addressing these questions, account should be taken of Glatter’s (1999) arguments against the selective and uncritical adoption from industry of certain ‘new managerialist’ methods (e.g. performance management) and rejection of others (e.g. human resource development).

### iii Training and development for educational leadership

A third priority theme relates to questions about how school leaders and managers learn and how they are and might be trained and developed in general and, specifically, to promote evidence-based practice. Bolam (1997) presented an analytic and semi-historical account of recent developments in the organisation of school management training, its content and teaching methods, its underlying theory and its use of research into the professional knowledge base. Weindling (see Chapter 7) re-examined data from a series of studies of secondary head-
teachers over a ten year period using socialisation theory while Ribbins (see Chapter 6) explored the concept of ‘leadership as a career’, applying it to the development of headteachers via the NPQH. Hall (see Chapter 12) argued that adult learning theory should be central to management development. Eraut (see Chapter 9) analysed the nature of headteachers’ knowledge, learning, cognition and practice, presented a critique of the national standards approach, exemplified in the National Professional Qualification for Headship (NPQH) and posed fundamental questions about the feasibility of the evidence-based practice model. Glatter (1999) proposed that CPD for educational leadership should focus on the whole job, warning against the atomisation implicit in the standards approach, that a national strategy should be pluralist not centralist, that HEIs should be given a bigger role in leadership training and that the complex issues raised by Eraut (see Chapter 9) about the learning and use of propositional and procedural knowledge are of central importance.

The research issues generated by these ideas should be pursued. In addition:

- the implications of evidence-based leadership for training and development, including studies, should be explored;
- so, too, should the potential of cognitive and problem-based approaches (Hart, 1999);
- finally, the contributions of the NPQH and related TTA programmes, including the projected National Leadership Centre and the implications of the projected introduction of performance management, should be studied and evaluated as a high priority.

4. Conclusion

This chapter presents a preliminary conceptual map of educational administration and an outline research agenda for educational leadership in the light of the ESRC Seminar Series and other related literature. The underlying rationale for the research agenda and priorities is, in summary, that they should:

- be both reactive and proactive and, therefore, be responsive to funding initiatives as well as pursuing carefully argued priorities based on a refined conceptual map;
- aim to improve the quality and relevance of research by building on earlier work through the accumulation and replication of empirical findings and by aiming to promote school improvement, thus taking account of the issues (vide Hargreaves, 1997; Hammersley, 1997; Tooley and Darby, 1998; Hillage et al., 1998) and policy initiatives (Sebba, 1999) generated by the wider debate on educational research;
- aim to inform policy and practice by publishing evidence-based critiques, for instance on the nature, scope and impact of ‘new managerialism’ and by developing and testing middle range theories;
• be grounded in a strategy based on greater collaboration and consultation with practitioners when planning and undertaking research, in improved collaboration, coordination and communication between ourselves as researchers, and in more systematic dissemination to targeted audiences, for example by using commissioned reviews of an aspect of the field.

Three caveats are offered by way of conclusion. First, it was beyond the scope of this paper to consider issues of design and methodology which, of course, are of critical importance and should be seen as integral to the development of a conceptual map. Second, the proposals are illustrative, not exhaustive and the thematic framework aims to assist researchers, practitioners and policy-makers in setting specific operational priorities in the context of available funding opportunities. Third, I have deliberately adopted a limited, even restricted, definition of educational leadership and management, locating it firmly as a sub-set of educational administration. This is essentially a technical distinction adopted primarily as a necessary, sensible step towards the production of a conceptual map of the wider field. Yet even this limited definition generates a host of important and difficult research topics and questions. Moreover, it enables us to be critical, to be explicit about our value positions and to collaborate with policy sociologists and others in the ‘knowledge for understanding’ project in order to ‘speak truth to power’ (Fitz, 1999). Equally important, as we collectively seek to improve education within the ‘knowledge for action’, ‘instrumentalist’ and ‘reflexive action’ projects, it also enables, and arguably requires, us to offer truthful empowerment to practitioners and policy-makers.

Introduction: the changing context of work

As we approach the new millennium there are few certainties in the world of work. The global nature of the economy, and the rapid pace of technological development, force changes in the workplace that would have been unimaginable just a few decades ago. ‘Jobs for life’ are as rare now as they were commonplace in the 1950s and this means a radical reappraisal of the nature of work and its place in people’s lives.

Handy (1994) draws attention to the contrast between those who have ‘proper’ jobs and those who are on the fringe, with poorly paid, often part-time, employment; ‘bits and pieces of pocket-money work’. He points to the dilemma of economic growth being increasingly underpinned by this low-wage philosophy: ‘America, in the years from 1973 to 1989, managed to create 32 million net new jobs . . . but it was mostly hamburger work for hamburger pay’ (Handy, 1994, p. 8). In contrast with this economic underclass is the remaining group of people in full-time employment who continue to enjoy good pay and conditions but in a climate of high pressure to perform. The ‘shakeout’ of employees means that those remaining must work harder, to sustain output and to demonstrate the commitment necessary to provide a (partial) guarantee that their heads will not be the next on the block.

Handy (1994) points out that such ‘totally consuming’ jobs are not for everyone. They tend to exclude other aspects of life, including family and hobbies, and may create other problems for society. There is also the very real risk of ‘burnout’ as the stress of the long hours, high pressure and insecurity begin to affect performance. Megan Crawford examines some of the dysfunctional consequences of stress in Chapter 8 but the wider issue is the problem of society fragmenting into the ‘haves’ with good, well paid but insecure jobs, and the ‘have-nots’ who are unemployed, underemployed or working for low wages.

The impact of these changes on education have been limited but seem certain
to become more profound in the future. Preparation for the world of work is a powerful imperative for education, with a significant impact on both the aims and content of the curriculum. Lofthouse (1994, p. 144) refers to this vocational approach with its emphasis placed on instrumental values where the needs of the individual are subordinated to the requirements of society. Employment and enterprise are perceived as vital to the growth of a free-enterprise society. With over-riding weight placed on individual survival through employment, vocational definitions of the curriculum stress the transmission of useful knowledge.

A fundamental problem with this approach is that the precise nature of a work-related curriculum is difficult to define in the context of such rapidly changing work patterns. Flexibility and transferable skills may be more important than specific knowledge focused on a single industry. This has particular salience for further education but is relevant for all sectors. The decline of the coal, shipbuilding and textile industries, for example, exposes graphically the limitations of a specific vocational curriculum and the human consequences of non-transferable skills.

Schools have been relatively sheltered from the impact of employee ‘shakeout’ and unemployment. In the 1990s, however, there are signs of growing insecurity and of increasing stress and ‘burnout’ with stress-related retirements at a record level (Williams, 1996). The research by Campbell and Neill (1994a; 1994b) shows that there is significant overload in schools in England and Wales arising from what they describe as ‘teacher conscientious’.

Staff in further education colleges have been expected to adjust to rapid, and often painful, change since incorporation in 1993. Funding is increasingly linked to recruitment of students and successful completion of courses. Business values have become prominent, conditions of service have been ‘eroded’, more part-time staff have been employed and senior managers are increasingly drawn from the business sector. Elliott and Hall (1994, p. 9) point to the dysfunctional consequences of ‘the cultural transformation from education to business’ in further education:

While such foundations may prove adequate for the survival of colleges as financially viable institutions, they are inadequate for their survival as providers of high quality post-school educational experiences . . . The danger is an obvious one. Starved of adequate staffing, courses are reduced to minimum contact time, staff are overworked, overstressed and overtired, conflict between teaching and management staff becomes systemic, morale falls, staff goodwill is withdrawn.

O’Neill (1994) refers to the potential for self-managing schools and colleges to determine the precise nature of their staffing on the basis of their specific needs rather than have a staffing structure imposed by the LEA. He argues that educa-
tional institutions need to be able to exercise maximum discretion in three aspects of staffing:

- The type and length of employment contract offered.
- The linkage between pay and market forces.
- The range of additional benefits which form part of a complete retention and development package.

This increasing flexibility is already evident in further education where almost half the total staff are part time and 52 per cent of teaching staff are on part-time contracts (FEDA, 1995, p. 11). It is also beginning to impact on schools where local management of schools (LMS) forces senior managers and governors to prepare a cost-benefit analysis, explicitly or implicitly, when selecting new teachers or associate staff. The perceived quality of current and potential staff, once the decisive factor, has to be considered alongside the budgetary implications of recruitment or retention. This change in stance has led to an increase in the early retirements of experienced, and more expensive, staff, and the replacement of departing staff with newly qualified teachers. There is also evidence of greater use of part-time staff, a significant increase in temporary contracts to provide flexibility and the employment of classroom assistants as an inexpensive alternative to teachers (Levacic, 1995).

**Self-managing schools and colleges**

The pressure for developed and developing economies to become more efficient in order to compete effectively on the world stage has led to a heightened awareness of the links between educational capability and economic performance (Dearing, 1996). A skilled workforce depends largely on the achievements and outputs of schools, colleges and universities. This has led to a plethora of legislation as governments have sought to raise educational standards.

A major thrust in the legislation has been the development of self-managing schools and colleges in many countries. The Australian writers Caldwell and Spinks (1992, p. 4) define this concept:

> A self-managing school is a school in a system of education where there has been significant and consistent decentralisation to the school level of authority to make decisions related to the allocation of resources . . . The school remains accountable to a central authority for the manner in which resources are allocated.

Self-management in England and Wales takes one of three forms:

- **LMS** which devolves funding and resource management to governing bodies and limits the powers of LEAs. This is the dominant mode of
self-management which applies to some 23,000 primary, secondary and special schools.

- **Grant-maintained status** which applies when schools choose to ‘opt out’ of LEA control and receive their budgets direct from the Funding Agency for Schools (FAS). This applies to about 1,100 schools.
- **Incorporation** of further education colleges, independent of LEAs, which receive their budgets mainly from the Further Education Funding Council (FEFC).

The shift to self-management is underpinned by the assumption that management is likely to be more effective if it happens ‘close to the action’ rather than at a distance from the institution. School and college managers are able to determine their own priorities on the basis of an assessment of their specific needs rather than simply responding to priorities set by national or local governments. Caldwell and Spinks (1992, p. 14) argue the case for self-management:

> It is simply more efficient and effective in the late twentieth century to restructure systems of education so that central bureaucracies are relatively small and schools are empowered to manage their own affairs within a centrally determined framework of direction and support. Two arguments have usually been offered, one is concerned with responsiveness, the other with priorities for resource allocation in times of economic restraint or budgetary crisis.

The emphasis on self-management has been welcomed by many principals in schools and colleges (Bush *et al.*, 1993) because it facilitates greater institutional control of policies and resources. However, it poses problems for small primary schools whose heads often have a full-time class teaching role. The extra management demands have to be accommodated during evenings and weekends, adding to the stress referred to earlier.

The shift to self-management has been accompanied by a new accent on accountability to parents as surrogate ‘consumers’ rather than to teachers, the ‘producers’ of education. The concept of ‘open enrolment’ in England and Wales allows parents to express a preference for the school their children will attend, although that preference may not be met if the school is oversubscribed. This limitation diminishes parental choice but the concept remains a powerful component of government ideology in the UK and elsewhere.

The emphasis on consumer power also applies in further education where responsiveness is to the needs of employers as well as to those of students. These developments in both sectors mean that managers have to give heightened attention to the attitudes and preferences of those who ‘consume’ educational services, directly or indirectly. Inevitably, this means that market accountability has become more significant: ‘The notion of market accountability has been reinforced by the legislation and this model is probably the most relevant for
schools and colleges in the 1990s. Satisfying customers and potential customers is now the most important indicator of success’ (Bush, 1994, p. 323). The pressure for schools to compete for clients is sharpened by the publication of ‘league tables’ of performance in public examinations and tests. A low placing in these lists is likely to lead to a fall in demand for places with knock-on effects for pupil numbers, budgets, staff levels and the quality of teaching and learning. Adherence to national educational norms is sought through the imposition of a National Curriculum for schools and through a national inspection regime for both schools and further education.

The shift to self-management, and the inspection regime, are intended to raise standards. In further education, funding is linked closely to student retention and completion rates. For schools, there is intense pressure on headteachers and staff to improve their position in the league tables. The weakness of such a powerful competitive environment is that it is bound to lead to ‘winners’ and ‘losers’. Only one school can top the table but this does not mean that children and staff in the other schools should be valued less.

The presence of a National Curriculum, and state-sponsored inspection, means that self-managing schools have limited scope to develop on an individual basis. All schools offer a standard ‘product’ and competition is confined to the perceived quality of the educational process, as evidenced by inspection reports and examination and test results, and to the ‘image’ presented to prospective clients.

Managing people in a new climate

The shift to self-management, and the pressure on resources, have led to two major developments in the management of people:

- traditional staffing structures and historical divisions between professional and non-professional work are increasingly being called into question;
- organisations are less tolerant of ‘organisational slack’ or of suboptimal performance by teachers and other staff. Schools and colleges are under pressure to ensure competent performance from all staff (O’Neill et al., 1994, p. 29).

The change to self-management means that governors and senior managers need to take full responsibility for the management of staff. It is no longer possible to hide behind national or local government officers and inspectors or to blame them for shortcomings. Human resource management, in all its aspects, has to be handled within the organisation. In particular, schools and colleges have to operate in accordance with both legislation and changing societal expectations.

Equal opportunities

One significant area influenced by the law and by changing attitudes is that of equal opportunities. As David Middlewood indicates in Chapter 10, recruitment
and selection procedures must have regard to legislation on equal opportunities. Applicants should not be disadvantaged because of race, religion, disability or gender but, in practice, it can be difficult to ensure equality of opportunity.

In Chapter 9, Marianne Coleman points out that there are several barriers to career progress for women despite the legislation enshrining equal opportunities. These obstacles may be summarised as

- women make fewer applications for promoted posts;
- women are more likely to experience conflict between their professional and family roles;
- women are more likely to take career breaks;
- educational culture is male-centred;
- there is overt and covert discrimination against women; and
- there is a limited number of suitable female role models.

Some of these barriers also apply to other areas of disadvantage, including race. There is a dearth of black teachers in British schools despite the legislation outlawing discrimination. As long ago as 1986, the Commission for Racial Equality (CRE, 1986) drew attention to the shortage of black teachers and the need for strategies to increase their numbers. Research in eight LEAs with a significant proportion of people from ethnic minorities found that only 2 per cent of teachers were black. The proportion of black teachers in promoted posts was even lower. There was little improvement by the end of the 1980s. Clay et al. (1995) report that in 1989 only 2.4 per cent of students on BEd courses were from black ethnic groups.

It appears logical to assume that the following barriers, adapted from the Coleman analysis, operate to limit the appointment and advancement of black people in education:

- Black people make fewer applications for promoted posts.
- Educational culture is Eurocentric.
- There is overt and covert discrimination against black people.
- There are few suitable black role models.

The CRE (1986) research presents evidence of perceived discrimination and also implies that cultural factors and the absence of suitable role models may apply to black teachers and aspirants. Singh’s (1988) survey of Asian sixth-formers indicates that well qualified pupils were deterred from becoming teachers because of their personal experiences of racism from other pupils and staff. McLaughlin (1993) also refers to racism as a disincentive for prospective teachers: ‘Bigotry is probably another factor reducing the number of black and Asian teachers . . . Many [people] believe minority teachers get a raw deal – and that pupils know it’ (quoted in Clay et al., 1995, p. 22). There may be a double disadvantage for black women seeking to enter, or advance within, the teaching
profession. The stereotype of the white male manager in education is a significant barrier for aspiring black women, as one headteacher suggests: ‘I had to work hard – doubly hard to prove I was a good head, a good black headteacher, a good, black, female headteacher. I felt I was in a glass cage. I felt very lonely’ (Mortimore and Mortimore, 1991, p. 81). The under-representation of women and black people in senior posts in education is unfair. An even more significant consequence may be the underutilisation of human capital and the lost potential for more effective teaching and leadership in schools and colleges. If women and black students are deterred from pursuing careers in education because of the lack of suitable role models, and/or through perceived discrimination, the effect is to limit the overall quality of the teaching force with inevitable implications for the quality of teaching and learning.

**Associate staff**

Another potential area of disadvantage in education relates to associate staff. Teachers are invariably regarded as the prime resource in schools and colleges because of their central role in the teaching and learning process. They are also usually paid significantly more than associate staff, although the differential has narrowed to some extent since the introduction of LMS. There may be a double disadvantage for the high proportion of associate staff who are women.

The increasing emphasis on managerial effectiveness in education has led to a reappraisal of the role of associate staff. Mortimore et al.’s (1992, p. 19) research shows that flexible deployment of associate staff can enhance the cost-effectiveness of schools:

> If two schools which are comparable in every respect are equally effective in terms of performance, the one that uses the smaller amount of resources is the more cost-effective . . . Cost-effectiveness, in this sense of the term, is highly desirable. A school that uses its resources more cost-effectively releases resources which it can use to promote further development.

There is increasing evidence of schools using the flexibility provided by LMS to deploy associate staff in imaginative ways. Wallace and Hall’s (1994) research shows that some schools now include a bursar in their senior management teams. In many schools, associate staff are undertaking administrative tasks formerly performed by highly paid senior staff (Mortimore et al., 1992). Research by Levacic (1995) shows that many schools have increased the use of classroom assistants, technicians and librarians during the 1990s. ‘Local management has stimulated the growth of a para-teaching force in schools’ (Levacic, 1995, p. 155).

There are similar trends in further education. Kedney and Brownlow (1994) refer to the introduction of new para-professional roles such as workshop supervision, student guidance and support, and course design which would have been
regarded as lecturers’ work until the early 1990s. There has also been an increase in the number of senior managers appointed from the business sector (Elliott and Hall, 1994). There has been a reduction in the proportion of time spent by students in formal classroom programmes and an increase in learning supervised by associate staff. Kedney and Brownlow (1994, pp. 11–12) spell out the financial pressures driving these changes:

The imperatives to reduce unit costs in the drive for efficiency set by the funding mechanisms will mean more than reducing taught hours for students and expecting lecturers to teach longer and more flexibly . . . The future points to the potential removal of the institutionalised distinction between academic and support staff and the development of a new and more flexible model.

Schools and colleges make their own judgements about the balance of staffing in the light of their specific requirements but making the best use of the talents of all staff makes good sense. The effective management of associate and teaching staff is an essential element in education as O’Neill et al. (1994, p. 7) suggest:

A broader definition of the term people is inclusive rather than exclusive. It suggests that each adult employed within the school or college plays a critical role in its success. Acknowledging the unique contribution of individuals engenders their commitment.

**People and performance**

The management of staff in self-managing schools and colleges is located with governing bodies, principals and senior staff. The link between the leading professionals and lay governors is vital for the health of the organisation and requires ‘managing’ just as much as other relationships. Where governors and staff work together constructively and harmoniously, it provides a powerful basis for success (Bush et al., 1993) but conflict, or separation, between professionals and lay governors, may serve to inhibit development.

People are the most significant resource available to school and college managers. Their selection, induction, deployment, development and appraisal are the responsibility of principals and senior managers, reporting to the governing body. The quality of their work, and their motivation to perform well, are related directly to the nature of the human resource management process. Where staff management is skilled and sympathetic, a successful organisation is likely to result. Where it is clumsy and inadequate, poor performance may occur. The fundamental issue of managing for people or performance is examined by Colin Riches in Chapter 2.

The pressure for schools and colleges to compete for clients reinforces the
need for high performance which is necessarily related to the quality and commitment of all staff. Teachers and associate staff often work significantly more than their contracted hours in order to deliver the performance needed to meet the requirements of internal managers and external assessors.

The contract of employment introduced in 1987 requires school teachers in England and Wales to work for 1,265 hours of ‘directed time’. This time includes five days of compulsory in-service training. During these hours, head-teachers are able to specify the activities of teachers:

Under the contract teachers have to perform such duties as may be reasonably assigned to them by their head teacher. For example, head teachers could ensure, by the allocation of directed time, that teachers attend parents’ evenings, curriculum planning sessions, and other school meetings.

(Busher and Saran, 1992, p. 23)

Teachers are also required to work beyond their contracted hours to perform their duties satisfactorily. Preparation for teaching and marking pupils’ work, for example, are expected to be undertaken during this additional time. As a result, the 1,265 hours constitute a minimum rather than a maximum figure, as research by Busher and Saran (ibid., p. 39) demonstrates:

Some heads pointed out that teachers in their schools . . . worked far more than 1265 hours . . . By 1990 most heads commented that their staff were working incredibly long hours, that there was sickness and work-related stress, that they were having to protect their staff and in some cases ‘tell them to work less’.

The problem of ‘overcommitment’ also emerges from the research of Campbell and Neill (1994a; 1994b) in primary and secondary schools. Teachers were working for 54 hours a week, well beyond their contractual commitments. The researchers explain this ‘overcommitment’ and point to some of its dysfunctional consequences:

The teachers were primarily motivated by a sense of vocation or obligation to their pupils . . . The occupational culture of the school remained stubbornly at odds with the assumptions of central government’s legislation on working conditions . . . It is unlikely . . . that anyone other than the teachers themselves will take steps to reduce work overload, since most of the overload is in the teachers’ own time.

(Campbell and Neill, 1994a, pp. 223–4)

The partly self-induced heavy workload of teachers suggests that most staff fulfil O’Neill et al.’s (1994) assumption that commitment is an essential
component of successful organisations. However, long working hours may serve to diminish effectiveness and reduce the quality of work performance. In this context, senior managers have a responsibility to limit overload in order to promote the quality of teaching and learning:

A major function for heads and other managers in the post-ERA period might be to find ways to limit teacher workloads by identifying priorities for their schools, and filtering out demands which make the most conscientious teachers’ workloads unreasonable . . . There is no evidence that very long hours lead to better quality of teaching.

(Campbell and Neill, 1994a, p. 224)

The evidence of overcommitment suggests that teachers and associate staff are highly motivated but may be risking ‘burnout’ through working long hours over extended periods. In this context, managers need refined motivational skills to build high morale, sustain good performance and avoid dysfunctional overload. Riches (1994, p. 239) refers to the link between motivation and the ‘high performance cycle’:

- There should be high expectations of staff. Low expectations are demotivating.
- Managers should ensure a sense of satisfaction in return for effort.
- Satisfaction will derive from personally meaningful work which members are capable of and in part from managers taking pains to reward performance.
- Managers should encourage staff to set specific, challenging but realistic goals for high performance.
- Feedback on performance helps staff to effective task strategies and to be motivated.

This approach is reinforced by Torrington and Weightman (1989, p. 52) who stress the importance of valuing staff. They identify four types of esteem on the basis of their research in secondary schools:

- Consideration and praise.
- Feedback.
- Delegation.
- Consultation and participation.

Another dimension of motivation relates to staff development. Taking a proactive stance towards individual professional development provides tangible evidence of managers’ appreciation of staff commitment. Elliott and Hall (1994, p. 8), however, caution that staff development in further education may be directed towards organisational rather than personal objectives and form part of a response to changes imposed by external bodies:
Staff development is likely to be highlighted to greater prominence, but as a means of widening staff competence in order better to meet institutional needs. It is further likely that multiskilling will be privileged in order to maximise ‘output’. Retraining and redeploying staff provides one alternative to declaring staff redundant.

While individual staff development may serve to increase motivation, there is an emerging view that high performance may also be linked to pay. In England and Wales, this is specifically encouraged by the formal pay and conditions policies and in rhetoric from ministers (Tomlinson, 1992a). Performance related pay (PRP) is discussed in detail by Keith Foreman in Chapter 14.

The rationale for PRP is that people work more effectively with financial incentives (Tomlinson, 1992b), but the evidence of Campbell and Neill (1994a; 1994b) shows that teacher conscientiousness is widespread and arises from commitment to pupils rather than financial reward. The argument that financial incentives promote improved performance in vocational employment remains unproven.

Conclusion: managing the context

The context for human resource management in education provides a searching text of management capability. High unemployment, and an increase in short-term, low-paid jobs, raise important questions about the purpose of education. While governments urge schools and colleges to prepare young people for the world of work, specific skills are subject to obsolescence as a consequence of industrial change.

The international trend towards local management means that senior managers, and lay governors, are increasingly responsible for handling the human consequences of multiple change. The emphasis on consumers rather than producers, by governments in the UK and elsewhere, requires responsiveness to the needs of students, parents and employers. However, effective education can be achieved only by motivating teachers and associate staff to ‘deliver’ high quality.

Campbell and Neill’s research, discussed in Chapter 7, shows that teachers demonstrate their commitment to their students by working long hours. As Riches (1994) and Torrington and Weightman (1989) stress, praise for teachers and associate staff is essential if this overcommitment is not to lead to dysfunctional stress or ‘burnout’. A genuine concern for staff welfare should not be subordinated to the need for organisational efficiency.

THEORY

Hong Kong, like many societies, is undertaking major restructuring of its school system. A close examination of the three policies forming the backbone of the reform reveals a remarkable similarity to those introduced in the United States, Britain and Australia over the past ten years. Indeed, in one of the three Hong Kong policies, explicit mention is made of its origins in reforms emanating from Australia, with additional influence from research in the USA. In addition, consultants from both of these countries and Britain are frequently called on for advice. The blueprint for school restructuring initiatives has been exported from the West, and imported into the Asian culture of Hong Kong. In this respect, Hong Kong is no different from many other Asian and Western countries in ‘cloning’ reform policies initiated elsewhere. This is part of the ‘globalization’ of education currently taking place.

Importation of policy raises important questions about its appropriateness for indigenous cultures. Researchers working in the field of educational management and policy have, to date, paid relatively little attention to detailed analyses of the cultural matching of educational policy. Undergirding this paper is the assumption that successful take-up of an innovation depends heavily on the extent to which there is cultural fit between policy imperatives on the one hand and the beliefs, values and behaviours of those charged with implementation, on the other. The central purpose of this paper is to explore the appropriateness and synchrony between the policy reforms imported into Hong Kong and central features of its host culture. A process of deductive reasoning is followed by juxtaposing the policy reform with cultural characteristics, in order to clarify the likelihood of adoption and implementation of the intended policies. The conclusion is that some aspects of the reforms appear to harmonize well with the indigenous culture, while others may require rather greater degrees of autochtony and adaptation at the implementation stage.
The paper first outlines the major features of Hong Kong’s current school restructuring. It then attempts to conceptualize and to map key aspects of societal-level culture by describing and applying Hofstede’s (1980, 1991) cultural dimensions to provide a framework for identifying and gauging the culture of Hong Kong in juxtaposition with other cultures. The final part of the paper is constructed around a dialectic between the policy imperatives of school restructuring and the characteristics of Hong Kong’s culture, as reflected by Hofstede’s cultural dimensions. Tentative conclusions are drawn about the extent of fit between the restructuring policy and Hong Kong’s culture, and the possible need for adaptation.

**School restructuring in Hong Kong: theory, policy and practice imported from the West**

Attempts to restructure Hong Kong’s schools began in the early 1990s and, to date, centre on three major policy initiatives, namely, the School Management Initiative (SMI), the Target-Oriented Curriculum (TOC), and Quality Schools (ECR7). In common with the restructuring of school systems elsewhere, these initiatives can be conceived as two-pronged, one aimed at reforming the administrative, managerial and governmental aspects of schools, the other targeting the curriculum, teaching, learning and assessment. A summary of each policy follows.

**The school management initiative**

After several decades of education policy focused on quantitative and logistical concerns, especially coping with growing student numbers, the Hong Kong Government, in 1991, turned its attention to improving the quality of education, a theme which has dominated policy throughout much of the Western world for most of the final decade of the 20th century. In its policy document, the School Management Initiative (SMI), the Hong Kong Government (Education and Manpower Branch (EMB) and Education Department, 1991) set out the background prompting, and the proposals for, the reform of the school system. The SMI is to be seen within the context of public sector reform, with its emphasis on accountability for performance and within the context of the school effectiveness movement, with its characteristic features of devolution and delegation of decision making in support of the principle of subsidiarity.

The policy aimed to define more clearly the roles of those responsible for administering schools, particularly sponsors, managers and principals; to provide for greater participation by teachers, parents and former students in school decision making and management; to encourage more systematic planning and evaluation of school activities; and finally, to give schools more flexibility over the use of resources. The recommendations included, first, that the Education Department (ED) change its role from a controlling to a supportive,
advisory function. Second, new more effective management roles for school management committees (SMCs) and principals were recommended. Accordingly, every SMC should produce a constitution setting out the aims and objectives of the school and the procedures and practices by which it will be managed. Third, greater flexibility in school finance was advocated and schools would be given a block grant to decide their own spending patterns within the policy framework set by the ED. They were to be given the discretion to use their savings and to seek non-government sources of funding. Fourth, the participation of teachers, the principal, the SMC, and to appropriate degrees, parents and students in decision making was to be encouraged. SMI specifically singled out teachers and parents as excluded from decision making. Few schools had parent–teacher associations and closer contact between schools and parents was urged as a means of fostering more effective learning. Fifth, a framework for accountability was to be established, involving a staff appraisal system. In addition, each school should produce an annual school plan, setting out its goals and activities for the coming year, against which it could be held accountable. Such a plan would allow the school to assign priorities, allocate its budget, and provide the community with information about school direction. It also proposed that each school prepare an annual school profile covering its activities in the previous year and detailing its performance by developing indicators in a number of key areas.

By 1995–6, only a minority of schools (approximately one-quarter) had chosen membership, an outcome regarded as somewhat disappointing. A survey of SMI progress (Education Department, 1994a) found that member schools had constituted their SMCs with extensive involvement of principals, and to a lesser extent teachers, but with minimal involvement of parents and alumni. Most schools were successfully managing their decentralized block grants. There was evidence of more systematic planning, with all schools having an annual plan, including statements of mission and goals. Such planning, however, may be illusory since involvement appeared to be confined to the senior levels of staff, especially the principal. The implementation of staff appraisal schemes also appeared to be causing difficulties. Respondents indicated an increased workload, with especially heavy demands falling on middle managers. The reform had not penetrated to affect the work of teachers at the classroom level. School personnel felt a lack of support at system level and some complained of time constraints (Y.C. Cheng, 1992). These latter findings are in line with restructuring experiences elsewhere (Dimmock, 1995).

**Quality school education (ECR7)**

Five years after the introduction of the SMI policy, the Education Commission published its Seventh Report in the form of a consultative document called *Quality School Education* (Education Commission, 1996). There is a significant shift between SMI and ECR7 from ‘effective’ schools and schooling to ‘quality’
schools and schooling, in line with changes of policy nomenclature in the West. The following recommendations were made. First, a framework should be established for developing and monitoring quality school education. A Quality Development Commission should advise the Director of Education on quality school education. In addition, a new whole-school approach to school inspections is advocated. The present inspection divisions should be reorganized into a Quality Assurance Inspectorate to coordinate resources for periodic comprehensive assessment of the performance of each school.

At school level, school development plans, annual budgets and staff appraisal schemes should be institutionalized. Teachers should contribute to the improvement of quality education through active participation in the SMC and the School Executive Committee (SEC), the latter being a second-tier executive arm of school management, chaired by the principal and responsible to the SMC. School management should pay greater attention to the needs of students according to their abilities and aptitudes and to identifying meaningful input, process and output indicators by which to judge school quality in line with a value-added approach. Second, key stakeholders should receive appropriate training and professional development, especially in financial and human resources management. Third, performance indicators and the concept of value-added achievement should be introduced in order to assess school performance. This would provide an equitable base for school self-evaluation and external quality assurance. Schools should also develop as soon as possible a proper appraisal system for assessing the performance of teachers and principals. Fourth, in order to build a quality culture, the government should provide incentives for schools to strive for continuous improvement. Consequently, a ‘Quality Development Grant’ should be introduced to fund worthwhile innovative projects on a competitive basis. Cash awards might also be available to a small number of schools demonstrating the most impressive value-added performance. This should raise the morale of teachers. It would be up to the principal to decide, after having consulted with the SMC, teachers and parents, how the money should be used. Fifth, all schools by the year 2000 should practise school-based management in the spirit of SMI.

The Target-Oriented Curriculum

Restructuring of the Hong Kong school curriculum follows trends evident in Britain, Australia and the United States. Noteworthy in this regard is the introduction of the Target-Oriented Curriculum (TOC) (Education Department, 1994b).

The TOC policy centres on notions of improved practices of teaching and learning based around more learner-centred approaches, the division of the curriculum into progressive learning targets and objectives for four key stages of learning, and the development of content, teaching methods and assessment strategies geared to the learning targets. Emphasis is placed on setting learning
targets and on close assessment of individual children in terms of target achievement. In accordance with the introduction of the TOC, a framework of learning targets and related support materials is being developed for the three core subjects of Chinese, English and mathematics. A pilot scheme began in 20 primary schools in 1993. Despite some teething problems, it was decided that the TOC should be introduced to Primary 1 classes in 70 primary schools in 1995.

In summary, observers of Hong Kong’s school restructuring policy framework would not be able to differentiate it from similar initiatives taking place in Australia, the USA and in Britain. Even the changes of terminology and of policy emphasis which have characterized school restructuring during the 1990s in English-speaking Western countries are replicated in the Asian cultural setting of Hong Kong. Having outlined salient aspects of policy reforms in Hong Kong, the question arises as to their suitability for, and degree of fit with, the culture. It is therefore to aspects of Hong Kong’s culture that the paper now turns. First, however, it is necessary to clarify the concept of culture and its possible measurement.

Hofstede’s cultural dimensions and their application to Hong Kong

Education, as an essentially human activity, is culture-bound. Policy makers and school leaders, therefore, need to be mindful of societal and organizational cultural characteristics when formulating, adopting and implementing policies. The prospect of successful implementation is enhanced when policy makers and school administrators adopt policies consonant with the characteristics of the prevailing societal culture.

Agreement on a definition of a complex concept like culture is not easy. Hofstede, one of the leading advocates of cultural comparative research in international management, defines culture as, ‘patterns of thinking, feeling and acting’ underpinning ‘the collective programming of the mind which distinguishes the members of one group or category of people from another’ (1991: 4–5). The ‘collective programming of the mind’ refers to shared beliefs, values, and practices of a group of people, whether that group be a society, nation state, or organization. He goes on to argue that culture is learned, not inherited, and that societal and organizational cultures are qualitatively different concepts.

Since culture centres on shared values, beliefs and practices, the expressions of which are both visible and intangible, it can be a difficult phenomenon to measure, gauge or even describe. The identification of cultural dimensions, defined as ‘core axes around which significant sets of values, beliefs and practices cluster’ (Dimmock and Walker, 1998), not only facilitates their description and measurement, but promotes comparison between different cultures. In short, dimensions provide common benchmarks against which cultural characteristics at both societal and organizational level can be described, gauged and compared. Despite their usefulness, however, Hofstede’s cautionary remarks about
dimensions are correct, when he claims that the same limitations apply to them as to culture itself: ‘They are also constructs that should not be reified. They do not “exist”: they are tools for analysis which may or may not clarify a situation’ (1994: 40).

Minimal research on cultural dimensions has taken place in educational administration. We therefore have to rely on Hofstede’s work in the international management field (Redding, 1994). While the need for further refinement of Hofstede’s dimensions should be acknowledged (indeed, Hofstede himself admits that the dimensions are not necessarily exhaustive), his work remains definitive for the time being.

Five generic cultural dimensions underpin Hofstede’s framework (1980, 1991). All five, he claims, are empirically verifiable and are applicable universally across all societies or nations. Presented as choices between pairs of alternatives the dimensions allow the emergence and identification of patterns within and between cultures, and facilitate their meaningful ordering (Hofstede, 1980: Hofstede and Bond, 1984). The five dimensions are outlined below. Each is applied to Hong Kong in order to present an exposition of its distinctive cultural characteristics.

**Power Distance**

This (PD) refers to the distribution of power within society and its organizations. It is defined as the extent to which the less powerful members of institutions and organizations within a country expect and accept that power is distributed unequally. In societies with large PD values, greater inequalities of power distribution are expected and accepted in the family, in school and in the workplace. Many Asian societies are high PD cultures, while many Western societies have low PD values. The more Westernized is the Asian society, the more likely it is to change from a high to low PD.

Hong Kong, like Singapore, displays a high Power-Distance Index (PDI), being ranked 15th out of 50 countries. By contrast, the USA is ranked 38th, Australia 41st, and Britain 44th. Not only do most Asian societies traditionally exhibit high PD, but in the case of Hong Kong, the British colonial government has further enhanced PD.

**Individualism versus collectivism**

This dimension (IC) is the degree to which individuals are integrated into groups and to which there is closeness between persons in a relationship. Vecchio (1995) describes it as the extent to which a person is ‘inner-directed’ or ‘other-directed’. In individualist societies, individuals place their personal goals above those of their in-group, the ties between individuals are loose, people are expected to look after themselves and their immediate families. In collectivist societies, people place group goals above their personal goals, they are brought
up to be loyal to, and integrate in, strong cohesive groups, which often include extended families.

On this dimension, Hong Kong, Singapore, Malaysia and Thailand are ranked towards the collectivist end, Hong Kong being placed 37th out of 53 countries. At the individualist end of the spectrum, the USA, Australia and Britain occupy the first three places. Large power distance societies, like Hong Kong, tend to be more collectivist, while small power distance societies tend to be more individualist.

**Masculinity versus femininity**

This dimension (MF) is concerned with the ways in which ‘biological differences between sexes become perpetuated in differences in social and organizational roles played by men and women’ (Harrison et al., 1994: 246). The assertive pole is termed masculine and the modest, caring pole, feminine.

Hong Kong ranks 18th out of 53 countries and regions, compared with Britain, USA and Australia, which are 9th, 15th and 16th, respectively. All of these societies tend towards the more masculine end, indicating much less of a Western/Asian divide on this dimension.

**Uncertainty avoidance**

This dimension (UA) relates to how people react to, manage, cope with, and tolerate uncertainty and ambiguity in their lives. Uncertainty-avoiding cultures tend to proliferate laws, rules, safety and security measures and, on a philosophical and religious level, tend to believe in absolute truth. Conversely, people in uncertainty-accepting cultures are more tolerant of a range of different opinions, they prefer fewer rather than more rules and, on the philosophical and religious level, are more relativist and tolerant of different faiths and creeds.

Most Asian societies rank low on uncertainty avoidance. Hong Kong, for example, is ranked 50th out of 53 countries and regions. Singapore is 53rd. Britain is 48th, USA is 43rd, and Australia 37th. People in these societies do not feel sufficiently insecure and threatened by the unknown, unfamiliar or uncertain that they take measures to regulate their lives.

**Long-term versus short-term orientation**

This fifth dimension (LS) was added to Hofstede’s original schema after research by Chinese scholars (The Chinese Culture Connection, 1987) and is less validated than the other dimensions. Values associated with long-term orientation, such as thrift, perseverance and willingness to make short-term sacrifices for long-term gains, are counterbalanced by values associated with short-term orientation, such as respect for tradition, fulfilment of social obligations and protection of one’s face. Although many of these values are associated
with Chinese (Confucian) values, they also seem to apply to other societies without a Confucian heritage.

China, Hong Kong and Taiwan rank first, second and third out of 23 countries and regions on this dimension. Australia, the USA and Britain rank 15th, 17th and 18th, respectively. Hong Kong, like its East Asian neighbours, ranks very high on long-term orientation.

**Assessing the compatibility between Hong Kong’s school restructuring and its culture**

In common with most policy documents, SMI, ECR7 and TOC emphasize objectives, goals and directions more than the processes and practices necessary for operationalizing and institutionalizing reform. Yet, the importance of the latter in successful reform is undeniable. The points at which policy is transformed into practice are critical, too, from a cultural perspective, since culture is deeply embedded and manifested in the beliefs, values, practices and behaviours of actors at the school site. While it is argued that policy should be tailored where necessary to harmonize with culture, it is not assumed that culture is a fixed, immutable and unchanging phenomenon. Rather, it is assumed that societal culture does change, if only slowly, and that policy and culture need to be juxtaposed. Even in situations where restructuring policies are aimed at changing the culture, the relationship between policy and host culture is iterative.

In the following section six key aspects of Hong Kong’s school restructuring agenda (reflected in the SMI, ECR7 and TOC), all based on policies imported from Australia, Britain and the USA, are matched for appropriateness of fit with features of Hong Kong’s culture, as characterized by Hofstede’s dimensions. The six aspects of restructuring are: planned reforms to teaching and learning; changes demanded in principals’ leadership style towards collaborative and participative decision making; decentralization; school development planning; staff appraisal; and professional development and training.

**Planned reforms to teaching and learning**

Although the SMI and ECR7 policies are primarily concerned with management issues, there is a strong tacit understanding that the ultimate objective is improvement in the quality of teaching, learning and curricula. Two recommendations of the ECR7 address issues of direct concern to teaching and learning. The first refers to the need for a pluralistic school system ‘to cater for the needs of students according to their abilities and aptitudes’, and the second to the aim of developing fully ‘students of different abilities in the spirit of equal opportunities’ (Education Commission, 1996: 39).

Each of these citations suggests major reforms in the way students and teachers are to be grouped for learning and in the teaching methods to be used. It is implied that teachers must change their teaching methods and approaches.
towards more student-centred strategies. The TOC policy also endorses this aim as indicated in the Programme of Study for English Language (Curriculum Development Council, 1995), which advocates ‘learner-centred methods and strategies for teaching’ (p. 43) and ‘learning should be experiential rather than instructional since students learn best through activities that demand involvement’ (p. 41). The same document goes on to advocate how teachers can cater for individual differences by being ‘sensitive to each student’s needs, by evaluating each student’s development of cognitive ability, judging the materials to challenge each student, arousing each student’s interest, responding to and helping the student who needs extra attention, and appraising each student’s capacity to learn and improve’ (p. 44). How well adapted are current teaching-learning methods in Hong Kong’s schools to meet these expectations? And what influence might culture have?

These questions are best addressed by referring to the prevailing cultural characteristics of Hong Kong’s classrooms, to recent research showing significant differences between how Chinese and British and American teachers teach and students learn, and to current classroom conditions. According to Hofstede, in large PD societies such as Hong Kong, teachers are traditionally expected to take all the initiatives in class and they tend to be seen as gurus transferring their personal wisdom. Students are not expected to speak up unless invited by the teacher, and are more comfortable speaking in small groups than large. Formal harmony and preservation of relationships is important at all times (Hofstede, 1986: 312). The attainment of those student-centred learning methods which are dependent on assertive expression, persuasion and argument between group members, may thus be more difficult to attain. Moreover, because Hong Kong is more collectivist, children learn to think more in terms of ‘we’ than ‘I’, and this may run counter to more individualized instruction. Students in collectivist societies, for example, may not feel comfortable or motivated to compete with one another in class. By the same token, however, the collectivist values of Chinese students appear to be receptive to more cooperative methods of learning.

Hong Kong’s students and parents place high value on examination results. Thus new teaching-learning methods which emphasize processes of learning rather than results may find some disfavour. Although Hong Kong society in general is classed as a low uncertainty avoidance culture, its schools display many characteristics of a high uncertainty avoidance culture. School life, including the teaching syllabus, is regulated by an abundance of prescriptive rules and regulations. This degree of prescription may work against the fostering of more exploratory forms of teaching and learning. In addition, Hong Kong students tend to feel more comfortable in tightly structured learning situations. Finally, the long-term orientation of Hong Kong educators is characterized by an innate conservatism and by values such as perseverance and observing the ordering of relationships by status, all of which tend to militate against the easy acceptance of new relationships between teachers and students.

The prevailing ethos in East Asian societies values effort rather than ability
and competition is seen as a way of improving results and as a means of socialization in order to prepare the young for tougher competition in society (Cheng and Wong, 1996). Students are ranked according to their academic scores and in Hong Kong this ranking is important in allocating primary students to secondary school. This leads Cheng and Wong to conclude:

In this context, individualized teaching, where students work towards diverse targets at different paces, is almost inconceivable in East Asian societies. Therefore, the emphasis on the administration of teaching is more on how students of different abilities could learn to adapt themselves to the common curriculum and common examination, rather than adapting the curriculum and teaching to the diverse needs of the students.

(1996: 44–5)

Recent research findings on differences between Asian and Western students in how they learn (Watkins and Biggs, 1996) are also instructive in throwing light on the question of the cultural appropriateness of recent educational policy directions in Hong Kong. These authors claim that Hong Kong students are representative of students in other Chinese cultures, namely, Singapore, Taiwan and Mainland China, in that they all share a Confucian-heritage culture (Watkins and Biggs, 1996: 269). They argue that many of the views typically held by Westerners in relation to Chinese (and other Asian) learners, are in fact, myths. The first misconception centres on the contribution made by repetition and rote learning to memorization and understanding. All agree that Chinese and Asian students have a tendency to rote learn. Western interpretation of rote learning is derogatory, implying that little understanding or reflection takes place. Marton, Dall’Alba and Tse (1996) claim that memorization can lead to understanding, although whether it deepens understanding, or is a precondition for it, is not clear. For some Asian students, the relationship between memorization and understanding is a two-way cause-effect phenomenon. That is, while memorization is sometimes used to deepen understanding, at other times it is simply used for passing exams. The Asian student appears sufficiently sophisticated to vary the process to suit the objective. Westerners often fail to see the advantages of rote learning in enhancing understanding.

A second myth relates to motivation. On this matter, Watkins and Biggs assert, ‘Western ways of categorizing motivation do not travel well, at least not to the Orient’ (1996: 273). Westerners tend to see intrinsic motivation as the precursor to meaningful deep understanding. The Chinese student, however, taking a more pragmatic view, may be motivated by a mixed set of forces, including ‘personal ambition, family face, peer support, material reward, and yes, possibly even interest’ (1996: 273).

Collectivist notions also affect the teacher-student relationship, which although hierarchical, can also be warm, caring and supportive (Chan, 1993).
Tang (1996) found Chinese students collaborated much more outside the classroom in helping each other to obtain material useful for the completion of, and entering discussion on, assignments, than did their Western counterparts. In addition, although it is seldom attempted, Winter (1996) found that organized peer learning can work very well in Hong Kong schools. Watkins and Biggs (1996: 275) conclude, ‘Hong Kong secondary school students would in fact prefer a more collaborative learning environment which they consider would promote the deeper, more achievement-oriented approach to learning’. In these ways, some of the new directions for core technology espoused in TOC and ECR7 might well be supported by prevailing cultural characteristics.

If there are at least some cultural characteristics which appear supportive of policy changes in core technology, current classroom conditions in Hong Kong’s schools do not favour the student-centred and individualized methods. Most Hong Kong classrooms are cramped and crowded. It is commonplace to find 40 students in a class. Desks are formally arranged in rows. Classrooms are typically small, so that both students and teachers work in confined spaces. Opportunities for mobility and flexible classroom layouts are therefore severely restricted. Most classrooms are not well equipped by Western standards, having no more than the bare essentials of a blackboard, desks and chairs. These conditions dictate that few alternatives exist to direct teaching methods supplemented by discussion in pairs or small groups. Opportunities for catering to the variability of student needs and abilities as well as introducing more flexible student-centred learning approaches seem to be severely curtailed.

Given the prevailing cultural characteristics of Hong Kong, are reforms to teaching and learning recommended in Hong Kong’s restructuring policies appropriate? Evidence suggests that the collectivist dimension of the Chinese culture seems well suited to cooperative learning and peer tutoring, both of which are consistent with the reform policy. Present classroom conditions of large class sizes and confined spaces will, however, present major difficulties to teachers when implementing these methods. However, peer tutoring and cross-age tutoring are convenient and appropriate teaching methods for overcoming large student:teacher ratios and would seem to fit well with the culture. While the current over-reliance on didactic teaching needs to be reduced, it could serve as a useful base from which to develop best practices of direct teaching, itself a highly effective teaching method.

**Decentralization**

Decentralization of much of the responsibility for school management is at the heart of the SMI policy in Hong Kong. According to Hofstede (1991), large PD societies such as Hong Kong traditionally prefer centralization. Centralization, however, can take place at different levels. Power and responsibility may be decentralized from the central bureaucracy to individual schools, only to be centralized again at school level in the person of the principal, who captures and
monopolizes them, aided by staff who are only too willing to display subordination. This seems to have already happened in Hong Kong. Problems ensue in high PD societies where administrative responsibility is decentralized, while the traditional hierarchical pattern of social relations remains intact.

**Principals’ leadership style: collaborative and participative decision making**

A strongly advocated feature in both the SMI and ECR7 is the change required in principals’ leadership, from an authoritarian to a more collaborative, participative style. SMI, for example, states that ‘because proper management structures and processes are lacking, some principals are insufficiently accountable for their actions and see their post as an opportunity to become ‘little emperors’ with dictatorial powers in the school’ (EMB and ED, 1991: 14). It goes on to refer to a lack of educational and managerial leadership in schools. Effective leaders, by contrast, ‘would provide strong support for school-based management and collaborative decision making within a framework of school objectives, and provide the link between the school and the SMC’ (EMB and ED, 1991: Annex 2). This belief is reinforced in ECR7 where the recommendation is made to set up a two-tier management structure in schools: an SMC and a School Executive Committee (SEC). The SEC would be the executive arm of the SMC and be headed by the principal. This is a clear attempt to disperse some of the present power and authority exercised by principals. Elsewhere in ECR7 the statement is made that the teachers’ role should be more than just classroom teaching: ‘Teachers should participate in school management to help develop the various school activities in a professional way’ (Education Commission, 1996: 30). Teacher participation is thus advocated in both the SMC and the SEC.

Collaborative leadership styles are currently advocated in school restructuring policies in Britain, Australia and the USA. The assumption is that collaborative leadership brings multiple benefits, including better quality decisions, sharing of workloads, and greater staff commitment to implementing decisions. However, even in Western societies, where it is strongly advocated, some of these supposed benefits appear more rhetorical than real. Collaboration may, in fact, have negative effects, such as slowing down the decision-making process. It can be difficult to achieve: the concept itself is capable of many interpretations and may operate at different organizational levels; it is also inextricably intertwined with power, authority and responsibility. In sum, leaders are often reluctant to collaborate when they fear loss of personal power and control, especially in situations where they are ultimately held accountable.

In Hong Kong, as elsewhere in Asia, the collectivist culture would seem to favour collaboration. However, high PD seems to predispose them to following and respecting the authority and power of a strong leader to whom they look for direction and structure. Hui, for example, arguing that participative leadership is counterproductive in Chinese societies, states, ‘a participative superior is seen as
indecisive and, therefore, not worthy of respect’ (1990: 203–4). Cheng and Wong (1996) remark that teacher participation in schools is hierarchical, that is, teachers at different levels of the administrative ladder hold different expectations of participation. They claim that rank-and-file teachers often see participation as a privilege granted from above rather than as a right. Hence, in East Asian schools, ‘participation is often seen as a matter of pragmatic needs rather than a matter of democracy’ (Cheng and Wong, 1996: 44).

Taking cognizance of these characteristics, the conclusion is that collaboration fits well with the prevailing culture of Hong Kong when it takes place at levels of school organizational life which preserve the vertical hierarchy or authority gap between the principal and staff. In other words, collaboration is well suited to departmental and faculty levels of school organization, but concepts of senior team management may be more difficult to reconcile. In advocating the SEC, ECR7 appears to be in conflict with the high PD culture of Hong Kong.

**School development planning**

Planning is generally favoured in low PD, high UA societies. When PD is high, there is too little trust to make planning effective (Triandis, 1982–3: 156). Planning is also promoted in cultures with an orientation towards the future rather than the past. In terms of Hofstede’s cultural dimensions, societies with high UA have a predisposition for structure and direction. Although Hong Kong’s ranking on the UA scale is not high, in respect of its school life, it displays typical characteristics of a high UA society. On the other hand, Hong Kong’s ranking on long-term orientation is high, suggesting a preference among its people for planning and thinking about the future. A further cultural characteristic which seems to favour planning is what might be called a gestalt capacity, an ability to see the whole picture. Cheng (1995: 96), citing Liu (1988) summarizes this characteristic as follows:

> I would not hesitate to say that Westerners have ingrained in their culture and milieu, a very strong analytic ability. As if created by God for a contrast, the Asians, and in particular the Chinese, seem to have a high sense of synthesis.

This seems to be an ability which the Chinese possess in abundance.

In addition, according to Cheng and Wong (1996: 44), Chinese societies have a general belief in collective aims and objectives. In relation to Hong Kong, these authors state:

> . . . successful schools are often led by objectives beyond individualistic aims such as ‘full development of personal potential’. Even in schools where the school objective is not explicit, there is a general ethos that teachers who work in a school belong to the school. There is some
subtle bonding among teachers in a school, that members of the same school unite and work towards the common goal of the school. . . . However, submission to the common goal is not the result of rational consensus building, or anything emerging from any device of the system. It is a traditional value where individuals are expected to submit to organizational goals.

This cultural trait might thus favour teacher submission rather than commitment to the school plan.

Staff appraisal

Both the SMI and ECR7 are unequivocal about introducing a staff appraisal system. The importance of appraisal, as set out in the SMI, is its assessment of staff strengths and weaknesses, clarification of staff development needs, and its contribution to ensuring a meritocratic basis for promotion. The same arguments are repeated again in the ECR7, only this time appraisal is seen as part of a quality assurance process. By 1997, few schools, even those which were part of the SMI scheme, had introduced appraisal. In the absence of strong teachers’ unions in Hong Kong, difficulties associated with the introduction of appraisal seem more attributable to practical problems of implementation at the school site.

Part of the problem is that Advisory Committee documents (Education Department, 1992, 1993) on appraisal do not detail clear procedures for operationalizing an appraisal system. This situation typifies a key dilemma of school reforms elsewhere: the ED is either unwilling or unable to provide schools with detailed guidance and direction on implementation, thereby leaving it to each school to work out its own response: schools rarely seem to possess the technical knowledge, expertise, initiative and resources to make such reforms happen.

Is Hong Kong’s culture suited to appraisal? Hofstede (1995) has addressed this issue in the context of the business world, noting that performance appraisal systems, strongly advocated in Western management literature, suggest that employees’ performance will improve when they receive direct feedback, usually from a superordinate. This may be true, he says, for individualist cultures. Western models of appraisal not only assume direct feedback, open communication and more equal relationships between the superordinate and subordinate, but also that organizational members see themselves as individuals rather than as team or group members. In collectivist societies, however, these assumptions may not hold, and the giving of direct feedback can destroy the harmony which is considered so important in governing interpersonal relationships. The employee may lose ‘face’ and, with it, personal loyalty to the organization.

The implication of Hofstede’s remarks for introducing appraisal into the collectivist societies of East Asia, is that feedback should be given indirectly,
'through the withdrawing of a favour, or via an intermediary person trusted by both supervisor and employee' (Hofstede, 1995: 157). In other words, appraisal in Hong Kong’s schools may need to be adapted from Western approaches relying on direct face-to-face feedback between appraiser and appraisee. It would also probably need to place greater emphasis on peer appraisal. The significance of culture is particularly highlighted in the management of interpersonal relationships.

**Professional development and training**

High priority is accorded in SMI and ECR7 to the professional development of principals, teachers and other key participants. This is rightly seen as a prerequisite for the successful implementation of restructuring policies. Both reports, however, are extremely cursory in detailing the form and delivery such training should take, or the standards or quality to be met. In fact, despite the acknowledgment that the successful implementation of all three reforms rests heavily on professional development, it is noteworthy that in none of the three policy documents is there an account of the quality and type of professional development required.

According to Cheng and Wong (1996: 45), schools in Chinese societies are judged by their ‘atmosphere’ (xiaofeng) or culture/climate. This means that:

Management skills are seldom a concern among Chinese school principals, because they do not believe that schools are managed by skills. They believe that petty skills and techniques in management are no replacement for a good principal who is respected by all the teachers, students and parents as a comprehensive leader-gentleman.

Moral leadership is therefore very important. As Hallinger and Leithwood (1996: 112) state,

Traits such as dedication, discipline, strong will and persistence are considered highly important as are age, seniority and experience. This reflects a different sense of administrative priorities from the performance-oriented normative descriptions of administrative practice that characterize Western nations.

This view of school principalship has clear implications for the knowledge base of programmes for administrator preparation and for understanding how Chinese principals might approach professional development activities based on imparting skills.

It is not only Western educational policies but also professional development programmes that are imported into Asian societies. In this regard, Hallinger and Leithwood (1996: 110) state:
Both the content and methods used in the administrative training programmes of developing countries have generally been borrowed more or less directly from Western societies. Although exceptions do exist . . . this has been the case even when there is neither conceptual nor empirical validation of the knowledge base in the receiving culture.

They go on to argue that it is imperative for Asian and other non-Western countries to localize the knowledge base underlying administrator preparation. There is a need ‘to explore the empirical basis for the application of theoretical knowledge, craft knowledge and school/system policies’, since ‘learning is a culturally-mediated activity’ (Hallinger and Leithwood, 1996: 111). There is also a real danger that even where Asian principals understand and correctly apply Western knowledge they do so in a context of different assumptions, relationships and expected behaviours, the outcome of which may be unpredictable.

If it is reasonable to assume that the restructuring of Hong Kong’s school system is predicated on professional development, then more thought needs to be invested in the quality and type required, especially with respect to the knowledge, skills and attitudes of its school leaders. As Muller and Watts (1993: 361) caution, ‘organisations often adopt first-rate strategies that are implemented by managers with second-rate education and training. When these managers work in out-of-date work environments, the result is that the organisations become third-rate.’

Conclusion

The contemporary culture of Hong Kong consists of Western culture grafted on to an otherwise historically ingrained Chinese culture. The Western elements in Hong Kong’s culture are attributable to its exposure to education, religion, law and government associated with a long period of British colonization, and to commerce, trade and tourism, all promoted by Hong Kong’s strategic geographical position. Despite these powerful Western influences operating over a long period of time, the majority of Hong Kong people have maintained their inherent Chineseness.

School system restructuring and the globalization and internationalization of educational policy will predictably continue. The phenomenon of policy cloning, seen as part of the globalization of education, enables the process of policy formulation to be hastily completed, with the consequence that minimal attention is paid to the receptivity of the host culture to the imported policy. The present analysis finds this to be the case with Hong Kong’s reform initiatives. Autochtony and adaptation will fall on the shoulders of principals and teachers working at school level, where cultural dimensions find expression in the processes of teaching and learning and of leadership and management. As Hallinger and Leithwood (1996) note when citing Hofstede (1976), how people approach space, time, information and communication are shaped by the cul-
tural context and appear broadly to differentiate Eastern (high context) and Western (low context) cultures. They go on to claim, ‘we view culture as having an impact on schools at the institutional level, on the community context, on the beliefs and experiences of administrators, on administrative practice, and on a school’s particular culture’ (Hallinger and Leithwood, 1996: 108).

Cultures are changing, especially in East Asia, where rapid economic growth, the opening up of economies and societies to world markets and competition, international tourism and the media are all tending to graft Western influences on to indigenous cultures. This is clearly the case in Hong Kong, and is becoming so in China. Younger generations hold different cultural values from their more traditional parents and grandparents. As Cheng and Wong (1996) note, with the spread of education in East Asian societies involving entire populations rather than just a selected few, the present emphasis on conformity and effort may change. Will the present faith in work effort as a means of achievement be undermined by Western philosophies geared to catering for individual needs and adaptive teaching? Will a tension develop in Asian school systems between progressive teachers who advocate change on the one side and traditional teachers and conservative-minded parents on the other? How much attention will be paid to special needs and heterogeneous abilities? Will schools be expected to adapt to the diversity of their clientele rather than expect the clientele to adapt to schools, as at present? Will the traditional hierarchical structures give way under capitalist market reforms? How will societies like Hong Kong reconcile Eastern and Western values and trends in their education systems? Paradoxically, with the convergence of educational policies and school systems around the world, the importance of cultural divergence increases.

EDUCATIONAL ADMINISTRATION 
AS SCIENCE

A post-positivist proposal

Colin Evers and Gabriele Lakomski

Introduction

Recent debates in educational administration have often focussed on purported limits to scientific views of administration and on the provision of alternatives. For example, scientific approaches are said to be incapable of dealing with ethical issues; yet the practice of administrators, managers and policy analysts is irreducibly value-laden, being routinely concerned with questions of what ought to be done or what is the right course of action to advise or follow. Or, since organisational behaviour involves vast networks of intentional human activity, no adequate understanding of organisations seems possible without some appeal to human subjectivity, to the interpretations people place on their own actions and those of others. Yet scientific models of administrative behaviour in the name of objectivity, seek to eschew interpretations, intentions and the inner life of agents in general. In the realm of research too, case studies, cultural studies and ethnographic methods seem able to deliver important detailed knowledge about administrative processes. But again, these are methodologies that are hard to place within a scientific tradition of controlled experiment or statistically significant reproducible results.

Such major differences between the orientation of traditional scientific approaches to educational administration on the one hand and the focus and direction of often quite systematic rivals or alternatives on the other, clearly lie behind much of the perceived intellectual turmoil in the field. Educational administration, in common with most of the applied social sciences, has experienced a growing appreciation of the methodological weaknesses inherent in positivist construals of science and its methods. Ironically, however, the natural sciences go from strength to strength and hardly any part of modern life remains untouched by the application or use of some aspect of natural science: for
example, medicine, transport and communications, to name just a few. So at a
time when natural science has never been more successful in explaining and pre-
dicting phenomena and in enhancing our understanding of the world, paradoxi-
cally its methods and content are increasingly being questioned or even denied
in the social sciences.

We suggest a resolution of this paradox as it arises in educational administra-
tion. In our view, the paradox is generated principally by the still widespread but
mistaken belief that positivism, in its many varieties, can be equated with
science. But in philosophy positivism, in all its main forms, is now regarded as
false, its key tenets clearly refutable. The most plausible current developments
in philosophy of science and theory of knowledge reflect post-positivist views.
Our point, therefore, is that while many of the criticisms of administrative
science in educational administration are sound, they are directed at a narrow
target. They discredit only positivist versions of administrative science. An
alternative post-positivist science of educational administration, we believe, is
not only possible but theoretically and practically desirable. The argument we
employ for this conclusion has the following broad structure. First, we acknow-
ledge the importance theoretical writers have attached to epistemology or theory
of knowledge, by arguing that the weaknesses critics have identified in tradi-
tional administrative science flow from foundationalist epistemological assump-
tions embedded in traditional views. Instead, we claim that the proper
justification of knowledge is structured by coherentist considerations such as
theoretical simplicity, consistency, comprehensiveness, conservativeness and
fecundity. If the justification of scientific claims, including administrative
claims, proceeds according to the coherentist canons of our holistic epis-
temology, then the scope of science is very much broader than is usually con-
ceived and will fail to sustain significant distinctions between fact and value, the
subjective and the objective, and the alleged ‘paradigms’ of educational
research.

Second, we note that major recent criticisms of traditional administrative
theory assume theories that in turn share foundationalist epistemological struc-
ture. Critics tend to argue for more or different foundations for knowledge to
supplement the deficiencies of positivist science. We advance our case here by
offering some coherentist epistemological criticism of the Theory Movement,
critical theory, and administrative decision-making.

**Educational administration and the theory of knowledge**

Since the mid 1970s, educational administration, as an area of study has under-
gone a fundamental transformation. Although traditional views of science still
dominate understandings of theory, research and administrative practice, there
are now systematic alternatives to this approach. As a result, educational admin-
istration is now theoretically much richer, more diverse and complex than at any
other time in its short history.
The developments have not occurred without controversy. For example, following a relatively brief period of intense, indeed unprecedented, academic debate in journals, books and conferences, Daniel Griffiths (1979, p43) remarked, in 1979, that, ‘if educational administration is not in a state of intellectual turmoil, it should be, because its parent, the field of organisational theory, certainly is’.

Griffiths could well have added a number of related areas of applied social science to make his point such as policy analysis (Garson 1986), educational studies and educational research methodology, (Phillips 1987) and social theory (Giddens 1982). These areas, too, were in turmoil, and for much the same reason. The traditional scientific view of knowledge was increasingly perceived to be inadequate as a basis for social science because it ignored values, human subjectivity, and the social and political context in which organisations exist and in which administrative practices occur.

It is unlikely that objections such as these would have been so effective in reshaping the agenda of educational administration were it not for the existence of alternative philosophical perspectives on the nature of knowledge which could function as frameworks for rival systematic conceptions of administration. And in our view, what has made the alternatives seem credible is the work done in the 1960s by Thomas Kuhn (especially his 1962), Paul Feyerabend (1981) and other philosophers of science which showed, successfully, that traditional views of scientific knowledge are inadequate even for the physical sciences.

The importance for administrative theory of philosophy in general and theories of knowledge, or epistemologies, in particular has been widely acknowledged by writers such as Greenfield (1975), Griffiths (1979) and Willower (1981). In a recent analysis of the state of educational administration conducted as part of a review of contributions to the Handbook of Research on Educational Administration, Willower (1988, pp730–1) identifies six trends representing ‘. . . directions in which educational administration as field of inquiry appears to be moving’, and he completes the list by remarking: ‘The sixth trend is a turn towards philosophy, and especially towards epistemological questions’. In our view, Willower is perfectly correct. The only caveat we would want to enter – and one with which we expect he would entirely agree – is that philosophy, especially epistemology, has always been significant, though perhaps not widely recognised as such until of late.

Epistemology and administrative knowledge

We argue that all major developments in educational administration, from the rise of the Theory Movement (see Culbertson 1981) in the late 1940s onward, have been driven by philosophical considerations. Although the reasons for this are complex and vary with the particular developments in question, the general pattern is clear enough. For any set of organised interrelated claims that purports to be knowledge, such as a theory of administration, is subject to constraints that
apply to all knowledge claims. However, within philosophy it is epistemology that deals with questions concerning the nature of knowledge, what makes claims knowable, and how they may be justified. Our central argument is that what epistemology counts as a satisfactory justification imposes powerful constraints on the content and structure of administrative theory. Or, in other words, the structure of justification, as specified by epistemology, determines much of the overall framework in which theorising in administration is conducted.

Three major developments in epistemology may be cited to illustrate this point. Logical empiricism, which developed out of, and partly in opposition to, the logical positivism of the Vienna Circle provided the first systematic philosophical influence. (For an overview, see Achinstein and Barker 1969.) In particular, it is Herbert Feigl’s version of logical empiricism which has been critical in the development of the Theory Movement (Feigl 1974) which in turn has shaped much of mainstream educational administration throughout the 1960s, 1970s, and the 1980s. In it may be found the bases for separating fact from value and observation from theory, for employing the methodological constraint of operational definitions, and for seeing administration theory as a classical hypothetico-deductive structure with laws at the top and facts at the bottom. (See Feigl 1953.)

The second development is the paradigms approach associated with the work of Kuhn and Feyerabend. Originally formulated as a systematic critique of logical empiricist views of scientific knowledge, their work – and especially Kuhn’s since it is written in non-technical language – has functioned increasingly to underwrite attacks on objectivity in the social sciences, and to promote varieties of relativism and subjectivism. It has been able to do this because, crucially, a paradigm is supposed to contain within itself the standards for its own assessment. (See Kuhn 1962, pp109–110.) In this intellectual climate, if alternative views of administration are construed as either different paradigms, or as developing within different paradigms, then they are presumed to enjoy some methodological immunity from objections arising from one particular paradigm, say a systems scientific view. At the extreme, different paradigms are said to be incommensurable, or unable to be compared or adjudicated (Kuhn 1962, p150).

Two important results of the Kuhn-Feyerabend critique of logical empiricism are alleged to support this extreme view as well as a number of other familiar subjectivist conclusions. The first result is that empirical adequacy is not a sufficient criterion for deciding the merits of competing theories: the same empirical foundation may adequately confirm any number of different theories. The second is that what counts as empirical evidence is partly determined by theory. Observations are said to be theory laden, mainly because the vocabulary used to describe observations is also part of a wider theoretical vocabulary.

Consistent with the paradigms approach, a further conclusion drawn from these results is that science is significantly non-empirical, that considerations of empirical adequacy place no essential constraints on the construction of scientific theories. Thomas Greenfield (1978, p8), whose writings have been largely responsible for
the subjectivist turn in educational administration, needs to presume something as strong as this in order to say:

The process of truth making in the academic world . . . does not differ materially from what goes into truth making in the world at large. Truth is what scientists agree on or what the right scientists agree on. It is also what they can get others to believe in.

And this, in turn, yields talk of reality being mind-dependent, of us inhabiting different worlds or their being multiple realities all of which outrun any empirical evidence for distinguishing them. It also suggests a certain methodological infirmity when it comes to the question of evidence for adjudicating the merits of different interpretations of human behaviour, the stuff of hermeneutics, ethnographies and cultural studies of organisational life. (See Evers 1988.)

The third, most recent approach, and the one we prefer, acknowledges the soundness of certain key results arising out of the 1960s critiques of logical empiricism; notably the underdetermination of theory by observation and the theory ladenness of observation. However, the correct conclusion to be drawn from these results is not a flight from objectivity and realism. Rather, it is the admission that there is more to evidence than observation or the establishing of mere empirical adequacy (Churchland 1985). After all, any theory can be made to square with empirical findings if we are prepared just to go on adding statements to it. What is more, a contradictory theory will square with any finding whatsoever. On this third approach, which we endorse, theory choice needs to be guided by a consideration of the extra-empirical virtues possessed by theories. These virtues of system include simplicity, consistency, coherence, comprehensiveness, conservativeness and fecundity, though they are often referred to collectively as coherence considerations or as the elements in a coherentist account of epistemic justification (Quine and Ullian 1978; Williams 1977).

In the following, we want to demonstrate briefly, how the constraints on justification imposed by our preferred coherentist or holistic epistemology can be used to reshape and redefine the substantive content of educational administration in the direction of a new science of administration.

**Foundational epistemologies and coherence justification**

Since coherentist epistemologies are best seen as responses to the problems of foundational theories of justification it will be useful to begin by sketching a classical solution to the problem of knowledge. How do we know anything at all?? What is knowledge and what makes it possible?

Within the classical empiricist tradition the candidates for immediate knowledge – the foundations – have been, in decreasing order of strictness, sense data, first person sensory reports, and observation statements (Hooker 1975). However, as the history of philosophy readily attests, the hope of justifying all
knowledge in this way is fraught with difficulty, especially in view of some of its consequence for science. For example, many of the objects posited by physics are unobservable, at least directly – such things as time, curved space, electrons and quanta – and are known only through economical theorising about more gross observable consequences. Worse still, the law-like universal generalisations characteristic of our best theories, seem to require as evidence an infinite number of observations. Yet only a finite range of observations is ever available for justifying claims of the form ‘all X are Y’. It would be nice if we had some sound principle of induction that would enable us reliably to infer from a finite set of observations to an infinite set of past, present and future events of the sort that scientific laws can delimit; but no such principle has ever been forthcoming (Popper 1963, especially Ch 1). Because so little of what ordinarily passes for reliable knowledge can be deduced from empirical foundations, classical empiricism functioned more as an attack on knowledge, with scepticism the end result, rather than a rational reconstruction.

The crucial methodological worry here is that the knowledge claims ruled out appear more reliable than the epistemology that rules them out. This is because an epistemology, in specifying conditions for claims to count as knowledge, also embodies a theory of the powers of the mind (Churchland 1987). For what we can know will depend, to some extent, on our cognitive capacities, our skills for learning and, in general, what sort of creature we are. One weakness of classical empiricism is that it embodies a singularly implausible empirical psychology of learning. For example, the process of learning from perception is not one in which a passive mind more or less faithfully records copies of sensory images, permuting them (or their decomposable components) according only to the laws of logic. Our current most sophisticated neurological theories of sensory information processing tell a vastly more complex story of human knowledge acquisition (Churchland 1986).

A further methodological worry with the classical view is that it appears to be unknowable on its own account of itself. To see this recall that the epistemology makes general or universal claims concerning all (human) knowing. On its own terms, either these are known directly or indirectly. But classical empiricist epistemology in all its generality cannot itself be a sensory experience, that is, part of the foundations, if for no other reasons that only a limited number of relevant observations are ever possible. Nor can it count as derived knowledge because of the problem of induction, the problem of using finite observational evidence to infer a general claim. On our view, these methodological problems suggest that the epistemology is incoherent.

