The debentures of the second series of £2,560,000 were issued in March, 1905, for a variety of purposes, of which the principal were (a) the construction of a line in Northern Rhodesia from Kalomo to the Broken Hill Mine, (b) the acquisition and conversion to standard gauge of a line from Salisbury to the Ayrshire Mine built by the Ayrshire Mining Company and the construction of a branch to the Eldorado Mine, (c) repayment of loans amounting to £350,000, and (d) the provision of interest during construction, and of about £50,000 working capital. The price received by the company for these debentures was 90 per cent. The total discount was accordingly £256,000.

The British South Africa Company gave land grants amounting to about 281 square miles in Northern Rhodesia, covering both land and mineral rights, in connection with the Kalomo-Broken Hill line, and an unconditional guarantee of due payment of capital, interest and premium. The debentures are repayable at par on 1st January, 1955, or earlier at the option of the company at 105 per cent.

So far as the Mashonaland Railway Company accounts are concerned, the discounts may be stated as follows:

Hammond, Report on the Railway System of Southern Rhodesia

If the first issue of the first series is taken as being issued at eighty, and the discount on the £800,000 issue on behalf of the Beira and Beira Junction Companies is included, the total amount of discounts and expenses becomes £627,825, and bears a percentage of 12.4 to the nominal amount of debentures. On the same basis the percentage of interest paid on cash or value received is 5.7. It is not possible to draw any just comparisons with these figures, however, as so much of the capital is represented by value and not cash received. The discounts are being written off at the rate of £5,250 per annum, which cannot be regarded as a heavy burden.

The expenditure on capital account amounted at 30th September, 1924, to £4,432,142 for 607 miles; this figure excludes the expenditure in connection with the widening of the Beira Railways. If allowance is made for the Beira Railway / debentures held, this works out at approximately £7,160 a mile over the whole system. As this includes the original cost of the Umatali-Salisbury section and of improvements and additional equipment since, it shows that the cost of constructing the remainder was considerable lower than that of building the first section. This final result of £7,160 can be called a very moderate figure.

As in the case of the Rhodesia Railways, the proportion of debentures to total capital is most marked, but as the British South Africa Company guaranteed the interest on all these issues also, the reason for this must again be sought in the difficulty of raising capital otherwise.

**RHODESIA RAILWAYS TRUST.**

The Rhodesia Railways Trust is a financial company; its present share capital is as follows:–

</tbody>
</table>
The situation regarding share capital is explained by the Railway Authorities in the Financial History of the Trust, Appendix III., in following terms:

‘The Rhodesia Railways Trust, Limited, was formed in June, 1899, with a share capital of £1,000,000 in £1 shares, having for its object the amalgamation of the interests of the shareholders in the Rhodesia Railways, Limited, and in the Mashonaland Railway Company, Limited.

At this time the share capital of the Rhodesia Railways, Limited, was 8,000 shares of £1 each, of which the British South Africa Company held 4,000, and of the Mashonaland Railway Company, Limited, 450,000 shares of £1 each, of which the British South Africa Company held 226,000. At this date, therefore, the British South Africa Company held one-half of the share capital of each of the Railway Companies.

Discussions took place between the British South Africa Company and those representing the interests of the outside shareholders of the Rhodesia and Mashonaland Railway companies, and terms were arranged on which practically the whole of the share capital of both the Railway companies should be acquired by the Rhodesia Railways Trust in exchange for shares. These terms were that 71 Rhodesia Railways Trust share of £1 each should be issued in exchange for each Rhodesia Railways share and five-eighths of a Rhodesia Railways Trust share for each Mashonaland Railway share.

It may be noted that the share capital of the Rhodesia Railways, Limited, viz., £8,000, does not and never was intended to bear any relation whatever to the actual value of the undertaking. It was merely a figure chosen for convenience of definition of interests, which were in very few hands.

The exchange of shares has resulted to date as follows:

567,219 Shares of £1 each issued as fully-paid in the Rhodesia Railways Trust, Limited, in exchange for 7,989 shares of £1 fully-paid in the Rhodesia Railways, Limited.
280,922 Shares of £1 each issued as fully-paid in the Rhodesia Railways Trust, Limited, in exchange for 499,475 1/5 shares of £1 each fully-paid in the Mashonaland Railway Company, Limited.

Of the shares capitals of the number of shares not acquired by the Rhodesia Railways Trust, Limited, at 31st March, 1924, are as under:

<table>
<thead>
<tr>
<th>No of Shares</th>
<th>Rhodesia Railways, Limited</th>
<th>Mashonaland Railway Company, Limited</th>
</tr>
</thead>
</table>

From the inception of the Rhodesia Railways, Limited, and the Mashonaland Railways Company, Limited, the British South Africa Company made advances to the two companies, on open account without any security (1) to enable the companies to meet their debenture interest, and (2) to provide funds for capi-
In November, 1910, the Rhodesia Railways Trust, Limited, agreed with the British South Africa Company to create a further 2,000,000 shares and to give to the British South Africa Company an option to call upon the Trust to take over from the British South Africa Company the debts due to that company on account of advances made to the Rhodesia Railways Limited, and the Mashonaland Railway Company, Limited, and to allot to the British South Africa Company fully-paid shares at par in respect of the amount of such debts so taken over. The British South Africa Company further undertook to subscribe in cash for 25,000 Trust shares at par in order to provide a small working capital and the liquidation of current liabilities.

The British South Africa Company in 1911 exercised its option under the above arrangement, and 1,131,888 shares in the Rhodesia Railways Trust, Limited, were issued to them at par as the purchase price for debts due by the two Railway Companies in accordance with the following:

<table>
<thead>
<tr>
<th>Shares</th>
<th>Amount</th>
</tr>
</thead>
<tbody>
<tr>
<td>570,024 Shares of £1 each issued as fully-paid for the purchase of the debt due from the Rhodesia Railways, Limited</td>
<td>£570,024</td>
</tr>
<tr>
<td>561,864 Shares of £1 each issued as fully-paid for the purchase of the debt due from the Mashonaland Railway Company, Limited</td>
<td>£561,864</td>
</tr>
<tr>
<td><strong>1,131,888</strong></td>
<td><strong>£1,131,888</strong></td>
</tr>
</tbody>
</table>

These arrangements did not affect the position of the Railway Companies, but only changed their creditors.

Since 1911 the Rhodesia Railways Trust has provided further financial assistance to the two Railways in order that progress should not be arrested by the want of capital to provide proper facilities and the equipment required for their important undertakings.

The following is the position of the capital account of the Rhodesia Railways Trust, Limited, as at the 31st March, 1924:

### Share Capital.

- **Authorised**: 3,000,000 shares of £1 each
  - ... £3,000,000
- **Issued**: 2,005,767 shares of £1 each, fully-paid

   (b) Mashonaland Railway Co., Ltd. ... 280,922

1,157,626

848,141

£2,005,767

'It will be evident from these figures that the issued share capital of the Rhodesia Railways Trust, Limited, represents the combined share capital of the Rhodesia Railways, Limited, and of the Mashonaland Railway Company, Limited; and that such dividends as are paid upon its shares measure the return received by the proprietors of the system upon their capital.

It has been frequently stated in Rhodesia that the greater portion of this capital is paper, or water, and that the two railways have received no corresponding benefit from its issue. In many quarters it is regarded as bonus shares paid to promoters. Even if it were so, it would be quiet reasonable and in keeping with the usual practice that the promoters of a system of railways of the magnitude of those serving Rhodesia and neighbouring territories should receive some recognition for their conception, work and risk; but, in the present case, it can be clearly shown that the Railway Companies have received good value for every Rhodesia Railways Trust share issued.

As regards the 1,157,626 shares issued for cash or its equivalent, amounting to £1,157,626, no question can arise. The whole of this sum is represented by cash which has been provided and expended for railway purposes, and from this point of view such minor portion of the total as represents accrued interest must obviously be equally regarded as money lent for railway purposes by the persons to whom it was due.

As regards the balance of £848,141 shares, the two Railway Companies have received the following benefits from the British South Africa Company:–

(a) Concessions which enabled the Railway Companies to build or acquire 1,994 miles of railways, with the necessary land.
(b) Land grants, carrying mineral rights: 8,000 square miles in Bechuanaland; 1,062 square miles in Rhodesia.

Note. – The revenue derived from the sale of land, leases, mineral royalties, etc., to the 30th September, 1924, has been approximately £210,000. The area of the land unsold at 30th September, 1924, was approximately 3,046,000 acres, which, at a conservative valuation, with the mineral royalties, may be put at £460,000, thus making a total estimated value of the land grants £670,000.

(c) Financial. – Guarantees in respect of debenture issues of the Railway Companies involving a liability on:
1. Interest account of £19,523,550.
2. Capital account of £6,810,000.

These guarantees enabled the two Railway Companies to raise:–
£252,870 at 3 per cent.
£3,997,130 at 4 per cent.
£5,060,000 at 5 per cent.

and without such guarantees the rate of interest, and therefore the annual interest charged, would have been appreciably higher.

The onerous character of these guarantees is shown by the fact that, out of its own general funds the British South Africa Company had at the 30th September, 1909, provided on open account and without any security whatever as much as £1,011,580 under such guarantees and for other purposes.

(d) Subsidies paid to the Rhodesia Railways, Limited, by the British South Africa Company in cash to an amount of £100,000.

(e) £150,000 ‘C’ debentures in the Beira Railway Company, Limited, which have been exchanged for £105,000 4½ per cent. debentures and £71,250 six per cent. income debenture stock.'

The public interest in the matter lies in whether or not the capital of the company has been watered, and centres chiefly on the price paid for Rhodesia Railway shares, namely, 71 £1 shares in the Trust for each Rhodesia Railway share.

The whole of the 8,000 £1 ordinary shares of the Rhodesia Railway Limited, were issued to the British South Africa Company in two distinct transactions. The total considerations given in exchange were:–

(a) Concessions which enabled the Company to build or acquire 1,396 miles of railway.

(b) Land grants, with mineral rights, of 8,000 square miles in Bechuanaland and 801 square miles in Rhodesia.

On the basis of estimation taken above the present value of these grants is approximately £655,000.

(c) Subsidies in cash to an amount of £100,000.

(d) Guarantees of interest on debenture issues of £6,250,000, and of capital and premium on £3,250,000.

It is quite clear, therefore, that these shares were of purely nominal value; the value of the cash subsidy alone was over twelve times the par value of the shares. It would be difficult to estimate the value of the land grants at the time of the formation of the Trust; the value of the guarantees to the Railway Company would be even more difficult to assess.

In the case of the Mashonaland Company, the total benefits given by the British South Africa Company were:–
(a) The concessions which have enabled the Company to build or acquire 607 miles of railway.

(b) Land grants, with mineral rights, of 281 square miles in Northern Rhodesia, which, on the same basis of valuation, are now approximately £15,000.

(c) £150,000 ‘C’ debentures of the Beira Railway Company, valued at about the same date by the Railway Company in its own accounts at £82,500.

(d) Guarantees of interest on debenture issues of £5,060,000, and of capital and premium on £2,560,000.

In return they received 225,993 £1 shares, the remaining 224,000 shares having been given to the contractors as part consideration for the building of the line. These shares were equivalent on exchange to 141,246 £1 shares in the Trust; deducting the value of the debentures this leaves 58,746 £1 shares in the Trust to set off against the considerations detailed under the headings (a), (b) and (d).

An important point to note is that at the time of the formation of the Trust 4,000 of the Rhodesia Railway shares and approximately 224,000 of the Mashonaland Railway shares were in other hands than those of the British South Africa Company, and that practically the whole of these outside shareholders exchanged into the new Trust, showing that they at any rate were satisfied with the assessment as between the two Companies.

The British South Africa Company also itself, ten years later, exchanged debts of the two Companies bearing interest at five per cent. for shares of the Trust at par, and in view of the British South Africa Company’s guarantees of interest on debentures, these debts could certainly be classed as good ones. Further, it subscribed for 25,000 shares at par.

These facts tend to show that not only was the assessment as between the two Companies considered fair by those most directly concerned, but that the values themselves were reasonable.

I am of opinion that full and adequate considerations were given by the British South Africa Company in return for the shares which it received in the Trust, and that the shares of the latter cannot in justice be considered as having been in any way ‘watered.’

I have already explained, when dealing with the Rhodesia Railways, Limited, the terms of the joint secured notes. The only points which it remains to add are that, for hire of the rolling stock purchased by the Trust out of its share of the notes, the Rhodesia Railway has only to pay an annual charge equal to six per cent., free of income tax, on that share, so that the Trust makes no profit on the rental of the rolling stock or the use of the money.
BEIRA COMPANY.

The issue and application of the capital of the Beira Railway Company* were complicated. They are thus described by the Railway Authorities in the Financial History, Appendix IV.:–

The Beira Railway Company, Limited, is peculiar in that the liability of its shareholders is limited by guarantee. It accordingly issued no share capital for cash. The members of the Company are entitled to the net profits. In order to determine the relative proportions of the interests of the members, the Company is deemed to be divided into 600,000 shares, and members are deemed to be interested in the Company in proportion to the number of such shares registered in their names. The members are liable for the capital of the Company, which consists of the amounts (not exceeding £1 per member irrespective of the number of shares held) which may be required of the members in the event of the Company being wound up during their membership, or within one year afterwards.

CAPITAL.

Authorised: 600,000 shares (no value expressed).

Issued: 295,000 to the Mozambique Company in part payment for the concession to build the railway.

305,000 (to bearer) were offered as a bonus to subscribers of the ‘A’ debentures at the rate of twenty shares for every £20 of debentures. The voting power in respect of these shares is vested in the British South Africa Company in trust until the 1st July, 1942.

ORIGINAL DEBENTURE CAPITAL.

</tr>
</tbody>
</table>

All three series of debentures were redeemable at par on the 30th June, 1922, or earlier at the option of the Company at £110 per cent. Interest was funded for three years and then paid in cash, with the exception of £9,856, which was liquidated by an issue of ‘C’ debentures at par.

* Appendices IV. and VI.
The above debentures were issued mainly for the purpose of providing funds for the construction of the original 2 feet gauge line, and for rolling stock, plant and equipment.

The discounts and expenses of issue of these debentures were as follows:–

<table>
<thead>
<tr>
<th>Description</th>
<th>Amount</th>
</tr>
</thead>
<tbody>
<tr>
<td>Total nominal amount of debentures</td>
<td>£1,099,046</td>
</tr>
<tr>

</tr>
</tbody>
</table>

Cost of discounts and expenses of issue to nominal amount of debentures ... 20.8 per cent.

It may be stated that a considerable portion of the authorized issue of series ‘A,’ ‘B’ and ‘C’ debentures were issued to the contractors at par, or at a discount, in connection with the construction of the line.

**Conversion of 6 per cent. Debentures.**

In July, 1900, the debenture holders approved a scheme for the exchange of the three series of the 6 per cent. debentures for 4½ per cent. debentures and 6 per cent. non-cumulative income debenture stock, with a sinking fund of £½ per cent., for the redemption of the debentures, to be provided out of each year’s net profits, in the following proportions:–

</tbody>
</table>

At the same time the debenture holders of the Beira Junction Railway Company were invited to exchange their bonds for the new 4½ per cent. debentures and 6 per cent. income debenture stock of the Beira Company, sufficient capital having been created for the purpose. Almost all the Beira Junction debenture holders took advantage of this offer, and the Beira Railway Company held, at 30th September, 1924, £249,821 12s. 1d. of the £249,959 6s. 6d. debentures of the Beira Junction Company. The basis of exchange was £60 of the 4½ per cent. debentures, and £55 of the Income Debenture Stock for each £100 debenture of the Beira Junction Company.

The new 4½ per cent. debentures are redeemable on 31st December, 1926, and are secured by deeds which provide for the creation of a sinking fund for their redemption. The redemption price was originally at par, but was increased
to £103 per cent. under the arrangement for the redemption of the rent charge, to which reference will be made later on. The income debenture stock is redeemable at par at the option of the Company on giving six months’ notice, expiring after the 31st December, 1926.

The main features in the conversion scheme were (1) the holders of the 6 per cent. debentures of the Beira and Beira Junction Companies were allotted in exchange sufficient of the new 4½ per cent. debentures and the 6 per cent. income debenture stock as would give them a return on their new capital equal to what they previously received, assuming that the interest on the 6 per cent. income debenture stock was regularly paid, which has not been the case; (2) that although the total interest charge remained the same, the annual debenture interest charge upon the Company was reduced from £65,943 to £37,431; and (3) to provide additional capital for purposes of the undertaking.

The nominal addition to capital, viz., £207,947, consequent upon the carrying out of the conversion scheme, has been charged to capital account in terms of the Beira Railway Act, 1914. The following particulars will show how this amount was arrived at:–

<table>
<thead>
<tr>

\]

The discount and expenses on the £123,000 4½ per cent. debentures and the £5,500 income debenture stock sold for cash, amounted to £13,586 or 10.6 per cent. on the nominal amount.

**Prior Line Rent Charge.**

In addition to the 4½ per cent. debentures and the 6 per cent. Income debenture stock, the Beira Railway Company has a further capital liability in respect of the debentures issued by the Mashonaland Railway for widening the gauge of the Beira line, improvements to the line, and for other purposes.

Reference has already been made in the memorandum relating to the Mashonaland Railway Company to the fact that the funds for these purposes were raised by the two Beira Companies creating a prior lien charge of £42,500 a year in favour of the Mashonaland Railway Company, of which the Beira Railway Company’s proportion is £35,099 9s. 10d., and the Beira Junction Railway Company’s £7,400 10s. 2d.

This rent-charge was originally irredeemable except in certain contingencies, when it became capitalised at £850,000, of which the Beira Railway Company’s proportion in respect of its line from Fontesvilla to Umtali is £701,990, the balance being a charge against the Beira Junction Railway Company. This rent-charge is now redeemable, and the two Beira Companies have undertaken to make a provision of £8,500 per annum out of the net earnings after the following charges have been met:— The annual prior lien rent-charge, the annual debenture interest, the existing sinking fund of £5,500 per annum and the interest on the income debenture stock. The Mashonaland Railway Company has undertaken to use the amount of £8,500 in the redemption of its own debentures, together with such portion of the annual prior lien rent-charge of £42,500 as will (after the first payment for redemption) be equal to the interest on the amount of debentures already redeemed. It is estimated that these annual redemptions will redeem the £850,000 debentures in a period under forty years.

The Beira Railway Company’s proportion of the annual provision referred to is £7,020. Up to the 30th September, 1924, the total amount provided towards the redemption of the prior lien rent-charge was £44,002 7s. 7d.
**Discounts and Expenses of Issue on Debenture and Income Debenture Capital and on Capital Funds obtained from the Mashonaland Railway Company, Limited, for the widening of the line and other purposes.**

As the original 6 per cent. debentures of the Beira Railway Company, Limited, have been exchanged for 4½ per cent. debentures and 6 per cent. income debenture stock, the discounts and expenses of issue on the existing capital funds of the Company may be stated as follows:– /

Nominal amount of debentures and income debenture stock of the Beira Railway Company, Limited, also the Mashonaland Railway 5 per cent. debentures, the proceeds of which were advanced to the Beira Railway Company, Limited, for widening line and other purposes £2,413,176

Total amount of discounts and expenses of issue connected with the above 307,007

Net amount £2,106,169

Percentage of discount and expense of issue to nominal amount of debentures 12.7 per cent.
‘Redemption of Debentures.