In response, logical empiricism, in common with twentieth century varieties of positivism, reversed the earlier classical relationship between theory and foundational evidence. For logical empiricists like Hempel (1965) or Feigl (1974) observation statements are deduced from theories rather than the other way around. That is, logically, theories imply observations. The relationship between theory and observation is therefore one of testability.
Roughly speaking, theories, as networks of general and particular empirical statements, are supported by evidence to the degree that the observation statements they imply are confirmed or the tests are successful. As a method for testing hypotheses by matching deduced observation statements against actual observations, logical empiricism is sometimes identified with the hypothetico-deductive method.

For present purposes, two clear difficulties which lead to revisions along coherentist lines, may be briefly noted. The first, mentioned earlier, is that the same finite observational base may equally confirm different theories, as pointed out by Karl Popper (1959, p266). Piling up more and more confirming instances, he argued, is of little value when it takes only one disconfirming observation to falsify a theory. It is falsification that is crucial for promoting the growth of knowledge, for improving our theories, not confirmation. Theory change is driven by counter-examples, unexpected observations and predictions that are shown to be false. And our best theories are those that have been subject to the most severe testing but have not been falsified.

However, more is required for excellence of theory than just passing severe tests, for it is never individual hypotheses that are tested but, rather, whole networks of statements (Hesse 1970). And if networks or conjunctions of statements are needed to deduce observation statements for testing, a counter-example, or unexpected observation, shows at most only that one or more statements in the network are faulty. It does not, by itself, show which particular statements are in need of revision, as Quine (1951, p43) has argued. We can even adjust the troublesome observation statement if we feel that those parts of our theory under threat are more reliable than the theory implicit in making the observation.

How then are we to choose the best theory from among an infinite number of empirically adequate alternatives, all equally supported by whatever they deem to be a foundation for knowledge? Our suggestion is to choose the most coherent theory, that is, the one that enjoys more than any other the extra-empirical virtues of system. (See Lycan 1988; Bonjour 1985.) To see how a coherence approach can work over the question of choosing theories of knowledge, consider again the two methodological weaknesses we noted in classical empiricism. One was that the epistemology could not explain how it could ever be known. It failed to be comprehensive over the matter of self-reference. In seeking to adjudicate on the status of all knowledge claims it assumed an external vantage point which it could never know to be true. Other things being equal, therefore, we would prefer an epistemology that was truly comprehensive; one whose embodied psychology of knowledge acquisition renders it knowable.

Once we see an epistemology as itself a set of knowledge claims, we can ask whether the claims it rules out as knowledge are more reasonable or plausible than the epistemology that rules them out. For classical empiricism this is an acute methodological issue since it attempts to disqualify all of the most characteristic features of good science on the strength of a very modest empirical psy-
chology used to select foundations for knowledge. It renders this particular programme of foundational justification incoherent by robbing it of its point. The way to avoid the problem is to require an epistemology to embody our most powerful and sophisticated theories of knowledge acquisition. But if we are appealing to our best natural science of human learning to justify knowledge there is no need to bother with foundations. We just appeal to science outright to justify and explain how scientific knowledge is possible. In our view, there is no knowable epistemically secure and privileged vantage point from which the whole of knowledge can be adjudicated. There is just our most coherent scientific practice. Epistemology becomes naturalised, as Quine (1969) suggests, and falls into place as a part of psychology.

How then can we apply coherence criteria to theories of educational administration? In general we require consistency; we would aim for more comprehensive theories – those able to explain more phenomena rather than fewer, and with fewer anomalies, counter-examples and falsifying instances rather than more. We would prefer simplicity to complexity in the sense of using the least amount of explanatory apparatus to account for the largest range of phenomena. We prefer theories that do not outrun their own explanatory resources, that do not posit distinctions for which there is, on their own terms, no evidence. Finally, we require that administrative theories be learnable in the sense that they meet the following two demands that were applied specifically to epistemologies: first, that they cohere with the broad demands of our best naturalistic accounts of human learning and second, that they are not inconsistent with more reliable bodies of knowledge elsewhere in our total or global world view. The net effect of these demands is to require administrative theory to be a part of the most coherent global theory we can construct. We end up with a science of administration to the extent that this global theory also includes our most reliable scientific knowledge (Evers 1988).

Applying these general considerations is always a matter of detailed critique of particular issues. Coherence justification, because of its global character, is just a more intricate and difficult business than foundational justification. However, since foundationalism is mistaken, there is really no serious alternative. The following applications, because of their brevity, are only methodological guides. Nevertheless, they do go some way towards illustrating the use of a coherentist methodology.

The theory movement

In the late 1940s an increasing number of scholars doing research in educational administration, sought to develop a more systematic and rigorous basis for their work and findings. (For a historical overview, see Moore 1964.) As an antidote to the so-called ‘naked empiricism’ (Halpin 1958, p1) of fact finding and anecdote collection assumed typical of the field, a number of attempts were made to establish a theoretical structure for administrative theory as it was then being
applied in educational studies. The notion of theory that found favour, as we
toted earlier, was Herbert Feigl’s logical empiricist account of scientific theory,
and so what became characteristic of the Theory Movement was the attempt to
structure administrative theory and research according to the strictures of Feigl’s
vision of science and its methods. The results, always energetically pursued, met
with varying degrees of success. We here consider one.

Of the many ways in which the epistemological doctrines of logical empiri-
cism shaped the early development of the movement, none is perhaps so
counter-intuitive and unrepresentative of ordinary administrative thought and
practice as the removal of values from the scope of administrative theory.
Administrative theories that disqualify themselves from addressing the value
question have, however, a theory/practice problem: theory fails to be relevant
for a large part of administrative practice.

This methodological infirmity arises if it is believed that every empirically
significant term in a theory is meaningful because it corresponds to some spe-
cific range of sensory experience. Terms like ‘chair’ and ‘table’ readily satisfy
this condition; terms like ‘good’ or ‘just’ appear problematic. Similarly, we have
a fair idea of what counts as favourable or unfavourable evidence for testing the
claim ‘there is a chair in my office’; for a claim like ‘that person was treated
unjustly’ there is a difficulty. Essentially the difficulty is this. All the sensory
evidence we may ever gather for the claim will merely describe how the person
was in fact treated, the facts of the matter, as it were. But the injustice is not a
fact there to be observed. It is not some kind of object that produces sensations
of injustice. Rather, so the story goes, the basis for our judgment of injustice
resides in our subjective response to the observational evidence. So if cognitive
significance resides in term by term correspondence with specific sensory
experiences, or even in testability then, as Hooker (1975, p191) remarks in his
critique of empiricism’s theory of language, ‘... empiricists, like positivists,
offer no cognitive content to ethics, aesthetics, religion, metaphysics, or indeed
to philosophy ...’ Stripped of its cognitive content, moral deliberation and
judgement collapse down into mere affective preference.

We will outline here just one line of response to this argument. We can begin
by noting that if the argument is sound our knowledge of scientific concepts like
electron or quantum is as problematic as our knowledge of moral concepts since
neither many of the theoretical terms of science nor the sentences in which they
figure correspond to any definite range of observations. The demand that all con-
cepts be operationally defined – that is, defined as the operations to be per-
formed in some test – is the traditional way of meeting this difficulty (Hempel
1966, pp88–97). Hence the common practice of attempting to give operational
definitions in traditional science of administration. (See Griffiths 1959, pp75–91,
for examples.) However, strictly speaking, every purported definition admits of
an infinite number of alternative possible operations, which would make a
scientific vocabulary potentially limitless, and hence unlearnable. To be sure,
many of the differences would seem trivial; for example distinguishing ‘length’.
as measurement with a wood rule from ‘length’ as measurement with a plastic
rule. But the distinction between trivial and non-trivial differences is a theo-
retical distinction, drawn with the aid of an antecedent grasp of the concept to
be operationally defined. This is an instance of a logical empiricist epistemo-
logical procedure outrunning its posited resources.

The source of this difficulty is the belief that a specific range of sensory
experience exhausts the meaning of a term. Once we need to use theory (as turns
out to be the case in foundational justification) to select the relevant sensory
experiences, we end up blurring the distinction between observation and theory.
Since the portions of theory being used are assumed to be cognitively signifi-
cant, in our view it is more reasonable to suppose that the significance of more
theoretical terms like ‘electron’ or ‘quantum’ resides in their conceptual role
within the theory rather than in any immediate connections with experience.

The view we wish to defend is that moral terms like ‘good’ or ‘right’ are
significant in the same way that the most theoretical terms of science are. In
realist fashion, we assume the unobservables of science exist because they are
posited by the most coherent global account we can give of our interpreted
experience (Quine 1960). Similarly, we suppose a moral theory and its associ-
ated judgments to be warranted to the extent that they also are part of the same
global theory. On a coherentist approach to scientific knowledge there is there-
fore no sharp epistemological boundary to be drawn between administrative
theory on the one hand and a large class of naturalistic moral theories and their
normative claims on the other.

Critical theory and administration

Among the many critics of traditional science of administration are those who
have been influenced by the writings of Jürgens Habermas. There is now a con-
siderable body of literature in educational administration that might be regarded
as falling within the critical theory perspective. (See Foster 1986, for an
overview.) Although critical theory approaches to administration are complex
and multi-faceted, covering ethical, political, social, linguistic and personal
dimensions, at least one strand of Habermas’s thought that has been developed
and applied to administrative contexts is uncompromisingly epistemological and
lends itself readily to some brief coherentist remarks here.

We have in mind Richard Bates’s thesis that a science of administration is
essentially manipulative and concerned with social control (Bates 1980, 1983).
In developing this claim Bates draws on a reading of the early work of Haber-
mas for an understanding of science; particularly the epistemological theses of
Knowledge and Human Interests and the ‘General Perspective’ lecture published
as the Appendix to the English translation (Habermas 1972). In this work,
Habermas (1972, p308) identifies three ‘knowledge-constitutive’ interests: the
technical presumed by the empirical analytic sciences; the practical underlying
the historical-hermeneutic sciences, and the emancipatory represented by critical
social science. Traditional (so called positivist) science which Bates, following Habermas, identifies with empirical-analytic science, is seen as hypothetico-deductive after the Nagel/Hempel empiricist model, with predictive success a measure of technical exploitability. For Habermas (1972, p309)

... theories of the empirical sciences disclose reality subject to the constitutive interest in the possible securing and expansion, through information, of feedback-monitored action. This is the cognitive interest in technical control over objectified processes.

In Bates’s view, the technical scientific definitions of knowledge and rationality are far too narrow for social science and need to be supplemented by critical discourse. A suitable broadening, he suggests,

... is argued at length by Habermas, who contends that the annexation of rationality by dominant scientific, technical, manipulative interests has prevented the continuation of an historical discourse directed towards a rational administration of the world...

(Bates 1980, p68)

He goes further, asserting that: ‘as currently conceived by professor and professional alike, educational administration is a technology of controls’ (Bates 1983, p46).

And finally, in summarising a robust and systematic indictment of poor philosophy for this state of affairs, he declares:

The inadequacies of the hypothetico-deductive model of positivist science and the positivist, apolitical model of society were argued to be intellectual products that provided the illusions necessary for the continued employment of techniques of hierarchical administrative control that perpetuate the injustices of an unequal society.

(Bates 1983, p30)

There are a number of things that are puzzling about this account of science and administration, especially in view of the fact that Bates thinks traditional empiricist accounts of the practice and conduct of science are mistaken. For if the traditional view of science is wrong, and we know that it is thanks to the work of Quine, Kuhn, Feyerabend, Hesse and others, then the story Habermas tells of empirical science being constituted by technical interests of control and manipulation is also wrong. This is because Habermas’s account of empirical-analytic science is as much dependent on traditional empiricist theories of science as the traditional science of administration that Bates is using Habermas’s machinery to criticise. In more recent work Habermas recognises some of these difficulties. (See Hesse 1982.)
One attempt at avoiding the major incoherence threatening knowledge constitutive interests is worth briefly noting. The key move would involve distinguishing between traditional accounts of science being wrong on the one hand and people acting as though these wrong accounts are true on the other. A revised Habermasian argument might then run as follows:

If traditional views of science (positivism, logical empiricism and the like) were true then technical control and manipulation would occur. Therefore, if everyone (professor and practitioner alike) acted as though they were true then technical control and manipulation would occur.

The missing premise in this argument is a subjectivist claim to the effect that my having a particular theory of the world somehow makes the world that way, or brings it into line with my theory. This is perhaps an extravagant extension of the reasonable epistemological thesis that all observation is theory laden. To see the limits of the thesis, however, consider another example. Suppose, for the moment, that the dominant orthodoxy concerning water says that it flows uphill. We know that the orthodoxy is wrong but we also know that if water did flow uphill it would require a special form of technical handling. It does not follow that if everyone acted as though water flowed uphill it would require a special form of technical handling. Presumably, water would continue to defy orthodoxy in a range of ways.

Critical theorists may be sympathetic to certain subjectivist theses since bad theory may influence humans more than it influences water. But they cannot be too sympathetic to this one without undermining the reality of human suffering and injustice, or the objectivity of the class and political analyses that underwrite their approaches to human emancipation.

**Administrative decision making**

The last two examples of epistemological critique were directed mainly at views of the content and structure of administrative theorising. Our final example will draw attention to the importance of epistemological views for organisational design.

The classic work in the field of administration is undoubtedly Herbert Simon’s *Administrative Behavior*, first published in 1945. In that work Simon identifies rational decision-making as the locus of administrative theory. As against the prescription to make optimal decisions, the cornerstone of Simon’s theory of decision-making is the bounded or limited nature of human rationality. We satisfice rather than optimise. He identifies three sources of limitation that organisational structures would need to address to enhance decision-making. First, an individual is limited in skills: dexterity, reaction times, powers of computation, thought and understanding. A second limitation concerns individual values and the understanding of organisational values and goals. Finally, there are limits to relevant knowledge, both knowledge of theory and knowledge of all
the conditions that must obtain for a sound application of theory (Simon 1976, pp.34–41).

Simon is reluctant to endorse any ‘principles of administration’, for enhancing administrative efficiency in advance of specific analyses of case by case administrative arrangements for reducing these limitations. Nevertheless, a particular approach to administrative reform is suggested by his theory. For example, if the growth of knowledge is a matter of accumulating more and more information, as the empiricism behind Administrative Behavior implies, a satisficing strategy will have a characteristic emphasis. For if optimal decision-making requires optimal initial information inputs to best theory, a less than optimal or second best approach will involve not a difference in kind but a difference in degree of ambition. Resulting administrative arrangements will place a premium on ensuring the highest practicable quality of initial input into the actual point of decision-making. Depending on cases, reforms may focus on ensuring suitable concentrations of expertise, communications structures aimed at enhancing the availability of that expertise, and so on.

But on a coherentist epistemology, very large changes in knowledge are seen to occur through the promotion of a systematic virtue like simplicity in a theory network that includes among its statements a number of theory laden contrary observations. For the big gains in knowledge appear to flow more from the theoretical resolution of error than the incremental accumulation of data. Given that the existence of limitations to our knowledge is likely to promote the occurrence of error, a case by case analysis of decision making may show greater gains to be had by the promotion of error correction at the expense — given only finite resources — of extensive attention to error prevention. Of course, in any administrative design for sound long term decision making there is always some trade-off, in the allocation of resources, between error prevention and error correction. But a theory of learning, the core of which conceives knowledge as growing through a process of conjecture and refutation, is more sensitive to the possibility of learning through mistakes. The option of securing efficiencies in decision making through the rapid correction of error becomes, on this approach, a more explicit methodological guide to defining a suitable prevention/correction trade-off. Empirical studies by Chris Argyris and co-workers (Argyris 1982; Argyris and Schon 1978) show some of the conditions under which error correction by administrative feedback loop structures is more valuable. Not surprisingly, these are where the organisational environment is unstable or undergoing rapid change; where organisational knowledge and expectations are most likely to be falsified, and where there is a greater premium on more rapid acquisition or growth of knowledge.

This epistemological consideration suggests that theories of organisational learning can impose important constraints on the administrative structures of decision-making. Simon’s position in Administrative Behavior does not deny this. However, in noting the relevance of epistemology for administrative theory it is sufficient to observe, for our purposes, that significant differences in organisational consequences can flow from adopting divergent theories of human knowledge acquisition.
Summing up, in applying coherentist considerations very briefly to some issues concerning the Theory Movement, critical theory, and a view of decision making, we suggested a number of conclusions. Since our holistic epistemology places severe limits on attempts to partition knowledge into different compartments, we challenged both the fact/value distinction posited by logical empiricism and the three-fold division in knowledge posited by Bates’s use of the earlier work of Habermas. Both challenges have extensive consequences for the administrative theories that employ these partitions in knowledge. Finally, we explored some organisational consequences of different views of the growth of knowledge on the question of enhancing structures for decision making.

Note

1 This chapter is based on parts of the Preface and Chapter One of CW Evers and G Lakomski 1991 Knowing Educational Administration, Oxford: Pergamon Press.

References

In this article I will discuss and attempt to draw connections between four of the major current preoccupations within our field of study:

- the framework for educational policy-making;
- the technical-rational approach to leadership and management;
- ‘best practice’ in management outside education;
- professional development, research and the contribution of higher education.

In each of these areas there are currently major challenges, particularly for those of us working in academic settings within the UK context. I will indicate those which I find most salient, and where relevant will suggest what responses we might make to them and what shifts in our own focus and practice might be appropriate.

**The framework for policy-making**

The emphasis in much research following the 1988 Education Reform Act has been on the effects of devolution (e.g. Bullock and Thomas, 1997; Levačić, 1998a) and marketization (e.g. Whitty, 1997; Woods et al., 1998). This is not surprising and is understandable, given our focus on leadership and management and our consequent major research objective of discovering the impact of policy on practice at institutional and community level.

Arguably, however, the growing power and influence of the central state has been a more significant trend of the past decade than either devolution or marketization, yet scholarly work in our field has rarely focused on it directly (Bottery, 1998; Riley, 1998a). Maclure (1993: 7) charted the rise of state centralism in education since 1944 and predicted the loss of any meaningful political contri-
bution by locally elected members in a system ‘directed by an authoritarian central government’. Raab’s (1994: 16) analysis of the changing governance of education led him to conclude that

The uprooting of old ‘partnership’ understandings in favour of newer ones operating at several levels . . . can be seen as government’s attempt to restructure networks within the education system that will be more reliable instruments of policy implementation, or at least less resistant to central initiatives.

Jenkins’s (1995) excoriating but well-researched critique chronicled the advance of the central state in numerous fields including education. The change within a single generation has been remarkable. In 1970, a prominent local authority education officer described the fragmentation and diffusion of the English system and lamented that there appeared to be no clear sources of power from which changes could spring (Birley, 1970: 114). The system was until the 1980s widely regarded as one of the most decentralized in the world. Today it is among the most centralized of the advanced industrial countries.

The trend appears if anything to have intensified since the coming to office of the Labour government in May 1997. At a press conference to launch the School Standards and Framework Bill in December 1997, the Secretary of State for Education and Employment, David Blunkett, was reportedly asked why the government was imposing unprecedented central government control over local authority schools. His quoted response indicated that it was

. . . because our experience led us to understand that central government carried responsibility without power. It would be to delude the electorate to suggest the Government could deliver change without the mechanisms to deliver it. We are taking the necessary structural powers to ensure the people on the ground do their job.

(Carvel, 1998)

This quote presents an argument for further centralization in terms of securing the mechanisms to achieve strategic objectives and promote the effective implementation of national policy. Most people would regard the achievement of greater coherence, clearer outcomes and fulfilled promises as desirable. Problems, however, may be thought to attach to the extent of central control now being established.

The history of national policy-making has been erratic and often short-termist. The public profile of education has risen sharply since the early 1980s, with the result that successive waves of ‘reform’ have been introduced in apparently shortening cycles, often before the previous reform has been properly evaluated and without the intention of building upon the knowledge and expertise
gained from it. Stronach and Morris (1994), who proposed the label ‘policy hysteria’ for this process on the basis of their experience with projects such as the Technical and Vocational Education Initiative (TVEI) and Compact, argued that reform initiatives tended to be ignored as their political significance waned and that ‘the speed and overlap of reform waves meant that few of these initiatives could succeed’ (p. 7). It remains to be seen whether a still more powerful central government can now operate a more consistent, evolutionary policy process.

Such ‘policy hysteria’ is clearly not a UK prerogative. Fullan, writing from a North American perspective, considered the impact of this phenomenon on school principals: ‘Not only are the demands fragmented and incoherent, but even good ideas have a short shelf life as initiatives are dropped in favour of the latest new policy. Overload in the form of a barrage of disjointed demands fosters dependency’ (Fullan, 1998: 6). He argues that such dependency is debilitating, and that successful renewal in modern conditions demands that the bonds of dependency be broken. We will return to this argument later.

Many of the policy developments are justified by reference to the assumed connection between educational attainments in basic subjects and our national economic performance. However, a careful study of the available international data concluded that there was no evidence to support such a link and that ‘any generalisations about the assumed inadequacies of English education are unfounded’, adding that ‘what could be a sober and informed debate about English education is in danger of being drowned out by the simplistic and often shrill rhetoric which seems to dominate policy making in education’ (Robinson, 1998: 9 and 10).

This ‘simplistic and shrill rhetoric’, which contributes to what I have elsewhere called the ‘rather monolithic ideas context’ faced by educational managers (Glatter, 1997: 186), includes key slogans which are frequently repeated and amplified through the media. One example is the contention that ‘standards matter more than structures’ (DfEE, 1997: 12). Such a dichotomy surely needs to be questioned, not least by people working in the management field, given our understandings of the ways in which performance is powerfully affected by organization. ‘Flaws in the structure . . . have consequences for education, and if they are not tackled and improvements made, the learning opportunities and experiences of children will be adversely affected’ (Woods et al., 1998: 213). Another is the claim that a context of social and economic deprivation is no excuse for poor school standards. The complex relationship between social disadvantage, educational opportunity and school improvement has been reviewed by Mortimore and Whitty (1997) among others.

The signs at present are that the dominance of central government in education and elsewhere will grow further. The position of local authorities, for example, given their lack of constitutional protection, appears entirely conditional on the government’s assessment of their performance, defined in its own terms: ‘If you are unwilling or unable to work to the modern agenda then the government will have to look to other partners to take on your role’ (Blair, 1998: 22). The significance of this appears far-reaching. There may be substantial
devolution to individual educational institutions, but even the largest of these is too small to provide a credible source of countervailing power. In this scenario, fears that local authorities and school leaders are becoming simply agents or instruments of national policy (Riley, 1998b) have substance.

Yet there appears to be a paradox at the heart of government policy regarding governance, as Marquand (1998: 21) has pointed out: on the one hand the style of policy-making is centralist and authoritarian, resting on the premise ‘that government at the centre not only can, but should remake society to fit an a priori grand design’, while on the other there exists a radical constitutional agenda pointing the way ‘towards a profound transformation of the British state’. There appear to be acute tensions in the reform of governance between a centralist and a more pluralist conception, and these tensions are clearly reflected in the proposals for the development of local government (DETR, 1998).

Numerous issues relevant to educational management surround this set of developments, but perhaps two stand out. One is philosophical and normative: to whom should the schools (and other educational institutions) belong in an advanced modern democracy (Riley, 1998a)? I will not seek to tackle this here, while fully recognizing its significance. The second is much more pragmatic. How well suited is such a system of educational governance to respond to the current and forthcoming challenges of educational leadership and management? This issue is touched on at various points in what follows.

The technical-rational approach

The perspective underlying much of the current approach to government of the public services is that of performance management (Grayson, 1997), an attempt to deal with the problem neatly encapsulated by Drucker, when he wrote about managing non-profit organizations, in his question: ‘What is the bottom line when there is no “bottom line”?’ (Drucker, 1992: 81). Target setting, performance indicators, standards, performance reviews, audit and inspection are key concepts within the approach, which was well exemplified in the White Paper Modern Local Government: In Touch with the People (DETR, 1998). The well-publicized requirement of the Treasury to be given evidence of outputs in return for the allocation of additional resources is undoubtedly an important current driver of this movement.

One phenomenon which has emerged from this development is what Power (1997) called the ‘audit explosion’, which has left very few people in the public sector untouched by the need to give more and better accounts and which has led to many new career opportunities in the audit and inspection fields. He argued that what is involved is ‘ritualized processes of verification’ (p. 14) with image management and legitimation as key purposes. ‘Worse still, audits may turn organisations on their heads and generate excessive preoccupations with, often costly, auditable process. At the extreme, performance and quality are in danger of being defined largely in terms of conformity to such process’ (p. 143).
These processes are, of course, essentially technical-rational, and our field has long been concerned with the significance and limitations of rational models (for example, Bush, 1996; Wise 1977). Moreover, the symbolic importance of rational models as a basis for policy-making ‘in a secular industrial society which believes in technology and rationality’ (Colebatch, 1998: 108) is hardly surprising. Two relatively recent developments are, on the one hand, the very substantial growth of technical-rational approaches and, on the other, the much greater awareness of turbulence and complexity in the macro-environment. In this context, Samier’s analysis of the bureaucratic language of technical-rationality is interesting. She refers to the expression of ideologies or myths ‘elevated to inviolability’ such as ‘teamwork’ and ‘high standards’, and also to the use of such language in ‘helping to maintain a belief that order still prevails in a world in which chaos threatens to break through’ (1997: 420).

It is very important to stress that I am not implying here that rational-technical approaches are without value nor that their public use is always only for purposes of legitimation. Indeed, I have referred elsewhere (The Open University, 1996: 85) to the potential value of work such as that of the National Audit Office on strategic planning in schools. There is evidence that OFSTED’s ‘rational’ resource planning model may have beneficial effects on curriculum and assessment planning in primary schools (Glover et al., 1997). The issue is rather how far the tightly coupled, performance-based system which the present government (like its predecessor) has been pursuing is likely to be viable, and for how long.

In her review of a range of models of managing change, Ouston (1998) argues that those which make ‘rational’ and ‘linear’ assumptions are most suitable for stable environments and conditions in which the outcomes of management action are regarded as predictable (see also Bell, 1998). In the coming years it will be extremely difficult to meet the first of these conditions even if some of us still retain a degree of faith in the second. Hargreaves goes considerably further. He comments (in terms similar to Samier’s quoted above) that ‘Politicians play to people’s fears and dreams, and in particular their fears of social disintegration and dreams of stability and cohesion’ (Hargreaves, 1997: 11), and argues that the discontinuity and pluralism endemic in (post)modern society will render the notion of a distinctive and coherent state-managed system meaningless within a relatively short time, to be replaced by polymorphic or much more variegated educational provision, loosely coordinated and monitored from the centre.

Such a set of developments appears to be partly foreshadowed within current policy. Alongside the attempt to apply a ‘tight’ control over much of the school system, the arrangements for Education Action Zones, EAZs (DfEE, 1998: 3) to operate a set of licensed experiments, or ‘testbeds for innovation’, may emerge as the start of a response to one of the major weaknesses of the system as it has developed over the past decade—the tendency to discourage and marginalize innovation. This trend, ironic in view of the explicit policy goal of promoting
choice and diversity, was clearly evident from our work on the Parental and School Choice Interaction (PASCI) study at The Open University as well as from other work on choice and competition (Glatter et al., 1997).

A more competitive system does not of itself increase diversity between schools or encourage innovative approaches to education . . . Innovation is and has been undertaken by schools, but it is increasingly running counter to the centralising trends of educational policy. With the encouragement of innovation there need also to be structures that facilitate their critical evaluation and dissemination.

(Woods et al., 1998: 209, 213)

The strategy on Education Action Zones is in alignment with prescriptions from chaos and complexity theory to tolerate parallel developments, permit experimentation and provide organizational ‘slack’ to develop future frameworks and processes alongside existing ones (Turner, 1996).

In general, little attention has been given to broader macro-environmental developments and their potential implications for educational leadership and management (Caldwell, 1997; Davies, 1997). We have tended to stay close to the action in the here-and-now. The uncertainties which are associated with ‘futures thinking’ and the danger of being trapped in highly speculative activities gives substance to this approach. However, some trends are now quite well established, for example, the significant changes in the nature of work and the rapidly growing impact of information and communication technologies (ICT) on education. The report of the ‘Redefining Work’ initiative of the Royal Society of Arts (RSA) (Bayliss, 1998) has shown how with careful analysis and strategy development it is possible to respond creatively to such major challenges. There are significant implications both for leadership and research which we need to pursue urgently. The report gives substance to the truisms about the constancy of change and about educators and learners facing a much more turbulent, complex and fluid future. Its conclusion about education—that ‘we are still preparing people for a world that is fast disappearing’ (p. 68)—and its call for a new educational philosophy and a radical reappraisal of the system ‘covering structures, standards, processes and outcomes’ (p. 50) are clearly not the last word, but they are surely topics that need to be addressed.

The RSA report’s prescriptions for recasting the curriculum and assessment as well as school organization and the role of teachers in initial education would, if accepted, pose a considerable challenge to both the prevailing technical-rational model of performance management and to the social conservative, traditionalist ideology which has underlain policy on state schooling for most of its history (Edwards and Whitty, 1997). Whether such a transformation would be politically feasible, especially given the attachment of many politicians, professional interest groups, parents and voters to perceptions of education based firmly on their own schooldays (Levin and Riffel, 1997), must remain in consid-
erable doubt. Nevertheless I hope it is evident that this is a key area of work for
the future, and that there is a contribution to be made by those with expertise in
educational leadership and management.

Best practice outside education

The connection between leadership and management (both in theory and prac-
tice) outside and within education has been an issue for debate from the begin-
nning of educational management studies in the UK. I have previously discussed
the notion of ‘best practice outside education’ (Glatter, 1997) and it seemed
worth revisiting it here, both because of its relevance to the theme of this paper,
and also because of its continuing use by the Teacher Training Agency (TTA) in
connection with their training programmes for headteachers. Thus, for example,
one of the key principles of the national Leadership Programme for Serving
Headteachers (LPSH) is that ‘it draws on the best leadership and management

I drew attention previously to some of the difficulties surrounding the term. ‘As
in education itself, there are different approaches and contending schools of
thought’ (Glatter, 1997: 187). It is also important to be clear whether we are refer-
ing to the literature of general management or to actual practice outside education,
since these often diverge. Are we assessing best practice as portrayed by acade-
mics and other writers in the management field or by business (or other) practi-
tioners? Another distinction is that between best practice now and best practice
in the future—for example, the RSA report on redefining work makes sugges-
tions regarding the appropriate nature of management in virtual and near-virtual
organizations (Bayliss, 1998: 66).

Bearing these caveats in mind, it is striking that reports of or prescriptions for
good practice outside education do not generally relate to performance manage-
ment or other aspects of the dominant rationalistic paradigm within education.
Indeed, it is because of dissatisfaction with the results of elaborate corporate
planning that, according to Kay (1993: 356), the familiar idea that ‘successful
strategies are often opportunistic and adaptive rather than calculated and
planned’ has recovered ground.

Most of the reports focus on the key importance of the management of people
and of human relationships. For example, a study of a large sample of employees
by the Industrial Society emphasized the severe limitations of command-and-
control and centralized approaches to leadership in modern conditions, prescrib-
ing instead ‘liberating’ leadership, with a focus on trust, integrity, fairness and
belief in self and in other people (Turner, 1998). There are claims that some com-
panies have gone so far as to reject the job title ‘manager’ in favour of ‘coach’
(Baker, 1998)—as in professional football—raising the intriguing possibility that
the roles of ‘manager’ and ‘teacher’ may be merging in at least some parts of
industry. However, one research-based study suggests that the practice does not
generally match the rhetoric, that the claimed modernization of employment
relationships has not taken place and that there has instead been an intensification of authoritarian control systems in the UK (Gallie et al., 1998).

Of particular interest is a longitudinal study of 67 companies for the Institute of Personnel and Development by the London School of Economics and Sheffield University, which related company practices in various areas to ‘bottom line’ performance measures such as productivity and profits—apparently a pioneering study in the UK. The results indicated that effective human resource management (HRM) practices contribute far more, in statistical terms, to company performance than do strategy, quality, technology and research and development combined. Such practices were found in only a minority of organizations studied, but in these it was clear that

HRM and employee commitment, satisfaction and participation were the central elements in their business strategy. Our data suggest this latter orientation is the correct approach for most effectively promoting company profitability and productivity . . . Satisfied employees are more likely to co-operate with each other and to perform beyond stipulated job requirements in order to promote organisational effectiveness. (Patterson et al., 1997: 21)

Similar results have apparently been obtained in the USA by the Gallup organization, this time using hard measures of employee retention and customer satisfaction as well as of profitability and productivity (Caulkin, 1998).

The increasing emphasis on people management is reflected in the growing literature on the significance in modern conditions of the ‘intellectual capital’ of organizations (e.g. Allday, 1998; Stewart, 1998), with its implications for valuing, motivating and developing staff. A study of workplace learning with 120 managerial, professional and technical staff in engineering, business and health care drew attention to

the tension between performance management systems, which focus on short-term results and key activities which directly affect ‘the bottom line’, and a human resource development approach focused on the development of staff capability over a longer time scale.

(Eraut et al., 1998: 31; emphases in original)

Research on leadership in education mirrors that reported in the general management literature in pointing to the importance of the quality of relationships and communication processes (Hallinger and Heck, 1998) and this is supported by teachers’ perceptions of the features of effective leadership (Weindling and Earley, 1987). People working in education like to think, of course, that this emphasis on the human factor is a special characteristic of our service. Morrison (1998: 227), however, argues that commercial companies are often more person-centred than schools.
The swing in business towards human resource development as the key to productivity through the fulfilment and self-actualisation of employees has been taking place for decades. The business literature was seen to take with the utmost seriousness the twin notions of organizational development and human resource development in deliberate, planned and supported ways. The achievement of productivity was seen to reside in these rather than simply the development and use of new technologies.

This is Morrison’s conclusion from a survey of the applicability of ideas from business to educational settings. It may be more accurate in respect of the general management literature than of a wide spectrum of business practice. Nevertheless it appears likely that the notion of ‘best practice outside education’ in the minds of educational policy-makers relates more to technical-rational approaches such as performance-related measurement than to human resource and process issues. Despite the difficulties of defining ‘best practice’, the above suggests that this perception needs to be seriously questioned.

Professional development, research and the contribution of higher education

A key conclusion suggested by the previous analyses is that continuing professional development (CPD) for educational leadership should take ‘the whole job’ as its central focus (Eraut, 1998). In an earlier article prepared before the National Professional Qualification for Headship (NPQH) got under way (Glatter, 1996), I referred to the reaction of a very successful and experienced headteacher who, on seeing the first draft of the TTA’s standards for headteachers, said ‘Where’s juggling?’ It appeared to me then that the standards were in danger of fostering an excessively atomized and disaggregated approach which would not reflect the reality of the job and that insufficient attention was being given to the integration of the various leadership and management capabilities. Also, as experience of elaborately detailed approaches to CPD accreditation in other fields had shown, it ran the risk of producing ‘a system which is monolithic, mechanistic and expensive to operate, which makes the recognition of existing skills and achievements unnecessarily difficult and which can deter suitable candidates from coming forward’ (Glatter, 1996: 28).

The argument against close specification does not rest only on its cost and bureaucratic implications. As Bolman and Deal (1991: 16) maintain, such specification ignores the fact that “in a rapidly changing world . . . the behaviours that work today may be irrelevant tomorrow”. In a fluid world, emphasis needs to be placed on the more holistic meta-competences (such as judgement, analytical ability, self-management, self-evaluation, the ability to learn from experience and of course juggling!) as well as specific competences (Brown, 1994). Levin and Riffel studied the problematic link between environmental change and
organizational response in Canadian school districts, and concluded that part of the problem of low responsiveness in education lay in the training of educators which ‘tends to focus on technical skills of managing the system rather than on conceptual analysis of the system or discussion of alternatives to it’ (1997: 53).

So far as the evolving framework of national programmes of leadership development is concerned, some of the ‘lessons’ suggested in this article are being applied. Particularly noteworthy is the fact that the Leadership Programme for Serving Headteachers (LPSH) has been designed and developed (by Hay McBer, The Open University and the National Association of Headteachers) on the basis of a model which is

- based on research undertaken over a considerable period in a variety of contexts,
- founded on the development of meta-competences rather than isolated skills, and
- centred on human resource development approaches.

This programme could well make a significant contribution to tackling the issue of achieving adequate integration that I raised in relation to the NPQH. Whether my concerns prove justified in relation to the latter must await detailed and hopefully genuinely independent evaluations.

A second issue that I mentioned prior to the start of the NPQH related to pluralism. ‘The framework needs to be sufficiently open and flexible to allow different routes to the qualification. No-one has a complete answer, and everyone involved can expect to be on a steep learning curve’ (Glatter, 1996: 28). This issue is closely bound up with the growing centralization across the system as a whole. It is given added point by the control which the TTA is now exercising, not just over national programmes like the NPQH and the LPSH, but also over funding for other programmes in educational leadership and management such as award-bearing courses provided by higher education institutions (HEIs). The latter, where they are receiving TTA funding, are to be subject to inspection by the Office for Standards in Education (OFSTED). This raises a major question: will debate about, and the critical analysis of, government policy be allowed within TTA-funded and OFSTED-inspected CPD programmes in educational leadership and management? This is particularly apposite in the light of the constancy of change and the importance in this scenario of having a critical edge in training programmes (see the quotation given from Levin and Riffel, 1997). The tacit, if not the overt, pressures in this situation are likely to be towards convergence rather than divergence (Lukes, 1974) with the consequent likelihood of limited and inadequate responses to the challenges presented by the macro-environment.

The issue of pluralism is also relevant to the nature of professionalism in education. The growing central control of CPD is differentiating education more sharply from other professional and occupational groups who are free to
choose from a more diverse range of offerings in universities supported by funding from the Higher Education Funding Councils. The trend for an increasing amount of CPD to be provided through contract arrangements against explicit, centrally determined criteria raises significant issues of accountability and responsibility (Mahony and Hextall, 1997). It also fosters among both providers and participants a relationship of dependency with the centre which, as Fullan (1998: 8) argued, is not well attuned to dealing with the present challenges.

Leaders for change get involved as learners in real reform situations. They craft their own theories of change, constantly testing them against new situations. They become critical consumers of management theories, able to sort out promising ideas from empty ones. They become less vulnerable to and less dependent on external answers.

I suspect that most providers in higher education would strongly assent to this quote and its implied critique of heavily directive forms of CPD for educational leadership. However, it also presents a significant set of issues for such providers, which are relevant to our increasing dependency and loss of control. Our expertise is strongly identified with what Eraut (1997: 552) has called ‘Type A’ or ‘propositional knowledge, codified and stored in publications, libraries, databases, etc., subject to quality control by editors and peer review’. Developments in the governance of research are aimed at strengthening this expertise and sharpening still further the focus upon it. We are not widely seen as being proficient in supporting learners to enhance their Type B knowledge or ‘personal knowledge—i.e. what people bring to practical situations that enables them to think and perform . . . It includes propositional knowledge along with procedural and process knowledge, tacit knowledge, and experiential knowledge in episodic memory’ (Eraut, 1997: 552). (Eraut views skills as part of knowledge rather than separate from it.) This Type B knowledge is closely related to the notion of meta-competences discussed earlier. If this formulation and my interpretation of its significance are accepted, a key issue arises: if our main focus is perceived as being upon the development of Type A knowledge, how do we ‘position’ ourselves in relation to Type B knowledge vis-a-vis our CPD programmes in educational leadership and management?

A further point concerns the transfer of learning. Eraut (1997) concludes from his work on knowledge use that learning to use propositional knowledge, and generic skills, in a work context presents a considerably greater challenge than learning to use them within a formal educational situation. Therefore the transfer process itself and how it can be supported or accelerated becomes a key issue for CPD providers if they are to be able to secure credibility, and it is arguably at least as significant as the selection of ‘content’ for programmes. Once again, this is not an area in which our expertise (to the extent to which it exists) is generally acknowledged.
It need hardly be said that these are not new issues, and there have been numerous attempts to wrestle with them, both practically through methods such as action learning, project work and problem-based education and, less often, conceptually (e.g. Hall, 1998; Levačič, 1998b). However, they seem to be becoming ever more salient as they are juxtaposed with other developments which themselves present notable challenges. Brown, for example, writing from a management education perspective, has suggested that both competences and meta-competences pose problems for management educators. In the case of competences, this is because of their technical-rational features, the sense of certainty and predictability on which they are based, implying (as with the NPQH) ‘that managerial skills can be rendered universal, standardized to explicit criteria, taught (or trained), and clearly and fairly measured and assessed’ (Brown, 1994: 297). The problem with meta-competences is precisely the opposite— their uncertainty and ambiguity: ‘Meta-competences are problematic because they are fluid, dynamic, often intuitive, aesthetic and innate. But they can be learned, they cannot be explicitly taught’ (ibid.). Neither of these key modern concepts appears strongly aligned with the production of propositional knowledge which is seen as the distinctive expertise of HEIs.

A number of strategic options suggest themselves for HEIs, including:

• seeking a ‘niche’ market composed purely of those practitioners and others who want to be exposed to the latest Type A knowledge;
• seeking to broaden the actuality and/or the perception of our expertise to cover, explicitly and unambiguously, Type B as well as Type A knowledge, and transfer processes as well as content (recognizing of course that many institutions would lay claim to possessing this breadth already!);
• developing partnerships with other, non-HE, organizations to attempt to secure such breadth.

Surprisingly little research has been undertaken on issues surrounding CPD in educational leadership and management, considering that this is one of the main preoccupations of staff concerned with this field in HEIs. There needs to be considerable development of work in this area. The TTA has identified the impact on professional practice in schools as one of the criteria to be addressed in bids for CPD funding. This appears to me an important development, since it offers an incentive to investigate the interactions involved in CPD and to assess its relationships with practice (Smith and Bennett, 1998). It is perhaps regrettable that more attention was not given to this area sooner.

The discussion so far has focused on tensions relating specifically to CPD. A wider tension is that between research and teaching, which is of course ever-present in universities, but is currently exacerbated within our field. On the one hand the Research Assessment Exercise (RAE), as a centralist technical-rational procedure focused on the measurement and assessment of research performance, is pulling staff towards the increased production of outputs in the Type A know-
ledge domain. On the other hand, a different centralist trend is making CPD more instrumental, targeted and convergent, with a considerably reduced emphasis on Type A knowledge and scholarship. This diminishes the possibilities for creative inter-connections between research and teaching. It is an acute and growing tension. Somewhere along the continuum between these two activities are hybrid ventures such as the new Doctor of Education degrees, where the possibilities for synergy perhaps seem greater (Hall, 1998) but whose character still appears to need definition.

In an era of such strong centralization, it seems vital that critical and independent assessments of educational policy and governance (Raab, 1994) are conducted within our field. Such studies undertaken from a standpoint of educational management would imply greater engagement—with an intention of contributing to educational improvement rather than simply offering critical assessment—than when using the lens of 'educational policy sociology' (Ball, 1990) or 'policy scholarship' (Grace, 1995). The obstacles to pursuing such work, in an era when official attempts to circumscribe research agendas may be expected (Hillage et al., 1998; Tooley and Darby, 1998), are likely to be formidable.

Other aspects of macro-environmental change might also be given greater attention than they are at present. For example, the RSA report on redefining work to which I have referred proposed the establishment of a Learning Institute. Among other functions, this would promote and support research on the learning needed by individuals to enable them to function effectively in all aspects of their lives, in a world in which the boundaries between work and non-work are likely to become more fluid (Bayliss, 1998). There seems a need for contributions on the leadership and management aspects of the coming changes.

A somewhat related point was made in the 1997 White Paper which contained a section on the government’s intention to encourage ‘research and development into schools of the future’ (DfEE, 1997: 43). It contrasted what it saw as the remarkable stability of the teaching and learning process with the dramatic pace of innovation in many other sectors:

New thinking about leadership and management, operational research, new uses of ICT and the ever-increasing pressure for high quality have led to a transformation in many knowledge-based industries. Teaching and learning should not be exempt from this revolution.

(DfEE, 1997: para. 22)

As with EAZs, the government appears here to be breaking out of the technical-rational mould.

It is worth making particular mention here of research on the relationship between information and communication technologies (ICT) and educational leadership and management. Numerous issues and aspects of this relationship could be explored but there appears to be almost no literature at all in this area, at least in the UK.
In summary, I would argue for future research to be more strongly focused on:

- the changing context, broadly defined, within which educational leaders and managers work, and
- the connections between leadership and management on the one hand and curricula and methods of teaching and learning—which may be about to undergo radical change—on the other hand.

**Conclusion: towards a redefinition**

In an era of high centralization and a dominant rationalistic paradigm, the field of educational leadership and management is becoming increasingly resource-dependent and facing growing pressures to play a purely technical role in both teaching and research. Institutional leaders are seen as conduits of government policy and the content of the field is beginning to be defined by government agencies rather than within the field itself. The challenge of retaining academic integrity and an appropriate degree of independence in these circumstances is a formidable one, but it must be addressed if our contribution is to be more than transitory.

This set of conditions calls for reflection, redefinition and repositioning. A start might be made by redefining the field’s relationship with the educational enterprise. By focusing on how educational management differs from general management, we have tended to define the field in terms of what it is not rather than what it is. Perhaps we need to reconnect with education, in respect of both:

- the processes of human learning and development (as distinct from the specific and limited concept of ‘the classroom’), and
- the changes which formal educational provision will undergo in response to macro-environmental and social forces in the years ahead.

The question to be considered might be stated thus (Boyd, 1992): ‘What is educational about educational management?’

THEORY

THE FIELD OF EDUCATIONAL LEADERSHIP

Studying maps and mapping studies

_Helen Gunter and Peter Ribbins_

The field of educational leadership is multi-site, in which those who study and practice leadership are located within networks which connect across institutions and sectors. Charting the growth of this dynamic field is the central purpose of this paper and six interconnected typologies of knowledge production are presented: Producers, Positions, Provinces, Practices, Processes and Perspectives. We argue that these typologies enable those involved to generate descriptions and understandings of the interplay between researching, theorising and practising in educational settings. This focus on knowledge production enables us to be mappers, to undertake mapping and to produce maps. These, we would stress, are all political processes through which we challenge what is said to be known and make our own claims to know. As such our agency to make choices within our practice as researchers, theorists, and practitioners is exercised within a complex setting of organisational, cultural and social structures.

1. Introduction

Enquiry into knowledge production in the field of educational leadership is a challenging but necessary project. The approach we have taken is to develop ways that make it possible to describe and understand those who produce knowledge, what they produce, why they produce it and where they produce it. We label this as a study of _mappers_ (who), _mapping_ (how, why and where), and _maps_ (what) and will outline our thinking through six typologies: Producers, Positions, Provinces, Practices, Processes, and Perspectives. These typologies can be used to describe and explain knowledge production but they also have the potential to support professional practice across all sites of educational activity.
More specially, they can enable questions and activity surrounding research, theory, policy and practice to be scoped and the choices that are made, along with orientations towards them, to be opened to scrutiny.

2. Knowledge production within the field of educational leadership

Leadership, as a field for study and an arena of practice, is a territory where networks around improvement, effectiveness, management and policy are engaging in a dialogue about purposes, theory and research, and hence are creating and testing boundaries. This is done in two main ways: through the activity of research and publication; and, through reviews of this activity and attempts to conceptualise the purposes of the activity. If we pragmatically focus on the study and practice of headship we can see how the first aspect is illustrated through research activity seeking to describe, understand and theorise the meaning of headteachers’ work. This has been done by headteachers (Barker, 1999; Rae, 1993), by headteachers who became professors (Hughes, 1973; Southworth, 1995), by professional researchers (Fullan, 1992; Hall, 1996) or within partnerships (Rayner and Ribbins, 1999; Tomlinson et al., 1999). In reviewing this activity we can see where work has been done and where more work is needed (e.g. Hall and Southworth, 1997).

Clusters have developed and as such the positions that have been adopted have been clarified through the promotion of distinct purposes, and formalised through labels, networks and journals. The field of educational leadership is a territory where those labelling their work as policy sociology, educational management, school effectiveness, and school improvement locate their activity (see Gunter, 2001). For example, boundaries have been drawn between education policy sociology and educational management, both in how they have described themselves and also each other. Both share a common intellectual heritage in the importance of the social sciences (Ball, 1990, 1995; Baron and Taylor, 1969; Bush, 1995; Glatter, 1979), but have sought to distinguish their approach to educational leadership from the late 1980s (Grace, 1995). The field of educational management in the UK sees itself as practitioner orientated through the production of better ways of knowing within day-to-day practice, and the development of longer-term perspectives through the description of practice and an understanding of that practice. This has not always been true of educational administration in the USA. From the early 1950s the field there was dominated by claims that a science of organisation and a profession of administration based on that science were about to be realised. Labelled the ‘New Movement’ (Hughes, 1985) or ‘Theory Movement’, it sought a grand theory of human behaviour, within which the theory of administration in education would be a sub-set, with the natural sciences providing the model (Griffiths, 1957, p. 388). This, as Greenfield, a critic, put it, meant: ‘The professor supplanted the practitioner as the source of valid knowledge
about administration. If practitioners did not know or accept they were no longer masters of the basic knowledge that underlay their craft, it did not matter . . . in educational administration . . . we need the scientist and his theory to interpret for us’ (Greenfield and Ribbins, 1993, p. 3). By the 1960s doubts were raised. Schwab (1964, p. 47) dismissed ‘the pursuit of one sufficing theory of administration’ as ‘a manifest impossibility in the foreseeable future, and an uncritical aping of the wrong model’. And Griffiths admitted that, ‘the search for one encompassing theory (if anyone is searching) should be abandoned. . . . We have learnt a modest approach to theory pays off’ (in Baron et al., 1969, p. 166).

Members of the field of educational administration in higher education in the UK have generally resisted the blandishments of such grand theorising. In part, this is because most have begun their careers as practitioners in schools rather than as researchers in universities. They then shifted the location of their work because they wished to know more about that practice through research (Gunter, 1999a). In this sense the field is largely made up of those having a ‘practitioner-academic’ habitus (Gunter, 2002a) or a disposition towards working within and understanding the interplay between theory and practice. Conversely, educational policy sociologists tend to have biographies that lead them to more of an academic habitus where the emphasis is on understanding practice as a site of contested power relations through which the state delivers its goals.

While there are arguments that these two positions have compatible purposes (Bolam, 1999; Glatter, 1979) disputes over knowledge claims between the two areas of activity have focused on: first, who produces knowledge regarding educational leadership? Is it those who are involved actively in its practice or, as claimed by the advocates of the Theory Movement, is it professors engaged in studying it? Or is it a combination of both? (Ribbins and Sherratt, 1992). Second, how is such knowledge produced? Is it through theorising from the practice of role incumbents or through the use of theories of power from within the social sciences to explain the practice of role incumbents? Third, what forms can such knowledge take? Is it, as Eraut (1999) defines, meaning in ‘professional discourse’ ‘public knowledge’ or ‘private knowledge’ (sub-divided into ‘professional knowledge’ and ‘management knowledge’)? Fourth, where is knowledge produced? Is it through every day practice regarding what Eraut (1993) describes as ‘knowing how’ within action or is it through access to theories and case studies or ‘knowing that’? Fifth, what types of knowing are regarded as constituting the truth regarding the human condition? Are claims regarding this based on an objective view of the world in which procedures can be designed in order to gather data or is it based on a subjective orientation in which the world is constructed through practice and attributing meaning to that practice? Sixth, what do we know about the practice of educational leadership when in the doing of it much goes unrecognised and unrecorded? Are attempts to change practice based on what we know or on what is regarded by particular interests as normatively good practice? Seventh, how do we know about educa-
tional leadership? Is it through informal dialogue and reflection or through systematised research or both? Eighth, how do we bring our own perspectives into the generation of knowledge about educational leadership? How much weight do we give to our experience, to our intellectual heritage, to the demands of the current policy context, to the predictions of what the school of the future will be like?

3. Developing and using typologies

Questions of the kind listed above can tell us a lot about knowledge production because they identify points of difference and similarity regarding purpose, and demonstrate the importance of dialogue on position. When we listen to a lecture or read an article we are engaging in knowledge production, we can see that it is contested and can live within the problematics of what is and is not regarded as the truth and truthful. While there have been attempts to describe knowledge production, they usually focus on a particular aspect. They categorise producers of knowledge, or the types of knowledge being used, or the contexts in which knowledge producers produce knowledge. The scope of the task and the positioning of the knowledge worker tends to shape the focus of the study, and so while aspects of knowledge production are illuminated much can remain in darkness.

For example, Fitz (1999) identifies three types of knowledge producer – the academic, practitioner and entrepreneur – but overlooks the learner and community in knowledge production (Fielding, 1999; Ranson, 2000). Harries-Jenkins (1984, p. 215) catalogues knowledge as a series of approaches: comparative, organisational, managerial and environmental, without a full recognition of the users and producers of this knowledge of the kind Ball (1995) offers in his categorisation of policy science, policy scholarship and policy entrepreneurship. Thus while there is a tradition of categorising different types of knowledge, of knowledge producer, and of knowledge use, no conceptual typology is available designed to facilitate a dynamic approach to describing and understanding knowledge production. We have taken up this challenge not with a view to settling the border disputes, but to provide a framework through which knowledge production within and between these borders can be conducted and problematised.

Before turning to this, we should problematise ‘types’ and ‘typologies’. There are ‘tight’ definitions. The Encyclopaedia Britannica (1993) defines ‘Typology’ as a ‘system of groupings … usually called types, the members of which are identified by postulating specified attributes that are mutually exclusive and collectively exhaustive, groupings set up to aid demonstration or inquiry by establishing a limited relationship among phenomena’ (p. 89, our italics). There are also ‘loose’ definitions. For Mitchell (1979) ‘A typology is no more than a classification. A classification may be an ad hoc … where the categories are neither exhaustive nor mutually exclusive’ (p. 232, our italics).
For Hodgkinson (1996), typing: ‘is a very basic human instinct. It is a first attempt at imposing order upon a welter of experience so as to derive meaning and form. We cope with an excess of information by arranging its disorder into . . . schemes of meaning . . .’ (p. 89). It makes complex social life possible. On this Mennell (1974) recalls Schutz’s claim ‘that we experience the external world of things, people and events as typifications. Typifications are classifications and categorisations . . . we have to classify and group in order to organise reality, and that most of these typifications are socially learned and handed down to us . . . Any unique qualities are seen against a background of typification’ (p. 47).

Given this, as Hodgkinson (1996) argues, it is not surprising that: ‘In the study of administration the typing instinct has not been inactive. It has ranged from the trivial to the profound . . . Perhaps the most influential scheme has been Max Weber’s formulation of charismatic, traditional and rational-legalistic administration with their corresponding modes of leadership . . . [His] ideal types . . . facilitate . . . inquiry, research, philosophy and policy’ (p. 89). Schutz goes beyond Weber. As Mennell (1974) puts it, ‘one consequence of Schutz’s view of knowledge is that ideal-types no longer appear to be a methodological device peculiar to social science, as Max Weber implied, but an inherent feature of everyday knowledge . . . Weber’s famous ideal-types . . . then appear merely as highly formalised and unusually coherent typifications consciously created for sociological purposes’ (p. 47). In applying such ideas to the study of leadership, Hodgkinson (1996) points to an ‘overload of information and a surfeit of data’ and asks, ‘How can we make sense of this plethora?’ (p. 89). For him ‘real understanding . . . must be grounded in qualitative aspects of the human condition and a depth of understanding of human nature. This intellectual territory is vast and much of it is terra incognita but a first mapping may be achieved by using the techniques perfected by Max Weber . . . That is, by seeking ideal types as a first patterning of administrative modes. Taxonomy is the beginning of science’ (p. 90).

This approach can be interpreted in more than one way. As Sanders and Phiney (1983) put it, ‘Typologies are simply classificatory schema composed of two or more ideal or constructed types. Ideal types provide abstract categories in terms of which individual or group phenomena can be analysed. The difference between ideal type categories can be conceptualised as a gradual continuum or as discrete’ (p. 284). The notion of locating types within a continuum has informed key aspects of our own approach to field mapping, particularly on the identification of knowledge provinces. Culbertson (1981) contends that organisational theory faced a serious epistemological crisis related ‘to questions about the nature and validity of knowledge’ and we have been influenced by his solution through identifying ‘three scholarly traditions . . . contending for the allegiance of social science scholars and professors of educational administration . . . logical positivism, hermeneutics, and critical theory’ (p. 1). The contrasting features of each of these traditions in terms of their disciplinary links, major
authors, central purposes, significant outcomes, modes of generalisation, assumptions about knowledge, and criteria of validity are discussed. In challenging this model, Burnett (1981) claims that, ‘epistemologies of the types which Culbertson cites are ‘school epistemologies’, the distillation of thinkers each of which is considerably more complex than the distilled, composite version of their views . . . [and] profound contradictions are often discovered when one analyses the thoughts of one as opposed to another, of the thinkers within a given, composite view’ (p. 16). He also asks, ‘why just these three epistemologies?’ (p. 17).

These are forceful criticisms, somewhat diminished insofar as they would seem to apply with equal force to any approach to types and typing. On this Greenfield takes a pragmatic view that we share. In commenting on a Culbertson style typology proposed by Ribbins (1985) he acknowledges that: ‘No doubt there are methodologies or enquiry and positions about the truths of social reality that do not fit within this typology. It is nevertheless a good working beginning for anyone trying to understand what characterises and distinguishes the modes of enquiry in the field and what watersheds of assumption and world-views divide them’ (Greenfield and Ribbins, 1993, p. 179). With this in mind, what is involved in Burnett’s criticisms and the assumptions on which they are based? Two seem pertinent. First, that any acceptable typology needs to be able to offer a satisfactory explanation of why the types that it identifies are both the best available and fully sufficient. Second, that each of the types it includes must be wholly discrete from each other and from all other possible types. These may seem reasonable expectations, but they assume, rather than seek to justify, the supposed merits of a ‘tight’ definition of types and typologies. We have opted for a ‘loose’ definition; and in doing so are content to settle for the modest merits that Greenfield is prepared to accord to a choice that is otherwise so determinedly non-Cartesian.

Against this backdrop we propose six typologies that facilitate the production of maps (see Figure 1). In doing this we have sought to strike a balance between the need to respect the complexity and dynamism of the field while at the same time creating a framework that is useful without being too elaborate. These typologies have a heuristic purpose and as such their categories are meant to illuminate rather than stifle, and to open up rather than create barriers. The typologies are meant to aid thought rather than replace it.

We propose that these approaches to categorising the field can be used to produce maps in the form of books, lectures, research projects etc.; the process of doing this we identify as mapping, and those who undertake this work we identify as mappers. This metaphor enables us to capture what it means to use and produce knowledge, and it facilitates questions about the past, present and future, while issues of purposes and direction can be foregrounded. Nevertheless it is possible that this type of work can be seen to be another example of indulgence by ‘wacky theorists’ (Woodhead, 2000), or a contribution to unproductive ‘paradigm wars’ (Oakley, 2000). We would position ourselves
differently, and like Alvesson and Willmott (1996) do not see critical evaluation as necessarily taking an oppositional stance but as creating spaces for dialogue about what we know and why we know it. Consequently, we are mindful of how our own agency and the structures we inhabit shape how we read and use such typologies. We have a disposition to draw on a multiplicity of intellectual resources including the philosophical (Ribbins, 2003a,b), critical (Gunter, 1997, 2001) and humanistic (Pascal and Ribbins, 1998; Rayner and Ribbins, 1999; Ribbins and Marland, 1994) and the use of qualitative methods (Gunter, 1999a,b; Ribbins, 1997; Ribbins, 2003c). The philosophical tradition within the field and our work gives us permission to speak out loud about our thoughts and ideas, and to be inconclusive. In other words, what we propose does and does not need to lead to immediate action, but could lead to a better understanding of the actions that have happened or could happen. Locating ourselves here means a rejection of what Popkewitz et al. (2001), drawing on Walter Benjamin, depict as:

*an empty history*: the picturing of a universal, boundless human progress associated with ideas of an infinite perfectibility, an additive viewpoint whose illusions are of a seemingly continuous movement from the past to the present, and whose methods have no theoretical armature.

(p. 4, authors’ own emphasis)

Instead history, ‘is the critical engagement of the present, by making its production of collective memories available for scrutiny and revision’ (p. 4). Work on issues of social injustice such as gender (Blackmore, 1999; Hall, 1996) means the authoring process is more open to scrutiny and the values on
which choices are made can be displayed so readers can position themselves within the account.

4. Typologies of knowledge production in the field of educational leadership

(i) Provinces

We have identified six provinces, as illustrated in Figure 2.

The identification of these provinces is based on an analysis of the publication outputs of the field (Bush et al., 1999; Gunter, 2001), producing clusters around differentiated approaches to purpose. Knowledge provinces mean what is being asserted as constituting the truth underpinning the intention behind any leadership activity. These provinces have been placed along a continuum – with the conceptual at one end and the instrumental at the other – that symbolises praxis. All six are places where theory and practice are central to field activity but the emphasis and disclosure of purpose varies. For example, those to the left of the continuum put more emphasis on understanding doing, while those to the right are more concerned with particular types of doing. This paper is a map of the field and in producing it we have drawn on the knowledge claims underpinning the conceptual and critical provinces. We are both investigating issues of ontology and epistemology within the field and producing a dialogue regarding the contested nature of the issues. We are taking action through the production of typologies, and are commenting on action by identifying the dominance of the evaluative and instrumental knowledge claims in the field.

(ii) Practices

The experience and understanding of everyday practice and how that activity can be challenged and developed is a core purpose of the field. The question is how the six knowledge provinces interconnect with questions of what we know of practice. By juxtaposing Figure 2 with the practice of leaders, leading and leadership we can generate the questions which are central to our interrogation and understanding of current and possible practice. What is described as past, current and possible practice of educational leaders by themselves and/or by others is too vast to engage with fully in this paper. However, we are mindful that educational leadership should be located in an educational setting, be about educational practice, and be intrinsically educative. Therefore we have adopted the ‘components of the process’ of effective school leadership identified by Reynolds and Teddlie (2000, p. 144) in Figure 3 to produce a typology of leadership practice.

The knowledge worker can use Figure 3 to read authors, publications and key issues, and/or draw on it to view current practice through research. For example, we would expect to see recognition of research in the critical domain that
<table>

<td>Concerned with issues of ontology and epistemology, and with conceptual clarification.</td>
<td>Seeks to provide a factual report, often in some detail, of one or more aspects of, or factors, relating to leaders, leading and leadership.</td>
<td>Seeks to gather and theorise from the experiences and biographies of those who are leaders and managers and those who are managed and led.</td>
<td>Concerned to reveal and emancipate practitioners from injustice and oppression of established power structures.</td>
<td>Concerned to measure the impact of leadership and its effectiveness of micro, meso, and macro levels of interaction.</td>
<td>Seeks to provide leaders and others with effective strategies and tactics to deliver organisational and system level goals.</td>
</tr>
</tbody>
</table>

*Figure 2* Knowledge provinces in the field of educational leadership (Gunter and Ribbins, 2003).
focuses on evidence, descriptions and explanations of how and why gender has an impact on how and why leadership has been experienced as a power structure. This is in contrast with work in the evaluative domain that can show the emphasis on isolating and using organisational variables to measure impact on outcomes.

Using the knowledge provinces to interrogate what is presented as an effective model of school leadership enables a strategic overview of knowledge claims. Reynolds and Teddlie (2000) present evidence regarding the importance of leadership and in particular the primacy of the headteacher in effective school leadership. However, the conceptual, descriptive, humanistic and critical enables us to ask questions that generate understandings about whether effective school leadership is educational leadership. We can also ask whether a model generated from distilling the findings from work done at different times and in different nation states and cultures can be transferred to other settings. The language of instructional leadership could suggest that the headteacher is directly located in contextualised teaching and learning, and yet the research evidence that this approach draws on (Murphy, 1990) characterises it in organisational terms, and is North American. Instructional leadership is about goal setting, resource allocation, the creation and maintenance of a performance culture, and enabling participation by stake-holders. This is the type of generic organisational leadership that is rooted in business management rather than educational leadership.

(iii) Processes

Understanding the processes by which knowledge is produced is more than a methodological issue, and needs to take into account the use and production of knowledge within practice. Figure 4 juxtaposes the six knowledge provinces with the methods by which effective leadership is currently being researched.

Instrumental approaches are a synthesis of ‘interesting’ findings usually combined into a convincing strategy for enabling change to happen. In contrast, evaluative approaches put emphasis on quantitative measurement, while humanistic approaches seek to gather experiential accounts through qualitative methods. Increasingly, quantitative methods through randomised controlled trials are being favoured and the literature is being read and weighed in the form of systematic reviews. It is intended that this type of work will support evidence-informed practice where practitioners have access to what works, and so can make the right decisions regarding how to teach and facilitate learning. This positions practitioners as secular consumers of knowledge that they can efficiently and effectively purchase commercially to change their practice. We would argue for a wider understanding of consumption where the emphasis is on how the user of knowledge is knowledgeable and is a producer of new knowledge (Ribbins and Gunter, 2003). We raise these matters because work that is conceptual, critical and humanistic is in danger of being marginalised as supposedly lacking relevance, rigour and validity. This is so because knowledge

*Figure 4* Researching effective leadership.
production that draws on these knowledge provinces is based on the complexities of what we know and is enriched by analysis of how and why we come to know it: the choices we make, what we accept and what we discount, what we store and what we forget. These knowledge provinces are more about conceptually informed practice where we can and cannot witness intellectual work, where practice is and is not immediate, where context does and does not shape outcomes (Gunter, 2001).

(iv) Positions

We identify five positions knowledge workers can inhabit: training, consultancy, expertise, intellectual work and citizenship. Training is a position where there is no direct association with an explicit ideology and the model of pedagogy is facilitation. Learners as knowers are given opportunities to display their knowledge rather than have knowledge transmitted to them. Nevertheless, the learning process is highly structured and controlled by the facilitator. In consultancy a particular belief system is usually adopted but this may not be made explicit because the emphasis is on enabling others to improve their work. Learning is about reflecting on current practice as a means of accepting the new strategies provided through consultancy. Research and theory are played down in the training and consultancy positions; if evidence and ideas are used they tend to be located in the instrumental and evaluative provinces. Expertise is a position where the emphasis is on providing evidence and argument promoting particular solutions; its pedagogic model is to inform others. Learning is through engaging with this knowledge and transferring it into practice. Research is amplified in this position with the use and production of empirical data from a range of methodologies, leading to theorising in the form of models of good practice. In the positions presented so far the stress is on presenting the self as politically neutral and so seeks to disconnect the individual and group from the political, and contrast with the two next positions which are overtly political and social.

Intellectual work is concerned with providing evidence and argument about fundamental questions in society. The emphasis is on praxis, and within this the self is politically committed. The pedagogic model is focused on mediating between theorising from practice and using theories developed by the social sciences. Learning is engaging with these ideas, and building a commitment to a political position. Research is a key aspect of this position through the use and production of empirical data combined with insights and argument based on judgement and discretion. Citizenship is a position with an explicit commitment to democratic practice. Pedagogy is a political commitment to develop citizenship and the identity of being a citizen. Learning is a social and socialising process through dialogue, listening, challenge and agreement. The skills associated with research and theorising are a prerequisite for effective citizenship so that evidence, argument, and knowledge can be described, understood and evaluated.
Figure 5 presents how we might begin to characterise the possible positions that have been, currently are, or could be taken up around the production and use of knowledge regarding the Reynolds and Teddlie (2000) model of effective school leadership.

The emphasis in Figure 5 is on doing the knowledge work rather than being a trainer, consultant, expert or intellectual, though it is the case that knowledge workers do seek to explain what they do by titling (or typing) the self or are titled (typed) by others. It is possible to inhabit all the positions within professional practice at once and/or over time. In asking questions about effective school leadership then we need to ask where those arguing for or against it locate their work, and for what purpose. The positions that are becoming very crowded are those of training and consultancy, and we need to recognise that there are other positions than that of training teachers to implement effective school leadership. In particular, if headteachers and others in schools need to develop effective educational leadership, how do we develop alternative models to that produced by Reynolds and Teddlie (2000) if we are herded into particular positions (e.g. training and consultancy) and we are so over worked that the other positions remain out of our reach? If some positions are in the ascendancy and others in decline we need to ask why this is the case and what the implications are for knowledge production.

(v) Producers

Researching educational leadership needs to be understood through questions about who the knowers are, what they claim to know, why they know, how they claim to know, who legitimises their knowing. A central feature of the field is that it is multi-site and hence inclusive of a range of practitioners from schoolteacher to administrative officer, and from researcher to policy maker. We have argued elsewhere that there has been a tendency to downgrade knowledge producers in universities, and to focus on role incumbents (particularly heads) in schools as the authentic knowers (Gunter and Ribbins, 2003; Ribbins et al., 2003). Not only does this fracture the culture and practice of partnerships between schools/colleges and universities in professional development and research, but it also perpetuates exclusion as a strategy within knowledge production. By labelling one part of the field as irrelevant to practice does not help the case to be made for others in the field to be given more recognition. We would want to argue that parents, students and wider communities are a part of the field and are knowers about educational leadership.

Knower identities are a complex matter, and there are many identities an individual may inhabit that shape how s/he sees themselves as being and doing. An individual may be a school governor, a teacher, a parent, local councillor and church-goer to name but a few. In addition to these functional identities there are social, historical, cultural and economic ones such as class, race, age, sexual orientation and gender. We can best understand this through the interplay of

</tr>
</tbody>
</table>

*Figure 5* Positions in knowledge production.
agency and structure. The agency of the person to engage in effective leadership depends on their dispositions to do so and how structures support or stifle this. If we view effective leadership from the vista of headteacher identity within a school then there is a direct interest in and more direct experience of practice compared with a parent who may not acknowledge their role in and contribution to effective school leadership. Furthermore, effective school leadership as defined by Reynolds and Teddlie (2000) is organisational in relation to purposes and activity, while other approaches could characterise effective school leadership from the point of view of the wider community. Figure 6 presents a selection of possible identities and juxtaposes them with the knowledge provinces, and this enables issues regarding the dimensions involved in describing and understanding knowledge producers to be developed.

(vi) Perspectives

The development of maps is a road well travelled. We are building on an intellectual tradition of debating knowledge claims in the UK (Baron and Taylor, 1969; Bush et al., 1999; EMA, 1999; Gunter, 1997). As a field of study, educational leadership and management has drawn on various disciplines including philosophy and history, but it is the social sciences, especially sociology, that have dominated perspectives on knowledge and knowing. These perspectives are political and powerful constructs. In tracing the emergence of the field we can see how the validity of the social sciences is central to its legitimacy for professional researchers (Baron, 1979), and researching professionals (Hughes et al., 1985). We can conceptualise and argue that a thesis, or an article, or a book is a map or even make claims for it being the map. Certainly we need to give recognition to work over time that has captured field purposes at a particular time and made recommendations for future directions (for example, see Baron (1979) on research, and Hall (1999) on how gender needs to feature within research aims and practices). However, we also need to consider how maps of the field of educational leadership are not abstracted outcomes of knowledge production but are deeply embedded within it. This is not just an issue for how professional researchers and writers make transparent the published knowledge they are drawing from and building on, but also the position they take in making selections to include and exclude. What we are raising here is how we bring to our practice at one and the same time the pre-developed maps of practitioners and researchers that can be full or partial, or explored or unexplored. Therefore when we are in particular contexts such as a meeting, a research interview or a training session then maps are in use and are being drawn and redrawn through knowledge production. By juxtaposing producers, positions, provinces, practices and processes we can both enquire into the use and production of knowledge within real time, real life action, and into the published research that seeks to describe, explain and theorise action. In this way we can show the integration of theory and practice, and remove the dichotomy that not only fails us as

knowledge workers, but also enables political positioning to privilege one type of knowing from another.

5. The onward journey

We have reached a stage in our work where some questions might usefully be generated to stimulate discussion:

**Provinces:** are the six knowledge provinces the only ones or might there be others? We would want to continue to challenge our reading of the published maps of the field and to interrogate the knowledge claims regarding how assumptions about praxis underpin them.

**Practices:** how do we engage with educational leaders, leading and leadership as distinct from leaders, leading and leadership in effective educational institutions? We are concerned here to continue to ask what is educational and educative about leadership in educational institutions because it enables us to challenge the politically motivated importation of generic models.