‘The 4½ per cent. debentures of the Company are redeemable on 31st December, 1926, at £103 per cent., and are secured by deeds which provide for the creation of a sinking fund of ½ per cent. for redemption purposes, to be provided out of each year’s net profits. Owing to no net profits being available, it was not possible in many years to contribute towards the sinking fund. It will be seen from particulars furnished in Schedule ‘C’ that at the 30th September, 1924, the contributions to the sinking fund amounted to £66,000 4s., and out of this sum debentures of the face value of £64,880 had been redeemed.

Consequent upon the agreement arrived at with the Mashonaland Railway Company in regard to redemption of the prior lien rent-charge by gradual payments, arrangements were approved by the Trustees and debenture holders of the 4½ per cent. debenture issue for the creation of an additional sinking fund for the redemption of Beira Railway 4½ per cent. debentures. This additional sinking fund has to be provided out of the net earnings of the Company after the following charges have been met:– The prior lien rent-charge, the annual debenture interest, the existing sinking fund of £5,500 a year, the interest on the income debenture stock, and the sum of £7,020 a year for the redemption of the capital liability attaching to the rent-charge. This additional fund is to be equal to 55 per cent. of the amount available to be paid in any one year as dividends to the shareholders, with the following limitation:– The total sum to be set aside for the additional sinking fund, plus the sinking fund of £5,500, plus the £7,020 paid to the Mashonaland Railway Company in redemption of the prior lien rent-charge, shall not in any one year exceed £50,000, that is to say, the maximum amount of the additional sinking fund for 4½ per cent. debentures cannot exceed £37,480 in any one year.

No payments to the additional sinking fund have been made to 30th September, 1924.

Act of 1914 to empower the Beira Railway Company to make Adjustments in its Accounts and for other Purposes.

In 1914 the sanction of Parliament was sought and obtained to rectify the balance sheet of the Company by increasing the value of the assets of the Company by £852,754 19s. 8d. as follows:–
Hammond, Report on the Railway System of Southern Rhodesia

AMOUNTS ELIMINATED FROM THE BALANCE SHEET.

Clause 3 (1c) of the Act also sanctions the retention in the account of the permanent way, telegraph stations, etc., and cost of widening the line; the whole cost, as included therein, of the construction work upon the original narrow gauge railway of the Beira Company.

What, in effect, Parliament was asked to say was that the expenditure upon the narrow gauge railway, the cost of its conversion to 3 feet 6 inch gauge, cost of raising the necessary funds connected therewith, also the losses made during the earlier years, though not represented by tangible physical assets, were, in fact, necessary elements in making good and proving the value of the concession and railway, and could be rightly included as part of the cost of the undertaking.

A precedent for the Beira Railway Act, 1914, is to be found in the case of the Metropolitan District Railway Company who, by a special Act of Parliament, were empowered to carry to their capital account not only all the cost
of electrification, but also all the losses during electrification until a profit could be obtained.’

It will be noticed that the discounts in the first issue of debentures were high, being about twenty per cent. Many of the debentures were issued to the contractors at 60 and 65. The rate of interest was six per cent. as compared with five per cent. on the Rhodesia Railway debentures, which were issued at about the same time.

The best test in this case is, I think, the capital cost as recorded in the Company's accounts, and the interest charge thereon. The original cost of constructing and equipping the 168½ miles from Fontesvilla to Umtali was approximately £1,023,000, or £6,070 a mile, and the interest charge approximately £61,400, or £364 a mile. The climb on to the main plateau entailed much heavier work than is to be found anywhere else on the system. The difficulties which were encountered during construction, owing to disease and the unexplored and unhealthy nature of the country, are a matter of common knowledge. Added to this was the difficulty of getting capital for a line in the colony of a foreign power, of which little was known. Bearing in mind these handicaps, I do not consider, despite the high rate of discount, that the original cost per mile or the interest charges were excessive.

The decision to widen the gauge of the line from 2 feet to 3 feet 6 inches was taken very shortly after the line was completed to Umtali. It may now appear strange that the line was not built to the larger gauge in the first place. It must be remembered, however, that the Beira line was commenced before the Bechuanaland Railway Company, the forerunner of the Rhodesian Railways, was even incorporated. Everything points to the fact that it was projected merely to give access to the new countries from the eastern coast, without any thought of ultimately linking it with a line starting from the Cape Colony system. It took much longer to build than the western line and, in the meantime, the situation had developed very rapidly. The trend of political affairs appears also to have altered materially.

I have come across nothing in my investigation which tends to show that the original decision was taken in anything but good faith. If it is called an error of judgment, it was one against which even the far-sighted vision of Mr. Rhodes was not proof, and the debenture holders have paid largely for the mistake, as only for a few years did they receive the equivalent of the full interest on the original debentures.

This widening naturally added considerably to the capital cost, but despite this disadvantage the cost per mile was still only slightly higher than £8,100. In view of the particular circumstances this was not excessive.

As regards the Beira Railway Act of 1914, all the items, with the exception of the nominal additions to capital, the loss on sale of narrow gauge rolling stock
and the debit on profit and loss account, already before the passing of the Act appeared in the capital account. It should be noted that in this case a different line was adopted in relation to discounts; nothing has been written off against them out of revenue. As it happens, it would have made no practical difference up to the time of the Act which course was adopted, as if the discounts had been written off partially out of revenue the only result would have been to swell the debit on the profit and loss account.

The item of £207,947 for nominal additions on conversion of debentures was a necessary consequence of the conversion, and no exception can be taken to it. It entailed no increase in interest charges; on the contrary, under the scheme the debenture holders could never get more interest than they did before, and could and did get considerably less.

In respect of the item for capitalising the losses on working, the Railway Authorities have quoted a precedent. The bulk of the items, as stated above, already figured in the capital account; the Act merely regularised them and moved them, so to speak, from one place in the balance sheet to another. Though no fresh capital issue was entailed, the transaction practically absorbed any balance standing to the credit of the capital account.

The net result of the operations under this Act was to allow the Company to include in its balance sheet several items of expenditure for which there were no tangible assets.

The capital cost of the railway, including these adjustments, stood in the accounts of the Company on the 30th September, 1924, at £2,240,469, or £13,297 a mile, which, for a railway of this standard, is very high. The capital, including the capitalised value of the prior lien rent-charge but excluding the debentures issued in exchange for Beira Junction Railway debentures, stood at 30th September, 1924, at £2,072,638, or £12,300 a mile.

As explained earlier, considering the difficulties, the capital expenditure was not excessive until after the passage of the Beira Railway Act. The principal causes, therefore, for the heavy capitalisation of the railway are the losses incurred during the earlier years of working and the consequent embarrassed financial situation of the Company, who was thus forced to place against capital items which, under happier circumstances, would have been recovered out of revenue. There is no evidence that this was due to mismanagement; it seems rather to have been due to want of traffic.

Three funds for redemption of capital exist. The first in priority is for the redemption of the 4½ per cent. debentures, at the rate of £5,500 a year; the instalments for the past four years have been paid, but there was a break of four years before that when nothing was paid. The second is for the redemption of the prior lien rent-charge; this is at the rate of £7,020 a year. No allocation on this
account was made until the year 1923–1924, when, in addition to the current charge, £36,982 was allotted on account of arrears. The third is for additional redemption of the 4½ per cent. debentures; no payment has yet been made to this fund. Up to date the total sums allotted to redemption of capital amount to approximately £110,000.

The ordinary shares of the Company are certainly peculiar; they are not represented by any asset. They may be regarded as merely an arrangement for sharing the surplus profits of the Company; so far there have not been any. In so far as they are unrepresented by any asset, they may be regarded as ‘water’; but, on the other hand, the 295,000 issued to the Mozambique Company were an obligation, and the remaining 305,000 were given to subscribers to the ‘A’ debentures, as an additional inducement to subscribe.

**BEIRA JUNCTION RAILWAY.**

The capital of the Beira Junction Railway* is as follows:–

</tbody>
</table>

The £249,959 six per cent. debentures were issued at a discount of £96,777, or about 38¾ per cent. This is an extremely high rate of discount, even higher than for the Beira Railway, although the rate of interest was the same. The reason for this is not apparent; the original contracts are not available in this country.

Here, as in the case of the Beira Railway, the best test is the actual cost to the Company of constructing the railway. The original cost of the 2 feet line, including interest on debentures during construction, was approximately £215,400, or

* Appendices V and VI
about £6,070 a mile for the 35½ mile length. This is practically the same rate as for the Beira line. The difficulties of the unhealthy country were worse in this case but, on the other hand, the actual construction was easier. / For a line over easy country the figure quoted is on the high side, but it looks as though a general price had been fixed to cover both railways, although there is no direct evidence on this point. On this assumption a general figure of £6,070 per mile for the whole distance from Beira to Umtali is not excessive.

All but £138 of these debentures are now held by the Beira Railway, under the exchange agreement already mentioned when dealing with the capital of that Company. They are due for redemption on 1st July, 1925, at par; presumably they will be renewed on the present terms. With the exception of £2,649, paid in 1900, the discounts on this issue have been capitalised.

The issue of £121,300 five per cent. debentures was made in 1915, to meet the following liabilities:–

(1) Arrears of interest to the Beira Railway Company on six per cent. debentures from 1st January, 1907, to 30th September, 1911, £67,300.

(2) Repayment to Mashonaland Company of sums advanced to meet capital expenditure, £54,000.

While no comment is necessary on the second item, the first transaction was for the purpose of financing past losses. A different course was pursued to that adopted by the Beira Railway Company, but, as in that case, the financial difficulties do not appear to have been due to mismanagement, but rather to want of traffic. Here a new issue was made to cover the deficiency, and a further fixed charge placed on the revenues of the Company. The interest on the five per cent. debentures was, in turn, in arrears on the 30th September, 1924, to the extent of £35,404. There was no discount on these debentures.

Besides these debentures, the Beira Junction Railway Company has a further capital liability in respect of the prior lien rent charge, on account of widening, which was fully explained when dealing with the Beira Railway Company. The Beira Junction Company’s share of the capital liability is £148,010, and the annual rent charge is £7,400 10s. 0d. To the redemption of this liability the Beira Junction Railway Company should allot £1,480 a year out of net profits, before paying interest on the five per cent. debentures; the arrears on this redemption charge were made good during the last financial year, and £14,801 in all has been allotted to this account. The discount of £14,801 on the five per cent. debentures of the Mashonaland Railway Company, raised for the purpose of widening, has been capitalised.

The 423,583 six per cent. cumulative preference shares of five shillings each were subscribed for in cash by the British South Africa Company to provide funds for the construction of a pier at Beira, usually known as the B.C.C. pier. This pier was never completed and has been abandoned. Some of the material
has been sold. No interest has ever been paid on these shares; so far as the British South Africa Company is concerned, the money thus subscribed has up to date been a dead loss, except in so far as it ensures them control of the Company.

The capital expenditure on the railway and wharves, excluding the special expenditure on the B.C.C. pier and a special item of cost of concession, to which reference is made later, amounted on the 30th September, 1924, to approximately £543,000, or about £15,300 a mile. Of this, approximately £191,100 has been spent on improvements to the line, or an average of £5,383 per mile. The bulk of this has been expended on the provision of lighter wharves at Beira, the reclamation of ground and the provision of railway facilities in connection therewith. As the railway itself is so short, only 35½ miles long, this expenditure naturally works out at a very high figure per mile. The remainder of the capital expenditure is represented by the charge of £148,000 for widening, and I have already dealt with this question when reviewing the capital of the Beira Railway. Thus, though the figure of £15,300 per mile is undoubtedly very high for a railway of this standard, there are special circumstances which, to a certain extent, account for it.

The fixed interest charges, including the prior lien rent charge, amount to £28,463, or £800 a mile. This is a very high figure, due partly to the causes mentioned above and partly to the creation of the five per cent. debentures to liquidate arrears of interest.

The 250,000 ordinary shares of five shillings each are stated in the Financial History as having been applied in payment of the concession, with the exception of seven, which were retained as Directors’ Qualification Shares. No interest has yet been paid on these shares.

BLINKWATER RAILWAY.

The authorised and issued capital of the Blinkwater Railway consists of 200,000 ordinary shares of £1 each. The whole of these shares are owned by the Beit Railway Trustees. There are no debentures.

The capital expenditure up to 30th September, 1923, was £411,750, the excess of expenditure over the receipts being met as to £175,749 by loan on open account from the Beit Railway Trustees, and as to the remainder out of the provision made for renewals.

As the line is 123 miles long, the capital cost works out at under £3,350 a mile, an extremely low figure. Not only has no interest ever been paid on the ordinary shares, but on the money advanced on open account the interest payable is limited to the annual net profits of the Company, subject to a maximum of six per cent. Also, it is not cumulative. Only in five years out of twelve has any interest been paid on the loans, and the total sums thus disbursed have only amounted to £46,517, although the advances at the end of the financial year have for the past twelve years averaged £215,980.
RHODESIA-KATANGA JUNCTION RAILWAY AND MINING COMPANY.

As this railway is not under the control of the British South Africa Company, the information obtainable locally as regards its capital is somewhat incomplete.

This Company was formed not only for railway purposes, but also to work the mineral assets of the Tanganyika Concession in Rhodesia. In order to construct the line, 132 miles in length from Broken Hill to the Congo Border, it raised in 1909 £800,000 5½ per cent. debentures, guaranteed for twenty years as to interest by the Tanganyika Concessions, Limited. The Stock Exchange Year Book shows the whole of these debentures as having been raised at par. They are redeemable at par in 1959. In addition to these debentures, the Company has ordinary shares of two denominations of £1 and 1s. each. The capital expenditure on the railway, as shown in the Company’s accounts on the 30th September, 1919, was £761,348, and since then £5,719 has been expended in Africa on their account by the Mashonaland Railway Company. The first figure apparently covers the expenses of issue and the purchase of the right to construct. The capital expenditure up to date may therefore be taken at £767,000, or at the rate of £5,800 a mile. This figure is a low one, as might be expected from the easy nature of the country traversed.

The lease of £44,000 a year, paid by the Mashonaland and Rhodesia Railways, covers the interest of the debentures, for the payment of which it is allocated.

As the Company has other interests than railways, and the debentures are secured on its other assets as well as on the railway, it is not possible to allocate the shares and debentures to any particular undertaking. All that it is possible to say is that, in addition to meeting the service of the debentures, the railway paid to the Company a profit of £24,251 in the year ended 30th September, 1923, and £35,115 in the year ended 30th September, 1924.

CAPITAL EXPENDITURE OF THE WHOLE SYSTEM.

In the detailed scrutiny above I have indicated those directions in which there appears to have been unusually high capital expenditure. It has been necessary to treat the Companies separately because, amongst other reasons, higher rates are in force on the Beira-Salisbury section than on the rest of the main line. Also, the Rhodesia Railways, Limited, gives to this section twenty per cent. more than its mileage proportion of the receipts from traffic between Beira and points west of Salisbury, besides paying £10,000 a year to the two Beira Companies to compensate them for the suspension of transit dues. The reason given for the first grant is that it is made to compensate that section for the higher costs of working and the lower graded traffic which it carries. Their financial situation is also obviously
responsible as well. In this manner the stronger company comes to the assistance of the weaker ones. / 

If the capital expenditure of the whole system is averaged out, it will be seen that it is extremely low; the sections where high expenditure was incurred form only a small proportion. The total capital expenditure may be summarised as follows:–

<table>
<thead>
<tr>
<th>Railway</th>
<th>Capital Expenditure.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Rhodesia Railways, Limited</td>
<td>£8,499,304</td>

</tr>
</tbody>
</table>

The figures for the Blinkwater Railway are only up to 30th September, 1923, whereas the remainder are up to the same date in 1924, but the expenditure on this line has been small during the past year and does not affect the total materially.

The following table compares the capital expenditure on the Rhodesian system with other railways in Africa, all of which are either 3ft 6in. or metre gauge:–

<table>
<thead>

<td>397</td>
<td>16,297</td>
</tr>
</tbody>
</table>

The face value of the capital issued on account of the Rhodesian system, excluding the ordinary shares of the Rhodesia Railways, Limited, and the Mashonaland Railway, and including instead those of the Rhodesia Railways Trust, amounts to £18,388,173, plus 600,000 shares in the Beira Railway Company (of no expressed value), or £7,469 a mile.

The Rhodesian system has not been built to the same standard as the others, nor has it undertaken any new construction since the war, but after making full allowance for these facts, it will still remain at a figure far lower than any. This is accentuated by the fact that in the case of the South African, Nigerian and Gold Coast Railways, discounts and expenses of issue have not been included in the figures given. In fact, it would be difficult to find anywhere in the world a railway
system whose share capital or capital expenditure is so low as this one in proportion to its mileage. The public served by the Rhodesian system get the advantage of this low over-all capitalisation indirectly as well as directly, because it enables the lower capitalised members, such as the Rhodesia Railways, Limited, to assist the others financially.

Special reference is made in the Letter of Instructions, paragraph 3, to capital expenditure on works which have been abandoned subsequently. The only considerable items which come under this heading are the widening of the lines of the two Beira Companies, and the B.C.C. pier at Beira. The transactions connected therewith and the results on the capital expenditure have already been explained.

**REVENUE.**

The revenues for the years ended 30th September, 1923 and 1924, as contributed by the various sections of the railway system [...]. It will only be necessary to note here the salient features. The total revenues for the whole system for 1923-1924 were £3,411,134, of which £383,833, or 11.25 per cent., came from passengers, parcels and luggage, £1,237,733, or 36.27 per cent., from general goods, £477,169, or 13.99 per cent., from coal and coke, £857,006, or 25.12 per cent., from minerals of all descriptions, £87,443, or 2.56 per cent., from livestock and vehicles, and £45,885, or 1.35 per cent., from maize and maize meal for export. There had been a general increase of £389,500 since the previous year, of which the bulk had been contributed by an increase of £150,284 in general goods, £106,856 in copper for export, and £77,046 in chrome ore. Maize and maize meal for export decreased by £4,447, and in the year 1922-1923 these contributed 1.66 per cent. of the total revenues.

For the eight months ended 31st May, 1925, there has been an increase of £434,856 in gross revenue, when compared with the corresponding period of the previous year.

In order to allocate the revenue and ton-mileage more closely to the various commodities and classes of traffic than is usually done on these railways, the commodity ton-mileage and goods revenue statistics [...] were compiled. To obtain these figures practically every invoice has to be dissected, and ton-mileage figures have to be worked out therefrom. To have done this for the whole year was clearly out of the question, owing to the labour, time and expense involved. It was therefore decided to prepare them for the most representative month, and October, 1923, was chosen, as the earnings during that period bore the closest proportion to the total earnings for the year. These statistics are based on the total revenue from goods carried for the public, and earnings from railway stores and coal, pier dues, livestock and vehicles, telegraphs and mails, rents and sundry receipts are excluded. They show that 38 per cent. of the total public goods
revenue was derived from goods carried at class rates, the remaining 62 per cent. being from traffic at special rates. Out of this 62 per cent., 16.41 per cent. of the goods revenue was derived from copper for export, and 18.32 per cent. from coal and coke. The proportions of chrome ore and maize for this month are not typical, as the traffic in the former was being restricted in favour of the latter; these are obtained more accurately from the annual figures, which show that export maize and maize meal traffic was 1.69 per cent. of the total revenue from public goods traffic. As the ton-mileage figures show that revenue from local traffic and traffic to the Union in maize and maize meal is in the proportion, approximately, of 4½ to 4 to the revenue from export, the total traffic in those commodities may be said to bring in as nearly as possible 3.6 per cent. of the total revenue from public goods traffic. Chrome ore brings in annually about 7.32 per cent. These are the only commodities in which the monthly figures may be called unrepresentative of the year to any marked degree.