**Processes:** how might we use our typologies to enable the development of systematic reviews? We are concerned here with how our typologies can enable the identification and development of a review question to be more scholarly and hence systematic. Furthermore, we would argue that our typologies provide understandings of research methodologies and methods that generate alternative ways of knowing to those produced by systematic reviews.

**Positions:** how might we understand the movement between positions, and the choices that are made in professional practice? We are concerned here with the interplay between agency and structure, and how choices are made regarding what is and is not appropriate practice and how this links to the formation and development of identities.

**Producers:** how might we develop a more inclusive approach to knowledge production by embracing students, parents and wider communities? We are concerned here with the democratisation of knowledge production, and how we give recognition to and facilitate knowledge used and produced in these complex networks of interactions and processes.

**Perspectives:** how can we create spaces and places where pre-developed maps (in our minds, practices, disciplines, publications) can be accessed and critically analysed? We are concerned here to see maps as living and dynamic knowledge that are open to scrutiny and to development.

A fundamental issue underlying the thinking we have done is how power is conceptualised and informs our understandings of educational organisations. Much
more has to be done. In doing so educational leadership needs to be put into the context in which our attempt to exercise agency as practitioners and as researchers is being shaped and structured. There are preferred models, effective school leadership is a current example, and we should ask how they are being configured, who by and why, and which types of research and practice are being airbrushed out.

6. Notes
1 A fuller account of the development of the typologies is in Ribbins and Gunter (2002) and Gunter and Ribbins (2002).
2 See Gunter and Ribbins (2002, 2003) for a fuller account of the development and use of the maps, mapping and mapper metaphor.
3 In this paper we engage with a conceptual approach to the development of the typologies but do not directly address the theorising of the practice of field members and how we might explain knowledge production. For this see Gunter (1999b, 2000, 2001, 2002a).

THEORY

THEORY AND PRACTICE IN EDUCATIONAL MANAGEMENT

Meredydd Hughes

Introduction

Theory and practice are uneasy, uncomfortable bedfellows, particularly when one is attempting to understand the complexities of human behaviour in organisational settings, and still more so if the purpose in seeking to achieve such insight is to influence and improve the practice.

Such issues have been faced for nearly a century in industrial management and public administration. The main traditions in these areas are considered in the first section of the chapter, ending with a brief review of their application in education.

A sustained attempt to develop an explicit theory of educational management or administration, which was initiated in the USA in the late 1950s, is then considered because of the challenging and innovative way in which it sought to tackle the relationship of theory and practice. Later development in the UK and in other parts of the world, both developed and developing, has inevitably been influenced, whether positively or negatively, by the US experience.

The third section of the chapter adopts a more catholic and flexible approach and seeks to show the kind of theorising within the social sciences on which contemporary students of educational management are able to draw. An attempt is made to examine in some depth the extent to which the ever-present challenge to lessen the gap between theory and practice has led to the development of new perspectives, which provide different kinds of insight, helpful to participants in appreciating the complexities of the diverse facets of organisational experience.

The final section briefly reviews the continuing tension between theory and practice, which is seen as an opportunity for further development rather than as a cause for despair.
The empirical roots of traditional management studies

It has often been noted that the pioneering works on the management and functioning of organisations were written by engineers, managers and industrial consultants who were very familiar with the practical problems encountered in operating large productive organisations. There were later developments on similar lines in business management and in public administration, but it was the managers of industry who first sought to derive management principles of general application from their personal experience in factories and foundries. Some of the milestones celebrated in traditional management texts will be briefly mentioned.

The scientific management movement of Frederick Taylor

The leading figure of the scientific management movement, which was influential in the early decades of the century, was Frederick Taylor. He trained as a mechanical engineer and rose from labourer to foreman, and then to chief engineer at a US steelworks, subsequently becoming a management consultant. In his definitive work Taylor (1911) called for a systematic study of working practices to discover the most efficient means of performing every task, and a corresponding study of management to determine the most efficient means of controlling the workers. Such ‘scientific’ management, resulting in low labour costs and high wages, would be in the interest of both employers and workers, and would lead, it was claimed, to the general elimination of all causes of dispute between them.

Taylor favoured time and motion studies, involving systematic observation and measurement of workers, coupled with incentive payment schemes. He applied similar ideas to management also, insisting on the advantages of maximum specialisation and separation of functions. All organisational members, in his view, could be regarded as essentially rational beings who, with appropriate instructions and agreed incentives, could be expected to operate like machines to increase productivity.

The scientific management movement had many supporters, and Taylor’s methods achieved wide currency on both sides of the Atlantic. They also gave rise to bitter resistance and controversy among those who regarded his analysis of human motivation as inadequate and crude, so that the pejorative overtones of the term ‘scientific management’ are still not entirely dispelled.

Classical management theory

A number of writers, also from a practitioner background, developed a more general analysis of organisations than is implied in scientific management. An early example was a French mining engineer, Henri Fayol, whose major work (Fayol 1916) was the outcome of thirty years’ experience as an industrial managing
director. He defined the fundamental elements of management as being ‘to forecast and plan, to organise, to command, to coordinate and to control’. Pugh, Hickson and Hinings (1971, p. 65) identify him as the earliest known proponent of a theoretical analysis of management activities. He formulated what have become known as Fayol’s general principles of management, which begin with an insistence on division of work and specialisation and end by proclaiming the desirability of management actively fostering the morale of employees.

Fayol’s writings on management may be described as classical both for their concern with form and structure and because of their emphasis on management principles of general application. He has been praised for his clarity and criticised for his apparent rigidity and authoritarianism. Baker (1980, p. 15) perceived him as a kind of Napoleon of industrial and general organisation theory: ‘immensely creative in opening up clear straight lines through hitherto not easily penetrable jungles; and hence, like Napoleon, stimulating the creativity of others’.

Among those others was Colonel Urwick in Britain, who drew substantially on Fayol’s work and on his own military experience in his treatment of principles of administration (Urwick 1947). In the USA James Mooney, a General Motors vice-president, and Luther Gulick, a prominent public administrator, were among the enthusiastic advocates of general management principles. Gulick (1937), in a volume which he edited jointly with Urwick, described the work of a top executive as consisting of seven distinct tasks: planning, organising, staffing, directing, co-ordinating, reporting, and budgeting. In countless management lecture rooms these have since been recalled by means of the well known acronym, POSDCORB.

It may be noted that the readiness with which the generalisations of Fayol and other classical writers were widely and uncritically accepted owed much to their impeccable practitioner credentials. Their robust and wide-ranging commonsense pronouncements, relying more on individual personal experience than on systematic study, were usually expressed clearly and authoritatively. They gave little attention, however, to constraints and qualifications, or to the conditions which would need to be satisfied for their propositions to be of value in predicting future performance. They were pioneers whose confident generalisations provided a basis for conceptual clarification and further refinement.

Organisations as bureaucracies

The word ‘bureaucracy’, which may be traced back to pre-revolutionary France of the mid-eighteenth century (Albrow 1970, p. 16 ff.), belongs to a different world, the world of government departments. It referred to the rule of officials in public administration, and was discussed in such terms by a succession of writers, including John Stuart Mill. Described as ‘the giant power wielded by pigmies’, bureaucracy was both popularised and castigated by Balzac (1836) in his novel, Les Employés.
In the late nineteenth century the German sociologist and jurist, Max Weber, offered a succinct and influential statement of the essentials of a bureaucracy which had a profound influence on later writers on organisation, and was in close accord with the ideas independently promulgated by the classical management writers. As conceived by Weber (1947), a bureaucracy has the following characteristics:

a. a clear-cut division of labour leading to specialisation;
b. a hierarchical authority structure, the scope of such authority being specified;
c. a comprehensive system of rules and regulations to ensure uniformity and continuity in organisational decisions;
d. impersonal relationships among officials and between officials and clients;
e. employment and advancement based on objective criteria.

Underlying Weber’s classic formulation is a concept of authority which is legal and rational, carefully distinguished by Weber from both charismatic authority, which is dependent on the personal quality of the leader, and from traditional authority, which is based on custom and precedent. In contrast to social groupings involving charismatic and traditional authority, a bureaucracy, according to Weber, can be relied upon to ensure rational decision-making which is neither arbitrary nor compromised by inappropriate and irrelevant considerations.

Silverman (1970, p. 74) has suggested that it was ‘in an uncharacteristic moment of dogmatism’ not typical of Weber’s general emphasis on understanding and interpreting the subjective meaning of situations to individuals, that Weber boldly asserted that bureaucracy is the most efficient form of administrative organisation. The claim was not based on empirical research, and it has been noted by several commentators (e.g. Blau and Scott 1963, p. 34) that Weber’s characterisation of bureaucracy was intended as a conceptual construct or ‘ideal type’ rather than as a composite description of actual organisations.

Whereas Weber was concerned to explain the contribution of formal structure to efficient organisational functioning (and may thus be regarded as adopting a ‘structural–functionalist’ viewpoint, as described by Ribbins in Chapter 9), subsequent research and theoretical analysis (Gouldner 1955; Merton 1957; Blau and Scott 1963) have focused attention in contrast on the dysfunctional consequences of bureaucracy, which are more apparent to the general public. Some later empirical studies, as will be noted, have questioned more basically the unitary assumptions of the ideal-type conceptualisation. These further developments, however, in no way diminish the intellectual power of Max Weber’s precise and perceptive characterisation of bureaucracy rooted in the world of European officialdom, or lessen the profound and far-reaching influence it has exerted indirectly on society in general and, more specifically, on the thinking of both practising administrators and organisational theorists.
Human relations perspectives

It could be argued that the tenets of scientific management, the general principles of the classical management writers and the impersonal structures of bureaucratic theory give only cursory recognition of the fact that organisations basically consist of people with varied personalities, purposes and perceptions. The Human Relations Movement, which developed and gained recognition within industrial management in the 1920s and 1930s, was a conscious attempt to redress the balance and modify the emphasis of the earlier theorists.

The research conducted by Elton Mayo and his associates from 1927 to 1932 at the Hawthorne Plant of the Western Electrical Company in Chicago has been frequently cited and is well documented (Mayo 1933; Roethlisberger and Dickson 1939). Mayo concluded that the relationship of workers with management and each other may be more significant in affecting productivity than the streamlined procedures and incentive schemes proposed by Taylor or the rational management principles advocated by the classical theorists. The potent influence of informal groups on motivation and behaviour came to be appreciated, so that organisational goals were modified in practice through the pressure on members of their peers’ expectations.

The concept of informal organisation, defined as ‘the aggregate of the personal contacts and interactions and associated groupings of people’, was introduced by Barnard (1938, p. 115) as a necessary concomitant of every formal organisation. In an influential text on the functions of the executive, based on his experience in commerce and government, Barnard’s emphasis was on teamwork and communication: ‘Authority depends upon a co-operative personal attitude of individuals on the one hand; and the system of communication in the organisation on the other’ (1938, p. 175). Paradoxically, he also referred to a need for managers to indoctrinate those at the lower levels with general purposes and major decisions (p. 233). In order to strengthen the influence of the formal organisation, he suggested, the informal organisation should be manipulated by management through friendship ties and deliberate leaks of information.

Not surprisingly Barnard has been criticised for the basic inconsistency in his approach (Perrow 1970; Greenfield 1975; Burrell and Morgan 1979). More broadly, his work provides an apt illustration of two general criticisms which can be made of the human relations approach: first, that because of a managerial bias human relations adherents tend to disregard genuine conflicts of interest between workers and their employers (Clegg and Dunkerley 1980, p. 134); and second, that human relations studies tend to ignore external factors such as mobility aspirations, market forces and union membership (Silverman 1970, p. 76).

On the other hand, human relations theory may be regarded in retrospect as an approach which directed attention to important personal variables in organisations, which had previously been neglected. As such the theory has been seen, particularly by practitioners, to provide a valuable corrective to views of
management which rely exclusively on the abstractions of organisational charts and bureaucratic structures.

Management ideas applied to education

In a subtle and pervasive way the management ideas briefly indicated in preceding sections have become part of the intellectual currency of our time. Most people will readily appreciate what is involved in time and motion studies, lines of command and faceless bureaucracy, and a good number will be familiar with the Hawthorne effect. Those with responsibilities in educational management during the last half-century or so are likely to have had a broad familiarity with the main issues involved, though probably few of them would have studied the texts of industrial management or public administration. It is of interest to note some examples of educational management practice which may be regarded as anticipating, or more frequently echoing, the management traditions which have been described.

The level of funding of the new elementary schools in England and Wales in the latter part of the nineteenth century depended directly on the performance of pupils in oral and written examinations administered by HM Inspectors. The resulting slogan, 'payment by results', was in common usage some thirty years before Frederick Taylor’s workers’ incentive schemes, but was very much in the spirit of scientific management. The mounting opposition to the scheme, which finally led to its abandonment by the turn of the century, may be compared to the resistance often engendered by scientific management crudely applied in industrial concerns.

In the USA, performance-based accountability in education came a little later, as Callahan (1962) has shown in fascinating detail. It was evidently as committed advocates both of scientific management, and of the wholesale application of general principles of management to education, that the early professors of educational administration, Bobbitt, Spaulding and Cubberley, gained nationwide recognition. According to Cubberley (1916, p. 338), education had to have its corps of efficiency experts like ‘every manufacturing establishment that turns out a standard product or series of products’, while ‘it is the business of the school to build its pupils according to the specifications laid down’.

Such ideas might nowadays be regarded as crude and simplistic. It is salutary to note, however, that some of the thining about assessing educational outcomes—which has led to competency-based training for educational administrators in North America (Lipham 1975; Project ASK 1980) and to the progressive development of objective testing techniques in Britain on lines already well established in the USA (Becher and Maclure 1978; Holt 1981)—is essentially similar to that of the scientific management advocates of the early years of the twentieth century.

An updated version of Taylorism is also (arguably) implicit in recent detailed studies of managerial activities in industry, as Hodgkinson (1978, p. 17) sug-
gested in commenting on Mintzberg’s (1973) influential study, which involved the intensive systematic observation of five chief executives. Similar studies in education, mainly relying for their data on diary entries (Webb and Lyons 1982), on structured interviews (Jenkins 1983) and on structured observation (Martin and Willower 1981; Duignan 1980; Willis 1980; Thomas, Willis and Phillips 1981) respectively, have all drawn to some extent on Mintzberg’s work. They provided support in an educational context for his conclusion that managers are not reflective planners, and that their activities ‘are characterised by brevity, variety and fragmentation . . . with the trivial interspersed with the consequential’ (Mintzberg 1973, p. 51). The observational studies, which followed Mintzberg in incorporating a time-study element, were among those criticised by Gronn (1982; 1984) for introducing ‘Neo-Taylorism’ into educational management, a charge rebutted by Willower (1983). From the lively interchange between the two writers it may at least be concluded that the ideas of Frederick Taylor are still meaningful in current controversy.

A similar conclusion may be reached concerning Max Weber’s ideas about bureaucracy. Over the years, the terms bureaucracy and bureaucratic, which are almost invariably used pejoratively by frustrated participants, have been found relevant in describing the functioning of educational systems and institutions. Schools and colleges, particularly if they are large, conform to a considerable degree to Weber’s specification of bureaucracy, as judged by their division of work, their hierarchical structures, their rules and regulations, their impersonal procedures and their employment practices based on technical criteria (Anderson 1968; Jones 1974).

Adopting a historical perspective, Musgrove (1971) has written of the advantages of bureaucracy in education, and has argued that the bureaucratisation of schools has given more dignity and power both to school heads and to assistant staff (p. 98). It has been shown that some aspects of bureaucracy, such as the precise definition of individual responsibilities, are not necessarily unwelcome to school staff (Hughes 1977). There is evidence that the heads of larger schools tend to be bureaucratic, in the sense that they lay greater emphasis on the application of rules and regulations to govern procedures (Cohen 1970), though the same study also indicated that they appeared no less concerned than the heads of smaller schools for the individual child, the individual teacher or the particular parental request.

Cohen’s study is thus an example of both a bureaucratic and a human relations viewpoint, and the strength of the latter emphasis is further illustrated in the work of Bates (1970) and Bernbaum (1976), both of whom show heads of schools giving priority to the traditional human relations aspect of their work. There have also been many studies of staff morale and satisfaction in educational institutions—sometimes explicitly drawing on similar work in industry—which have typically explored the relationship between satisfaction and staff participation in decision-making (Chase 1952; Sharma 1955; Belasco and Alutto 1972; Nias 1980).
The influence on education of the human relations movement of the 1930s, occasionally with specific reference to the Hawthorne studies, was soon evident in books advocating democracy in educational administration (Koopman 1943; National Society for the Study of Education 1946; Hughes 1951), and was reflected in texts on school management (Yauch 1949; Griffiths 1956; Bassett, Crane and Walker 1963). A generation later, staff development and involvement and participative leadership continue to receive close attention in texts on the management of educational institutions (Newell 1978; Bush et al. 1980; John 1980; Gray 1982).

It is also of interest that a model for higher education recently proposed by Becher and Kogan (1980) distinguishes at four levels (individual, basic unit, institution and central authority) between an operational and a normative mode, concerned respectively with what people actually do and what they count as important. Their normative mode at the individual level is specified in terms of job satisfaction, personal wants and expectations and subscription to group norms (Figure 2.1, p. 19), i.e. in terms of basic concepts which today are familiar and generally accepted, but which were new and unexpected when put forward by the human relations management consultants of the Hawthorne Studies era.

The extent to which general management theory can be applied to schools has been considered on a number of occasions, e.g. by Thomason (1974), Landers and Myers (1980), Paisley (1981) and Handy (1984), to name only a few. It has been maintained by Everard (1984) and in publications of the Industrial Society for heads of schools (Warwick 1984; Trethowan 1984) that school management has much to learn from industry, a view challenged by Fielding (1984) and White (1984). Research by Jenkins (1983) has identified a number of similarities, but also some significant differences in the ways in which managers in manufacturing industry and those in schools in England and Wales actually perceive their job.

In concluding this section it may thus be claimed that the various concerns and emphases of management writers, ranging from scientific management to human relations theory, have found expression in a variety of ways in the management of education and in the related literature. To begin with, this happened in a very piece-meal and haphazard manner. Even in the USA, where courses in educational administration had been mounted since early in the century (generally staffed by former administrators drawing anecdotally on their past experience), there was, for a long time, little attempt to integrate or reconcile the various disparate approaches available, or to consider how, if at all, the management of education differed from other kinds of management. From the mid-1950s the position changed significantly with the emergence in the USA and Canada of what came to be known as the ‘New Movement’ in educational administration. Its influence in Britain and other Commonwealth countries was somewhat indirect and came later.

This was a period, as Culbertson (1980, p. 326) later recalled, of ‘an intense romance with theory’. The New Movement sought to provide coherence in edu-
cational management by emphasising the importance of theory. Sceptical practitioners were assured, in the oft-quoted words of John Dewey (1929, p. 17), that ‘theory is in the end . . the most practical of all things’. It involved nothing less than a new paradigm and a new approach to the relationship of theory and practice in educational management. Its aspirations, achievements and limitations are considered in the next section.

The theoretical bias of educational management’s ‘New Movement’ paradigm

In this section the emergence and major achievements of the New Movement in US educational administration will be described, followed by an account of some of the doubts and challenges to its basic viewpoint which later developed. But first it will be helpful to clarify the meaning of the term ‘paradigm’ as used in the title of this section.

Paradigm: a term of multiple meanings

The word ‘paradigm’ is defined in the Concise Oxford Dictionary as ‘example, pattern, especially of inflexion of noun, verb, etc.’, and thus has a very specific, concrete meaning as used by philologists. Nowadays the term is widely used with very different connotations, this being largely a result of the work of Thomas Kuhn, a historian and philosopher of science. As he later recalled in a volume of selected papers (Kuhn 1977, pp. XVII and 318), the concept of paradigm was first extended by him in 1959 to refer by analogy to shared examples of successful practice within a scientific community, as distinguished from agreed rules and definitions. Acquiring an arsenal of exemplars, according to Kuhn (1977, p. 307), is ‘integral to the process by which a student gains access to the cognitive achievements of his disciplinary group’.

In Kuhn’s influential book, The Structure of Scientific Revolutions (1962), the concept of paradigm is progressively broadened from its original meaning, so that one commentator (Masterman, 1970) has identified at least 21 different usages of the term. As Kuhn later admitted, paradigms took on a life of their own:

they expanded their empire to include, first, the classic books in which these accepted examples initially appeared and, finally, the entire global set of commitments shared by members of a particular scientific community.

(1977, p. XIX)

The essential point which Kuhn made in his major work is that what is called normal science involves the solving of problems without questioning the assumptions, explicit or implicit, of the generally accepted frame of reference or
paradigm of the scientific community. There are, however, other periods of revolu-
tionary science in which the paradigm itself is called into question, because of
deep-seated anomalies which it cannot resolve. Such transitional periods, it
was suggested, lead in due course to the emergence and acceptance of a new
paradigm.

The concept has been broadened even further within the social sciences with
the recognition that alternative frames of reference may be available simultan-
eously. Thus Burrell and Morgan (1979, p. 36) argue that ‘social theory can be
conveniently understood in terms of the co-existence of four distinct and rival
paradigms defined by very basic meta-theoretical assumptions in relation to the
nature of science and society’.

The progressive extension in meaning of the term paradigm is thus itself a
potent reminder of the essential inter-penetration of theory and practice. ‘Para-
digm’ was originally introduced into scientific discourse to signify the specific
exemplars which provide the constituents of the shared understandings embedded in alternative views of
reality presented by paradigmatic theorists.

The emergence in US educational administration of a ‘New
Movement’

The mid-1950s may be identified as a period of intellectual ferment in relation to
educational management studies in the USA, as evidenced by a number of
significant publications (Coladarci and Getzels 1955; Campbell and Gregg 1957;
Griffiths 1959a, 1959b). There was a significant infusion of new ideas, propogated
by a new breed of able enthusiasts whose expertise in educational management was
derived more from study and research in the social sciences than from long practi-
tioner experience. Andrew Halpin, Ronald Campbell and Dan Griffiths were
among those who called for a more rigorous theoretical approach in the study of
educational administration.

In his contribution to the Campbell and Gregg volume, Halpin (1957 p. 197)
vigorously rejected ‘naked empiricism’ and rebuked those scholars who spent
their time on practical problems rather than doing the research on theoretical
issues, which he regarded as much more important. The term ‘theory’ itself had
to be rescued: it would not be used by Halpin ‘as a euphemistic synonym for any
speculation about administrator behaviour—no matter how vaguely formu-
lated—but in the restrictive sense employed by the social scientist’ (Halpin
1957, p. 156). He quoted with approval a rigorous definition of theory as ‘a set
of assumptions from which can be derived by purely logico-mathematical proce-
dures a larger set of empirical laws. The theory thereby furnishes an explanation
of these empirical laws . . . ’ (Feigl 1951, p. 182).

The ideal which Griffiths enthusiastically envisaged was the development of
a general theory of human behaviour, within which the theory of administrative
behaviour in education would be a sub-system. The natural sciences, and
particularly physics, would provide the model, Kepler’s Laws of Planetary Motion being the prototype of the yet undiscovered laws of educational administration (Griffiths 1957, p. 388). He added later that he agreed with Halpin’s suggestion that Feigl’s definition of theory be adopted, and observed that this ‘would mean that theoretical work would be more narrowly limited than previously’ (1959a, p. 28).

A necessary consequence of the new determination to rely exclusively on a natural science methodology was that, in accordance with the philosophical tenets of logical positivism which Feigl advocated, the concepts used were to be defined operationally, i.e. their meanings were to correspond, as Herbert Simon (1947, p. 37) had also insisted, ‘to empirically verifiable facts or situations’. Value judgements as to the desirability of policies and behaviours were therefore to be firmly resisted in the new studies being initiated, which would concentrate on determining what is rather than what ought to be (Culbertson 1965, p. 4). Similarly, Gregg (1965, p. 46), writing approvingly of a National Society for the Study of Education Year-Book (1964) which was an outcome of the New Movement, supported its emphasis on validated operational concepts within a theoretical context:

> Such concepts help to illuminate the nature of administration. They do not prescribe rules for administrative action, but they may enable the administrator to analyse administrative problems more penetratingly and accurately, to view events in different perspectives, and to reflect in ways which would not be possible without such concepts . . . The current scientific approach to administration is directed to identifying and describing the variables of administration and their relationships, so that an administrator can have a better understanding of them and thus control them in terms of whatever goals and policies he chooses.

The new ideas gained international currency in the 1960s, the initial impetus for Commonwealth development coming largely from William Walker, who founded The Journal of Educational Administration in Australia in 1963, two years before the US-based Educational Administration Quarterly was established. The first major UK involvement was in 1966 in Canada and the USA, at the first of what have become quadrennial International Intervisitation Programmes (IIP) in educational administration (Baron, Cooper and Walker 1969).

The early writings of the leaders of the New Movement paradigm were critical and perceptive papers which provided a welcome, astringent antidote to the unsupported generalisations—often based on dated and untypical experience—that had been customary in the educational administrative literature. What was actually achieved through this new style of research is more problematic. Three major areas of development will be briefly described: a framework for conceptualising organisations as social systems, some examples of role studies, and studies of organisational climate.
The Getzels-Guba social systems model

An example from the early days of the New Movement of an abstract formulation intended to generate hypotheses as a basis for empirical study, is provided by a model of educational administration as a social process, which was developed jointly by two social psychologists, J. W. Getzels and E. G. Guba (1957). Basically the model proposed that a social system be conceived in terms of two types of phenomena, involving respectively an organisational (or nomothetic) dimension and a personal (or ideographic) dimension. Observed behaviour is then regarded as the result of the interaction of elements located on each of the two axes.

The organisational dimension permits analysis successively in terms of the institution, its constituent roles, and the specific expectations attached to each role. Implicit is a structural view of organisation, such as Fayol or Weber might have proposed, with a clear division of tasks among official positions or roles. It is assumed that the obligations and responsibilities which these roles involve can be specified in terms of explicit expectations, which serve as an agreed prescription for the particular role. The various roles are interdependent and complementary, and it is to their interrelationship that the term ‘organisational structure’ applies.

The personal dimension takes account of the human aspect which the organisational dimension ignores, and thus accords with a human relations emphasis. It focuses on the individual members of the system, the analysis being successively in terms of the concepts of personality and need-disposition. Need-dispositions are described as a person’s ‘individual tendencies to orient and act with respect to objects in certain manners and to expect certain consequences from these actions’.

Though the justification for the use of the term ‘dimension’ is somewhat obscure, it may be granted that the model neatly accommodates the two main strands in traditional management theory, the classical and the human relations, and suggests three levels at which interaction can be considered: institution and individual, role and personality, role expectation and need-disposition.

An extension to the model (Getzels and Thelen 1960) took account of the fact that every social system is embedded in a wider environment. This was conceptualised in terms of a further anthropological dimension, of which the constituent elements are: culture, ethos and values.

In its original two-dimensional form the model generated a number of research studies of the correlates of role-personality conflict and of conflict within the organisational and personal dimensions, some of which are described by Campbell, Corbally and Ramseyer (1966, pp. 189–216). Personal satisfaction was found to be positively related to the extent to which need-dispositions are congruent with role expectations. The extended model led to studies being undertaken of the influence of value conflicts on relationships between school administrators and their school boards. The sensitive position of the administra-
tor was thus highlighted, first as the mediator of intra-organisation conflict, and second as the organisational representative exposed to diverse external measures.

Commenting on the model, Trow (1959, p. 124) noted that Getzels used it to illuminate empirical problems. Trow saw it as being ‘likely to be useful to administrators both in their thinking and practice’, and suggested that its ‘simplicity and clarity’ derived from ‘its close connection with his (i.e. Getzels’) empirical research’. More recently it has been severely criticised for excessive simplicity, in that ‘it manages to reduce the puzzles, conflicts and pain of life in organisations to a few neatly-working regularities by applying some very special assumptions to the mysteries of existence’ (Greenfield 1979/80, p. 222). Such criticism is well-founded in terms of the perspectives now available, and can justifiably be extended to the methodological limitations of the associated research. Nevertheless, the Getzels-Guba model deserves to be recognised as a conceptual framework which generated a succession of hypotheses which were subject to empirical test. Within the parameters of the New Movement paradigm it thus contributed to developing a closer relationship between theory and practice.

**Role studies in educational management**

Apart from role studies conducted within the Getzels-Guba framework, numerous studies of the roles of the US superintendent (responsible, for education territorially, to a school board) and of the principal (responsible, for an individual school, to the superintendent) were undertaken in the early 1960s from the standpoint of role theory, i.e. that social behaviour is to a significant extent socially determined.

The most comprehensive of the role studies were those in which Neal Gross and his associates at Harvard University were involved. These included a study of the superintendency role (Gross, Mason and McEachern 1958) which explored differences in the expectations of superintendents and their board members. It was found, as hypothesised, that in defining the division of responsibilities between the two positions, each group assigned greater responsibility to their own position (p. 141). The study also explored the incidence and resolution of role conflict.

A study by Carlson (1962) of a sample of recently appointed school superintendents introduced an overt sociological perspective into a field which had hitherto been dominated by psychologists. Carlson showed that superintendents promoted from within the system (the ‘insiders’) and those brought in from other systems (the ‘outsiders’) tended to differ in their organisational behaviour. The outsiders were more likely to introduce major innovations and to accept the possible risk of community disapproval; the insiders, wishing to stay in the community, were more cautious and adapted themselves to survive. Though Carlson concluded that ‘there is no reason to expect that one type is more capable than the other type’ (p. 14), the study has been recognised as having implications for achieving organisational change.
A large-scale research project may also be mentioned, which Halpin and Hayes (1977, p. 269) later singled out as ‘perhaps the most monumental single study ever conducted within the field of educational administration’. Using sophisticated simulation techniques and a formidable battery of psychological tests and assessment procedures, Hemphill, Griffiths and Fredericksen (1962) studied intensively the personality characteristics of a sample of 232 elementary school principals. The final conclusions, arrived at by elaborate statistical treatment, were ambiguous and obscure. From the viewpoint of practical application the best that can be said is that the array of situational exercises developed in the research were resourcefully converted by the University Council for Educational Administration (1960) into the ‘Whitman School’ simulation, and used in the in-service training of thousands of US elementary school principals.

A general criticism which can be made of the educational role studies which appeared in the 1960s is that they did not take heed of misgivings already expressed concerning the basic assumptions of role theory. Levinson (1959) had vigorously challenged the ‘unitary’ assumption that there is necessarily a close correspondence between the expectations of ‘society’ for a given role and those of the role incumbents, and between such expectations and actual behaviour, these being assumptions which do not accord with empirical evidence. Likewise Gross, Mason and McEachern (1958, pp. 21–47) had clearly rejected ‘the postulate of role consensus’, i.e. the assumption that there is general agreement in society regarding expectations for different roles. It is paradoxical that, in their empirical studies, Gross and his colleagues seem not to have fully appreciated the potency of the explosive device, with slow-burning fuse attached, which they had unwittingly planted within the corpus of management studies (cf Chapters 9 and 13).

With the benefit of hindsight and the alternative perspectives now available, the host of meticulously undertaken role studies may be seen at best as providing static, statistical composite snapshots, which ignore many of the subtle differences which really matter, and which afford little insight into the dynamics of changing perceptions and relationships.

Organisational climate studies

The organisational climate of schools is an imprecise notion which falls well short of the rigorous conceptual standards to which Halpin and his colleagues originally aspired. It has been loosely defined as that set of internal characteristics which distinguishes one school from another, and which influences the behaviour of people in each school (Hoy and Miskel 1978, p. 137); the idea has received considerable attention from researchers in the USA and elsewhere working within the New Movement paradigm.

Foremost was Halpin and Croft’s pioneering study (1963) of 71 elementary schools, which was based on a simple comparison. As Halpin later recalled (1967, p. 6), ‘Croft and I began with the obvious analogy that personality is to
the human individual as ‘organisational climate’ is to the organisation’. He added that they might just as easily have chosen the term ‘organisational personality’ for what they had in mind. Their approach was to develop a questionnaire to explore various aspects of teacher–teacher and teacher–principal relationships. In its final form their definitive instrument, the ubiquitous Organisational Climate Description Questionnaire (OCDQ), contained 64 items. Addressed specifically to teachers, it invited them to indicate for each item, on a four point scale from ‘rarely occurs’ to ‘very frequently occurs’, their answer to the question, ‘To what extent is this true of your school?’

Using factor analytic techniques Halpin and Croft were able to arrange the OCDQ items so as to provide eight sub-tests measuring particular variables. Four of these scales related to perceptions of the principal’s behaviour, namely, production emphasis, aloofness, consideration and thrust; the other four related to perceptions of staff behaviour, namely, hindrance, intimacy, disengagement and esprit. It was thus possible to provide an eight-dimensional profile of the organisational climate of each school in terms of the mean perceptions of its teaching staff. The researchers found that these profiles clustered in six groups, and consequently ‘invented’ (the term is that of Halpin himself, 1967, p. 6) a typology of six climates, arranged along a continuum from an ‘open climate’ at one end to a ‘closed climate’ at the other. The open climate is characterised by ‘authenticity’ on the part of both principal and staff: the principal leading by example and the staff showing commitment and working well together, so that acts of leadership emerge naturally as needed. The closed climate is in stark contrast: the principal provides no effective leadership and is preoccupied with formalities and trivia, while the teachers are frustrated and apathetic, responding at a minimum level.

Later research has thrown doubt on the usefulness of the four intermediate categories which were identified, but the idea of assessing educational organisations on a climate continuum from open to closed has generated substantial research activity in many parts of the world. Such research should be treated with caution, however, for the OCDQ research instrument, originally developed and tested in a small sample of US elementary schools, has sometimes been used ‘with greater zeal than wisdom’, as Halpin (1977, p. 7) has sadly observed; i.e. in very different institutional and cultural contexts and without adaptation or further validation.

In spite of his caveats concerning misuse, Halpin (1977, p. 270) interestingly included the OCDQ research in his selection of the five studies which, in his view, best characterise research within the New Movement in its first decade. (It may be added in parentheses that his other nominations included the Getzels-Guba study, the Carlson insider/outsider study, and the large-scale Hemphill, Griffiths and Fredericksen study of elementary school heads, each of which has been noted above. His fifth nomination was his own earlier study of leadership styles, to which reference is made in Chapter 10).

The inclusion of the OCDQ in the top five may not be surprising in view of
its wide currency and obvious appeal, especially to those favourably disposed to
greater staff participation. Matched against the initial claims of the New Move-
ment, however, the theoretical basis of the study is slight, relying on the simple
analogy of personality, which is presumably a reflection of the fact that Halpin’s
specialist field was psychology. One may speculate that if Halpin’s training had
been in sociology, he would have linked the climate concept firmly to the liter-
ature on ‘culture’, allowing for the identification and inter-relating of the
equivalents of sub-cultures, rather than submerging all differences in a single
holistic concept of one organisational climate.

The post facto specification of six discrete organisational climates was soon
challenged on empirical grounds by Brown (1965) whose computer printout,
using a sample of schools in Minnesota, identified eight climates. Replication by
Andrews (1965), using Canadian schools, also raised fundamental questions
about the concept operationally defined by the OCDQ. He observed that an
instrument completed only by teachers, and concerned essentially with the inter-
action of teachers and principal, does not effectively recognise the contribution
to the distinctive culture of the school of relationships which involve the pupils
and the parents. It is of interest that a subsequent National Foundation for Edu-
cational Research (NFER) study of school climate in the UK (Finlayson, Banks
and Loughrans 1971) included the perceptions of pupils as well as of teachers.
This has been replicated in Australia (Deer 1980).

A further point, which relates to the shallow theoretical underpinning of
organisational climate research, is that it provides no insight as to how a particu-
lar organisational climate comes into existence or how a closed climate can be
made more open. As Halpin (1967, p. 11) himself frankly admitted, ‘The blunt
truth is that we do not yet know very much as to how to change a climate’. It is
thus tantalising that, though organisational climate can be seen by practitioners
as a useful rough and ready means of generalising about their organisations, it is
not a concept which theorists have been able to define with any precision.
Because of its lack of clarity it has failed to generate powerful hypotheses and
has done little to increase understanding. It appears that it is the inadequacy of
organisational climate as theory which has lessened its usefulness for practice.

A paradigm partly accepted, variously challenged

While a cursory reading of the literature might suggest that the rigorous, theo-
retical epistemology of the New Movement writers had quickly been accepted as
the new orthodoxy of the field, a survey by Jean Hills (1965), later confirmed by
a more extensive study (Campbell and Newell 1973), showed that even among
US academics the commitment was less than total. Professional associations of
administrators were supportive, but in somewhat general terms (American
Association of School Administrators (AASA) 1963).

Substantial discrepancy between theoretical aspirations and research achieve-
ment made the original optimistic forecast, that a comprehensive general theory
was about to emerge, less convincing. At the same time it could be argued that the
large-scale, statistically sophisticated research projects, and the more modest doc-
toral dissertations which were copiously produced, shared a hidden paradigmatic
assumption to which the New Movement implicitly subscribed. This was the
belief that social science research is essentially concerned with random samples
(the larger the better) with mean responses and standard deviations, and with the
statistical significance of differences. The varying perceptions and qualified
answers of particular respondents tended to be disregarded, scientific methodology
having no means readily available to handle unique individual cases.

A tendency to advocate, and to make some use of, general systems theory was
perhaps the nearest that the New Movement got to the adoption of a universal con-
ceptual framework. An extensive theoretical treatment, drawing on the work of
Talcott Parsons, was provided by Hills (1968), and made evident the underlying
reliance on the analogy of a living organism in the discussion of pattern mainte-
nance, integration, goal attainment and adaptation. Practical applications of consid-
erable sophistication were developed, notably at the University of Oregon. These
involved the adaptation to educational planning of system analytic techniques such
as planning, programming and budgeting systems (Piele, Eidell and Smith 1970;
Eidell and Nagle 1970), but they were not always successful in enlisting whole-
hearted practitioner co-operation, as Wolcott’s evaluative study (1977) makes clear.

The ideal of a science of educational administration, based on a single grand
theory, appeared to become less compelling by the mid-1960s. Schwab (1964, p.
47) cogently argued that ‘contrary to the burden of recent literature on adminis-
tration, the pursuit of one sufficing theory of administration is a manifest impos-
sibility in the foreseeable future, and an uncritical aping of the wrong model’
(emphasis added). He further observed that ‘a sophisticated and cynical grasp of
about a dozen separate and distinct bodies of “theory” are indispensable to delib-
erately good, intelligent administration’, a sentiment broadly in harmony with
the viewpoint adopted in the latter part of this chapter, though the epithet
‘cynical’ would not necessarily be endorsed.

At the 1966 International Intervisitation Programme, Griffiths counselled that
‘the search for one encompassing theory (if anyone is searching) should be
abandoned … We have learned that a modest approach to theory pays off’
(Baron, Cooper and Walker 1969, p. 166). Similarly Erickson (1967, p. 376)
reported that ‘the field is very much in flux. The erstwhile search for “adminis-
trative theory”, for example, seems virtually abandoned today …’.

Robin Farquhar (1977, p. 356), referring to ‘some disarray’ in administrator
preparatory programmes in the mid-1970s, called for more attention to be given to
‘grounded’ theory, and ended his survey ‘on a note of cautious optimism’. Donald
Willower (1975, p. 3), who continued to be a consistent upholder of the broad
principles of the New Movement paradigm when others were expressing doubts
and reservations, argued that highly abstract, large-scale theory had not been an
issue and that ‘in spite of its use as a straw man by some writers, there has been no
real effort to construct a “grand theory” of educational administration’. His own
A cautious defence of theory prudently excluded Feigl’s rigorous definition, previously mentioned, which ‘sets a standard that would exclude virtually everything done in educational administration to date’ (p. 3). He commended Merton’s more modest view that a large part of what is called theory ‘consists of general orientations toward data, suggesting types of variables which theories must somehow take into account rather than clearly formulated, verifiable statements of relationships between specified variables’ (Merton 1957, p. 52). The notion of theory as a general orientation towards data was, of course, a significant retreat from the position boldly proclaimed in the heyday of the New Movement (Griffiths 1959a), but it enabled Willower to maintain some optimism concerning future development.

In stark contrast was the bleak disillusion expressed by Halpin (1969, 1970, 1977) in papers drawing variously on the imagery of a foggy view from Olympus, a fumbled torch and a broken ikon. The papers were, regrettably, less convincing in their suggestions for the future.

More constructively Jean Hills (1980), while recognising that the field was in disarray, called for an appreciation that educational administration is an applied science which draws on many disciplines. ‘Any concrete, common sense object or event’, he observed, ‘is of such infinite diversity that its full richness cannot be grasped in terms of any system of abstract concepts’ (p. 226). He proposed arrangements to facilitate socialisation with regard to clinical values in administrator preparation, an emphasis at variance with the positivist separation of facts and values characteristic of the New Movement. Similarly Culbertson (1980), who – like Hills – was addressing the 1978 IIP in Canada, called for the development of a new ‘Theory for Practice’.

In concluding this section it is appropriate to recall Kuhn’s differentiation between a period of normal science, when the assumptions of the accepted paradigm of a scientific community are not questioned, and a transitional period when the paradigm itself is under attack. By the mid-1970s two US scholars, Oliver Gibson (1975; 1977) and Donald Erickson (1977), were, in fact, writing about the need for a ‘paradigm shift’ in educational administration. In neither case was the kind of change desired clearly indicated, while the basic assumptions of the prevailing paradigm were not fundamentally questioned.

At the 1974 IIP, held in the UK, Tom Greenfield (1975) made an assault on the accepted tenets of the New Movement in a paper which has come to be recognised by supporters and opponents as a landmark in theory development. He rejected ‘the apparent assumption that organisations are not only real but also distinct from the actions, feelings and purposes of people’ (p. 71), and that organisational structures are invariable while ‘people occupy organisations in somewhat the same way that they inhabit houses’ (p. 72). Organisations are not, he suggested, real entities with a life of their own or governed by a generally accepted set of values; they are invented social reality reflecting the values of people with access to power. The emphasis should therefore be on ‘discovering how different people interpret the world in which they live’ rather than on ‘dis-
covering the universal laws of society and human conduct within it’ which had been the ideal of the New Movement academics (p. 77).

The underlying assumptions of the pervasive social science paradigm associated with ‘structural-functionalism’ and ‘natural systems theory’, which Greenfield was directly challenging in his repudiation of the New Movement orthodoxy, will be considered further in Chapter 9, together with the various alternative viewpoints which have been proposed, and which are still emerging.

The new perspectives debate, conducted in the USA in *Educational Administration Quarterly* and in the UK in *Educational Administration*, in the wake of Greenfield’s paper, has been lively and generally constructive. The result to date, as well illustrated by Griffiths’ analysis (1979) of the intellectual turmoil within educational administration, has been a sharpened appreciation of the strengths and weaknesses of competing perspectives and paradigms. For the student of educational management the current situation is as stimulating as it is demanding. As compared with the undisputed emergence and wide acceptance of a single new orthodoxy—which Kuhn appeared to envisage when a period of normal science is replaced by a transitional phase—a diverse, less predictable prospect is revealed, which may well presage a more productive, interactive and critical relationship between theory and practice.

The account, given in some detail, of the achievements and disappointments of what have been called ‘the developing decades’ (Cunningham, Hack and Nystrand 1977) in the study of educational management and administration, provides both an instructive case study in theory—practice relationships in an emerging field and some of the necessary background for appreciating the significance of more recent developments.

**The contemporary applied science, field of application, perspective**

A variety of potentially relevant modes and areas of knowledge is today available to all who are concerned to improve educational management through better understanding of its concepts, processes and structures. In the UK a cautiously pragmatic, multidisciplinary approach has characteristically been generally adopted. It is, incidentally, also an approach which is currently more widely favoured internationally, as the monodisciplinary aspirations of the North American New Movement appear less attainable (Griffiths 1982). In this section the implications of a multidisciplinary approach will be considered, followed by an inevitably selective survey of some of the models and constructs of possible relevance for application to educational systems and institutions.

**The multidisciplinary approach**

An important early landmark in the development of educational management and administration as a field of study in the United Kingdom was the publication
of Educational Administration and the Social Sciences, edited by George Baron and William Taylor (1969). The editors acknowledged ‘the influence of recent American, Canadian and Australian thinking’, but claimed that ‘the dominant note is that of English pragmatism; this is perhaps as it should be in a book emanating from a country in which the practice of administration has long been held in high esteem and in which its theory is only now receiving serious attention’ (p. vii).

Several chapters of the book drew substantially on the US literature, familiar names such as Halpin, Getzels and Guba and Griffiths being frequently cited. The theoretical bias of the New Movement, however, was not endorsed, Baron noting that ‘to the practitioner in England . . . writing of this kind can appear highly remote from his concerns’ (p. 12). Hoyle, in a chapter on organisational theory and the sociology of organisations, referred to shortcomings of the New Movement due to its ‘over-ambitious approaches to theory construction’ (p. 38), and was sceptical about the use of general systems theory as a source of hypotheses. He concluded that ‘a more limited approach to theory construction would enable us to handle the problems arising from the unique or limited characteristics of educational administration’ (p. 45).

The approach adopted in the Baron and Taylor volume was that educational management is a field of application and that its study should draw widely, but with discrimination, on the social science disciplines and on already recognised applied fields such as organisational theory. Multidisciplinary study, rather than interdisciplinary study, was the preferred descriptor, since the latter ‘could suggest an approach which, in its generality, falls between the interstices of the disciplines and adds nothing solid’ (Hoyle p. 47).

The multidisciplinary standpoint was further developed by Ron Glatter (1972) in a survey of approaches to management development in education, which endorsed Snyder’s warning to the 1966 IIP concerning the art of ‘squeezing disciplines’: ‘Only on the basis of rigorous specification of need and an equally rigorous grasp of how a particular discipline organises its knowledge can one establish relevance and borrow safely and productively’ (Snyder 1969, p. 297).

Both the priority given to substantive practical issues and the multidisciplinary emphasis in theoretical analysis have been much in evidence in the expansion of UK provision in educational management (Hughes, Carter and Fidler 1981), in the parallel growth of the British Educational Management and Administration Society as an association bringing together the practitioners and the academics, and in the increasing availability of relevant books and journals.

_A field of application_

As Hills (1980, p. 225) reminded his US colleagues at IIP 1978, an applied science is required to pay close attention to the special characteristics of its field of practice, which need to be thoroughly and sympathetically understood. One
cannot automatically assume, without further testing, that intellectual currency minted for other economies will be acceptable in the educational marketplace. Research and analysis has to be done in an educational context, which may reveal the need for substantial modification of concepts and methodologies developed elsewhere. The need for awareness and sensitivity in relation to the problems and concerns of practice as defined by practitioners makes it particularly appropriate that most of the contributors to this book regard themselves primarily as practitioners rather than as academics.

A multidisciplinary study

In the past, organisational studies in education have drawn mainly on social psychology, sociology and economics. The range of borrowings has broadened to include philosophy, political science, anthropology, a diversity of micro-social sciences, and the methods of qualitative, as well as quantitative, research. Also recognised as of interest are the many-sided contemporary studies of organisational structures and change processes, in schools of management studies which have long superseded the simplicities of the traditional management writers.

Indiscriminate borrowing, however, resulting in the accumulation of an undigested aggregation of discrete bits of incompatible theory, is likely to be unproductive in achieving understanding. In choosing an eclectic mode of proceeding, Snyder recognised that it is essential to be aware of the strengths and limitations of the concepts and methodologies of the particular discipline or sub-discipline one is using, and also of the underlying assumptions of the perspective adopted.

Given such understanding, a pragmatic approach which is prepared, circumspectly and critically, to make use of more than one perspective, is likely to provide greater insight into the complexities of an educational system than a methodology which confines attention to one kind of problem or one mode of inquiry. In similar vein Gareth Morgan (1980) has advocated ‘a theoretical and methodological pluralism which allows the development of new perspectives for organisational analysis’ (p. 605). He called for uncontested assumptions to be exposed to the challenge of alternative ways of seeing. A cosmopolitan outlook would enable the practitioner and the theorist to avoid being imprisoned by a single set of metaphors.

In the present volume various aspects of current interest in the management of educational systems and institutions will be described and considered using a variety of models and approaches, the models providing a framework for coherent analysis. In some cases alternative models might also be appropriate, and it would be a rewarding exercise for the reader to test out such possibilities. To give some indication of the vitality and rich diversity of the ideas available, selected areas of recent and continuing theory development, which may be of use as sources of concepts and models applicable to educational management, will now be briefly described.
A diversity of structural models

A considerable body of empirical research and theory development on organisational structure may be interpreted as a vigorous rejection by later structuralists of the classical doctrine, equally upheld by Fayol and Weber, that there is one right model of organisation. The universal acceptance of the ideal of a tight hierarchical structure has given way to the concept of structural relativism, which permits alternative, more differentiated, and more flexible structures.

Burns and Stalker (1961), on the basis of their pioneering study of innovation in Scottish electrical companies, had come to the conclusion that ‘the beginning of administrative wisdom is that there is no optimum type of management system’ (p. 125). They identified a pair of contrasting ideal-type management structures, a mechanistic form appropriate to stable conditions and an organic or organismic form to handle less predictable problems more flexibly. Litwak (1961) showed that different types of structure may be appropriate even within the same organisation, a human relations model being applicable in handling work of a non-uniform nature and a Weberian model in dealing with uniform work of a routine nature.

A comparative study by Lawrence and Lorsch (1967) of ten varied industrial organisations led to the construction of a ‘contingency model’, which developed further the implications of the view that structures are contingent upon the problems with which they have to deal. They identified and produced measures of distinct organisational sub-environments, matching each sub-environment to an appropriate sub-unit structure. ‘Goodness of fit’ became the important issue. The more turbulent and uncertain the environment, the greater the tendency for a high level of performance to be associated with high differentiation among sub-units, coupled with effective integration achieved by means of shared information, flexible procedures and open decision-making.

Another approach also challenged the unitary concept of bureaucracy by seeking to identify and measure a number of independent dimensions of organisational structure. Work by Hall (1963) in the USA was followed by an impressive array of systematic empirical studies by the Aston group in England, which have been brought together in a series of volumes (Pugh and Hickson 1976; Pugh and Hinings 1976; Pugh and Payne 1977). The dimensions identified in these studies were: specialisation of activities, standardisation of procedure, formalisation of documentation, centralisation of authority, and configuration of role structure. They also developed measures of contextual and performance variables, and explored relationships between variables, using factor analysis and correlational induction. The studies originally used heterogeneous samples of commercial and governmental organisations to develop general propositions connecting structure and context, and the group’s exclusive preoccupation in such studies with variables involving objective quantifiable data at the expense of political and ideological factors has been severely criticised (Burrell and Morgan 1979; Clegg and Dunkerley 1980).
Interestingly, some later but loosely related cross-institutional studies of local authorities (Greenwood, Hinings and Ransom 1975) and of churches (Hinings 1979), using a contingency theory approach, have led to the conclusion that belief systems and ideologies, which had previously been regarded as irrelevant, deserved detailed study. A theoretical model has been proposed which includes the conceptual categories of provinces of meaning and power dependencies, as well as contextual constraints (Ransom, Hinings and Greenwood 1980). Whereas the more technical aspects of the research produced as a result of the original Aston studies may not be directly relevant to educational management, the methodological flexibility which their dimensional approach entailed is certainly of interest, as is the recent move to develop a framework to incorporate ‘ostensibly disparate perspectives’ with a view to ‘searching for the relations between cause and meaning, between what is determinant and what voluntary in the relation of structure and action’ (Ransom, Hinings and Greenwood, 1980, p. 14).

In selectively reviewing structural models, it is appropriate finally to refer to two theoretical contributions which substantially widen the meaning of the term ‘structural relativism’. The metaphor of a rigid invariant structure is fundamentally challenged both by Karl Weick’s (1976) perception of organisations as ‘loosely coupled systems’ and by the closely related ‘organised anarchies’ of Cohen, March and Olsen (1972), which appear to provide the ultimate antithesis to Weberian bureaucracy.

Loose coupling, a term previously used by March and Olsen (1975), is intended to signify that the parts of an organisation are in some relationship to each other, but that the linkage is limited, uncertain and weak, and certainly much looser than the tight hierarchical control of bureaucratic theory. Weick added that loose coupling also ‘carries connotations of impermanence, dissolvability and tacitness all of which are potentially crucial properties of the “glue” that holds organisations together’ (1976, p. 3). He argued specifically that educational organisations can be viewed as loosely coupled systems. In Chapter 4 of the present volume the applicability of the model is tested in relation to policymaking for the school curriculum.

Meyer and Rowan (1977), who used the concept in an empirical study of school structures, concluded that loose coupling helps to maintain the facade that formal structures are really working when they are not. In a later paper Weick (1980) accepted that loose coupling can be seen as having a stabilising function, in that the connection points of sub-systems act as shock absorbers which internalise pressures rather than transmitting them to other parts of the system. A further factor is that feedback is neutralised as a result of incomplete information being available concerning the effects of previous action. Because of such considerations Foster (1983) has argued that the flexibility claimed for loosely coupled systems is illusory, and that the concept is not essentially different from the ‘exception principle’ of Frederick Taylor’s Scientific Management, which allows for attention to be focused on exceptions to the smooth flow of work (Foster 1983, pp. 20–21).
Writing from an educational management viewpoint, Willower (1980, p. 6) repeated the suggestion in Weick’s original paper that the extent of coupling should be investigated as a dependent variable, subject to the influences of organisational and environmental factors. As Weick further observed, ‘If an organisation faces a scarcity of resources its pattern of couplings should differ from when it faces an expansion of resources . . .’ (1976, pp. 13–14). It may be noted that scarcity in the resources currently available to the maintained school system in the UK is likely to be one factor, among others, contributing to the tightening of curriculum control at national level which is noted by James Waddington in Chapter 4.

The term ‘organised anarchy’ is intended to signify structural looseness in an extreme form. It is a fair description of the ‘Garbage Can Model of Organisational Choice’ described by Cohen, March and Olsen (1972), and further developed by Cohen and March (1974), and by March and Olsen (1976). In such an organisation the goals are inconsistent and ill-defined, the technology for achieving them is unclear to the members, and those involved in decision-making vary unpredictably. Thus problems, solutions and decision-makers are not systematically related to each other. Problems may be created in order to provide opportunities for applying previously discovered solutions, and decision-making serves purposes other than the production of decisions. Organisational choice may be viewed as being achieved by various participants unpredictably throwing various kinds of problems and solutions into a ‘garbage can’. Such an organisation, in brief, is characterised by severe ambiguity and irrationality.

The creators of the model applied it in a university context. Colin Turner (1977, p. 8) has argued that it also applies to further education colleges and polytechnics operating within turbulent, unpredictable environments. The model has attracted wide interest because of its vivid portrayal of the fact that the completely rational organisation is no more likely to exist in real life than its antithesis. Padgett (1980) operationalised the theory to show how variable ambiguity impinges on decision-making at different levels in a traditional Weberian bureaucracy, and showed that the model is potentially applicable even when the system is not highly decoupled. Lutz (1982) argued that universities are differentially coupled, ‘tightly coupled in some aspects and uncoupled in others’. It is the informal system, he suggested, which can best be described as an organised anarchy. ‘Academe is not so fragile’, he concluded, ‘that it could not survive tighter coupling’ (1982, p. 668).

In this section a diversity of approaches to organisational structure have been described which may be regarded as portraying different ways of bringing the ideal rational structures of traditional management theory into closer touch with the ‘brute facts’ of real life. The different models can each provide significant insight in particular circumstances. Even the most sophisticated model, however, can only provide partial enlightenment. Structural approaches of themselves, as Ransom, Hinings and Greenwood (1980) came to appreciate, do not take account of the values, motivations and power relationships of organisational participants.
Policy-making models

Grant Harman (1980), in his study of the policy process in education, found it necessary to take account of twelve different models taken from political science and other disciplines. Here brief reference will be made to three different frameworks: Easton’s political systems model, Simon’s modified rational model, and Lindblom’s incremental model.

A political systems model was proposed by David Easton (1965) as a framework for political analysis. It was developed as a means of considering the process of policy-making at national level, Easton’s distinctive insight being that the political system can be conceptualised as the means for the authoritative allocation within society of valued things. The output of the system is thus the allocation of benefits and resources made through the enunciation of government policies, consequent decisions and the implementation of actions.

The system’s inputs are of two kinds. First, there are the demands which finally reach the political agenda as items for political decision. A sophisticated and often protracted process is involved, by which general wants are crystallised into specific demands, which are then progressively modified, combined, and reduced in the interest of ‘realism’ by interest groups, political parties and officials. The second type of input consists of the general support which the political system requires in order to function effectively. This involves the concept of a political community which is supportive of the political system generally, of the regime of rules and regulations by which decisions are made, and of those in authority who make the decisions. Feedback mechanisms, providing information concerning reactions within society to allocations made or proposed, enable the system in normal circumstances to adapt and regulate its processes as necessary to cope with disturbance and potential conflict. There is thus an assumption, which is a basic feature of the systems viewpoint, that there is sufficient stability and consensual agreement on values in the society for the allocative decisions of the authorities to be generally accepted.

Though developed in a national context, the model clearly has potential for more general application, such as to policy-making in the local education service (cf Chapter 5). In this context it is of interest that Easton himself has recently referred appreciatively, in a foreword to Howell and Brown’s (1983) twin studies of policy-making in education, to the conceptual novelty, daring, and genuine promise of regarding educational organisations as parapolitical systems, the scope of the term ‘political’ being thereby broadened.

While Easton’s model thus provides an appropriate framework for appreciating the essentially political nature of policy-making, it does not provide an analysis of the different stages involved in the decision-making process. A number of approaches to the process of decision-making are possible, ranging from the comprehensively rational to the modestly incremental.

The classical or rational approach, as described by March and Simon (1958), may be regarded as the ideal if time and resources are plentiful. Three phases are
involved, the first being that of problem recognition. This may be no simple matter in a complex situation, as Vickers (1967) has noted; it would require judgement based on experience and an alertness of mind. The second phase is the search for solutions, which may be a routine matter if the problem can be computer-programmed. If the problem is novel and unusual, creative solutions along completely new lines may have to be sought. The third and final phase is that of choosing a particular solution, having regard to the costs and benefits of alternative solutions. This requires not only a technical appraisal of feasibility but also a judgement of what is practical and politically expedient in the given circumstances, having regard to demands and supports.

A modification to the rational model, first proposed by Simon (1947), has been named the ‘satisficing’ model. This takes account of the constraints and pressures on those involved in decision-making by limiting the search for solutions to those considered most promising and ending the search as soon as a solution is found which is regarded as reasonably satisfactory in the circumstances. ‘Satisficing’ is the term introduced to indicate that the policy-maker accepts the first alternative regarded as satisfactory rather than continuing the search for an optimum solution. In this way Simon conceded that the splendid rationality of ‘economic man’ assumed in the classical theory has to give way in practice to the more modest notion of the bounded rationality of ‘administrative man’.

A hard-headed appreciation of what actually happens in many real life situations is even more evident in the ‘disjointed incrementalism’ model of Lindblom (1959; 1979). This accepts the idea that in practice it is often only a small step, rather than a radical change, which is likely to be acceptable to the diverse groups that the policy-maker has to satisfy. The policies considered are therefore only slightly, or incrementally, different from those previously followed, but a small move in the desired direction may be possible. As external conditions permit or internal changes take place, it becomes possible to make further small advances, so that improvement is achieved not by a continuous process but by a patient strategy of ‘disjointed incrementalism’. The process is also ‘exploratory in that goals of policy-making continue to change as new experience with policy throws new light on what is possible or desirable’ (Braybrooke and Lindblom 1963, p. 71).

Such a mode of proceeding, well known to experienced educational managers, has been dubbed ‘the science of muddling through’. It involves cultivating a political awareness of what can be achieved in the short term, but without necessarily compromising commitment to long-term objectives. In this respect it differs markedly from the random separation of problems and solutions which is a characteristic of Cohen, March and Olsen’s organisational anarchy.

The examples of policy-making models that have been given serve to illustrate some of the ways that theories are structured or are modified to take account of the specifics of practice. They also suggest that different approaches are not necessarily to be treated as exclusive alternatives, but may complement each other by illuminating different facets of complex reality.
Emerging perspectives in the economics of education

Though educational finances have always been a concern of educational administrators at the system level, it may be claimed that sustained academic study of economic aspects of education both in the UK and in the USA began in the late 1950s. An early UK outcome was John Vaizey’s (1958) *The Costs of Education*, while in the USA ‘Investment in Man’ was the significant title of Theodore Shultz’s presidential address to the American Economic Association in 1960. The rapid development of empirical studies which then took place in the USA, involving the analysis by computer of elaborate census returns, also inspired more modest studies in the UK (Woodhall, 1972).

That the new subject had implications for educational policy-making and educational management was soon appreciated. Mark Blaug (1983, p. 7) recently referred to the decade of the 1960s as the golden years ‘when no self-respecting Minister of Education would have dreamed of making educational decisions without an economist sitting at his right hand’. By the middle of the decade Innes, Jacobson and Pellegrin (1965) were already reporting to US educational administrators the human capital and economic growth findings of Schultz, Becker, Denison and others, which were endorsed as ‘highly significant research on the economic benefits accruing to the individual and to society from investment in education’ (p. v). Similarly Peston (1969, p. 63), in a chapter linking economics with the administration of education in the Baron and Taylor volume, argued that the economics of education is of value to the administrator in the way it formulates problems and in its methods of research, and because of its substantive empirical contributions.

The rapid worldwide growth of the subject owed much to the interest of international agencies and of governments in both developed and developing countries in the part played by education in economic growth. Interest was particularly focused on the key concept of human capital, the invention of which, according to Blaug (1976), could be regarded as a very significant paradigm change in the Kuhnian sense. Reviewing the field, Williams (1982, p. 98) concluded that to most authors ‘human capital theory is at the heart of the economics of education’.

According to human capital theory, education enhances productivity so that educational expenditure is as much a form of investment, for both the individual and the society, as capital investment in industrial installation and equipment. From this perspective the resource requirements of education and training (i.e. the capital outlay) are viewed exclusively in terms of the increased income to be derived from that outlay. The propositions underlying the theory were amenable to empirical investigation, which was undertaken on a massive scale in the United States. Some work was also done in the UK, mainly by special surveys to compare the average earnings of persons with different levels of education.

Peston (1969), while admitting that research in Britain was ‘still in a most primitive condition’ (p. 62), provided a summary of substantive findings as follows:
That having allowed for all the other variables which are likely to influence the distribution of income and having attributed the remaining income difference to education, the value of education in producing income differences may be calculated as a rate of return. This return is typically in the range 6–12 per cent per annum and compares favourably with returns to investment in the public and private sectors. From the point of view of the individual this formulation is adequate. From the national standpoint an additional assumption has to be made, namely, that incomes measure productivities (more strictly, that income differences measure differences in marginal productivities).

(p. 63)

Peston himself was prepared to make such an assumption, as is evident from a later passage:

Using work of this kind it is possible to calculate what share of a country’s growth is attributable to improvements in human capital as opposed simply to the quantity of labour, physical capital and technical progress. As much as fifty per cent of growth is attributable to human capital.

(p. 63)

Reviewing the situation over a decade later, Williams (1982, p. 99) was distinctly more cautious. He warned that, since relative earnings are to some extent dependent on supply and demand, which change with time, past experience was an unreliable guide to future development. He conceded, however, that ‘expenditure on education has in the past been, and is seen to be, a worthwhile private investment’ (p. 99). Whether it is also a worthwhile social investment was in his view a more debatable proposition.

Similar doubts have been expressed by Blaug (1983) in his exposition of what he called a second-generation economics of education, which developed the subject in new directions in the 1970s but did not ‘perhaps deliver the same firm pronouncements on matters of educational policy as did the first generation’ (p. 9). He singled out two new directions of particular relevance to human capital theory: first the recognition, stimulated by the neo-Marxian critique of Bowles and Gintis (1976), that schools have a significant socialising function, i.e. the transmitting of specific values and attitudes, which is overlooked by teachers and orthodox economists whose emphasis is on the imparting of cognitive knowledge; and second the challenge to human capital theory, as formulated in 1960s, which is presented by the so-called ‘screening hypothesis’. Each requires some elaboration.

If the second-generation view is accepted—that socialisation, rather than the acquisition of skills and knowledge, is the primary economic function of education—there are implications to be drawn for practice which differ significantly
from the standpoint traditionally expected of economists. First, it would appear that attempts, in the presumed interest of the labour market, to make secondary education more specifically vocational at the expense of general education may be misguided and irrelevant. Second, doubts are raised about the wisdom of educational planning, whether in developed or developing countries, which relies on precise forecasts of manpower requirements for different kinds of educational attainment.

The screening hypothesis adds another dimension to the conceptual framework, by proposing a further economic function for education. Education appears to assist employment agencies by separating out, at different stages, those regarded as less suitable for positions of responsibility and higher salary. A strong version of the hypothesis therefore claims that education is no more than a filtering device, conveniently regarded by all concerned as fair and appropriate, which identifies those with the attributes required in different positions but which does nothing to create or develop those attributes. Blaug concluded, after reviewing the empirical evidence, that this strong version of the hypothesis is untenable. If education were simply a screening mechanism, it would obviously be cheaper and simpler, as Blaug observed (1983, p. 15), to replace it by a battery of personality tests.

A weaker interpretation of the hypothesis, which recognises that educational qualifications (whatever their other functions and merits) are in fact used as predictors of future job performance, can hardly be disputed, as Blaug also admitted. He further suggested that, because promotions usually involve the operation of an ‘internal labour market’ rather than external competition, advantages at initial appointment tend to be perpetuated throughout working life.

The extent to which a modified human capital theory can accommodate the new insights of Blaug’s second-generation economists of education is a matter of continuing debate, which clearly has direct relevance for government policy and for the management of education. If, as advocates of stronger versions of the screening hypothesis claim, increased educational expenditure for further and higher education simply gives salary and employment advantages to the better qualified, it is difficult to justify continued total dependence on public funding which, as Williams (1982, p. 101) notes, ‘provides able individuals with additional lifetime benefits at the expense of their contemporaries’. On the other hand, if educational expenditure can be shown to be a significant factor in increasing national productivity, the case for relying in the main on public finance for the provision of further and higher education will continue to be strong.

Educational costs, resource utilisation and manpower forecasting and planning can be cited as further areas of theory development and research of relevance to both the study and the practice of educational management, the economist’s constant concern being to analyse the implications and explore the consequences of alternative uses of resources. The concepts and methodologies of economics are thus likely to have a contribution to make to the professional
development of educational managers. It may be instructive for the reader to consider, in view of the previous discussion, whether this would be as human capital investment or as part of a sophisticated occupational screening device.

**Micropolitics and other micro-perspectives**

New directions which have recently emerged in the social sciences, potentially of significance for educational management practice, have in common a concern with individual persons and their perceptions of the events in which they are involved, rather than a primary emphasis on collectivities and institutions. Such studies, which may collectively be called the micro-social sciences, vary in theoretical background, basic assumptions and areas of specific interest. Their methodologies differ to some extent, but broadly rely on ethnographic research methods, i.e. on qualitative research, including participant observation (Hammersley and Atkinson 1983).

In particular, the significance for educational management of *micropolitics* has been recognised in the UK (Pratt 1982), the term being used to embrace ‘those strategies by which individuals and groups in organisational contexts seek to use their resources of power and influence to further their interests’ (Hoyle 1982, p. 88). In responding to Hoyle’s paper, Bailey (1982 p. 101) suggested that ‘degree of legitimacy’ is a useful concept in considering the propriety of political strategies, while Glatter (1982 p. 162) warned against regarding micropolitical analysis as prescriptive as well as descriptive.

The concepts of micropolitics, significantly gaining currency in a period of worldwide resource constraint, throw into relief the limitations of theories which virtually ignore the issue of power, through their reliance on rational choice and bureaucratic models of organisation (Pfeffer 1978; Bacharach and Lawler 1980; Pfeffer 1981). It was proposed that more attention should be given to the micro-events of organisational politics, defined by Pfeffer (1981, p. 7) as ‘those activities taken within organisations to acquire, develop and use power and other resources to obtain one’s preferred outcomes in a situation in which there is uncertainty or dissensus about choices’. A similar suggestion had been made by Zaleznik (1970), as noted by Handy (1976), and by Baldridge (1971).

The micropolitical model begins by recognising the diversity of perspectives and goals within organisations, which are pluralistic in terms of values and beliefs and are divided into various interests, sub-units and sub-cultures (Baldrige 1971, p. 25). In contrast to classical and human relations management models—which rely respectively on structural control devices and on normative influences to achieve consensus on organisational objectives and models of implementation—the political model accepts that, in practice, general agreement on goals and technology cannot be taken for granted. In this respect it is similar to the garbage can model previously discussed, but does not accept the anarchic view that decisions are the adventitious result of the interplay of opportunities, problems, persons and solutions. The randomness implied in the
garbage can model, according to Pfeffer (1981, p. 30), ‘is inconsistent with the observation that in organisational decision-making, some actors seem usually to get the garbage, while others manage to get the can’. At least some organisational participants, it appears, know what they want and have the power to get it.

The key themes, as identified by Bacharach and Lawler (1980), are power, coalitions and bargaining. Shifting coalitions promote the opposing interests of different organisational sub-groups. Decisions are the result of bargaining and compromise; they are unlikely to satisfy completely the preferences of any individual or sub-group, but will tend to favour the preferences of those with most power and influence. Attention has thus been given to the measurement of intra-organisational power within organisations, considered as bargaining and influence systems (Abell 1975).

Whereas power is, in part, structurally related, it is claimed that structures are themselves to some extent politically determined. ‘To understand organisational design, one must examine the distribution of power and the preferences of those in the organisation’s dominant coalition’ (Pfeffer 1981, p. 271). Similarly Child (1984) recommends a ‘political contingency approach’ to organisational design. Among the political skills which are then helpful in operating within the structure are an ability to assess the issues which can be won and those which are hopeless, and an ability, taking account of changes in power distribution, to form new coalitions and structures.

Several writers (Peters 1978; Mangham 1979; Pfeffer 1981) have given attention to the crucial role of political language and symbolic action, involving ceremonies, symbols and settings. This applies both in mobilising support and quieting opposition, and, as in Mangham’s action research, in encouraging, guiding and sustaining organisational change. Mangham draws on the symbolic interactionist viewpoint of Blumer (1969) to illuminate the self-reflective character of human relationships in organisations, involving interpretive interaction and tentative definitions of situations, in which non-verbal language may be as significant as what is actually said.

Blumer’s *symbolic interactionism* is one of a number of micro-sociologies which may now be briefly noted. Its relevance to Mangham’s work may be surmised from the following quotation:

> Symbolic interaction involves *interpretation*, or ascertaining the meaning of the actions or remarks of the other person, and *definition*, or conveying indications to another person as to how he is to act. Human association consists of a process of such interpretation and definition. Through this process the participants fit their own acts to the ongoing acts of one another and guide others in doing so.

(Blumer 1966, p. 538)

In its more subjective form symbolic interactionism claims that it is through the process of interacting, and only so, that participants create for themselves a
meaningful social world. The resulting research task is to discover how participants come to agree upon certain meanings and definitions for co-ordinated action (Denzin 1970).

*Ethnomethodology* switches the focus of enquiry from the interactive situation to the methods by which everyday life situations are organised, perceived and understood. It has sought, ‘by paying to the most commonplace activities of daily life the attention usually accorded extraordinary events . . . to learn about them as phenomena in their own right’ (Garfinkel 1967, p. 1). The use of language has been studied, as has the fact that conversations convey meanings beyond what is actually said (Cicourel 1972). The way in which social contexts are negotiated has been examined, and organisational concepts such as structure and efficiency are taken as problematic, i.e. as topics to be investigated rather than terms to be taken for granted (Bittner 1965).

Other micro-social approaches of potential relevance include: *ethogenics* (Harré 1977) which analyses social episodes through the verbal accounts which people give to explain their actions; *hermeneutics* (Gadamer 1975), which seeks to understand situations by an iterative process—the hermeneutic circle—such as is used cumulatively in the interpretation of literary texts; and *critical theory*, which—as developed by Habermas (1974)—might be described as a radical version of hermeneutics. The relevance of critical theory for educational administration practice has been strongly advocated by Bates (1982) and challenged by Lane (1983).