The statistics show further that the average rate received per ton mile on public goods traffic is 1.06 pence; the only comparative figure which I have is from the Nigerian Railway for 1923–1924; this was approximately 2.08 pence. The Rhodesian figure is at a low level owing to the high proportion of low-graded traffic and the long average haul. This is illustrated by the fact that maize and maize meal, railway construction material, coal and coke, lead, chrome ore, asbestos and copper, which are the heaviest traffics, although they account between them for 79 per cent. of the ton-mileage, only furnish 53 per cent. of the total goods revenue, and earn less than ¾d. a ton a mile.

The same statistics taken out for the portion of the railways inside Southern Rhodesia show that the average rate per ton mile is 1.01 pence, and that the same commodities, as mentioned above, produce 81 per cent. of the ton mileage and earn 54 per cent. of the revenue, with an average ton-mile rate of two-thirds of a penny.

Of the individual average rates per ton mile, the most important are local maize at 1½d., export maize at .36d., chrome ore at .46d., copper at 1d. and coal at ½ d. The average rate for all class traffic is 3.23d. per ton mile.

In order to ascertain the revenue which was derived from goods traffic within the boundaries of Southern Rhodesia for the year ended 30th September, 1924, the invoices for that year were dissected and allocated. The results show that the revenue was £1,285,192 out of a total of £2,806,863; it was necessary to include in both these figures the revenue from fuel and stores for railway use. The revenue from traffic worked in Southern Rhodesia was thus 45.79 per cent. / of the total from public goods traffic. Out of this £1,285,192, £253,734, or 20 per cent., was from local traffic from point to point within Southern Rhodesia; £550,780, or 43 per cent., from traffic between points in Southern Rhodesia and points outside, and £480,658, or 37 per cent., from traffic in transit through.
The figures which have been extracted for the traffic with Congo show that the goods and livestock revenue therefrom amounted to £1,229,327, of which livestock accounted for £17,544. The parallel figures, including livestock, for the whole system were £2,795,222. Revenue from the carriage of railway stores and coal is, of course, included in neither case. The receipts from Congo traffic contributed, therefore, 44 per cent. of the total revenues of the whole system from goods and livestock, a striking indication of the importance of that traffic. Of the total increase in revenue of £434,856 for the eight months ended 31st May, 1925, as compared with the corresponding period of the previous year, approximately £280,000, or 64 per cent., has been contributed by traffic to or from the Congo.

WORKING EXPENDITURE.

In my examination of the working expenditure and administration of the system, the main point which I have kept in mind has been the result to the public as reflected in the charges. I have not attempted a minute scrutiny of each particular operation or office, in order to show where minor economies could be effected. That I do not conceive to be the object of this enquiry, which should aim rather at ascertaining whether the railway business is being conducted, in general, with such a measure of efficiency as to ensure that the net revenues are not being diminished nor the rates charged to the public enhanced to an appreciable extent by mismanagement or waste.

In many cases the surest standard by which to judge the efficiency of a railway is to compare the results obtained with those reached by other railways working under conditions which are as far as possible analogous. The difference in the wages paid, however, makes it not only difficult, but also unreliable to compare units of work done against the respective costs, and it is not easy in all cases to obtain the actual figures of cost. Therefore, where comparisons have been drawn with other systems, I have adopted standards which are as far as possible applicable to all. Thus I have compared the amount of labour employed per mile on maintenance, and the mileage obtained from engines and rolling stock, etc., rather than the actual cost per unit of performing the various operations. Even so, local conditions, such as the length of haul and the quality of the labour, prevent these comparisons serving, in many cases, as more than a general guide.

TRAFFIC DEPARTMENT.

Taking first the working of the Traffic Department, as that is the one most closely in touch with the public, the organisation is on the ordinary district basis, with headquarters at Bulawayo. I examined the methods of traffic operation and control of movements, and satisfied myself that these give good results, as far as the limitations of the departmental system permit. In this connection a good guide
Communications in Africa, 1880–1939: Volume 3

A railway obtains from its goods wagons, with the same proviso, of course, as to local conditions. The following table gives statistics of the working of goods vehicles on various African railways, according to the latest figures obtainable; some lines, such as the South African, do not publish vehicle mileage statistics, and therefore are not included. In the case of the Rhodesian system, the average number of trucks on the system has been taken, and not the actual number owned; this is a fairer test, as all the other lines quoted are disconnected and have no exchange of stock with foreign lines. /

</table>
It will be seen that the Rhodesian system compares very well with any of the others; it also shows a progressive improvement. It has, however, advantages in its long average haul of 478 miles and in the fact that much of its traffic is not seasonal, and so gives employment to the trucks during the whole year.

Another test of operating efficiency is the average time taken by trucks in transit. For this purpose I chose certain transits and had the average time taken for them worked out. The average transit time for copper from Sakania to Beira, a distance of 1,467 miles, was 12.0 days in January, 1925, and 13.3 days in April, 1925; and for chrome ore from Selukwe to Beira, 583 miles, for the same months 6.0 and 7.8 days respectively. In October, 1924, the average transit time for trucks of general goods from Beira to Sakanin was 9.3 days. The average time for the round trip for wagons containing coke, taken from the departure from Sakania of the empty trucks to their arrival there loaded, varied in the last eight months of 1924 from a minimum in October of 10.33 days to a maximum in July of 12.41 days. In January the effect of the rains started to make itself felt and caused congestion, with the result that the average rose to 14.06 days. The effect of this congestion is also seen in the increase of the April transits from Sakania and Selukwe as compared with the January ones. The cause of this is, however, outside the control of the agency under immediate review, the operating branch, and the figures given show that trucks are forwarded with good despatch and, under normal circumstances, no unnecessary delays occur en route.

The figures for the average time taken during the months of November, 1923, November, 1924, December, 1924, and January, 1925, between the receipt of consignments in the goods sheds at Beira and their despatch by rail, were respectively 1.29, 1.58, 1.71 and 1.78 days. In November, 1923, 75 per cent. of the consignments were forwarded either the same day or the day following that on which they were consigned; in November, 1924, 66 per cent.; in December, 1924, 62 per cent.; and in January, 1925, 57 per cent. Practically the only traffic which was not despatched on the second day after receipt was either oil or pier traffic awaiting the completion of the consignment before it could be despatched, or traffic from the Trans-Zambesia Railway, which has to wait for the weekly train service. The figures for November, 1923, are good; those for November, 1924, although not so good, call for no serious adverse comment, except that it is to be regretted that the high standard, previously reached, has not been maintained. The figures show that there is no undue delay between the time when the railway receives the goods, fully consigned, and their despatch.

Complete operating statistics for each section are compiled in the Traffic Manager’s office, giving figures for tractive, gross and net ton mileage, the various relations between them and to the train engine hours, together with average train loads, and train mileage in relation to train engine hours. I satisfied myself that not only are these figures compiled, but that they are used both by the Traf-
fic Manager and by the General Manager; in this way it is possible to keep a close check on the working of the outside districts.

[...]. The proportion of gross ton miles to tractive ton miles is a measure of the use made of the power supplied. In 1924 this figure was 81.38 per cent.; the Uganda Railway, the only one whose figures for this are available to me at the moment, had in the year 1923 a proportion of 86.91 per cent., and in 1924 of 87.47 per cent. The latter may be called distinctly good figures, and the Rhodesian one a fair average.

The train miles run per train engine hour provide a check on delays and afford an indication as to the work obtained from engines whilst actually employed. The figure of 14.86 for 1924 is satisfactory, considering the quality of the track and the speed of the trains.

The proportion of train mileage to engine mileage shows the percentage of power employed on other services than the actual hauling of trains, that is, on such tasks as shunting, assisting and running light, which may be classed as unproductive. In 1924 the Rhodesian system had a train mileage of 3,058,222 and an engine mileage of 3,659,551, or a percentage of 83.5. The South African Railways, in the year 1923–1924, had a percentage of 78.8, and the Uganda Railway, in 1923, had 81.7 and, in 1924, 84.7. Local conditions, such as the amount of assisting work necessary on the South African Railways, prevent an exact parallel being drawn, but the figures show that the Rhodesian system is at least on a par with the remainder, and that watch is kept over such matters as the employment of shunting engines, which otherwise can become a fruitful source of waste. A good sign in these figures is the improvement shown each year in the majority of items. This remark does not apply, of course, to the six months ended 31st March, 1925, but, as explained, these were affected by abnormal circumstances.

The increase in train load in 1922 is due to the advent of some more powerful engines in July and August, 1921, but increases since then and the improvement in the other heads can rightly be claimed by the management as due to better working. The difficulties of the past wet season, and the effects of traffic working, are well illustrated by the falling off in the statistics for January, February and March, 1925.

The systems of consigning and invoicing goods and of station accounting are similar to those used in England and the Union, and call for no comment.

From examination of the staff records and from inspection, the staff does not appear excessive; on the contrary, owing to the use of intermediate crossing places where no resident staff is maintained, and the distance between stations, the numbers employed are probably below the average, but it is impossible to give under this head exact figures capable of comparison.
LOCOMOTIVE DEPARTMENT.

The total of locomotives in the books of the Locomotive Department is 127, and a further two are on loan from the South African Railways Administration. Twelve engines of the Garrett type are on order.

The number overhauled during the past five years has been an average of 72,706 each year, or, put differently, approximately 60 per cent. of the engines have received an overhaul each year. The average mileage run between overhauls during the year 1923–1924 has been 42,132 for the main line and 41,066 for branch line and shunting engines. Taking the various classes of engine, the largest main line type, the 11th class, has averaged 42,567 miles between overhauls during the past five years, and the most numerous, the 9th class, has averaged 41,769 miles. Of the smaller engines, the 7th class is the most important, and they have averaged 42,239 miles between overhauls. [...]

The figures usually allowed for general overhauls are once in every two years, or after a mileage of 60,000. The policy adopted hitherto on the Rhodesian system has been to give lighter overhauls than is the usual practice, but to give them more frequently. It is now the intention to alter that policy, and to give more complete but less frequent overhauls. I think, personally, that the change in policy is correct, but it is largely a matter of opinion, and the figures quoted show that no serious exception can be taken to the results obtained. The stock has been maintained in good condition and at reasonable cost.

The average time taken for a general overhaul during the past five years has been 49.18 days for main line and 60.47 days for branch line and shunting engines. These figures, and especially the former, are distinctly below the average, as might be expected from the policy adopted up to date, and the only comment called for is that they show that the engines have not spent an unduly long time either under or awaiting repair. This is also borne out by the next statement in Appendix XX (not included), which shows that during the past five years locomotives have spent only 8.62 per cent. of their total time under overhaul.

Turning to running performance, during the year ended 30th September, 1924, the average miles obtained a year from each main line engine in service ranged from 39,984 for the 10th class to 34,895 for the 8th class. The two most important classes, the 9th and the 11th, averaged 39,768 and 35,654 respectively. On the Nigerian Railways the average mileage obtained from engines in service was 23,006 in 1921–1922 and 20,365 in 1922–1923. The average mileage on the Rhodesian system for all engines, including those under repair, was 28,890; this figure compares with 26,020 miles on the South African Railways for the year ended 31st March, 1924, and 27,605 for the year ended 31st March, 1923. On the Uganda Railway the average mileage, on the same basis, for 1923 was 17,384 and for 1924 was 24,623. The Rhodesian figures are distinctly good,
and prove that full value is being obtained from the capital locked up in the locomotives. This is due mainly to the use made of the system of double-trips and caboose-working. At the same time, the figures given for repairs show that this mileage is not being obtained out of the engines to the detriment of their upkeep. It is proposed to extend the system of double-trips to two new sections, which will further improve the mileage figures.

The number of engine failures is not so satisfactory. In 1923–1924 the number of failures was 200, of which 72 were total and 128 partial; this worked out at an average of one total failure per 50.83 thousand miles run, one partial failure per 28.59 thousand miles and one total or partial failure per 18.30 thousand miles run. The method of classifying engine failures varies on different systems, so that it is difficult to quote any direct comparisons, but from my personal experience I am in a position to state that the figures of the Rhodesian system show that the percentage of failure is higher than in ordinary practice, including therein lines on which native artisans are mainly employed. The redeeming feature is that there has been a marked and progressive improvement in the past five years; in 1919–1920 and in 1920–1921 the failures averaged nearly three times as many as in 1923–1924. The figures for the first five months of the current financial year show one failure of every kind to 20.41 thousand miles run; while no exact comparison can be drawn with a whole year, owing to seasonal variations, this indicates that the improvement is at least not being lost. The present situation, although not satisfactory, cannot be regarded as having any appreciable effect on the working expenses, but rather as capable of improvement and requiring attention for that reason.

As regards the coal consumption per engine mile, the 9th and 11th classes consumed respectively in 1923–1924 68.19 and 71.19 lbs. of coal per engine mile. After taking into account the comparatively high calorific value of Wankie coal, 13,433 B.T.U., these results can still be regarded as a good average, more especially that of the 11th class engines, with their higher tractive force. The high figure for the 8th class engine, 81.84 lbs. per engine mile, is due to the fact that they are the only main line engines which are not super-heating.

The consumption of oil of all descriptions per 100 miles is 5.61 pints for the 11th class engines, 5.31 pints for the 9th class, 9a and 10th classes, 4.90 for the 8th class and 4.85 for the 7th class engines. No fault can be found with these figures, and it was clear to me during my inspection that a good watch was being kept on this important item of expenditure.

In regard to the upkeep of vehicles, the only point to which it is necessary to refer is that of hot axle boxes. I was able to satisfy myself that in all other respects the vehicles were being maintained properly and that the number awaiting repairs was negligible; also that the facilities for repairs were adequate, and that the number under repair at any time was not disproportionate.
In the case of hot axle boxes, the statistics for the four calendar years ended 1924 show that the situation in 1921 was very bad; 5,667 cases occurred, and one axle box ran hot for nearly every 1,000 miles run. There was a marked improvement in 1922, the number of cases dropping to 1,393, and being thus reduced by over 75 per cent. In the year 1924 the total had been reduced to 542, or one-tenth of the number for 1921, and the average per 1,000 miles to .008, or one-twelfth of that for 1921. But, great as the improvement has been, the number of hot axle boxes is still higher than it should be. As in the case of engine failures, the present situation, although calling for improvement, is not such as to affect the public materially, either through the extra expenditure incurred or the interference caused to the service. The same report, however, could not have been given of the situation in 1921.

The main workshops are situated at Bulawayo and subsidiary ones at Umtali. The former are of modern construction and equipment, and the two together provide adequate facilities for the upkeep of the present stock of locomotives and vehicles, and of a small addition thereto. The Bulawayo shops are also capable of further extension when it becomes necessary. As mentioned earlier, the average times taken for general overhauls are not excessive.

The control of expenditure is mainly in the hands of the Chief Locomotive Engineer, in whose office the figures as to costs and moneys spent are compiled. The object of this procedure is to relieve the Works Managers as much as possible of clerical work, and so leave them free for personal supervision. While this enables a reduction in clerical staff to be made at the shops themselves, the Works Managers, who do not receive from the Chief Locomotive Engineer any figures as to their expenditures, are left very much in the dark as to the results they have achieved, when judged by the standard of money spent.

The Works Managers undoubtedly supervise the work in the various shops closely, and I satisfied myself by inspection of the shops and returns that it is executed with reasonable despatch and economy, but it would give the Works Managers a surer test by which to judge the work done if the Chief Locomotive Engineer informed them of the cost of doing it. I am not advocating the initiation of an elaborate system of costing every job undertaken, as that saves less than it costs in extra staff, but in the case of larger jobs, e.g., that of the general overhaul to an engine, the possession by the Works Managers of knowledge as to the cost enables them to keep a surer grip over the expenditure, and to see whether or not they are making any improvement in this important respect.
DIVISIONAL SYSTEM OF OPERATION.

I have stated earlier that the results of operation may be considered good within the limits of the departmental system. That system is the traditional one associated with British railways. The alternative is the one known as the ‘divisional’ or ‘transportation’ system. The essential difference is that in the latter the running of locomotives, the responsibility for their use and the charge of the locomotive running staff, are combined with the operation of traffic and movement of trains into one department, which is often, though not always, responsible also for the maintenance of track. In the other system, the Locomotive Department is alone responsible for the running of locomotives and for their charge, whether on the road or in shops, and the Engineering Department for the maintenance of way and works, while the Traffic Department looks after the movement of trains and vehicles, and has supervision over the guards and conductors as well as the station staff.

The advantage claimed for the divisional system is that everything connected with the operation of transportation is under one head, both throughout the railway and in the districts or divisions into which the railway is split. There is thus more unity of effort than in the departmental system, where not only questions of principle, but matters of detail have to be referred to headquarters should the local representatives of the departments be unable to agree. Even at headquarters, unless the departmental chiefs agree, the decision of the General Manager has to be sought on comparatively trivial matters. This only occurs, it is needless to say, in extreme cases, and it is fair to say that I did not notice any evidence in the Rhodesian system of inter-departmental disputes at the present time, but there was evidence that it had occurred in the past, and it is always liable to recur. Even if the relations are harmonious, there cannot be the same unity of effort when two have to combine as where one man is solely responsible. He can look at all aspects of any particular question and make a decision on the general merits, whereas in the departmental system the traffic man and the locomotive man are bound to regard everything in the first place from their particular standpoints. They would not be human if they did not think first of how a proposal would affect their own particular costs of working, by which they are judged, but the divisional man is judged by the costs of operation as a whole, and so can take a wider view.

On a lengthy or widely spread system, where several days may elapse before a final decision can be obtained from headquarters, the divisional system is obviously placed in a still better position.

That these benefits are not merely theoretical is shown by the number of railways who have in recent years changed from the departmental to the divisional system, whilst there is no single instance of which I am aware of the reverse. The
Central South African Railways adopted the latter system in the year 1909, and, when the Union of South Africa was formed, it was extended to the whole of the South African Railways. It was inaugurated in the Uganda Railway as the result of my recommendation in 1922, and subsequent annual reports have borne witness to the advantages gained. It was introduced on the Great Indian Peninsula Railway in 1923, and the Chairman in his speech at the annual meeting the following year stated that, thanks to its adoption, the railway had been able to load and move more wagons than ever before in the busy season, though the wagon stock was much reduced, as reflected in the wagon balance account with other railways. The New Zealand and the Madras and Southern Mahratta Railways are making arrangements to change their organisation in the same way, as also, I understand, is the Nigerian in consequence of my recent report on that railway. Finally, in England, the home of the departmental system, both the London, Midland and Scottish and the London and North Eastern Railways have modified schemes in force. Throughout the United States and Canada the divisional system has always been the rule, probably due to the immense distances, which disclosed in early days the defects of the alternative method. This is a formidable array of evidence, against which it is impossible to place, as far as I know, any instance of a change in the other direction.

The Rhodesian system is long and scattered; though its headquarters are placed centrally, the distance to either end, where most of the traffic originates, is at least two days by the fastest train. A divisional organisation is therefore well adapted for its needs, and I am of opinion that its introduction would reduce the costs of operation. It is impossible to give any accurate forecast as to the amount, because the effect would be felt mainly in the shape of better use of locomotives, rolling stock and staff, all items difficult to assess, rather than in elimination of offices and consequent reduction of clerical staff.

The General Manager is, in principle, in favour of the adoption of the divisional system, and had a scheme prepared as early as 1921 with that object. The obstacle which apparently stands in the way is that the senior staff of the two departments principally affected, the Traffic and the Locomotive, has been weakened recently by resignations and death, and the General Manager is unwilling to incur the dislocation, which the inauguration of a new organisation would entail, until the personnel has been strengthened. I think, on the contrary, that the longer the alteration is delayed the greater the dislocation which will occur, especially with the large increase in the Congo traffic which may be anticipated shortly. I am of opinion, therefore, that the sooner the new system is brought into force the better; the advantage will be reaped when the heavier traffic has to be handled.
ENGINEERING DEPARTMENT.

I have stated earlier that the whole system, despite certain improvements, still remains, as regards its track and formation, a pioneer line. The formation is narrow, and no stone-ballast is laid except in a few spots. A line of this character is admirably suited for the early days of development, when traffic is scanty and only a few trains are run. Even if trouble is experienced during the rainy season and derailments occur, it is not a matter of supreme importance. It is much better to have a few derailments and washaways than to burden the railway at its start with excessive interest charges. It is unfortunately only too often that one sees new lines built to an extravagant standard, when all the traffic which they will carry for the first few years cannot exceed two or three trains a week at the outside. But, once the traffic reaches any considerable dimensions, the track must be strengthened to carry it. It is not only that the extra number of trains does an increasing amount of damage to the track, but derailments and interruptions disorganise the traffic to an extent which increases out of all proportion.

During the year ended 30th September, 1924, the Rhodesian system carried 1,351,188 tons; the tonnage on the Beira-Salisbury section was 584,568, and, on the Salisbury-Kalomo section, 984,135 tons; the average per day over the whole system was 3,700 tons, and on the heaviest section was 2,700 tons. Much of this traffic is also in full truck loads of heavy commodities like chrome, copper and coal. A railway carrying this traffic can no longer be classed as a pioneer line for development purposes; it has long passed that stage. The consequence of attempting to run traffic of these dimensions over an unballasted line is illustrated very well by the number of derailments* which have taken place. In the year 1921–1922 there were 253 derailments; in the year 1922–1923, 482; and in the year 1923–1924 there were 252. The rains during the wet seasons of 1921–1922 and 1923–1924 were light, which accounts for the smaller numbers, but even these figures, namely, 253 and 252, are high. All these figures, however, are completely overshadowed by those for the past wet season. This brought the heaviest rainfall that has been known for many years, and it showed up in a very forcible manner the weakness of the track. In the three months January to March, the derailments reached the alarming figure of 586, or over seven a day; of these 78 entailed a delay of over six hours each. This delay does not measure the dislocation of traffic, because it is merely the time taken to get the line clear and open for working; the effect of the interruption is felt all down the line and in an increasing degree. During the same period twenty washaways occurred, exclusive of the big break at the crossing of the Pungwe River, which suspended traffic for twenty-four days; this is excluded, as it is a special case requiring special treatment, and therefore must not be confused with
what I may call the every-day washouts and derailments. The consequences of these were very serious and far-reaching; they were, of course, accentuated by the Pungwe break, but long after the time lost through that should have been regained, the constant interruptions interfered so seriously with the movement of trains and rolling stock that the arrears of Wankie traffic have not yet been overtaken, and until well into April most of the passenger trains were running hours late. Nor are the effects limited to the traffic; in addition to the heavy cost and damage due to the derailments themselves, large overtime payments had to be made to the train and maintenance staff, and, quite apart from the expense and waste of overtime, the effect of long hours on the staff is in itself bad.

The gravity of the situation has been recognised by the Boards in London. I have seen the correspondence which has passed between the General Manager and the London Office, as a result of which the General Manager has been instructed to prepare a programme for ballasting the main line throughout with stone, widening, lifting and draining as necessary. In the letter calling for this programme it is stated that it is the intention of the Boards that the work should be completed in five years. The estimated cost is £982,000, which for the 1,461 miles of main line works out at £672 per mile. A programme of this magnitude cannot be carried through in a short space of time; engines and rolling stock have to be obtained, if there is not sufficient surplus available locally, new quarries have to be opened along the line, special traffic arrangements have to be made, and the whole undertaking requires some time to get under way. I do not consider that five years is at all excessive, but every effort should be made to keep up to programme.

The organisation of the Engineering Department follows ordinary departmental lines, and calls for no comment. The low standard of the track makes it very difficult to judge the efficiency of the department, because in the rains of the last wet season it was humanly impossible to keep an unballasted road in order under so heavy a traffic. The derailments added to the difficulties, because so much of the time was spent on them and constant attention had to be given to the specially weak spots, to the detriment of the rest.

The main expenditure of an engineering branch is on labour; it always provides more than half, and often runs up to as high as two-thirds of the total. On the Rhodesian system the lowest number of natives* employed on the track during the year 1923–1924 in any one month was 1.83 per mile, which increased to a maximum of 2.75 during the rainy season. The European gangers averaged .149 to .169 per mile. This figure includes inspecting staff, so that the average length may be said to be slightly more than seven miles. The maximum is about eleven miles, decreasing to about six on the worst section east of Umtali. These figures are very low. The average number of men allowed per mile in India is two; in Nigeria, where only a small proportion of the line is unballasted, the average
per mile in 1924 was 3.04. On the Uganda Railway, where the track and conditions resemble more closely those in Rhodesia, although of a higher standard, the number employed per mile in 1922 was 3.2. The figures for Uganda and Nigeria are certainly on the high side; those for Rhodesia, on the other hand, are much below the average, lower, in fact, than I think advisable for this class of track.

Turning to expenditure, the cost per mile in Rhodesia for maintenance of track was £135 0s. 5d. For the whole work of maintenance of way, works and buildings it was £154 per mile. In Uganda, in 1924, the figure was £181, in Nigeria £178, and on the South African Railways £237 per mile. No strict comparison can be drawn between these figures, and especially with the last, because the conditions on the South African Railways as regards the track itself and the speeds run over the main lines are so different, but it is sufficient to show that the Rhodesian figures are distinctly low. I am very doubtful, however, whether in this case a real economy has been effected, and whether the expenditure of more money on maintenance would not in the end have proved the truer economy. The past season has certainly produced rains which have easily exceeded those of any previous year since records have been kept, and the Railways contend that it would be unfair to expect them to be prepared for something which was quite out of the ordinary. But on the other hand, the derailments of previous rainy years, such as 1922–1923 when there were 482, are by no means negligible. On the contrary, they are far higher than one would expect to find. Even though a programme of ballasting was not undertaken, which in the light of after events would certainly have been the wisest course to pursue, I think a certain improvement could have been effected by a larger expenditure on maintenance. The length of line for which a ganger is responsible is certainly above the average, especially on unballasted track with this traffic. In tropical rains it is practically impossible for a man to maintain efficiently a length of eight miles with many sharp curves and narrow cuttings, such as are found on the heavy grades in Portuguese East Africa. The difficulty in making them smaller lies partly in the spacing of the gangers’ cottages; to have shortened the length would have meant building a large number of new houses, which would in turn have become useless when the ballasting is completed and the gangers’ sections can be again lengthened. I think the difficulty could have been met by the use of temporary houses, or wood and galvanised iron buildings, which could have been removed elsewhere when not required.

I do not mean to imply that the whole of the trouble of the past season could have been avoided, or that once the rains had started the employment of large numbers of extra men, who would necessarily have been entirely new to the work, would have afforded much relief, but I am of opinion that if the lengths had been shorter, say, five to six miles in the bad sections, and a proportionately
larger force of labour had been employed habitually, the number of derailments in previous rainy years would have been reduced and a certain amount of relief given, even in the past year.

STORES DEPARTMENT.

One of the first items which strikes the eye of anyone reading the report of the General Manager and the published accounts is the large sum shown in the assets under the heading of ‘Stores on Hand.’ Apart from the loss of interest on the money thus locked up, it is a possible means of creating reserves, although a clumsy one for the very reason that no interest is being earned.

The store-holding Company is the Rhodesia Railways, because it is the one in the best financial position. The other Companies buy their stores from it as required.

The statement of assets* in the General Manager’s report for 1923 shows the value of stores in hand and in transit on the 30th September, 1922, as £1,009,649; by the 30th September, 1923, this figure had been reduced to £840,755, and by the 30th September, 1924, to £783,409. Although there has been a marked reduction in the past two years, the value of the stock in hand still appears to me to be too high. The value of stores issued for the year 1923-1924 was £537,640, so that the stock carried represents about 1½ years’ consumption.

The normal time which elapses between the despatch of indents and the receipt of stores from England is six months. Some of the stores are purchased / locally, and are therefore obtained in a much shorter time than this. For stores received from England it would not be safe to work on a lower margin, for items of everyday consumption, than would be provided by nine months’ stock. Allowing for a normal stock of spares, this would give a stock on hand of the value of about £500,000, and this I consider should be adequate. On the Nigerian Railway the stock on hand on the 1st September, 1923, was £257,735, for a line 1,126 miles [illeg]ong; on the Uganda Railway the value at the end of 1924 was £314,263, for a mileage of 940.

The principal cause for the present excess is the large quantity of locomotive, carriage and wagon spares held. The stock of stores held specifically for this Department amounted, on 30th September, 1924, to over £389,000. While it is only prudent to hold sufficient to ensure that, in the event of accident, locomotives and rolling stock are not kept idle, waiting for the receipt of spare parts from England, it is wasteful to maintain large stocks of parts which require to be replaced very infrequently. The custom in the past has been to stock three or four parts of this kind where one article, or at the most two, would have been ample to guard against any probable contingency. To quote examples from those which
came to my notice when examining the stores and the books, four pairs of connecting rods are stocked for 9th class engines; there has only been one pair issued since the beginning of the year, and a pair to replace it was at once ordered. For the 11th class there are four spare pairs of connecting rods in stock, and none have been issued since 1921. One hundred compensating beam link pins for 11th class were in store in July, 1922; since then only 33 have been issued.

The chief blame in this matter lies with the Chief Locomotive Engineer, because it is a technical matter in which the Stores Superintendent has little say. The Locomotive Engineer likes to have a large reserve; the loss caused thereby does not appear in the running costs and is not debited to his Department. He is, in fact, working on a large margin at someone else’s expense. It is only just to the present holder of the office to say that the large orders which gave rise to the present excess were placed before he was appointed.

It is unfortunate that a large part of the locomotive spares were ordered when prices were very high, and it will take a long time to work off the surplus stock. Efforts are, however, being made to sell the surplus to other Railways, such as the South African, who have the same classes of engine. If these efforts are unsuccessful, it will take some time to work down to the total stock figure of £500,000 which I have named.

I have seen the correspondence which has taken place between the General Manager and the London Office regarding the whole subject, and it is clear from this and from the statements in the annual reports that the Railway Authorities had already recognised that the stocks were too high and were endeavouring to reduce them. Precautions against excessive ordering had also been taken.

No attempt has been made to write down to present-day values stocks still held which were purchased at the high prices ruling shortly after the war. These are still shown in the accounts at the price paid for them.

A stores stock adjustment account is maintained by means of contributions of one per cent. on the cost of stores, other than permanent way material. The average amounts thus set aside have been £3,000 a year, and the credit of the account on 30th September, 1924, was £38,189. The objects of this account are to adjust differences in stock verification and to provide funds to compensate for loss or wastage from obsolescence. I have no adverse comment to make as regards the maintenance of this account.

The Stores Department is worked on the same principle as on the South African Railways. The overhead charges of the Department are met by adding certain percentages to the cost of articles when issued to Departments. In this way there is no separate heading in the accounts for the costs of the Stores Department, but they are distributed amongst the other Departments in proportion to the work performed by them. The system is a sound one, and now that a Purchasing
Board has been established to keep a check on indents, the organisation appears well adapted to guard against a recurrence of over-ordering. / GENERAL ADMINISTRATION.

This examination of the principal departments of the Railway Administration shows that there are no evidences of mismanagement or waste, such as would affect the net revenues or the rates appreciably. I have criticised certain features, but in most cases, and certainly in all the more important ones, the Railway Authorities were already paying special attention to them. From personal inspection, also, I am of opinion that the system is managed and operated with a good measure of efficiency, and the expenditure is carefully watched.

My Letter of Instructions specially asks me to state whether reduction of working expenses could be made without loss of efficiency; I would be failing in my duty if I did not point out one particular direction in which, in my opinion, they could be reduced. It does not lie, however, entirely in the hands of the Railways. I refer to the technical education of the native.

There is a very large class of so-called skilled work, which does not require skill or knowledge of a high order and can be performed by natives under periodical supervision after a short period of instruction. Examples of this are drilling, rivetting, plain turning, house painting, firing on a locomotive, and the ordinary gangers’ work on the track. To take the last example, a skilled ganger is expected to be able to lay a set of points and crossings, but the ordinary ganger on a railway like this is seldom, if ever, called upon to do it. Many of them must pass through their whole service without ever being required to carry out such work. The bulk of their duty consists of lifting and packing, maintaining curves in good condition and seeing that the drains and ditches are kept clear. No one can deny that a native could acquire the necessary knowledge in a short time. More supervision would no doubt be necessary, but this could be arranged by placing a European permanent way inspector in charge of every thirty to forty miles, with native gangers under him, and by giving him a pump trolley. It would also solve the difficulty of housing, in connection with the shortening of the gangers’ lengths. Similarly, the work of firing a locomotive is easily within the scope of the native, and he is probably better suited physically for this work than the man of English descent. Work requiring a much higher degree of skill than the trades mentioned is being performed by natives in many parts of Africa. The contention may be raised that the native of Rhodesia is not as capable of receiving instruction as those of other countries. This argument has been advanced by the opposition in practically every country where native skilled labour is now used, and has, as invariably, been found false. It therefore carries little conviction.
The European wages bill of the Engineering Department is over £150,000 a year, and of the Locomotive Department over £300,000. As the natives would only cost at the most £3 a month against the £20 to £25 which is now paid to the Europeans, it is clear that a saving of £100,000 in each of these departments should be obtainable in two or three years without difficulty. There is no need to lay stress on the importance of this from the point of view of rates. If education of a more skilled order was given, and the native was allowed to be employed as a fully-skilled tradesman, still larger economies would be effected.

The adoption of such measures would entail a complete reversal of present policy; the Railways alone could not embark on it; the change would have to be supported by the people of the country and the Government.

The only aspects of the case which I can discuss are the economic ones, as they affect the railway situation; against these have to be weighed the social and political views, which do not lie within the competence of this enquiry.

RESERVES FOR RENEWALS.

Before examining the provision which has been made by the Railway Companies for renewals, I think it advisable to explain the principles upon which provisions for this purpose are made in accepted railway practice, because from the statement of case put forward by the Association of Chambers of Commerce there appears some misconception of the subject. In that statement the following words occur: ‘Provided the permanent way is maintained we cannot see that any charge by way of depreciation is incurred. On the contrary, the value of the permanent way (i.e., its carrying capacity) is increased as population and traffic increase.’

Maintenance and renewal of permanent way are two entirely separate things; maintenance consists in keeping the existing track in proper order for the passage of trains; renewal consists in replacing that track when worn out. It is true that occasionally the boundaries between the two are somewhat indefinite, as when a rail is broken or a short length of track wears out in an abnormally short time, but in general they are entirely distinct. The increase in the value of the permanent way owing to the increase in population and traffic has no relation to the question. Increased traffic and bad maintenance will decrease the life of the track, but whether the traffic increases or decreases and however well or badly the track has been maintained, a day will eventually arrive when the permanent way has to be renewed, and the same is true of all the wasting assets.

It is a fundamental principle of railway finance and accounting, as in other ordinary business concerns, that the assets which have been purchased by the original capital outlay must be renewed out of revenue when they are worn out. The provision for this purpose constitutes a working charge against revenue,
which must be met before any profits can be distributed. There is no other source
from which it can be drawn; to use fresh capital for the purpose could not be
defended on any grounds. The management has not merely the right to make
provision out of reserves; it is its duty. This cannot be expressed better than in
the words of a judgment of the Supreme Court of the United States:

‘Before coming to the question of profit at all the company is entitled to earn
a sufficient sum annually to provide not only for current repairs but for making
good the depreciation and replacing the parts of the property when they come
to the end of their life ... It is entitled to see that from earnings the value of the
property invested is kept unimpaired, so that at the end of any given term of
years the original investment remains as it was at the beginning. It is not only the
right of the company to make such a provision, but it is its duty to its bond and
stock-holders, and, in the case of a public service corporation at least, its plain

The methods used for making the provision from revenue vary. In early days
in England nothing was provided until the time came when the asset had to be
replaced, and the whole cost was then charged against the working expenditure
of that year. This method obtained until quite recent years on a few English rail-
ways. It had the grave disadvantage that it did not equalise the charge over the
whole life of the asset, and threw an extremely heavy burden on some years and
practically none on others. This method has been abandoned since the amalga-
mation of the British Railways.

The second method, which is that now used by all the four big British Rail-
ways, as shown in the evidence before the Railway Rates Tribunal on section
58 of the Railways Act, 1921, is to set aside each year amounts based on the
estimated lives of the various wasting assets, so that when the life has expired
the original cost will have been replaced. These annual provisions are put to the
credit of a special fund, to which is debited the cost of replacement. The same
procedure is enforced by the Inter-State Commerce Commission of the United
States. This method was formerly adopted by the South African Railways, but
was subsequently altered for one under which a lump sum was contributed, cal-
culated at 2.86 per cent. of the capital cost of the wasting assets at the time of the
change. Subsequent modifications have been introduced, lowering this percent-
age. The aim of the South African Railway Administration is to provide funds
sufficiently large to meet the maximum expenditure that is likely to be incurred
in any year.

Another method, adopted, I understand, by some South American Railways,
is to fix the annual contribution at a certain percentage of the gross revenue. This
has the disadvantage that the amount required for renewals does not vary in
direct proportion to the revenue and may have only a distant relation to it.
Until 1921 no regular system was adopted by any of the railway companies of the Rhodesian system. Sums were allocated from time to time to renewals reserve, but on no fixed basis. The sums so allocated fell short by a large amount of what would have been provided under any of the regular methods. In 1921 it was decided to adopt the method of basing the annual provisions on the estimated lives of the assets. The capital cost of the engines and rolling stock was ascertained from the books, and contributions based on the estimated lives of these assets have been made since that date. As regards the contributions which should have been made for the previous years of their lives, sufficient sums were noted as available for this purpose from the sums already available in the renewals reserve, so that so far as these items are concerned full provision has been made to date. The same procedure is adopted for engines leased under hire purchase agreements. The cost of renewing the permanent way over the various sections of the track was calculated, and the lives of the various sections were also estimated. The valuation was re-adjusted in 1922 to the prices then ruling. Annual contributions based on these estimates are now made. For the previous contributions which should have been made, the balance remaining out of the pre-1921 contributions, after the claims of locomotives and rolling stock had been satisfied, was assumed as available. It was insufficient, however, and since 1st October, 1924, additional contributions have been allotted, sufficient to make good this shortfall before the expiry of the various lives. The same procedure has been adopted for buildings (other than stores and workshops) and telegraph poles and wires. It should be noted that the current financial year is the first in which provision for shortfall, based on the unexpired life, has been made locally in Africa; any provision which has been made hitherto on this account has been made by the London Offices.

For stores and workshop buildings, workshop plant and machinery, a similar procedure is adopted, but the amounts, instead of being debited to ordinary working expenditure in Africa, are notified to the London Office and credited by them to the reserves. No allocation to make good shortfall is applied in this case, as in previous years due provision was credited and debited to working expenditure between the respective companies who did the repair work and for whom it was done. In the case of plant and machinery along the line and at depots, no provision, either current or for shortfall, is made at present.

The Vryburg-Bulawayo section is treated in the same way as regards locomotives and rolling stock, but differently for its other wasting assets. A lumpsum allocation of £50,000 a year is made on account of them; if calculated as for the other sections, the annual charge would be £105,700, including provision for shortfall. Although separate allocations are made as regards the different classes of items, the final results are merged together into a single heading, reserves for renewals. No fund, in the proper sense of the word, is maintained.
For the Rhodesia-Katanga Junction Company no contributions to renewals reserve are made in Africa, nor is there any evidence available locally as to whether or not any are made in London.