There are thus a number of different approaches which overlap in their areas of interest, but differ in theoretical background and ideological assumptions. A common feature is that they seek to come to terms, as has happened in modern physics in the wake of Heisenberg’s uncertainty principle, with the inescapable fact that the investigators themselves and their methodologies are in integral part of the situation being investigated (Hammersley and Atkinson 1983). Though the philosophical debate will long continue, it appears that the customary sharp differentiation, between the assumed objectivity of a positivism based on an outmoded view of natural science and the admitted subjectivity of the micro-social sciences (some of which have been described above), may prove to have been an over-simplification.

An early integration of micro- and macro-perspectives does not seem to be at hand, in spite of Cicourel’s recent optimism and his injunction that ‘we must study the way human decision-making in complex micro-settings contributes to the creation of macro-structures by routine problem solving activities necessary for the simulation or realisation of basic organisational goals’ (1981, p. 67). It may be, however, that those involved in educational organisations, whether primarily as practitioners or as students, will be disposed to accept the validity of the seeming paradox enunciated in the same volume by Knorr-Cetina. She suggests that ‘it is through micro-social approaches that we will learn most about the macro-order, for it is these approaches which through their unashamed empiricism afford us a glimpse of the reality about which we speak’ (1981, pp. 41–2).
For Thomas Kuhn (1977) the essential tension was between tradition and innovation in scientific research—the tension that leads in time to paradigm change within a scientific community. There is a sense, however, in which Kuhn’s tension is subsumed within that more basic tension between theory and practice which has been the underlying theme of this chapter.

It has been customary for practitioners to state the dichotomy in robust terms: airy-fairy theory versus down-to-earth practice. Sir Edward Bridges (1956, p. 23), when he was Permanent Secretary to the Treasury, put his emphasis squarely on the value of ‘working with or working under people who have far more experience, far more wisdom in handling affairs and dealing with people than I had’. Similarly it has been suggested that understanding the pupils, having commonsense, and being able to profit by experience are the only essential requirements for school headship (Thomas 1927).

Lest it be thought that such views would be exceptional today, it is salutary to note, from a Birmingham University dissertation (Turner 1981), the results of a survey of 66 recently appointed first-time secondary school heads. Placing little reliance on ‘concepts, techniques, theories, perspectives’, the new head teachers stress operational problems and their practical solution strictly in terms of the educational context. Moreover they prefer to rely upon personal qualities and wide experience rather than the findings of observation and research to inform the decision-making process.

Such a viewpoint would presumably not preclude learning from the experience of others, as suggested by Bridges, or from common sense, as recommended by Thomas. It thus involves an acceptance of the distilled wisdom of past experience as concentrated in the precepts of common sense. Commonsense knowledge, however, inevitably carries with it unspoken assumptions and unrecognised limitations. Theorising is taking place without it being acknowledged as such.

In contrast, the theorising about management of Taylor, Fayol, Gulick and the rest, the engineers and captains of industry who produced the pioneer management texts, was quite explicit. It was essentially a commonsense extension of their own considerable and relevant practical experience. Generalisations were then often made with unwarranted assurance, and there was little appreciation, even by proponents of scientific management, that attention needs to be given to the critical conditions which have to be satisfied for propositions found to be tenable in one context to be relevant also in an entirely different situation. This last observation is particularly applicable, as Fielding (1984) has noted, when attempts are made to apply general principles of management developed in an industrial context to other areas, such as education.
Such strictures are less applicable to the human relations tradition, which drew on a number of carefully conducted research projects. Though these may be criticised with hindsight for methodological and conceptual defects, they were successful in drawing attention to human variables inadequately recognised in traditional management theory. As applied to education, human relations ideas found a ready response, as has been noted, because of the support they provided for more participative and democratic forms of management.

For both the classical and the human relations management writers, the immediacy of the claimed connection with practice was paramount. Theory consisted essentially of generalisations from past experience and field observation, whether by scientific management efficiency experts or human relations industrial psychologists.

The New Movement in educational administration and comparable developments in other management areas, such as those which resulted in the founding of the journal, *Administrative Science Quarterly*, in 1956, provided a very different kind of justification for theory and for its relationship to practice. Henceforth, as with the laws of motion of Newtonian dynamics, theory was to consist of assumed relationships between operationally defined concepts, from which empirical laws would be defined and tested. From this viewpoint it is theory which gives meaning to facts, rather than the reverse. The point was clearly made by Griffiths:

> Facts, to be of value, must bear a relationship to one another. The use of theory in the gathering of facts provides this relationship ... But over and above the search for new facts is the concept that theory gives meaning to the facts which are uncovered.

(1959a, p. 26)

It does this by providing practitioners with sets of concepts which enable them to organise the facts with which they have to deal in a systematic and orderly manner. According to Goldhammer (1963), social science concepts provide the tools ‘through which the administrator finds the meaning and the significance of events which confront him’ (p. 15), and hence provide the means necessary ‘for the development of an independent science of educational administration’ (p. 21).

Even in the early days of the New Movement, misgivings were expressed concerning the dangers of excessive abstraction. ‘There are scientists, and administrators too’, stated Halpin (1958), ‘who consistently soar in the clouds. They forget that theory must be rooted in the actual world of experience’. He later complained (Halpin 1960) that ‘the theoretical models are too rational, too tidy, too aseptic’ and that the school superintendent feels that they omit ‘much of the palpable stuff which quickens his pulse in his daily job’.

What the practitioners were in fact saying was that the theories they were being offered, far from providing new perspectives for ordering their experience, were ignoring aspects of that experience which they regarded as important. The rather modest success achieved within the New Movement paradigm has already
been described, research findings relying more on statistical techniques than on insightful conceptualisation. As Iannaconne (1973) observed, ‘We have rigorously tested a lot of poor ideas in educational administration’.

The latter part of the chapter has sought to show how the recognition of educational management as a field of application, rather than a unitary science, has enabled more productive relationships to be developed with the world of practice. This has taken place partly because of the diversity of perspectives in the social sciences and other disciplines, such as philosophy (Hodgkinson 1978), on which an applied field may nowadays draw, and partly because the theories and models currently available make it possible to come closer to the irreducible ‘brute facts’ of real life of which Whitehead (1926) wrote.

The trend to take closer account of the reality of practice has been demonstrated in a number of areas. Whereas the high abstraction of Weber’s ideal-type conceptualisation of bureaucracy contributed immensely to clarifying the concept of organisation as a structure, the various models introduced under the heading of structural relativism, from the binary construct of Burns and Stalker to the organised anarchy of March, Cohen and Olsen, provide examples of ways in which different aspects and assumptions of the classical model can be challenged from the viewpoint of practice. Contrasting models of policy-making for different kinds of situations have been similarly described. Human capital theory in the economics of education provides an example of the modification of a powerful concept of relevance in educational policy-making to take account of perspectives and mechanisms identified by second generation economists of education. Micropolitics has been shown to illuminate an aspect of organisational life, very familiar to practitioners, which is inadequately handled in mainstream theories mainly concerned with the rational achievement of agreed objectives. The related micro-social sciences, by careful analysis of events, language and behaviour, provide insights into how individuals perceive and create their own organisational life and contribute to that of others. The intensely human nature of organisational involvement is highlighted, its implications for understanding and for practice being matters of continuing debate. A further matter for debate is the extent to which reconciliation is possible between macro- and micro-approaches to educational management.

The tension between theory and practice in educational management and in cognate areas of applied social science shows little sign of abating. Such tension can be dissipated and wasted in uncomprehending, sterile debate, but this is not inevitable. Tension can also be dynamic and creative, leading to deeper understanding and to a consequent improvement in the practice of educational management. May it always be so.

THEORY

Iannaccone, L. (1973) ‘Interdisciplinary theory guided research in educational administration’. *Teachers College Record, 75*.

University Council for Educational Administration (1960) *Simulation in Administrative Training*. Columbus, Ohio: UCEA.

This paper attempts to apply the techniques of discourse analysis to some of the key concepts in educational management. It employs a conceptual framework which is informed by management theory and policy studies as well as by the literature on discourse. The central part of the paper considers examples of discursive forms which serve to disguise or conceal the power dimension in educational institutions: these include appeals to ‘learning communities’, ‘transformational leadership’ and ‘participation’. It also examines the significance of discursive shifts from ‘rational’ to ‘emotional’ language in education, drawing on the work of James (2000) and Hartley (1999). The dominant vocabulary of educational management is then related to wider issues of political power. Finally, the paper summarises the value of discourse analysis at three levels of critical interpretation – text, voice and narrative – and suggests that, despite the pervasiveness of managerial discourse, there remains scope for interrogation and challenge.

Starting points
Much has been written about the origins of discourse analysis in the work of Baudrillard, Derrida, Lyotard and, above all, Foucault, and its analytical and critical techniques are now widely employed in the humanities and social sciences. The present paper draws on this background but it does not attempt to enter the highly complex theoretical debates about competing definitions of discourse or to take sides amongst the various postmodernist schools of thought. Its aims are much more modest in scope and focus on the use of rhetorical devices by managers in educational settings and the purposes which they serve. One point of departure is a belief in ‘the significance of language in the production, maintenance, and change of social relations of power’ (Fairclough, 1989, p. 1).
It will be argued that the management of meaning is an important instrument of professional, institutional and ideological control. Peter Cookson states:

Decoding the power discourse requires a series of understandings about the nature of language as a verbal expression of social relations. Words do not exist in a disembodied form; they have meaning within a social context that is class bound, conflictual and power driven. Those who control this symbolic world are able to shape and manipulate the market-place of educational ideas.

(Cookson, 1994, p. 116)

The ‘social context’ that frames the prevailing rhetoric requires that attention is paid not just to verbal expressions but also to organisational structures and processes, social relations and taken-for-granted assumptions about institutional ‘reality’. Commenting on Foucault’s account of the relationship between knowledge, rhetoric and power, Harvey (1990) observes:

Close scrutiny of the micro-politics of power relations in different localities, contexts and social situations leads him to conclude that there is an intimate relation between the systems of knowledge (‘discourses’) which codify techniques and practices for the exercise of social control and domination within particular contexts.

(p.45)

Schools, colleges and universities are examples of particular sites where these micro-political processes can be seen at work (see Blase and Anderson, 1995). In these institutional settings the prevailing discourses (promoted by those who ‘manipulate the marketplace of educational ideas’) provide the concepts and assumptions which shape the ‘common sense’ view of the world held by teachers and students. The deconstruction of some examples of these prevailing discourses forms the central part of this paper.

In respect of methodology, discourses ‘can be analysed at various levels, from their basic constituents, statements, to accumulated discursive formations’: they are ‘associated with ‘games of truth’ working within fields such as science and government to authorise what can be judged as true or untrue’ (Dannaher, Schirato, & Webb, 2000, p. 45). In the case of education, the task is to examine educational ‘texts’ of various kinds produced by those seeking to promote or explain policy initiatives and management practices. These ‘texts’ invite scrutiny not just in terms of their surface meaning but also in terms of their underlying purposes. Sensitivity to the nuances of language, to the relationship between speaker or writer and audience(s), and to the social and cultural dynamics of the institutions which generate and receive ‘texts’, is at the heart of the process.

Discourse analysis has been employed very effectively by Stephen Ball (1990; 1994) in the relation to UK (particularly English) educational policy and
its influence can be seen in policy studies in other countries (see, for example, Hargreaves, 1994; Smyth, 1995). Its application to management has been less fully developed though Anderson and Ginsberg (1998) have offered a subtle theoretical account of how Foucault's ideas on power can illuminate the field of educational administration. The deployment of a range of discursive techniques has been an essential element in the legitimation of educational policies and management practices in a period of rapid change. The policy context within which this process has occurred will be sketched in the next section. First, however, it is necessary to comment briefly on the changing character of management as a discipline.

Pollitt (1997) has drawn attention to different stages in the evolution of management theory and has identified the 1980s as a period when ‘culture management’ became fashionable. This was a reaction against over-rational mechanistic and ‘systems’ approaches to the management of organisations. By contrast, ‘culture management’ emphasised the importance of metaphor, symbolism and ritual in organisational life. The task of shaping the organisational culture was seen as the responsibility of senior management who were expected to motivate staff, not through traditional techniques of regulation but through a positive climate which encouraged the internalization of constructive attitudes among the workforce. Metaphorical and symbolic representations of the values of the organisation were a crucial part of this process. The place of metaphor in educational contexts will feature in later discussion.

There is usually a time lapse between the development of management ideas in the private sector and their appropriation by the public sector and recent debate within the field of educational management reflects this. A special edition of the journal Educational Management and Administration appeared in the summer of 1999 and sought to redefine the conceptual map of the field. Bush (1999) argued that while educational management was not in a state of ‘crisis’ it was at a ‘crossroads’ and needed to avoid the charge of merely serving to justify the agendas of bureaucratic bodies such as the Teacher Training Agency (TTA) in England. Likewise, Ribbins (1999) drew attention to the danger of the field of educational management becoming ‘overly technicist and managerialist in its orientation’ and suggested that ‘one set of possible correctives is to refocus on policy, context and environment’ (p. 235). This leads back to particular institutional settings and the discursive strategies that are used to maintain their structural and managerial ‘integrity’. It also requires some understanding of the wider policy framework which sets limits to the way individual institutions can function.

The policy context

All advanced educational systems have experienced major reforms in the last two decades. Although the specific policy configurations have varied in different countries, certain general trends are identifiable. These include an emphasis on market forces and consumerism, choice and the rights of parents, school
effectiveness and school improvement, teacher competence and accountability, and raising standards of achievement. The role of central governments in promoting these policies has invited contrasting interpretations. From one perspective, government intervention can be viewed as a necessary step aimed at challenging the conservatism and self-interest of professionals and the inefficiency of intermediate layers of government (at state, district and local authority levels). From another perspective, it can be seen as a confused attempt to devolve responsibility to individual schools and colleges, leaving them without the collective support structures they need and, ironically, leading to an increase rather than a decrease in bureaucracy (as each institution has to deal with administrative matters formerly handled elsewhere in the system).

The effect of these trends on teachers and other education professionals has received a great deal of attention from commentators: for example, the reforms of the 1980s, particularly in England but also in other parts of the UK, have been subject to extended analysis by Knight (1990), Lawton (1992, 1994), Barber (1996), and Hartley (1997). More generally, the literature on the management of change has become increasingly international in character (Hargreaves 1994, 1997; Fullan & Hargreaves, 1992). One reading of these developments is that they have created educational systems that are so caught up in the implementation of reform that most teacher energies are directed towards ensuring that new systems, structures and processes are in place. There is little or no time to reflect on aims and principles. As far as teachers are concerned, it is permitted to ask ‘How?’ questions but not ‘Why?’ questions. Indeed, some politicians and bureaucrats would argue that it is not the business of teachers to spend time on these ‘first order’ questions: their job is to concentrate on operational matters within a framework that is ‘given’. Chris Woodhead, HM Chief Inspector of Schools in England and Wales, has been disarmingly frank on the subject. With reference to the training of headteachers, he has posed the question: ‘… should a headteacher qualification involve participants in ‘scrutinising’ (a weasel word if ever there was one) government policy?’ His answer is unambiguous: ‘Training for headteachers ought to be practical … To suggest that they should waste precious time sitting around pontificating on the rights and wrongs of the latest political announcement simply reveals how ludicrously out of touch and self-indulgent some academics, on occasion, can be’ (Woodhead, 1998, p. 55). The message is clear. Would-be headteachers who value questioning, reflection and critical thinking, and who believe that these skills can lead to better-informed practice, need not apply for a place in Woodhead’s Brave New World.

Another way of describing these trends would be to say that they can be interpreted as an attempt to decouple policy and management. A few years ago the present writer published an article reflecting on this in the Scottish context and argued that the effect of some of the reforms that were taking place was deskilling and de-professionalising, not just for teachers but also for managers. Staff were encouraged ‘to focus on the ‘efficient’ performance of the immediate task in hand, and to refrain from thinking too deeply about the constraints within
which they work, far less about the social function of institutionalised schooling’ (Humes, 1994, p. 182). The article called for greater courage on the part of managers and suggested that they have a moral obligation to challenge policy makers to live up to the ideals contained in policy documents – by, for example, providing adequate resources to ensure effective implementation (see also Fairley & Paterson, 1995).

The somewhat optimistic title of that paper was ‘Policy and management: mending the fracture’. In fact, the fracture has, if anything, got worse. New Labour’s reform programme continues the momentum of the New Right and ensures that a chronically tired and largely demoralised teaching force lacks the strength and the will to engage in any kind of sustained critical interrogation, let alone develop an effective strategy of resistance (see Docking, 2000). Their position is not eased by the fact that many of those who occupy leadership roles within the education service – and this includes some academics – have succumbed to the pressure to concentrate narrowly on matters of implementation, without any serious reflection on the justification for official policies. They simply wait for the directives from above and pass them down the line. They have found, in some cases from bitter experience, that compliance and conformity are rewarded while resistance is penalised. In England, Ofsted and the Teacher Training Agency can claim much of the credit for this compliance culture. In Scotland, Her Majesty’s Inspectorate has moved in a similar direction, though less crudely and with greater teacher resistance.

Sooner or later, however, a counter-movement to the regime of surveillance, policing and control will begin. On present policies there are likely to be more failing schools, more demoralised teachers seeking a way out, greater problems of recruitment, more ‘super-heads’ deciding to quit. The counter-movement is likely to have a number of origins, some of which cannot be predicted. An important element in preparing the ground for a counter-movement – in terms of increasing understanding of what has been happening – is the use of discourse analysis to deconstruct the rhetorical deceptions that have been an essential part of educational policy-making and management practice since the 1980s. As Fairclough (1989) remarks in his study of language and power, ‘consciousness is the first step towards emancipation’ (p. 1).

**Metaphor and the discourse of community**

There are Idols which we call Idols of the Market. For Men associate by Discourse, and a false and improper Imposition of Words strangely possesses the Understanding, for Words absolutely force the Understanding, and put all Things into Confusion.

(Francis Bacon, *Novum Organum*, 1620)

It was noted above that the application of discourse analysis to educational management (as distinct from policy) is somewhat under-developed. However,
the territory is not completely uncharted. Some writers in the field of educational management have been very aware of the importance of language. Davies (1994) has written that ‘Educational management is not a discipline, but a collection of languages, a collection of different ways of seeing . . . Before managing schools in particular directions, one has to manage meaning’. He adds that most schools are the scene of ‘a series of competing [management] discourses’ (pp. 4–5). Again, writers such as Beare, Caldwell and Milliken (1989), and Clark (1996) have drawn attention to the importance of metaphor in expressing the core beliefs and values of an institution (see also Bacharach & Mundell, 1995). Clark (1996) suggests that most schools ‘are governed by mixed metaphors’ (p. 118) and that such governing metaphors are largely taken for granted. A recent writer on Catholic education, Sullivan (2000), structures his analysis in terms of the competition between various metaphors for dominance in thinking and practical decision-making. He discusses five in particular – school as family, as business, as church, as political community, as academy. The general point is that metaphorical comparisons represent one attempt to ‘manage meaning’ and shape the perceptions of those who work in an institution. Such attempts can be perfectly well-intentioned and can be motivated by a desire to give unity of purpose to staff and a sense of belonging to pupils. However, they can also serve less benign purposes and can operate as barriers to thinking about ‘first order’ questions of aims and values. Morgan (1997), who has written extensively about the use of metaphor in organisations in general (not specifically educational organisations) has observed that ‘any given metaphor can be incredibly persuasive but it can also be blinding and block our ability to gain an overall view’ (p. 347). When this happens, the restriction serves to limit the parameters of legitimate debate about policy and management. In other words, discourse itself can be subject to management.

An emphasis on ethos, climate and culture is usually associated with a symbolic or metaphorical representation of the organisation. Such representations are invariably positive in character – David Hargreaves’s comparisons of schools with factories, prisons and asylums (in Mulgan, 1997) do not feature in official discourse. Beare, et al. (1989) suggest that one way of enhancing school culture is for principals or headteachers to ‘select deliberately a metaphor which affirms the way they image the school and repeatedly to use it . . . Keep it simple: one simple picture, constantly repeated which affirms ‘This is what our school is like’” (pp. 189–90).

Consider the concept of community, which has become a popular metaphorical representation – more especially the school as a learning community, one embodiment of the learning society which politicians are so fond of invoking. (‘Learning society’ is perhaps the soft, reassuring version of ‘knowledge economy’.) Community is clearly intended to be a praiseworthy concept. Communities are regarded as places which give identity and self-esteem to individuals and provide them with a network of support: they have rules and conventions which express a value system and which are intended to protect rights
and freedoms that serve the interests of the members. The achievements of educational communities are sometimes given formal public recognition in the shape of Investors in People status or Health at Work awards. However, it is not unknown for staff to express scepticism about the real value of such awards which they regard as designed for external consumption rather than as indicative of a genuine concern by management for the health and welfare of employees.

Communities are not invariably or inevitably positive. Some communities are negative and destructive in their effects. Any major city – and increasingly some rural areas – has communities that are rife with crime, vandalism, drugs and intimidation, where the quality of life is poor. For some pupils and some teachers, the school ‘communities’ which they inhabit will be rather like that – for example, pupils who are bullied or who experience repeated failure, teachers who are suffering from stress and overwork. Furthermore, in such institutions all kinds of negative learning will be taking place: how to suppress fears and emotions, how to conceal feelings of worthlessness, how to remain silent in the face of unfair treatment. In such circumstances, the positive concept of community is at best a myth, at worst a sham. Even Clark, who (in his 1996 book, Schools as Learning Communities) holds up the concept largely for approval, acknowledges that the power of community can be ‘corrupting’ and that a ‘vague and unctuous version of community [can be] used to cover a multitude of sins (and conflicts).’ (p. 164).

The discourse of leadership

The same kind of analysis can be applied to other areas of fashionable discourse. ‘Leadership’ is an example of a concept that is widely invoked but subject to very little in the way of critical scrutiny. Hargreaves and Goodson have written that the literature on leadership ‘is often strong on rhetoric but weak on evidence’ (in Leithwood, Jantzi, & Steinbach, 1999, p. viii) and West-Burnham (1997) observes: ‘Leadership . . . is subject to normative writing where exhortation replaces research and where ethical stances are seen as overriding any empirical base’ (p. 4). Politicians find educational leadership an attractive concept because it places responsibility for success or failure largely in the hands of professionals: thus ‘failing’ schools are presented as the victims of poor leadership (rather than ill-conceived policies) and the belief that a new leader should be able to turn them round gains currency. The school effectiveness and school improvement movements have (no doubt unconsciously) helped to reinforce this attitude by attaching considerable weight to ‘in school’ factors in explaining differential results by apparently ‘similar’ schools and perhaps underestimating the extent to which external social factors influence pupil achievement. Add to this the current focus on the management of change in educational institutions and the scene is set for the elevation of leadership to revered status. Fullan (1993), for example, states that ‘... educational leaders must learn to influence and coordinate non-linear, dynamically complex, change processes’
(pp. 74–5). One exception to this pattern is MacBeath (1999) whose study of the ways in which schools can, through a process of self-evaluation, manage their own strategies of improvement, does not include leadership as one of its key categories.

Those writers who do give prominence to leadership recognise that it can take a variety of forms. Leithwood, et al., (1999) offer a classification of different types based on an extensive survey of the literature: instructional leadership; moral leadership; participative leadership; managerial leadership; contingent leadership; and transformative leadership. The last category is particularly interesting because of its compatibility with the emphasis on the management of change. Included under the term transformational leadership ‘are writings about charismatic, visionary, cultural and empowering concepts of leadership’. It should be noted here that all of the adjectives linked with the word ‘leadership’ serve to soften any authoritarian associations it might have on its own. ‘Charismatic’ and ‘visionary’ convey the sense of an inspirational quality which will energise colleagues. ‘Cultural’ and ‘empowering’ draw attention to the value system of the organisation as a whole and suggest that agency is distributed democratically. ‘Transformational’ implies that staff are engaged in the shared enterprise of initiating and responding to change, in which everyone has a stake in meeting the challenge successfully. Qualifying ‘leadership’ in these ways may serve to make it more palatable and deflect attention from its directive aspects. Similarly, writing on ‘leadership as spirituality, as artistry, as the creation of meaning’ (West-Burnham, 1997, p. 4) shifts the focus from the authority of the leader to the supposed benefits for the led. Such linguistic softening cannot, however, entirely conceal the realities of educational hierarchies. In the final analysis, ‘Leadership is realized in the process whereby one or more individuals succeed in attempting to frame and define the reality of others’ (Smircich & Morgan, 1982, p. 258).

Some teachers are not unaware of the control purposes of the rhetoric of leadership and learning communities, though most teachers are simply too busy to have time to reflect on the implications. Career-minded staff may pay lip service to the prevailing management culture without being committed to it at a personal level. Others are capable of thinking and acting ‘subversively’ with the new forms of discourse and using them to challenge perceived management failures. Over time this can lead to the discrediting and displacement of once fashionable terms. What may not change is the day-to-day reality of teachers’ lives as they struggle to cope with competing and sometimes conflicting demands for increased accountability, higher standards and curriculum reform. In these circumstances, is it any wonder that staffroom cynicism is widespread?

The discourse of participation

One of the paradoxes of the education policy agendas pursued by governments in advanced democracies is that the regulatory mechanisms which serve to
reduce teachers’ autonomy and increase their accountability are often accompanied by a discourse of participation (Hargreaves, 1994). Teachers are ‘consulted’ about curricular reform programmes and are encouraged to become involved in research studies, community projects and development groups. Writing in an American context, Anderson (1998) argues that ‘the current discourse of participation is part of a historical concern of school administrators with public relations and – particularly when schools are viewed as in crisis – the creation of greater institutional legitimacy’ (p. 573). He cites studies which suggest that teachers increasingly complain that participation is often bogus and, far from increasing job satisfaction, adds to their workload and reduces the amount of time they can devote to what they see as their primary task, namely interactions with students. Anderson refers to ‘the linguistic slippage that occurs with regard to the meaning of participation and the diverse agendas that are promoted within its discursive umbrella’ (p. 574). In effect, he suggests that most appeals to participation should be regarded as strategies of containment designed to disguise the power nexus within educational systems.

Presented more positively, the manager who encourages participation might be seen as a ‘human resource developer’ (see Usher & Edwards, 1994, 111–116) allowing junior colleagues to enjoy staff development opportunities. However, those selected to participate are often more appropriately regarded as beneficiaries of senior management patronage: they are being identified as people who will operate constructively within existing conventions and who may merit further advancement. Where a more open form of participation is allowed, the process is usually carefully managed. In Scotland, the discourse of participation is closely allied to notions of consultation, partnership and consensus (see Humes, 1986, 1997; McPherson & Raab, 1988). It is part of the received wisdom about how the Scottish educational system functions that it is open and democratic in character, inviting widespread consultation on policy initiatives, involving all the major stakeholders and seeking a consensus wherever possible. In practice, the consultation process is skilfully orchestrated by Her Majesty’s Inspectorate, the ‘partners’ are certainly not equal and the consensus is often more apparent than real (see Humes 1999). The preferred outcome is invariably a single cost-effective ‘solution’ to complex educational problems.

It would be wrong, however, to conclude that participation offers no scope for what Anderson (1998) calls ‘authentic’ involvement. He asks a series of important questions which open up the territory for debate:

- Participation toward what end?
- Who participates?
- What are the relevant spheres of participation?
- What conditions and processes need to be present locally for participation to be authentic?
- What conditions and processes must be present at broader institutional and societal levels to make participation authentic? (586–594)
It is by responding to these questions that educators may find some discursive space in which to challenge the limited participation that officially-managed processes normally allow.

**Rational and emotional management**

Managerial language is typically upbeat, even evangelical, in character, expressing a ‘can do’ philosophy of positive action and achievement. Managers like to hear and spread the ‘good news’ and celebrate achievement. Their discourse speaks of ‘challenges’ and ‘opportunities’ rather than ‘problems’ and ‘obstacles’. They define their own role in terms of providing ‘vision’ and articulating the ‘mission’ of the institution and projecting its public ‘image’.

Within this basic framework there are variations of tone and emphasis. Sometimes the continuing potency of hard-edged managerialism is in evidence. This is apparent in the invocation of terms like ‘objectives’ and ‘targets’, ‘competences’ and ‘standards’, ‘achievement’ and ‘effectiveness’, ‘quality’ and ‘accountability’. The emphasis is on rational strategic and operational planning, usually with a focus on ‘delivery’ within a clearly defined time-scale. School development planning is an example of this.

At other times, a gentler form of discourse can be found. This is sensitive to the ‘morale’ of staff and the ‘ethos’ of the institution. It speaks of ‘empowering’ individuals and giving them ‘ownership’ of policies. ‘Communication’ and ‘consultation’ and ‘collegiality’ are essential elements of this approach. Managers have to adopt a ‘listening’ mode and be ‘responsive’ to the representations of colleagues. They seek to create an atmosphere of ‘trust’ and ‘loyalty’ and ‘openness’ in which the ‘dignity’ of staff is respected, in the hope that they will achieve personal and professional ‘fulfilment’. The inclusion of these terms in the lexicon of educational management suggests that the appeal is more to emotion than to reason, though it would be wrong to present the two forms of discourse as dichotomous. As will be shown, there are important points of convergence.

In an unpublished paper, James (2000) has offered an interesting perspective on these discursive modulations. He states that schools are ‘complex emotional mazes’ which require headteachers to ‘consider more than the rational and functional aspects of their leadership’. Moreover, ‘emotions are powerful and intrinsic within organising and because educational institutions are arenas for particularly high levels of emotion, especially during radical change, managing this emotional dimension is significant’. James draws a distinction between emotional containment, which he presents as a legitimate process involving the creation of ‘structures and processes in organising within which emotions can be experienced’ and emotional control, which involves illegitimate attempts ‘to limit and restrict the experience of emotion’. He concludes that since there is no escape from the emotional dimension ‘it must in some sense be managed’. He adds, however, that ‘emotions cannot be managed in the way that other objects
can be during the management of radical change in schools’. Among other things – though this is a point that James himself does not make explicitly – the management of emotions requires a different form of discourse from the management of, for example, curriculum, resources or finance.

Addressing similar issues, Hartley (1999) offers a more critical account of the shift from ‘rational’ to ‘emotional’ management. Whereas the former attends mainly to structures and bureaucratic processes, and the strategic objectives of the organisation, the latter attends to social processes and the human (not just the professional) qualities of staff. Hartley goes on to suggest that ‘emotional’ management ‘may serve as the new legitimatory rhetoric in the management of teachers’ (p. 317). He cites the discourse employed in a 1998 publication on the training of headteachers in Scotland. This document describes the preferred interpersonal qualities which might be required of headteachers. These are:

- demonstrates confidence and courage
- creates and maintains a positive atmosphere
- inspires and motivates others
- communicates effectively
- empathises with others
- values and works through teams

The discursive shift represented by this terminology can be explained as a recognition that schools are increasingly seen as complex, ambiguous, messy institutions which cannot be managed solely on the basis of rational planning. Attitudinal and dispositional qualities are at least as important: thus the management of those attitudinal and dispositional qualities becomes an issue and the example set by the headteacher is crucial. The headteacher is expected to display and demonstrate a range of permitted emotions which, unsurprisingly, are to be positive and optimistic in character. Hartley coins the term ‘contrived emotionality’ (p. 320) to describe this attitudinal and dispositional repertoire. In a sense, what is happening is the rationalisation of the emotions, a process that helps to explain why the two styles can co-exist without obvious conflict. The sociologist Mestrovic, whom Hartley quotes, describes the process as the ‘manipulation of emotions by self and others into a bland, mechanical, mass-produced yet oppressive ethic of niceness’ (Mestrovic, 1997, cited in Hartley, 1999, p. 319).

Blase and Anderson (1995) show how a culture of ‘niceness’ leads to the ‘institutional silencing’ (p. 138) of criticism. Norms of propriety, courtesy and civility discourage the voicing of concerns which might be construed as a challenge to authority. Furthermore, if meaning is managed effectively, the majority of staff internalize the professional and organizational vocabulary through which work is defined by officialdom. Dissent is silenced by representing it as straying beyond the boundaries of acceptable professional discourse. Descriptions such as ‘troublemaker’, ‘negative’, ‘not a team player’ and ‘over the top’ are used to
label those who refuse to play by the (linguistic) rules of the game. ‘The individual is marginalised and pathologised through labelling in order to protect the legitimacy of the institution’ (Blase & Anderson, 1995, p. 138).

The business of management, however carefully presented and softened by emotional terminology, is at one level concerned with control. It is designed to defuse those aspects of institutional life which are potentially disruptive – the rivalries and ambitions of staff, the personal resentments and disappointments, the anger, frustration and cynicism that simmer in staffrooms, the sense of injustice which management decisions sometimes provoke. These are real emotions, not the sanitised variety that so often features in official documents about ethos and school culture. But they are also negative emotions and so are not ‘permitted’, however justified they may be by circumstances. The functioning of the organisation requires that they are controlled, not least in the interests of pupils. Professional socialisation at the training and induction stages of a teacher’s career provides the basis for self-imposed emotional control. But with a teaching force increasingly affected by low morale, overwork and surveillance regimes of various kinds, other influences are required. It is against this background that emotional management from above becomes important.

There is some evidence of an emerging professional debate involving administrators, policy makers and school leaders, not just academic researchers, about the importance of emotion in educational settings. A recent online conference organised by the Australian Principals Associations Professional Development Council (APAPDC) had, as one of its key themes, ‘Healthy School Communities’ and a number of the contributors made reference to the importance of understanding the emotional dimension of school dynamics affecting students, teachers and parents as well as principals (headteachers). A Canadian contributor (Beatty, 2000) in a paper entitled ‘Pursuing the Paradox of Emotion and Educational Leadership’ (http://www.apapdc.edu.au/) offers a particularly interesting report of empirical studies investigating the positive and negative emotional experiences of, first, teachers in their interactions with educational administrators and, secondly, principals (headteachers) in their roles as leaders. Beatty’s aim is to begin ‘to create a collection of voices pertaining to emotion and educational leadership’ (see also McCrea & Erlich, 1999). Her approach complements (and in certain respects challenges) the perspective on leadership offered earlier in this paper.

Underlying all of this is the question of power. Whose interests do the various strategies of ‘discursive containment’ serve? Who is advantaged by the strategic capture of the marketplace of educational ideas? Ball (1994) says: ‘Discourses are about what can be said, and thought, but also about who can speak, when, where and with what authority’ (p. 21). To gain discursive control enables a ‘regime of truth’ to be established – ie, a ‘common sense’ version of events that
comes to be seen as self-evident and serves to marginalise or exclude other representations. Thus persuading teachers that they work in a ‘learning community’ in which they are ‘empowered’ and allowed to develop ‘ownership’ of the policies which they are expected to implement is a sound managerial strategy which serves to disguise the power dimension of the organisation. It strengthens the legitimacy of the leadership by representing policy and management in terms of democratic consultation, partnership and consensus. Against this background, it is very hard for teachers to find their own voice, far less to have it listened to, in an arena that will enable it to have any impact. Leaders who present themselves as benign change-agents using a rhetoric that makes great play of ‘participation’ are likely to be much more successful than those who simply invoke the authority of their formal status.

Whether this is, in the words of Bacon, a ‘false and improper imposition of words’ or a legitimate way of trying to cope with the uncertainties and confusions of the post-modern world, might be a matter for debate. But, however it is interpreted, it is important to note the wider political context within which all this is happening. This is an age of public relations experts, spin doctors whose function is to present ‘reality’ in a particular way, an exercise that involves the skilful manipulation of language and media images, the leaking of information and mis-information, the promotion, destruction and rehabilitation of political and professional reputations. Witness the rise, stumble and rise of Chris Woodhead.

Presentation becomes all-important. ‘Reality’ becomes malleable, another commodity that can be packaged and marketed. What emerges is an Orwellian world in which words mean something other than that which they ostensibly denote. Thus ‘guidelines’ are, in fact, mandatory; ‘empowerment’ involves taking on additional responsibilities without additional power; ‘ownership’ requires unreflective acquiescence in the face of central directives; and ‘consultation’ is a process to be managed rather than a source of insight. In all of this the notion that education has something to do with knowledge, truth and understanding becomes a naive anachronism.

It will be apparent by now that the present writer subscribes to the sceptical school of management represented by writers such as Furnham (author of The Psychology of Managerial Incompetence) and Burrell (author of Pandemonium: Towards a Retro-Organization Theory). The value of certain forms of management thinking for educational institutions has been oversold and, fortunately, there is a growing awareness of some of its weaknesses. For example, the jargon associated with Human Resource Management (HRM) and Total Quality Management (TQM) is increasingly subject to criticism (see, Fitz 1999). The mantra of so-called management gurus – terms like commitment, flexibility, excellence, integration, transformation, continuous improvement – is recognised as offering a simplistic solution to highly complex problems. It is no accident that people speak of the ‘cult’ of managerialism – implying a naive faith, gullible followers and charismatic leaders concerned as much with their own power as with the
enlightenment of their audience. Certain forms of managerial discourse have outlived their usefulness – the ‘macho’ variety of the 1980s and its ‘spiv Delboy’ successor which offered to credit-rate and certificate students with an ease that rested uncomfortably with claims of quality. More subtle forms are now in evidence – thus the emergence of emotional management and the appeal of learning communities, the latter implying a collegiality of approach to counteract the less attractive aspects of private corporate culture invading the educational world.

Discourses are constantly developing in response to internal and external pressures coming from ideological, economic, political, professional and institutional forces. This means that the language in which educational policies are expressed is subject to constant adjustment and refinement – examples would be the successive formulations of the National Curriculum in England and Wales and higher still in Scotland. In higher education, staff in the UK are currently having to come to terms with the notion of ‘benchmarking’ as a way of trying to ensure comparability of standards across institutions teaching similar subjects for the same level of award. This exercise, at one level, is a sensible attempt to respond to the move towards a mass system of higher education taught within a highly diversified range of institutions. At another level, it represents a victory for the educational bureaucrats of the Quality Assurance Agency (QAA), and a dangerous move towards a centrally-directed national curriculum in higher education. There is considerable scope for the use of discourse analysis in deconstructing the documentation of QAA and the Funding Councils. For most senior managers in universities, the massive task of simply assimilating the contents of the daily directives which issue from these bodies ensures that critical interrogation is rarely possible. This may help to explain why someone like Sir Stewart Sutherland, Principal of Edinburgh University, has suggested that in recent years universities have failed to ask the right questions and, to that extent, have been complicit in their own containment (Sutherland, 1999). These examples reinforce the point made in the opening section about the need to locate the language/power configurations of particular institutions within the wider political/ideological context which frames them. The final section will attempt to summarise the ways in which the study of discourse can inform both micro and macro levels of analysis.

**Text, voice and narrative**

Both policy and management discourses can be considered at the simple level of ‘text’. This involves looking at what is said, the central concepts and recurring metaphors that are employed, their clarity and consistency, their meaning for the audience or audiences to which they are directed, and the extent to which they relate to the stated purposes of the organisation. Text can be read ‘on the lines’ and ‘between the lines’: discursive threads can be elucidated and subjected to analysis. It is not enough, however, to confine the exercise to internal linguistic deconstruction. Gale (1999) points out that ‘discourses produce texts as well as
interpret them and they appeal to ideologies while also being informed by them’ (p. 397). Attempting to explain the ideological context within which discourses are developed and come to dominance is an essential part of the process.

Management discourses can also be considered at the level of voice. Here the questions are: ‘Whose account is being heard?’ ‘Is it an authentic voice based on real experience or an unconvincing application of half-understood management jargon to the world of education?’ ‘Is there scope for alternative voices, including minorities?’ A comparison with feminist readings of history is instructive here. The dominance of male voices has been challenged and illuminating feminist readings of many fields of human endeavour are now available. Similar techniques need to be applied to the world of educational management in which the dominant voices remain those who exercise authority and have access to privileged knowledge (see Blackmore, 1996). Creating discursive space for the voices of classroom teachers to be heard is not easy, particularly in a climate where they are discouraged from straying from the tightly-defined territory mapped out for them by officialdom. But it is not impossible. There is major work to be done, both in initial teacher education and in continuing professional development, to counteract the negative effects of recent and current policies on teachers’ perceptions of their potential contribution to policy development and management practice.

The voices which control the text are able to construct a ‘narrative’, a preferential account of what happens in organisations. It is usually a story of managerial success and organisational achievement which is hard to challenge, as the experience of ‘whistleblowers’ testifies. Failures are consigned to footnotes or explained as the result of circumstances beyond managerial control. The ‘integrity’ of the organisation and the ‘credibility’ of the management requires that counter-narratives are discredited – by, for example, being presented as the misrepresentations or fabrications of disaffected employees. The highly contestable nature of many of the official narratives that are presented for public and professional consumption is disguised by the form in which they are written. ‘Public policy documents . . . almost always conform to a generic structure that is “written in such a way as to deny the politics of discourse”’ (Gale, 1999, p. 400, quoting Yeatman, 1990, p. 160). Thus certain narratives become dominant and serve as the received wisdom of educational institutions and systems. Discourse analysis can help to expose the political character of official accounts of policy and challenge the ostensibly ‘neutral’ stance adopted by bureaucrats.

The interrogation of managerial discourse along the lines suggested takes the researcher beyond the particular institutional context in which the language appears. It opens up questions about the origins of dominant discourses, the way in which they have been promoted, the ideological climate which has enabled them to gain currency, and the groups which benefit from them. It re-instates the importance of theory in educational debate and lifts the head (and the spirit) above the mind-numbing routine and bureaucratic regulation that afflicts so many educational institutions. Finally, it challenges the claims to knowledge

THE DISCOURSES OF EDUCATIONAL MANAGEMENT

175
which managers and decision-makers assume and requires them to explain, justify and defend both their own position and the demands they make on others. To the extent that these opportunities for discursive interrogation and the occupation of discursive space are seized, the possibility of beginning the counter-movement to the oppressive regimes of control, which have become a feature of educational systems in advanced societies, will be strengthened.

Acknowledgements

I am grateful to Chris James of the University of Glamorgan for permission to quote from his BEMAS paper in advance of publication, and to Valerie Friel, Fiona Skelton, Tom Bryce and Malcolm MacKenzie for their comments on an earlier draft of this article. I also wish to thank the two anonymous referees for their helpful suggestions in revising the paper.

‘REALLY GOOD IDEAS’?
Developing evidence-informed policy and practice in educational leadership and management

Rosalind Levaćic and Ron Glatter

Introduction
In the light of the current promotion of evidence-informed policy and practice (EIPP), we examine its potential in relation to educational leadership and management. We begin by considering what may be meant by the term and some of the issues to which it gives rise. We then look at some factors promoting and inhibiting the development of EIPP. Finally, and most importantly, we suggest a way forward for developing EIPP in educational leadership and management, including some ideas about the possible role of BEMAS in supporting an EIPP agenda.

Our general stance is that we see considerable potential in this approach, which is why in this article we go beyond a conceptual discussion to develop a set of proposals. EIPP is concerned among other things with the culture of the research community and the relationships of its members with policy makers and practitioners (matters which have been central to BEMAS in the almost 30 years of its existence). It requires the creation of structures and practices that promote effective interaction between the three communities. This is not a simple task. Hence we seek in what follows to be realistic and to take account of the context within which each community operates and the pressures to which it is subject.

EIPP in context
In order to assess the problems and possibilities of EIPP we need to be clearer as to what the term might mean. The word ‘evidence’ defines the term more narrowly than if ‘knowledge’ or ‘research’ were used instead. However, in public debate these three words tend to be used interchangeably. For instance, David Blunkett (DfEE, 2000a) in a lecture to an ESRC seminar affirmed his belief ‘that having ready access to the lessons learnt from high quality research [our italics] can and
must vastly improve the quality and sensitivity of the complex and often con-
strained decisions we, as politicians, have to make’. He stated that ‘good, well-
founded evidence [our italics] for key issues is needed’ and proclaimed that the
‘new Centre for Management and Policy Studies in the Cabinet Office is promot-
ing practical strategies for knowledge-based policy making’ (our italics). At the
same time, he endeavoured to appeal to the whole research community by also
calling for ‘blue-skies research which thinks the unthinkable’. This speech indic-
ates well why we need to disentangle the term ‘evidence-informed policy and
practice’ from the broader but clearly related issue of the value of research—in all
its variety—to society. EIPP cannot be the only justification for social research nor
can all social research fit into an EIPP framework.

EIPP presents the challenging aim that ‘decision-making at every level can be
done in the knowledge of the best possible evidence’ (Sebba, 1999: 6). This con-
trasts with alternative sources of ‘knowledge’ upon which policy making can be
based. Davies (1999), for example, lists these as political ideology, conventional
wisdom, folklore, wishful thinking and public opinion formers using selective,
unsystematic and biased research. Thus what counts as ‘evidence’ is crucial in
defining EIPP and in staking it out as a terrain for particular researchers and
their associated research methodologies. EIPP is bound to be contested territory.
Defined too narrowly it will have very little currency among educational
researchers; defined too broadly it will collapse under the inability to agree on
what counts as ‘evidence’.

The recent shift in terminology from ‘evidence-based’ to ‘evidence-informed
policy and practice’ seems important, for at least two reasons. The first relates to
the conjectural and changing nature of knowledge (and hence evidence) and the
fact that ‘the relationship between knowledge production and knowledge use is
problematical’ (Pratt and Swann, 1999: 5). Recognizing this, the Economic and
Social Research Council (ESRC) is preparing a major research programme on
‘The Evolution of Knowledge: Interaction of Research and Practice’ (ESRC,
2000), covering several fields of professional activity, aimed at developing a
better understanding of the complex processes involved. As Boyd (1998) argues,
it may be simplistic to assume that the main contribution of research to policy is
problem solving, by straightforwardly providing ‘data for decisions’ or clear
evidence on ‘what works’. Its more significant functions may be to illuminate
and formulate problems and define alternatives.

The second reason for the importance of the shift concerns the nature of pro-
fessionalism and policy making. Central to both is the exercise of judgement and
this requires appropriate ‘space’: ‘The judgements that shape professional work
involve applying the knowledge base to unique and particular circumstances’
(Luntley, 2000: 8). In the same way, ‘Policy-makers translate evidence in the
context of the policy process taking into account resource and political implica-
tions’ (Sebba, 1999: 4).

EIPP thus consists of a set of interrelated processes involving various stake-
holders by which research issues are selected, evidence on these collected, vali-
dated and communicated and then used or ignored in decision making by two key players: policy makers and practitioners, though lay and client audiences may also have roles. EIPP corresponds closely to the ‘knowledge chain’ that consists of:

knowledge systems, knowledge creation, dissemination, absorption and application in decision-making and practice. Actual ‘knowledge chains’ involve the interaction of experts, intermediaries, managers and decision makers, using data, information, and knowledge exchanged through a variety of media.

(ESRC, 2000: 4)

A model of EIPP may help in distinguishing the key processes, their relationship to each other and the main stakeholders. This enables us to focus on the major components of EIPP and to locate problems and possibilities in relation to these. A model of EIPP applicable to education or other areas of social policy is depicted in Figure 1. Since EIPP is seen as an interconnected sequence of processes, where one breaks into the cycle is not particularly significant.

Figure 1 EIPP Model.
Research

Research is all the activities that generate research findings and conclusions. We need to distinguish two types of research that can inform practice: ‘public-domain’ research and ‘private-domain’ research.

- Public-domain research consists of investigations that aim to contribute to the accumulation of openly accessible knowledge. It is mainly undertaken by ‘professional’ researchers in universities and research institutes, although practitioners also contribute through part-time postgraduate study and subsequent active research.
- Private-domain research refers to institutionally based research undertaken mainly by practitioners into their own practice or that of groups of colleagues or their educational institution. It is intended for informing practice. Clearly action research is included within this category, though it also embraces other forms of research, for example institutional research into student and parental perceptions, such as the Scottish Office Education Department’s School Ethos Indicators (SOED, 1992a, b) and value-added analysis of student level test and examination data. The research is undertaken by practitioners or alternatively by consultants employed by them, such as providers of statistical analysis of institutional value-added pupil performance data.

There is a tendency in the current debate on EIPP to associate it with public-domain research, as for example in recent discussions on forming a Campbell Collaboration for organizing and disseminating peer reviews of public-domain research in education (Boruch et al., 1999). An important issue is whether the promotion of EIPP as referring to public-domain research will further promote the professionalization of research, with the attendant marginalization of practitioner research (Anderson and Herr, 1999).

Validation

A key process in EIPP is the validation of research, this is the determination of what is good-quality research and hence what findings and conclusions count as evidence. The different research paradigms are distinguished by the kinds of criteria they use to determine good-quality research, an important element of which is what counts as valid evidence. A crucial issue for EIPP in educational management is which research paradigms to include. Currently the most influential model of EIPP comes from health care, in particular the Cochrane Collaboration (www.cochrane.org) which organizes, conducts and disseminates systematic reviews of research on health care interventions (Chalmers et al., 1997). Here the criteria for validating evidence are those required for valid evidence of causality derived from randomized controlled trials (RCT). Clearly, the issue for
education—and even more so for educational leadership and management—is how to develop and implement agreed criteria for validated evidence not only for non-RCT research using statistical analysis of observational data but also for qualitative research.

Validation criteria affect what research is undertaken and how it is conducted, as well as the peer evaluation of published research findings. One of the main planks of EIPP is improved validation through systematic reviews of the literature on given issues and the dissemination of syntheses of validated findings in ways appropriate for the particular stakeholders. The work of the DfEE-funded Centre for EIPP in education will be particularly important in this respect. The EIPP model in action means that some research findings do not get validated by the criteria employed by the EIPP community: the research is in effect designated as not of sufficiently high quality. Figure 1 depicts unvalidated research as being discarded. Such non-validation is clearly controversial, so ‘unvalidated’ research gets diffused outside the EIPP system by members of the research community or the media who are sympathetic to the ‘unvalidated’ research. Hence ‘unvalidated’ research can influence policy and practice.

The validation process for private-domain research is much less public. However, its validation criteria are normally derived from public-domain research methods, even though they may be less formal and rigorous. Greater exposure of practitioners to EIPP relating to public-domain research is likely to feed back into the criteria used for judging the quality of institutional evidence that is used to inform practice.

**Dissemination**

The dissemination of validated research findings within and beyond the research community is the next crucial stage of EIPP. An important element of EIPP is the advocacy of far more replicatory research and of research that is cumulative as it builds on previous work. Peer organization of systematic literature reviews enables evidence to be efficiently accumulated and disseminated, so that it can more readily be built upon. In education (as in other social sciences) placing greater emphasis on replicatory research and systematic review requires a change in what is valued by the research community (Apple, 1999). Funding bodies and academic journals tend to place much more value on ‘original’ research: research replicating previous studies is rare and that which reanalyses data from previous studies even rarer, particularly in qualitative research.

If evidence is to influence policy and practice it must be effectively disseminated to these audiences. This requires communicating findings at different levels of sophistication depending on the users’ prior knowledge and available time. To influence these audiences findings need to be communicated briefly in non-technical language, but still retaining the correct interpretation of the evidence. This can be particularly difficult when evidence is equivocal or applies to
particular circumstances but not others. At the dissemination stage of EIPP some evidence is lost through poor communication and only part of it is actually received by policy makers and practitioners. This is depicted in Figure 1 as a leakage of validated evidence into the discarded category.

**Policy making and practice**

The next stage in the EIPP cycle is the influence of validated evidence on policy making and practice. It is safe to assume that only a fraction of the validated evidence disseminated actually succeeds in influencing policy and practice. The EIPP model treats policy making and practice as distinct spheres of activity. Policy makers and practitioners seek to influence each other and both communities may use recourse to ‘evidence’ as part of these efforts. There is a substantial research literature on how policy is made and implemented (e.g. Ham and Hill, 1993; Weiss, 1991) and on professional practice which can help us to understand how evidence may or may not influence policy and practice (Eraut, 1994). Recent reports from the USA (National Research Council, 1999) and Australia (Selby Smith, 1999), concerned with the influence of education research on policy and practice, both reinforce the view discussed above, that it is more appropriate to aspire to evidence-informed rather than evidence-based policy and practice.

> It is seldom the case that a specific social problem is solved by a decision to use the results of a research study ... Knowledge use is more likely to be a process of 'enlightenment' that is gradual, indirect and interactive, characterised by incremental changes that aggregate over time to become significant structural and substantive changes.

(National Research Council, 1999: 44)

Selby Smith (1999) in a study of the impact of vocational education and training research on decision making makes a similar point, noting that the influence mainly occurs via affecting the climate of opinion. Both these reports stress the importance of building and maintaining linkages between the research community and policy makers and practitioners, if policy and practice in education is to have a more secure research base.

The EIPP model categorizes policy making as either evidence-informed or non-evidence-informed, though as the discussion above indicates, there is no rigid divide between the two. For the purposes of the EIPP model, successfully disseminated validated evidence influences policy making and hence practice via the effects of evidence-informed policies on practice.

The EIPP model also divides educational practice by teachers and educational managers into evidence-informed and non-evidence-informed, recognizing the opaque boundary between the two. As with policy making, the mission of EIPP is to increase the proportion of practice that is evidence-informed. The
The distinction between public- and private-domain research and the relatively low profile of practitioners in public-domain research have important implications for the respective power of researcher and practitioner communities.

In the top–down public-domain version of the EIPP model (the more common one) ‘validated evidence’ is produced by the research community, using practitioners (and their clients) as the subjects of research. The issue then is how to get practitioners to take on board evidence so that it influences their practice. Eraut distinguishes between public propositional knowledge and personal knowledge:

In general, many differences can be found between the personal knowledge of working professionals which informs their judgement or becomes embedded in their performance and the public knowledge base of their professions as represented by publications and training courses.

(1994: 17)

Eraut subdivides personal knowledge into personal propositional knowledge—that which the individual can articulate—and tacit personal knowledge, which individuals use in their practice without being fully conscious of it or being able to articulate it. He claims that ‘a significant proportion of the learning associated with any change in practice takes place in the context of its use’ (p. 33). Practitioners can only utilize public propositional knowledge in their work when they have internalized it so that it becomes part of their personal knowledge. It follows from this that if researcher generated and validated evidence is to influence practice, making it accessible to practitioners is not sufficient. They must be motivated to use it in their practice and be able to learn how to utilize it in their work contexts.

The practitioner-as-researcher has two potential roles in EIPP. One is undertaking public-domain research, for which practitioners do not generally have the time and resources that are available to professional researchers. The practitioner is much more dominant in the other role, that of generating and utilizing private-domain research in order to inform practice. The problem is for practitioners to have sufficient incentives, resources and capacity to inform practice with private-domain research evidence.

Practitioners are, like policy makers, influenced by ‘non-validated evidence’, due often to the absence of validated evidence. For example, in making resource allocation decisions headteachers and governors (as well as the current government) are predisposed to believe in the effectiveness of smaller class sizes and, in primary schools, the use of learning support assistant (LSA) hours. However, we currently have hardly any UK evidence that either smaller class sizes within the normal range experienced or more LSA hours produce measurable increases in student learning (Blatchford and Mortimore, 1994; Crowther et al., 1998). Non-validated findings are depicted in EIPP model in Figure 1 as influences on policy and practice that lie outside the EIPP system.
Selection of research issues

The determination of issues selected for research is the outcome of competition for scarce research resources. EIPP is embedded in what for want of a better label we term ‘plural society’—that amalgam of interests and ideologies that vies for influence over the structures for and forms of political decision making in society. The goals that EIPP addresses are, of course, determined politically and reflect particular interests and values that have been successful in influencing these goals. What issues are currently dominating policy and practice agendas will influence not only what existing research is validated and disseminated to policy makers and practitioners but also what new research is undertaken. An attempt is made in Figure 30.1 to depict the pervasive influence of interests and ideologies on all stages of the EIPP cycle.

In the current UK policy context, primacy is famously accorded to the pragmatic, rather than the ideological or idealistic, through the dictum ‘what works is what counts’. Yet any assessment of ‘what works’ must be informed by some criteria, with particular relative weights attached to them, and these criteria and their weightings will inevitably be derived from a set of values. So the extent of pragmatism may be smaller than is claimed, and the values underpinning ‘pragmatic’ policy are a legitimate and important subject for research.

Another feature of contemporary governance, at least in England, is its centralized character: ‘Increasingly, the direction of change in educational thinking and practice is top–down’ (Davies, 1999: 108; see also Glatter, 1999). Policy making is also accorded an aura of certainty and finality. As the Secretary of State for Education and Employment perceives the position. ‘We know what works and how to spread it’ (Blunkett, 2000). In a television interview, Tony Blair expressed his frustration that, ‘when I’m sitting as Prime Minister trying to get something done . . . you can have a really good idea and drive it through from the top’ (Blair, 1999), but its journey could be blighted on the way down by layers of bureaucracy and the risk-averse nature of the public sector. The Prime Minister’s views on the shortcomings of the public sector have been much debated. Of greater interest to the present discussion is the notion of the ‘really good idea’ originating from the centre. How do central policies arise? One view, which may or may not be an accurate account, is that:

National policy-making is inevitably a process of bricolage: a matter of borrowing and copying bits and pieces of ideas from elsewhere, drawing upon and amending locally tried and tested approaches, cannibalising theories, research, trends and fashions and not infrequently flailing around for anything at all that looks as though it might work.

(Ball, 1998: 126)

A government which promotes EIPP, by putting new funding into research to support it and diverting existing research funding towards EIPP, is exerting
more control over research than a government which maintains policy making as a ‘knowledge-free zone’. Hence, one of the important criticisms of EIPP is that it promotes government control of research to the detriment of the longer term benefits of society from research (Hammersley, 2000), which are broader and more intangible than the instrumental goals which are given priority by EIPP. Since policy goals are contested in a plural society, educational research is not a purely instrumental activity, and the intellectual foundations of policy makers’ goals should come under scrutiny (White, 2000). Such analysis can be an important engine of social advance: ‘Criticism (specifically that which is constructive) is crucial to any endeavour designed to develop knowledge and improve practice’ (Pratt and Swann, 1999: 8).

A crucial issue for EIPP is whether it is founded on the values of research objectivity and rationality, in conformity with which researchers strive to ensure that their validation of evidence is not affected by personal political beliefs or interests. An alternative value perspective is that the purpose of social research is to form part of the ammunition in the competition of ideas through which differing political interests vie for influence and power (Lindblom (1987) makes this distinction). From this perspective researchers interpret evidence through their political values and justify this as serving higher ends.

The fundamental argument for EIPP is that it leads to better achievement of the intended goals of practice and policy, through the use by policy makers and implementers of ‘validated’ research evidence in their decision making. If the research evidence used to inform policy and practice is biased, then research will lose its claim to assist in determining the best means for achieving particular social goals and instead will function only as material for legitimating policies and practices based solely on interests and ideologies. In this event its currency will diminish further over time. An interesting example of the misuse of research evidence in order to legitimate policy is given by Allington and Woodside-Jiron (1999). They argue (with evidence) that certain educational researchers provided a misleading review of ‘30 years of research: what we know about how children learn to read’ which was highly influential in Texas and California in mandating a literacy curriculum that placed great emphasis on phonics. In this example both researchers and policy makers were in alliance, the former to further careers and the latter to legitimate policies founded on opinion and tradition concerning ‘back-to-basics’ in teaching.

It is our view that researchers should not become polemicists and that EIPP should strive for ‘political unbiasedness’ in the validation of evidence. This seems to be the consensus view among those advocating EIPP, a stance which separates it from those who see social research as inherently non-objective and necessarily linked to an ideology. Nevertheless, in advocating a ‘disinterested’ stance, one must still recognize that EIPP serves the interests of those researchers whose methods it utilizes.

When policies have widespread effects, as is likely in a relatively centralized governance structure, it is important that they are well founded and are indeed
based on ‘really good ideas’. This suggests that EIPP is at least as necessary to the stage of policy development as it is to that of policy implementation, evaluation and practitioner use. The contribution of research to problem formulation and the definition of alternatives, mentioned above, is relevant here.

Factors promoting and inhibiting EIPP

The current policy climate in the UK appears more supportive to research than in the recent past. The so-called ‘Third Way’ to policy making emphasizes a pragmatic approach to improving learning outcomes, founded on applying evidence of ‘what works’ rather than on ideology. The DfEE claims to be almost doubling its own spending on research over a three-year period and to be taking steps to ensure that policy makers are well-informed about the current state of knowledge in their areas (DfEE, 1999a). It is also establishing a number of research centres (Wicks, 2000).

In addition, recent policy statements on research (DfEE, 1999a, 2000a) have indicated support for a breadth of research activity, including not just the evaluation of policy initiatives and systematic reviews on the one hand and ‘blue skies’ research on the other, but also research which ‘gives a coherent picture of how society works: the main forces at work, and those which can be influenced by government’ (DfEE, 2000a: 1). This suggests a view of EIPP which goes beyond a technicist approach, and which is not restricted to a current policy agenda. While attacking some research for being too inward-looking and piece-meal, Blunkett’s speech to the ESRC also conceded that government needed to eschew anti-intellectualism and learn to interpret and apply evidence.

Two examples related to leadership and management

Achieving these aspirations may take some time. The explicit use of evidence in policy formation still appears rare. For example, in relation to the far-reaching and controversial proposals on the performance management of teachers, the claim was made that, ‘In designing our proposals, we have taken account of experience in private and public sectors, and of research findings’ (DfEE, 1999b: para 54). There was no discussion of which findings were drawn on or how these related to the specific proposals. This was a noteworthy omission in an area in which the research findings are equivocal to say the least (for example, IPD, 1999; Marsden and French, 1998). Perhaps in an age in which, as Scott (1999: 322) argues, ‘electoral politics seem to be more dominant than ever’, it is naive to expect that high-profile policies mandated from the centre will always be founded on a thorough review of all the evidence or subject to independently evaluated pilots. A researcher respondent to the DfEE-commissioned review of educational research relating to schools considered that ‘Policy-makers introduce initiatives which are not allowed to fail’ (Hillage et al., 1998: 42).
The use of research evidence needs to be extended in another area even closer to leadership and management—that of the definition of standards for assessing individuals’ fitness for leadership positions and for recruitment to them. The development of professional standards in education has been a feature of recent years, deriving from the competency movement in vocational education and training in the UK (Raggatt and Williams, 1999) and it appears likely to become more widespread (DfEE, 2000b). Standards were developed by the Teacher Training Agency for headteachers (TTA, 1997) as well as for other categories of school staff, but despite the wealth of research into headteachers over the past 20 years (Hall and Southworth, 1997) there is no evidence that it had any influence on the construction of the standards. The standards formed the basis for the assessment of candidates for the National Professional Qualification for Headship (NPQH) during its first three years of operation (1997–2000).

More recently, a different approach to the specification of headship has begun to be taken. As part of the development of the national Leadership Programme for Serving Headteachers, the management consultancy Hay McBer conducted ‘behavioural event interviews’ (BEIs) with 40 headteachers in which the subjects described their actions and feelings in specific school improvement situations. The data were subjected to thematic and statistical analysis to produce 15 characteristics of headship which were considered to be related to ‘superior performance’: the resulting framework was termed ‘Models of Excellence’ and underlay the design and delivery of the programme, which has been running since 1998 and has been taken by many hundreds of headteachers. The research has now been extended to cover more headteachers and some deputy heads in order to inform the development of the new version of NPQH, which the government intends should shortly become a mandatory qualification for headship. The government also commissioned Hay McBer to conduct research into effective teaching in connection with their plans for teacher performance management referred to earlier (Hay McBer, 2000).

The development of the ‘Models of Excellence’ was therefore ostensibly a research-based approach, by contrast with the process which underlay the construction of the National Standards for Headship. However, the research has not to our knowledge been published and we are not aware of any plans to publish it. This is highly relevant to the issue of validation, which we raised in our discussion of Figure 1. We would suggest that an EIPP approach requires such models and the research on which they are based to be subjected to rigorous processes of validation, particularly where the models are intended to underpin large-scale programmes of professional development or the implementation of national staff management policies.

A further issue arises from both of these examples (on teacher performance management and models of headship). It may reasonably be argued that embedding an EIPP approach will inevitably take time, and that both the examples include indications of increasing attention being given to evidence and research. However, the increasingly centralist and political nature of educational policy...

189
making discussed earlier may well be a significant inhibiting factor. The political imperative, determined by the electoral cycle, for quick results means there is often inadequate time for piloting interventions and responding to evaluations of pilots before full-scale implementation takes place. As well as the National Standards for Headship, the original formulation of the National Curriculum in 1988 and the National Literacy Strategy of recent years might be considered examples of this. Even in the case of literacy, where there is a considerable evidence base, Hannon (2000) notes that the Labour Government scrapped the idea of an experimental evaluation of the National Literacy Strategy, and embarked on a nationwide implementation, with ‘still no research-based rationale, although one was commissioned later [namely] Beard, 1999’.

Thus ministers can subsequently find themselves defending positions they have taken up without an adequate evidential base. Politicians may consider themselves unable to admit to an error because of the political consequences of loss of legitimacy and credibility: they have a ‘sunk investment’ in what looked originally like ‘really good ideas’ but in fact turn out on investigation to be poor ones. The equivalent phenomenon in the business world has been termed ‘strategic entrapment’ (Proctor, 1993) in which decision makers persist with an ineffective course of action to justify the resources they previously invested in that strategy.

The research assessment exercise

Both promoting and inhibiting factors are also to be found in a key aspect of the framework surrounding educational research, the Research Assessment Exercise (RAE). The criteria for assessment to be used by the Education Panel for the 2001 Exercise refer to ‘the educational significance of the research and its relevance for the academic community, policy makers and practitioners’ (HEFC(E), 1999: para 3.59.15). Such significance can be included in claims by institutions relating to the two key criteria, the quality of published output and the vitality of a department’s research culture. The new recognition given to ‘educational significance’ can be seen as a response (arguably a limited and provisional one in the context of the exercise as a whole) to the criticisms of the RAE as a significant restraining influence on the development of more policy and practitioner focused research in education (Hillage et al., 1998; Tooley with Derby, 1998). The new emphasis on ‘users’ may also in part be a reaction to the growing professionalization of research which, Scott (1999: 318) has argued, ‘has tended to exclude “amateur” researchers whose main involvement is as policy-makers or practitioners’.

On the other hand, the criteria still give prominence to originality as a characteristic of quality and they do not provide explicit encouragement for researchers to engage in replicatory studies or to devote energy to disseminating the results of their work to practitioners and policy makers and developing long-term linkages with them.
Research and researchers

Other inhibiting factors are intrinsic to the process of research, even when the research is designed to yield evidence for policy or practice. We have already suggested that research may not be able to provide ‘data for decisions’ in a straightforward, problem-solving sense. In addition, it may take a considerable time for studies to yield validated findings. This was the case in relation to studies of the impact of competition and parental choice in which the authors were engaged during the 1990s. In (hopefully rare) cases, the evidence may not arrive until the topic of the research has ceased to be of interest or relevance to user groups. The growing rapidity of change within both society and the educational process exacerbates this tension while at the same time reinforcing the need for EIPP to offer guidance in a turbulent world. Researchers and other stakeholders should address how the problem may at least be mitigated. Finally, the research process, even when conceived of (as we conceive of it here) in terms of disinterested inquiry, is likely to have a sceptical character (Bridges, 1999; Merton, 1973) since it is founded on questioning. This can often present an uncomfortable and unwelcome challenge to practitioners or policy makers who are understandably committed to initiatives in which they have a personal investment.

It is important that this account does not leave the impression that all the constraints upon the development of EIPP lie outside the research community: with politicians, officials, practitioners, the RAE and the research process. As the Institute of Employment Studies report persuasively argued, there are many ways in which researchers can and should adapt their methods and practices to speak more convincingly and helpfully to user audiences, not least in the area of accessibility: ‘The burgeoning forest of academic research and papers appears to be increasingly impenetrable to an academic audience, let alone the wider education community’ (Hillage et al., 1998: 52). The development and maintenance of long-term research-policy-practice partnerships is a key element in the Strategic Education Research Programme proposed by the US National Research Council (1999) and also fostered by the ESRC’s Teaching and Learning Research Programme. The community of scholars and researchers in educational leadership and management in the UK has from its origins been strongly committed to a close linkage between theory, research and practice for improving education, a commitment that is reflected in the membership mix of BEMAS. In the next section, we will outline some ways in which an EIPP approach might sustain and enhance this linkage.

A way forward

In this section we focus on how EIPP could be taken forward with respect to educational leadership and management, under the aegis of BEMAS as an organization dedicated to promoting the symbiosis of research and practice. Hence we focus more on practice than on policy.
There are four main processes within the EIPP cycle depicted in Figure 1 which need to be addressed in thinking about a way forward:

- practitioner interaction with research
- the validation process
- the dissemination of validated research
- the selection and conduct of research

These processes are interrelated. We need to be clear about what kinds of evidence practitioners need to inform their practice before we proceed to organizing better validation and dissemination processes. In turn the availability of accessible and validated evidence will stimulate practitioners’ use of it to inform their practice.

**Practitioner interaction with research evidence**

A first step is to develop a clear idea of the needs of practitioners with respect to informing their practice with ‘validated’ evidence from the public domain. A key question is which aspects of educational research supporting EIPP are appropriate for educational leadership and management as a ‘field of inquiry’? Is it to be limited to research which is about leadership and management or widened to include research evidence on educational practices which headteachers and other leaders/managers of student learning, as well as policy makers, need to know in order to make evidence-informed decisions? We would argue for the latter interpretation because this is the evidence base educational leaders need to have at their finger tips in order to take informed decisions about what educational practices to adopt or modify in their own contexts.

How broadly the topics are defined clearly determines how wide the net is cast for research which is to be included in the validation process. In particular, are the topics to be confined to those which come within the classification of ‘interventions’—that is, concern the manipulation of particular variables or processes which have intended and unintended educational consequences? The discussions about a proposed Campbell Collaboration to undertake and disseminate reviews of educational research have been couched in terms of educational interventions (Boruch et al., 1999; Oakley, 1999). Limiting the research evidence included to educational interventions would make the enterprise more manageable but would exclude more wide-ranging research that is concerned with educational practices in natural settings which do not involve ‘interventions’. In the light of evidence that social science research currently influences policy and practice mainly indirectly by creating a climate of opinion, we need to include within EIPP for educational management and leadership research which goes beyond the technical ‘what works’ variety, provided that it is evidentially based.

Topics and practices that are currently at a stage where systematic reviews
for practitioners could be extended or developed include the effects on student learning and other outcomes of:

- class size
- setting, banding and grouping by ability or gender
- peer group tutoring
- gender differences
- specific strategies/programmes for teaching literacy and numeracy
- organization of the school day/year
- using target-setting for improving students’ educational outcomes
- use of homework at different ages
- specific uses of ICT to enhance learning

Important topics in the field of leadership and management practices are:

- teacher performance management and performance-related pay
- models of excellence for headship
- teacher appraisal
- monitoring teaching and learning
- involving parents in pupils’/students’ learning.

A crucial issue for BEMAS is its role in promoting a culture in which educational leaders and managers use validated research evidence, from both public and private domains, to inform their practice. According to Davies (1999: 111):

> The problem is not so much that teachers do not undertake research or that they are often excluded from determining the research agenda (both of which may be true), but that there is often not a culture of teachers using research to inform their everyday school practice.

The problematic nature of the research–practice interface has long been recognized: it is also contentious because it concerns power relations between practitioners and academic researchers, as experts and gatekeepers of public-domain research. The relationship is made more complex and contentious when politicians impose on teachers educational practices/interventions which the former claim are founded on research evidence, even though this evidence is still highly disputed among the research community.

BEMAS members who work in higher education can assist in the development of a practitioner culture of EIPP in a number of ways. A key role is as providers of postgraduate courses in educational management and leadership. To evaluate evidence teachers need to know about relevant research methodologies. Such knowledge is better developed conducting research relevant to their own practice. Most postgraduate courses include research methods and research projects. However, the research is usually conducted in relative isolation, is inevitably small-scale
and lacks an integrative framework within which research evidence can build cumulatively. We need a way of linking academic-researcher peer group efforts to review and disseminate research on key topics with practitioner research undertaken under the auspices of different HE institutions and in many different educational settings. If validated evidence were more easily available to practitioners and if they could relatively easily check summary evidence in reviews against original studies, practitioners would be in a better position to select projects for their own research which are relevant to their practice and/or can add cumulatively to public-domain evidence.