It will be seen that the method adopted by the Rhodesia Railways is based on what I called earlier the second method, *i.e.*, that of basing the annual provision on the lives of the assets. This method, as I have pointed out, has high authority behind it. The South African Railways have adopted another, which results in a smaller annual contribution, and are satisfied that this is sufficient for their purposes. That is a matter for the South African Railways, and they are sufficiently good judges of what suits them best, but what is possible and may be sound for a State railway, with the finances of the Union behind it in case of difficulty, is not necessarily sound for a private railway company. For instance, the South African Railway accounts for the year ended 31st March, 1924, show a balance to the credit of the renewals fund, taking the railway portion alone, of £1,711,360, and disbursements from the fund, on account of railways, of £1,282,131. I do not think a private railway company would feel very secure if it had habitually a reserve of less than 1½ years’ expenditure. It is impossible to condemn the Rhodesian Companies for adopting the same principles as are used by all the big British Companies and are enforced by the Inter-State Commerce Commission of America, which was formed to watch, primarily, over the interests of the public and is extremely jealous of them.

As regards the provision to make good shortfall, the whole of the money to replace the asset must be found out of revenue by the time the asset has to be renewed. If insufficient provision has been made in the past, it has to be provided currently. The past has escaped its full share of the burden, and so the present and the future have to make it up by the time the life expires.

So far, therefore, as concerns the principles on which their renewals provisions are made, the Railways stand on unimpeachable ground, and the only counts upon which they can be condemned are if the lives which have been estimated for the various classes are too short, if the values which they have taken for replacement are excessive, if they have paid for renewals out of current working expenditure at the same time that they were making annual allocations to reserves for the same asset, or if any charges which should rightly be borne by capital, such as the cost of improvements effected in the course of replacement, are being debited instead to the renewals reserve.

The lives which have been assumed by the Railway Companies are as follows:

- Engines: 28 years
- Coaches: 28 years
- Wagons: 25 years
- Buildings (other than workshop and store buildings), brick: 100 years
Buildings (other than workshop and store buildings), wood and iron  
Workshop and store buildings, brick  
Workshop and store buildings, wood and iron  
Workshop plant and machinery  
Telegraphy poles and wires  
Pumping plant and machinery, cranes, etc.

50 years  
75 years  
20 years  
20 years  
50 years  
25 years

The lives of the rails and sleepers have been estimated separately for each section of the line. For the rails, the lives vary from 40 years on the branches to 35 years on the Victoria Falls-Broken Hill section, 30 years on the Victoria Falls-Umtali section, 28 years on the Beira Railway and 26 years on the Beira Junction Railway. For sleepers, the lives vary from 35 years on branches to 27, 26 and 25 years on the main line.

None of the lives taken for the assets, in the above table, can be called too short. On the contrary, those for ordinary brick and wood and iron buildings, and workshop plant and machinery, appear to me to be too long. None of them are less than, and some of them are higher than, the lives which I have previously recommended for adoption by various Government railways in Africa. Also, it is established that the contributions cease for any asset as soon as its estimated life has expired and its original cost has been replaced in the reserve for renewals. Should it still be kept in service after this, no further contributions are made on its account.

The lives of the rails and sleepers have been very carefully estimated and do not appear to me excessive. The estimates were made comparatively recently, when the need for renewal was becoming apparent. It is owing to this that they coincide so accurately with the five years’ programme of renewal, started in 1923 and now in operation. The Railways consequently can claim complete justification in that the money will be required to carry out the actual renewals by the time the life has expired.

In every class except permanent way the contributions have been based upon the original capital cost, and to this no objection whatever can be raised. In the case of permanent way, the contributions were based on the estimated cost of renewal in 1923 at the prices then ruling, which, for the material alone, was £2,079 a mile. The Railways’ argument in support of this may be summed up to the effect that in the case of permanent way, where one rail is replaced by one identical to it in weight, the actual cost of replacing that rail must come out of revenue and not only the original cost. They point out that this method is used both in the United States and India. The danger lies in the possibility of prices falling, as they have done in this case, and so causing too large contributions to be made. The last permanent way material purchased by the Railways was in April of this year, and cost £1,774 a mile. This figure was given to me by the management; they regard it as abnormally low owing to foreign competition, and
judged by the quotations in the trade press it certainly appears on the low side. As against this the labour costs of re-laying have increased since 1923. There is as yet no danger of the total contributions being too large on this account, owing to the low contributions paid for the Vryburg-Bulawayo section and also because of the shortfall of previous years, but it will occur if the total contributions, current and for shortfall, are continued up to the end of the estimated lives. The remedy for this is re-valuation, when the contributions already made are taken into account and reductions made in the annual allocation both to allow for this and for the decreased cost. The Railways made one re-valuation on these lines in 1923; they state that they intend to make them in the future. I consider that one should be made to take effect in the accounts for 1925–1926.

During my investigation I have found no evidence whatever that renewals are being charged to ordinary working expenditure at the same time as annual allocations are being made to reserves for the same assets. When the track on sharp curves wears out in a very short time, the renewal is charged to working expenditure, but this is normal practice, because when the time comes for the whole section to be renewed these curves are also renewed, and the cost of that operation is borne by the renewals reserve. Any intermediate renewals which are necessary must be charged against current working expenditure.

I have also satisfied myself that charges which should rightly be borne by capital are not being made to renewals reserve.

Where, as in re-laying the branch to Selukwe, a heavier rail was used than the original one, more sleepers were laid to the rail length and additional ballast provided, the cost of the extra weight of rail and of the extra sleepers and ballast has been charged to capital. The same procedure is being followed in the re-sleepering of certain sections of the Beira and Beira Junction Railways. Another instance is the substitution of stone as ballast for disintegrated granite, where (the extra cost is being borne by capital.

Most of the criticisms which have been levelled against the Railways on the score of renewals have been based on the figures shown in the balance sheets of the Companies under the heading 'Reserve for Renewals.' In the balance sheets of the Companies for the year ended 30th September, 1924, the reserves for this purpose are shown as follows:

<table>

</table>
The final accounts of the Blinkwater Railway Company for the year 1923-1924 are not yet available, but at the 30th September, 1923, the reserve for renewals stood at £37,893, so that the total of the reserves at the 30th September, 1924, for these five companies, may be placed at £3,500,000.

The Rhodesian railway system is a young one as the life of the railways and their assets are measured. None of them are more than thirty years old, and most of them are under twenty-five. The time when the principal assets, the permanent way and the rolling stock, will become worn out and must be renewed is only just arriving; up to date the amount which it has been necessary to spend on renewals has been negligible, but the next few years will make a great change in that respect. A five years’ programme was commenced in the financial year 1923-1924, and is due to be completed by the 1st October, 1928. The total cost will be £936,631, of which £882,274 remain to be spent. This programme contemplates the renewal of 250 miles of rails and 340 miles of sleepers, between Beira and Salisbury, and the renewal of 250 miles of sleepers between Salisbury and Bulawayo. The portion of this which will fall to the debit of the Beira Railway is £295,338; its renewal reserves are at present £184,507, and the four years’ contributions due till 1st October, 1928, will be £133,224, so that when the programme is completed the Beira Railway Company’s reserves will have fallen from £184,507 to £22,393. This programme affects only a small portion of the system; it will mean re-sleepering less than one-third and re-laying with rails less than one-tenth of the Mashonaland Railways, and as regards the Rhodesia Railways it means re-sleepering less than one-fifth of its length and no renewals of rails. That work will have to be undertaken as soon as the present programme is completed, and when it is done it will cause very heavy reductions in the renewals reserves, as in the case of the Beira Railway, only much greater because of the larger mileage to be renewed. In the next four years, too, it is anticipated that £300,000, approximately, will have to be spent on renewals of locomotives and rolling stock. The very high level at which the reserves stand is, therefore, a passing phase due to the fact that the time for renewals is only just arriving.

MISCELLANEOUS AND SPECIAL EXPENDITURE.

Examination of the working expenditure does not show any instances of expenditure, which should have been borne by capital, having been debited to the ordinary working heads of permanent way and works, telegraph expenses, locomotive and rolling stock maintenance and running, traffic, pier and general expenses.

The Mashonaland Railway Company leases a certain quantity of rolling stock from the Beit Trustees on hire purchase agreements. Under their terms a certain fixed sum is paid yearly, of which a portion forms the redemption of the
principal and the remainder the interest. The interest naturally decreases each year as the principal is redeemed, until towards the end of the time the bulk of the fixed sum paid each year goes to redemption. In addition, the same allowances as for the ordinary rolling stock are set aside for depreciation each year. The sums set aside yearly for redemption are entered in the balance sheet of the Company and are not debited to revenue. The interest charges are included in the interest account and depreciation is charged to revenue. On the completion of the account the sums placed to redemption of principal are added to the capital account, and those to depreciation to the renewals account. Until then it would be incorrect, of course, to include the expenditure on the stock in the capital account, as it is not yet the property of the Company. The interest charged is light, being in most cases five and in some cases as low as four per cent. The original value of the stock hired to the Mashonaland Railway Company, under agreement, amounts to £168,650. These agreements are normal; although not common in England, they are frequently used abroad and especially in America. It will be seen that there is nothing in them to which exception can be taken.

For the remaining two heads of working expenditure, miscellaneous expenses and special expenditure, I have had a statement prepared covering the last four years and showing the several items in more detail than in the published accounts. [...] The only considerable items in the miscellaneous expenditure for the last year are £11,755 for accidents and derailments and £22,222 for maintenance of rentable property; the total of the whole heading is £44,198. I have already commented on the heavy expenditure caused by derailments, but both it and maintenance of rentable property are indisputably correct charges against current revenue. The same remarks apply to the expenditure for previous years.

The special expenditure for the year 1920-1921 was £125,156. The most important item in this is £32,544 for arrears of maintenance of track in excess of amount reserved. During the war it was impossible to maintain track up to standard; this was common to all railways. Special allocations were made by the Railway Companies after the war out of revenue, to meet the cost of this; these were insufficient by £32,544 and the balance was charged against special expenditure. I have examined the documents in connection with this, and am satisfied that the sums were spent on maintenance and not either upon renewals or improvements. The next largest item is £9,715, being contribution to staff medical fund, and this is clearly an appropriate charge. The other principal items are losses on Catering Department, sub-division and survey of blocks of land at Beira, and expenses of the Directors’ visit to Rhodesia. These are all fair charges against revenue.

For the year 1921-1922, apart from recurring items such as contributions to staff medical fund, the principal item is £6,736 for Beira wharf, scheme of
reconstruction, re-arrangement and extension of facilities. This forms part of a
general scheme, the total cost of which, £60,000, was spread over five years. The
cost was borne by the Beira Junction Railway Company, the Beira Railway Com-
pany, the Mashonaland Railway Company and the Rhodesia Railways, Limited,
pro rata to the revenue each derived from export traffic through the port. Of
the total, £22,940 was spent on reconstruction of a portion which had collapsed,
removal of buildings to new sites and re-arrangement of new tracks; these are all
fair charges against revenue. Of the remainder, £32,243 was for the extension of
the wharf in timber, including stone pitching, and £4,067 was for the reclama-
tion of foreshore. The Railways claim that these were all works of a temporary
nature, which would be superseded by larger and permanent works, and that the
cost should therefore be liquidated out of revenue, spread over a period of five /
years. The situation has now been changed by the contemplated purchase of the
port assets of the Beira Junction Company by the Port of Beira Development
Company. Amongst the assets will be this wharf, and it should therefore now be
credited to revenue and debited to capital by the Beira Junction Company. That
Company should refund the respective amounts to the other Companies who,
in turn, should credit them to their revenue accounts.

The next most important item is £6,248 for cost of earthworks abandoned
on deviation of line. Prior to 1921–1922 it was not the practice for the Com-
panies to write off from capital the cost of earthworks abandoned. Since that
date they have written off, in addition to the above, £12,974 in 1922–1923 and
£6,400 in 1923–1924. It would appear that the change in procedure was not
unconnected with income tax. The items are not large but embody an impor-
tant principle. The practice at present, when a section of line is deviated or
re-graded, is to charge the cost of the new earthworks to capital and write off
the cost of the abandoned earthworks out of special expenditure. The arguments
which the Railways put forward in defence are that, if they did not write off
the abandoned sections, there would be double capitalisation. For example, if a
nine-mile deviation is substituted for a previous ten miles of earthworks, nine-
teen miles would be included in the expenditure on capital assets, whereas only
nine miles of railway actually exist. A new section of line is being provided out
of revenue in place of the old, and the operation is therefore analogous to writ-
ing out of capital account the cost of the old rolling stock when superseded by
more efficient types. The Railways point out that the British Commissioner of
Taxes allows deduction against revenue on this account, notwithstanding that
such cost has been charged to capital account. On the other hand, the Appellate
Division of the Supreme Court of South Africa has recently given a judgment to
the effect that in respect of income tax no deduction could be allowed to devia-
tions, Whether it is treated by the British Commissioner of Taxes in one manner
and the Supreme Court rules that it should be treated on a different basis in
South Africa does not materially affect the question, so far as this enquiry is concerned. The British Commissioner of Taxes deals with it in accordance with the income tax procedure in England; the Supreme Court interprets the legislation of Southern Rhodesia on income tax. The object of this portion of the enquiry is to ascertain whether capital expenditure is being paid for out of revenue, and for that purpose the criterion must be, not the interpretation of the law on income tax, but the best recognised railway practice. That is, I think, without doubt in favour of writing off the abandoned sections against revenue. The argument that otherwise double capitalisation would result is a very strong one. If those sections are allowed to remain on the books, they do not represent any tangible asset. The analogy with replacement of rolling stock and other assets also adds weight. Renewals funds are for the purpose of replacing not only those locomotives and wagons which are worn out, but also those which have become obsolete. Earthworks are considered in railway practice as being indestructible if properly maintained, and therefore no provision for renewals is made, but they do become obsolete as the traffic becomes too large for them or justifies an expenditure on easier gradients. The whole cost of the new earthworks is charged to capital, but the cost of the old ones is deducted therefrom, so that only the difference between the two, i.e., the actual improvement, is eventually a capital charge. This is precisely the same procedure as is followed when a new and larger locomotive replaces an old one. The argument which has been used, that if sufficient deviations were constructed a completely new line could be built out of revenue, fails for this reason: only the replacement of the old earthworks which have served their purpose but have now become obsolete would be charged to revenue, as is only right and as is done in the case of all wasting assets. The difference, i.e., the improvement, is charged to capital.

This method is that adopted by all the British Railways, the South African Railways and the Inter-State Commerce Commission of the United States. It is backed, therefore, by the authority, not only of British railway accounting practice, but of one of the largest and best run state railways in the world and of a body whose main function is to guard the interests of the public. I think that procedure, which is upheld from quarters differing so widely as those, can be called with justice the best acknowledged practice.

The only items in 1922–1923 which call for comment and have not already been dealt with are £7,745 and £783, being, respectively, amounts written off the / shareholdings in the Zambesi Saw Mills Company and The Rhodesian Native Labour Bureau. I do not think there is any justification, from the point of view of the public, for writing off the cost of shareholdings out of revenue.

In the year 1923–1924, £9,207 was spent out of special expenditure on new minor works of a capital nature. Prior to that all improvements of a capital nature, however small, were charged to capital. If a new bath of an improved
quality was substituted for an inferior one, it was charged to capital. The Board then gave authority to the General Manager to charge to special expenditure new minor works of this nature, costing under £100 each. In theory it is, of course, wrong; every improvement, however small, should be charged to capital, but in practice it is done by nearly every railway in the world, whether owned by the State or privately. The total amount is small and therefore there is no grave objection to it, but it should be limited strictly as to the total amount. It must be remembered, too, that there is no betterment fund on these railways.

This investigation of the miscellaneous and special expenditure shows that the Railways have not been incorrectly charging any considerable sums to revenue which should have been borne by capital. The £60,000 for the Beira wharf scheme, though it may have been a fair charge against revenue when originally incurred, should be charged back again to capital, and I consider that the writing off of shareholdings in companies is also incorrect, but apart from these no adverse comments can be made. On the contrary, I think it only right to say that the Railways have been scrupulous in their observance of the distinction between capital and revenue expenditure.

Appropriations have been made by the Rhodesia Railways to Pensions Liability Account, amounting to £160,000. None of the other Railways have made any such appropriations, with the exception of the Rhodesia-Katanga Junction Company; in their case the amount actually appropriated is not known locally. The Chief Accountant estimates the accrued liability on this account at not less than £500,000 and the annual liability at not less than £50,000. This estimate is based on six per cent. of the pensionable salaries and wages, on the assumption that the sums so appropriated are set aside and accumulate at compound interest. The amounts set aside are still a long way below these figures, and whether this estimate be accepted or not there can be no question that the amounts allocated up to date are not excessive. They are a fair charge against current revenue, as the liability should be met as it is incurred, so that each year bears its proper burden; it is quite wrong to make no provision until the time comes to pay the pensions, because then an unfair burden is thrown on later years. In fact, I think it would be prudent if the Railway Companies adopted the same course as in the case of renewals and entered the liability in their accounts, even if they have no funds to place against it.

PROFITS.

Rhodesia Railways, Limited.
The following table shows the net profits made each year since the war by the Rhodesia Railways, Limited, after interest on debentures and notes and income
and other taxes have been paid, as well as the distribution of those profits and the credit balance at the end of each year after distribution:

**RHODESIA RAILWAYS, LIMITED.**

</table>

I have already referred to the appropriations to renewals reserve; these were made before the present system of calculating contributions was adopted; no objection can be made to them. Nor can exception be taken to the appropriations to pension liability account.

Until 30th September, 1923, it is obvious that no objection can be made to the dividends paid, nor to the increase of £35,225 in the credit balance. Until and including the dividend paid that year, only three dividends had been paid in the thirty years since the inauguration of the Company, and they totalled altogether £208,000, free of income tax. In October, 1923, also, rate reductions were introduced, involving a surrender of approximately £100,000 of revenue, of which roughly a half could be regarded as the portion relating to the Rhodesia Railways, Limited.

In the year ended 30th September, 1924, a marked change occurred; the net profits rose from £58,311 to £251,148, a dividend of £64,000 free of income tax was paid and the credit balance increased by £137,148. In estimating the relation which these bear to the capital of the Company, I propose to use the figure of £71 for each Rhodesia Railways share because, as I have explained earlier, the stated capital of £8,000 is obviously a nominal figure, and full and adequate consideration was given in return for the £71.

On this basis the ordinary share capital stands at £568,000. The dividend of £64,000 was paid free of income tax, so that it was worth to its proprietors £82,581, or slightly over 14½ per cent., in addition to adding £137,000 to the credit balance.

The argument might be put forward that although these results, when regarded as those of a solitary year, may appear excessive, when previous results are taken into account they are only compensation for the many lean years through which
the Company has passed. But the country suffered as well during these lean years, and the Railway cannot claim to make up the whole of its past dividends out of present earnings. It is now recognised universally that all that railways generally have a right to expect is a fair return on capital invested. This usually includes a margin for fluctuations, to avoid frequent alterations in the tariff, and often a bonus is allowed as well to give an inducement to the company to render good service and develop trade. No controlled railway of which I have knowledge would have been allowed to earn such large sums in proportion to its capital as those just noted, whether distributed as dividend or left to swell the credit balance; or, rather, if it had made them would not have been forced to readjust its rates so as to surrender the bulk of the surplus. In this case the rise in net profits was sudden; it was not possible to expect any reductions until the year was completed and the results known. When the year was completed the Directors decided to make certain reductions; the surrender of revenue entailed thereby, over the whole system, was £100,000. It is not easy to estimate the surrender of revenue entailed in rate reductions, but I have satisfied myself by inspection of the documents that this estimate was computed quite fairly. Of this £100,000, £54,600 is the share of the Rhodesia Railways, Limited, calculated on its proportion of the gross receipts of the whole system from the main traffic heads affected by the reductions.

The Railway Administration defends the failure to surrender more revenue on the grounds that most of the increase was due to causes which might be temporary, such as the carriage of mining machinery to Northern Rhodesia and railway material, machinery and other traffic for the Congo. The increases in net revenue during the eight months of the current year are also due to the same causes, and the argument put forward is that, while the rate reductions would be permanent, if most of these traffics are lost there is a danger that the reduced revenue would not give an adequate return on the capital invested. As against this, however, the Company had a net credit balance at 30th September, 1923, of £224,116, or about forty per cent. of its ordinary share capital on the valuation which I have taken; it is therefore in a strong financial position, and it has gained that position out of the revenues which it had collected from the public. The public, therefore, has the right to demand that those credits should be the first to be used when it becomes a question of making good decreases due to lost traffic in preference to maintaining rates at the higher level. When the latter course is adopted, if the traffic is not lost, the Company gains a lot and the public loses the rates reductions which it would otherwise have gained. If the traffic is lost, the public still loses.

I consider, therefore, that until September, 1923, the profits cannot be considered excessive, but that after September, 1924, as the net gain for that year represented by the dividend and the increase in net balance was over £219,000, a larger surrender of revenue than £54,600 should have been made.
Another feature is the delay in introducing the reductions. The financial year ends in September; by that time the final results are known approximately. By September, 1924, the Board had decided that reductions should be given, and the total amount of revenue to be surrendered had been more or less agreed. Most of the actual reductions were not brought in until the following July, or ten months later. One month and a half to obtain the final consent of the Board and two months and a half to make adjustments with the South African Railways, or four months in all, should have been ample, and it should have been possible to bring in the reductions by the 1st February. The reductions were delayed six months, however, to the detriment of the public and to the gain of the Company. I have seen the correspondence connected therewith, and it is clear from this that the delay was due not to the reluctance of the Board to surrender the revenue nor to any desire to obtain the benefit of the delay, but merely to the retention by the Board of detailed control over the rates. Abnormal delays, which are unjust to the public and hamper the Railways, are bound to occur if rate details have to be discussed with people three weeks distant by post. The important features for the Board are the amount of revenue to be surrendered, any departures from the general rates policy and any points which will affect the special contracts with the big concerns, such as the Union Minière and the Broken Hill Mine. The General Manager should be left to decide any details within these limitations; he is in a far better position to judge than anyone else. It must be understood that I am speaking now of the existing situation where no State control exists over the Railways in Southern Rhodesia.

I am informed that it is the intention of the Directors to institute further reductions in rates, and steps to that end are now being taken.

**Mashonaland Railway Company.**

I give below a table for the Mashonaland Railway Company, showing for each year since the war the net profit or loss for the year and the accumulated net loss at the end of each year:

<table>
<thead>
<tr>
<th>Year ended</th>
<th>Net profit or loss</th>
<th>Accumulated net loss</th>
</tr>
</thead>
<tbody>
<tr>

</tr>
<tr>
<td>30th September, 1924</td>
<td>+177,835</td>
<td>1,376,170</td>
</tr>
</tbody>
</table>

This Company has never paid a dividend since it started. Until 1921 it had a net profit on working in two years only, and consequently has always had an accumulated net loss which went on increasing until it reached £1,675,227 in
that year. This loss had decreased by the 30th September, 1924, to £1,376,170, or, roughly, £300,000 in four years, of which £178,000 is attributable to the last financial year. These losses have been financed by loans from the Rhodesia Railways Trust. In the balance sheet of that Company for 31st March, 1925, the loan is shown at £565,349, and the accrued interest from 1st April, 1919, to 31st March, 1925, at £382,934, making a total of £948,283.

The net profits shown in the above table are the amounts arrived at after deducting the current year's interest on the loan from the Rhodesia Railways Trust. This loan is not a fixed amount, because the Trust acts as banker for the Mashonaland Railway Company.

As in the case of the Rhodesia Railways, no question as to profits can arise until the last financial year. In that year the net profits rose from £28,470 to £177,835. Here, again, I think that the best criterion of the profits which the Company should make in any specific year is a fair current return on the capital invested. Whether that goes, as in the case of a company in a good financial position, to paying dividends or, as in the case of one in a low financial position, to paying off arrears of interest on loans, is immaterial. The current interest on the loans is a fair working charge; they have been incurred in order to provide funds to enable the concern to be kept going. There is no evidence that the losses which the moneys were borrowed to cover were due to mismanagement. On the contrary, they appear to have been due to want of traffic, a necessary concomitant of developing a new country. But, provided the Company is allowed this as a fair working charge, the arrears of interest, from the point of view of the public, should not be cleared off at a greater rate than would be allowed if it was a question of return on capital invested. If the railway were under State control of profits or rates, it would not be allowed to make a larger revenue out of the public merely in order to pay off arrears of interest accumulated in the past. If it is allowed to make the current interest on its debt and the equivalent of a fair rate of interest on its capital invested, it will have been treated very fairly.

The nominal share capital of the Mashonaland Company is £450,000, but when taken over by the Rhodesia Railways Trust each £1 share was re-valued at 12s. 6d. Just as in the case of the Rhodesia Railways, Limited, I consider it fair to take the valuation made at that time, so it should hold good in this case. On this basis the ordinary capital of the Company stands at £281,250. Against this the net profit in 1923-1924 was £177,835. It should be noted that, unlike the Rhodesia Railways, Limited, no provision has been made for pension liability account, but even after a liberal allowance has been given for this, the net profit is out of proportion to the capital.

As in the case of the Rhodesia Railways, Limited, it was decided to make rate reductions in consequence of these results, and so surrender a certain amount of revenue. The proportion of the total £100,000 for the whole system which can
be estimated as borne by the Mashonaland Company is £23,300. The argument as to the possibly temporary nature of the increased revenues is, in this case, stronger. The financial situation is very different; there are no credit balances to fall back on. Even the reserves for renewals are not covered by a corresponding asset. But though, no doubt, such considerations must weigh very largely in the minds of the Directors, from the point of view of the public the latter has the right to expect back a larger share than £23,300 out of net profits of £177,835, when the share capital is only £281,250, even though the Company is not strong financially. The public would certainly get more back under any of the systems of control with which I am acquainted. My conclusion, therefore, is the same in this case as in the previous one, that though the profits up to September, 1923, cannot be considered excessive, a larger surrender of revenue should have been made on the results of September, 1924. The same remarks also apply regarding the delay in introducing the rate reductions. I am informed that in this case, too, steps are being taken to institute further reductions.

**Beira Railway Company.**

The table below shows the net annual results of working and the accumulated net loss at the end of each year for the Beira Railway Company:

<table>
<thead>
<tr>
<th>Year ended</th>
<th>Net profit or loss.</th>
<th>Accumulated net loss.</th>
</tr>
</thead>
<tbody>
<tr>

</tr>
</tbody>
</table>

This table gives only an incomplete picture of the results of working, because the interest on the six per cent. income debenture stock has to be subtracted before the net loss for the year is arrived at. During the years included in the table the only interest which this stock has received has been 2½ per cent. in 1922, 1½ per cent. in 1923, plus the additional three per cent. granted subsequently for that year, and the full 6 per cent. in 1924. The whole of the profit still remaining on the year’s working, after the charges prior to the income debenture stock had been met, has to be devoted to the service of that stock; this accounts for there being no profit or loss shown in the table during the latter years. After the income debenture stock has been satisfied, the contributions for redemption of
the prior lien rent charge have to be met before a net profit can be recorded. Nothing was put to this fund until 1924, when, besides the charge for this for the current year, £36,982 was allotted on account of arrears.

The situation of this Company, like the others, has undergone a marked change for the better during recent years. During the war and for some time after, the trade through Beira suffered very much, with the result that the total revenues of the Company fell from over £300,000 in 1912–1913 to £172,666 in 1918–1919. They had recovered by September, 1923, to £363,643, and for the year 1923–1924 reached £452,897. As a consequence, in the last year it has been enabled for the first time to meet the interest on its income debenture stock in full and to make up some of the arrears on its fixed charges. So long as the Company has unsatisfied arrears of prior charge obligations, protected by trust deeds and legislation, and in view of the fact that it is surrendering £14,100 under the recent rate reductions, it is clearly difficult to say that it should have surrendered more, but once these arrears of charges are cleared, as seems probable will occur in the current year, the question will bear a different aspect. From the strict point of view of profits, it was only through the assistance it has received from the Rhodesia Railways that it was able to reduce rates in October, 1923, and again in July, 1925.

**Beira Junction Railway.**

The following table gives the net profit or loss for the Beira Junction Company for each year since the war, and the accumulated net loss for each year:

<table>

</tr>
</tbody>
</table>

It will be remembered that the capital of this Company consists of £249,959 six per cent. original debentures, of which all but £138 are held by the Beira Railway Company; £121,300 five per cent. debentures, of which £54,000 were issued to the Mashonaland Railway Company for amounts advanced to meet capital expenditure, and £67,300 to the Beira Railway Company for arrears of interest on six per cent. debentures; 423,583 six per cent, cumulative preference shares of five shillings each, all subscribed for by the British South Africa Company, and 250,000 ordinary bearer shares of five shillings each. In addition, there is
a charge of £1,480 a year for redeeming the prior lien rent charge; this charge ranks in front of the five per cent, debentures.

The interest on the six per cent. debentures has been paid in cash since October, 1911. Up to 30th September, 1923, £4,161 only had been paid to the redemption of the prior lien rent charge, but in the year 1923–1924, in addition to the current year’s charge of £1,480, it was possible to make good the whole of the arrears, and the amount credited to this account now stands at £14,801. No interest was earned on the five per cent. debentures prior to 30th September, 1924; in the 1923–1924 net revenue account, for the first time, sufficient was earned to pay the current interest, but it does not appear to have been actually so paid, and the balance shown in the last balance sheet as owing to this account is £35,404. It follows, of course, that no interest has ever been paid on the cumulative preference or ordinary shares. / Here, again, as in the case of the Beira Railway Company, it is clearly difficult to say that excessive profits have been earned during the past financial year. Even if the interest on the £67,300 five per cent. debentures, issued for arrears of interest, is ruled out, there will remain a balance on net revenue account of £6,461 only, of which the recent rate reductions are estimated to absorb £3,900.

The financial situation of this Company will be modified very largely by the arrangements now under negotiation with the Port of Beira Development Company.

**Blinkwater Railway Company.**

The net profit or loss for each year since the war on the Blinkwater Railway, and the accumulated net profit, are given in the following table:—

The accounts for the year ended 30th September, 1924, are not available at present.

No interest has yet been paid on the £200,000 ordinary shares held by the Beit Railway Trustees. In addition, they have advanced money on open account, the interest on which is limited to the annual net profits of the Railway Company, subject to a maximum of six per cent. per annum. The following table
shows the advances each year since the war and the interest received thereon by the Beit Railway Trustees:

There is obviously question here of profits. Apart from the ordinary shares, full interest has not been paid during any year on the advances.

This is however, largely due to the fact that the branch has never received any credit for the traffic it has brought to the main line. It has had to be content with the takings on the branch only; the whole of the profit on the traffic which has been brought to the main line by the branch, and which has been created by it, has gone to the main line. This has an important bearing on rates, because, owing to its bad financial position, rates are calculated on the Blinkwater Railway as starting afresh from the junction; in other words, the taper does not continue. The journey on the branch is regarded as a fresh journey, and the public on the branch have to pay a higher rate for the same haul, say from Bulawayo, than if they were situated on the main line. To show the effect which this has on the finances, the gross revenues from traffic on the branch in the year ended September, 1923, were £45,820. It is a fair assumption that the takings on the main line from traffic to and from the branch equaled this figure at least. The ratio of expenditure to receipts over the whole system, in 1923, was approximately 60 per cent., but the cost of working on the main line the additional traffic brought by the branch cannot have been more than 40 per cent. of this, so that the cost to the main line of working this additional traffic cannot have been more than 40 per cent. of 60 per cent. of £45,820, or £11,000, leaving a gain to the main line on this traffic of about £34,000. These figures are only approximate; they do not pretend to do more than show the large proportionate gain to the main line. It is only right and just that the branch should get a substantial credit from this revenue, which it has been the cause of producing, and assuming, as is the case here, that no special service has to be performed at the junction, such as transhipment on change of gauge, or that the construction has not been unusually expensive, both of which might justify a special charge, it is unjust to impose higher rates to make up for the bad financial situation, unless the branch has received a substantial credit on this account. It is also harmful to development.

It would entail too much work to ascertain in the exact amount represented by the exchanged traffic, but on the 1922–1923 figures, if a credit of £15,000 has been given on this account, there would have been sufficient to pay the full
six percent. on the advances and the same on the ordinary share capital. I do not consider, therefore, that the bad financial situation of this Company, in the absence of any allowance, is an adequate reason for fixing its rates at a higher level than for the rest of the system.

Rhodesia-Katanga Junction Railway Company.

No final accounts for this Company are available in this country, subsequent to those for the year ended 30th September, 1919, nor are any details available as to provision for renewals. It is impossible, therefore, to discuss whether or not the profits are excessive. Under the lease to the Rhodesia Railways, Limited, and the Mashonaland Railway Company, the net profit received by the three Companies after meeting the service of the debentures, represented by the yearly rental, have been as follows:–

Net Profits Received by Joint Companies.

Judged solely from the point of view of profits, my conclusions are, therefore, that the Rhodesia Railways, Limited, and the Mashonaland Railway Company should have surrendered more revenue in consequence of the results of the year ended 30th September, 1924, and that there should have been less delay in introducing the reductions which were made. The existence of arrears of prior charges protected by legislation prevents the same conclusions as regards the Beira and Beira Junction Railway Companies. The necessity for higher rates on the Blinkwater Railway is not proved, and I consider they should be abolished. No decision can be given as regards the Rhodesia-katanga Junction Company. The Railway Administration states that further rate reductions over all lines are
now in contemplation. I have no information as to the extent of these nor as to
the effect which it is estimated that they will have on the profits.

One direction in which I think improvement could be effected by these
reductions is in equalising the rates throughout the system, instead of having
a higher tariff local rates on the Beira-Salisbury section and Mazoe and Loma-
gundi branches. The legislation which protects the prior charges was enacted
because of the embarrassed financial situation of the two Companies; that situ-
ation was caused largely by losses due to developing a new country. The Rhodesia
Railways grant the Beira-Salisbury section 20 per cent. more than its proportion
of certain receipts, to compensate it for its heavier working expenditure and the
lower graded traffic which it carries. It is to the advantage of the former to do so
in order to enable the other Companies to fix their rates at a lower level than their
results of working would otherwise justify, and thus to prevent the retardation of
development which would be caused by the higher rates in the districts served by
the Rhodesia Railways, Limited, itself. Part of the revenue which the Railways
contemplate surrendering might therefore be applied suitably to reducing the
differences in the local rates by a new basis of division of receipts, with a view
to their ultimate elimination, and thus to abolishing the manifest disadvantages
and inequalities of the present arrangement. The clearance of the arrears of prior
charges will assist this. The whole system, from Beira and Vryburg to Broken
Hill, was originally built by the British South Africa Company for the purpose
of developing the territories under its administration; that object is best served
by regarding the system so far as possible as one whole, in which the weaker
sections are helped by the stronger, just as in any large railway company. The
principle has already been accepted; it only remains to apply it more fully.

GENERAL ASPECTS OF RATES.

Mining Industry.

Turning from the strict point of view profits to the more general aspects of rates,
including their effect on the industries of the country, the case put forward by
Mr. J. R. Fulton on behalf of the Chamber of Mines, for reduction of rates affect-
ing the mining industry, is based on the proposition that if railway rates were
reduced lower grade ore bodies could be worked by the present mines, or that
lower grade mines could be opened. Mr. Fulton points to the fact that no new
mine has been opened by any of the gold mining companies since 1914, as tend-
ing to the conclusion that a point had been reached where the prospective profits
were insufficient to justify the equipment of a mine on a large scale. It is a prop-
erty common to all mines that if working expenses can be reduced, lower paying
ore bodies can worked. It is a process that could be carried on almost indefinitely,
provided costs can be reduced. It is merely a question of where to draw the line.
Mr. Fulton does not produce any evidence that owing to railway rates it is not possible to work as low grade ores in this country as it is in others. He quotes the case of the Shamva Mine as an instance where lower grade ores could be treated its costs were reduced, but it is well-known fact that the Shamva Mine, owing to its peculiar situation, is already able to work much lower grades than is usual. The argument that no new mine has been opened up since 1914 is marred by the fact that since then the rates on all mining supplies, with the exception of explosives and coal, have been reduced materially. The rate on explosives has increased by three per cent. and that on coal by 21 per cent.; the rate on the latter commodity is admittedly a low one. Mr. Fulton given no instance of a mine which would have been opened up if the rates were lower, or which has stopped because the present rates are too high. I do not consider that any case has been made out that the rates charged have hampered the gold mining industry in this country to a material degree.

The only other mineral mentioned is chrome ore, and the objection there made is directed, not to the amount, but to the method assessment. It is significant that no reference is made to either asbestos or mica, and in view of the large increase in the exports of these commodities the only conclusion that can be drawn, in face of this silence on the subject, is that rates cannot be said to be hampering their production and export.

The rates on chrome ore are given in detail in the replies of the General Manager to the statements of case of the Chamber of Mines and the Mining Association of Southern Rhodesia. A basic rate of 20s. a short ton is taken for any distance from Beira within a zone of 145 to 600 miles; if the ore is sold at prices above 75s. per long ton c.i.f., the Railways receive an extra sixpence per long ton out of every shilling per long ton in the actual price above 75s. If the / shipper gets a freight lower than 22s. 6d. a ton, the difference is added to the selling price, and vice versa, but in no case the rate drop below that applied to a selling price of 75s. a long ton. In practice an initial rate of 25s. a ton is charged, and rebates are given on production of documents. If a satisfactory bank guarantee is given the initial rate charged is 20s. a ton, and, in the case of the Rhodesia Chrome Mines, settlement is effected in London.

The rate thus varies with the price and the freight which the seller obtains; the higher priced ore with the shorter haul will pay more railage than the lower priced ore near the end of the zone. The Railways take practically half of the extra profit which the seller gets above 75s. a long ton. It should be noted that no actual complaint was lodged with me against the ultimate equality of these rates.

In theory, no doubt, this method of assessment can be defended on the grounds that the traffic which gets the higher market price can bear the higher agree with Mr. Fulton that it is straining the axiom of what the traffic will bear to its extreme limit. The fact that the ore from one place has a slightly higher
content does not, to my mind, justify its being made to pay a higher rate than ore from a place much further off which has less. The method of rebate bears heavily on the smaller men, to whom the obtaining of a bank guarantee is not always easy, and who may have to stand out of his money for a long time. It is not always easy for him either to obtain the final documents on which his claim for rebate must be based. It mixes the Railway up with shipping freights, with which it has no concern; it is meticulous and offers temptation to fraud. It is right that a rate should be fixed which will enable the Rhodesia Chrome Mines at Selukwe to compete in the world’s markets, as they were the pioneers of the industry and deserve consideration to this degree. To the extension of that rate to a zone to cover all the stations in Southern Rhodesia which load chrome ore, no serious objection can be raised, provided it is free of all conditions as to price and cost of shipping, but the continuance of the present arrangement is bound to keep alive discontent and suspicion.