The validation process

The specialist role for academic researchers is in the validation process for public-domain research. We should start by setting up peer panels to conduct a few systematic focused syntheses of research on specific ‘practices’ relevant for educational leadership and management for which there is a body of existing research evidence. In order to create these research surveys the research community needs to be mobilized. Peer groups would organize surveys of specific ‘practices’, using agreed criteria for (a) what qualifies as a research study to be included in a survey and (b) the criteria for judging the evidence (the effect of the practice on learning or other specified outcomes). The peer group needs to be committed to keeping its database of research surveys up to date. A focus on reviewing existing research requires a change in what the research community values as ‘good research practice’. Much greater value needs to be given to research synthesis, conducting a thorough survey of existing research before embarking on a new study, and doing replicatory and cumulative studies, as well as to dissemination to professional audiences.

In considering areas suitable for review and meta-analysis, we need to recognize and build upon previous attempts to provide syntheses of existing research. For example, in the field of educational leadership and management several noteworthy reviews have been published in recent years. The ESRC commissioned Wallace and Weindling to produce an analytical review of research that had been funded by the Council relating to reforms in school management. The result was a booklet highlighting key findings and messages for practitioners (Wallace and Weindling, 1997) as well as a discussion of the exercise and its implications for future research aimed at an academic audience (Wallace and Weindling, 1999). Hall and Southworth (1997) published a valuable review and synthesis of research on school headship in Britain since the 1970s. Taking a more international (and quantitative) perspective, Hallinger and Heck (1998, 1999) systematically reviewed a wide range of studies in addressing the key question ‘can leadership enhance school effectiveness?’ Such existing overviews and the methods underpinning them should provide useful benchmarks for developing reviews and syntheses of the research literature, both for practitioners and researchers, in the future.
BEMAS and EMA can encourage the setting up of peer group research evaluation and dissemination panels, but additional government funding is required for peer groups to develop a common methodology for systematic review, undertake research surveys, keep them up to date and disseminate them. The creation of the Standing Conference on Educational Leadership and Management (SCRELM) is a very promising step in this direction. At the time of writing, SCRELM is engaging in discussions with the DfEE-funded Centre for Evidence Informed Policy and Practice, about undertaking a systematic review in the field of educational leadership and management.

Research review groups in educational management will need to agree validation criteria and implement these agreements. A crucial and contentious issue, already raised in the discussion of the EIPP model, is what is to count as validated evidence and hence which kinds of research evidence can be diffused within the EIPP cycle. Not all forms of educational research are appropriate for EIPP: for a start, only empirical research is relevant for ‘what works in practice’, though such research needs to be theoretically informed. A further restriction is that not all empirical research produces data, findings and conclusions that can be validated using peer-agreed conventions. Another criterion that would impose a further restriction is that the research selected for validation for EIPP, and the validation process itself, should be ‘disinterested’—that is, not deliberately biased by the social beliefs and personal interests of the researcher.

In attempting to delineate the types of educational research that could be validated for EIPP, the typology of educational inquiry proposed by Constas (1998) is helpful. He distinguishes three dimensions that characterize a method of social inquiry. These are the methodological, political and representational dimensions.

The **methodological dimension** is the criteria by which evidence to support propositions is amassed. The methodological domain is ‘normative’ if there are agreed rules for assessing evidence, in particular the criteria of internal and external validity and reliability/replicability. The alternative methodological domain is ‘idiosyncratic’, when evidence is personal and situational: each project uses its own data preferences.

The **political dimension** is subdivided into ‘centred’ and ‘decentred’. A research approach is centred when it eliminates or ignores power relations that affect the investigation or treats them as variables to be analysed in a detached way. In contrast, decentred research sets out to challenge established power relations.

The **representational dimension** concerns the ways in which research findings are presented. The traditional academic stance, which Constas calls bounded, is described as depersonalized, distanced and objective. Forms of presentation which break these rules, for example, evocative narratives, are termed unbounded. Constas then distinguishes seven research typologies, according to which combination of centred/decentred, normative/idiosyncratic, bounded/unbounded they involve.

EIPP falls into the centred-normative category. We have previously argued
that it should be disinterested and not polemical (hence centred) and that it should have agreed rules for validation (normative). This restriction would exclude research which promotes specific ideological perspectives, whatever their political orientation. Whether or not the presentation of evidence for educational management should have agreed rules and conventions is problematic. If peer groups are set up to review research topics and disseminate reviews, they are likely to develop rules for presentation. Different forms of presentation, in particular different forms of language and pictorial representation, will be deemed appropriate for different purposes and audiences, as is now the case in journals aimed at academic, mixed or professional audiences.

An important challenge for implementing the validation process for EIPP in educational leadership and management is reaching widespread agreement on normative rules for the methodological dimension and implementing these. This will need to be done by review groups set up to prepare reviews of evidence on specific topics, such as, for example: does educational leadership affect organizational performance or what are the qualities of ‘effective’/‘excellent’ educational leadership?

Because of the nature of the issues of importance in educational leadership and management, the research included in validation for EIPP cannot be restricted to random controlled trials of educational interventions. Nor should they be excluded. It will be distracting to devote energies to debating the superiority or otherwise of random controlled experiments in educational research. Instead, we should accept and value the continuum of research designs relevant for investigating educational practices, rather than pigeonholing them as discrete and separate. This continuum of research designs is depicted in Figure 2. First, educational practices can be subdivided into those that can be regarded as ‘interventions’—deliberate manipulation of structures, systems, financial rewards or other variables, which are intended to bring about a discrete change in practice. This could be undertaken as a random controlled experiment, where subjects are randomly assigned to intervention and non-intervention states. Alternatively, the intervention may take the form of a natural experiment (no random assignment), where a particular change takes place in some natural settings and not in others. This enables researchers to gather data on settings where the intervention does and does not take place. By gathering a wide range of data from the selected intervention and non-intervention settings and applying statistical techniques used in observational studies, the threats to internal validity from non-random assignment can be considerably reduced (Meyer, 1995).

Moving further along the continuum, there are interventions that are universally applied to an education system (such as local management of schools, national curricular changes, performance management of teachers) so that there are no control groups, which are not experiencing the intervention. Unfortunately for EIPP research, much educational intervention has been of this type.

Much empirical educational research is not concerned with assessing the impact of educational interventions. This is classified in Figure 2 as non-intervention research: this collects observational data from natural settings. In
some research designs settings can be deliberately selected to exhibit contrasts or similarities (e.g. research on different leadership styles or on differential school effectiveness). Or the settings may be selected to be representative so as to enhance generalizability. Alternatively, there may be no particular pattern or intent in the selection of settings for research.

Whether the data collected are quantitative or qualitative is not necessarily determined by the type of research design. Although random controlled trials generate quantitative data in order to investigate effects sizes, the research design can be enhanced by collecting qualitative data to assist in understanding reasons for differences in effects sizes between settings and participants. Although qualitative research designs are usually associated with research in natural settings, quantitative data are also gathered from non-intervention natural settings (e.g. data on pupil attainment and pupil background and school variables in school effectiveness research designs).

The normative criteria for the methodological domain are essentially the same for quantitative and qualitative data, so long as the qualitative research designs are normative and not idiosyncratic. These are shown in Table 1.
instance, Guba and Lincoln (1981) proposed a set of rules for ‘meeting tests of rigour’ to ensure that the trustworthiness of the information and interpretations drawn from naturalistic inquiry match those of scientific inquiry. The scientific criteria (used for evaluating evidence from random controlled trials as well as from statistical tests of observational quantitative data) for validity are matched by corresponding naturalistic criteria.

Miles and Huberman (1984) proposed twelve tactics for testing or confirming findings in qualitative research. Patton (1990) in the last chapter of his book on Qualitative Evaluation and Research Methods, also addressed the issue of enhancing the quality and credibility of qualitative analysis, listing three major considerations:

- the rigour of the techniques for gathering and analysing data, attending to issues of validity, reliability and triangulation;
- the credibility of the researcher: since the researcher is the research instrument, information on researcher qualifications, experience and perspective should be provided;
- the philosophical beliefs of the researchers in relation to naturalist inquiry.

Reviews of evidence in educational leadership, developed by peer reviewing groups, should be explicit about the criteria of research validity used to select research for inclusion in a review and to judge the quality of evidence presented in the subsequent review. The development of agreed and commonly applied criteria in the validation process for EIPP should have spillover benefits in improving the quality of research undertaken, in the research methods learnt in educational management courses and in the consequent ability of practitioners to evaluate research evidence critically and undertake their own research contributions.

**Dissemination**

The visible outcome of successful establishment of a structure for EIPP would be easy access for practitioners to evidence on the effects of specific educational practices. One of the major constraints on practitioners informing their practice

with evidence is lack of time to become informed. Hence quick, cheap and ready access is required, which accommodates differences in the extent to which users wish to become acquainted with the breadth and depth of the evidence. The Internet is particularly suited to providing access to evidence for informing practice which meets these criteria. Practitioners should be able to access a website on which they would find high-quality research surveys of the evidence on the effects of specified educational practices. The surveys should be accessible at three levels:

- a bullet point summary
- a survey article
- original high-quality studies included in the survey.

Too often texts making evidence-based claims of ‘what works’ are insufficiently referenced to the sources of evidence, and even if these are provided, it takes time and effort to acquire the sources. Busy professionals do not have the time to pursue original sources, so that it is too easy to proselytize for a particular practice on the grounds that there is evidence that it works when the evidence may well be equivocal or context-specific. It also useful if the methodological perspective of the review is classified as, for example, in the *Review of Review Report* to the ESRC’s Teaching and Learning Steering Committee (ESRC, 1999), which classifies listed reviews as ‘technical’, ‘interpretative’ and ‘mixed’.

**Selection of research studies: evaluation of pilots**

The earlier discussion noted the problem from a policy-making perspective that research evidence is not sufficiently relevant or timely with respect to current policy interventions. In particular, the timeframe of policy makers and practitioners is shorter term than that of researchers. In contrast, from a research perspective valid evidence on the impact of educational interventions on learning and other outcomes takes time to emerge, collect, analyse fully and present. Overcoming this dichotomy requires the building up and sustaining of long-term linkages between researchers, policy makers and practitioners, so that the EIPP cycle can be made more effective through continual interaction between research and policy/practice. It also requires accommodation by both parties. Policy makers would need to acknowledge the dangers of mandating large-scale national implementation of major policy innovations which have not had independently evaluated trials. The research community would need to recognize the time-pressures involved in policy change, develop better and faster methods for the evaluation of pilots, value this form of research activity more highly and accept that all the requirements of rigorous research may not be achievable within the timeframes available. Indicative results may need to be regarded as acceptable when the alternative is no evaluation at all.

A change in the culture of both parties would be needed. Researchers would
need to be prepared to risk producing findings and conclusions which are liable to later revision, while politicians would need to be more open about the tentative nature of proposed policy solutions and less prone to entrapment in sunk policy investments. Other features of such a learning culture would be open, unhindered publication and a preparedness by policy makers and practitioners to change course in the light of the results.

Conclusions

If we look to other models of EIPP, such as the Cochrane Collaboration and the proposed Campbell Collaboration for education, we can see that they are very focused in organizing the validation stage of the EIPP cycle. Clearly this is an essential part of EIPP and without it we cannot expect practitioners and policy makers to base decisions on ‘the best available evidence’. It is also the part of the EIPP cycle for which ‘professional’ researchers have particular responsibility. However, it is only part of EIPP and its development has to link in closely to the interests and aspirations of the other stakeholders, in particular, practitioners and policy makers. More broadly, the ‘new model for educational research’ proposed by the National Research Council (1999) emphasizes interactions among researchers, practitioners and policy makers in a programme of research, synthesis and implementation which concentrates on a limited number of important topics.

EIPP will only fulfil its potential in education if it is not misused by its stakeholders. Researchers may be tempted to progress their careers by promoting insufficiently validated research (which can happen with well-intentioned media efforts to disseminate research), while policy makers in search of legitimation for their policies may be too ready to seize selectively on insufficiently validated evidence.

To develop EIPP in educational leadership and management we need to work towards the creation of a web-site on which users can find high-quality reviews of evidence on the effects of specific educational practices and interventions which are accessible at different levels. To achieve this we need to organize peer reviewing teams and secure resources for review and dissemination.

The cultures of academic researchers and HE teachers, practitioner and policy-making communities need to promote EIPP as the professional norm. This can be encouraged through professional development programmes, organized in HE and elsewhere, and placing greater emphasis on teachers undertaking research which provides evidence for informing decision making and evaluating practice.

Notes

1 The ESRC’s Review of Review classifies Beard (1999) as an interpretative, not a technical, review.

THEORY

Emergence of management

Management has become one of the most pervasive phenomena of our times. A number of organizations, in public as well as private sectors, are trying to acquire and apply this body of knowledge and skills in an effort to improve their performance. There is widespread acknowledgement that organizational performance is not optimal and that modern management concepts and techniques have a great deal of promise for improving their effectiveness.

Several indicators of the growing interest in management can be cited. First, the number of institutions that offer management courses has increased manifold. Thirty years ago, there were only two or three institutions that offered the MBA programme. These were prestigious institutions designed to attract the brightest students and train them for high-level managerial positions. Today, there is hardly a university or college that does not offer a management course. This growth is indicative of the demand for management education. With the possible exception of computer science, management is the fastest growing area in higher education. Second, most major organizations have instituted some form of training programmes for their employees. Generally referred to as staff development, most of these programmes focus on management concepts and techniques. Particularly striking is the acceptance on the part of government organizations that their administrators need to be oriented to management. This is evidenced by the establishment of management and training institutes by central and state governments alike. Finally, management is gaining recognition as a profession: a number of individuals and firms have come into existence to offer their services as management consultants.
Why this ‘love affair’ with management?

It seems reasonable to ask what has brought about this obsession with management in recent years. Our organizations were being run prior to the emergence of management. Were they not managed? We did not use the word ‘management’ then; ‘administration’ was more commonly used. Is management different from administration?

Let me cite four factors that seem to explain the ascendance of management in India as elsewhere:

1. Organizations have become large and complex. They have grown not only in size but also in the diversity of their objectives. The diversification of functions has resulted in multiple roles being created for employees.

2. It is recognized that human resources are more important than physical and financial resources. It is the people that spell the difference between successful and unsuccessful, productive and unproductive, organizations. While physical and financial resources are necessary, they can become productive only in conjunction with people.

3. Today’s workforce is more aware, more self-conscious, more aspiring. It has a much wider exposure to outside environment and influences. The traditional ‘command and control’ approach to managing people in organizations is no longer valid. A whole new philosophy is needed to motivate people to higher levels of performance.

4. The discovery of new knowledge and techniques makes it necessary to educate and train people to apply it effectively.

As Bennis points out, management has been particularly receptive to the behavioural sciences, which gathered momentum because conventional wisdom and practice failed to work. A fundamental change in the basic philosophy which underlies managerial behaviour is reflected in the following three areas:

• a new concept of man, based on increased knowledge of his complex and shifting needs, which replaces the oversimplified, innocent, push-button or inert idea of man;

• a new concept of power, based on collaboration and reason, which replaces a model of power based on coercion and fear;

• a new concept of organizational values, based on a humanistic orientation, which replaces the depersonalized, mechanistic, value system (1993: 219).

The essence of management

Let us now see what management is all about. What does it mean? How would one define or describe it? Simply stated: management is a set of activities...
directed towards efficient and effective utilization of organizational resources in order to achieve organizational goals.

The key words in this definition are goals (translated as results or output), resources (which constitute the means to achieving the goals), efficiency (translated as economy in the use of resources) and effectiveness (which is measured in terms of results, not inputs). Management literature typically lists planning, organizing, coordinating, delegating, controlling, evaluating as management functions. The term ‘activities’ in the definition, however, is comprehensive enough to include almost anything that a manager may do. It is intent and direction that determine if an activity is managerial or not. This is an important point in understanding the difference between administration and management.

Sources of management concepts

The three major sources of management concepts and techniques are behavioural sciences, quantitative sciences and computer technology. Psychology, sociology and organizational theory and behaviour provide many of the concepts around which the practice of management has been developed. Motivation, communication, interpersonal relationships, authority and accountability, and leadership are among the frequently discussed concepts in management parlours. Maslow’s hierarchy of human needs, McGregor’s Theory X and Theory Y, and Herzberg’s Theory of Job Satisfaction are among the contributions of behavioural scientists to management thought and practice. The notion that organizations have their own identity, apart from that of its members, has led to the study of organizational behaviour and the development of organizational theory. The concept of organizational culture has evolved to help management understand the dynamics of organizational life.

The reliance of modern management on rational, objective and quantitative methods has given it the flavour of a science. Mathematical models and sophisticated statistical techniques are widely used in data analysis and decision-making. The information explosion has become a major challenge for management. Since accurate and reliable information is the basis for sound managerial decisions, managers need a systematic way of collecting, sorting out and storing meaningful information. The emergence of computer technology has made all this feasible. Management Information Systems (MIS) has now become a highly specialized field of study.

Administration versus management

A great deal of ambiguity surrounds the use of the terms ‘administration’ and ‘management’. While some see them as synonymous and use them interchangeably, others see them as different and use both, along with the conjunction ‘and’. The pre-eminent degree in management studies is called Master of Business Administration. The Commonwealth Council of Educational Administration
(CCEA), a prestigious professional organization, was renamed Commonwealth Council of Educational Administration and Management (CCEAM) in 1994. Management literature does not help either; in fact, it seems to confirm that words have no meaning; people give meanings to words. Educational administrators in different countries have their own definitions; for most, this is not an issue at all. In India, most professional educators have had to take a course in educational administration where they have learned the values, assumptions and procedures found in the departments and agencies of the government. The first question they ask in a management training programme is: how does management differ from administration?

There are various responses that might be given to this question. In summarizing my thinking I sometimes resort to the idea of presenting the two terms as an overview of two models A and B in Table 1.

One way to resolve the dilemma is to trace the roots of the two words. Since language is a reflection of culture, the root of a word generally provides a clue to its cultural association. Administration, a much older term, owes its origin to the institution of state. It reflects, therefore, the dominant culture of a government organization. Management, a relatively newer term, has come from business and

</tbody>
</table>
industry. In fact, for most people in India, and even in the West, management means business management. Drucker (1999) argues that this is an unfortunate error. ‘Management is not business management—any more than, say, Medicine is Obstetrics.’ The reason for associating management with business is that most management literature is focused on business and industry and that business is the pre-eminent institution where management concepts and techniques have been most effectively applied. The term, therefore, reflects the dominant culture of business organizations. Once this is understood, it is easy to compare the assumptions, values and modes of operations that define the two cultures: government and business.

**The administrative–hierarchical–bureaucratic model**

The administrative model that was introduced in India primarily for the governance of the country made its way into most other organizations, including education. It was very effective during the pre-Independence period when government was the only institution that really mattered; institutional infrastructure in the non-government sector was minimal and enjoyed little autonomy to recognize the need for alternative models. Rules, regulations and operating procedures in educational institutions were the same as in government departments. There was unquestioning adherence to the assumptions of bureaucracy, which are:

- Efficiency is achieved when jobs are broken down in segments and routinised so workers need limited knowledge to carry out assigned tasks.
- Organizations are effective when managed from the top down, divorcing both frontline workers and clients from major decisions.
- Knowledge residing at the top of the bureaucracy can be codified in procedures so workers need little skill except in following orders (Darling-Hammond, 1997).

A critical study of selected educational institutions resulted in the identification of the following characteristics that define their organization culture (Sapre, 2000). First, being essentially reactive in their response to issues and problems, educational administrators tend to develop reform proposals on a one-at-a-time basis, unmindful of the consequential changes necessary for their effective implementation. This isolated, single-issue approach is reflected in such recent initiatives as internal assessment of students, performance appraisal of teachers, autonomous colleges and more recently, accreditation. For any of these to succeed, significant other changes must occur. In a system where pay scales and annual increments are predetermined and automatic, performance appraisal is either seen as irrelevant or not taken seriously. This is precisely what happened when the University Grants Commission first introduced the reform. Today, hardly anyone even talks about it.

Second, administrators appear to be overly concerned with resources. An increase in resources is often considered synonymous with progress. Annual
reports of heads of institutions typically highlight additions to inputs made during the year: library books and journals, equipment and technology, space and facilities, and personnel. In comparison, references to the process and product dimensions are minimal.

Third, administrators’ accountability follows the chain of command within the hierarchy. Maintenance and control being the twin responsibilities of administrators, they are answerable to their immediate superiors for the proper deployment of financial and physical resources and the execution of all policies and directives. Lines of authority and jurisdiction are sharply drawn and rigidly observed. There is no audit of performance and little accountability for results produced.

Fourth, inefficiency in the maintenance and control of resources is considered a more serious breach of duty than poor performance and ineffectiveness. Inaction is safer than initiative or judgement, taking risks and committing an error.

Fifth, interpersonal relationships are determined strictly by hierarchical status, authority and jurisdiction. Except perhaps among people at the same rank, relationships are typically impersonal, cold and passive. Dissent is scrupulously avoided in dealing with higher authority.

Sixth, rules, regulations and precedent are the determinants of major decisions. They are viewed, not as means, but as ends in themselves. A rigid, rule-based mode of governance is used more to limit employee freedom than to encourage action.

Seventh, seniority is the principal, often the exclusive, basis of the reward system. Promotions and other privileges are earned in proportion to the length of service. Open, data-based and participatory performance appraisal systems have not yet replaced the ‘confidential report’ which plays a major role in shaping one’s career. This is a subjective evaluation of an individual’s performance and conduct written by the boss and filed in the individual’s service record without requiring any feedback. The formative dimension of evaluation is absent.

Eighth, efforts to bring about change and improvement in efficiency are centred on structure and form, rather than on content and people. It is assumed that when an organization is restructured, reorganized or given a new name, it results in increased efficiency.

Ninth, ‘reculturing’ people in the organization does not find a place in the reform agenda.

Tenth, since the structure is highly centralized, changes occur only when perceived as necessary by, and initiated at, the highest level of administration. Subordinates are encouraged neither to identify needed changes nor to propose improvements.

**Education management and the reform movement in India**

Education reform is a consistent theme in almost all countries. Educational journals report change initiatives and relevant research on a regular basis. In the
developed countries, many proposals for change emanate from professional organizations and school districts. In India, by contrast, all initiatives for educational change come from state agencies—the Ministry of Education, the University Grants Commission, the National Council for Teacher Education and the like. In the absence of a professional culture, educators see themselves at the receiving end of change proposals that often take the form of mandates which they have to carry out, with or without understanding and commitment. The half-hearted implementation, even resistance, explains why the reform movement in Indian education is a story of lost opportunities. In education, as in many other fields, it is easier to change structure than to change process or product. A few examples help us understand this. The 10+2 pattern of secondary education was adopted and has been sustained. The four-year integrated programmes of teacher education, though not abandoned, have not been replicated. Examination reforms, including internal assessment, performance appraisal of teachers, autonomous colleges, and accreditation are in various stages of implementation, if not abandoned already.

One of the major trends in Indian education is the infusion of management concepts in teacher preparation and staff development programmes. This trend owes its origin to two significant and parallel developments. The first is the New Education Policy and Programme of Action, which recommended some form of management training, not only for educational administrators but also for teachers. The second is the phenomenal growth of management education and training in the country. A few universities have introduced formal courses of study in education management. Programmes of in-service education for school administrators, teacher educators and teachers now include such management concepts as the systems approach; performance appraisal; total quality management, and even leadership.

Despite the proliferation of such programmes, there is little indication of any significant changes in the way educational institutions operate. The mind-set of those who have both the authority and the responsibility to initiate reform has yet to change. In a critical review of education reform movements, Pogrow (1996) analysed the dynamics of educational change and explained why top–down reforms almost always end up making things worse: ‘The history of education reform is one of consistent failure of major reforms to survive and become institutionalised’ (p. 9). The analysis is pertinent to India as well. Reformers typically feel that their solutions would work if only people would get on board. When this does not happen, the practitioners are blamed for not supporting the change. It is unreasonable to expect practitioners to develop their own methodology and techniques for implementing a complex reform idea. To support and implement a reform proposal, they need to understand the proposal in its entirety, the rationale behind it, its possible effects on the institution and the people who work there, the step-by-step process of implementation and its subsequent monitoring. When these elements are ignored or dealt with superficially, the reform is doomed to fail. Repeated failure of reform initiatives is un-
settling for practitioners and students. Reformers need a deeper understanding of the dynamics of change, what sustains a reform and what does not.

Disillusionment with top-down reforms, like those coming as state mandates and concentrating more on structure than on content, is growing. Scholars are discovering other approaches to lasting and continuous improvement in education. Pogrow concludes his analysis of the reform movement as follows: ‘The only way to improve education is by the use of more powerful forms of curricula in the hands of very good teachers who are trained to teach better. All three of these conditions must exist.’

**Realizing the potential of management in India**

What then are the prospects of realizing the potential of education management in India? A few suggestions for moving in the right direction seem warranted:

1. Adaptation is wiser than adoption. Not all concepts or models provided by management literature fit into education in their entirety. The systems approach, with its input–process–output model, was devised for industry. Nothing would be more dangerous than to look at education in terms of the assembly line. The usefulness of the model lies in redirecting the focus of educational administrators from resources to results, in sensitizing them to the need for thinking, first, about their goals—the expected outcomes of the educational experience for the students—and then make decisions about appropriate processes and the resources needed to put the processes in place.

2. Since the primary condition for any organizational change to take place is collective will, administrators must become effective change agents. This calls for leadership, which is both collaborative and authoritative. School leaders need to have a vision as well as the ability to communicate that vision to all stakeholders.

3. All change involves resistance. Resistance comes from both the ‘haves’ and ‘have-nots’. The haves are people in authority who have a vested interest in maintaining the status quo; the have-nots are those for whose benefit the change is designed but who are ignorant about its nature, its rationale and its precise consequences. In the context of Indian education, a shift to a managerial–professional model poses a threat to those who have the ultimate power to make decisions.

4. Staff development programmes have to be site-based, carefully designed to achieve identified purposes and conducted and led by people whose credentials and motives are impeccable.

5. Perhaps the greatest challenge in education is to usher in a professional culture in which educators see themselves not only as employees, supposed to carry out other people’s mandates, willingly or unwillingly, but as professionals whose locus of control is internal, who are committed to continued
personal and professional growth, who set their own agenda and consider themselves accountable to those they serve. We have a vicious cycle in India: government justifies its authority and responsibility for educational reforms on the grounds that educators are a passive lot, unwilling to be involved in any change process. Educators lament the fact that the system is too centralized, gives them neither autonomy nor opportunity to be heard, treats performers and non-performers alike (there is no reward for performance and no punishment for non-performance) and holds them accountable for carrying out policies in whose shaping they had no part.

These tasks are not easy by any means. The deep-rooted administrative model has created its own vested interests. The management model has not been understood even by those who are supposed to train others. The only hope lies in the possibility that teachers will become more professional, through individual and collective efforts, feel empowered through professional growth and begin to see the need and the benefits of changing the organizational structure and climate of the institutions where they work.

Part 5

SCHOOL EFFECTIVENESS AND SCHOOL IMPROVEMENT
This article reviews research from 1980–1995 exploring the relationship between principal leadership and student achievement. The focus is on the substantive findings that emerged from the review. Earlier reports focused on conceptual and methodological issues. The general pattern of results drawn from this review supports the belief that principals exercise a measurable, though indirect effect on school effectiveness and student achievement. While this indirect effect is relatively small, it is statistically significant and supports the general belief among educators that principals contribute to school effectiveness and improvement. Moreover, the review suggests that previously described discrepancies in research results may be explained by the conceptual and methodological tools employed by researchers. We also emphasize the limitations of these studies. Even taken as a group they do not resolve the most important theoretical and practical issues concerning the means by which principals achieve an impact on school outcomes and how contextual forces influence the exercise of leadership in the schoolhouse. It is concluded that while substantial progress has been made over the past 15 years in understanding the principal’s contribution to school effectiveness, the most important scholarly and practical work lies ahead. In addition to this qualified, we assert that scholars are better equipped conceptually and methodologically to address these challenges than in 1980.

One of the fundamental tenets of research and practice in the school improvement community concerns the apparently powerful impact of principals on processes related to school effectiveness and improvement. Research findings
from diverse countries and school contexts draw a similar conclusion. Schools that make a difference in students’ learning are led by principals who make a significant and measurable contribution to the effectiveness of staff and in the learning of pupils in their charge (Andrews & Soder, 1987; Bossert, Dwyer, Rowan, & Lee, 1982; Murphy & Hallinger, 1992).

The international chorus of support for this belief has, however, occasionally been broken by discordant voices questioning the empirical validity of this claim (Miskel, 1982; Rowan, Dwyer, & Bossert, 1982). Despite the supposedly dispassionate perspective of the scholarly community, those who call this particular dogma into question have not always received a fair hearing. At a professional meeting some years ago Professor Cecil Miskel (1992) presented a rigorous assessment of the empirical basis for claims of principal effects. His presentation was subsequently derided by a senior scholar whose negative critique was based not on the quality of Miskel’s analysis, but on Miskel’s questioning of the orthodox position.

More recently, research in the Netherlands further explored the basis for claims concerning principal effects (van de Grift, 1987, 1989, 1990). Expecting to confirm positive findings of principals from North America and the United Kingdom in the Netherlands, van de Grift and colleagues conducted their own empirical studies (van de Grift, 1989, 1990). Surprisingly, however, they found few significant effects of principal leadership on student achievement or school outcomes.

They speculated on the basis of this discrepancy in results in the Netherlands. Their explanations included context differences in school settings, variation in the principal’s role, alternative theoretical models, and methodological differences in how analyses were conducted. This discrepancy has presented a puzzle for researchers. The puzzle grows into a challenge when we consider that the actual results of empirical studies in the U.S. and the U.K. are not nearly as consistent in size and direction as rhetoric would have us believe (Bossert et al., 1982; Bridges, 1982; Cuban, 1988; Hallinger & Leithwood, 1994; Miskel, 1982; Rowan et al., 1982).

In this article, we review the empirical literature on principal effects that emerged during the period from 1980 to 1995. This was a period of significant activity in policy, research and practice in educational administration. Stimulated by early studies of school effectiveness and a maturing research base in school improvement, researchers turned their attention to examining the impact of school administrators, particularly principals. A series of research reviews appearing early in the 1980s further encouraged researchers to focus on the effects of principal leadership (Bossert et al., 1982; Bridges, 1982; Leithwood & Montgomery, 1982; Murphy, Hallinger, & Mitman, 1983; Shoemaker & Fraser, 1981). The purpose of the current review is to examine the body of empirical research on principal effects conducted between 1980 and 1995. We seek to understand what has been learned about the substance of claims that principals’
Exploring the Principal’s Contribution

leadership practices make a difference in school effectiveness. We also explore explanations for the discrepant findings concerning principal effects that have emerged internationally over the two past decades.

This review builds explicitly on two related papers in which we reviewed this same body of studies (Hallinger & Heck, 1996a, 1996b). The earlier reviews focused on conceptual (Hallinger & Heck, 1996a) and methodological (Hallinger & Heck, 1996a) issues that emerged from this research. Little attention was given in those analyses to the means by which principal leadership appears to influence the school and its outcomes for students.

In this paper, we focus primarily on the substantive findings from empirical studies conducted during this period. We only address conceptual and methodological issues as they impinge on assessing the validity of the substantive results or help make sense of the pattern of findings. We believe the framework drawn from this knowledge base could form the basis of the next generation studies on the principal’s role.

We begin the article by presenting the method for the review and briefly outlining the conceptual framework used to organize the review. We then discuss the substantive findings from the review. Finally, we suggest how the results from this latest period help frame the next generation of studies of principal effects.

Method of the review

Any attempt to integrate a body of research into a coherent framework that summarizes empirical, conceptual and methodological issues must begin with an acknowledgement of its limitations. First, while this review was conducted at a particular point in time, the field’s conceptualization of organizational processes, including the school leadership construct, is constantly evolving. Thus, characterizations of the field that emerge from a single review focus on a target that is moving even as the review is being conducted. This was certainly the case here as normative notions of principal leadership continue to evolve surprisingly rapidly in response to new environmental demands.

Second, we know of no universal paradigm or theory for examining organizational behavior that is valid in all societal or organizational contexts. This point is especially salient for the current review since we include studies conducted internationally and at different levels of schooling.

Third, a variety of frames have been proposed for studying school leadership (e.g., Leithwood, 1994; Ogawa & Bossert, 1995; Slater, 1995) as well as leadership more generally. This conceptual diversity has not, however, been borne out via substantial empirical inquiry. This presents a challenge for a review seeking to summarize the effects of educational leadership.

Conceptual diversity also came into play in another respect. As we shall note shortly, our decision to focus this review on quantitative studies of principal effects excluded some empirical explorations that would have incorporated quite
different epistemological assumptions and conceptualizations of leadership (e.g., distributed leadership; see Heck & Hallinger, in press).

Finally, proposed theories often become problematic when they seek to model the actual detail and richness of life in organizations (Bossert et al., 1982; Hallinger & Murphy, 1986). The complexity of extra- and intra-organizational processes in schooling represents a challenge for researchers who seek to study causal relationships (Bossert et al., 1982; Boyan, 1988; Pitner, 1988). Social scientists who seek to develop valid theoretical models and apply appropriate analytic techniques to assess how those models work in the world confront a formidable set of tasks.

Within the context of these constraints, the approach taken in this review is to conduct a critical synthesis of the literature. We focus specifically on the substantive findings and interpreting their meaning for the field. We discuss methodological issues as far as they impinge on understanding trends in the substance of the findings.

Selection of studies for review

We began this review with the assumption that the number of studies to be included would not be so large as to require a sampling strategy (Bridges, 1982). This was borne out despite the fact that we conducted an extensive search for studies. We first searched the ERIC (Resources in Education) and Current Journals in Education (CJIE) databases. We used the resulting sources as well as our personal knowledge of published and presented research to identify additional studies.

Three criteria guided our selection of studies for review. First, we were interested in studies that had been designed explicitly to examine the school principal’s beliefs and leadership behavior. The research must have clearly conceptualized and measured principal leadership as an independent variable. We did not require any specific conception of educational leadership for inclusion in the review.

Second, the studies also had to include an explicit measure of school performance as a dependent variable. Most often performance was measured in terms of student achievement data, but occasionally other definitions such as effectiveness were used. It was also our desire, though not a necessary condition for inclusion, to identify studies that examined the principal’s impact on teacher and school level variables as mediating factors.

The dual focus on processes and outcomes reflects the priority that we assign to student outcomes as the goal for school improvement as well as to the importance of classroom and school-level variables in contributing to school effectiveness. We did not, however, include studies that examined principal impact on intervening variables if they did not also incorporate a measure of school outcomes. This criterion shifted the focus of the review towards quantitative studies of principal effects, as opposed to studies about the nature of the principal’s work.
Third, given the growing interest in international perspectives on school improvement, we made an extra effort to seek out studies that examined the impact of principals conducted in a variety of countries. We were reasonably successful in attaining this goal. Eleven of the studies reviewed were conducted outside of the United States. Although we do not undertake comparative analysis in this chapter, we have included studies conducted in a diverse set of cultural contexts including the United States, Canada, Singapore, England, Netherlands, Marshall Islands, Israel, and Hong Kong.

Consequently, the review includes 40 published journal articles, dissertation studies, and papers presented at peer-reviewed conferences. We are reasonably confident that the chapter has captured most empirical studies of principal impact on school effectiveness disseminated internationally between 1980 and 1995. We owe particular debts to the earlier efforts of Bossert and colleagues (1982), Boyan (1988), Bridges (1982), Leithwood, Begley, and Cousins (1990), and Pitner (1988) for laying the groundwork for this review.

Conceptualizing the principal’s role in school effectiveness

Pitner (1988) identified a range of approaches that could be used to study administrator effects through non-experimental research methods: direct-effects, antecedent-effects, mediated-effects, reciprocal-effects, and moderated-effects models (105–108). These models offer a comprehensive set of different perspectives for viewing the effects of the school context on administrative behavior and the influence of administrative behavior on the school and its outcomes.

Of course, these are not the only theoretical perspectives from which leadership can be studied (e.g., Ogawa & Bossert, 1995; Slater, 1995). Pitner’s framework does, however, offer one useful means for conceptualizing and organizing studies on administrative effects. We adapted Pitner’s framework for classifying the studies collected for this review (Figure 1).

We employed variations on three of these models to classify the studies: direct effects (i.e., where the principal’s actions influence school outcomes); mediated effects (i.e., where principal actions affect outcomes indirectly through other variables); reciprocal effects (e.g., where the principal affects teachers and teachers affect the principal, and through these processes outcomes are affected). These theoretical frameworks can also be combined with the antecedent-effects model proposed by Pitner (1988). The simplest combination model integrates antecedent and direct-effects frameworks (see Figure 1, Model A-1). A more complex theoretical model results when antecedent effects are combined with the effects of leadership on in-school processes and indirectly on school outcomes (see Figure 1, Model B-1).

Using this conceptual framework, we categorized and analyzed the content of the empirical studies listed in Table 1. Working independently, we classified the studies by model. After comparing our completed schemes, we resolved several discrepancies and triangulated our results with previous reviews (Bridges, 1982;
Erickson, 1967: Pitner, 1988). Note that Table 1 actually includes 41 studies. The additional study represents our revised analysis of data drawn from one of the studies that we reviewed (Braithwaite & Riley, 1991). In this case we re-analyzed the data using an alternative conceptual model (Table 1).

As is apparent from Table 1, the studies most frequently employed variations of direct-effects and mediated-effects models. Furthermore, there is a chronological pattern in the results. Over time researchers have moved from employing relatively simple direct-effects frameworks (Models A, A-1) to the use of more complex models (Models B, B-1, C). Even among the mediated-effects studies, for example, the later studies tend to use more comprehensive models involving both antecedent and mediated effects.

**Direct-effects models**

Direct-effects models (Figure 1, Model A) propose that the leader’s practices can have effects on school outcomes. Moreover, this approach assumes that these effects can be measured reliably apart from other related variables. Thus, researchers using this model do not typically seek to control for the effects of other in-school variables such as organizational climate, teacher commitment, instructional organization.

At the same time, recognition of the fact that other variables may have a prior effect on school outcomes led several researchers to include variables such as socioeconomic status and/or previous test scores. However, these were not hypothesized as variables interacting with leadership construct or mediating its effects on the selected outcomes.

Figure 1 Modeling principal effects on school effectiveness (adapted from Pitner, 1988, pp. 105–108).
Direct-effects models are quite common among the studies listed in Table 1. Most of the studies in this group were conducted during the earlier period of this review. Prior to around 1987, they represented the norm among principal effects studies (Hallinger & Leithwood, 1994).

Though common, Model A studies have been criticized for making untenable assumptions about the nature of leadership and its effects on school outcomes (e.g., Hallinger & Heck, 1996b; Pitner, 1988; Rowan et al., 1982). In such studies, the process by which administrators achieve an impact on school effectiveness is hidden in a so-called black box. A relationship is empirically tested, but the findings reveal little about how leadership operates.

The methods of analysis used to investigate direct-effects models are mainly bivariate (e.g., O’Day, 1983). Researchers using this approach typically use correlation, t tests, or chi square types to analyze principal effects (see Table 1). Recently, however, more sophisticated analytic techniques such as structural equation modeling have also been more employed to assess the direct relationship between leadership and school outcomes (e.g., van de Grift, 1990). Interestingly, the degree of sophistication in analytic techniques appears unrelated to the trends in results when using a direct-effects model (Hallinger & Heck, 1996a, 1996b).

The results of direct-effects studies of leadership effects are surprisingly clear. Researchers adopting this model have been unable to produce sound or consistent evidence of leadership effects on student outcomes (e.g., Braughton & Riley, 1991; Cantu, 1994; Cheng, 1994; Krug, 1986; O’Day, 1983; van de Grift, 1990). A finding of no significant relationships has been most common, with occasional findings of mixed or weak effects. This overall finding supports the critiques offered by Bridges (1982) and Miskel (1982) as well as empirical findings from research in the Netherlands (van de Grift, 1987, 1989, 1990).

By way of illustration, Cheng (1994) found many significant differences between weak and strong principal leaders in terms of organizational and teacher performance indicators. However, the results with respect to principal effects on student outcomes were mixed. Cheng only found differences in two of seven student-perceived outcomes: attitudes to school and attitudes to learning.

The direct-effects models (A, A-1) have limited utility for investigating the effects of principal leadership. They have not demonstrated conclusive results with respect to principal effects. Even when employing sophisticated statistical methods such as structural modeling, this approach suffers from severe conceptual limitations. In the future, such studies offer little hope as a means of contributing substantially to our understanding of questions concerning either if or how leadership influences student outcomes.

Mediated-effects models

A mediated-effects framework (Model B, Figure 1) hypothesizes that leaders achieve their effect on school outcomes through indirect paths. Leadership

**Notes**

Key for Dependent Variables: 1 = student achievement; 2 = school effectiveness; 3 = teacher perceptions of school effectiveness; 4 = organizational effectiveness; 5 = attendance; 6 = student self-concept.

* Antecedent variable(s) were limited to controlling for exogenous effects on achievement.

practices contribute to the outcomes desired by schools but the contribution is almost always mediated by other people, events, and organizational factors such as teacher commitment, instructional practices, or school culture (Leithwood, 1994). This conceptualization is consistent with the proposition that leaders achieve their results primarily through other people. Mediated-effects studies, therefore, offer concrete indications of possible means through which leadership may achieve an impact on the school’s outcomes and effectiveness.

Notably, these studies also produced a consistent pattern of results, though of a different sort. As seen in Table 1, studies employing a mediated-effects model produced either mixed or consistently evidence of positive effects of principal leadership on school outcomes. When combined with antecedent variables, the more complex model (Model B-1, Table 1) shows an even more consistent pattern of positive indirect effects of principal leadership on school effectiveness.

Table 1 extends the trend implied in our discussion of the direct-effects model concerning the relationship between methods and results. Mediated-effects studies have employed more sophisticated analytic methods than did the direct-effects studies. Researchers initially relied upon multiple regression analysis in which the strength of indirect effects are implied through the use of interaction effects. More recently they have begun to use more powerful variations of path analysis in which the strength of direct and indirect effects can be calculated simultaneously (Hallinger, Bickman, & Davis, 1996; Heck, Larson, & Maroulides, 1990; Leithwood, 1994).

These analytic methods are necessary to cope with the more complex relationships framed in mediated-effects models. It is interesting to note that greater consistency in findings of principal effects only emerged after these methods began to be used by researchers. This reinforces the importance of bringing conceptual and methodological power to the study of leadership effects.

**Reciprocal-effects models**

A third conceptual approach to understanding administrator effects is the reciprocal-effects model (Figure 1, Model C). Scholars have proposed that relationships between the administrator and features of the school and its environment are interactive. This proposition is not, however, captured in either the preceding models, A or B. A reciprocal-effects framework implies that administrators adapt to the organization in which they work, changing their thinking and behavior over time.

Principals enact leadership in the school through a stream of interactions over a period of time. In doing so they address salient features of the school such as the current and changing states of student outcomes or staff morale or commitment. Alternatively, they may initiate changes in the school’s curriculum program or instructional practices. These actions may cause changes in the conditions of the school. This subsequently produces feedback that causes recipro-
cal effects in the originating variable, leadership. This is an example of a reciprocal process.

By way of illustration, a principal might enter a low performing school that has severe problems of discipline and order. In response, the principal might take highly directive measures to establish control. Once the school has achieved a level of stability, the principal may adopt a quite different way of thinking about both goals and actions for school development. To the extent that leadership is viewed as an adaptive process rather than as a unitary independent force, the reciprocal-effects perspective takes on increased salience. When employing this type of model, the researcher further entertains the possibility that causal relationships may be multi-directional, change over time, and even be nonlinear.

As seen in Table 1, few studies were conducted with this model type; in fact, none were specifically designed to model reciprocal effects. The ability to adequately test reciprocal effects has been limited by the types of data collected and the analytical methods employed by researchers. Analyzing how leadership processes and their effects unfold over time is demanding from a methodological standpoint. Up until a few years ago, the necessary methodological means to analyze reciprocal relationships quantitatively (e.g., structural equation modeling) or trend data were not widely accessible.

Cross-sectional data can give an impression that a certain type of principal leadership has an impact on other processes, as in Models A or B. However, it is also possible – even likely – that this form of leadership “worked” only at that certain point in time, or that effects go in both directions. Cross-sectional studies and related conceptual models do not capture the dynamic relationship that may exist among variables, especially with respect to how these may change over time.

A more complete representation, therefore, would require the assumption that the reciprocal effects will only become apparent over time. Thus, in order to specify such models completely, longitudinal data are preferred, and these are in short supply. Further development and exploration of this model represents a profitable area for future research. As research questions are framed within this type of conceptual framework, it will undoubtedly lead to revised conceptual models and corresponding methods of analysis.

**Conceptualizing educational leadership**

Although this review focuses primarily upon the issue of principal effects, we must briefly discuss the range of leadership conceptualizations represented in this body of research. The field’s conceptualization of principal leadership has evolved considerably over the past 25 years (Hallinger, 1992). This was aptly demonstrated in these investigations as researchers employed at least six distinctly different leadership frameworks to study principal effects.

Although a variety of conceptual models were employed in these studies, two major approaches have predominated in the study of principal effects over the
past fifteen years: instructional leadership and transformational leadership. Studies from the early to late 1980s were dominated by an instructional leadership conceptualization drawn from the effective schools literature (e.g., Andrews & Soder, 1987; Biester, Kruse, Beyer, & Heller, 1984; Hallinger & Murphy, 1986; Jackson, 1982; Jones, 1987; Krug, 1986; O’Day, 1983; Scott & Teddlie, 1987). Though defined in a variety of ways, 31 of the 41 studies conceptualized the principal’s role in school effectiveness in terms of instructional leadership.

Since 1990, researchers have begun to shift their attention to leadership models construed as more consistent with evolving trends in educational reform such as empowerment, shared leadership, and organizational learning. This evolution of the educational leadership role has been labeled as reflecting “second order” changes (Leithwood, 1994) as it is aimed primarily at changing the organization’s normative structure. The most frequently used model of this variety has been transformational leadership (e.g., Jantzi & Leithwood, 1993; Silins, 1994).

Transformational leadership focuses on increasing the organization’s capacity to innovate. Rather than focusing specifically on curriculum and instruction, transformational leadership seeks to build the organization’s capacity to select its purposes and to support the survival of changes to the school’s core technology. The core theoretical and empirical work on this model has been conducted by Leithwood and his colleagues at the Ontario Institute for Studies in Education. Three studies examined transformational and transactional leadership constructs (Jantzi & Leithwood, 1993; Leithwood, 1994; Silins, 1994).

Several other leadership frameworks were used in these investigations. In one study Cheng (1994) adapted Bolman and Deal’s (1992) popular conceptualization of organizational leadership. This framework conceives of four frames – political, structural, symbolic, human resource – for viewing the role of leadership in organizations. Given its widespread use in administration preparation programs, it was surprising to see that so few studies used this framework in the study of principal effects.

We would be remiss if we did note that the epistemological breadth of conceptualizations included in this corpus of studies was limited by the decision to focus specifically on principal effects on school effectiveness and achievement. This decision immediately limited the range of alternative conceptualizations likely to appear in the review. For example, it meant that scholars who conceptualized effectiveness via non-quantitative approaches would not be captured by the review. It also meant that scholars who focused on intermediate-level variables such as academic learning time or other classroom- or school-level process variables would not be included. Finally, it meant that we would miss studies by scholars who employed measures of leadership that did not focus on the principal. These considerations all led, in our view, to the relatively narrow range of conceptualizations embedded in this set of studies.

In this instance, the predominate paradigm of the 1980s – school effectiveness – drove the review. Consequently, our definition of scope for the review –
principal effects on school effectiveness and achievement – biased the study
towards certain ways of seeing leadership effectiveness and also towards certain
methodological approaches. We acknowledge this as a limitation of the review
with the result that the full range of principal leadership studies is not represent-
ted here (see Heck & Hallinger, in press, for an analysis of the broader range of
conceptual models being employed). At the same time, we assert the appropri-
ateness of carefully defining the scope of a research review and the validity of
focusing on the school effectiveness paradigm in this review.

In the following section, we discuss the substantive results from studies
employing these educational leadership models. Although we discuss the overall
trend of findings among the studies, we focus primarily on those studies, that
found administrative effects. Since these studies tend to be found among the
more complex models (B, B-1), that is where we give the greatest attention.

Results
In this section we examine the results that emerged from the substantive findings
of the studies. The findings are organized into three sections representing the
main leadership model components: in-school processes, antecedents, outcomes.

Avenues of influence of principal leadership
Given these varying conceptualizations of the principal’s leadership role, we
needed a more general framework that could encompass the specific models of
principal leadership that were investigated. We chose to organize the presenta-
tion of our findings around Leithwood’s (1994) as well as Ogawa and Bossert’s
(1995) theoretical leadership frameworks for exploring leadership effects. These
represent recent thinking about how school leadership operates within an organi-
zational context and we found considerable overlap in their conceptualizations
of leadership effects.

These frameworks hypothesize four areas through which leadership may
influence the organizational system: (1) purposes and goals; (2) structure and
social networks; (3) people; (4) organizational culture. In the current image of
school organization, therefore, leadership not only influences individuals – it
influences the organizational system in which individuals (e.g., teachers, stu-
dents, parents) work. After we examine the findings along the four identified
domains, we discuss how antecedent effects interact with the mediated-effect
model.

Purposes and goals
The most consistent findings among the studies support the view that principals’
involvement in framing, conveying and sustaining the schools purposes and
goals represent an important domain of indirect influence on school outcomes.
This focus on goals reflects the popularization of vision, mission, and goals in the management literature of this period. Primarily through mediated-effects studies, researchers studied the principal’s impact on the staff’s educational expectations, the framing of educational purposes, the substance of the school’s mission, consensus on goals, and the principal’s role in goal-setting processes (e.g., Andrews & Soder, 1987; Barnburg & Andrews, 1990; Brewer, 1993; Cheng, 1994; Goldring & Pasternak, 1994; Hallinger et al., 1996; Hallinger & Murphy, 1986; Heck et al., 1990; Leithwood, 1994; Scott & Teddlie, 1987; Silins, 1994).

For example, Brewer (1993) noted that principal leadership affected both the selection and motivation of teachers in terms of their classroom goal-setting. After controlling for a variety of environmental influences, Brewer found higher academic gains in high schools where principals held high academic goals and selected more of the teachers. Conversely, where principals held lower academic expectations and selected fewer teachers, lower test score gains resulted. While the methodology of this study was limited in its ability to clarify fully the relationship among these variables, it reinforces the potential importance of the school culture. It suggests both the importance of the principal’s expectations for achievement and staff selection as a vehicle for increasing the school’s focus.

Goldring and Pasternak (1994) similarly found that the principal’s role in framing school goals, establishing a clear mission, and gaining staff consensus were stronger predictors of school outcomes than other instructional or managerial activities (e.g., allocation of time, control or influence). Notably, within their framework, goals were conceived more broadly than simply as academic achievement. The important variables included emphasizing good citizenship, personal growth, good work habits and learning skills among students and securing staff agreement about educational goals.

Hallinger and colleagues (1996) found that establishing a clear school mission was a key avenue through which principals influence school effectiveness. In their study principal leadership was significantly related to the variable, clear school mission. It was through this avenue that principals shaped teachers’ expectations and students’ opportunity to learn in the school. Again both academic focus and staff consensus were conceptualized as part of a constellation of systemic variables. This path of indirect effects had a measurable impact on the reading achievement at the elementary school level.

Additional supporting evidence for the importance of this component of our model is provided by Leithwood (1994) and Heck (1993). Their data support the key role principals play in identifying and clarifying the meaning of school’s vision. Both studies reinforce the importance of coordinating the school’s goals with its curriculum. Moreover, as in the Brewer (1993) and Hallinger et al. (1996) study, high performance expectations again emerge as a potentially potent source of influence. These variables were related to the principal’s ability to stimulate innovation and flexibility as well as to higher productivity in terms of restructuring the organization’s goals and achieving school outcomes.
It is important to draw a conceptual distinction between the role of goals as employed in the instructional leadership models and the transformational leadership models. Goal setting within the instructional leadership tradition emphasized the principal’s capacity to focus staff on the school’s academic improvement. Within this model, goals are viewed as an instrumental agent used by instructional leaders to narrow the attention of staff, parents and students on a limited range of activity.

This distinction was highlighted by Hallinger and Murphy (1986) in their study of effective and typical elementary schools. They noted that even within the instructionally effective schools, there were differences between how principals employed goals. Some used explicitly defined school goals as instruments for coordination and control. Other principals sought to establish and maintain a general direction for the school, but they employed goals in a more generative manner building upon and reinforcing important purposes that emerged from the staff and community. These observed differences appeared to be related to contextual characteristics of the school such as socioeconomic status of students.

Within the transformational leadership model, as conceived by Leithwood (1994) and Silins (1994), the goal-setting function of the leader is somewhat different. Here the leader seeks to stimulate people to arrive at new (and higher) goals for personal and professional development. Leithwood suggests that the strongest influence of transformational leadership on outcomes is through vision building and fostering commitment to group goals. These in turn lead to an increased capacity for innovation.

Leithwood and colleagues (Leithwood, Jantzi, Silins, & Dart, 1993) provide evidence of small effects of principal behavior in this domain. They find that principal vision, group goals, high expectations, and individual support have effects on several in-school processes such as goal formulation, school culture, teachers, policy and organization. In turn these influence school improvement outcomes including achieving school reform goals, policy and organizational change.

Thus, goal framing and mission-building, though critical in both leadership models, take on different emphases. Despite differences in how the principal’s leadership role is conceptualized, however, both frameworks do emphasize the importance of vision and goal cohesion within the school. Additional research is needed to unpack how goals operate in fostering school improvement. However, these findings offer strong evidence of this domain’s validity in terms of the leader’s role in school effectiveness and improvement.

Structure and social networks

A second domain of leadership influence involves the interplay between organizational structures and social networks. Theorists suggest that leadership is linked to organizational roles and the network of relations among roles because it is this network that comprises the organizational system. Ogawa and Bossert
(1995) propose that leadership enhances organizational performance and survival by affecting social structures, the regularized aspects of relationships existing among participants in an organization. Hence, leadership can be distributed across organizational roles. The concern in this dimension is with how leadership is exercised (e.g., centralized or dispersed) and what are its basic aims with respect to other people in the organization.

Evidence from the mediated-effects studies provides strong support for this view. In an early paper, Weil et al. (1984) found that principal support of teachers and a proactive stance on problem solving were areas separating effective from more typical elementary schools. In a more-recent effort, Silins (1994) determined that transformational leadership (i.e., actions aimed at providing support, challenging work, and sense of vision and mission of the school) produced significant effects on a variety of teacher-perceived reform processes as well as on school, program, and student outcomes. The effects of a contrasting model, transactional leadership (i.e., focusing on fulfilling basic needs and supplying extrinsic rewards) were much less pervasive.

Positive effects of transformational leadership on in-school processes and a range of teacher-perceived outcomes have also been reported by Leithwood and his colleagues (Leithwood et al., 1993; Leithwood, 1994). The areas of transformational leadership that primarily affect this domain are providing support for individual teachers, fostering cooperation, and assisting them to work together toward the fulfillment of identified school goals. Leithwood suggests that principals’ transformational leadership affects three psychological dispositions of teachers (i.e., their perceptions of a variety of school characteristics, their commitment to school change, and their capacity for professional development). In turn, Leithwood argues that leadership indirectly affects the organizational outcomes of restructuring initiatives and teacher-perceived student outcomes, but had little effect on student participation in school activities and student grades.

Several studies across a variety of national contexts indicated that more involvement from a variety of stakeholders in decision making is characteristic of higher-producing schools. Weil et al. (1984) determined that collaboration in decision making was an area separating effective and more typical elementary schools. This was the case for both teacher and parent participation in decision making (also see Heck, Marcoulides, & Lang, 1991). It is interesting to note that this finding receives support from cross-national research. For example, Heck (1993) found that more collaborative decision making and more flexible rule structures were associated with higher-achieving secondary schools in Singapore. Cheng (1994) found that strong primary school principal leaders in Hong Kong schools tended to promote participation in decision making, stronger and more cohesive social interactions, attitudes about work, commitment, and higher morale. In a Canadian study, Leithwood (1994) also suggests greater implementation of a variety of primary school change outcomes where decision making power is shared, principals provide relative auto-
nomy to teachers, and where collaboration is used in decision making, and time is provided for all of these activities.

As implied above, parental involvement may be another area in which principals exercise an indirect effect on outcomes. For example, Weil et al. (1984) noted that parents in effective schools in the study also perceived themselves to be more involved in the school and in participating in decision making about the school. Similarly, in a study conducted in Israel, Goldring and Pasternak (1994) noted that highly-effective elementary principals emphasize involving parents in the school. Controlling for community background variables, Heck et al. (1990) also found that principals encouraged greater levels of parental involvement in highly-effective elementary and high schools. As we also note later, parental participation and expectations have a corresponding impact on principals.

People

It seems clear from several proposed leadership frameworks (e.g., Bossert et al., 1982; Leithwood, 1994; Ogawa & Bossert, 1995) that administrative activity is largely directed at people in the organization (i.e., students, teachers, parents and community, district personnel). Ogawa and Bossert (1995) argue that social interaction among people within the school community is a primary building block of leadership. As they note, leadership requires the use of personal resources, for example, responsibility, cooperation, and commitment.

The evidence from the last 15 years of research on educational leadership provides considerable support concerning the importance of this domain of principal influence. In a synthesis of several studies of the impact of the principal from a transformational leadership perspective, Leithwood (1994) highlights “people effects” as a cornerstone of the transformational leadership model. Within the model proposed by Leithwood and colleagues (e.g., Jantzi & Leithwood, 1993; Leithwood et al., 1993; Leithwood, 1994; Silins, 1994), many of the outcomes of interest in terms of restructuring schools are teacher effects (e.g., changes of behavior, adoption of new programs, teaching techniques). Thus, they suggest a major impact of principal efforts is to produce changes in people.

More specifically, Leithwood (1994) found that principal effects are achieved through fostering group goals, modeling desired behavior for others, providing intellectual stimulation, and individualized support (e.g., toward personal and staff development). In these schools, principals were better at supporting staff, providing recognition, knowing problems of school, were more approachable, follow through, seek new ideas, and spent considerable time developing human resources. A conclusion drawn from Leithwood’s studies is that transformational leadership has an impact on teachers’ perceptions of school conditions, their commitment to change, and the organizational learning that takes place. With respect to outcomes, leadership had an influence on teachers’ perceptions of progress with implementing reform initiatives and teachers’ perceptions of increases in student outcomes.
Other studies using an instructional leadership model also provide considerable support for principal effects on people as a means to affect outcomes indirectly. Heck et al. (1990) found that teachers in higher-producing elementary and high schools spent more time than their counterparts in low-producing schools in the direct classroom supervision and support of teachers, as well as in working with teachers to coordinate the school’s instructional program, solve instructional problems collaboratively, help teachers secure resources, and provide in-service and staff development activities.

Similarly, in our re-analysis (see next section) of the Braughton and Riley (1991) study, we discovered that principals were much more directly involved in the classroom supervision and support of teachers who had lower skills in teaching reading. Principals’ classroom involvement with teachers had a significant indirect effect on school outcomes. Goldring and Pasternak (1994) found that effective elementary schools had greater staff consensus about educational goals than less-effective schools. Eberts and Stone (1988) argued that the principal’s role in resolving conflicts within the school is an area of impact on school achievement (in more effective schools teachers perceived conflicts were resolved adequately). Together these findings suggest that more effective (or higher-producing) schools have greater educational and social cohesiveness (e.g., Heck, 1993).

Organizational culture

Recent theories of school leadership emphasize the influence of organizational culture on the meaning people associate with their work and willingness to change (Bolman & Deal, 1992; Leithwood, 1994; Ogawa & Bossert, 1995). As Ogawa and Bossert (1995) argue, leaders operate within environmental (i.e., societal) and organizational cultures and affect how other participants interpret organizational events and thus influence how they behave. This focuses on the importance of developing shared meanings and values.

Relative to societal cultures, few of the studies in the past 15 years were designed to compare leadership across cultural contexts. In one such study, Heck et al. (1991) noted likely differences in principal leadership associated with the cultural context of the schools in which the study is conducted. Others were simply case studies of the principal’s role within a variety of different cultural contexts.

There is less support in this particular empirical literature concerning the principal’s role with respect to organizational culture and learning outcomes than the other three domains. At least in part this results from the newness of this construct as a focal point for research on the principal role. Even within the wider organizational and management literatures, this has been related to disagreement about the conceptual components of the construct.

Similarly, in the earlier effective schools studies, culture was perceived as “climate”. For example, the original Bossert et al. (1982) framework used the
term climate. Weil et al. (1984) found that effective and typical schools differed in several important respects in their organizational processes. They termed these processes school learning climate (e.g., mission, opportunity to learn, expectations), organizational climate (e.g., collaborative processes, open communication), social climate (e.g., sense of community, student involvement). Teachers in the study suggested that effective schools tended to emphasize group processes in solving problems, the promoted instructional improvement, curriculum and testing were aligned, and principals were seen as more supportive of teachers. Moreover, in effective schools the learning climate appeared to be solely a function of the leadership climate.

Heck et al. (1990) also found that principals’ efforts in improving the educational environment of the school (e.g., communication processes, high expectations for students and teachers, increasing morale) were indirectly related to school outcomes. Although they labelled this construct “school climate”, it also emphasizes elements of the school’s value structure (e.g., high expectations). In both of these studies, school climate seemed to reflect values processes that we consider to be important facets of organizational culture.

A few years later, Leithwood et al. (1993) conceptualized school culture as widespread agreement about norms, beliefs, and values. They proposed that school culture was central to achieving the coordination necessary to implement change. Principals were found to impact school culture which, in turn, impacted a range of restructuring outcomes including program, policy, teacher behavior, and students.

Useful distinctions can be drawn, however. In one attempt to clarify the relationships between these constructs, Heck and Marcoulides (1996a) described climate as participants’ perceptions about “how things are” (e.g., work conditions) on a day-to-day basis as opposed to deeper values and structures that affect socialization and norms governing subsequent actions within the organization. In clarifying the relationship between the two constructs, climate, therefore would be expected to change more readily – depending, for example, on the actions of administrators – than the entire system of variables comprising the school’s culture (e.g., its structure, value system, managerial processes).

**Antecedent effects on leadership**

The model discussed above focused on the impact of principal leadership on in-school variables and school outcomes. This body of research also focused on a variety of antecedent and context effects on principals. This relationship was investigated through both direct-effects and mediated-effects studies.

Despite a range of conceptual and methodological problems, one interesting finding is suggested by several studies. Socioeconomic factors in the school and community appear to influence principal leadership and its impact on school effectiveness (e.g., Andrews & Soder, 1987; Hallinger & Murphy, 1986; Rowan & Denk, 1984). For example, Andrews and Soder (1987) reported that principal
leadership affected reading and math outcomes in elementary schools. When controlling for SES and ethnicity, however, the effects of principal leadership on reading and math outcomes tended to disappear in high SES or predominately Caucasian elementary schools. They remained significant in predominately African-American or low SES schools. This supported their hypothesis of context effects on the leadership exercised by principals.

Hallinger and Murphy (1986) found that community SES affected how elementary school principals perceive their work. For example, the school mission was defined differently in low and high SES effective schools, with low SES schools stressing the mastery of basic skills. Consequently, in these schools a greater percentage of time was allocated to basic skills instruction with frequent, extrinsic rewards for success. Moreover, principals in low SES schools tended to define their leadership role more narrowly in terms of curriculum coordination, control of instruction, and task orientation.

Similarly, Scott and Teddlie (1987) identified a link between SES and elementary school principal expectations. Principals’ expectations, in turn, affected their responsibility; however, they determined that principal responsibility was not directly related to outcomes. Although untested by Scott and Teddlie, we noted a possible indirect effect (likely statistically significant) of principal expectations on school outcomes through principal responsibility.

Antecedent influences were also found to impact upon principal behavior with respect to structures and social networks. Hallinger and Murphy (1986) found that SES impacts how principals go about developing such linkages. For example, they noted that school linkages to the home and parent involvement were weak and limited in low SES effective schools. In contrast, linkages to the home and parent involvement were strong and pervasive in high SES schools. Parents contributed time as classroom aides, their money supported expansion of school programs, and they assisted in organizing schoolwide festivals.

In the lower SES schools, principals acted as buffers between the school and home, controlling access to the school and protecting the school’s program from outside influences that might dilute its effectiveness. In higher SES schools, however, the principal acted as a boundary spanner, constantly seeking ways to involve community members who had great interest and stake in the school’s operation.

These findings hint at the relationship between wider community cultural context and corresponding school culture. The different extent of contact between school staff and community is important because teacher and administrator attitudes appear to be shaped by expectations and beliefs of the wider community (e.g., Hallinger & Murphy, 1986; Ogawa & Bossert, 1995). Outside of this relationship to the wider community (e.g., expectations), Hallinger and Murphy found that effective schools in high- and low-SES also had similarities in terms of their instructional and organizational arrangements – a clear mission, emphasis on achievement results, high expectations, a well-coordinated curriculum, and principal behavior that was concerned with instruction. Of course,
effects of principal behavior with respect to culture is a topic that needs further empirical study.

Cheng (1994), noted that other contextual factors (e.g., school size, teacher background) were not generally found to exert any important influence over principal leadership in secondary settings. Heck (1992) found differences in principal discussion of instructional issues and problems and discussion about how instructional techniques impact student achievement to be similar across school level, with principals in both effective elementary and high-school schools more involved with these variables than their counterparts at low-achieving schools. There is an interaction with level, however, with principals in effective elementary schools more heavily involved than principals in effective high schools. Heck (1992) also noted that principals in elementary schools (controlling for effectiveness) spend more time attempting to communicate goals to teachers and others than principals in secondary schools. The findings from Heck’s (1993) secondary school study tend to corroborate Leithwood’s studies with primary schools in this area, although the leadership constructs employed are different.

Unit of analysis and multilevel effects

Closer inspection of Table 1 reveals that previous research on the principal’s role has been conducted using widely different units of analysis. For example, these include principals, individual teachers, teacher responses aggregated to the school level, and various sub-groupings of students. This issue introduces additional complexity into the discussion of principal effects on school processes and school outcomes.

At each level of the organizational system different effects can be conceptualized. Students bring individual abilities to their classrooms. Teachers shape the children’s classroom environment. Principals monitor teachers within their schools. Superintendents develop improvement plans for their districts. Thus, within a given organizational system the effects of actors (or groups of actors) at different levels must be taken into account.

Theoretically, this has been referred to as a “nested structure” and represents an example of a hierarchical data structure (Bossert et al., 1982). Most of the mediated-effects studies that found a relationship between principals’ leadership, school processes, and outcomes focused on teachers’ perceptions of organizational processes, measured variables either at the individual or school level (e.g., Hallinger et al., 1996; Heck et al., 1990; Leithwood et al., 1993). A smaller number of studies finding positive effects of leadership studied principals directly (e.g., Eberts & Stone, 1988; Silins, 1994). One issue raised by different units of analysis is the extent to which various role groups perceive the principal’s leadership similarly.

When studying the interrelationships among principal, teacher, and student-level variables, therefore, the structural features of educational organizations
take on particular importance. Principals are likely to influence the school level of the organization more directly than classroom (e.g., how teachers organize instruction) or student levels (e.g., the motivation of particular students). Unfortunately, in the past such issues were often blurred in the transformation of conceptualizations into operational measurement.

One illustration of this problem for example, can be seen in the conceptualization of school learning climate, a popular variable measured in these studies. It remains a point of contention whether constructs such as school climate (or principal leadership) are basic properties of the organization or merely perceptions of the individuals. If we accept the former conceptualization, perceptions should be measured at the school level. In the latter case, they would more appropriately be measured at the individual teacher or student level.

Earlier studies on principals seldom addressed the problem of variables such as student achievement that are impacted by multiple levels of the organization. In such studies, for example, the unit of analysis tended to be either the individual level (e.g., teachers and principal as individuals without regard to their school setting) or the school level. In the latter case, teacher responses were summed to create school means. The researchers would then compare schools within the sample.

Neither solution is completely satisfactory. A limitation of a school-level analysis is that every individual in the school is assumed to hold the same perception about the principal. Individual level analyses do not allow us to assess accurately the effects of different levels of the organization on the relevant outcome of interest. For example, if quality of teaching is hypothesized to affect student learning, then we know that some students in our sample of individuals have the same teacher and, further, differ in the quality of teaching that they receive. To ignore this, we violate the assumption of independence of observations that is basic for classical statistical techniques. That is, systematic groups of students in our sample would have the same value on all variables at the classroom level (Bryk & Raudenbush, 1992).

Several promising analytic techniques have been developed over the past few years (e.g., structural equation modeling, hierarchical linear modeling) that allow the investigation of these effects across organizational levels. These techniques were not, however, used to investigate multilevel effects in the studies we reviewed. For example, Heck et al. (1990) developed separate structural models at the individual and school levels and compared the estimates. Yet, this approach did not bring together one set of within- and between-level estimates.

To address this shortcoming in principal leadership studies further, Heck and Maroulides (1996b) recently reanalyzed an earlier study to assess the effects of multilevel data on the assessment of principal leadership and its effects. This analysis revealed several new findings. Hierarchical linear modeling (Bryk & Raudenbush, 1992) was employed to separate the variance accounted for in principal leadership practices into within-school and between-school components. First, most teacher perceptions of principal leadership were individual proper-
ties; that is, variance in leadership practices across several dimensions (governance, instructional supervision, culture and climate building) was roughly 70% to 80% within each school. This suggests that individual-level analyses do manage to capture most of the inherent variation in the data. Therefore, we should not discount the findings of previous studies conducted at the individual level of analysis. Second, the analysis revealed that in all leadership domains investigated, principals rated their direct involvement more highly than their teachers did.

The 20 to 30% variation in leadership practices across school, however, suggests that there are substantial differences in principals’ leadership practices at the school level as well. In the Heck and Marcoulides (1996b) study, this variation was accounted for by the level of the school (i.e., with high school principals being perceived as less actively involved in various leadership activities) and the achievement context of the school (with principals in high-achieving schools more actively involved in leadership activities).

Thus, the caution here is that between-school studies treat the smaller amount of variation due to differences in leadership among the set of schools as if it were 100% of the variation in the data. This has the potential to alter the findings. Interestingly, another such study (Rowan, Raudenbush, & Kang, 1991) determined that most of the variance in teacher perceptions about principal leadership (roughly 75%) was also the result of within-school variation in how teachers view the principal’s actions. Of course, this variation would be lost if measurements were simply aggregated to school level means, and those school-level means used in a between-school analysis. Therefore, studies that do not account for within-school variation can run the risk of overemphasizing (or underemphasizing) differences in leadership between schools.

Now that several techniques are available to estimate multilevel effects, one alternative solution proposed through hierarchical linear modeling is to develop a within-school model to determine the relative effects of various factors (e.g., gender, backgrounds of teachers) on teachers’ perceptions about the principal’s leadership. The approach is illuminating for many research situations in that it allows the variability in important dependent variables (e.g., outcomes, leadership) to be decomposed across different levels of the organization. In this manner, we can also determine whether leadership has been measured with sufficient reliability and validity within each school to permit a school-level analysis of differences in principal leadership.

Impact of school leadership

As noted at the outset, one purpose of this review was to explore possible explanations for the ambiguity and inconsistency in findings of principals’ effects. The conceptual organization of the studies (see Table 1) began to offer clues for the discrepant findings. As noted earlier, the finding of positive effects to be associated with the conceptual model used by the researcher. That is, mediated-
effects studies yielded more consistent findings than did the direct-effects studies that were popular earlier in the decade.

The contrasting findings between mediated- and direct-effects studies led us to re-analyze one of the direct-effects studies to see if formulating a different theoretical model might affect the nature of the findings concerning leadership and school outcomes. We used available data (through inclusion of a correlation matrix) that had employed direct-effects models and found no principal effects on student outcomes (Braughton & Riley, 1991).