As regards the mining industry generally, therefore, I do not consider that railway rates can be said to be hindering its development in Southern Rhodesia to-day. The local rate on maize and maize meal is referred to later.

**Agriculture.**

The case for the agricultural industry has been put forward by Mr. C. B. Gwynn, on behalf of the Rhodesia Agricultural Union. I propose to treat first the rates on exported products, as it is obvious that on the capacity to export must depend the future development of the country. New mines opened promote development probably more rapidly else, but, apart from and in the temporary absence of this cause, development must depend on capacity to compete in the world’s markets.

*Maize.* – The first product, in order of importance as a crop, is maize. The rate on export maize is a zone rate for 300 to 600 miles from Beira, varying with the c.i.f. selling price overseas. When this price is 32s. 6d. per quarter or under, the rate is 12s. 6d. a ton; when it is 32s. 6d., the rate is 15s. a ton; and when it is over 37s. 6d. a quarter the rate per ton rises to 17s. 6d. The figures produced by the Rhodesia Agricultural Union for the costs and prices received for this crop may be summarised in the following manner. A farm of 1,500 acres in the maize belt is taken, of which 469 acres are planted to maize. An investment in the farm of £6,500 is assumed, split up into £4,500 as the cost of the land, £1,000 as the cost of the equipment, and £1,000 as the cost of the buildings. The costs of production per acre are taken at the following figures:–

| Native wages and food, depreciation on implements and cattle | £1 | 7 | 6 |
| White labour at £20 per mensem                                      | 10 | 3 |
| Bags                                                                 | 8 | 11 |
If white labour is eliminated, the cost per acre would be £2 7s. 5d., or £1,111 18s. 5d. for 469 acres.

The average production per acre in a good year, 1922–1923, is taken, and the average selling price at Salisbury. The first is 7.83 bags to the acre, and the second is 8s. 6d. a bag. The statement of the Rhodesia Agricultural Union points out that the railway rates affect every bag sold, and on this account it is fair to take the average selling price at Salisbury as an indication of the result on the farmer. On these bases the total receipts are £1,448 16s. 6d. and the gross profits £336 18s. 1d. Against the latter Mr. Gwynn sets the return of interest on the investment of £480; this is actually lower than the Rhodesian bank rate of eight per cent. The result is a deficit of £143 1s. 11d., without allowing for white labour. Analogous figures for 1923-1924, a bad year, show a deficit of £4. I have taken the same figures as chosen by Mr. Gwynn, but have presented them in a simpler form. The fact that a farmer would do better in a bad dry season than in a good one is a common phenomenon; in this case it was due to the fact that the overseas market was high.

These figures as presented are, I think, too bad to be true, that is, to afford a correct indication of the situation. If the 1922–1923 figures represented the actual situation, it would mean that the rate charge would have to be lowered on the whole output by £143, or 10d. a bag, if the farmer is to receive sufficient to pay his interest, leaving out of account any charge for white labour or reward for his own services. At the middle rate of 15s. a ton, it would mean reducing the rate to 6s. 8d. a ton before the farmer could hope to get any real profit on his overseas sales in a good year. The rate would have to be one-third less than the old South African Railway rate, and one which is obviously out of the question. I do not wish to impugn Mr. Gwynn’s figures, which have been drawn from reliable sources, some of them official, but the only conclusion I can draw from them is that, put together and taken as a whole, they draw far too gloomy a picture. Under such circumstances an increase in the export of maize from 399,434 bags in 1919 to 862,703 in 1923 would have been out of the question.

But, whether this picture of a good year is accepted or not, the farmers can certainly contend that they are handicapped by the rates when compared with their African competitors, the Union and Kenya. On the South African Railways the railway rate for grain passed through a country and port elevator is 10s. a ton for any distance carried over 140 miles; if consigned direct to a port elevator, the maximum charge for railway and elevator services is 15s. a ton. On the Uganda Railway the rate is 11s. 2½d. a ton from any station in Kenya to the
port. Against these the Rhodesian farmer has to pay a rate varying from 12s. 6d. a ton when prices are bad to 17s. 6d. a ton when they are good. This is a serious handicap to carry when competing in world markets. The Railways contend that these rates do little more than cover haulage costs over the Beira-Salisbury section. They do not, however, quote any figures in support of this; I recognise the difficulty of doing so, but in the absence of any attempt in this direction it cannot be accepted as a final argument. If it was so accepted, and the idea of any assistance from the wealthier sections of the system ruled out, it would mean that the Southern Rhodesian maize grower must always carry a heavier burden than his rivals, and development must always be checked to that extent.

The sliding scale basis is also open to many objections; I have already mentioned some of these when dealing with chrome ore. If the commodity has a market price which can be fixed by reference to some recognised authority, so that the price regulating the rate is known before carriage has to be paid, or if one or two large bodies only are concerned with the transport, as in the case of the Union Minière and Broken Hill, a sliding scale of rates can often be introduced with advantage, but where many bodies or even individuals may be concerned, and the final selling price is the measure of the rate, and rebates have to be given, the disadvantages outweigh the advantages. That the sliding scale was introduced at the suggestion of the Farmers’ Co-op., Limited, does not alter my opinion on this point. I consider, therefore, that a fixed rate more in line with those given by other African railways, viz., at least as low as 11s. 6d. to 12s. a ton, should be granted. The total receipts from maize and maize meal for export in 1922–1923 were £50,332; in 1923–1924 they dropped to £45,885. Both constituted well under two per cent. of the total revenues of the whole system. A reduction, such as I have foreshadowed, would obviously have no serious effect on the finances.

While I consider such a rate should be introduced, I think it only right to say that I do not consider that any startling increase in development will be caused thereby. No evidence has been presented to me which would tend to show that there is much ground, naturally good and suitable for maize and within ten to fifteen miles of a railway, which is not being used. The drop from 3s. to 3s. 6d. a ton from the middle price will merely increase the zone, from which it will pay to export, by four to five miles, taking the cost of road transport at about 1s. a ton mile. It will also bring in a larger return to those farmers already growing maize, and so give an extra stimulus, but it would be dangerous to exaggerate the total results of these on development. That must come rather from the opening up of new areas by new railways.

**Tobacco.** – The rate for tobacco, both for export and local, is 4th class, with a maximum of £5 11s. 1d. per ton. The export rate is *via* Beira or Mafeking. The Rhodesia Agricultural Union claim that there should be a special export rate *via* Beira, and that this should be lower than the one *via* Mafeking. They produce
no figures to show that the export cannot stand the present rate; they base their claim merely on the fact that tobacco carried through from Northern Rhodesia has the same maximum and does not pay more. This same argument would apply to any zone rate. It can hardly be accepted in face of the increase in export from Southern Rhodesia from 829,608 lbs. in 1919 to 4,997,870 in 1924. The Railways admit that the local rate is ‘perhaps a little high, although there is no definite evidence to show that the traffic cannot stand it.’ It works out at present on the distance from Bindura to Salisbury, 70 miles, at 7.14d. per ton mile. This is a high rate for an unmanufactured article, and although the increase in exports shows that it has not prevented development, it constitutes a large contribution out of the growers’ profits, especially from a rather uncertain crop. I think that there is a case for reduction in the local rate.

_Cotton and Cotton Seed._ – Mr. Gwynn, in his final reply, says that ‘no complaint was made regarding the present rates on cotton and cotton seed,’ and that his remarks were ‘not in criticism of the present rate, but a caution against rate advances in the future.’ I must confess that I fell into the same error as the General Manager in concluding that Mr. Gwynn considered some alterations should be made in view of the words in his first statement of case that ‘cotton rates should be readjusted to give the grower every facility.’

I think Mr. Gwynn is wise in not asking for any reductions in this connection, because his own figures show that at present there is a very ample profit for the grower. The present rate is lower than those in force on the Uganda and Nigerian Railways.

_Citrus._ – No complaint is made as regards the export rate on citrus fruits.

_Slaughter Cattle for Overseas Export._ – The value of Mr. Gwynn’s original case for reduction of the rate on slaughter cattle for export overseas was negated by the fact that no reference was made to the 50 per cent. rebate given on proof that the cattle or the carcases had been exported overseas. This was through no fault of Mr. Gwynn’s, as the rebate had not then been published. His amended case rests on the value of the dressed weight of meat as compared to the railage charge. For large oxen he quotes the value at Durban at £6 per head, dressed weight, as against a railage charge of £2 1¼s., or, allowing the 50 per cent. rebate, £1 7s., from Bulawayo to Durban; the latter equals 22½ per cent. of the value at the port. At first sight this certainly appears a high percentage, but it must be remembered that the length of the journey is very nearly 1,200 miles; the Railways point out that on this mileage the earnings per truck mile work out at 2.59d. and 2.08d. over the Rhodesian system and the South African Railways respectively. In the case of a journey from Salisbury to Mafeking, the rate per truck mile on the Rhodesian system is 2.23d. These rates for earnings per truck mile certainly cannot be called exorbitant; they are, on the contrary, very low. Nor does Mr. Gwynn produce any proof that it is stopping the export. Govern-
ment statistics show the reverse to be the case, that there is a noticeable increase in the export / business. Whatever may have been the situation before the introduction of the rebate, I think no complaint can be maintained at the present figure. A point which must be borne in mind is that the cattle trade has been going through a period of depression all over the world; even in the Argentine it has been felt very strongly, and Rhodesia has been suffering from the same cause.

**Slaughter Cattle to the Rand Quarantine Market.** – The claim for a reduction in rates for slaughter cattle to the Rand is based also on the proportion of the railage to final cost. This varies from 13.5 per cent. to 16 per cent. The defence put forward by the Railways is based again on the truck mile earnings, The distance from Bulawayo to Johannesburg is 681 miles; for the portion over the Rhodesian system the truck mile rate is 4.31d. and over the South African Railways 5.79d. For the longer haul from Salisbury, the Rhodesian truck mile rate is 3.42d. Although not so low as the rate for export overseas, the Rhodesian rates, which were brought in specially at the instance of the Cattle Industry Committee and are appreciably lower than the South African Railway rate, cannot be called excessive. As to the effect on the industry in Rhodesia, it is difficult to give any results, because the market is limited by the restrictions imposed by the South African Government.

**Cattle to the Congo.** – The rate on cattle to the Congo is £15 10s. per short truck for 550 miles, after which the additional charge is 2s. per short truck for every ten miles in excess of 550. At 550 miles the rate works out at 6.76d. per truck mile, dropping to 5.44d. at 794 miles, the distance from Bulawayo to the Congo border. The Railways claim that this is ‘undoubtedly a very low rate.’ While I cannot agree to this definition, I do not think that the rate can be called prohibitive or as hindering the traffic.

**Local Rates on Maize.** – Turning next to the local rates, the rate on maize in bulk is 11th class for 450 miles; then a flat rate of 37s. 6d. is introduced until 600 miles is reached, after which a rate of ¾d. per ton per mile is applied. The General Manager admits that these rates are ‘somewhat high’ and that ‘a case does exist for the reduction of the local rates for maize, kaffir grain and most of the descriptions of produce which are charged at the same rates.’ Mr. Gwynn protests mildly against the extension of any reduction to kaffir grains, mainly on the grounds that they are native grown. I cannot agree to this differentiation in local rates on similar commodities, especially as they, as well as maize, are staple foods in the labour compounds. I think the rate is undoubtedly high and should be lowered.

**Fertilisers.** – The Rhodesia Agricultural Union in their statement of case lay stress very rightly on the importance of fertilisers, especially for the lighter soils which form so large a part of the farming area. The bulk of the fertilisers used in Rhodesia come from Firgrove, a haul of some 1,600 to 1,700 miles by rail. The
factory price varies from £4 10s. to £23 a ton. A medium price, quoted by the Agricultural Department, is £7 5s. The railage to Salisbury, excluding cartage, is 48s. a ton, of which 14s. 8d. goes to the South African Railways for the 867 mile haul to Mafeking and 33s. 4d. to the Rhodesian system for its haul of 791 miles. These rates work out respectively at one-fifth of a penny and ½d. per ton per mile. The Railways state that, though this is a low rate, the commodity is one which might be considered in future rate revisions. In view of the importance to the country and to the Railways of a fuller use of fertilisers, I think this commodity is certainly one of the first to be included in rate reductions. If, however, the rate were reduced to the same as that on the South African Railways, which is obviously a specially low one, it would mean a saving to the farmer of 18s. 10d. a ton, or only 1s. 10d. an acre. It is clear that this is not going to effect any large difference.

The trouble lies in the fact that it is economically quite wrong to haul a commodity like fertiliser 1,600 miles by rail. Mr. Gwynn admits this, but bases thereon a claim for a reduction in the rates on raw materials, which at present are carried at the same rate as fertiliser, the lowest class rate in the tariff. He cites in support of his argument the rates on raw material from Firgrove to Salisbury, but, if it is uneconomic to haul fertiliser 1,600 miles by rail, it is still worse to haul the raw materials that distance. I do not pretend to any knowledge of the manufacture of fertiliser, but the remedy appears to lie in the manufacture of the article locally, fed by raw materials from the shortest route via Beira, Low freights to Beira should not be difficult to obtain on some of the many ships which come there half-empty to load. /

General Considerations. – I have examined above the more important reductions proposed by the Rhodesia Agricultural Union; I do not propose to examine in detail all the remaining reductions which were put forward in that statement, as it would swell this already large report to inordinate lengths, nor would any very practical purpose be served by examining each item.

In order to obtain a strictly impartial view of the railage paid by the farmer on the equipment and maintenance of his property, I asked the Department of Agriculture to prepare a statement for me, showing the cost of equipping a mixed farm of 3,000 acres in the neighbourhood of Salisbury, and maintaining it for four years. The Department very kindly furnished me with the details [...]. This statement shows that the total original cost, including that of the imported material necessary for building a house and sheds, of fencing and of purchase of stock and implements, may be estimated at approximately £1,592, of which £145 10s. 7d. represents cost of railage. Of this £1,592, £182 was for the purchase of oxen, sheep, pigs and poultry, which are assumed to have been bought locally. All the material is assumed as imported via Beira, the wagon to be railed from Durban and the dairy cows and bull from Bloemfontein. £1,410 represents the cost
of the articles railed and £145 10s. the railage on them, that is, the original cost is increased by 11.5 per cent. by the railage. The expenditure on maintenance and further extensions during the first four years is placed at £1,856, of which £1,724 has paid a railage of £180. In this case the railage increases the original cost by 11.7 per cent. I do not think that an addition of 11.5 and 11.7 per cent. to the original cost of items brought a distance of 374 miles, and sometimes more, can be said to be placing such a burden on the industry as to prevent its development. The rates on some of the items, such as agricultural machinery and wagons, are certainly high, and if lower rates were in force the farmer would have more money to spend on developing his property, which would in turn make itself felt throughout the country. Lower rates would, in fact, mean a more rapid rate of development, but it cannot be said in justice that the present rates, so far as they affect expenditure, are actually proving a serious bar.

The list of reductions and concessions which the Rhodesia Agricultural Union claim in their statement is rather a formidable one. It includes the following: Maize for export overseas, local maize, maize to the Congo (for which compensation is to be given to the local growers by lowered short distance rates and to Northern Rhodesian farmers by lowered rates for export overseas and to the Union), slaughter cattle overseas, slaughter cattle to the Rand, slaughter cattle to the Congo, pedigree cattle, tobacco for export and tobacco carried locally, all rates on dairy products, eggs exported to the Congo and local, sunflower seeds, monkey nuts, potatoes, local wheat, flour, stock salt, grain bags, fertilisers, cement, petrol, cartage and storage charges, and concessions on second class passenger fares to the coast. The only rates with which it expresses content are those on citrus, cotton and cotton seed. The Railways’ general defence to these demands, as distinguished from their examination of the individual cases, rests mainly on the financial aspect; that only recently has the financial situation justified substantial reductions and that such reductions have been given, with the result that rates on many commodities and exports are lower than before the war, and that the present improved financial outlook gives a prospect of further reductions to assist development. This improvement in the finances of the Railways has certainly enabled them to reduce their rates in many directions below the prewar level, in contradistinction to most railways, where all rates are still above pre-war figures. As many of these reductions, estimated to cost £100,000, were introduced in October, 1923, when the financial outlook was by no means as good as it is to-day, I think it only right that this should be recorded. A further £100,000 has been surrendered recently in reductions, but I have already stated my opinion that this should have been larger. It is clear, however, that the acceptance of the whole of the proposals of the Rhodesia Agricultural Union would probably impair the financial stability of the Railways or, if it did not actually result in that, would divert to the local farmer practically the whole of the ben-
efits, to the detriment of the other users of the railway, who can claim that they also require some consideration. I agree that from the point of view of development the farmer is the first to be considered as being most in need of assistance, but the mines and the general public cannot be left entirely out of count. The countries, other than Southern Rhodesia, who are served by the railway, also can expect with justice some of the benefits. Nor can the Railways be expected to surrender more revenue than would leave them in a position to pay a fair return on capital invested, and it is evident from my Memorandum of Instructions / that this is also the view of the Government. I have indicated certain directions in which the need for alteration is the most urgent and important; these include the local and export maize rates, the local tobacco rate and the rate on fertilisers. If these demands are satisfied first, it would give the farming industry that priority of assistance in development to which it is entitled. The remaining rate reductions could be distributed more generally amongst the various sections of the community, preference being given to any articles which tend to increase production rather than to general goods. In this respect I am entirely in accord with the Rhodesia Agricultural Union.

In order to obtain a general view of the rates on imported articles as they compare with those in force on other African railways, I have had a series of charts prepared. These charts, which are attached to this report, show the respective charges in pence per 100 lbs. or per ton at the various mileages. I have chosen the rate ex Delagoa Bay as the South African Railways port rate to be charted, because it is over the shortest distance and therefore, from the point of view of what the traffic will bear, is the governing one, the others being adjusted to it. A few rates, such as those on fertilisers, do not lend themselves to charting and so are omitted. On the other hand, I have included charts of some of the more important export and local traffic rates, where they can be suitably treated in this way. It is necessary, however, to add a word of caution as to their application. This can be only of a very general character because the conditions vary so greatly between the railways. For example, the South African Railway has 4½ times the route mileage of the Rhodesian system, its gross earnings are seven times as great, its tonnage is 15 times as great, and each route mile produces three and one-third times as much tonnage, on an average, as one route mile of the Rhodesian system. I am glad to note that in the statements of case both the Chamber of Mines and the Rhodesia Agricultural Union the impossibility of drawing any close comparison between the two systems has been noted, and no attempt has been made to draw unfair inferences from it. On the Uganda Railway, over 60 per cent. of the capital is non-interest bearing and Indian and African skilled labour is used; on the Nigerian Railways no provision is made for renewals, beyond the sinking funds of the various loans and until 1922–1923 even without this they
did not pay their way. A lot of the trained staff is African also and costs much less than it would in Rhodesia.

All these conditions vitiate any close comparison. The charts do, however, provide sufficient information to confirm the statement that, taken as a whole, the Rhodesian rates on imports are higher than those of the other railways. The causes for this can be sought mainly in the same reasons as I have given why no close comparison can be drawn.