We formulated antecedent with mediated-effect models using their available observed variables and, in the case of the Braughton and Riley (1991) study, applied a different analytic method. For this analysis, we used structural equation modeling. The usefulness of this approach is that it forces the researcher to propose a specific theoretical model before actually testing the model against the data and allows for complex tests of direct, indirect, and total effects involving several dependent (and mediating) variables in one analysis. Moreover, the analysis provides several measures of fit of the hypothesized model to the actual data. This allows the determination of whether the model may be considered a plausible representation of the data.

In the structural equation approach to data analysis, there are two basic steps. First, a series of latent constructs (i.e., unmeasured constructs such as leadership practices) are defined in terms of several observed variables. This hypothesized set of relationships may then be fit against the actual data. After successfully defining the measurement properties of the relations, the structural parameters among latent constructs are then investigated. Through illustrating this approach using previous studies, we hope to raise the possibility of uncovering “hidden” effects in the data by applying a different system of theoretical relations.

In the Braughton and Riley (1991) study, the authors found no effects of a variety of variables measuring principals’ knowledge and supervisory actions on students’ fourth grade reading scores. The model was originally cast as a regression model with several indicators of principal and teacher knowledge and actions as predictors of fourth grade reading. The only significant predictors they found were the students’ second grade scores and fourth grade teachers’ knowledge of reading processes.

We recast their regression model into a mediated-effects with antecedent framework as follows. Drawing on earlier research by Glasman and Fuller (1992), we assumed that student test scores affect principal behavior. We then hypothesized that second grade reading scores might help explain principal behavior in terms of their decisions in supervising teachers’ classroom work with the four grade classes. We, therefore, defined a latent construct measuring principal involvement in supervision and another latent construct measuring teacher classroom reading practices.

We then tested this newly-proposed model with LISREL 8 (Jöreskog & Sorbom, 1993) using the authors’ correlation matrix as input (Braughton & Riley, 1991). First, our model fit the data quite well. Using several common
indicators of model fit (chi-square/df ratio, goodness of fit index, root mean square residual) we concluded that our proposed model had a good fit with the data. The chi-square/df ratio was 1.3 \( (p=.064) \), the goodness of fit index was .90 (values of .9 are considered evidence of acceptable fit), and the root mean square residual was .08.

After establishing the fit of the model, we examined the standardized structural coefficients (not tabled). We found a significant relationship (.34) between grade two reading scores and teacher practices with these children in grade four. Principal supervisory activities affected teacher practices significantly (−.38) and outcomes indirectly through their supervision of grade four teachers (.23). Consistent with Braughton and Riley’s (1991) own results, we found a direct effect of grade two reading scores on grade four outcomes (.70), and no direct effect of principals’ actions on outcomes (.09). Thus, the effects of principal leadership on school outcomes were almost completely indirect through supervising teachers’ classroom practices (e.g., with the negative coefficient reflecting greater supervision in classroom where teachers were weaker).

A cautionary note

While we believe that this reanalysis provides a useful and valid approach to understanding the meaning of these findings, we must also acknowledge several limitations. First, it is important to remember that in any test of a model the evidence of a good fit to the data does not mean that other models cannot fit the data equally well or better. Failure to reject a particular model as ill-fitting only indicates that this is one of many possible models that might describe the data. We therefore encourage researchers to use theory to enhance the specification of their model tests and when possible to consider testing competing models.

Second, we recognize Jöreskog and Sorbom’s (1993) caution concerning the use of a correlation matrix as input data. For example, if equality constraints are used when making comparisons, they may modify the model. Use of the correlation matrix as input data may also produce incorrect chi-square values and standard errors. Despite these limitations, the same authors also note that in many social science applications the units of measurement in the observed variables have no definite meaning (Jöreskog & Sorbom, 1993). When this is the case, in practice, it is neither uncommon nor incorrect to analyze correlation matrices for interpretational purposes. Of course caution must be exercised and alternative interpretations considered.

We cautiously interpreted the new findings in our re-analysis, as well as the consistent findings from the set of mediated-effect studies in Table 1. Despite continuing limitations in the actual use of these more recent research methods, we conclude that convincing empirical evidence suggests that principals do affect school outcomes. The impact is, however, achieved primarily through complex indirect relationships with other external environmental forces (e.g., community) and in-school processes.
Conclusions

The bulk of research, policy and practice in education has assumed the stance that principals make an important difference in school effectiveness. Over the past 15 years, however, several respected scholars have raised questions concerning the validity of this conclusion (Bridges, 1982; Miskel, 1982; Rowan et al., 1982; van de Grift, 1990). This review was initiated in part to see whether persisting questions concerning the effects of principal leadership might be illuminated by the recent proliferation of research into this domain of educational administration.

The review yielded a number of interesting findings that derive from the interplay among methodology, theory, and results. First, we were surprised by the number of empirical investigations (over 40 studies) into principal effectiveness conducted since 1980. Given Bridges’ (1982) finding of relatively few studies of administrator effects or impact conducted in the immediately preceding period of time (1967–1980), this increase was heartening.

Moreover, the conceptual and methodological trends that emerged from the studies was equally encouraging. We observed a pattern of increasing sophistication in the research during the period under review. This enhanced our confidence in the reliability and validity of the overall findings (Hallinger & Heck, 1996a, 1996b). It also offered evidence that scholars in the field had heeded the recommendations encompassed in earlier critiques of research in this domain of educational administration (e.g., Bossert et al., 1982; Bridges, 1982; Leithwood & Montgomery, 1982; Leithwood et al., 1990; Murphy et al., 1983; Pitner, 1988; Rowan et al., 1982).

The general pattern of results drawn from this review supports the belief that principals exercise a measurable, though indirect effect on school effectiveness and student achievement. While this indirect effect is relatively small, it is statistically significant, and we assert, meaningful. Moreover, the review suggests that it is possible that previously described discrepancies among research results may be explained by the conceptual and methodological tools employed by researchers. Both our own reanalysis of the Braughton and Riley (1991) study and the more general trend in which more sophisticated investigations tended to generate more findings of positive results support this hypothesis.

Despite this generally positive assessment of the literature, we must also emphasize the limitations of this body of research. Even as a group the studies do not resolve the most important theoretical and practical issues entailed in understanding the principal’s role in contributing to school effectiveness. These concern the means by which principals achieve an impact on school outcomes as well as the interplay with contextual forces that influence the exercise of school leadership.

As we suggested earlier, part of this issue is related to the unit of analysis problem (e.g., teachers, principals, individual-level or group-level) and the multilevel nature of schooling (i.e., individual children nested in classrooms, in
schools and districts). In the latter case, we provided a re-analysis of one of our studies to illustrate possible findings about leadership processes related to multi-level analyses. Thus, our assessment is that the field has made substantial progress over the past 15 years and is now equipped conceptually and methodologically to address the important substantive issues in this domain.

For example, we discovered an evolving sophistication in thinking about the principal’s role in this group of studies. This was observable in the theoretical and methodological frameworks used by researchers into principal effects. We view this as suggestive of what Kuhn (1970) described as a change in paradigms – the constellation of beliefs, values and techniques that guide scientific inquiry within a community of scholars.

During the early years of this review, 1980 to 1987, the complexity of the relationship between principal leadership and school outcomes often overmatched the conceptual and methodological tools in use by researchers. Over time, however, we noted a movement from simple to more complex models. Specially, researchers began to move from using direct effects to mediated-effects conceptualizations of the principal’s role. There was a simultaneous pattern of progress in terms of the application of increasingly robust analytic methods. Other recent literature also has begun to explore leadership as a distributed variable, not simply assuming that it resides primarily in the person or is enacted only through the behavior of the principal.

Concurrently, during this 15 year period, the question being asked by researchers shifted subtly. During the early years bounded by the review, researchers focused on answering a relatively simple question, “Do principals make a difference?” More recently, researchers have extended the bounds of this inquiry. They have sought to understand not only if principals have effects on school outcomes, but more particularly the paths through which such effects are achieved (including within- and between-school analyses).

This review revealed several paths that begin to describe the means by which principal leadership influences student learning outcomes. These included school goals, school structure and social networks, people, and organizational culture. In particular, the principal’s role in shaping the school’s direction through vision, mission and goals came through in these studies as a primary avenue of influence. While the state of this research is still evolving, these variables represent both a reasonable focus for principal practice and also for future research into school effectiveness and improvement.

A survey is undertaken of the ‘paradigms’ of the academic communities of school effectiveness and school improvement researchers, practitioners and scholars. It is argued that the two ‘paradigms’ are very different, and that this has hindered the improvement of educational practice. Examples are given of programmes which are a ‘blend’ of the two different approaches, and detail is given as to how the school effectiveness and school improvement communities can meet the knowledge needs necessary for improving the quality of schooling.

Introduction

If a Martian, that value free creature so beloved of social scientists, were to visit the planet to take a look at its educational arrangements, one of the most remarkable things that would probably strike him or her about our educational research and practice would be the lack of mesh between the enterprises of ‘school effectiveness’ and ‘school improvement’. With the exception of North America which now exhibits the beginnings of links between these two disciplines or sub disciplines, in virtually all other societies around the world there are few points of intellectual or practical contact between scholars in the two fields. In addition, the take up of school effectiveness knowledge not just directly into the mechanics of school improvement programmes, but indirectly into school practice through influence upon the practitioner and policymaker communities is comparatively rare.

In this paper we outline the reasons for this overall lack of synchronisation between school effectiveness knowledge and school improvement research and practice. We survey the two communities internationally, and attempt to under-
stand the origins and distinctiveness of the different paradigms that inform and guide the two communities. Examples of fruitful intellectual and practical inter-relationships between the two bodies of knowledge, which represent in fact a distinctively new paradigm built on the foundations of the existing two, are then given. It is hypothesized that the further linking of these hitherto separate disciplines would advance our knowledge of how to generate high quality schools for our children. Crucially, we conclude by outlining what changed practice within each of the effectiveness or improvement communities could hope to contribute to satisfaction of the knowledge needs of the other.

An international survey
We should start by further examining the nature of the inter-relationships between school effectiveness research and school improvement practice internationally.

In North America, particularly within the United States, there exists perhaps the closest of the international relationships between school effectiveness and school improvement. Over half of all American school districts are currently running improvement programmes based upon, or linked to, the effective schools knowledge base (General Accounting Office, 1989; Taylor, 1990). It must be noted however that the knowledge base within the improvement programmes is likely to be of the earlier simplistic variety of ‘five factor’ theories developed by Edmonds (1979) and popularised by Lezotte (1989), rather than that more recently developed from a considerably more advanced research base by researchers like Stringfield and Teddlie (Wimpelberg et al, 1989). In addition, there are in the United States the well known demonstration projects which have involved the direct, controlled transfer of research knowledge into school improvement programmes with built-in evaluation of outcomes, which have demonstrated enhanced school effectiveness (e.g. McCormack-Larkin, 1985). In Canada likewise there are programmes which involve the utilisation of school effectiveness knowledge within school improvement programmes (Stoll and Fink, 1989, 1992), and the school effectiveness knowledge base has also penetrated many other ongoing improvement projects (see reviews in Sackney, 1985, 1989).

In spite of this evident relationship between the two bodies of knowledge at the level of practice, at the intellectual level there is less of a relationship or communality of perspective between the scholars who contribute to their respective knowledge bases. In part this may be because school improvement scholars have reacted against the simplistic nature of much North American school effectiveness literature. The emphasis has been on the generation of effective academic outcomes and on simple lists of 5, 7 or 9 ‘factors’ which were said to cause schools to be effective. There has also been the advocacy of certain school processes as being effective within the existing range of school practice, rather than the development of ideas in terms of what might be effective within a differently structured system (see Holly, 1990, for a range of American views).
Whatever the precise reasons, school improvement scholars such as Fullan, Hall, Miles, Louis and Joyce rarely base their school improvement strategies upon the work of school effectiveness researchers. Fullan (1991) for example refers to only half a dozen school effectiveness studies from the United States, only two from United Kingdom and to none from any of the other societies like Australia, the Netherlands or New Zealand in which major school effectiveness projects have been carried out. Indeed, in earlier work (e.g., Fullan, 1985) he makes explicit his emphasis on more ‘process’ orientated approaches to understanding schools as organisations. Were we to take Fullan and the other improvement writers noted above, a survey of their bibliographies suggests that only about 2 or 3 per cent of their total references are from writers commonly regarded as writing within the school effectiveness research paradigm.

Were we also to take the American school effectiveness research community and look at the nature of their references, probably only about 1 per cent of total references would relate to writers conventionally located within the paradigm of school improvement.

The situation of two separate, discrete bodies of knowledge and two separate research communities that exists in North America is in evidence in most other parts of the world; indeed in certain parts of the world the separation is even more in evidence. In the United Kingdom, there has, until recently, been little collaboration between those working within the school effectiveness and school improvement paradigms, little practitioner take up of the knowledge base of school effectiveness (Mortimore, 1991; Reynolds, 1991), little use of the research in school improvement or school development programmes (Reid et al, 1987), and little appreciation or referencing of school effectiveness material in the works of ‘school improvers’ (and vice versa).

In other parts of the world the situation is similar to that in Britain. New Zealand, for example, was the site of pioneering school effectiveness research (Ramsay et al, 1982), but there are no current signs of engagement of this knowledge base by those working within the ‘school improvement through decentralisation’ paradigm that has existed since the Picot Report in the late 1980s. The Netherlands now has perhaps the world’s most extensive research base within the field of school effectiveness (see Creemers and Scheerens, 1989), but there is no evidence of school effectiveness based school improvement programmes, nor of any penetration of school effectiveness research knowledge into schools through the development planning which is now mandatory within Dutch schools. Australia too has a small school effectiveness research base (see Chapman and Stevens, 1989), and indeed some of this knowledge has been linked to school improvement through the school self-management approach of Caldwell and Spinks (1988). But again, more developmentally-orientated material from Australia shows only limited take up of, or reliance on, school effectiveness literature. Indeed, the Australian school improvement tradition relates primarily to the literature on educational management and administration, itself notable for the absence of linkages with the school effectiveness research base.
Only in Israel internationally do we see any systematic application of school effectiveness findings in school improvement programmes (Bashi et al. 1990).

This analysis suggests that underlying these two distinctive bodies of scholarship, and the separation of the two groups of scholars, are two very distinctive intellectual traditions and histories. In the following two sections of the paper, we examine more closely the values, research and practice implicit in both approaches.

The school improvement paradigm

Approaches to school improvement have, over the past thirty years, been characterised by two very different sets of assumptions, as seen in Figure 1.

In the 1960s and 1970s school improvement in the United States, the United Kingdom and internationally displayed a number of paradigmatic characteristics associated with the empirical – analytic tradition. It was linked as an enterprise to a technologial view of school improvement, in which innovations were brought to schools from outside of them and then introduced ‘top down’. The innovations were based upon knowledge produced by persons outside the school, the focus was on the school’s formal organisation and curriculum, the outcomes were taken as given, and the innovation was targeted at the school more than the individual practitioner. The whole improvement edifice was based upon a positivistic, quantitative evaluation of effects. The worldwide failures of this model of school improvement to generate more than very partial take up by schools of the curricula or organisational innovations became an established finding within the educational discourse of the 1970s, explained widely as due to a lack of teacher ‘ownership’.

*Figure 1* Characteristics of two school improvement paradigms.
Out of the recognition of this failure came the new improvement paradigm of the 1980s, which is still reflected in much of the writing on school improvement that is current and in evidence today. This new movement celebrated a ‘bottom up’ approach to school improvement, in which the improvement attempts are ‘owned’ by those at the school level, although outside school consultants or experts can put their knowledge forward for possible utilisation. This new approach tended to celebrate the ‘folk-lore’ or practical knowledge of practitioners rather than the knowledge base of researchers, and focussed on changes to educational processes rather than to school management, or organisational features which were regarded as reified constructs. It wanted the outcomes or goals of school improvement programmes to be debated and discussed, rather than accepted as given. Those working within this paradigm also tended to operate at the level of the practitioner rather than at the level of the school, with a qualitative and naturalistically orientated evaluation of the enterprise being preferred to quantitative measurement. The improvement attempt was ‘whole school’ orientated and school based, rather than outside school or course based (see Reynolds, 1988).

There is little doubt that the reactive nature of the new school improvement paradigm outlined above was deficient in terms of it actually generating school improvement, as some of its proponents began to realise. The process orientated ‘journey’ of school improvement was still stressed, but by the late 1980s the journey was also undertaken in order to enable schools to evaluate their processes and outcomes. This attitude was exemplified in the work of the OECD sponsored International School Improvement Project (ISIP) and the knowledge that emanated from it. School improvement was defined in the ISIP as (van Velzen et al, 1985, p.48):

a systematic, sustained effort aimed at change in learning conditions and other related internal conditions in one or more schools, with the ultimate aim of accomplishing educational goals more effectively.

In this reformulation, school improvement is about developing strategies for educational change that strengthen the school’s organisation, as well as implementing curriculum reforms in the pursuit of student achievement. This obviously implies a very different way of thinking about change than previous approaches to school improvement. The ISIP served to popularise a revised school improvement approach to educational change, and we have summarised the characteristics of so-called ISIP knowledge in Figure 2.

The school effectiveness paradigm

The school effectiveness research paradigm has, of course, a very different intellectual history and has exhibited a very different set of core beliefs concerning operationalisation, conceptualisation and measurement by comparison with the
The approach to school improvement taken by the ISIP rests on a number of assumptions:

- the school as the centre of change. This means that external reforms need to be sensitive to the situation in individual schools, rather than assuming that all schools are the same. It also implies that school improvement efforts need to adopt a ‘classroom-exceeding’ perspective, without ignoring the classroom.

- a systematic approach to change. School improvement is a carefully planned and managed process that takes place over a period of several years.

- a key focus for change are the ‘internal conditions’ of schools. These include not only the teaching-learning activities used in the school, but also the school’s procedures, role allocation, and resource use that support the teaching-learning process (in our words the school’s management arrangements).

- accomplishing educational goals more effectively. Generally speaking, educational goals are what a school is supposed to be doing for its students and society. This suggests a broader definition of outcome than student scores on achievement tests, even though for some schools these may be pre-eminent. Schools also serve the more general developmental needs of students, the professional development of teachers and the needs of its community.

- a multi-level perspective. Although the school is the centre of change it does not act alone. The school is embedded in an educational system that has to work collaboratively or symbiotically if the highest degrees of quality are to be achieved. This means that the roles of teachers, heads, governors, parents, support people (advisers, higher education consultants etc.), and local authorities should be defined, harnessed and committed to the process of school improvement.

- integrative implementation strategies. This implies a linkage between ‘top-down’ and ‘bottom-up’; remembering of course that both approaches can apply at a number of different levels in the system. Ideally ‘top-down’ provides policy aims, an overall strategy, and operational plans; this is complemented by a ‘bottom-up’ response involving diagnosis, priority goal setting, and implementation. The former provides the framework, resources, and a menu of alternatives; the latter, energy and school based implementation.

- the drive towards institutionalisation. Change is only successful when it has become part of the natural behaviour of all those in the school. Implementation by itself is not enough.

Figure 2 A summary of ISIP knowledge (adapted from van Velzen et al, 1985, and Hopkins, 1987).

changing approaches of the school improvers. It has been strongly committed to the use of quantitative methods, since many researchers were concerned to refute the ‘schools make no difference’ hypothesis advanced by Coleman et al (1966) and Jencks et al (1971) by utilising the same conventional methods of empirical research as their perceived opponents had utilised. Many researchers have also believed that teachers, especially North American ones, would pay more attention to work conducted within the quantitative paradigm.
School effectiveness researchers have also been primarily concerned with pupil academic and social outcomes, which is not surprising given the political history of school effectiveness research in the United States, where it has grown and built on the beliefs of Ron Edmonds and his associates that ‘all children can learn’. Processes within schools only have an importance within the school effectiveness paradigm to the extent that they affect outcomes – indeed, one ‘back maps’ with the paradigm from outcomes to process. The school effectiveness paradigm furthermore regards pupil and school outcomes as fundamentally unproblematic and as given. Indeed, in much of the North American effectiveness research, only a limited range of outcomes are used, reflecting the acceptance of ‘official’ educational definitions of the school as an academic institution. School effectiveness researchers indeed often talk of a ‘good’ or ‘excellent’ school as if that were unproblematic.

Lastly, the school effectiveness paradigm is organisationally rather than process based in terms of its analytic and descriptive orientation, preferring to restrict itself to the more easily quantifiable or measurable. As an example, Fullan’s (1985) process factors such as ‘a feel for the process of leadership’ or ‘a guiding value system’, or ‘intense interaction and communication’ are largely eschewed in favour of organisationally and behaviourally orientated process variables such as ‘clear goals and high expectations’ and/or ‘parental involvement and support’. Additionally, the focus within the school improvement paradigm on the attitudinal, and on personal and group ‘inner states’, is replaced within school effectiveness research by a focus on the more easily measured behaviour of persons.

Towards a synthesis

From the outline of the history of the two paradigms above, it can be seen that the disciplines of school effectiveness and school improvement are ‘coming from’ very different places intellectually, methodologically and theoretically. A crude characterisation that contrasts both approaches is as seen in Figure 3.

As noted above, the school improvement paradigm from the early 1980s tended to react against the top down imposition of elite defined knowledge in schools towards a celebration of practitioner lore. In this reactive phase, school improvement has been very different in its orientations to the school effectiveness paradigm which began to emerge in the early to mid 1980s, with the latter’s outcome focus, its quantitative methodology, its concern to generate truthful knowledge about schools (whether practitioners agreed with it or not!) and its concerns with the reified school organisation and easily measured behaviours, rather than with the attitudes, of teachers and pupils.

There is recent evidence, as we noted above, that some of those appreciative of aspects of the school improvement tradition have realised the necessity for ‘paradigmatic change’ within that paradigm and a new, more rigorous approach to school improvement is becoming increasingly common. The Department of
Education and Science project on ‘School Development Plans’ (SDPs) in England and Wales, for example, was an attempt to develop a strategy that would, among other things, help governors, heads and teachers to take control of the process of change (see Hargreaves et al, 1989; Hargreaves and Hopkins, 1991). Development planning provides a paradigmatic illustration of new type of school improvement strategy, combining as it does curriculum innovation with modifications to the school’s management arrangements, both with the overarching aim of enhancing student achievement and modifying the culture of the school (Hopkins, 1991). The work of Bruce Joyce and his colleagues (see Joyce et al, 1983, 1988, 1992) has also for some time transcended both paradigms. Although located within the school improvement tradition, Joyce argues strongly for the raising of student achievement through the utilisation of specific models of teaching and staff development designs.

Some scholars within the school effectiveness community have also argued for the interpenetration and synthesis of both bodies of knowledge in the interests of improving pupil performance and school quality. Mortimore (1991, p.223) argues for transferring ‘the energy, knowledge and skills of school effectiveness research to the study of school improvement’. Stoll and Fink (1992, p.104) maintain that ‘it is only when school effectiveness research is merged with what is known about school improvement, planned change and staff development, that schools and teachers can be empowered and supported in their
growth towards effectiveness’. Murphy (1992), himself a school effectiveness researcher who has in his own empirical work existed within the effectiveness paradigm outlined earlier, now also wants to move in directions that celebrate the potential not just of conventional school improvement programmes, but of a more radical ‘restructuring’ of the educational system, its power relations, and the teaching – learning process in schools.

In addition, elsewhere one of us has argued that school improvement attempts need to understand the complex psychological abnormality that is exhibited within ineffective schools (Reynolds, 1992), evidence of which should be taken from the effective schools literature. The mission statement of the journal *School Effectiveness and School Improvement* (Creemers and Reynolds, 1990) also argued for the still, small voice of empirical rationality being utilised to jointly assess the validity both of existing models of school improvement and the validity of our existing, simplistic, factor based theories of school effectiveness.

In all these respects, the historical divisions between school effectiveness and school improvement may be diminishing in importance, and there are currently a number of projects in their embryonic stages which show what a more integrated enterprise might look like. In the following three sections of this paper we give brief examples from our own work of possible lines of development. All three examples below represent a blend of what have hitherto been regarded as mutually exclusive orientations, theories and methodologies. All three approaches suspend existing commitments to present disciplinary purity and to the historically constructed bodies of so called ‘normal science’ and accepted practice, in favour of the adoption of an approach which is problem, pupil and school centred. All three approaches adopt not an ‘either’ ‘or’ orientation but are concerned to ensure ‘both’ school effectiveness ‘and’ school improvement are joined together in an intellectually creative and practically productive new wave of educational studies.

**Improving the Quality of Education for All**

Our first example is the ‘Improving the Quality of Education for All’ (IQEA) project at the Cambridge Institute of Education (Ainscow and Hopkins, 1992; Hopkins et al., 1993), which represents a useful blend of approaches and methods which have until now only been used exclusively in either effectiveness or improvement initiatives. It is pupil outcome orientated, involves measurement of programme success or failure at outcome level but is also concerned with the within-school study of school processes from a qualitative orientation. Although the school improvement knowledge base is used to generate and inform change strategies and professional development, there is also space for both the ‘elite’, research determined knowledge concerning school effectiveness and instructional effectiveness, and for the results of professional collaboration, reflection and education. In short, the chosen improvement strategies exhibit a blend of research and practitioner knowledge.

The project currently involves a group of twenty-five schools in a variety of
Knowledge and Improvement Practice

English Local Education Authorities. The aim is to produce and evaluate a model of school development, and a programme of support, that strengthens a school’s ability to provide quality schooling for all its students.

The key finding, from the research undertaken to date, is that school improvement works best when a clear and practical focus for development is linked to simultaneous work on the internal conditions within the school. Such school improvement efforts appear to include three elements:

* reconstructing externally imposed educational change in the form of school priorities;
* creating internal conditions that will sustain and manage change in schools;
* embedding these priorities and conditions with an overall strategy.

What is happening in these schools is that they are taking the opportunity of centrally imposed change to enhance student outcomes. They do this by strengthening the school’s organisational ability to support the work of teachers. This is done intuitively in many cases, by using a series of strategies that link classroom practice to whole school purpose. These strategies focus on the primacy of teaching and create opportunities for teachers to feel more powerful and confident about their work.

These strategies are concerned with staff development, inquiry and reflection, leadership, co-ordination and planning. Although they are summarised in Figure 4

**Staff Development:**
- staff development processes are used to support individual teacher and school development
- teachers are involved in each others teaching
- where appropriate, external consultants are used to support teacher development

**Inquiry and Reflection:**
- there is a search for increased clarity and shared meanings
- reflection and review activities are used to monitor progress and enhance the professional judgement of teachers

**Leadership:**
- staff throughout the school are encouraged to adopt leadership roles
- temporary systems or working groups are created
- individuals take on key roles in initiating change and supporting development work

**Co-ordination:**
- efforts are made to maintain momentum
- links are made between formal and informal structures
- images of success are created

**Planning:**
- planning processes are used to legitimise and co-ordinate action
- resources for school improvement are specifically allocated.

*Figure 4 Some strategies employed by schools in the IQEA Project.*
linear fashion, in reality they coalesce. On a day-to-day basis, the curriculum focus, the work on the internal conditions of the school, the various combinations of strategy, and their impact on student achievement, combine in the minds and work of teachers to present a uniform whole. It is through this holistic approach to school improvement that the schools are managing to ‘move’, to achieve quality within the context of a national reform agenda and to blend effectiveness and improvement approaches together.

**Halton’s Effective Schools Project**

A second example of fruitful cross-paradigm work is the Halton Board of Education’s Effective Schools Project in Canada (Stoll and Fink, 1992) noted earlier. This began as an attempt to bring the results of school effectiveness work done within one culture (Mortimore et al, 1988) into the schooling practices of another, but it soon became clear to the programme developers that potential difficulties involved in the implementation of the project could only be resolved by the adoption at school and system level of organisational and planning arrangements from the school improvement literature. Essentially, ‘top down’ mandates to schools to address the characteristics of effectiveness were not working because they did not engender ownership or commitment among the very people who were responsible for the day-to-day implementation and ultimate success of their improvement attempts. Furthermore, such mandates rarely paid attention to the process of change and its impact on those who were working through it.

After having conducted a thorough search of the international effectiveness literature, a task force originally came up with a model of the characteristics of school effectiveness. Through visits to school districts where change was known to have occurred successfully, and through familiarisation with the current school improvement literature, task force members became firmly convinced that improvement was more likely to occur when the school was seen as the focal point or unit of change (Fullan, 1991). A School Growth Planning Process was developed, to incorporate four stages: assessment, planning, implementation, and evaluation. Schools were to work through these stages over at least a three-year period, rather than by means of the yearly goal-setting that traditionally occurred.

Where do the characteristics of school effectiveness fit in? Within the assessment phase, when the school is trying to get a picture of its current successes and areas for improvement, it examines Halton’s model of school effectiveness as it relates to its own context. Surveys for teachers, students and parents focus on where the respondents think the school is in relation to a set of indicators, and on how important each indicator is in order to create a more effective school. Through analysing the gap between where the school is and where it should be, the school can identify areas of need. Clearly, this is not the only information schools examine during the assessment phase; they also look at current curricula
and instructional practices, initiatives coming out of the school board and the Ontario Ministry of Education, and also a variety of information related to their students’ progress and development. In line with the emphasis on equity in school effectiveness research, schools are encouraged to disaggregate student data; that is, to look for any differences in achievement, progress or development between subsets of the population (e.g. females versus males).

It quickly became apparent to pilot schools engaged in trials of the growth planning process that this was a very different experience from traditional forms of planning. Increased staff involvement in decision-making necessitated greater understanding on the part of principals of the processes involved in working with groups. The more successful principals paid attention early on to the development of clear decision-making structures and organisational processes that would reduce later problems. In short, they built a climate within which a more dynamic and ongoing planning process could occur. More important, they spent time building a collaborative culture within the school, in which teachers felt valued, and where risk-taking was encouraged. Finally, the successful principals had a vision of where they saw their school and were able to build support for this vision without ‘blinding’ their teachers through their own charisma or zeal (Fullan, 1992). In essence, the growth planning process showed that the creation of an effective school depends on much more than the knowledge of what has been successful and effective elsewhere. Each school is unique, and as such must vary the process slightly to fit its own culture.

Further novel characteristics of this project have been the importance of the role of the school district in the process. Halton created a strategic plan that emphasises three key directions. One of these is the school growth planning process itself. The second is a focus on instruction, in recognition of the central role in the determination of school outcomes of what actually goes on in the classroom. The third direction supports the other two; that is an emphasis on staff development. Thus, the system provides a framework within which growth planning can occur, and offers support for the process. This support comes in the form of workshops for school teams on all aspects of growth planning, and for entire staffs on their chosen instructional goals (Stoll, 1992). Support is also offered through regional consultants who work with individual teachers or whole staffs, and area consultants assigned to particular schools. Thus, the school is not seen as an isolated ‘unit’ of change, but as the ‘centre’ of change (Sirotnik, 1987; Fullan, 1991).

Institutionalisation of school growth planning in Halton has resulted from the weaving together of a variety of initiatives; the development of a shared language around school effectiveness and improvement; incorporation of existing aspects of Halton’s culture, such as the teacher evaluation process, and a strong commitment to collaboration; strategic directions that acknowledge the importance of the process; and an emphasis on well co-ordinated leadership and staff development. The result of Halton’s project has been a combination of the effectiveness knowledge base about effective practices, and the improvement generated knowledge.
base about successful school-based planning and change. Simply, there has been a commitment to make the Halton schools more effective for all students through the blended application of school effectiveness and school improvement research.

*The Cardiff change agent study*

Our final example of a fruitful blending or synthesis of perspectives from what have hitherto been regarded as the traditions of school ‘effectiveness’ and school ‘improvement’ are the school improvement programmes at the University of Wales, Cardiff, in which senior personnel from schools work with University staff, engaged on the process of changing their schools.

The systematic education of school personnel within this novel school improvement programme was based upon the following principles:

- the knowledge base was both the effective schools literature and the practitioner conceptions about what makes for effective practice;
- the programme relied upon individual teachers’ motivation for professional education and upon group activity based in the schools of the participating teachers to ensure permeation within the organisation;
- the programme was located outside the school within the university, although the course was school focussed;
- the programme was ‘top down’ in its relationship to school processes (since most participants were senior managers in their schools), but was also ‘bottom up’ in that attention was given to group based techniques at school level to ensure ‘ownership’;
- the approach was ‘empirical-rational’ in the sense that the course aimed to generate rational, problem solving change agents, but also involved giving participants information about group work techniques, the social psychology of organisational life and the related psychological and psychiatric insights necessary to confront the school cultures of ineffective schools;
- the orientation was both behavioural in the sense of being concerned to change programme participants’ behaviour and the behaviour of others within schools, and was at the same time concerned with ensuring attitudinal change in the ‘deep structure’ of values and relationship in schools;
- the programme was outcome orientated but involved concern with school processes.

The results of these programmes were impressive. Over three-quarters of programme participants changed aspects of their school’s organisation, with an average of four major organisational changes per person. Over 85 per cent of these changes had survived in a six year follow-up study, and the schools that had exhibited organisational change had improved in terms of their academic and their social outcomes by comparison with a group of ‘control’ schools who were not included in the programme (fuller details are available in Reynolds, Davie and Phillips, 1989).
What can school effectiveness and school improvement do to help each other?

Our suggestion, based on the above three experiences, is that school effectiveness and improvement persons should consider suspending their commitment to distinct paradigms and investigate further the utility of putting together coalitions of what have been all too often seen as mutually exclusive approaches derived from the knowledge base of both paradigms. If the two specialties were to form closer relationships, as we have seen above, there is much evidence for believing that both can contribute greatly to the academic and practical needs of the other. To take school improvement first, school improvers need to have knowledge about those factors within schools and within classrooms that may be manipulated or changed to produce higher quality schooling: school effectiveness researchers can provide that knowledge. Correspondingly, at their simplest level, school improvement strategies provide the ultimate test for many of the theories posited within the school effectiveness research enterprise, since the potential changes in school outcomes identified by research as being linked to school processes is the way of testing whether there is a causal link between school processes and student outcomes. School improvement plans, and the strategies based upon the school effectiveness research communities’ identified characteristics, are therefore of crucial potential importance to the future health and development of school effectiveness research.

At the moment, school effectiveness researchers are failing to generate knowledge useful for, and relevant to, the school improvement enterprise. Similarly, there are a number of ways in which changed school improvement practice could facilitate the further development of school effectiveness research. In this section we make a series of suggestions about how this confluence of perspectives can be achieved.

1 There are very few studies at the level of ‘case studies’ of effective or for that matter ineffective, schools that would show the inter-relationships between school process variables and which would paint a picture for improvement practitioners of the fine grained reality of school and classroom processes. The American study of Rosenholtz (1989) and some of the recent ‘mixed methodology’ work from the Louisiana School Effectiveness Study of Stringfield and Teddlie (1990) are exceptions to this trend internationally, but even they do not get that ‘close to the action’. In Britain for example we still have no in-depth, qualitative portrait of the effective school equivalent to Louis and Miles’ (1990) *Improving the Urban High School*, which provides excellent case studies of process variables. The absence of rich case study data reduces the practitioner relevance of the effectiveness research and makes the transfer of knowledge to the improvement community (with its qualitative orientation) more difficult.

2 School effectiveness studies are very deficient at the level of ‘processes’
rather than factors, since effectiveness researchers have considerably more experience at the level of school organisational factors. School processes defined in terms of attitudes, values, relationships and climate have been largely neglected therefore, even though school improvement needs information on these factors within schools, given their centrality to the process of improvement and development.

3 School effectiveness studies customarily show a ‘snapshot’ of a school at a point in time, not an evolutionary and moving picture of a school over time, a neglect which hinders the usefulness of the knowledge for purposes of school development. School improvement needs to have ideas about how schools came to be effective (or for that matter ineffective) in order to replicate (or for that matter eradicate) the processes. This necessitates a dynamic, evolutionary, evolving and ‘change over time’ orientation within school effectiveness research.

4 Most school effectiveness studies from outside North America, particularly those from the secondary sector in Britain (e.g. Reynolds et al, 1987; Rutter et al, 1979), neglect the detailed study of the crucial variable of the principal or headteacher. Both the early British studies of school effectiveness, for example, have few ‘headteacher variables’ because the researchers had to promise their sponsoring educational authorities that they would not concentrate in detail on this area, which in the context of the professional headteacher autonomy prevailing in the 1970s and 1980s was hardly surprising. When the Rutter team later sought to translate their findings about effective school factors into their schools, it is not surprising therefore that their knowledge deficient improvement programmes failed to generate much overall improvement in educational processes or pupil outcomes (Maughan et al, 1990).

5 School effectiveness studies have tended, with perhaps the exception of work by Coleman and Larocque (1991), to neglect the importance and potential impact of other educational institutions, arrangements and layers above the level of the school. As Hopkins (1990, p.188) notes when discussing school improvement conducted within the ISIP ‘... much thought ... was given to the way in which improvement policies are established at various levels ... to the structured factors related to support, e.g. external support. ... Much of the effective schools literature appears to take such ‘meso level’ issues as unproblematic, yet the ISIP case studies suggest that this is just not so.’ School improvement needs to be informed by knowledge as to what conditions outside the level of the school are necessary to generate process and outcome improvement. School effectiveness can currently only generate knowledge about school level variables.

6 School effectiveness research, whether of North American, British or Dutch origin, tends towards the generation of lists of organisational process factors within schools that are associated with pupil outcomes, yet of course what school improvers need to know is not what ten, twenty or thirty factors may
be useful enhancers of outcomes if changed but which one or two factors should be changed. The need for change strategies that relate to a small and discrete number of factors is magnified by the need to alter those variables within schools which are the key determinants of other process variables. No school effectiveness study so far has attempted to isolate the direction and strength of the influences that link school process variables together.

7 School effectiveness research, to compound the difficulties noted above, cannot even prove conclusively which process variables are causes of school effectiveness and which effects. If we take as an example the well-established link between teachers’ high academic expectations of their pupils and their students’ good results in examinations or tests of attainment, it may be that the direction of the relationship is a positive one, or academic success may by contrast generate high expectations, since the experience of high examination passes at school level may lead to an expectation of them continuing. Alternatively, there may be interactive influences. The directionality of the relationship – crucial for the decision concerning what to target for improvement – is not established from the research base for this variable and for many other groups or pairs of variables within the school effectiveness knowledge base.

8 School effectiveness knowledge also misses the chance of satisfaction of the needs for school improvement by being thoroughly dated. Improvement schemes in the 1990s need to be based on knowledge that is generated from schools that reflects the characteristics of schools in the 1990s, not the schools of the 1970s and 1980s. At the level of what makes for effective schooling, process factors such as the assertive principal and instructional leadership which was associated with school effectiveness in the 1980s may not be associated in the same way in the 1990s, when demands for ‘ownership’ by teachers may have changed the educational cultural context. Outcomes appropriate for measurement in the 1980s, such as academic achievement or examination attainment, may not be the only outcomes appropriate to the 1990s, where new goals concerning knowledge of ‘how to learn’ or knowledge in mastering information technology may be necessary.

9 School effectiveness research has rarely been ‘fine grained’ enough to provide information that is needed for school improvement, since the variation in ‘what works’ by contexts has been a focus only of a very limited amount of recent North American work (Hallinger and Murphy, 1986; Wimpelberg et al, 1989). School improvement needs more than the notion of what works across context in the average school, and needs more than data upon the relationships between school processes and outcomes for all schools. It needs knowledge of the factors that will generate improvement in particular schools in particular socio-economic and cultural contexts. Since only a small amount of our school effectiveness data base is analysed by context, the delineation of the precise variables that school improvement...
needs to target to affect outcomes is clearly impossible at present. The needed disaggregation of samples of schools to permit the analysis of contextual variation needs, of course, to also focus on the precise organisational and process variables that may be responsible for the differential effectiveness of schools with different groups of pupils within them (Nuttall et al., 1989). Findings of differential school effects also necessitate investigations oriented towards differentiated analyses of within school factors, rather than the present concentration upon ‘common’ school process factors.

10 Many educationists often find themselves working in historically ineffective educational settings, yet the knowledge base within school effectiveness may not be necessarily easily applicable to those settings. It is probable that the ineffective school may possess variables at the level of interpersonal problems, projections, defences and the like which do not exist in the effective school. Yet the possible existence of these ‘ghosts’ or ‘shadows’ on the change process seems to be rarely considered by researchers. The knowledge required by improvers of ineffective schools is simply not found in school effectiveness research, where the good practice of effective schools is simply ‘back mapped’ onto ineffective schools, and then assumed to be sufficient to make them improve.

11 School improvement practice/research all too rarely measures the impact of changes in improvement programmes upon the outcomes of pupils or students. Part of the explanation for this may be the historical tendency of school improvement to celebrate certain styles of professional practice, because of its association with the training needs and desires of the teaching profession within schools. Another part of the explanation may be the reluctance of many within the school improvement paradigm to be explicit about what the nature of school outcomes, or the educational goals of their programmes, really are. However, the absence of data on programme effects restricts the ability of those within the school improvement tradition to help the school effectiveness research base expand, in terms of further understanding the possible causal relationships between school processes and school outcomes.

12 Those engaged on school improvement need urgently to pay attention to the implications of multi level modelling procedures for their programmes. As noted earlier, the evidence from effectiveness research that schools can have differential effects upon their pupils (Nuttall et al., 1989) and that schools effective for some groups of pupils may actually be ineffective for others, has wide ranging implications for school improvement. These results imply that improvement attempts need urgently to move away from the much vaunted ‘whole-school’ strategies towards more finely targeted programmes that may vary within the school in terms of their content, their focus and their target group. Above all, schools need to examine assessment data, whether these are academic results, attendance patterns, attitudes or any other measures of students’ progress and development, and look for variations between different
subsets of the population. By taking these differences into account, and by focussing improvement at the level of boys/girls, high ability/low ability pupils, and pupils from ethnic minorities/pupils from ‘host’ cultures, it would be possible to generate more appropriate school change strategies. This would in turn allow researchers to generate evidence about differentially effective school processes, as the effects of the change attempts were targeted within schools.

13 Besides focussing more on outcomes, school improvement researchers also need to ‘polish their independent variables’. Knowing that student achievement has increased is not much use for policy making, if we do not know why the change has occurred. Although this point is linked to the three previous ones, it specifically demands more theoretical precision from school improvers in clarifying the links in the school improvement chain, their anticipated impact, and in developing ways of measuring them.

14 School improvement research needs to refocus its activities, from an emphasis only on the school level to include the level of the classroom. A considerable volume of research now exists which suggests that teachers’ focal concerns are with the content of their curricula and the nature of their instructional practices, rather than with the wider ambit of the school. Yet many school improvement efforts neglect the primacy of instruction. By not focussing on instruction, school improvement runs the risk of manipulating variables only at the level of the school, which in most recent research explains much less of the variation in student outcomes than do those variables at the instructional or classroom level (see, for a review, Creemers, 1992).

Finally, in the spirit of collaboration that pervades this paper, we feel that practitioners should extend an invitation to school effectiveness researchers to come into their schools and jointly plan an evaluation of their improvement efforts. Greater teacher involvement in research would lead to increased credibility of the findings and to commitment to their future implementation. A breaking down of the barriers between practitioners and researchers, the transcending of boundaries between effectiveness and improvement, more accessibility in the writing and presentation of research findings and change strategies, and the creation of a mutual process of enquiry into school development will, we believe, result in a more robust knowledge base and more specific strategies for affecting practice and enhancing outcomes in our schools.

**Coda – towards a synergy**

We have described in this paper wide divergencies in the orientation, methodology and theoretical approaches of the specialisms historically known as ‘school effectiveness’ and ‘school improvement’. These differences are the result of the historical development of each group of ‘scholars’ and ‘practitioners’; with
school effectiveness researchers wishing to research within an exclusively quantitative framework and with school improvement practitioners and researchers adopting the qualitative, appreciative, developmental stance of school development. We have noted, however, some movement by members of both groups towards a blending of what had been seen as oppositional approaches. Three examples have been given of programmes which, in fact, are based upon the insights, findings and recommendations of both groups. We have continued by arguing, though, that there is much that school effectiveness researchers can do to develop the knowledge base which practitioners and school improvement programmes need to effect change in schools. We concluded that there is much that school improvement attempts can do to improve the validity and reliability (and in fact the transferability) of the school effectiveness knowledge base, by means of testing the findings of school effectiveness research, and their associated propositions, within schools in improvement programmes. We have then given 14 examples of ways in which effectiveness research and improvement practice could, if it were in each case changed, meet the needs of the ‘other’ more adequately.

Underlying all these discussions has been the implicit assumption that the intellectual and practical enterprises of ‘school improvement’ and ‘school effectiveness’ remain separate. Yet, as is evident, we feel strongly that this separation is undesirable, especially when compared with the potential benefits for knowledge and practice of an integrated, coherent and synergistic intellectual and practical enterprise concerned jointly with research and practice on school effectiveness and school improvement. It is in this spirit that we, one school effectiveness researcher and practitioner, and a school effectiveness and school improvement researcher and practitioner, have collaborated on this paper.

SCHOOL EFFECTIVENESS AND SCHOOL IMPROVEMENT

In the last few years the steady drip feed of change has been overtaken by a tidal wave of new initiatives: demands for higher standards, pressure for greater accountability and, in some countries, increasing prescription on what and how to teach. All of this has been advocated in the interest of improving schooling and preparing pupils for the future. The imperative of change cannot be denied and pupils at schools today are already living in a very different world from the one which their teachers and parents inhabited – experiencing changes to the working day and week, changes in the nature of access to information, changes in the structure of families and in their communities. Yet, despite the turbulence around them, schools have remained remarkably unchanged over the years.

As we know from more than 20 years of school effectiveness research, schools can make an important difference to pupil attainment and, consequently, to their continued formal education beyond school. We also know from studies of school improvement that some schools have been extremely successful in their attempts at improvement. However, as we discuss in Chapter 1, few studies have looked at schools that were less successful. This is, perhaps, underpinned by the belief that ‘good practice’ is the source of better practice, and we can learn more from other people’s success stories than from their failures. In the mid- and late 1990s, however, two particularly striking phenomena have become apparent. The first is the increase in the number of ‘designer’ programmes for improvement (for example, the New American Schools designs; Stringfield et al. 1996). Schools in many areas are strongly encouraged to ‘sign up’, and in some places virtually instructed, to participate in a preferred programme. Given that many of the well-known design programmes have been piloted and evaluated, it may seem like carping to question whether schools should become involved in them, but the problem is that even when a programme has been evaluated and has ‘passed the test’, there are always schools for whom ‘the pill
didn’t work’. When it comes to wider dissemination, less successful pilot schools are usually forgotten and insufficient attention is paid to determining whether the right programme has been selected by, or for, a school. Indeed, schools do not always know their needs, nor how to choose the most appropriate design (Datnow 1998). This is where the second phenomenon comes in – contextual differences between schools and their implications for school improvement.

In the 1980s and early 1990s a small number of school effectiveness studies examined contextual differences between schools. They found, for example, that leadership strategies in effective schools serving areas of greater advantage are different from those in effective schools serving disadvantaged areas (Hallinger and Murphy 1986; Teddlie and Stringfield 1993). Yet, in some countries, we still appear to be doing what House warned against more than a quarter of a century ago:

Avoid the primary pursuit of transferable innovations. Distributed problems cannot be solved by a single innovation that will work in all local settings, for those settings are not only different and unpredictable in specifics, but they are also constantly changing . . . Different innovations will be more or less useful under widely different specific circumstances of their application. There is no Golden Fleece.

(1973: 245)

House concluded that behaviour is determined more by the ‘complex nature of the school as a social system’ (p. 235) than by staff development in which new teaching strategies are demonstrated. While there has been increasing disquiet about a one-size-fits-all school improvement strategy, it is only recently that researchers have looked at different types of schools and tried to follow through the implications of different school improvement strategies. It appears that different change strategies, leadership styles and communication networks may be required to effect change (Stoll and Fink 1996; Hopkins and Harris 1997; Gray et al. 1999). Furthermore, it seems that while some schools seem to embrace opportunities offered by change, whether it is externally prescribed or internally inspired, others do not even appear able to get off the starting-block. Others still get started then run out of steam shortly afterwards. In revisiting the Rand Change Agent Study of the 1970s in the United States, McLaughlin concluded that ‘the net return to the general investment was the adoption of many innovations, the successful implementation of a few, and the long-run continuation of still fewer’ (1990: 12).

**Internal capacity and its influences**

While most would agree that the ultimate goal of school improvement is preparing pupils to deal with the changing world, Fullan (1993) adds a sharper edge to
that with his claim that ‘the secret of growth and development is learning how to contend with the forces of change’ (p.vii). Our own work leads us to a similar conclusion: that the learning opportunities for generations of pupils are determined by the extent to which their schools are themselves able to learn and grow. Successful schools are, therefore, those which provide conditions for their pupils to learn more successfully, and our explorations have led us to conclude that vital clues lie in the school’s internal capacity.

While other writers have described sets of improvement-related capacities, we see it as a more generic concept. ‘Internal capacity is the power to engage in and sustain continuous learning of teachers and the school itself for the purpose of enhancing pupil learning’ (Stoll 1999). Determining internal capacity and readiness for change is therefore vitally important for internal and external change agents (Fullan 1993).

Our involvement in ISEP from 1995 to 1997 (Stoll and MacBeath 1997; Robertson 1998a) provided us with an opportunity to investigate schools’ initial capacity for change and its relationship with later capacity and links with pupil outcome data.

Two schools

In this chapter we focus our attention on two primary schools and what they can tell us about internal capacity and its relationship to school improvement and effectiveness. In these two schools interviews were carried out in 1995 with the headteacher, a teacher with responsibility for staff development, an experienced and an inexperienced teacher, as well as with groups of pupils in P2 and P6. The headteacher was also interviewed in 1995 and 1997, together with a colleague, about the strategy and process of a specific development in the last few years. Teacher questionnaires were distributed to all staff at the start and end of the project. In addition, a group of staff were taken through a ‘change profile’ (see Chapter 9) in which they individually rated their school against 10 items and then came together to agree on a joint rating. This formed the basis of a discussion with the critical friend and researcher, both of whom also completed the change profile. An ‘ethos observation’ form was completed by the researcher and critical friend at the end of data collection periods; the critical friend completed notes on each visit; and a ‘support review’ form was completed at the end of the project, eliciting schools’ perceptions of support provided by critical friends.1

The two schools, in different parts of Scotland, serve similar deprived areas. Both performed poorly in terms of their raw score results in the English and mathematics tests in the baseline project assessments in 1995 (see Table 1).

Glendale primary school

Located in a ‘battleship grey’ concrete building, likened by the headteacher to ‘a fortress’ and by the pupils to ‘a prison’, this 330-pupil primary school was once
a secondary school. Project team members found it hard to get into the school because of locked doors and, once inside, found it hard to see out of windows. Long corridors made it difficult to move from one part of the school to another. While the school was clean and well kept, there was a feeling of sterility, and wall displays were hard to maintain because of vandalism. The infant (P1–P3) and junior (P4–P7) departments were separated physically, with two different staffrooms, echoed in the way staff in the two departments spoke about the school. The school served an area of extreme disadvantage, with 61 per cent of its pupils eligible for free school meals. Drug problems and violence were also rife in the locality.

The headteacher had been in post for nine years at the start of the project. Her senior management team (SMT) consisted of a new depute head (DHT) and an assistant headteacher (AHT), a dominant force in the school for the last 17 years. There were 17 teachers on the staff at the start of the project, but by 1997 this number had dropped to 15. The school's chosen focus for the project was increasing parental involvement in learning.

Interviews at this school were difficult. The assistant head would not consent to the interview being recorded, and asked, 'Why are you doing this project?' Another staff member, a smoker, blew smoke in the interviewer’s face. It seemed that every visit from the critical friend coincided with an emergency. Meetings were cut short and the critical friend was left waiting for long periods while crises were being averted or sorted out. On one visit a fire engine was called because a boy’s head was stuck in the railings outside the school. With constant disruption as a backdrop, it was hard to get staff to focus on sustained development activities. They were on the defence and both critical friend and researcher found it difficult to create a positive climate for discussion of the issues the school was facing.

By contrast, pupil interviews were open and friendly. However, much of their discussion accepted the inevitability of violence in the playground and pupils saw shouting by teachers as a natural response to disruptive pupils’ behaviour. Pupils appreciated their teachers and saw them as there to help them. Nevertheless, despite generally positive pupil feedback in this first round of data collection, staff were unwilling to accept the negatives, some even claiming that pupils were ‘liars’. Teachers’ own responses to the questionnaire showed that Glendale was one of the four lowest scoring schools on the items that made up Factor 3:

items related to pupils’ respect for teachers, pupil and parental clarity about behaviour standards, and prompt action to deal with disruption in classes.²

At the end of the project, Glendale pupils’ raw scores were still very low: contextualized value-added analysis showed some positive growth (not significant) in the area of maths but negative movement (not significant) in the English assessments. In terms of attitudes, the value-added analyses showed positive, although not significant, progress on self-rated perceptions of behaviour, engagement and pupil culture, and negative (not significant) ratings on self-efficacy. It was, therefore, a school that performed poorly at the start and the finish of the project.

St Aubrey’s

This school is situated in the east end of a large city in one of the most disadvantaged parts of Scotland and, indeed, Europe. The housing is mainly from the immediate pre- and postwar period and the local area is renowned for its drug and alcohol problems. Many children came from broken homes, with many young mothers and fourth generation unemployment. With 80 per cent of its pupils eligible for free school meals, St Aubrey’s was the most deprived of the 24 case study schools.

The school is a one-storey building at the end of a long road, butting on to derelict land. Despite its bleak exterior, the entrance and reception area are welcoming, as are interior decorations for the most part, giving it a ‘homely’ and ‘well cared-for’ feel, noted by a member of the research team as ‘a quality indicator in this school’. Litter monitors keep the playground tidy and ‘the school is spotless and a credit to the cleaning staff’. Six years ago, the school was burnt down in a suspected arson attack. While the plant was being rebuilt, the school moved in to the local secondary school. From all accounts, the fire proved a defining moment for the school, with everyone – staff, the local community and the local authority – pulling together to help the school through the crisis.

The school’s denomination is Roman Catholic, and a strong consciousness of its pastoral, moral and spiritual role was shared by all staff. At the start of the project the headteacher had been at the school for 16 years, six of them as AHT and 10 as headteacher. She was an imposing physical and emotional presence, and appeared deeply conscious of her role as an educational leader.

The baseline data-gathering experience was very positive, with researcher and critical friend being welcomed into the school. While pupil attainment levels were low and the school was ranked seventh out of 12 case study primary schools in terms of pupil questionnaire results, it was ranked first on both teacher and parent survey results. Indeed, on all three teacher questionnaire factors, the school scored in the top six or seven of all 44 primary schools, with 85 per cent or more of the teachers agreeing with 40 of the 54 items (for the primary teacher sample as a whole this was only true of 10 items). The school was welcoming of the feedback from the baseline data-gathering exercise. Its chosen project was language development and, in particular, functional writing.
The Change Equation

Over the period of the project, the school became increasingly critical of tests being used to determine school effectiveness because of the perceived irrelevance of these assessments, although the concept of value-added continued to appeal to and intrigue the staff. They were disappointed when, due to a change in critical friend, the support they received was oriented more towards the process of change rather than specific help with functional writing. They maintained their involvement throughout, however, and the head, while critical of the tests being used, nonetheless expressed herself as ‘really looking forward to the results’.

At the end of the project, St Aubrey’s pupils’ raw scores were still very low: contextualized value-added analysis showed some positive growth (not significant) in the area of maths but negative movement (not significant) in the English assessments. In terms of attitudes, the value-added analyses showed significantly positive progress on self-ratings of self-efficacy and positive, although not significant, progress on self-rated perceptions of behaviour, engagement and pupil culture.

Comparing outcomes and improvement

At the end of the project, when the pupil assessments and attitude questionnaires were repeated, neither of these two schools made significant gains in pupil attainment, but in relation to pupil attitudes St Aubrey’s showed a significant boost in pupils’ self-esteem. This result is particularly interesting, because only two of 44 primary schools added value to their pupils’ attitudes in this area. Given that as pupils grow older their attitudes tend to become less favourable (MacBeath et al. 1998), this is an important result. In addition, the headteacher had argued passionately at the start of the project that the most important thing the school was trying to achieve was ‘to make children feel valued; to build their self-esteem’. Another teacher at the school said, ‘When ISEP tries to take a snapshot of a class at a certain time there is no magic wand we can wave to make these children’s lives better which in turn would affect their learning. Firstly we have to boost their self-esteem.’ It appeared that what they had set out to do had been achieved. The results in these two very different schools, both starting from such adversity, raise the question ‘capacity for what?’ Are the outcomes selected by many school effectiveness projects, and by governments and state departments, the appropriate outcomes for all schools? If so, should pupils in all schools be expected to achieve them over the same time period?

Given that the project had dual foci – to look at effectiveness and improvement – the research team decided from the outset to analyse the qualitative data and teacher questionnaire data separately from the pupil outcome data, so that improvement could be viewed from different perspectives. After the initial data collection, a variety of techniques were used to examine separate pieces of qualitative evidence, together with survey data, in order to inform predictions about possibilities and directions of improvement (Robertson and Sammons...
1997a). Schools were rated on a five-point scale based on their perceived potential for improvement, as well as their approach to school development planning (Reeves and MacGilchrist 1997):

1 = no likelihood of improvement  
2 = little likelihood of improvement  
3 = on present evidence it is very difficult to tell whether there will be any improvements in this school  
4 = considerable likelihood of improvement  
5 = every likelihood of improvement

On the basis of available evidence, Glendale was assigned a score of 1 and St Aubrey’s a score of 4.

Thirty-five subthemes had been revealed in the analysis of the initial teacher interviews. Each subtheme was associated with one or more of the main project themes – ethos; learning and teaching; and development planning. At this stage, the evidence spoke so strongly about the importance of leadership that this became a new central theme of the project.

In 1997, each fragment of evidence from the data gathering at the end of the project was coded against each of these subthemes and rated on three scales in terms of what it revealed about the current quality of the school and about its potential for improvement. A five-point scale was used (from –2 to +2) to take account of the negative or positive contribution of each cluster of evidence. Ratings were cross-checked. A database was created to hold this categorical information (Robertson 1998a). Each school could therefore have a report based on the main themes and subthemes of the project, with associated scores for current quality, potential for improvement and improvement perceived by the respondents.

Across the 12 case study primary schools, the range of ‘ethos’ values derived from teacher interviews was from –23 to +32. In Glendale, it was possible to see from database reporting that the major negative components of the score were:

- pupil behaviour and discipline;
- teacher responses to challenges in the socio-economic circumstances of pupils;
- pupil–pupil relationships;
- pupil self-esteem and self-efficacy;
- parent liaison and involvement.

In contrast, in St Aubrey’s, the major components of the relatively high ‘ethos score’ were:

- perceptions of teacher expectations of pupils;
- teacher morale and engagement with the school;
THE CHANGE EQUATION

- teacher responses to challenges in the socio-economic circumstances of pupils;
- the influence of historical events on present activity;
- pupil relationships with teachers.

Tables 2, 3 and 4 show an example of categorization and scoring of the teacher interviews on the three scales.

See Chapter 6 for an explanation of current quality score.
Figures in these tables suggest that while initial indications of potential for improvement may not differentiate between the two schools in terms of their final pupil attainments as measured by mathematics and English tests, strong differences exist in relation to processes and themes of improvement. Not only is St Aubrey’s rated as far exceeding Glendale in terms of its current quality (Table 2) and its own teachers’ perceptions of their school’s improvement (Table 4) but the research team anticipates further potential for improvement (Table 3). One question this raises is whether, with a little more time, gains in pupil outcomes might be observed. It has also led us to consider how we might further explore schools’ internal capacity for improvement.

A model of influences on internal capacity

Many of the contrasting features analysed in these two schools are illustrative of features of a model of influences on schools’ internal capacity (Stoll 1999). Internal capacity is influenced by the individual teachers within the school, the school’s social and structural learning context, and the external context (see Figure 1). In Figure 1, the school is depicted by an amoeba-like shape. This emphasizes the dynamic and adaptive nature of schools; in many ways they could be seen as organisms (Morgan 1996). The breaks in the lines indicate that

Figure 1 The influences on internal capacity (source: Stoll (1999)).
influences at each level (individual, school and external context) are not discrete and self-contained: rather, they blend in complex ways to create different patterns of relationships.

The nature of ISEP did not permit detailed analysis at the level of the individual teacher. For the purposes of this chapter, therefore, we have restricted ourselves to examining the school and external levels, although we acknowledge, as the model does, that individual teachers as learners influence the school’s learning context, and are given their place right at the centre of school change. Eight interacting influences are particularly important to the teacher’s capacity to engage in and sustain continuous learning: life and career experience; beliefs; emotional well-being; knowledge; skills; motivation to learn; confidence that (s)he can make a real difference; and sense of interdependence (Stoll 1999). From these schools’ accounts, it is clear that if significant change was going to occur it would have to have an impact on people’s belief systems, their sense of interdependence, and the confidence that working together they really could make a difference to the lives of these children, however deprived their community. The particular focus of the interviews, however, generally emphasized school-level and external influences, rather than individual teacher influences, and the remainder of this chapter will focus on those two levels, although the following example is worthy of comment at teacher level.

‘Can do’ beliefs at St Aubrey’s came through clearly from everyone interviewed. In one teacher’s criticism of the Quality Assurance inspection of her school recently, she commented:

‘We want the best, but we have to give children tasks they can achieve, an appropriate curriculum. One of our problems with QA was that they came into the school and saw well-mannered children, speaking politely and they thought we weren’t pushing them enough. They didn’t realize that our children can’t take a lot of pressure. They are vulnerable and they have to be able to cope with what they are doing so you can praise them. It doesn’t mean that you don’t push them further the next time.’

She added emphatically: ‘If they are going to learn ... they will learn here’. Another colleague displayed the same firm beliefs: ‘Everyone wants the children to achieve great things’, and 86 per cent of the teachers at St Aubrey’s felt that ‘teachers in school believe all pupils can be successful’ (in comparison with 60 per cent for the whole primary teacher sample).

The school learning context

Teachers as learners do not operate in isolation. Their experiences, emotions, knowledge, skills, motivation, confidence and interdependence interact with the

277
learning context in which they are located (as the spaces in the model outline denote). This context, the other fundamental part of a school’s internal capacity, is influenced by a set of social forces:

**The particular mix of pupils**

Size and age of the pupil body; their ethnic, social class or cultural background; whether they are all girls, all boys or a mixed group; whether they are of a particular religious denomination; and the number with special educational needs all play a role. McLaughlin and Talbert (1993) note:

> Contemporary pupils bring different cultures and languages to school, different attitudes and support to the classroom and learning. They themselves are required to navigate difficult and competing pressures of family, peers, and community at the same time that they are expected to function as pupils.

(1993: 6)

The social mix of the school influences a school’s functioning, largely because of the cumulative effect of the peer group processes: how pupils relate and act as a group (Thrupp 1999). Thus, the very pupils who attend a school flavour it in a particular way through their own pupil culture.

In St Aubrey’s one teacher described pupils as: ‘friendly, loveable. They can be difficult. They take a lot of teaching but they respond well. They are well behaved in the classroom.’ Another explained: ‘On the whole they are very caring. They are streetwise; they possess knowledge outwith that of the teacher, but lack maturity. They behave well in the classroom, less well in the playground.’ She also noted they ‘can’t take pressure. If you “push on” and “up” the pace, then they complain of illness.’ One respondent described some of the children’s home lives as ‘emotional turmoil’, saying they were often exhausted when they arrived or ‘have so many things on their mind that reading and number work is very hard’. Researchers’ field notes and teacher interviews confirmed that pupils’ language outside the classroom was different from that inside. A researcher also commented that sometimes there was a feeling that aggression was being kept in check, and could explode if supervision was withdrawn. In contrast, however, she observed an unattended class of pupils working quietly.

Glendale staff appeared to view their pupils very differently. In the staff survey, no teacher agreed with the statement ‘pupils in this school are enthusiastic about learning’ (compared with 65 per cent for primary teachers in all project schools), and only 30 per cent thought that ‘pupils respect teachers’ (compared with 68 per cent for all project teachers). The headteacher felt most children were reasonably well behaved and motivated but noted that higher than average numbers of slow, poor learners and more children with social and behavioural problems affected the
peer group as well as themselves: ‘Much time is given to the aggressive, disruptive children.’ The assistant head felt there were split priorities in the school: ‘You are not able to do your job because of the concentration on discipline and the amount of time you have to spend on it.’ She also believed: ‘The children are out of control.’ This contrasts with the view of a new teacher who found the pupils ‘mannerly and courteous’. This split of opinion was characteristic of many responses to interview questions and tells us that the situations teachers describe are ones which they may also be creating.

**Relationships**

Working together productively in schools depends on positive relationships. When teachers come together as a whole staff or in departments, a dynamic of relationships is created. In some ways, successful schools share many attributes of caring families (Stoll and Fink 1996), but in some relationships are dysfunctional (Reynolds and Farrell 1996), severely inhibiting capacity for improvement. Such difficulties are picked up quickly, for example, by this new teacher in Glendale: ‘I was aware straight away about ripples between the staff.’ The relationship between the headteacher and assistant head in Glendale could be described as strained. An outside observer noted: ‘The assistant head is an obstacle to every good thing happening in the school’, while the head merely commented, ‘We agree to differ.’

At St Aubrey’s, relationships between teachers were described in researchers’ ethos observation forms as supportive: ‘A good team spirit is a feature. Staff talk about the school as a family . . . staff also respect each other’s strengths.’ Communications and relationships were viewed by staff interviewed as a strength: ‘People are willing to share and discuss problems’; ‘Staff are very caring.’ Researchers also commented on the apparent high staff morale, displaying ‘a positive attitude towards work and helping the pupils. All staff appear to work beyond normal school hours’ and were ‘united by care for their pupils’.

**Morale**

While morale is often associated with external conditions, it can vary from school to school (Evans 1998). Satisfaction and morale is higher in some schools than in others. Stark contrasts were seen between the two schools, when we compared teachers’ reactions to the questionnaire item ‘Teachers like working in this school.’ In St Aubrey’s, 100 per cent agreed with the statement, while in Glendale, only 13 per cent agreed (with an agreement rate of 76 per cent across the total primary teacher sample). Moreover, in 1997 almost a third of Glendale teachers (30 per cent) felt that the school had got worse ‘as a place to be’ over the previous two years, in comparison with none of the St Aubrey’s teachers (and 11 per cent across the entire primary teacher sample).
History

Schools, like other organizations, go through life cycles (Schein 1985). During some periods they are ‘ripe for improvement’. At other times there may be institutional ‘inertia’, often dependent on the staff at the time, the leadership, and whether previous efforts at innovation have been successful or otherwise. Some schools may have experienced a significant event – an amalgamation, threatened closure, or a fire. In others, teacher mobility is high or they have a history of appointing large numbers of recently qualified teachers. Over the years, certain schools also build particular traditions and reputations. All these can influence internal capacity.

History appears to have been significant for St Aubrey’s, the fire exerting both positive and negative effects but, on balance, the positive outweighed the negative. While there was clearly devastation at the loss of resources built up by teachers over the years, there was an immediate marshalling of significant support from the local authority, new resources, and ‘rallying around’ of staff as a single unit in the aftermath of the event. This was achieved in the face of loss of pupils’ work into which they had put much effort, upheaval involved in relocation into temporary accommodation, and immediate effect on staff morale. Relocation in part of the local high school also helped to build new connections. Perhaps something symbolic in the fire marked the end of the old and the beginning of the new. Added to this, the following year the school received a Curriculum Award in London. It had promoted great pride among teachers and parents, and had provided an important boost after the fire tragedy. Threat of closure prior to the fire had also seen mobilization of parental support, and closure was happily averted.

Specific historical events did not appear to have played a major role at Glen-dale, although staff changes seemed significant, with some new teachers attempting to introduce changes and bring together a split staff. Notably, the depute head, new just before the start of the project, tried to bring in team teaching, although by the end of the project, researchers noted that she seemed to have given up, and was looking to move to another school.

Culture

Improvement attempts that do not address school culture can be seen as ‘doomed to tinkering’ (Fullan 1993) because school culture influences readiness for change. The essence of a school’s culture is the deeper level of basic assumptions and beliefs shared by members, operating unconsciously, and defining the organization’s view of itself and its environment (Schein 1995). Each school has a different reality of school life, how to go about its work, and its orientation to learning. The views of teachers in the two schools highlight differences in expectations. In Glendale, when asked about the most significant factors affecting pupils’ ability to learn, replies included: ‘Home background,
deprivation, parental views on education. Often survival is more important than taking on board educational opportunities’, and: ‘Some children are never going to achieve very much.’ An aura of powerlessness was emitted, a feeling that it was impossible to overcome the forces ranged against the school, most notably social factors and deprivation. Feedback of data was resisted and the increased accountability that the school was facing was viewed as creating ‘quite a burden’. While each person interviewed offered a broadly similar vision of what the school was trying to achieve (‘a good, wide education’), their perceptions of how this might be achieved, and barriers to achieving it, varied.

In contrast, in St Aubrey’s, a teacher commented: ‘. . . there are no limitations. You can come in this door and the world is your oyster . . . the children will be encouraged. Nothing is holding us back’, while another told of how ‘the school is always trying to better itself’. The headteacher was clear: ‘Children come first . . . Pupils expect to be taught and taught appropriately and stretched.’ This was reinforced by all teachers interviewed, including a new member of staff, who felt the most important thing she was trying to achieve was: ‘To take the child from where they were when I got them and to take them forward . . . I try to build confidence.’ And when she was asked what she expected from teaching, she replied: ‘A feeling that I am doing something for every child in my class. Not only knowledge, but standards.’

St Aubrey’s also displayed norms of continuous improvement and collegiality (Rosenholtz 1989; Stoll and Fink 1996). The headteacher remarked: ‘Learning and teaching is part and parcel of the conversation of this school’, confirmed by 100 per cent agreement to the teacher survey item ‘teachers regularly discuss ways of improving pupils’ learning’ (compared with 74 per cent for the primary teacher sample as a whole), 93 per cent agreement to ‘teachers regularly collaborate to plan their teaching’ (57 per cent for the primary sample), and 100 per cent agreement to ‘staff have a commitment to the whole school and not just their class or department’ (72 per cent for the primary sample). Teachers told interviewers people were willing to share and discuss problems; a new teacher found teachers planned in pairs: ‘You bounce things off each other . . . I find that excellent.’ The school had also chosen to participate in the project for feedback on how it was progressing and a ‘fresh’ perspective on the school.

Micro politics

Schools are full of internal politics (Ball 1987); they are places in which control is a key issue. Teachers make strategic decisions daily as to what is ideal and possible in their context. Some are ambitious, some want to influence school decisions, others want to be left alone. Some schools, however, promote positive politics (Blase 1988), such that natural political activities of staff contribute to school goals.

The two staffrooms at Glendale symbolized the rift between the staff. In the assistant head’s opinion: ‘The smokers were thrown out, and this has caused a
split in the staff.’ Teacher responses to the survey highlighted disagreements. Only 36 per cent thought ‘decision-making processes are fair’ (in comparison with 62 per cent for the whole sample), and even fewer (29 per cent) that ‘staff participate in important decision making’ (compared with 59 per cent for the whole sample). The staff development coordinator, new to the school, mused, ‘Where there has been consultation with staff, I do not know how deep it has gone.’

In contrast, at St Aubrey’s teachers felt their opinions mattered and they were encouraged to give their views on school policies. The headteacher commented there was so much ongoing talk in the staffroom about issues that, once a decision had to be made in a meeting, there was seldom disagreement and if there was, ‘we disagree without falling out’. She reflected back on what the school had been like when she arrived. The previous headteacher ‘did divide and rule. One set would be cast up to the other. There has been a major shift, but it took a long time. Everyone is now treated with mutual respect and we can talk to each other. The community now knows that this is what the school stands for.’ Indeed, all teachers agreed with the survey item ‘there is mutual respect between the staff and the senior management team’, while 87 per cent agreed that ‘decision-making processes are fair’ and ‘staff participate in important decision making’ (the remaining 13 per cent were uncertain). The several new staff at St Aubrey’s were viewed as bringing a counterbalancing influence, as exemplified in a comment by a teacher at the school for 16 years: ‘New people bring new outlooks, yet we have stability with the head and deputy head.’

Support staff

Support staff can play a significant role in the lives of a school. Many live in the local area and are connected to the local community. Their involvement and interest in the school as a whole, and the ways in which they facilitate learning, are all potential influences on a school’s internal capacity (Mortimore et al. 1992). Support staff in both schools were viewed as friendly by the research team on their initial visit. Those at St Aubrey’s were also perceived as particularly helpful. In this school, all of the teachers agreed that ‘non-teaching staff feel involved in the life of the school’ (compared with 76 per cent for the entire primary teacher sample). The head, reflecting on what she described as a participative management style, observed: ‘The buck does stop here, but I do not see myself being separate in any way from any of the staff. From the cleaner right up we are all in this together and everybody’s role is important.’

In Glendale, only half of the teachers thought ‘non-teaching staff feel involved in the life of the school’; the other half were unsure, and the role and participation of support staff was not discussed by any teachers interviewed.
Structures

Schools are bounded by structures that can shape their capacity to learn and respond to change. For example, traditional egg carton, compartmentalized school designs inhibit collaboration, whereas more flexible architectural designs are more likely to support collaborative cultures. The size of the school and classes within it, the physical plant, and how the school day is divided are other examples of structural aspects of a school’s capacity. These types of structure could be viewed as ‘givens’, over which staff members may have limited if any control (Mortimore et al. 1988), but even within such structures decisions can be made concerning location of different departments or classes. While structural conditions appear to be less powerful influences on developing school-based professional communities than social conditions (Louis et al. 1995), they can influence internal capacity.

Glendale staff’s descriptions of their school building were stark: ‘The outside . . . was horrific looking’; ‘One of the things that struck me to begin with was that there was not that welcoming atmosphere about the school. It is badly sign-posted and I think the building has lost its humph: when you enter a department it should meet you and I don’t think ours does.’ Glendale parents, while generally positive about the school in survey responses, were less impressed than other parents that ‘school buildings are kept clean and in good order’ (37 per cent disagreed, versus 7 per cent for the total primary parent sample).

In St Aubrey’s, by contrast, bright and interesting displays of pupils’ work adorned the walls. The rebuilding after the fire enabled minor adaptations: ‘This improved the educational environment of the school, for example resource areas and storage facilities’, and gave ‘a facelift’ providing ‘a welcoming atmosphere’. The school is open plan and, in the headteacher’s words, this ‘forces cooperation. It can be threatening, but it also provides support. Teachers watch and learn from each other.’ A new teacher agreed: ‘I was glad to have come in to an open plan school. I like people being able to move in and out of my class.’ It had also been arranged for everyone to get together each morning from 8.30 until 9.00 for consultation and planning sessions.

Leadership

Countless studies have found positive leadership to be a powerful force for school effectiveness, school improvement and organizational learning (for example, Hallinger and Heck 1996; MacBeath 1998; Mortimore 1998; Leithwood et al. 1999). St Aubrey’s leaders appeared to present a picture of clarity about their vision and focus. In both 1995 and 1997, all teachers agreed that ‘the SMT communicates a clear vision of where the school is going’, and 93 per cent and 100 per cent respectively (in 1995 and 1997) agreed that ‘the primary concern of everyone in the school is pupil learning’. There was also a high level of satisfaction with what one teacher described as the school’s ‘open
management’. When asked about her headteacher’s leadership and management, a teacher responded: ‘Superb. She knows everything that goes on. She knows the curriculum, the children, the staff inside out, she picks up on your attributes. She brings out the best in everybody. She knows how her school wants to be.’ The head was extremely clear about her role: ‘I know what I want and I will get it.’ She acknowledged she was occasionally manipulative or devious but this was done ‘with good humour and also with respect for teachers’, whom she believed often knew much more than she did about classroom practice. She, therefore, viewed criticism as inappropriate. Others saw her as leading by example, and some explained how in the previous two years a larger senior management team (SMT) had evolved as she had brought in new people to work with her. While the SMT was seen as making a lot of the decisions, everyone felt they were consulted. Hiring decisions were also viewed by the head as critical, so the school could ‘capitalize on what they brought with them’. In contrast, a teacher in Glendale commented: ‘I would describe the management style as autocratic to a certain extent and not approachable enough.’ Results of the teacher questionnaires in both 1995 and 1997 showed teachers responding negatively to many items within the leadership and management factor. In 1995 the school was one of the four lowest scoring primary schools on this factor, and one of the six lowest scoring schools in 1997. Furthermore, when asked about change in leadership and management in the school over the previous two years, 30 per cent of the teachers felt it had become worse (compared with 9 per cent for the total primary teacher sample).

External contextual influences on internal capacity

While the school’s capacity and its readiness or orientation for change is internally driven, the external contextual influences on a school’s internal capacity cannot be ignored. Central among these are the following.

The local community

Schools are located in and serve very different communities. School effectiveness researchers have consistently demonstrated the impact of pupils’ background characteristics on their school achievement. Parental expectations and aspirations may also vary according to location and type of school. The demography of a school’s community can not only affect attainment outcomes but a school’s internal capacity for improvement. Disadvantage, however, does not automatically inhibit its internal capacity. Schools in disadvantaged areas can boost their pupils’ progress more than those in advantaged areas as our own study and previous research (Mortimore et al. 1988) has shown.

Both in Glendale and in St Aubrey’s, pupils brought with them into the school their experience of multiple disadvantage – a key factor affecting school ethos, pedagogy, management style, pupil–teacher relationships and relation-
ships between home and school. While social background factors are key con-straining influences on overall school attainment, they do not diminish the school’s internal capacity nor need they necessarily inhibit the process of sus-
tainable improvement. It need not imply that the teachers cannot prepare their pupils for challenges they will face in the changing world beyond the school gate. Comments of teachers in the two different schools, however, reveal significant differences in how they viewed their local communities and their impact. At Glendale, the community’s influence was described as the main limi-
tation of the school: ‘The community influence anything we try to do.’ More than a third of the parents responding to the survey (37 per cent) disagreed that ‘the school has a good reputation in the community’, significantly more critical than ISEP primary parents as a whole (6 per cent).

Although the St Aubrey’s catchment area was similar to Glendale’s, and the academic starting point of its pupil intake generally 18 months below the average (‘colours, number, recognition of shape cannot be taken for granted’), parents were seen as a strength: ‘They are loyal and supportive’, and teachers commented that the headteacher ‘knows them as a friend’. The head explained how it was necessary to offer a very safe and caring environment, for parents as well as pupils: ‘A lot of the parents, if it is a first child coming to the school, come to us with the baggage of their own experiences of school and they do not always have pleasant experiences.’

The broader community

The broader community can include many different groups. Universities’ and businesses’ requirements of those leaving schools influence curricula and assessments. Similarly, unions’ policy and practices influence how at least some of their members respond to changes in school. Attitudes of the broader community to schooling, particularly the media, can also affect teachers’ motivation and belief that what they are doing is worthwhile. Other key stake-
holders include local authorities. In Scotland these have not faced the same threat as their counterparts in England. ‘Devolved School Management’ has given more autonomy to schools but authorities, nonetheless, continue to play a significant role.

For St Aubrey’s, local authority support was high at the time of the school fire, both in terms of people and finance. As one staff member commented in 1995, ‘I have nothing but praise for the local authority.’ Concerns were being noted, however, that ‘support is now crumbling’, and by 1997 staff talked of a lack of support for an increasing number of children with emotional, behavioural and learning problems: ‘and there is no one there to answer your cry for help’. In Glendale, the picture was somewhat reversed. In 1997, the headteacher felt the school and local authority had moved closer together since 1995, and described various authority initiatives. A new teacher commented however, in a somewhat strained interview, that learning support had been lost.
**Political action and ‘tone’**

Policies and beliefs about the purpose of education that underpin them are critical influences on schools. The sheer amount of policy-oriented change is particularly significant. Overload is a dilemma and, with the best will in the world, teachers bombarded by unrelenting changes over a short time period tend to be exhausted. They find it hard to maintain energy, enthusiasm and, ultimately, willingness for change (Helsby and McCulloch 1996). It is not necessarily teachers’ characteristics that cause resistance, but pressures on them and limitations to their involvement in making change happen (Fink and Stoll 1998). With increasing demands on them, they face intensification of their work leading, in many cases, to feelings of guilt (Hargreaves 1994). While, for some, these present fairly easy-to-resolve dilemmas, for others there are uncomfortable tensions or constraints that can lead to stress (Woods et al. 1997). The very language and labelling of schools as ‘failing’ contributes to low teacher morale and feelings of impotence, and encourages the general public to believe that standards are low and that a significant minority of schools are in a state of perpetual crisis (Stoll and Myers 1998).

Glendale teachers described an increase in paperwork (‘it tends to take up so much of your time that you really can’t think straight with specific ideas that you want to teach . . . it’s way over the top’). In 1995 the headteacher commented that the Scottish Office supported schools ‘through the volume of manuals and guidelines received. The 5–14 documents are leading the way with the curriculum’, and their ethos documents were ‘fine, if you concentrated on that alone’. By 1997 she concluded: ‘Information is sent to be read, but it doesn’t really affect teachers or classrooms’, while another teacher’s view was ‘This 5–14 with its 10,000 strands. There’s too much curriculum change, too much jargon . . . 5–14 has affected terminology rather than practice . . . the burdens of 5–14 are too great.’ In contrast, one teacher at St Aubrey’s felt the 5–14 changes were ‘for the better, but it involves a lot of work and you need to be organized’, while another thought the 5–14 documents had ‘made us more aware’, although she, and other colleagues, had specific concerns about one subject document which ‘made us feel deskillled’. By 1997, however, the headteacher found the documents ‘much better than before . . . clearer, and quite helpful’.

**Professional learning infrastructure**

Some schools are located in areas or regions where the professional learning infrastructure is better developed than in other areas. Fullan and Watson (1997) argue that systems that sustain high-quality professional development have frameworks of support including elements such as appropriate policy, shared and agreed-upon priorities, time to engage in learning, access to best practice and recent research, and appropriate rewards and incentives.

Both schools were in areas where they could draw on a variety of external
sources, although neither was entirely happy with the externally available support. The head of St Aubrey’s described the school’s experience of external staff development as ‘not very positive’, with some described as ‘totally inadequate, staff returning frustrated, feeling time was wasted’. She believed: ‘The focus should be on what staff feel they need in relation to the school development plan and individual professional needs. Our career reviews are helpful in determining this. Staff have an informal chat with the head or depute head – where do you want to go? How can we help you get there?’ The school’s staff development coordinator added that staff development mainly takes place in the school: ‘where the most important staff development takes place . . . courses can be valuable, but staff development is not just going on courses’. Other teachers thought within-school staff development was ‘continuous’ and that if they wanted anything else, it was available. Indeed, when asked how the College of Education supports the school, one teacher replied: ‘It’s the other way around. We help the college.’ This school, therefore, appeared to have built its own infrastructure.

Although Glendale’s headteacher felt that staff development was suited to the school’s needs, and ‘the senior management team can give greater direction from an overview of the development plan and perceived staff needs, plus being able to send several staff on the same course’, she also commented on variable quality of outside courses, and problems in devising time for feedback by teachers who had attended courses. In response to a question about staff development, however, an inexperienced teacher appeared more concerned ‘that staff should feel that they are not on their own; that the management should be there to back them, as part of a team’. Teacher survey responses also showed that only 32 per cent of respondents agreed ‘staff development time is used effectively in the school’ (compared with 100 per cent agreement at St Aubrey’s and 59 per cent agreement in the total primary school sample).

Global change forces

Social, economic, technological, political and ecological forces, among others, shape our daily existence. Institutions, political, economic and social structures and, indeed, value systems worldwide appear to be changing or under pressure to do so. Such forces have major ramifications for all schools, including Glendale and St Aubrey’s, making it increasingly imperative that schools have the internal capacity to respond to such forces.

Issues

Preliminary analysis of the data for two Scottish schools suggests that the model of influences on school capacity may offer possibilities in helping identify schools with the internal capacity for change, but it also raises some issues:
The capacity model needs further testing in a range of contexts, and in relation to what is already known about improvement in different types of schools.

The model is not a model of increasing pupil outcomes per se. It is an attempt to take a closer look at a school’s internal dynamics and potential: what can help or hinder it from starting and sustaining the learning process. It is based on the premise that pupils will learn best when their teachers and schools learn. This may not always have appeal in a time of increased accountability and emphasis on standards, but it raises serious issues about the meaning of school quality, as well as potential for quality.

The various influences at the three levels can be positive, neutral or negative, and are a complex braid, many of which are interconnected. This needs further investigation to try to understand the way the influences connect. It also suggests that designers of improvement or restructuring programmes are likely to find it hard to identify particular actions to be taken in relation to each specific influence. There are no simple solutions.

The model highlights that schools can significantly differ from each other in a subtle range of ways. This means that ongoing auditing of the influences that affect each school is essential. Furthermore, for some schools, capacity building may need to focus on helping teachers develop the motivation and confidence to be able to get started in a change process, never mind becoming experts in a particular new teaching strategy.

In emphasizing social dynamics and social systems, the model tries to reach a more fundamental level about human relationships and philosophies of life. The differences in language of teachers in these two Scottish schools in areas of equal deprivation suggest a great deal more needs to be understood about differences between schools as human and dynamic systems before governments, in particular, advocate tightly controlled and regulated designs. The sharp contrasts of the two schools seem to suggest that the schools’ learning context is of more significance to their internal capacity than the external context. However, these are two schools serving very similar catchment areas. If one had been located in an area of affluence the picture might have been different, although ‘cruising’ schools (Stoll and Fink 1998) possess powerful norms that inhibit development.

**Research challenges**

We believe it is necessary to continue working with and studying schools to develop greater understanding of their internal capacity in the following areas:

- How the different influences work together – How do the range of combinations interact within and between levels? How important is each in the model? For example, if a school focuses considerable energy on external
forces, dealing with extended negative media attention or implementing a state or national government curriculum that does not take into account its local circumstances, needs or interests, to what extent might the learning context suffer or atrophy (Fink 1999)?

- Are the influences the same in schools in different phases? If not, how do they differ? Which ones are more important in secondary schools, for example, and why? What is missing?

- Differential internal capacity of different schools – For example, are individual teachers in a school like Glendale actually different from those in one like St Aubrey’s, two schools in very comparable social areas? Are they generally less confident as individuals that they can really make a difference to the lives of pupils in disadvantaged areas? Alternatively, are the leadership, relationships, culture and within-school internal learning context holding them back?

- How to build capacity in different types of schools – For example, if schools like Glendale are characterized by dysfunctional staff relationships, micro politics, and underpinning beliefs that some children will never learn, are the most important actions to be taken (a) developing a continuing focus on people, (b) promoting positive politics, (c) combating low expectations? Is it even possible or appropriate to determine a time sequence for capacity-building strategies?

- How schools with variations in their initial change capacity use different change strategies (Stoll and Fink 1996; Hopkins and Harris 1997; Earl and Lee 1998) and how they use external support – for example, did St Aubrey’s really need a process consultant or would specific help in their chosen area of writing have been more valuable? When does a school know what help it needs, and is there any school, no matter how successful, that would not benefit from a critical, external eye?

Some of these questions can be answered through statistical modelling. Many, however, depend on drawing on detailed case studies of schools and their improvement efforts (for example, Louis and Miles 1990; Mortimore et al. 2000) and by producing further case studies whose value as freestanding narrative should not be underestimated. As Robertson (1998b) argues, they show the way teachers understand the schools in which they work; and how they see the wider Scottish educational context. She continues: ‘These studies contribute towards our understanding of schools as organisations and also to the debate about the meaning of the “good school” ’ (1998: 4). Certainly, this cannot be teased out in infrequent regulatory inspections. This is because the nuances of people’s belief systems, interpersonal dynamics and subtle interconnections among influences are more likely to be seen over time. Only through ongoing involvement with the school and use of qualitative instruments over time could the project team see that a positive interview from the headteacher of Glendale at the start of the project was merely ‘putting a front on it’. In contrast, the
interview with the assistant head at the same time, while unpleasant, and difficult to carry out, was honest. This highlights the need for further carefully controlled longitudinal studies. Until more is known, through detailed case studies and specifically focused and evaluated capacity-building programmes, it is all too easy for blanket policy solutions to be advocated.

Greater attention also needs to be devoted by researchers to exploring how schools use research findings and how they could be used more beneficially. Without specific support, practitioners appear to view dissemination of research as imposed change (Wikeley 1998). The role of researchers in supporting and promoting the development of schools’ internal capacity could offer great potential.

Conclusion

Bringing about change in schools is extremely complex. School improvement and other reform strategies thrust on, or even offered to, teachers without taking account of unique differences between schools in their internal capacity are likely to lead to loss of the energy and creativity needed to take schools forward in the future. While support for real improvement involves challenge and accountability, more fundamentally, this study emphasizes it is about helping schools understand and develop their own capacity. This means focusing on individuals, their internal learning context and the external context. Without this, the chances of deep and lasting changes that can lead to improved pupil learning are slim.

MONETARY INCENTIVES AND THE REFORM OF TEACHER COMPENSATION

A persistent organizational dilemma

Stephen L. Jacobson*

Introduction

It seems that whenever education comes under attack, school reformers turn first to private sector models of monetary incentives to increase what they perceive as a lack of teacher productivity. The use of monetary incentives in the private sector is predicated on the basic economic assumption that workers will increase their level of effort if they believe that their rewards will increase accordingly. The application of monetary incentives to education assumes that teachers are subject to the same income/leisure substitution effects as workers in other vocations. Advocates of monetary incentive plans argue that without such incentives there is little reason for workers, teachers included, to exert effort beyond the minimum performance requirements of their respective jobs.

During the 1980s, over 99% of the teachers in the U.S. worked in districts using uniform schedules that paid salary increments based solely on longevity and graduate credit accumulation (Murnane & Cohen, 1985). At the same time, a number of influential reports appeared that questioned the quality of public schools in the U.S. (see, for example, Boyer, 1983; Goodlad, 1983; National Commission on Excellence in Education, 1983). These reports raised the spectre that a deteriorating educational system posed a serious threat to America’s global economic pre-eminence. Indeed, some suggested that a causal relationship existed between the widespread use of the uniform salary schedule and “the rising tide of mediocrity” in American public education (NCEE, 1983). The issue received considerable public attention and led to calls for marked changes in the way teachers are compensated. Among the most often recommended compensation reforms were increases in entry-level wages, career ladders with
differentiated salaries, and scarcity bonuses. But the most contentious reform proposals were calls for performance-related pay, more commonly known in the U.S. as ‘merit pay’ (Lipsky & Bacharach, 1983).

As we shall see, merit pay plans have been tried and tried again in public education, but their use has always been short-lived. Obviously, the question of whether the plans work needs to be examined. Not surprisingly, some plans work and others don’t. But judging the vicissitudes of educational policy solely on the relative success of a few monetary incentive plans represents a limited perspective. There seems to be a regular ebb and flow in public interest in the use of monetary incentives for teachers, and the question of how to most appropriately compensate teachers is one that persists. As Cuban (1992: 6) points out, problems that persist often do so because they require choices to be made between “competing, highly prized values (that) cannot be fully satisfied.” Cuban suggests that attempts to use the “template of technical rationality” to address administrative problems may hide conflicts in inherent values, leading to conflict-filled ‘dilemmas’ of administrative practice. In the first chapter of this book, Cuban points out that unlike problems that can be solved, dilemmas can only be managed, and the key to managing these persistent dilemmas is to recognize the values that are in conflict.

The purpose of the chapter

The purpose of this chapter is to examine the conflicting values that underlie debates about the reform of teacher compensation. Elsewhere I have studied teacher compensation and incentive plans pragmatically, trying to understand what works and why? (see, for example, Jacobson, 1993, 1991a; 1991b; 1990; 1989a; 1989b; 1989c; 1989d; 1988a; 1988b; 1988c; Monk & Jacobson 1985a; 1985b). In this chapter, I re-examine the effects of monetary incentives on teacher recruitment, retention, and absence, focusing on the conflicts in personal and organizational values that cause problems with teacher compensation to persist. Two key issues to be considered are normative expectations of teacher behavior and differential responses to income/leisure substitution. I will argue that the way society views teachers and the way teachers see themselves are often at odds. At these times, changes in compensation and the use of incentives are introduced in order to bring teacher behaviors in line with public expectations. The public’s perception of a ‘dedicated’ teacher is of an individual who is more concerned with the welfare of students than the attainment of monetary rewards. Teachers, on the other hand, desire to be treated like ‘professionals’ and not be compelled to compete for rewards. Yet, when monetary incentives are offered, they tend to adjust their labor market behaviors in relatively predictable ways, much like other workers in other fields.

I will argue that herein lies the root cause of a persistent organizational dilemma, i.e., school systems turn to monetary incentives to motivate teachers, yet they really don’t want teachers who are primarily motivated by money.
Teachers want to be respected for their dedication to children, yet they respond to monetary incentives and often demand extra compensation for activities school officials and the public perceive as being a part of their professional responsibilities. In other words, teachers and their school district employers both exhibit behaviors that seemingly conflict with their beliefs and values.

A case in point, teachers in the U.S. are presently being asked to become increasingly involved in site-based decision-making. The opportunity to participate as full partners in the governance of schools is perceived by the public as a professional responsibility that teachers should enter into without additional remuneration, i.e., teachers should volunteer their time just like parents and other community members who are involved in shared decision-making. Teachers, on the other hand, are questioning why they must subsidize these additional responsibilities by reducing their leisure time, i.e., why should they take on additional responsibilities without being offered additional income? Many teachers are asking that they be compensated for their involvement in shared decision-making activities, either through extra pay for extra work provisions, or release time from other professional responsibilities.

**The organization of the chapter**

In order to place this discussion in its political and social context, I begin the chapter with a look at teacher compensation in the U.S. and an examination of the composition of the American teaching workforce. Next follows a brief history of merit pay for teachers in the U.S., as well as a review of a number of studies of compensation reforms implemented over the past decade. I then examine what teachers value in their work and what society values in teachers. The reader will see that while monetary incentives can influence key labor market behaviors of teachers, their use tends to conflict with personal and societal expectations of what a ‘good’ teacher is and wants. There is also some misunderstanding about the income/leisure substitutions that teachers prefer. While monetary incentives plans assume that teachers will work harder for more pay, there is reason to believe that many teachers see the opportunity for more leisure time as a more attractive incentive than more money. These conflicting values and perceptions produce a persistent organizational dilemma caused in part by the very mechanisms employed to ‘solve’ it.

**Monetary incentives and the teacher workforce**

*Teacher compensation in the U.S.*

The reason salary is often singled out by educational reformers is that it is highly visible and easily amenable to comparison. As public employees, teachers’ salaries are a matter of public knowledge and negotiated locally. This is particularly relevant in a decentralized system such as the U.S., where there are nearly
15,000 districts. Texas alone has over 1000 school districts. Each district has its own Board of Education which is responsible for determining the district’s rate of pay, either unilaterally or through collective negotiations with teacher representatives. One consequence of local control is that teacher salaries vary markedly both across and within states. For example, in 1990–91, estimated average salaries for public school teachers across the U.S. ranged from a high of $43,808 in Connecticut to a low of $22,363 in South Dakota, a difference of almost 100% (Thompson, Wood & Honeyman, 1994). Within New York State, average district salaries for classroom teachers in 1992–93 ranged from $62,406 at the 90% percentile to $28,187 at the 10% percentile (NYSED, 1994).

These wage disparities reflect regional differences in the cost of living, alternative employment opportunities for teachers, teacher union strength, and the average level of teacher experience and education. America’s teacher workforce is very experienced and well-educated. Of a total teacher workforce of roughly 2.5 million in 1990–91, almost 65% had over 10 years of experience, 25% had been teachers for more than 20 years, and 47.5% had a Master’s degree or above. In addition, the teacher workforce is 72% female, meaning there are 1.8 million women teachers in the U.S. (NCES, 1994).

Wage disparities are also a reflection of the willingness of the local community to support public education. It is important to note that in the U.S., local control also means local support. The National Center for Education Statistics (NCES, 1994) reports that in 1990–91, 46.5% of all revenues for public elementary and secondary education came from local sources, slightly less than the 47.3% provided by state governments (Federal sources account for only 6.2% of all revenues for public education). When one considers that professional salaries and benefits often account for 65–70% of a school district’s operating budget, coupled with the fact that current per pupil expenditures have risen 33% since 1982–83 after adjustment for inflation (NCES, 1994), it is not surprising that American taxpayers have become highly sensitive to both increases in teacher salary and reports of declining student achievement.

The so-called ‘first wave’ reforms of the 1980s noted earlier, as well as a ‘second wave’ of reports (see, e.g., Carnegie, 1986; Holmes, 1986) led to significant improvements in teacher salaries. By 1992–93, the average salary for public school teachers in the U.S. was $35,334 (NCES, 1994). Adjusting for inflation, this is an 18% increase from a decade earlier, when the report *A Nation at Risk* (NCEE, 1983) first made educational productivity a national priority. But while their wages changed markedly over the past decade, the way that teachers are compensated did not. The vast majority of America’s teachers still work in districts that pay increments primarily on the basis of experience. Yet this has not always been the case and the use of monetary incentives has a long but erratic history in American public education (Johnson, 1984).
The use of merit pay

As early as 1903, teachers in Chicago fought the implementation of a merit pay scheme they felt would jeopardize their newly-won, longevity-based salary schedule (Urban, 1985). During the early 1920s, almost half of America’s schools had ‘merit pay.’ There was considerable interest during that period in applying the efficiencies of industry to education, and merit pay was one manifestation of that interest.

Ortiz and Marshall (1988) contend that, “a misreading of Taylor’s scientific management turned schools into competitive bureaucracies, rather than collaborative service organizations (p. 123).” Merit pay plans were, in fact, intended to foster competition, in the belief that competition can bring out a worker’s best performance. But ‘merit’ in these early plans was more often determined by gender or level of instruction than by performance. By the 1930s and 1940s uniform salary schedules were becoming increasingly commonplace. Public interest in the use of monetary incentives was renewed in the late 1950s when the Soviet Union launched Sputnick, and by 1969, 1 in 10 (11.3%) districts enrolling more than 6000 students used performance incentives as part of teacher compensation. But once again interest waned, and within a decade, the number of districts using monetary incentives was down to only 1 in 25 (4%) (Porwoll, 1979).

More recently Murnane and Cohen (1985) tried to identify schools districts that had used merit pay plans for at least five years, had paid awards of at least $1000, and had an enrollment of more than 10,000. They could find only seven districts that met these criteria in 1985. And in these few districts, Murnane and Cohen found that merit pay did not appear to have much of an effect on the way teachers teach.

But while monetary incentives may not affect the way teachers teach, other recent studies suggest that they do have an important effect on other teacher labor market behaviors, specifically recruitment, retention, and attendance.

Monetary incentives and teacher labor market behavior

Recruitment: occupation and location choice

A career in teaching can be demarcated by a series of critical choices, the first two, occupation and location choice are recruitment issues for the profession and school districts respectively (Jacobson, 1993). The first career choice, occupation, is particularly problematic and many of the reports cited earlier, most notably A Nation at Risk, expressed alarm at the lack of high caliber individuals entering teaching. During the 1970s and 80s, salaries in teaching, especially at the entry-level lagged behind those of other professions requiring equivalent educational preparation (Monk & Jacobson, 1985b). These national reform reports were unanimous in their recommendation that starting salaries in
teaching had to become more competitive with those in other occupations. The
resulting salary increases noted earlier indicate the influence of those reports.

After a person decides to become a teacher, s/he decides next where to teach,
i.e., the choice of location. This is especially important in the U.S. because the
decentralized nature of American education means that improvements in entry-
level salary must be dealt with at the local level. As teachers choose among
locations, they can be considered both buyers and sellers in the educational labor
marketplace, simultaneously purchasing the job characteristics of school dis-
tricts including starting salary, while selling districts their services (Antos &
Rosen, 1975; Chambers, 1981). Given that salaries vary from district to district,
one can chart the behavior of teachers to see whether their location choices are
influenced by money.

I examined school districts in two regions of New York State to see how
changes in starting salary affected the ability of these districts to compete
amongst themselves for the services of beginning teachers (Jacobson, 1990). I
found that school districts that improved the relative attractiveness of their start-
ing salary vis-a-vis their regional neighbors subsequently improved their likeli-
hood of recruiting the most highly educated novice teachers available. In other
words, beginning teachers are responsive to monetary incentives, and districts,
knowledgeable of that fact, use money to recruit these talented candidates as
they compete with other districts for their services.

Retention

After deciding where to teach, the next critical career choice an individual
makes is whether or not to remain in teaching, or more specifically, in a given
school district. Even those authors who contend that teachers begin their careers
with a willingness to forego high salaries in anticipation of teaching’s intrinsic
rewards recognize that over time frustration with salary becomes an increasingly
critical factor in teacher turnover (Chapman & Hutcheson, 1982; Goodlad,
1983).

Using the same sample of districts I used in the recruitment study, I also
examined the effects of salary change on teacher retention (Jacobson, 1988a).
The findings revealed that districts that improved the relative attractiveness of
their salaries, particularly salaries paid mid-career teachers, were the districts
with the highest rates of teacher retention. In addition, women in these districts
were more responsive to salary change than men, a finding that countered earlier
studies that claimed traditional economic forces have little influence on female
teachers (Charters, 1967; Lortie, 1975).

Attendance

What work to do, where to do it, and whether to remain represent choices made
just a few times over the course of a career. But whether to go to work on a
given day represents a decision teachers make regularly throughout their careers. In New York, a school calendar generally runs 180–190 days per year. On average, teachers in New York use 9 sick days per year, roughly 5% of available work time (Ehrenberg, et al., 1989). Some school districts have tried to use monetary incentives to reduce teacher absence. I studied teacher absence and found one attendance incentive plan that produced a significant, short-term reduction in the average number of days that teachers were absent from work (Jacobson, 1991a; 1989a; 1989b).

While it is not clear from these studies whether monetary incentives affect the quality of teacher performance, taken together the studies do indicate that monetary incentives have a significant influence on the way teachers behave in the educational labor market. I offer these findings to show the centrality of monetary incentives to the relationship between teachers and their public employers. When monetary incentives are offered, teachers tend to adjust their labor market behaviors in much the same way as other workers. But does society really want its teachers to act like other workers, or, do they hold teachers to a different standard? Next we look at what teachers value, and how these values match up with society’s expectations.

**What do teachers value? What does society value in teachers?**

Recall the central proposition of the chapter is that problems persist in teacher compensation because of conflicts in highly prized personal and organizational values. The studies reported above indicate that school officials use incentives to influence teacher behavior. Yet, the public’s perception of a ‘dedicated’ teacher is of an individual who is more concerned with the welfare of students than the attainment of monetary rewards.

In a study of New York City teachers, Griffiths et al. (1965) categorized teachers based upon what they valued most in their work. The “dedicated” teachers in this typology were those individuals who are most interested in children – the “pupil-oriented” teachers. The values held by these teachers match most closely society’s expectations of what teachers should value. “Subject-oriented” teachers represent a second category of teachers. The values these individuals hold dearest are not inconsistent with society’s expectations. The public recognizes that schools need individuals who are concerned with the subjects they teach and not just those who take their subjects. On the other hand, “benefits-oriented” teachers – individuals who value their package of compensatory benefits, including the generous vacation schedule – are anathema to these normative expectations.

Benefits-oriented teachers are teachers who use the compensation system to their best advantage. Griffiths et al. write that these “benefits-oriented” teachers move horizontally “until they find a good deal” (p. 24). When monetary incentives are offered, these teachers adjust their labor market behaviors in much the same ways as the teachers reported in the studies above, i.e., they move to better
paying districts, they remain longer in districts when their salaries become more attractive, and they attend more regularly when regular attendance is monetarily rewarded. And herein lies the rub, when money is offered, these teachers respond and school officials anticipate that they will. Yet neither side is entirely comfortable with the bargain. Teachers would prefer to be treated and paid like ‘professionals,’ and not ‘bribed’ with monetary incentives, while the public would prefer teachers who work to their full capacity without making additional monetary demands.

It would be naive to suggest that the categories in this typology are mutually exclusive. Certainly there are pupil-oriented teachers who are concerned about their benefits, and benefits-oriented teachers who are concerned about their subjects and students. It is as unfair to expect all teachers to be dedicated to their students as it is to suggest that all teachers are solely interested in their benefits. I believe that the relatively generous vacation schedule that teachers have accounts in part for public resentment over their attention to benefits. Let me offer one example of this resentment. I recall speaking to a dairy farmer in rural Central New York who was angry over teachers’ demands for higher salaries. In his eyes, the teachers in his district were part-time employees. He pointed out that a teacher’s workday begins well after his, and ends well before. And while children stay home on weekends, holidays, and ten weeks during the summer, his cows need to be milked twice a day, every day. From his perspective a teacher is a part-time employee. With so much time off, he would argue that teachers can find other employment if money is so important. Which brings us to the second issue in conflict, i.e., income/leisure substitutions and how society views teacher time.

**Income/leisure substitutions**

Richards et al. (1993) write that the income effect is, “The difference in the effort supplied at two different income levels” (p. 32). The relationship between income and effort is assumed to be positive, and the use of monetary incentives in education suggests teachers will work harder if they can earn more money. It also implies that unless these incentives are available teachers work at levels of effort that is beneath their capability.

In contrast, “the substitution effect occurs when an increase in earnings predisposes the employee to purchase more leisure” (Richards et al. 1993: 32). In other words, after attaining a certain level of income, workers are likely to seek more time rather than more money. To someone like our dairy farmer, the idea that increasing teachers’ salaries could lead to their purchase of more leisure time runs counter to his basic work ethic. He would argue that if we are to give teachers more money, they had better produce more, and not ultimately convert increased wages into still more free-time.

Those who advocate the use of monetary incentives in education believe that teachers presently have plenty of free time, and therefore additional time and
effort to be purchased. But teachers do not see themselves as part-time workers, countering that they already subsidize public education through low wages and the amount of preparatory work they undertake at home, on their own time, at their own expense. In fact, many teachers view time as a more attractive incentive than money.

**Trading money for time: deferred salary leave plans**

Deferred salary leave plans (DSLPs) allow teachers to voluntarily defer a part of their annual salary for a given number of years in order to self-fund a leave of absence. Teachers use the leave year for graduate study, travel, and other personal and family matters. The vast majority report a renewed enthusiasm for teaching upon returning from a leave, and quite a few opt into a second plan as soon as they return from their first. While some teachers use the leave year to improve their instructional skills, others simply want to escape the stress of teaching. These self-funded leaves are viewed by some teachers as an antidote to burnout (Jacobson & Kennedy, 1991; 1992).

DSLPs have been used in Canada since the late 1970s, but it wasn’t until 1993 that the first plans of this type were negotiated in the U.S., in school districts in Muskegon, Michigan and Rochester, New York. Government officials in the Netherlands, concerned with high rates of long-term teacher absences related to stress, have also expressed an interest in implementing DSLPs.

The increasing popularity of DSLPs (13% of teachers in one Ontario school district are involved in one stage or another of a leave plan), indicates that the opportunity for release time may outweigh the attractiveness of monetary incentives to teachers. In other words, the premise that teachers have generous amounts of free time and are willing to use that time to increase their productivity in exchange for extra money, may underestimate the level of effort that teachers currently expend and the extent to which they value what leisure time they have. More time rather than more money seems to be what some teachers want, but allowing teachers additional free time runs counter to society’s traditional work ethic.

**Conclusions**

Language can often confuse, as well as clarify, the way we look at our world. Much of administrative preparation and practice in education is concerned with the process of ‘problem-solving’ – identifying and framing problems, developing alternative solutions, and selecting among competing alternatives for the most feasible solution. When we have ‘problems,’ we seek solutions. But some problems seem to be more difficult to resolve. They defy a neat overlay of scientific rationality because they represent on-going struggles between competing values. As noted at the beginning of the chapter, the use of the “template of
technical rationality,” is likely to ignore these conflicting values and therefore the problems persist (Cuban, 1992).

Educational reformers of the 1980s reported problems with American education, especially problems with its teacher workforce. According to these reformers, teachers were both the cause of and potential cure for deteriorating student achievement. These first wave reforms focused on market incentives and state mandates to solve the ‘teacher’ problem (see, Farrar, 1990; Petrie, 1990; Jacobson & Conway, 1990 for details). Compensation reform was seen as a rational way to ‘solve’ the problem. There were few attempts to examine underlying values, and as Urban (1985) noted, current initiatives like those that had come before once again poured “old wine” (merit pay) into “new bottles” (compensation reform). Teachers rejected what they perceived as the demeaning treatment of having to compete for rewards, yet lobbied for substantial increases in salary. The public didn’t necessarily object to higher wages so long as teachers worked harder for them. Both parties recognize the importance of money, yet both have reservations as to how important it should be. In many ways teachers are no different than workers in other professions, but in one very important way they are expected to be quite different, i.e., they are expected to be dedicated to their students, and place their own benefits second. But teachers question why they’re expected to subsidize their employment in ways that other workers are not. Recall the example presented earlier, in which teachers and school officials disagree over whether teachers should be compensated additionally for their involvement in site-based decision-making. Should this be viewed as a function of good citizenship within a participatory democracy, or simply a case of extra work demanding extra compensation? As a result of fundamental disagreements such as this, the use of monetary incentives remains as much a topic of discussion as a practical reality.

The emerging wave of “systemic” reforms that have characterized the late 80s–early 90s, have become increasingly interested in the relationship between the social organization of the school workplace and teachers’ commitment, performance, and productivity (see, for example, Mitchell et al., 1987; Reyes, 1990; Rosenholtz, 1989; Jacobson & Berne, 1993). In some ways, these systemic reforms are closer, conceptually, to Cuban’s notion of managing the compensation dilemma than early reform attempts to solve it. For example, in order to make education more attractive to individuals contemplating teaching as a career, as well as to draw local stakeholders into educational decision-making, current reform initiatives in the U.S. have focused more on improving the school workplace and its relationship to its constituent community than on teacher salaries. Moreover, when incentives are successfully employed, they are used to reward collective rather than individual behavior (Richards et al. 1993).

Even with this heightened understanding of the systemic nature of the educational enterprise, policymakers continue to consider the appropriate role of compensation in school improvement. It is essential that we continue to explore relationships between monetary incentives and teachers’ behaviors. The studies
reported in this chapter suggest that monetary incentives can influence teacher recruitment, retention, and attendance, and that adjustments in compensation disbursement can allow teachers more leisure time which creates opportunities to alleviate job-related stress and burnout. But no less important to managing these persistent dilemmas is the need to study and try to articulate the personal and organizational values in conflict.

Notes
1 The fact that the teacher workforce is predominantly female may also shape this dairy farmer’s perceptions of their work and how teachers time should be spent.

MONETARY INCENTIVES AND TEACHER COMPENSATION

This paper sets out to understand local management of schools (LMS) in terms of the theory of organizational form. It is argued that the 1988 Education Reform Act was designed to change the LEA from a unitary form of organizational structure to a multidivisional (M-form), though the regulatory role of the LEA required in an M-form organization was left underdeveloped. Without a quality assurance function for a regulatory body decentralized management structures approximate more closely to a holding company or H-form organization. This interpretation of LMS is then applied to a case-study LEA. The theory of organizational form provides an analytical framework for understanding the restructuring the education sector is undergoing, while the case study yields data for assessing the applicability to current organizational changes in education of the multidivisional form model and its claimed efficiency advantages.

The M-form model is offered as a resolution of the apparent paradox in the Education Reform Act between the centralization of the curriculum and the decentralization of management responsibilities.

It is also argued that the M-form model for the LEA is more likely than a holding company structure to promote higher educational standards because of its stronger element of quality assurance. However, subsequent government policy changes have prevented LEAs developing as M-form organizations and are set to fragment and centralize LEAs’ previous strategic functions.
Introduction

This paper sets out to understand local management of schools (LMS) in terms of the theory of organizational form developed by, among others, institutional economists. The fundamental premise, therefore, is that the theory of organizational form applied to firms and public sector organizations is also relevant to education. I argue that the 1988 Education Reform Act was designed to change the LEA from a unitary form of organizational structure to a multidivisional (M-form), though the regulatory role of the LEA required in an M-form organization was left underdeveloped. This interpretation of LMS is then applied to a case-study LEA. The theory of organizational form provides an analytical framework for understanding the restructuring the education sector is undergoing, while the case study yields data for assessing the applicability to current organizational changes in education of the multidivisional form model and its claimed efficiency advantages.

I have two major reasons for proposing the M-form model. First it is offered as a resolution of the apparent paradox in the Education Reform Act between the centralization of the curriculum and the decentralization of management responsibilities. Some see this as an evident contradiction (Campbell et al. 1987, Coulby 1991, Busher and Saran 1992). Coulby argues that ‘the Act contains a particularly high level of contradiction’, citing this particular example (Coulby 1991). Others, however, spot the crucial connection between LMS and the national curriculum (Whitty 1989, Ball 1990). Ball comes close to recognizing the M-form structure when he writes:

The introduction of national tests alongside the provisions of the education market provides parents with a simple and crude but direct point of comparison between schools. Given that schools are also required to provide a fixed National Curriculum it is tempting to refine the business model slightly and see the education market as a system of franchises.

(Ball 1990: 68)

The second purpose is to put forward the M-form model for the LEA as more likely than a holding company structure (i.e., one with no central strategic management function) to promote higher educational standards. However, the Education (Schools) Act 1992 and the legislation foreshadowed in the White Paper, Choice and Diversity (Great Britain 1992) have removed the possibility of a fully developed M-form structure for LEAs. Instead the strategic functions of the M-form headquarters’ management are set to be increasingly taken over by central government.

Section 1 sets out briefly the theory of organizational form, sections 2 and 3 apply the theory to LMS, and the remaining sections apply and evaluate LMS as a M- or H-form organizational structure using the case-study data.
The theory of organizational form

If we take the basic element of social life to be an ‘activity’ (i.e., using resources of human time and materials to some end) then once an activity involves more than one person ‘transactions’ take place and co-ordination is required. The social science literature has coalesced around three basic modes of co-ordination – market, hierarchy and network (Thompson et al. 1991). The modes of co-ordination are briefly characterized as follows:

- **Market co-ordination** occurs between economic agents (either individuals or firms/organizations) who voluntarily exchange the ownership of goods and services in return for money. The price at which exchange takes place (the rate of exchange) is the key instrument of market co-ordination and is determined by the interaction of demand and supply. Self-interest is the prime motivation of the transactors. However, for the market to function agreements to exchange contracts must be enforceable. This is done both through a social culture whereby transactors are trusted to honour agreements to exchange and, failing this, through state legal enforcement.

- **Hierarchy** is co-ordination by means of rules and commands set within a pyramidal structure of superordinates and subordinates. Authority is concentrated at the peak of the hierarchy and distributed downwards through tightly specified rules. The transactors are thus vertically related in contrast to the horizontal linkages between market transactors. Hierarchical co-ordination occurs both within an organization and between organizations that are hierarchically related (e.g., the central government, local education authority and school). Individuals within hierarchies are motivated through rules specifying rewards and sanctions.

- **Network** is a lattice of interlinking individuals or organizational units which exchange information and favours. Since agreements to such exchanges are generally informal, relations depend largely on trust and are conducted within specific group cultures. Different kinds of networks can be distinguished, such as professional, social, interest group and policy networks. Networks coexist with market and hierarchical modes of co-ordination and lubricate their functioning. Networks operate within hierarchically arranged organizations and often underpin business and market relationships.

The key question is why some activities are co-ordinated mainly by one of the modes while other kinds of transaction are co-ordinated by another of the modes. Institutional economics (arising originally out of the work of Coase [1937] and developed by Williamson [1975]) has sought to find a rational explanation for this – namely that a particular mode of co-ordination is the most efficient in certain types of circumstances and will therefore emerge as the dominant mode – at least in sectors where competition prevails. The issue of which is the efficient mode of co-ordination in specific circumstances
arises because transactions are not costless. Transactions are costly because information is not perfect and freely available. This is due in part to uncertainty about the future and to the fact that even if information were certain it would still have to be collected and interpreted. Also contractual arrangements are costly to agree, monitor and enforce. It follows that an efficient organizational design is that which minimizes transactions costs. However, the valuation of transactions costs is not independent of individuals’ preferences, so what constitutes an efficient organizational design depends on the purposes of the organization and whose interests it is supposed to serve. This is a much more complex issue in public sector organizations than in the private sector where it is assumed that firms should aim to maximize shareholders’ wealth. Shareholders have a common interest in maximizing share value whereas citizens have conflicting interests and beliefs as well as a common interest in the provision of public and merit goods.

In examining the characteristics of an efficient organizational form for a particular set of activities being undertaken for some specific purpose, institutional economics has focused on three key sources of transactions costs – bounded rationality, opportunism and asset specificity (see Williamson 1975, Levačić 1992a):

- Bounded rationality is the limited capacity of the human mind to possess and process all the information that in principle is needed in order to make optimal decisions.
- Opportunism is the guileful pursuit of self-interest, not only on the part of those operating in markets but also of those working in organizations.
- Asset specificity exists when a capital asset acquired in order to produce specific goods or services would have much less value if it were transferred to some other use. When such assets are acquired in order to fulfil a contract then the asset’s owners will suffer losses if the contract is reneged upon by the other party. When assets are highly specific contractual arrangements which cannot be easily broken are much less risky and so less costly.

Initially institutional economics focused on the central question of why some economic activities are undertaken by separate firms and co-ordinated by the market while other activities are combined within a single firm. The academic analysis was stimulated by the observed growth of firms through vertical and horizontal integration. The original approach (Williamson) categorized co-ordination within a firm as hierarchy, arguing that bounded rationality, opportunism and, in particular, asset specificity mean that co-ordination by hierarchy within a firm results in lower transactions costs than market co-ordination. Subsequently much greater attention has been given to different organizational structures within firms which are assessed for their relative efficiency in resolving the problems posed by bounded rationality and opportunism.

Three distinct organizational forms are distinguished – the unitary or U-form...
firm, the multidivisional or M-form firm and the holding company (conglomerate) or H-form firm. Standard definitions of these organizational forms are:

- **U-form firms** are functionally specialized, hierarchically arranged organizations. There is a single peak co-ordinator (a person or board of directors to whom are responsible the heads of specialist departments dealing with production, marketing, purchasing, finance, etc.). Within each functional area there may be several further horizontal layers of responsibility and vertical demarcations of more finely specialized tasks.

- **In the M-form firm**, production activities are broken down into a number of quasi-autonomous operating divisions (typically based on products, brands or geographical area). The activities are co-ordinated via a general office, assisted by an elite staff, which undertakes strategic planning and resource allocation among the divisions, and exercises a characteristic form of monitoring and control over them (Cable 1988: 13).

- **The holding company (H-form).** This is the divisionalized enterprise for which the requisite internal control apparatus has not been provided (Williamson 1975: 152).

The U-form firm was the original structure adopted in the 19th century. Its particular advantage is that specialist functional departments can achieve lower costs through the division of labour and economies of scale. However, it is generally argued (Chandler 1966) that as the U-form firm grows in size and complexity, it can no longer enjoy the benefits of U-form since top management lose the capacity to direct the entire enterprise so as to fulfil organization-wide goals.

The inherent weakness in the centralized, functionally departmentalized operating company . . . became critical only when . . . the operations of the enterprise became too complex and the problems of coordination, appraisal, and policy formulation too intricate for a small number of top officers to handle.

(Chandler 1966: 382–383)

Williamson (1975) attributes the loss of organizational control in U-form firms to bounded rationality and opportunism.

Continued expansion eventually overcomes the capacity of the office of the chief executive to provide strategic planning and maintain effective control, which is another manifestation of bounded rationality. The usual means for augmenting this capacity has been to bring in the heads of the functional divisions into the peak coordination process . . . This change in the composition of the strategic decision-making unit produces a shift away from preferences characteristic of the office of the
chief executive, which tend to be enterprise-wide in scope, in favour of partisan interests more closely associated with the functional divisions.

(Williamson 1975: 135)

The multidivisional firm is seen as the solution to these problems because it releases top management from day-to-day operational matters and frees them to devote time to strategic oversight of the organization. A few instances of M-form developed in the 1920s and 1930s but it was only in the post-war period that it spread widely among large corporations. By the 1980s it came to be advocated for public service organizations.

**LMS as multidivisional and holding company organizational forms**

The summary characteristics of the M-form structure as summarized by Williamson (1970) are set out in Table 1. They mirror quite closely the original schema for the post-ERA education authority set out in the Education Reform Act and its supporting circulars (DES 1988, Welsh Office 1988) by the Audit Commission (1989a, b) and Coopers and Lybrand (1988) and latterly by the Society of Education Officers (1991).

As can be seen from the last row of Table 1, a key function of the top management and the general office of an M-form organization is to audit and evaluate the operational divisions in order to ensure good performance. The national curriculum is essential to the M-form model in providing the targets for schools to aim for and against which their performance is evaluated. Initially quality assurance was envisaged as an LEA function which would be enhanced under post-ERA restructuring. Subsequently this function has been taken from LEAs by the Education (Schools) Act 1992 and the related proposals of the White Paper (Great Britain 1992) and is to be given to privatized inspection teams regulated by Her Majesty’s Inspectorate for Schools. When in place the M-form headquarters’ quality control function will be performed by central government. With the withering away of the LEA all other headquarters functions would be performed by central government agencies. While these functions remain attenuated the schools system approximates to the holding company model. The main function of the business holding company is to act as an internal capital market which allocates resources to its divisions in accordance with performance signals received from the market.

**The U-form LEA prior to LMS**

The typical U-form structure of the pre-ERA local authority is depicted in Figure 1. Its design owes much to the adoption of corporate management structures in the 1970s. The authority is organized into operational departments (such as education, social services, transport, housing) and functional departments (such as
finance, property and planning, personnel, legal). The functional departments provide services to all the operational departments. The finance department, for example, does the accounting for the education department. Teachers’ salaries are recorded in a single account, regardless of the school at which they are employed. Similarly utility invoices are dealt with in another account, and not attributed to the building which incurred the heating or water costs. By paying utility bills in large batches discounts are obtained from suppliers. In like manner the property department services and maintains all the authority’s build-

### Management of Schools

314
ings. It therefore deals directly with schools which it deems to require maintenance work.

The education department is itself organized along U-form lines with distinct functional and operational departments. An example of operational departments are schools and community education divisions. Typical functional departments are the advisory service, educational psychologists and special needs support, education welfare, peripatetic teachers and learning resources, such as school museums and libraries. Characteristic features of U-form are that the general office and/or the functional departments decide what services should be supplied to the operational units and are involved in determining detailed operational matters, such as the number of teachers to be employed at the school or what maintenance work will be carried out. A particular feature of the local authority U-form structure is that the education department does not control all the resources used in schools – this is shared with the central functional departments which pursue either their own internal or authority-wide objectives.

The M-form LEA

An outline for a pure M-form model for an LEA is indicated in Figure 2. The roles of both the service department – education – and the functional departments are radically changed. Managerial responsibility for operational matters is delegated to self-managing operational units, such as schools, colleges (leaving LEA control in 1993) and community education committees. The education department general office concentrates on strategic planning, resource allocation
and evaluation functions. Responsibility for the various functions, determined in
the U-form model by central functional departments, passes largely to the opera-
tional units. The operational unit, such as the school, typically has a U-form
structure with specialist committees and associated senior managers for finance,
curriculum, staffing and property which now take over these functional tasks.

In some M-form organizations all the functional specialisms pass to the oper-
ating units, leaving the general office with the specialist functions required for
strategic control. In other M-form organizations functional departments still
exist but no longer have a hierarchical relationship with the operational units. Instead hierarchy as a means of co-ordination between operational and functional departments is replaced by an internal market. Operational units also relate to each other via a market relationship. For example, community education now has to rent premises and equipment from schools.

An internal market is a mode of co-ordination within an organization which is distinct from either hierarchy or network. The internal market mimics the external market in many respects but is ultimately regulated by the organization’s headquarters managers. In the case of education the regulations within which the LEA’s internal market operates are set by both the DES and the LEA, given their respective powers. For an internal market to exist within an organization it must be decentralized in structure so that there are a number of sub-units which act as buyers and sellers in exchanging goods and services with each other. Competition is an essential feature of the internal market. For this to exist the buying and selling units must have alternative independent parties with whom they can conduct exchange. For this reason exchange with agents external to the organization is usually a feature of internal markets.²

In an M-form authority, schools and the LEA’s ‘general office’ relate to each other both as buyers and sellers. The LEA acts on behalf of parents in buying education for children from its schools. Through the formula the LEA sets the price and other conditions at which it will contract with schools for education provision. Parents then determine, given the available places, which schools’ services are purchased. Thus in this part of the internal market the sellers (schools) are not free to set the price nor can they directly choose which pupils to admit. This can only be done indirectly through marketing activities and exclusion policies.

In the M-form model schools (and other operating divisions) are buyers of resource inputs, such as property maintenance work and advisory services, which under U-form were provided by the authority’s functional departments. A crucial aspect of the LMS legislation is the limitation placed on the proportion of the potential schools budget (PSB) that can be retained centrally. Further pressure to delegate central services was placed on LEAs by the DES when approving LMS scheme applications (Thomas and Levačič 1991). Central government squeeze on local government spending has had a similar effect. Once schools receive budget allocations for these items, the LEA functional departments need to sell their services to schools who may go elsewhere with their custom. Local authority property services departments have faced identical pressures. Although they have had to contract out to tender many of their services, direct labour organizations have been successful in winning contracts. As most of these contracts were entered into prior to schools receiving delegated budgets, schools were required to accept the local authority contract arrangements and were not able to negotiate their own until the existing contracts came up for renewal.

The ultimate justification for the M-form organization is that it leads to better performing organizations than U-form. In the private sector version of the model
good organizational performance for customers depends on the existence of competitive markets which forces the organization to perform well in order to survive and flourish. Under a U-form structure top management ensure good performance through hierarchical control of subordinates to whom they issue detailed instructions about operational matters. According to the theory of organizational form, top managers’ bounded rationality combined with subordinates’ opportunism brings about increasingly ineffective control systems as the organization becomes larger and more complex in terms of both its technology and its environment. If the M-form organization is to perform well, top managers must ensure that new mechanisms of control replace hierarchical control. Subordinates must be motivated so that they act to further the organizations’ goals, not personal or purely sectional ones.

Thus the whole analysis revolves around the issues of information and incentives. What kinds of information do top management and the middle managers in charge of operating and functional departments need and how should they be motivated in order to ensure organizational effectiveness? According to the M-form model setting up the operating and functional units as profit (or cost) centres economizes on the amount of information top management needs for effective control of the organization. The internal market is a crucial element in this argument since the fundamental basis of the Austrian school’s claim that the market is a more efficient co-ordination mechanism than hierarchy is that market arrangements economize on information and provide incentives for seeking out and utilizing information in order to satisfy consumer wants. To be effective the M-form organization depends on top managers motivating the divisional managers by setting them appropriate goals, measuring their attainment of these goals and rewarding them accordingly. This is achieved through the general office activities of strategic planning, resource allocation and evaluation. The operational decisions of how the goals are best achieved with the available resources is left to the divisional managers who are free to make their own decisions but are then held accountable for the results. The top managers economize on information because they need have no knowledge of operational details in order for the operating divisions to be effectively managed. The opportunism of middle managers is exploited for the benefit of the organization by ensuring that personal and organizational goals coincide. Another strategy is to reduce opportunism by inculcating an organizational culture which encourages employees to identify with the organization and its objectives.

Problems in applying the M-form model to the school system

Although there are many convincing parallels between the M-form model and the post-era school system, there are a number of problems in applying the M-form model to the education system.
The dual role of LEA as customer and producer

The first problem relates to the dual role of the LEA as customer and supplier of educational services compared with the M-form firm’s single role as supplier. A firm, whatever its organizational form, is not run in the interests of its customers. This is only ensured by means of the regulation provided by competitive product and capital markets, buttressed by legal safeguards. If these do not function adequately to protect customers’ interests, then the firm can earn monopoly profits for the benefit of the owners or instead be run by the managers in their and the employees’ interests as reflected in higher costs. In principle public service organizations exist for the benefit of the community and need to respond to the often conflicting interests of taxpayers and service users. In practice they are run by the provider professions and related workers. Without market regulation, good performance for clients (defined as users and taxpayers) is obtained through hierarchical controls and professional values.

Compared with the U-form structure M-form makes a much sharper and more transparent distinction between the provider and client roles of the LEA but there still remains a tension between them. In its role acting on behalf of taxpayers and users, the LEA determines the size and allocation of the education budget (within constraints imposed by central government) and, with DES approval, determines the number, location, size and types of its maintained schools. These are the roles of ‘planner of facilities’ and ‘leader of the education service’ proposed by the Audit Commission (1989a). A crucial LMS activity for the LEA is devising and operating the funding formula. Another two of the Audit Commission’s roles for LEAS – ‘providing information to users of the education service’ and ‘regulator of quality – also fall within the remit of the LEA in acting on behalf of taxpayers and users. With the Education (Schools) Act 1992 and mass opting out, if it occurs, only the consumer-oriented functions of funding and information provision with respect to LEA schools remain.

The final two Audit Commission roles – ‘banker to schools’ and ‘partner’ – cover the services which LEAS provide for schools. Most are due to disappear or be traded on an internal market. The image of partnership between LEA and schools is a long-standing one. Once used to soften the perception of hierarchical control of schools by the LEA, it now implies that the LEA provides support services which are valued by schools who can actively choose whether or not to use them. By means of the internal market the functional departments of the authority treat schools as their clients and solicit their custom.

The regulatory role of the LEA

The M-form model applied to the LEA requires the LEA to act as regulator on behalf of users and taxpayers. Although the monitoring and evaluation element of LEAS’ control system has in many cases been rather weak (Audit Commission 1989b, Hargreaves 1990) the thrust of ERA until the Education (Schools) Act
1992 was to strengthen this role. The government’s concern about the producer domination of LEAs underpins its desire to ‘privatize’ inspection. Denying LEAs the means to evaluate schools and apply rewards and sanctions removes from them a crucial internal mechanism of control which characterizes an M-form organization. Unless central government is able to perform the quality control function the restructured school system will resemble an H-form organization. H-form firms rely much more on market signals than internal control mechanisms for their main function of allocating resources.

Whether the M-form, with its strong internal control mechanism, is more effective than H-form depends on how far good performance (from the client perspective) can be secured from the two remaining and highly contrasting control devices – the professional culture of teachers, and the exit and voice of parents and pupils in the educational marketplace. In the theory of organizational design, internal monitoring, evaluation and reward mechanisms are needed to combat the opportunism of the organization’s employees. Such opportunism does not exist if members of the organization are motivated by professional ideals and public service values, so long as these reflect social preferences. Whether such opportunism is rife in the education service is very much a matter of ideological perspective, with public choice theorists claiming a disjuncture in public service monopolies between clients’ and professionals’ preferences. Under an H-form model great reliance is placed on the market as a regulating mechanism for ensuring that schools respond to customer preferences with inspection providing market information.

**Economizing on information**

A major strength claimed for M- and H-form organizations is that they economize on information. Top managers can be far more effective because they need less information to run an M/H-form structure and can concentrate on the information needed for strategic planning (in the M-form case), overall resource allocation and divisional monitoring. However, as the case-study evidence in the next section suggests, the informational demands of M/H-form in the public sector are likely to be greater than in the private sector precisely because the market is not allowed to function freely. The price system under LMS functions in a highly restricted way. Schools cannot vary the fees they receive except through collective political lobbying and cannot charge direct users except in a very limited way. The price is established by a complex formula which requires much gathering and analysis of information at the centre. This is in complete contrast to decentralized free market price setting which is not necessarily dependent on formal information-gathering activities. Deeply entrenched egalitarian values in society have prevented the government from permitting state schools to set their own prices, but at the same time it is recognized that schools need to incur different costs for pupils of the same age either because their plant operating costs differ or because pupils with learning problems are judged to need more resources applied to them. Consequently the LEA has to establish and
maintain a complex formula funding mechanism. Accounting for schools as cost centres has also contributed to the informational demands of LMS.

**Organizational restructuring in an LEA**

The rest of this paper is concerned with applying the theory of organizational form to the restructuring undertaken by a county LEA in implementing LMS in the period 1989–91. The LEA, Barsetshire, has experienced changes in party political control. It has neither enthusiastically embraced the radical right restructuring of local government from providers to enablers nor has it been predisposed to resist the implementation of the LMS as much as possible.

First the LEA’s role as purchaser of education services through formula funding is examined, then its changing role as service provider to schools, and finally the much murkier area of performance assessment is discussed.

**LEA as purchaser: the funding formula**

The funding formula is the chief means by which the internal market is regulated as it expresses the price and other terms on which the LEA contracts its schools to provide education. As schools cannot change the age-groups of pupils they admit or their admission limits or be closed or opened without DES approval, schools’ and LEAs’ ability to influence exit from and entry into the market is severely restricted.

The DES (1988) guidelines state that the formula should

a. be simple, clear and predictable;

b. be based on an assessment of schools’ objective needs, rather than on historic patterns of expenditure;

c. allocate at least 75% of the aggregated schools budget according to the number of pupils in each school weighted for differences in their ages.

In practice Barset’s formula was relatively complex because of the large number of other factors to be taken into account – additional costs of small schools, pupils with special educational need, size of school buildings and grounds, energy costs, community use of premises and split sites. A further complication was the addition of a transitional element to protect schools with higher than average teacher salaries. Thus the informational demands of the formula are considerable.

Transition to an M-form structure was marked by tensions in the relationship between the education department and the authority’s functional departments. For example, in devising a sub-formula for energy use the education department depended on information from the property services department on energy expenditure by school – data which had never previously been assembled. Reliable costs centre accounts were difficult to put together so the LEA had to allo-
cate energy costs on a historic basis for the first two years. There were disagree-
ments over devising a sub-formula for energy, with the property department
wanting an easily maintained formula based only on pupil numbers, while the
education department pressed for a fairer formula based also on premises area.
There were also problems with the accuracy of figures for compensating schools
for the cost of community use of their premises.

Another element of informational complexity was Barset’s special needs
index for the formula which was based on seven measures of social disadvan-
tage. This was poorly understood by teachers and governors. Few liked the
index but because Barset did not use authority-wide testing and DES rules did not
permit judgemental indices there seemed little alternative. The problem of con-
structing a special needs index is a good example of the informational demands
of the M-form structure adapted for the public sector. This information would
not be required if the LEA could set one price for all children of a given age and
not have to differentiate further. Neither would the information be needed at
headquarters level if schools were free to charge their own prices or differentiate
between pupils. Once additional social policy demands are made of the educa-
tion service then the issue of information requirements surfaces as does that of
incentives. The market way to induce schools to cater for special needs is
through cash incentives. This implies that an index which attaches extra money
to individual pupils is more effective than one which does not do this explicitly.
Apart from extra funding for pupils with special needs, there is also the question
of schools’ incentives to get rid of troublesome pupils. Barset’s formula discour-
aged such head teacher opportunism by requiring schools to pay for excluded
pupils’ tuition.

As well as price, a vital element of the contract is specifying the units being
bought. The Barset formula, like most, calculated the number of age-weighted
pupils for funding purposes as a 50:50 split between the numbers on roll in the
form 7 count in the January before the start of the financial year and the
number forecast for the next January. If pupil numbers had been under-fore-
cast schools did not receive additional money until the next financial year.
Secondary head teachers were dissatisfied that the forecasts did not take
account of more up-to-date figures on actual admissions for the coming year,
collected by the education office areas. The delay in information flows
between authority departments had not mattered prior to LMS when pupil fore-
casts were used for long-term planning purposes only. The LEA proposed to
make better use of admissions data in its forecasts. A further complicating
factor was the late decisions of Appeals Panels, in one case adding a form of
to entry to a school. The LEA has responded to under-forecast pupil numbers by
allowing schools with significant under-forecasts to budget for a deficit in
anticipation of the additional funding due in the next financial year.

One of the benefits of formula funding is that it has made much more trans-
parent what actual educational priorities are as revealed in the distribution of the
authority’s education budget to different ages and characteristics of pupils and
types of school. This has stimulated debate about educational priorities which focuses to a great extent on the formula.

As in other authorities, the primary sector was vociferous in pressing for an increase in primary age weights. In response to a well-argued case by the Barsetshire primary head teachers association, the members increased the primary budget by 5.5%. The real increases in primary and secondary funding are shown in Table 2.

Within the secondary sector 11–16, schools complained of being unfairly treated in comparison with schools with sixth forms which received a larger fixed cost element in the formula as well as a higher weighting for sixth formers. In 1991/92 the fixed cost addition for sixth forms was removed as part of a budget-cutting exercise. But the authority’s attempts to rationalize sixth-form provision by setting up a new tertiary college were put on ice on hearing of the government’s intention to remove colleges from LEA control.

An important policy issue now reflected through the formula is the maintenance of small schools. Barset’s formula gave lump sums for schools depending on the age range of its pupils. These accounted for 8% of the ASB in 1990/91 and 7% in 1991/92. The formula itself in 1990/91 was not biased against small schools (Levac’ic 1992b) though the greatest losses and gains were among small primaries. In Barsetshire Conservative councillors supported village primaries while Labour members favoured urban schools through the special needs element of the formula. However, in 1991, faced with the need to cut expenditure, the members agreed to reduce the fixed cost allocations of primary schools by 25% and put more money into age-weighted pupil units for the primary years. The episode is interesting because it is a clear example of members using the funding formula as a policy instrument. There were widespread complaints that the Council had no open policy on small schools: they were being underhand in using the formula to bleed small schools slowly to death rather than devising a rational plan for school closures and amalgamations. In response the members asked officers for a review of primary school provision. Meanwhile the district auditors started their own review. There had already been some structural adjustments with a number of infants, junior and

four middle schools being amalgamated and the governors of a school with 19 pupils requesting closure. So there is clear evidence that formula funding coupled with financial stringency increased the pressures to rationalize primary provision.

However there was no indication that the LEA encouraged popular schools to expand. One popular school in our case study sample of 11 was unwilling to grow. There is therefore some emerging evidence that parents are increasingly indicating a preference for an out-of-catchment school and that the LEA will have to decide how to respond by closing uneconomic schools and expanding popular ones, as well as in its policy towards subsidizing transport costs.

The LEA as client: selling in the internal market

As already indicated, Barset could not be classified as a radical decentralizing M-form authority. Its initial inclination was to retain under discretionary exceptions rather than to delegate. However, for 1991/92 the education committee had to cut £6.5 million or 2.5% from its planned budget in order to avoid community charge capping. School budgets were protected while the main brunt of the cuts was borne by central services and by peripheral school related activities – farms, outdoor centres, the library, museum and advisory services, curriculum projects, home-to-school links, music tuition, units for disruptive pupils and boarding places. Thirty to 40 central posts were shed and special needs advisory teachers reduced by 25%, a move particularly regretted by schools. The estimated real changes in primary and secondary school budgets over the years 1989/90 to 1991/92 are shown in Table 2.

Property services also faced enforced restructuring on M-form lines. Under local government legislation cleaning, school meals, grounds and building maintenance have been contracted out by the authority and most schools had to accept authority contracts. Some of these were won by DSOS, others by ex-council employees and yet others by independent private contractors. Other items, such as the property services department advice on building maintenance and energy, were to be charged for. With certain exceptions the schools’ level of satisfaction with authority-contracted services was rather low. One school in our sample, which was able to opt out of the county grounds maintenance contract and employ its own groundsman, was highly satisfied with the result. A number of schools wished to employ their own caretaker or handyman and ideas for joint school appointments surfaced. In the area of property services at least there is considerable evidence that M-form internal market arrangements have shown up the inefficiencies of the previous system. Private sector contractors, supplying such services as refuse collection in competition with district councils, were entering the market. The internal market in which schools, seeking value for money, are supplied both by the authority and private sector firms looks likely to flourish in the area of property services.

The Audit Commission (1989a) singled out ‘banker to the schools’ as one of
its six roles for post-ERA LEAs. Though budgets were delegated to schools, the actual unit of account remained largely a book-keeping entry in the LEA’s computers. In 1990/91, apart from a small amount paid into a bank account, schools did not get their budgets in cash. As the LEA openly acknowledged, reconciliation of the LEA’s and schools’ accounts proved a major headache, partly because of bugs in the software, inadequate training leading to operator errors and a lack of co-ordination between the three central departments involved. The lack of co-ordination stemmed from having to replace the previous U-form structure, whereby the finance department was a central functional department doing the accounts of all the other departments, by a system of cost-centre accounting. On the whole the schools were tolerant of the LEA’s problems in getting a complex system operating to the tight time-scale dictated by central government. Because of the lack of accurate and up-to-date budget monitoring data schools were largely navigating in the dark, relying heavily on their own records. The lack of information on spending must account, at least in part, for the extreme caution of schools which generated a large budget surplus of £6 million (7% of schools’ budgets).

Under impetus from members, the authority was already working on a cheque book pilot scheme prior to Circular 7/91 requiring LEAs to introduce chequeing facilities for non-staff payment for all secondary schools and offering them to primary schools. From the school’s point of view the potential advantages of cheque book facilities are gains from interest payments and prompt payment discounts and from cutting down the time spent querying the LEA’s version of the school accounts. The costs are the loss of interest earned by the LEA from managing large cash balances (deducted from the schools’ budgets) and the systems needed to ensure that the authority can still discharge its duty to account for public money.

To offset this loss of financial services provision, the LEA started a scheme of loan and saving facilities for schools. Provided a school committed surplus funds to the LEA for over a year it would earn interest at base rate. The LEA would also loan money to schools for specific projects at base rate plus half a per cent.

The provision of financial information for budget monitoring and planning is one of the major informational costs of LMS. The issue of how the financial recording and reporting function is best distributed between LEA and schools is not yet resolved but one can detect a distinct shift towards M/H-form structures, with the operating divisions taking on more of the functional activities and an internal market served by both the LEA and private sector banks developing.

**Accountability and regulation**

A key distinguishing feature of M-form organization compared with H-form is that in the former head office operates a strong internal control system for holding the divisions accountable by monitoring, evaluating and rewarding their
performance. In this aspect the M-form organization as applied to firms differs from the version in education. The top managers of a firm, whether or not it is M-form, are accountable to the firm’s shareholders via the market. The accountability of all other employees is channelled through the top managers: they hold the divisional managers accountable to them alone. In education accountability is diffused. Unlike middle managers, heads and governors are not in a clearly subordinate accountability relationship through the director of education to the members. Responsibility for holding the school’s professional managers accountable is shared between governors and LEA. Governors have their own power base through direct elections and can oppose the LEA so long as they do not display such incompetence that the LEA can take over their role. Even then the governors can appeal to the Secretary of State for reinstatement of their responsibilities. The shared accountability between governors and LEA reflects the fact that LMS in Britain involves political as well as organizational decentralization. This is in contrast to North American examples of school-based management which involve organizational decentralization giving no real power to school governing councils of elected parents (Brown 1990, Levačić 1992a). Central government, the third body politically accountable for education, has increasingly sought to tighten the regulatory framework for schools through the national curriculum, testing and inspection.

In Circular 7/88 the DES clearly stated that LEAs are expected to monitor and evaluate schools’ performance and required a statement of their intentions in their LMS scheme document. This specification of the LEA’s regulatory role is an essential element of LMS as an M-form organizational structure for LEAs. It was argued (e.g., Audit Commission 1989b) that most LEAs would have to strengthen their regulatory (i.e., inspectoral) function and separate it more clearly from the LEA’s advisory role. Others argued that the inspectoral and advisory roles needed to be fused (Hargreaves 1990). Whichever stance one adopts, evaluating value for money in the education service requires bringing together two previously entirely separate forms of monitoring – financial and educational.

Barset, like most if not all authorities, had separate processes for financial accountability and educational accountability. To account for themselves financially schools submitted their budget plans to the finance officers for approval. The criteria were financial: does the budget balance without relying on risky assumptions about costs or income? There was no consideration of educational goals, which the finance officers could not professionally assess in any case. Schools had few problems passing this test and the large surplus generated in 1990/91 was a testimony to their financial prudence. Barset’s educational culture favours professional not managerial accountability and a fusion of inspection and advice. Its pre-LMS educational accountability processes were based on ‘looking with schools not at schools’. Choosing their own objectives, schools carried out an extensive self-evaluation every five years assisted by divisional officers and advisers. The review was then shared with a panel of members. In late 1988 a working party on performance indicators identified around 200 performance
indicators which were presented as a menu from which schools could select items. In March 1989 the Education Committee approved a set of principles for evaluation and monitoring. The main ones were that institutions should be responsible for their own evaluation using their own data and supported by central staff. The institutions should supply the LEA with summary data and present reports to members. Two years later this was extended to include an annual school plan to be shared with members every four years. Thus the tight externally directed accountability enforced by top management in the M-form model was not favoured in Barset, an LEA which then had no opted-out schools. Interviews with heads confirmed the LEA’s soft approach to accountability which is at odds with the managerial accountability typical of the M-form model.

Barset’s tentative moves in the direction of more transparent accountability of schools illustrates well both the diffused, if not confused, nature of accountability specified by the 1988 Education Reform Act. LEA’s attempts to improve accountability of schools to them and develop a system of support for schools has now been undermined by the Education (Schools) Act 1992 and the legislation proposed in the 1992 White Paper (Great Britain 1992). It is now quite clear – which it was not in the 1988 Act – that the Department for Education, through Her Majesty’s Inspectorate for Schools, is charged with the quality assurance role of headquarters management in the M-form model.

Conclusion

This paper has developed a model of LMS as a restructuring of the education service from a U-form to an M/H-form organization. The discussion has highlighted the key concepts of information and incentives, their interrelationship and their significance for organizational design as applied to LMS. The conclusions are:

1. Interpreting LMS as a transformation from U-form to M/H-form is supported by empirical evidence from one LEA.
2. The claimed superiority of M/H-form in handling problems of bounded rationality and opportunism needs to be carefully reassessed when the model is applied to the education service, particularly in the form currently proposed.

The benefits of better incentives to generate and utilize information to improve efficiency and effectiveness have to be set against the extra costs of obtaining an increased quantity of information. The volume of information problem arises in large part from the market’s natural efficiency in processing information being suppressed by regulating it for social policy objectives. The information required for drawing up the internal market contract is not just factual, such as the cost of heating a building, it is largely judgemental, as with special needs funding and assumptions about class size. This stems from the fact that there is
not a well-specified educational production function mirroring the technical specifications of manufacturing production lines. This, of course, is a major justification for LMS, namely that schools know better how to allocate their resources between different inputs and processes than the LEA. If the education production function were well specified then it would be easier to organize its effective provision from the centre.

Some of the potential benefits of the M/H-form organization in terms of efficiency and effectiveness can be discerned from the Barset data though no attempt to assess their magnitude was made. One benefit is the much more transparent information about resource allocation which is stimulating debate about educational expenditure priorities and informing policy changes, in particular increased funding for primary schools. Greater efficiency in the allocation of resources is being promoted by moves to close or amalgamate higher cost schools. The tentative beginnings of an internal market in property services indicates that schools do not find existing LEA-provided services the most efficient and are looking for alternatives. The verdict on the most critical issue – whether schools make more effective use of the resources now delegated to them – is not addressed here. No methodology for directly establishing improved educational outcomes was deemed feasible given the lack of data in Barset on educational outcomes. Drawing on qualitative data from 11 case-study schools in Barset a very tentative conclusion is reached by Marren and Levačić (1992) that school managers by and large consider that they are now better able, even if in a limited way, to allocate resources according to their school’s priorities and that some schools have been actively developing processes for more effective resource management.

Another major issue is whether opportunism means that managerial modes of accountability have to be developed or whether opportunism is sufficiently limited in the education sector that professional modes of accountability are better at motivating staff. The 1992 Education (Schools) Act together with the 1992 White Paper have stymied the original intentions of the 1988 Education Reform Act that LEAs should develop further as regulators using combinations of managerial and professional modes of accountability. Instead considerable reliance is being placed on a market model of regulation, in which publicly available audit information informs consumers in their choice of school and lay governors in their policies towards their professional staff. Fearing that market regulation may prove inadequate, the 1992 White Paper has proposed compensating for the absence of an LEA quality assurance function by the creation of ad hoc Education Associations to turn round failing schools. Thus the White Paper belatedly recognized the absence of a well-specified schools’ regulator with a quality control function in the government’s earlier legislation. However, the government has fragmented the strategic functions of the M-form model’s headquarters management amongst a number of agencies, including residual and attenuated LEAs. Thus the postulated efficiency in information processing of the M-form organization is most unlikely to be fully achieved with the currently
proposed organizational design for the education system as it both fragments and concentrates discrete planning, funding and quality assurance functions in different central government-controlled bureaucracies.

Acknowledgements

This research was funded by ESRC grant R000 23 2234. I wish to thank education officers, teachers and governors in Barset for their cooperation with this research, in particular their goodwill in sparing time to provide data when ERA has imposed its own great demands on their time. I wish also to thank Eamon Marren and Julian Ducasse for their assistance in collecting and analysing data, and participants in the Education Reform Act Research Network Seminar (University of Warwick, February 1992) for their stimulating comments. All errors of fact and interpretation are my responsibility.

Notes

1 Some writers treat the holding company as a sub-division of the M-form.
2 For a further elaboration of internal markets applied to education, see Levačić (1992a).
3 The Austrian school of economists is associated in particular with von Hayek. In the 1980s it became much more influential politically. Its advocacy of the market is much less cautious than that of mainstream neoclassical economists with its concept of perfect competition and its static mathematical analysis. In contrast Austrian economics is dynamic and non-mathematical.
4 The real change excludes inflation and budget changes which have a neutral effect on schools, for example because they are adjustments of funds between the ASB and other budgets.

MANAGEMENT OF SCHOOLS

330
EFFICIENCY, EFFECTIVENESS AND THE LOCAL MANAGEMENT OF SCHOOLS

Tim Simkins

This paper reviews selected parts of the recent empirical literature on the consequences of LMS with particular reference to the latter’s potential for influencing school efficiency and effectiveness. It explores three areas: the effects of formula funding, patterns of resource allocation within schools and changing patterns of influence in school decision making. It suggests that LMS may be efficiency enhancing, but the evidence primarily relates to input efficiency, which in some cases may represent little more than economy, while the implications of LMS for effectiveness have been little considered. The paper explores some of the issues involved in examining these concepts more rigorously and concludes that greater consideration needs to be given to the interrelationship between efficiency and effectiveness and considerations of equity.

Local management of schools (LMS) in the UK is one of the key elements of the Conservative Government’s education reforms of the past five years. It represents one strand in a strategy designed to pursue the ‘five great themes’ of ‘quality, diversity, increasing parental choice, greater autonomy for schools and greater accountability’ (DEF 1992: 2). Under LMS schools are being given very wide powers over the management of resources: school budgets and most aspects of personnel and premises management are, or shortly will be, managed at the level of the individual school.

The powers granted to schools under LMS are delegated to governing bodies containing representatives of parents, teachers and the local education authority (LEA) as well as co-opted members; headteachers are responsible to these governing bodies. LMS, therefore, in Brown’s (1990) terms comprises both organizational and political decentralization of power. According to the Government:
Effective schemes of local management will enable governing bodies and head teachers to plan their use of resources – including their most valuable resource, their staff – to maximum effect in accordance with their own needs and priorities, and to make schools more responsive to their clients – parents, pupils, the local community and employers.

(DES 1988: para 9)

The reference to responsiveness alludes to the fact that the powers of LMS must be exercised within an environment which is itself undergoing a very significant transformation. There are two key elements here. First, schools are being made much more explicitly subject to market pressures, through a significant increase in parental choice of school and requirements that certain kinds of information about schools be published including performance of pupils in tests and examinations. Second, however, this market is being firmly controlled through the implementation of a National Curriculum and a tightly defined regime of testing associated with it. This paper focuses primarily on LMS, but it will be impossible to consider its effects in any depth without keeping in mind this broader context of increased parental choice and centralized curriculum control.

The radical nature of restructuring which LMS involves raises a whole range of research questions. It is possible to explore its consequences from accounting, economic, political, sociological and educational perspectives (Simkins 1990). The focus taken here will be primarily an economic one: it will explore in particular how ideas about efficiency and effectiveness underpin, implicitly or explicitly, the reform, and how far research about the consequences of LMS can be related to these ideas. The paper will draw on a selected number of research studies which address the resourcing and resource management consequences of LMS. In interpreting these studies it is important to bear in mind that the reform is still in its early stages of implementation so any findings about its consequences can be no more than extremely tentative.

**Efficiency and effectiveness**

It is now a commonplace, following the work of the Audit Commission (1985), to refer to the ‘three E’s’: economy, efficiency and effectiveness. Economy is defined as the purchase of a given standard of good or service at the lowest cost, efficiency as the achievement of given outcomes at least cost, and effectiveness as the matching of results with objectives. This distinction does not prevent confusion, however, especially when discussing educational programmes. This paper will focus primarily on the concepts of efficiency and effectiveness.

I will distinguish between a number of concepts of efficiency. *Production* efficiency concerns the relation between resource inputs and outputs: it comprises *technical* efficiency – combining resources in ways which maximize output per unit of input – and *price* efficiency – choosing that combination of resources which makes best use of a budget given a particular pattern of relative
prices. Particular educational objective might be achieved in a number of ways, all of which are technically efficient, but only one of these is likely to be price efficient for any particular pattern of prices. LMS is clearly and explicitly intended to cause schools to become more efficient in these terms. Block budgets, with almost complete virement within them, give managers the opportunity to choose resource combinations which seem to them most likely to provide the best value for money. The range of choices available is wide and will be considered in more detail below.

Considerations of efficiency are insufficient, however. Questions about how to produce have little meaning unless they are related to ideas about what to produce. The issue here concerns effectiveness: the matching of outputs to some objective function. The key problem for managers under LMS is that such an objective function can be derived in a number of ways. The Government statement reproduced above implies two perspectives: ’[governing bodies and head teachers’] own needs and priorities’ and the demands of ‘their clients – parents, pupils, the local community and employers’. To this must be added, of course, both the overriding expectation that schools will teach and test the National Curriculum and also professionals’ own perceptions of what is in the best interests of their pupils in relation to their educational and other needs. The implications of these competing conceptions of effectiveness have been little discussed in the empirical literature on LMS although they are clearly central to any attempt to evaluate its impact.

We will return to these issues later. It is sufficient to note here the two key questions posed about LMS by the efficiency and effectiveness perspectives. First, what assumptions about production efficiency guide choices in the allocation of resources to and within schools? And second, how do those within schools choose to deploy resources towards objectives which must balance the demands of the National Curriculum, of parents’ and other ‘clients’’ expectations, and of their own staff’s values and concerns?

Formula funding

School budgets under LMS must be determined on the basis of a formula which is dominated by pupil numbers – the ‘age-weighted pupil unit’ (AWPU). The operation of formula funding has been a major focus of research in the early stages of LMS. The importance given in the legislation to funding schools by formula gives both the Government and LEAs the opportunity to express key values and policies through the details of formula design. The majority of studies in this area have involved the examination of available documentation or large-scale surveys to explore how these values and policies are carried through in practice. The Government’s values have been embodied in the requirement that a high proportion of funds (initially 75%, now 80%) are allocated on the basis of pupil numbers and ages. LEAs, however, have the opportunity to exercise discretion – and hence pursue their own values – through the age weightings they use, the
ways in which they define and protect small schools, and the ways in which pupils with special needs and/or those suffering from socio-economic disadvantage are supported (Thomas and Levačić 1991, Thomas and Bullock 1992). There is not space here to review in any detail studies of the ways in which formulae have been designed, but a number of main findings need to be highlighted:

- LEAs vary considerably in the relative weightings which they give to pupils of various ages, but they follow a common pattern with older children more favourably resourced than younger ones (except for those in the very early years) with a noticeable step at around age 11 between primary and secondary school and smaller steps at age 13/14 and at the end of compulsory schooling (age 15/16). Absolute levels of funding per pupil at each age differ considerably between LEAs (Bullock and Thomas 1992, Levačić 1992a).
- The scale of gains and losses among schools as formula budgeting is implemented varies considerably among LEAs. However, there is a tendency, which is not uniform across authorities, for larger schools to gain, in both primary and secondary sectors, at the expense of smaller schools. Secondary schools with fewer than 700 pupils have the greatest chance of being losers (Levačić 1992a, Thomas and Bullock 1992).
- LEAs protect small schools in a variety of ways: by lump sums given to all schools, by sliding scales of additional resources related to school size and/or salary protection, or by a combination of these. Where lump sums are used the definition of smallness varies widely with sample LEAs ranging from 150 to 250 pupils in the primary sector and from 470 to 832 pupils in the secondary sector (Thomas and Bullock 1992).
- Pupils with special educational needs and those suffering from socio-economic disadvantage are supported through a variety of mechanisms which vary in the criteria used and do not distinguish consistently between these two kinds of need (Lee 1992, Thomas and Bullock 1992).

The idea of an ‘objective’ formula can be interpreted in two ways. On the one hand, it might simply imply that the formula is specified so that its outcome can be predicted once the values of the independent variables are known. Alternatively, and more demandingly, it might mean that there is a clearly defined rationale for its components. Evidence suggests that the early days of formula funding have been dominated by the former interpretation. First, the constraints imposed by the Government in its search for simple formulae have precluded the design of formulae based on any complex assessment of need. Second, and probably more important, LEAs in designing their formulae have generally attempted to reflect earlier patterns of resource allocation. In part, no doubt, this has been because such patterns were deemed to reflect long established – albeit qualitative – assessments of relative need. More important, though, has been the
determination to minimize the difficulties of transition in a situation where, for most LEAs, few if any additional resources were available. Thus the reaffirmation of earlier patterns of choice has been reinforced by the pressures to minimize the number of ‘losers’ and, therefore, the number of ‘winners’.

Comments made by Bullock and Thomas (1992) about differences in age-weightings can be extended without too much difficulty to differences in funding more generally:

The public and explicit nature of these resource rules provides a means for asking questions about the educational implications of resource distribution and the rationale for these first formulae. All too often it is likely that LEAs have sought to replicate current funding priorities rather than alter them . . . Yet the introduction of the National Curriculum suggests a case for examining the distribution of resources. Regardless of local or historic explanations, can the lower levels of funding at the junior level be justified given the demands of the National Curriculum? Questions may also emerge about the variations between LEAs in funding pupils of comparable ages: on what basis are such differences to be justified?

(Bullock and Thomas 1992: 12)

Such arguments bring to the fore questions of effectiveness and efficiency in a powerful way. What kind of educational provision is the formula expected to fund? And how might such provisions be made in the most cost-effective way? Formula funding enables the answers to questions such as these – which are rarely made explicit in LEA resource allocation policies – to be tested. Some studies, however, have begun to explore them from first principles. For example, Kelly (1992) develops a model on the basis of assumptions about curriculum provision, maximum group sizes, required contact time for teaching-related activities and for management, and provision for special educational needs. This generates an increased funding requirement for both primary and secondary sectors, but with a proportionately greater increase for primary schools. Other LEAs are now undertaking similar studies and reaching similar conclusions (e.g. Sheffield City Council 1992). The basis of such conclusions, of course, derives from professional judgement rather than any empirically established relationship between resource inputs and learning or other outcomes. It embodies, therefore, a particular conceptualization of how efficiency and effectiveness should be defined – in terms of ‘need’ – and of the kinds of evidence which are acceptable to demonstrate the resource requirements necessary to achieve them. The debate about need-based funding, especially in relation to the primary sector, will undoubtedly grow; but any resolution seems a long way off in a climate of tight public expenditure control.
Internal resource allocation

Compared with the ‘macro’ consequences of the implementation of formula funding, fewer studies of the responses of schools in terms of their internal patterns of resource allocation have been reported so far. This issue, among others, is addressed by a national study of the effects of LMS as perceived by headteachers which is being undertaken by a team from Birmingham University (Arnott et al. 1992). An initial survey of 812 headteachers in the second half of 1991 produced a number of interesting, if tentative, findings:

• headteacher workload: an average of eight hours per week associated with LMS, with two-thirds of heads feeling ‘unacceptable pressures’ as a result;
• staff contracts: indications of an increasing use of temporary staff;
• secretarial and clerical staff: a tendency for schools to increase modestly the number of hours worked;
• the effect of salary level on appointments: 18% of heads reported that salary had been a factor in the appointment of candidates;
• discretionary authority over salary level: 16% reported they had used this.

These findings must be treated with caution: they date from 1991, they are based on limited longitudinal data, they represent self-reporting by headteachers and they are not related to schools’ circumstances such as their size or whether they are winners or losers under formula funding. Some of these qualifications can be overcome by the use of detailed case studies; these, however, are relatively expensive and can take time to lead to conclusions. One such study, by Marren and Levačič (1992, Levačič and Marren 1992b), examines the first year of LMS in 11 schools in one LEA. Despite the short time-scale covered, a number of the findings are indicative. Schools are classified by sector (secondary, middle, primary) and by whether they are ‘winners’ or ‘losers’. The main findings confirm the expectation that the approaches taken by schools will depend upon their position on the ‘winner-loser’ spectrum.

... some schools were clearly constrained by their formula allocation in their ability to plan their resource use in relation to identified priorities. Those schools not so constrained were either content to continue as before or ... to use LMS actively to pursue the implementation of a number of stated objectives, [in one case] working closely with the school development plan. Other schools [mainly losers] had to be more selective and focused on particular priorities such as enhancing core curriculum areas ... or of increasing the pay of secretarial support staff. This has meant that other priorities have had to be shelved, such as an agreed incentive allowance structure or curricular provision ...

Those on the edge of viability ... were not even able to do this but had to use every means at their disposal to survive as they were. This
involved ... detailed examination of how every part of the budget was spent to ensure that limited resources were used most efficiently. This meant that schools were economising in ways they would not have had to previously. This included considering the cost of new staff ... Those schools ... which did worse under formula funding have been forced to examine their existing structures to find savings.

(Marren and Levačič 1992: 146–147)

These findings have been quoted at length because they raise important issues. They suggest that losers are more likely to concentrate on ‘efficiency’ strategies than are winners, but the latter do not necessarily use the opportunity provided by an increase of resources to pursue explicit ‘effectiveness’ strategies designed to enhance the achievement of their key objectives. Much seems to depend on the headteacher’s management style and the degree to which development planning is seen as a central element in school management: ‘energy and capability [in managing resources] did not depend on whether a school was a winner or a loser’ (Levačič and Marren 1992a: 22).

Nevertheless, resourcing opportunities, and therefore choices, clearly do depend on resourcing levels. Examples of choices made by ‘winning’ schools in the study by Marren and Levačič include increases in staffing and in non-contact time, increasing the salaries of head and deputy, maximizing incentive allowances, increasing secretarial support and salaries, additional funding on in-service training and increasing the resourcing of key curriculum areas. Losers, in contrast, had to consider restructuring, not replacing staff when they left and targeting additional resources extremely carefully to areas of critical need. The degree to which they could achieve the latter often depended on the ‘luck’ associated with such factors as staff retirements. Furthermore the, admittedly limited, evidence in the paper suggests that as the scale of budget loss increases (and as schools get smaller) efficiency strategies designed to pursue key priorities with fewer resources are increasingly replaced by ‘economy’ strategies whose main concern is to save money whatever the long-term costs.

School decision making

LMS has placed major new responsibilities on schools and has changed significantly the formal roles of headteachers and governing bodies. How are these changes being implemented in practice? A number of studies have explored this issue, mainly using a case study approach (Bowe and Ball 1992, Broadbent et al. 1992 and 1993, Levačič and Marren 1992b, Sheffield City Council 1992). One of the clearest findings from these studies is that resource and financial management are generally undertaken by one or two senior members of staff, sometimes, but not always, working with one or two active governors. The senior staff involved are normally the headteacher in primary schools and the head and/or a deputy in secondary schools, with an increasing tendency in the latter
case to employ a bursar or finance officer. The potential paradox here is stated clearly by a study in Sheffield:

In Sheffield, as elsewhere in the country, the growing practice of school development planning places great stress on a collaborative process of curriculum and resource planning led by governors and, through them, the head, and involving all the staff ... The case studies [of eight Sheffield schools] suggest that, for whatever reasons, we are still a long way from achieving this collaborative model ... This prompts two questions. Is this a satisfactory state of affairs? If not, what ought to be done about it?

(Sheffield City Council 1992: 6)

The reasons usually given for this centralization of resource management include both the level of knowledge about whole-school resource issues residing ‘at the top’ and the perceived need, in the words of one head, to ‘act as a buffer, a filter to protect the rest of the staff from the huge amount of issues, many of which are not important and would only upset them if they had to contend with them’ (Broadbent et al. 1992a: 59). Despite the rather patronizing assumptions embodied in this quote, the evidence from the case studies does seem to imply that teaching staff generally do not wish to be closely involved in decisions generated by LMS. For example, on the basis of interviews in their 11 schools Levačić and Marren commented on ‘the far higher rate of indifference to LMS [among classroom teachers] which a number of teachers attributed to the time demands upon them, particularly by the National Curriculum’ (1992b: 6). Their findings, however, place an interesting gloss on these issues. Their interviews showed that the differences in orientation between senior staff and classroom teachers seemed to hold whether the schools concerned were winners or losers: at all schools – including losers – senior staff were in favour of LMS while at almost all schools class teachers were indifferent, wary or hostile. The only exceptions to the general finding were large primary schools where teachers as well as heads seemed positively oriented towards LMS, because, it is argued, these schools represented an exception to the rule in drawing classroom teachers into LMS decision making through the development planning process.

Some of the research findings concerning middle managers in schools, especially heads of subject departments, raise similar issues. Both Levačić and Marren (1992b) and Bowe and Ball (1992) find that some heads of subject departments feel disempowered under LMS, in part because of the concentration of key decisions at senior management level, but also because formula funding has removed an important source of independent resource power – funds from LEA subject advisers. Bowe and Ball also suggest that there is an increasing tendency to delegate difficult resource decisions within schools rather than involve middle managers corporately in their solution.
In a number of instances it appeared as if delegating the consequences of financial constraints assumed more importance than discussing the principles on which costs might be balanced with benefits.

(1992: 76)

Currently the evidence of the impact of LMS on decision-making patterns within schools is quite limited beyond the general finding about centralization. However, given that any thorough analysis of effectiveness and efficiency must link resource considerations with curriculum delivery and the quality of learning, and teaching and learning depend primarily on classroom teachers and middle managers, research on LMS will have to probe more deeply before long.

The search for efficiency and effectiveness: the emerging agenda

So far I have attempted to map some of the research findings concerning the very early stages of a major innovation. These findings are inevitably tentative, but they do raise issues about the implications of LMS for the pursuit of efficiency and effectiveness. What can we say in general about these questions?

The Birmingham survey (Arnott et al. 1992) asked headteachers about their views in this area: 83% agreed that LMS ‘allows the school to make more effective use of its resources’, while only 68% agreed that LMS ‘means resources are being used more efficiently’. The difference is an interesting one; the problem, however, is that effectiveness and efficiency are not defined. Indeed, the research on LMS is often not precise in its use of these terms. For example, Bowe and Ball (1992: 112–113) write about ‘budgetary responsibilities [being] set over and against educational ones’ as ‘decisions about the best and most appropriate form of delivery for the National Curriculum were subordinated to budget setting and vocabularies of institutional survival’. On the other hand, Broadbent et al. (1992a) found that in all four of their case study schools, winners and losers alike, ‘educational values of the school remain intact. Nowhere has been heard the argument that any of the school’s activities should be stopped or reduced because of the economic or financial reasons only’ (1992a: 65). It is not clear here how far such conclusions represent contradictory evidence, which may or may not be explained by the differing circumstances of the schools studied, how far they arise from different conceptualizations of ‘educational values’ (and hence of effectiveness), or indeed how far the data-gathering processes are such as to elicit different responses from respondents. The rest of this paper will explore the efficiency and effectiveness consequences of LMS in more detail.

Efficiency

I will begin by considering the issue of efficiency as this is more consistently explored in the studies being examined and lends itself to less ambiguous conclusions. It can be addressed at two levels: the macro and the micro.
At the macro level issues arise about the distribution of resources between schools, especially in relation to school size. As we have seen, virtually all LEAs have built an element into their formulae to ‘protect’ smaller schools. There is no doubt that small schools have higher unit costs than large ones. For example the Audit Commission (1991) estimated that primary schools with less than 80 pupils on roll cost between £2000 and £3800 per pupil against £1000 for schools with more than 120 pupils. The limitations imposed on funding formulae by the Government, together with the political consequences of making this cost information more openly available at a time of severely constrained budgets, is likely to lead to pressures for rationalization over the next few years, at least in urban areas, and hence to the achievement of greater efficiency in unit cost terms at least. For example, Levačić (1992b: 6) found in a study of one LEA that:

. . . the formula is efficiency promoting in the sense that schools with low unit costs (which are related to size pupil-teacher ratios and occupancy rates) systematically benefit.

Further studies are likely to repeat this finding. However, it begs a number of questions about optimal school size which will be addressed shortly.

At the micro level of the individual school, an issue which has received less attention than formula construction has been the dynamic effects of the formula funding process itself. The requirement that formulae should be ‘objective’ means that the consequences of changes in independent variables – such as the number and age distribution of pupils, the relative weighting given to pupils of different ages or the number of pupils with special needs – on the dependent variable of the school budget can be predicted largely unambiguously. This should enable us to explore the consequences of such changes for provision within the school. What is the impact on the school’s budget, for example, of given change in roll or of a changed proportion of pupils with special needs? What choices do schools make about resource allocation at the margin in response to such budget changes, and what does this tell us about their values in relation to ideas of effectiveness and efficiency? And how far are school strategies influenced by their perceived consequences for future funding?

The issue of school size is particularly interesting in this context. As indicated earlier, there is certainly evidence from case studies that small schools find LMS more difficult to manage than large ones, especially if they are budget losers. However, as LMS develops, two further issues are likely to come to the fore. These are the consequences of changes in school size and, related to this, the concept of ‘optimum size’. As formula funding responds to changing patterns of parental choice as well as to population changes, schools will discover that ‘becoming smaller’ involves a rather different set of problems from those associated with ‘being small’. Arnott et al. (1992: 16) found that:

. . . a substantial number of primary schools may be experiencing
annual changes in pupil numbers equal to a roll change of 4%. Many secondary schools may be experiencing roll changes of 2.5%. These are changes that have a significant impact on their budgets and do not appear to be a consequence of competition. The requirement that, from April 1993, 80% of the Aggregated Schools Budget (ASB) be allocated on the basis of pupil numbers is likely to heighten this effect.

These changes, of course, may involve increases as well as decreases in roll, and in fact seem to be distributed approximately equally between them. Roll falls, however, are likely to cause the most problems, although the exact nature of these problems will be directly related to the design of the formula under which any particular school is resourced. Whether small schools are protected through a sliding scale of additional resources or through a flat rate allocation of resources to all schools will be critical in determining the possibilities available to schools in responding to falling rolls. Decisions made at the margin and from year to year will need to consider carefully the balance between efficiency and effectiveness. How far, for example, and for how long, will a school be able to provide a particular curriculum package before diseconomies of scale force it to modify its objectives? Conversely, how will growing schools strike a balance between resourcing a given curriculum more intensively and broadening the range of activities available to pupils? It is common to discuss matters of size primarily in terms of efficiency, with educational objectives taken as given. Yet school size clearly has an effectiveness dimension too. Many would argue that when a school’s size goes beyond a given range it is no longer the same school. For example, Bowe and Ball found that ‘In fact all of our case study schools actually developed and operated with a fairly well worked out sense of “optimum” or “preferred” size’ (1992: 46), and they go on to argue that ‘the rhetoric of the market has failed to address the issues involved in the impact of growth on quality in complex “people-processing” institutions like schools’ (1992: 49).

Whatever a school’s size, a major consequence of LMS is the extension of choice about the ways in which it can deploy its resources. At present evidence is patchy about the ways in which schools choose to exercise this increased freedom. More case studies over a longer period will be necessary before any clear patterns emerge. However, two themes can be identified which suggest that both technical and price efficiency considerations are increasingly likely to influence schools’ decision-making processes.

The first relates to the overall balance between the major areas of expenditure: teaching staff, support staff, materials and premises-related expenditure. Prior to the implementation of delegated budgets, most LEAs determined the number of teaching and support staff allocated to schools on the basis of different formulae with no virement allowed between them or into or out of other areas of budget expenditure. It is difficult to generalize but two trends do seem apparent: schools are thinking more creatively about the number and types of support staff they need (Mortimore and Mortimore 1992), and increasing
attention is being given to efficiency savings in areas of expenditure related to premises and grounds.

Second, the role of resource pricing is likely to change, particularly with respect to teaching staff salaries. It is Government policy that this should be so: schools are funded on the basis of average not actual salary costs, and there are increasing possibilities for schools to be flexible in their patterns of staff reward. We have already noted a trend for some schools to use discretionary authority over salary levels and to be influenced in their appointments by salary costs. The evidence suggests that these opportunities are only being used in a minority of cases at present, but this is likely to change over time.

The research on LMS to date, then, is most illuminating in relation to efficiency. There is some evidence that larger (and hence more efficient?) schools are being favoured at the expense of smaller ones. And it also seems that schools are increasingly choosing to deploy resources in new ways which imply some – albeit crude – sense of technical and price efficiency in their decision making. As Levačič argues:

The evidence . . . shows that delegated budgeting and the development of quasi-markets has improved efficiency on the input side of the education production function. School managers are seeking and finding new ways of using and combining resource inputs.

(1993: 25)

What is not clear, however, is how these changes relate to educational outcomes. Indeed, it is not always clear that the choices being made are concerned with efficiency rather than with economy: how for example, are we to interpret the appointment of a probationary rather than an experienced teacher because of budgetary pressures? There is little evidence about the ‘mental production functions’ which underpin managers’ choices about the allocation of resources, nor is there any clear evidence about the impact of these choices on pupil learning or other outcomes. This leads us to a consideration of effectiveness.

**Effectiveness**

As the foregoing suggests, a good deal of the research on the implementation of LMS can be explored in terms of its consequences for efficiency. Attempts to apply an effectiveness perspective, however, are fraught with difficulties both conceptual and empirical, and little of the research to date attempts to deal with the issue, at least explicitly, within an LMS context.

The most obvious way to explore effectiveness in education is to address the issue of pupil learning. The Birmingham study asked heads directly whether children’s learning was benefiting from LMS: 35% said it was while 31% said that it was not. Similarly 35% agreed that LMS ‘reduced staff time for the direct support of children’s learning’ while 40% disagreed. The authors comment as follows:
The paradox in our survey data is a matter of concern. How is it that heads are claiming that LM allows more ‘effective’ use of resources whilst reporting uncertainty about its effects on learning? This raises many questions. Might it be the case, for example, that whilst head teachers welcome the ‘flexibility’ of LM it is at a cost – in some schools – of an additional workload upon the head which affects their familiarity with the pupils’ learning? Or does the paradox arise where head teachers welcome the opportunities to make decisions without having to obtain LEA approval, recognise this as enabling a better use of resources but are not clear as to its effects on learning? Is the paradox a short term phenomenon, as the change becomes embedded, or does it relate to long term difficulties which may be associated with schools size and levels of resourcing. Are there explanations to be found in terms of the head teacher’s role as manager?

(Arnott et al. 1992: 6)

Of course, these points address only part of the problem. They beg the question of whether heads were equating effectiveness with children’s learning and, even if they were, whether they shared a conception of what ‘benefits’ in learning means. The issue of how effectiveness is to be defined, let alone who is to define it, is therefore not addressed. This is the case for most of the studies reported here.

Bowe and Ball, however, give one interpretation of this issue:

[Tensions] surround the definition of purpose, and these arise mainly from the constraints, requirements and opportunities created from the provisions of ERA. For example . . . educational decision-making may be set against budget-led planning, professional judgement against the expediencies of market image and professional autonomy against managerial fiat. Thus the development of ‘new management’ is not simply or primarily a structural or administrative change (although new roles and relationships are created): it is also a profound change in organisational culture.

(Bowe and Ball 1992: 145–146)

The point here is that, through LMS and its associated developments in relation to parental choice, schools are increasingly being expected to act as if they are enterprises in a ‘quasi-market’. However, ‘precisely what such enterprises maximise, or could be expected to maximise, is unclear, as is their ownership structure’ (Le Grand 1990: 5). The truth is that educational organizations must respond to a variety of competing claims on them from groups whose conceptions of effectiveness may differ considerably, as does the nature of their influence on school-level decisions (Kouzes and Mico 1979). The result of the reforms of which LMS is a part has been to establish at least three perspectives from which effectiveness can be viewed.
The first is that of national policy emanating from the Department for Education and embodied in legislation and regulations. The key elements here are the establishment of National Curriculum requirements and associated tests and examinations, and – no less important – the requirement that certain kinds of information, for example on examination and test results and on truancy, should be published. At this level, therefore, it could be claimed that a very clear definition of effectiveness is being mandated by Government.

Simultaneously, however, schools are expected to become more responsive to parental choice. It is possible, of course, that parental conceptions of school effectiveness are consistent with the Government’s emphasis on examination and test results and attendance. However, in so far as this is not the case, schools must attempt to ascertain parental expectations, perhaps try to influence them, and consider how their own strategies – including those of resource management – should take account of parental concerns.

Finally, those working within schools will have their own concerns and values. These may give rise to professional judgements about what is in the best interests of the particular set of pupils in their care which may or may not entirely match the expectations of the Government or of parents. They may also, of course, be expressed in particular professional interests which they wish to advance or protect.

It is difficult to discuss school effectiveness in the context of LMS without considering these complexities. We can do little more than pose some relevant questions:

- How far will the Government’s emphasis on test and examination performance backed up by the comparative publication of results lead schools to shift their balance of priorities towards academic achievement (especially that defined by test and exam scores) above other objectives?
- How far will parental expectations, or schools’ perceptions of these, (especially if they are not adequately encompassed by examination and test results) modify schools’ objectives?
- How far, as schools expand or contract, will schools of different sizes be seen, or claim, to be qualitatively different in the kinds of experience they offer pupils?
- How far will schools modify their professional definitions of the needs of individual pupils and groups – such as those with special needs – and their priorities amongst them if these are felt to be inconsistent with other externally imposed demands?
- How far will schools’ freedom to make choices about the allocation of resources be used to protect or to weaken teachers’ employment and working conditions?
- Will the various changes taking place in the school system lead to schools becoming more diverse or more alike in terms of the objectives they pursue?
These are complex questions not easily answered. What they do imply, however, is that, with changing demands on schools arising from the various threads within the legislation, the concept of effectiveness must be considered as both dynamic and contested: dynamic because definitions – whether explicit or implicit – will, for many schools, change over time as governors, managers and classroom teachers attempt to respond to pressures for change arising inside and outside the school; and contested because, for many schools, the various ways in which effectiveness might be defined may not prove easily reconcilable. Economic analysis, therefore, cannot easily be separated from micro-political considerations.

The latter can be explored at two interrelated levels. One concerns the relationship of the school with its environment. This includes the school’s response to Government demands, to parental behaviour and to the responses of other schools in the locality. Considerable research is taking place on these issues which suggests that environmental changes are indeed influencing schools in new ways but that both the changes themselves and the responses are more complex and differentiated than might perhaps be expected. There is a growing body of research on parental choice but rather less on school responses to such choice (Glatter et al. 1993). A research study at the Open University is exploring the interactions which occur in the ‘competitve arenas’ which are developing as a result of recent reforms (Glatter and Woods 1993, Woods 1992). The issues emerging from this and related research can only be touched on here. Two points are of particular importance. First, parental preferences seem to be differentiated, among other things, by social factors.

[Our] analysis . . . suggest that working class parents display significant differences (compared with middle class parents) in their pattern of priorities: in particular . . . they attach importance to their child’s preference for the school and his or her friends being there. The factor most important to professional and middle class parents was the school’s standard of academic education . . . The question is whether the differing priorities are the result of social inequalities (manifested for working class families in transport difficulties and a belief that certain schools are ‘not for them’) or whether they represent variations in values that stem from dissimilar (and equally valid) cultural perspectives.

(Glatter and Woods 1993).

Such findings suggest that schools seeking to respond to parental preferences may need to take quite fundamental decisions about which parents’ preferences should receive priority (assuming, of course, that certain types of preference are incompatible in terms of their policy and resource allocation implications), and, indeed, which groups of parents they particularly wish to attract.

The second point concerns school responses to parental choice. Here a distinction is made between changes which are ‘substantive (to do with policies,
practices, curriculum and the like)’ and those which are ‘concerned only with image and activities aimed at promoting the school’ (Woods 1992: 207). The Open University study is finding responses of both kinds. Changes of the former kind, drawn from a variety of schools,

... include alterations to homework policy, the introduction of banding, emphasis on the caring and pastoral aspects of schooling, encouragement of staff to gain more qualifications, increased stress on extra-curricular activities and greater community access to school facilities ... Whether such changes are in line with what parents want is another matter. Our data do not yet allow us to draw conclusions. However, it is apparent ... that in general enthusiasm for finding out what parents want is considerably less than for promoting the school to parents and the wider community.

(Glatter and Woods 1993: 15)

The ways in which schools choose how to respond to parental and other expectations in formulating resource allocation and other policies leads us to a consideration of the second key micro-political arena – that of the school itself. Where there are inconsistencies and potential contradictions between different interpretations of a school’s purposes and priorities attention is inevitably focused on the processes through which decisions are made. Of particular significance here is the evidence presented earlier about the growing ‘gap’ between senior managers and classroom teachers under LMS. From an economic perspective this can be viewed as a form of task specialization which may be potentially efficient.

In the vast majority of organisations the financial function is a specialization ... [F]inancial management is a task for senior management and ... should only impinge on teachers to the extent that it affects their immediate job. This division of labour implies an increasing differentiation between class teacher and senior manager and the need for the latter to acquire a range of competencies and understanding that extends beyond curriculum leadership.

(Levačić and Marren 1992b: 9)

The question which then arises is:

To what extent is class teacher involvement in financial decision making required in order for local management to result in improvements in teaching and learning expected of it by its proponents?

(1992b: 10)

For Bowe and Ball, however, the evidence can be interpreted in another way:
The ‘gap’ between the new managers and teachers is . . . not simply a division produced by role specialization. It also represents a division of values and purposes . . . establishing a balance between the marketing of the school and its income on the one hand, and making the right choices for individual students on the other.

(1992: 159)

A similar view is expressed by Broadbent et al. (1992a). For them, organizational responses to LMS may cause the ‘lifeworlds’ of the school to become fragmented with a small group of senior staff, working with governors, increasingly adopting the market-oriented and managerial values associated with LMS while the rest of the staff maintain traditional, pupil-oriented professional values. They do not think this inevitable, but where it does occur schools could become ‘schizoid . . . having different lifeworlds within different groups of organisational members. This may then lead to conflict within the organisation’ (Broadbent et al., 1992a: 67).

The argument here is that there is a contest within the school through which senior managers increasingly mediate the concepts of effectiveness arising from the demands of Government regulations and the ‘market’ while classroom teachers attempt to defend traditional, professional values deriving from the individual assessment of pupil needs. The implication is that these two sets of concerns are inevitably in conflict, or at least in tension. Clearly this does not necessarily follow: the degree of consistency between the values and expectations of different groups is an empirical question. The debate does, however, raise important issues about patterns of coupling within schools. What LMS does do is to emphasize ‘a corporatist’ conception of a school’s purposes – which is inevitably reflected in the concerns of senior managers – in contrast to a more ‘individualist’ one which is the prime concern of classroom teachers. In the corporatist conception, effectiveness is an aggregative concept relating to the achievement of broad objectives demonstrated through such indicators as aggregated measures of examination success expressed in league tables and trends in parental choice of school. In the individualist conception, effectiveness lies in the degree to which the complex needs of each child are identified and met and his or her learning maximized. In the days before the reforms it was possible – indeed common – for school managers to share with teachers an individualist conception of effectiveness; as the implementation of the reforms unfolds this is becoming more difficult.

What are the implications of this discussion for a consideration of school effectiveness in the context of LMS? The key point, surely, is to accept the contested and dynamic nature of the concept and to explore how its interpretation is reflected both in the choices which are made at school level and in resulting outcomes. It has always been the case that those within schools have had the task of reconciling as far as possible the demands of internal and external stakeholders and making choices about the use of resources in relation to these. The major
change arising from the legislation is that the balance of power has been redistributed among the stakeholders and the framework of constraints surrounding resource choices has been changed. In this context, it is highly relevant to ask what it is that those within schools now seek to achieve and how they use the new powers granted under LMS to enable them to do it. There are at least three ways into this issue.

The first would be through careful longitudinal analysis of expenditure patterns in an attempt to explore the concept of effectiveness through examining schools’ values-in-use as opposed to their espoused values (Argyris and Schon 1974). The kinds of questions which might be addressed by such an approach include:

- How far do schools use their increased discretion over resource use to channel resources of various kinds (including staff time) to the direct support of teaching and learning?
- Where resources do support teaching and learning, what aspects of the curriculum and which groups of pupils benefit? For example, is the emphasis on maximizing test/examination achievement or on targeting pupils with special needs?
- What resources are devoted to the management of LMS, including the management of the ‘marketing’ function?
- What resources are devoted to the enhancement of the school’s image?
- Are teaching technologies modified, through resource substitution (such as employing more support staff and fewer teachers) or through deploying existing resources differently (such as streaming or setting)? If so do such changes occur in response to professional judgement or to parental influence?
- Are resources used in ways which improve or protect teachers’ conditions of service (for example, through protecting permanent posts, providing free meals for teachers, or maximizing supply cover)?

Information relating to questions such as these would help to illuminate discussion about the kinds of changes which are taking place in schools’ implicit objective functions as they wrestle with the consequences of LMS and its related reforms. Interpreting such evidence would not be unproblematic, however. Information about patterns of resource allocation is notoriously capable of multiple interpretations: for example, decisions to protect full-time teaching posts might be interpreted in terms of the technological assumption that small group sizes and teacher stability are the prime determinants of teaching quality or in terms of the protection of teacher interests. Such alternative interpretations cannot easily be tested, however, because so little is known about the production function in education. Furthermore, and partly because of this, choices of technology may be as subject to micro-political negotiation as choices of objectives. An excellent example of this is the case quoted by Bowe and Ball.
(1992: 50–52) of a school under pressure to change its pattern of pupil organization in English in response to parental pressure and despite strong teacher reservations.

A second way to approach the effectiveness question is to consider whether the ways in which schools manage themselves under LMS embody specific attempts to use the flexibilities which LMS gives to focus on key outcomes, especially that of improving pupil learning. It might be asked, for example, whether LMS increases or reduces the likelihood of schools developing the characteristics associated in the literature with ‘effective schools’ (Rutter et al. 1979, Mortimore et al. 1988, Riddell and Brown 1991). The evidence available at present only addresses this issue in a fairly limited way. It might be argued, for example, that:

[i]f, as seems evident . . . principals become primarily concerned with financial management and public relations within the education marketplace, then the educational leadership which researchers find to be strongly associated with effective schooling, will be minimal, if not totally compromised.

(Ball 1993: 7)

On the other hand, there is some evidence to suggest that there is an increasing concern in schools to clarify objectives and priorities, to plan to achieve these and to monitor success. Certainly LMS has been accompanied by strong regulatory and other pressures for schools to engage in systematic ‘school development planning’ (Hargreaves et al. 1989, Hargreaves and Hopkins 1991). The Birmingham study found, for example, that:

Development Plans (DP) are prepared in almost all schools, although it is a very recent innovation. The adoption of a DP had led more than half of schools to review their statement of aims . . . [O]ver half of heads [reported] that DPS help in planning, prioritising and evaluating. Only 9% (63) reported that its preparation had not been helpful.

(Arnott et al. 1992: 13)

Such managerial approaches may be seen as an attempt to resolve, or at least reduce, the tension between the corporatist and individualist perspectives described earlier, although the evidence suggests that the turbulence of the policy environment makes such planning particularly difficult in present circumstances (Hutchinson 1993, Wallace 1991a, b). Furthermore, it is dangerous to generalize about concepts such as development planning which can mean very different things in different school contexts. This is undoubtedly an area where we need to know more and where a conclusion about British research to date would mirror that of Wohlstetter and Odden in relation to US research on school-based management (SBM):
There also is scant research on the intervening variables that have been shown to be related to student learning. How does SBM change the enacted curriculum? . . . How does SBM help to build a collegial or professional teacher culture at the school? . . . How does SBM build a powerful change process?

(1992: 536)

The linking of school effectiveness research and research on LMS is clearly an area for possible development in the future.

Finally, the issue of effectiveness might be addressed by considering the impact of LMS on school outputs directly. The problems associated with such an approach are clear, not least that of separating out the effects of LMS from those arising from other changes. As our earlier discussions have suggested, much of the work to date, for example in relation to formula-based resourcing and to school size, is primarily concerned with unit costs of provision and the definition of need in terms of expenditure levels. In this respect it mirrors most of the work on economies of scale in education. It does not attempt to relate costs to any measures of output such as learning achieved or examination success. Conversely, British literature on school effectiveness, referred to earlier, gives relatively little attention to questions of resources and costs. There is, however, a large and growing body of literature on the measurement of school performance with a particularly active debate on the measurement of value added. Little of this has been related directly to LMS but here again there is clear potential for future developments.

A fourth ‘E’: equity

Before concluding, it is important to recognize that the educational reforms have major equity implications. Indeed, it could be argued that, despite the Government’s strong emphasis on the objectives of increasing effectiveness, efficiency and choice in the school system, it will be equity considerations which are likely to dominate the debate as the consequences of the reforms begin to work through. However, the issue of equity has received only limited systematic attention in the research on LMS. Like effectiveness and efficiency, it can be considered in a number of ways.

First, a distinction clearly needs to be made between procedural and distributional equity. With respect to the former, it can be argued that the distribution of resources by formula is now ‘more equitable in that it is based on objective criteria (in the sense that the criteria are set out as common rules and not determined by administrative discretion)’ (Levačič 1992a: 27). The implications for distributional equity, however, are both more complex and less clear.

Wildavsky (1979) distinguishes between ‘market equity’ under which services are distributed equally among users, and ‘equal results’ under which resources are distributed in ways which attempt to ensure that all benefit equally
and that inequalities in starting points are compensated for. Certainly the design of formulae generally addresses equity questions more explicitly than it does those of efficiency and effectiveness. Since at least 80% of the budget must be allocated on the basis of the number and ages of pupils with the remainder available for use to compensate for pupils’ special needs and circumstances and for the diseconomies associated with small schools, the implicit rationale for the funding of schools appears to be one of equal opportunity qualified by some gestures towards equal results. However, clearly the issue is deeper than this. The requirement that the basic age-weighted pupil unit (AWPU) should be the same for all children of the same age in any LMS scheme introduces an element of equity, but only on the assumption that age is the prime determinant of need. Since this is only partially the case, much then depends on how allocations to small schools and to meet the needs of socially disadvantaged pupils and those with special educational needs actually work out. LEAs differ considerably in the ways they treat these factors, as indeed they do in their age-weightings and in the amount spent per pupil unit. Furthermore, the ability to meet differential need adequately is limited by the requirements to allocate the bulk of the budget on the basis of AWPU and to make the formula simple and objective (Lee 1992).

The issue is further complicated by the impact of parental choice on pupil opportunity. Many writers argue that, where such choice exists, situations will soon arise where popular schools will be able to select their pupils rather than the other way around, and this issue is made even more sensitive by the Government’s creation of a new class of schools – grant-maintained schools (GMS) – which can, on the basis of a parental ballot, ‘opt out’ of LEA control and be directly funded by central government.

It is not possible in this paper to review the substantial literature on the consequences of the creation of a more competitive education market in the UK. However, some points should be noted, particularly in relation to the level of the individual school, where the interrelationship between effectiveness, efficiency and equity needs to be better understood. In other words, we need to supplement our earlier discussion about decision makers’ conceptions of what is to be achieved through their resource choices and how with a consideration of whom they wish to benefit.

Here again the consequences of LMS need to be related to the wider package of educational reforms. Increasing competition accompanied by the publication of particular performance indicators, notably examination results and attendance rates, is likely to affect not only schools’ definitions of their purposes and their allocation of resources in pursuit of these purposes, but also their perception of pupils as ‘raw materials’ rather than ‘clients’. It can be hypothesized that an incentive system which emphasizes test and examination success will encourage schools, first, to become more selective in their admissions policies and, second, to exclude pupils who exhibit behavioural or other problems which affect the school’s image or place particularly heavy demands on resources, especially teachers’ time (Ball 1993). This is clearly an important area for research. At
present systematic evidence is limited, although there are some indications that both of these hypotheses are being validated in some cases (Stirling 1992).

A second issue relating to equity at school level concerns the ways in which resources are distributed internally among groups of pupils with differing educational needs. We need to explore decision makers’ assumptions about the contribution which particular patterns of resource allocation make to the achievements of particular groups of pupils. Relevant here is Brown and Saks’s (1975) distinction between ‘levellers’ who prefer smaller dispersions of pupil performance and ‘elitists’ who are willing to accept wider dispersions for the sake of higher mean levels of performance. Very little has been written about this so far; it is an area where much more research is needed.

**Conclusion**

This review of selected parts of the research literature on LMS suggests a number of findings which, given their tentative nature, might best be considered as hypotheses in need of further research. At a macro level, formula funding is tending to favour larger schools at the expense of smaller ones and is making assumptions upon which schools are funded more transparent. It is leading to a developing debate about the relationship between resources and needs. At the level of the individual school, LMS seems to be encouraging resource decision making which is consciously efficiency enhancing. However, the conception of efficiency used here is strongly input oriented, and it is not clear how choices made by schools about their patterns of resource acquisition and deployment relate to intended or actual learning outcomes or to other conceptions of effectiveness. Indeed, there is little evidence concerning the impact of LMS on school effectiveness, beyond examples of schools responding to parental choice through both ‘image-enhancing’ and ‘substantive’ changes in curriculum and organization. Furthermore, it is too early to draw firm conclusions about the consequences for efficiency and effectiveness of changes in school size which will occur as a result of increased parental choice as well as of demographic changes.

The nature of school responses to LMS seems to depend both on their circumstances (especially whether they are ‘winners’ or ‘losers’ under LMS formulae) and on the managerial approaches of their leaders. These leaders are finding themselves increasingly functionally separated from their staffs as they address issues of ‘corporate’ effectiveness in relation to the demands of external stakeholders while classroom teachers continue to concern themselves with the more individual needs of pupils within a context increasingly defined by the demands of the National Curriculum and testing. This separation is reflected in differences in orientation to LMS itself – headteachers overwhelmingly in favour, classroom teachers less so – whatever the resourcing experience of the schools in which they work.

More generally the paper suggests that, while the concepts of efficiency and effectiveness provide a useful and important framework for examining the con-
sequences of LMS, and much of the research can be related to these ideas and leads to interesting, if tentative, conclusions, much would be gained by a more rigorous and consistent use of the concepts. In particular, fundamental consideration needs to be given to how efficiency and effectiveness are to be interpreted and measured in a situation where schools’ objective functions are both dynamic and contested, and greater consideration needs to be given to the interrelationship between efficiency and effectiveness and ideas of equity.

SHEFFIELD CITY COUNCIL (1992) *Resourcing Sheffield Schools* (Sheffield: Sheffield City Council Education Department).

In his classic textbook on the economics of education, published a quarter of a century ago, Mark Blaug (1970) commented:

... the surprising thing about the economics of education is the extent to which the subject invariably draws upon the most basic concepts of economics. ... We do not need to know a great deal of economics to apply it to education, but the little we do know we must have in our bones.

(p. xv)

There remains a great deal of force and validity in that statement and part of my purpose is to show how the application of basic concepts continues to illuminate policy choices. However, it is also my intention to argue that national and international changes in education—notably the emergence of market forms—require economists to contribute to a clarifying analysis about the organizational contexts through which educational provision is made. This article begins, therefore, by outlining the main features of such an analysis and leads to the proposition that the challenge to policy-makers is how best to manage a mixed economy of provision. Such a proposition places a great deal of emphasis on an empiricism which tries to describe and explain the impact of different ‘mixes’ of market and non-market forms. It is at this stage, therefore, that I draw upon the concepts of efficiency and equity—as key social and economic criteria for evaluating policy change—and apply them to some of the field research I have undertaken in recent years. Finally, I intend to consider the status of research evidence in contributing to ‘objective’ judgements on the performance of education systems in meeting their goals. The article ends with a brief conclusion.
Exchange relations as mixed economies

There is a good deal of confusion in some contemporary usage of the language of markets in education. For example, in a book which ‘attempts to explain the philosophical underpinnings of the educational uses of terms which share a “family resemblance” with “markets” and “managers” ’ (Halliday, 1990: vii), it is evident that much of the text is concerned with the increased orientation of education to the ‘needs of the economy’ (p. vii) through vocational training and responding to employers as consumers of education. Indeed, the author is supportive of an increasing role for ‘free markets’ in determining the curriculum (p. 156). McMurty (1992) provides a second example of the elision of ‘markets’ with the needs of the economy, whereas what is described is a hierarchic model of government control. Such problems of definition and usage are not confined to education. In a collection of historical essays on *The Culture of the Market* (Haskell and Teichgraeber III, 1993), none of the contributors provides a definition of a ‘market’. Much closer to conventional definitions are the usage of Bowe and Ball with Gold (1992: Ch. 2, passim) where the underlying assumptions of an ideal-type market are given and their limitations addressed. There is also a recognition—following Le Grand—that what exist in education are quasi-markets. However, the identification of the quasi-market appears to lapse and the chapter contains the following usage: markets; ‘markets’; quasi-markets; micro-markets; pseudo-markets (p. 45, no definition); social markets (p. 46, no definition) and untrammeled market (p. 56, no definition). In their definition, Le Grand et al. describe markets as

... a form of economic organisation in which the majority of allocation decisions are made through the ostensibly uncoordinated actions of large numbers of individuals and private firms. The coordination of activities ... comes about because each factor of production (land, labour and capital) and each commodity has a price to which diverse groups respond in a way that reconciles their separate actions ...

(1992: 21)

Yet, the maintained-school system is almost wholly funded by general taxation and, for parents and pupils, is free at the point of consumption. The overall level of spending is determined by government (central and local), and the means of production are largely owned or employed by government, which also determines the rules for allocating funds to schools. More important still, the curriculum and assessment of pupils is largely determined by the Secretary of State. Indeed, in many ways, the maintained-school system is the counterpart of the ‘market’ system:

By ‘market’ is usually meant an allocative and distributive mechanism, the counterpart of which is not the state but ‘hierarchy’ and ‘planning’.
Whereas the ‘unit act’ of markets is voluntary exchange, the ‘unit act’ of hierarchies is ‘command’.

(Berger, 1990: 104)

It might be argued, of course, that I am missing the point and, indeed, there is undoubted force in characterizing the form of decentralization in England and Wales as a pupils-as-vouchers scheme with many market-like features (Thomas, 1988: 23). There are, nonetheless, strong arguments for a careful analysis of markets and their alternatives, not to classify usage as ‘right’ or ‘wrong’ but to provide a sounder basis for the analysis of education policies. I have set out such an analysis elsewhere and outlined a framework for clarifying the exchange relationships in the school system; the advantages and disadvantages associated with each form of exchange are considered and it is argued that no one form alone is either realistic or desirable (Thomas, 1994). It is not my purpose, therefore, to set out that argument here, but, in order to advance the wider analysis, it is necessary to summarize the framework.

In the 1994 article I argued that two concepts—interest and decision—provide the means of defining and discussing the mechanisms by which a society decides upon how much education it requires, what is to be provided, who is to provide it and to whom. The dimensions of Figure 1 represent each of these concepts.

The market, for example, represents those circumstances where decision-making is decentralized and self-interest is assumed to be the motive force of human action. By retaining the assumption of self-interest and introducing centralization as the locus of decision, we move to an allocative system characterized by ‘hierarchies’. This can be taken to represent the command view of the state and is the conventional opposite of the ‘market’. The distinction of ‘markets’ with ‘hierarchies’, presented by Berger and others is, however, more illuminating. It is a distinction which rests upon the concept of the ‘unit act’ which, in ‘markets is voluntary exchange [and in] hierarchies is “command” ’ (Berger, 1990: 104).

*Figure 1* Allocative mechanisms as ideal types.
The third form of organization I label the *college*. This *ideal type* identifies those contexts where altruism is assumed to be the motive force of human behaviour and where decisions are decentralized to small groups. I take altruism to be 

\[ \ldots \text{behaviour that benefits another (unrelated) actor and which imposes some cost on its originator}\ldots \]; it excludes behaviour to benefit a close relative someone with whose interests the actor may be presumed to identify, and altruism is defined here in *behavioural* terms and has not been related \ldots to the motives of the actor involved. 

(Ware, 1990: 187)

The choice of the word ‘college’ to represent this ideal type has the merit of creating an image of relatively small groups, the consequences of whose actions for others within the group can be anticipated. The self-images of professional groups, for example, would lay claim to modes of behaviour which place the interests of clients ahead of those of the service provider. We do not need to accept that image uncritically in order to recognize the place of some forms of altruistic behaviour as an important component of the commitment of some working groups, and relevant, therefore, to our understanding of how societies produce and distribute goods and services.

The final *ideal type* allocative mechanism is the *collective*. Here, decisions are taken by altruists but the locus of decision is centralized. The social order is one where its members draw satisfaction from an increase in the goods available to others and where there is general agreement that the efficient production of these goods and services requires complex organizations and centralized decision-making. Decision-makers would also make decisions on which goods and services should be produced, which breaks the personal connection between the provider and the recipient which would occur in the ‘college’, so that utility is derived impersonally from the act of giving.

The work of Titmuss (1970) on blood donation in the UK illustrates a real-world example of the production of goods and services and also argues that altruism draws forth acts of reciprocity. If this is so, it might equally be asserted that recent emphasis on self-interest will also draw forth reciprocity in kind, clearly an issue that needs to be taken into account when we consider the effect of changes in the mix of allocative mechanisms. That the choice lies in the emphases in our mixed models, however, is central to my argument. There is no choice between market and non-market provision in education but a world where these forms of provision necessarily coexist:

It has been the purpose of this paper to argue that a debate which juxtaposes ‘markets’ against some alternative(s) can be over-simplistic as, indeed, would be an argument as to whether people are motivated by self-interest or by altruism \ldots what is required is the much more complex resolution of the balance(s) to be struck between the variety of
means by which education services are produced and allocated in our society—the mixed economies to be found within the matrix bounded by decision and interest.

(Thomas, 1994: 52–3)

This view places a premium upon empiricism, as the choices required on the best mix of allocative/exchange mechanisms depend upon evidence on the nature and consequence of the mix and should not be guided by a value-based predisposition for or against markets, command, college or collective. Let me turn, therefore, to consider some data on the nature and consequence of the mixed economy of exchange relations in our school system. In doing so I intend, inter alia, both to illustrate the importance of the concepts of efficiency and equity to our analysis and to illuminate the paradoxes and ironies of some contemporary assumptions about markets. I will do so through two ‘vignettes’ from research projects in which I have participated.

**Efficiency and equity in mixed economies**

Efficiency is one of the more abused words in the lexicon of economics, having been used by the government over the last decade and more as a code for cheapness. As it is not my usage, let me begin with a definition of *economic efficiency*. This

\[
\text{ refers to the use of the budget in such a way that, given relative prices, the most productive combination of resources is used. That is, no alternative combination of resources, given the budgetary constraint, would enable the organization to produce a higher output.}
\]

(Levin, 1976: 153)

This definition makes some demanding assumptions about production possibilities, which are:

\[
\text{ governed by certain technical relationships, and the production function simply describes the maximum output feasible with different sets of inputs \ldots it represents the maximum achievable output for given inputs.}
\]

(Hanushek, 1979: 353)

On this criterion, we can be confident that schools are not efficient. That this should be so turns primarily on the absence of a convincing or wholly adequate theory of learning—a prerequisite for specifying clear technical relationships as a predictive basis for the relationship between inputs and educational outcomes. However, it is also a consequence of imperfections in the labour market, in which prices do not represent marginal productivity and labour and other factors are not easily substi-
tuted for each other. There is the added difficulty that schools are multi-purpose organizations and the achievement of some goals are not always compatible with others. For these reasons, therefore, it would be more accurate to refer to schools as seeking to become more cost-effective, an efficiency-related concept which is not predicated upon the same demanding conditions as production function studies. Cost-effectiveness analysis compares alternative ways of achieving the same objective: the most cost-effective will be the least costly of alternatives being compared, which is not necessarily the cheapest possible method of attaining the objective. In practice, however, since the word ‘efficiency’ is used to describe these least cost conditions, it is a usage I will follow in this article.

Information on efficiency also contributes to an analysis of equity, which I take to be a concern with who gets what. Secada (1989) argues that, as a position, disparities between social groups in society is ‘an injustice in the educational system’s distribution of its goods and that affirmative steps should be taken to remedy those injustices (p. 3). He later develops an argument around the principle that equity ‘refers to our judgements about whether or not a given state of affairs is just’ (p. 68). As this is a theme that I examine more fully in the last main section of this article, I do not develop the argument further here and proceed to examples which raise issues of efficiency and equity in the context of changes in exchange mechanisms.

Vignette one: is funding by age of pupil efficient and equitable?

Changes in the funding of schools was one of the major elements of recent reforms in England and Wales. Using its newly acquired powers of ‘command’, the national ministry set out detailed guidelines on how schools were to be funded, which transformed conditions at the local level where, previously, most Local Education Authorities (LEAs) had not known how much was spent on individual schools. The old system was replaced by a published formula by which all schools were funded on the same rules, so that comparable schools would receive the same level of funding. Whilst the change led to some schools gaining additional funds and others losing, there can be little doubt that the new arrangements are, in principle, more equitable; conditions where levels of funding were a mystery can, in Secada’s terms, scarcely be just.

When the new patterns of resource allocations are examined, however, the basis for deciding the relative requirements of different age groups is not readily apparent. Certainly, there is no consensus on their comparative requirements, so that it is impossible to discern a common view on the resources needed to provide an education, based upon the national curriculum, to pupils of different ages. Table 1 shows the value in 1990 of the age-weighted pupil units (AWPUs) in 10 LEAs, selected from a set of 71 because their AWPU for 8-year-olds (Year 4) are close to the mean for the 71 LEAs. The data raise questions about efficiency and equity.
Why do the LEAs in Table 38.1 differ in their assessment of the relative needs of pupils of different ages and why are the junior years cheapest? The step in funding from age 10 to age 11 has a mean of 38 percent, although it ranges from zero to 64 percent. Are these tenable in terms of differences in the requirement of the national curriculum? Following its own inquiry into this issue, the Education Committee of the House of Commons (1994) concluded:

... that concentrating on the change in funding between Year 6 and Year 7 can obscure the more important issue: the enormous importance of primary education (which has traditionally not been recognised in the resources it receives) and the continuous nature of the education process. The current funding profile does not recognise this educational continuum ... 

The greatest relative differences in Table 1 are between the AWPU for 8-year-olds as against 16–19-year-olds. In the Isle of Wight, for example, AWPU16 (£2325) is 2.9 times greater than the weighting of AWPU8 (£801). This compares with Sunderland, where the value of AWPU16 (£1664) is 2.08 times that of AWPU8 (£799). In some respects these age differences do no more than reflect the tradition of higher levels of resourcing for older students, but the different relative judgements among LEAs suggest an area for further examination in order to inform efficiency judgements about the most appropriate way of matching finance to curriculum requirements. Adoption of new powers of 'command' in the funding of education has opened these issues to public scrutiny for the first time.

The impact of LEA formulae on the funding level of individual schools was examined in a study which tried to select comparable schools from different LEAs (Bullock and Thomas, 1992). The selected example in Figure 2 is for schools with 221 and 222 pupils on roll. In this set the greatest difference in the level of funding through AWPU occurs within an LEA. School 12 is the least well-placed school and requires 22.8 pupils to attract the funds for an additional teacher and School E7 needs only 18.9 pupils. The difference is equivalent to an extra 21 percent of funding through the AWPU. Schools in other LEAs are close to both these levels of funding.

School E5 is almost the least well-funded school on the formula-per-pupil criterion, receiving £995, but School B15 has £962, £33 per pupil less. The best-placed school on this criterion is School G3 with £1323, 27 percent more than is received by School B15. The data on the primary sector as a whole show a wide range in the funding of schools through the AWPU factor. The greatest difference within one size range is 25 percent in the value of an AWPU between the lowest and highest figure, which occurs for schools in the size range 122–3. The smallest range is 6 percent and is for the largest primary schools. All other ranges are greater than 10 percent. These data raise questions about efficiency and equity: Is it necessary, for example, for comparable schools to be funded at such different levels in order to provide the same national curriculum?

**Notes**

a A level, £237; GCSE 6th Form, £2331.

b £1890 non-exam; £1952 exam.
Are the schools with comparatively high levels of funding providing a superior experience and achieving more than the less well-funded schools? It is only as a result of the new system of funding schools that there is evidence which enables these questions to be considered—a clear benefit from introducing a greater emphasis on ‘command’ in the funding of schools.

**Vignette two: funding additional educational needs**

The quasi-markets of locally managed schools do not necessarily have negative effects upon disadvantaged communities. For example, the requirement that schools meet the actual costs of teachers means that those schools that attract more expensive staff must now meet the additional costs—and vice versa. By contrast, under previous arrangements schools were allowed to employ an agreed complement of staff, as a result of which a hidden subsidy was made to those schools attracting the more costly staff. In practice, and on the basis of studies of the distribution of teachers, this meant a subsidy for schools in more privileged communities (Zabalza et al., 1979; Smithers and Robinson, 1991).

There is also evidence that, in some LEAs, schools serving more disadvantaged communities systematically benefited from the change to formula funding introduced as part of local management of schools (Bullock and Thomas, 1994). The same study also shows, however, that in other LEAs it was schools serving more disadvantaged communities who systematically suffered from the change to formula funding.

The ‘Funding’ study examined the individual formula allocations to 2792 primary and secondary schools in 13 LEAs. A detailed analysis compared each school’s historic budget with its formula budget, dividing schools into two groups: ‘winning’ schools, in the sense that a school’s formula budget is more than its historic budget; and ‘losing’ schools in the sense that the formula budget

---

*Figure 2* Formula per pupil, awpu per pupil and n pupils for teachers [nor = 221/222].

---

MANAGEMENT OF SCHOOLS
is less than the historic budget. The size of the loss or gain was also calculated, as a percentage of the formula budget, and an analysis undertaken of the relationship between the size of the loss or gain and the size of the AEN (Additional Educational Needs) allocation. Is it the case, for instance, that schools with comparatively large AEN allocations are more highly represented in the ‘losing’ group? Or is it the case that as the percentage of formula allocated on the basis of AEN increases, so the size of the loss decreases?

For 10 of our 13 LEAs these hypotheses could be explored and what is apparent is the diversity of local circumstance. The national framework for LMS (Local Management of Schools) has been sufficiently flexible to allow some LEAs to direct resources in such a way that the greatest beneficiaries have been schools with the highest proportion of AEN pupils. Far from being a regressive change, in four LEAs LMS has led to an apparent initial redistribution of resources benefiting the least advantaged. In three LEAs, however, the effect of LMS has been in the opposite direction, those schools with a high proportion of AEN pupils being the losers in the change of funding; in the remaining three there was no systematic pattern of change. These findings emphasize the need for empirical work to assess the effects of restructuring allocative mechanisms. In this case, the introduction of the pupil-based formula, a key component of the move to a market-based system, has effects which differ between LEAs. It is also apparent that a modification in the funding mechanism could increase the resources going to schools and pupils with additional educational needs.

The data reported in these ‘vignettes’ contribute to debates about the efficiency of schools and their performance on equity criteria; some also provide perspectives on the effects of changes in the mixed economy of the school system. This may be as much as can be expected—the data providing an episodic commentary on changes in the system. In other words, are the data part of an unresolvable debate about the ‘right’ level of funding, as in differences in the funding of primary as against secondary schools? Or are convincing and long-standing answers to these questions obtainable? In effect, is it possible to secure agreement on an assessment of educational needs that can underpin a more explicit and less subjective decision on funding education?

**Education and a theory of human need**

**Obtaining welfare from education**

In an earlier discussion of the problems of measuring ‘school effectiveness’, I offered a general welfare-based definition of education. Education was described as:

... an activity which generates a mixture of present and future satisfactions and dissatisfactions, with its net balance over time representing the sense of benefit and well-being created for the individuals involved.

(Thomas, 1990: 7)
In specifying what contributes to that sense of benefit and well-being, Hodgkinson wrote that education

... seeks to establish and enhance the values of security, health, the common good, the interest of the state, the capacity for profit, wealth of all sorts and the highest values of philosophy, ideology and religion. It is on this sense the most general human pursuit. If we were to seek a term for the basic educational value we might call it fulfilment. Education has been shown to be a general set of human behaviours and experiences organized about three categories of purpose: aesthetic, economic, and ideological. It can also be said to subserve all human values and to be a prerequisite to their fulfilment. It is this all-inclusive quality which makes education so special and, at the same time, so human.

(1991: 27)

Hodgkinson’s recognition of the importance of fulfilment is resonant of ‘benefit and well-being’, and both definitions set a demanding test for measuring the achievements of education. On the basis of these definitions, most of the measures normally used for reporting on the achievement of education—examination results, length of participation, levels of expenditure—are, at best, only proxies for the changes that take place in an individual and which manifest themselves over a lifetime: ‘occurring, in the last analysis, only within an individual mind’ (1991: 62). Whilst we might accept the moral force of Glennerster’s proposition that

The proclaimed objective of welfare provision in most societies is to ensure a basic standard of living for their citizens [and] will usually entail a minimum income and access to food, shelter, education, health care and support if they are sick or disabled.

(1992: 3, emphasis added)

Hodgkinson’s and my own more general definitions challenge the ‘commodity fetishism’ implied by Glennerster’s focus upon the provision of goods and services. My own general definition is influenced by Sen’s (1980) discussion which emphasizes the ‘relationship between persons and goods ... income and wealth are not valued under utilitarianism as physical units, but in terms of their capacity to create human happiness or to satisfy human desires’ (p. 366). On this argument, the level of access to education or the level of provision of education are not, in themselves, ways of directly measuring welfare; welfare is the sum of the ‘satisfactions’ embodied in the experience of education by those individuals who gain access and secure provision.

To insist that the measurement of welfare from education must be rooted in individual welfare is not, however, to argue that individuals must necessarily be given complete freedom to make their own welfare-seeking decisions. The more
difficult challenge is to ask whether some socially determined framework can be specified against which both the preferences of individuals can be assessed in terms of their entitlements and the achievement of the system judged in meeting the entitlements of all.

**Measuring human development**

In developing my answer to that question, an early influence has been the work of Sen (1987; Nussbaum and Sen, 1993) and, latterly, the work of Doyal and Gough (1991); within educational administration, Evers and Lakomski’s (1991) work is also relevant. Sen has challenged the neo-liberal view that preferences cannot be aggregated. The idea that social welfare can only be calculated by assuming the ordinality of utility and the impossibility of interpersonal comparisons is replaced by the opposite assumptions of cardinality and the use of interpersonal comparisons through ‘meta-ranking’ based upon a moral code. The result is a framework which makes it possible ‘to “tell” effectively the rich from the poor’ (Sen, 1979: 336). Cardinal measures of utility alone are inadequate: when utility information is the only legitimate information, two social states of equal utility may be equal because one allows torture to attain the utility level while another redistributes food (pp. 339–41). If we are to accommodate issues such as ‘telling’ the rich from the poor, exploitation and liberty—all of which are closely related to conceptions of welfare—an approach is required that is free not only from informational constraints but also neutrality (Sen, 1977: 258). This involves the use of weighting procedures so that some forms of utility count more than others (1979: 343), such weighting being non-utility information based upon underlying principles, such as notions of discrimination, exploitation or entitlement to social security, a general system of rights. Elster and Roemer (1991) provide a useful and recent edited collection of essays on these themes.