It should be noted that none of the public bodies, in their statements of case, have raised the point to which much attention is directed in the public Press from time to time, that the high rates are the cause of the high cost of living. In this I think they have been well advised, because, although this cry is often raised in many countries, when the matter is subjected to examination it is invariably found that even when the rates are high the actual result as reflected in the householder’s budget makes little appreciable difference. The reason is, of course, that the articles which make up that budget, such as food, drink, clothing, boots, etc., are all themselves comparatively highly priced and the railage is consequently bound to be very low in proportion. But, though the result as reflected in the individual budget may be small and is usually negligible, the total difference between low and high rates has to be borne generally by the public and goes to that extent, at any rate indirectly, to increase the general costs.

My conclusions on the subject of rates may be summed up as follows: The rates on imports, taken as a whole, are higher than on other African railways. The rates on the majority of exports are not excessive, but that on maize in particular compares unfavourably with those in force in other competing countries. That the rates are not lower cannot be attributed to mismanagement, excessive reserves for renewals, incorrect application of revenue to capital expenditure or, at any rate until 30th September, 1924, to excessive profits. It has been attributable rather to want of traffic, and that cause is being eradicated rapidly, principally through the increase of traffic with the Congo. The financial results of the year 1923–1924 justified a larger reduction of rates than was actually granted, and the reductions should have been introduced with less delay.

The rates now in force cannot be said to be hampering the development of the mining industry; in the case of agriculture, while the present rates cannot / be said to be preventing development, lower rates would induce a more rapid expansion. The further reductions which I consider justified by the present results could be applied, in the first place, most suitably to the rates which directly affect agriculture, and I have indicated the rates on export and local maize, local tobacco and fertilisers as those deserving first consideration. After that priority has been satisfied, the reductions should be distributed more generally, with preference to other categories which tend to increase production, including therein those affecting the mining industry. I consider radical altera-
tions should be made in the method of assessing rates on chrome ore and that the sliding scale for export maize rates should also be abolished.

COMPARISON OF RATES CHARGED IN RESPECT OF SOUTHERN RHODESIAN TRAFFIC WITH THOSE CHARGED IN RESPECT OF THE TRAFFIC OF OTHER COUNTRIES SERVED BY THESE RAILWAYS.

The class rates on port traffic from Beira and on the Beira-Salisbury section have a sharp taper every 100 miles up to 680 miles, after which the taper is much smaller. In other words, the rate per ton per mile decreases rapidly as the haul gets longer until 680 miles is reached, after which the rate per ton per mile does not decrease so fast. To take the most marked example, the first class rate commences at 11.2d. per ton per mile; at 680 miles it has dropped to 6.712d. per ton per mile, but at 1,460 miles it has only fallen to 4.84d. On the Rhodesia Railways and the Kalomo-Broken Hill section of the Mashonaland Railway there is a sharp taper every 100 miles up to 590 miles, and after that the taper becomes negligible; the rate per ton per mile on the longest haul is practically the same as on one of 590 miles. On class rates 11 to 13, which are applicable all over the system and are the lowest except for rates on special commodities, there is a taper up to 400 miles, after which the rate per ton per mile remains uniform.

It is the general practice in rate making to give a lower rate per ton per mile as the length of haul increases, because the long haul traffic cannot usually stand the same ton mile rate as the short haul. There are exceptions to this rule, such as zone rates and flat rates, but the principle of the taper is the generally accepted basis of all rate systems, and most of the exceptions themselves are framed with the same object of removing part of the disadvantage with which the man with the long haul is saddled. The Rhodesian railway system applies this system up to certain points, but after these it either has a more gradual taper or none at all. The result is to withdraw from the long distance man, at any rate in part, the compensation which he usually receives. The reason for this abrupt change in procedure is the competition of Union ports.

Bulawayo is 673 miles from Beira, so that the most populous portions of Southern Rhodesia get the benefit of the sharper taper on the Beira port rates, whilst Northern Rhodesia and the Congo get very little compensation for their long haul. If a uniform taper was applied every 100 or 200 miles throughout the system, the rate per ton per mile would be much smaller in comparison to the Southern Rhodesia one than it is to-day. The same applies, and with more force, in the case of goods forwarded from Beira on class rates 11 to 13; from Norton to the Congo border the rate per ton per mile remains the same. Southern Rho-
desia from Norton on suffers to a certain extent, but not to the same degree as Northern Rhodesia or the Congo.

On goods forwarded on ordinary class rates from Bulawayo, Northern Rhodesia as far north as Lusaka is, as regards taper, on the same footing as Southern Rhodesia, and on goods in the 11th, 12th and 13th classes as far north as Choma, but to all stations north of these points and to the Congo the rate per ton per mile only decreases very slowly, and so a slight advantage may be said to lie with Southern Rhodesia.

The rates from Union ports to stations on the Bulawayo-Congo border section are compiled by adding the difference between the Beira port rate at Bulawayo and the Beira port rate at destination to the Union port rate to Bulawayo. The object of this is to maintain the differential in favour of Beira throughout this section. The rate from Union ports to points on the Bulawayo-Salisbury section is compiled by adding the local throughout rate from Vryburg, or Mafeking as the case may be, to the South African Railway rate from the port to Vryburg or Mafeking. The local throughout rate mentioned would in this case be the Rhodesia Railway rate. / The effect of this is to give an advantage to the northern line; in the case of Livingstone and Salisbury, which are about the same distance from Durban or Delagoa Bay, the difference on 1st class goods is 33d. per 100 lbs; on 5th class goods it is 13d. and on 10th class goods 3d. per 100 lbs. If the comparison was extended to stations north of Livingstone and east of Salisbury, the difference would get larger, but no reasonable comparison can be drawn. Salisbury is 374 miles from Beira and 1,346 miles from Delagoa Bay; it would be quite wrong economically to encourage imports from a port which is nearly 1,000 miles further away, when there is one within 350 miles or so. No point east of Salisbury can legitimately complain that its port rates from the Union are not as low as those on the northern line. Southern Rhodesia can therefore complain that it is prejudiced as compared with one point only, namely, Livingstone.

Turning to export rates, that on maize overseas from Mazabuka, the nearest maize growing station in Northern Rhodesia to the coast, is 337d. per ton for a haul of 1,191 miles, The 300 to 600 mile zone, which covers practically the whole of the maize growing areas of Southern Rhodesia, has a rate varying from 150d. to 210d. a ton. In Portuguese East Africa the rate for export ranges from 75d. a ton for a haul of 18 miles to 143d. for a haul of 183 miles. Southern Rhodesia here is more favourably treated than her neighbours.

On maize and maize meal for export to the Union, Rhodesian rates apply as far as Mafeking, after which South African Railway rates are in force. The rate from Bulawayo to Mafeking is 210d. per ton for 492 miles, and from Salisbury 240d. for 791 miles. The next highest rate, which includes the Mazoe and Sinoia lines, is 270d. In Northern Rhodesia the lowest rate is 360d. per ton for a haul of
1,010 miles from Mazabuka, and in Portuguese East Africa it is 300d. for a haul of 982 miles. The advantage, if any, lies with Southern Rhodesia.

On maize for export to the Congo, the ordinary rate for maize in bulk is charged; that is to say, rate 11 for hauls up to 450, 37s. 6d. a ton for hauls from 451 to 600 miles, and ¾d. per ton per mile for hauls longer than that. The longest haul in Northern Rhodesia is 269 miles from Mazabuka, for which the rate is 358d. per ton. The nearest point in Southern Rhodesia may be taken as Bulawayo, with a haul of 787 miles, for which the charge is 590d. From Salisbury it is 815d. per ton for a haul of 1,086 miles.

Southern Rhodesia in this case stands little chance of competing in the Congo with Northern Rhodesia. The Agricultural Union state that they consider a maximum of 540d. to 600d. a ton should be imposed, 'which would bring the 'maize belt' in competition with Northern Rhodesian growers for Congo trade, and yet give the northern growers 2s. to 2s. 6d. (presumably per bag) protection on the geographical position; or grain traffic to the Congo should be treated as export and rated accordingly.' The statement continues that 'Northern Rhodesian growers have an outlet for surplus to Beira at 2s. 9d. to 3s., and to Mafeking for 3s.' This again presumably means per bag. At first sight this appears reasonable, but if examined more closely it will be found that at the present rates the Northern Rhodesian farmer exports practically nothing overseas and has no sale in Southern Rhodesia, except at Wankie; the rate of 450d. per ton for hauls of 451 to 600 miles allows the 'maize belt' to compete with him at Wankie, although the former has a much longer haul. The only markets thus left to him are his competitive share of Wankie, his local mines and the Congo; the last market is limited and the Northern Rhodesian farmer can claim that it is his natural outlet, while so far as Southern Rhodesia is concerned it would be an artificial one. He might with great justice complain if special rates were fixed which allowed farmers three or four times as far away to compete with him in what is not only his natural market but practically his only outside one.

The complaint of the Agricultural Union regarding the half-rate concession recently granted to pedigree cattle imported from the Union of South Africa into Bechuanaland, Rhodesia or Portuguese East Africa, was based on the misapprehension that the concession also applied to such stock sent from South African Railway stations to the Congo.

The coal rates from Wankie north are considerably higher than those to the south. The ordinary rate to the north ranges from 8s. 8d. a ton to Livingstone, or 1.39d. per ton per mile, to 37s. 4d. a ton to Bwana Mkubwa, or .80d. per ton per mile. Special agreements with the Union Minière, Bwana Mkubwa, and Broken Hill mines are in force, under which the price of the carriage of coal and coke as well as copper varies with the price of copper. The lowest figures under these are £1 12s. a ton for the Union Minière and Bwana Mkubwa, or £1 8s. for the latter
/ when 30,000 tons or more is carried in the year. The lowest figure for Broken Hill is £1 4s. 6d. per ton. All of these range between .6d. to .67d. per ton per mile, and if copper is above £61 a ton they are higher. As against this the rate south starts at 2d. per ton per mile, drops to 1d. at 50 miles, and thence by various stages to .4d. at 300, at which figure it remains. Bulawayo is the first point on the south line to use any appreciable quantity of coal, and the rate there is .47d. per ton per mile. Practically all the larger mines in Southern Rhodesia are more than 300 miles from Wankie, and so get a rate of .4d. per ton per mile. The rates to Southern Rhodesia are thus more than a third less than the special rates granted under agreement to large consumers in the north.

The only mine in Southern Rhodesia using coke in any quantity is the Falcon at Umvuma. The rate from Wankie is 25s. a ton or .8d. per ton mile for a haul of 377 miles. The rate under the contracts with the Union Minière and Bwana Mkubwa again varies with the rate of copper, but is never less than 40s. a ton or .83d. and 86d. a ton mile for hauls of 575 and 559 miles respectively. Thus, despite the special contracts and the longer mileage, the rate to Southern Rhodesia is always lower, and if the price of copper is high the difference may become very marked.

To summarise, it will be seen that only in one respect and at one point, viz., the rates from Union ports to Livingstone as compared with those to Salisbury, is Southern Rhodesia prejudiced. In all class rates Northern Rhodesia and the Congo do not receive the compensation which in ordinary practice is given to long distance traffic; in maize traffic they certainly receive no advantage, in fact it is rather the other way round; their coke rates are higher and their coal rates are over 50 per cent, in excess of those granted to Southern Rhodesia.

**CHARGE FOR CARRIAGE OF GOVERNMENT MAILS.**

The rate charged to the Southern Rhodesia Government by the Railways for the carriage of mails is £7 per mile per annum. It was raised from £5 per mile per annum as from October, 1921, to compensate for an increase of 21 per cent, in weight carried as compared with 1912, when the last test had been carried out, and also for the increase in the costs of operation.

At the same time the Government charges to the Railways for the maintenance of railway telegraph wires in Southern Rhodesia were increased by 20 per cent. on account of larger costs.

The Railways state that, when tested in April, 1922, the total amount paid per annum by the Government, namely, £8,136, represented at that time a payment at approximately 20 per cent, less than half parcel rates.

The charges for the carriage of mails are usually a matter of special contract between the Post Office and the Railways, on account of the large volume to be
handled and the special treatment required. In some countries they are regulated by legislation.

*Prima facie* a rate of 20 per cent. less than half parcel rates does not appear an excessive charge, nor to compare unfavourably with the South African Railways’ charge, which I am informed is £11 per mile. The mail matter carried by the latter is much greater, but no figures are available to me as to the amount carried on those lines, and it would be too much to ask that Administration to carry out special tests in order to supply the information. Also, conditions vary so much in each country that even when the figures were obtained no good criterion would be obtained. Furthermore, these rates are the result of arrangement and are fixed by the two parties at special prices, bearing no fixed relation to the amount carried, work done, or expense incurred. It is therefore clearly impossible to say definitely whether the rate is or is not excessive. Any change in the charges is also liable to work to the ultimate detriment of the Post Office, because the present scale takes no account of the amount to be carried, which is always increasing.

PORT OF BEIRA.

Beira is at present purely a lighterage port; ships lie in the main stream of the river, while the lighter wharves are situated on both sides of the Chiveve Creek. The rise and fall of the tide is approximately 20 ft., and the ebb tide runs, at its maximum, at about five knots. At ordinary high tide ships drawing 24 ft. can enter the port, but those of greater draught must wait for spring tides. The anchorage, although a long one, is somewhat constricted, and ships have not much room in which to swing to their anchors. / The harbour and the Customs wharf are under the authority of the Mozambique Company and not the Railways. The exports and most of the rough import goods pass over the Railway wharf, but the majority of the general import goods must go through the Customs wharf. After sorting and checking there the goods for up-country are trolleyed round by the forwarding agents to the Railway goods shed, and until then the Railways have nothing to say to them. A few trucks are loaded direct at the Customs wharf. The water in front of the Railway wharves is very shallow, and consequently the lighters, which usually draw 4 or 5 feet, are aground for three or four hours at low tide.

The Beira Boating Company undertakes the lighterage for all steamship companies using the port, except the German line, who do their own. The handling of goods on the Customs wharf and in the Customs shed is done by the same firm, but again with the same exception.

The port of Beira has a bad reputation both with the shipping firms and with the inhabitants of Rhodesia. The former complain of the delays to steamers, in consequence of which they have been forced to charge higher freights, and, in
some cases to avoid the port; the latter complain of the delays to goods in transit, entailing larger interest and insurance charges, loss of markets and dislocation of business. That there has been on many occasions serious congestion and delay, and that it is liable to occur again, is not contested by the Railways and may be taken for granted. The first point, therefore, is to find out how far the Railways are responsible, and to what extent the steps which they are taking will remedy matters. The idea that the Railways have full authority in the port is very widespread. It finds expression in the statement of the Association of Chambers of Commerce in the following words:—

‘The Rhodesian Railways under concession control the Railways in the Mozambique Company’s territory and the port of Beira in so far as the handling of traffic is concerned. In actual practice, apart from ordinary Customs precautions by the Portuguese authorities, the working of the port has always been, and is now, entirely in the hands of the Railways.’

It is strange that a public body, which has on several occasions sent sub-committees to report on the working of the port, should be so badly informed, and it is not surprising after this that the general public remain in ignorance on the point. The control of shipping in the harbour, the dredging, stevedoring and lighterage are quite independent of the Railways; in the case of goods passing over the Railway wharf, until the packages are placed from the lighters in the slings of their cranes, they have no control whatever, and in the case of those using the Customs wharf they have nothing to say to them until the cases are handed over at the goods shed and consigned up-country. At the most they can only be accused of being responsible for the delays between ship and Customs wharf through delay in dealing with lighters at their own wharf, as these lighters could then be released earlier for other traffic. For delays at the Customs wharf and between the Customs wharf and the Railway goods shed they cannot be held even remotely guilty. The importance of this lies in the fact that practically all general goods pass over the Customs wharf, and these are the consignments about which most of the merchants’ complaints arise. A striking instance occurred just before my visit to Beira. Complaint was made to the Government that goods landed from the s.s. Gloucester Castle, which cleared on the 12th April, had not reached Salisbury by the 14th May. On investigation I discovered that this ship had discharged 612 tons and the whole of this cargo, with the exception of one motor car and two lorries, had gone to the Customs wharf. There had been no undue delay in the despatch up-country of any of these three vehicles. The delay to the goods about which complaint had been justifiably lodged was due to congestion on the Customs wharf. I have dealt with this question first, as it is important that the popular misconception on the point should be corrected.
Leaving aside for the moment the question of the general adequacy of the facilities, three points were emphasised by the representatives of the shipping firms at Beira, in my interview with them and in their statement, as being necessary to obtain the best out of such facilities as existed. On all these they had arrived at a satisfactory agreement with the Railways prior to my arrival. The first was the method of sorting such import cargo as passed over the Railway wharf. The previous practice had been to check, sort and load to destination each consignment as it came up in the slings from the lighters. The delay caused thereby to the / lighters is obvious. The Railways pleaded that they were compelled to this course by the Portuguese Customs authorities, who insisted that nothing could be brought ashore in a non-Customs area unchecked. The Railways have now obtained their consent, subject to the whole area being fenced, to the goods being carried direct in trucks to a dumping ground, where all the operations of sorting, checking and loading to destination will be carried out. The dumping ground was being laid at the time of my visit and the fencing was in course of erection. The saving of time in the clearance of lighters which will result from this procedure will be considerable. Whether or not the Railways could have obtained this concession earlier from the Portuguese authorities is difficult now to determine and is no longer of great importance.

The second point was that the Railways should work double shifts on the import cranes. The Railways have agreed, and have established a continuous service from 6 a.m. to 6 p.m. They also inform me that they are prepared, when necessity arises, to put on a third shift. It is only fair to the Railways to state that the original correspondence shows that they themselves put forward this proposal in October, 1923, but the other parties did not then agree. Also, the overtime for Customs authorities thus engaged is being paid half by the Railways and half by the Beira Boating Company, and not by their employers.

The third point was the provision of another trolley line, so that three cranes instead of two can be used for the dispatch of chrome. This has now been laid.

While these alterations will no doubt improve the handling of export cargo, and of such import cargo as passes over the Railway wharves, and will benefit indirectly the handling of general goods by allowing better work to be obtained from the lighters, they cannot do anything to relieve the congestion on the Customs wharf, which, as I have said above, is the principal cause of delay to general goods. That congestion is caused by lack of space and lack of shedding. The sheds also are of bad design, having only one entrance. In the past 20 years not only has there been no increase in shed accommodation, but one shed has actually been taken from the wharf authorities and allocated to the Port Captain.

So long as the present arrangements and control obtain, it would be unwise to anticipate the provision of adequate accommodation; the new Port of Beira Company should be able to effect an improvement, but it remains to be seen
what it can do. The only hope for the immediate future lies in gradually diverting to the Railway wharf the surplus of imports, leaving to the Customs wharf only so much as it can handle with despatch. A move in this direction is being made, and it is intended shortly to divert to the Railway wharf the whole import cargo from one ship, as an experiment. If this is successful, it will justify the extension of the practice, and so afford a solution of the problem.

I attach great importance to the need for proper dredging. The amount performed now is quite inadequate, and the objection of ship owners to the port is in part due to this. The need for dredging applies not only to the anchorage and bar, but also to the Chiveve Creek, where the lighter wharves are situated. I am informed that there used formerly to be from 3 to 4 feet greater depth of water at the wharves than now. Great care will, however, have to be exercised in any dredging undertaken in the creek, so as not to imperil the piles supporting the wharves, and for this reason it will probably never be possible to regain the whole of the depth which has been lost. Now that the new Port of Beira Company has been definitely charged with the responsibility for dredging, there should be a marked improvement in the amount performed.

It remains to discuss how far the Railway wharf, when the additions now proposed have been completed, will be adequate to cope with the traffic which may be anticipated from the countries served by the port.

At present the Railways have a wharfage of 905 feet and 94,980 sq. feet of warehouse area. On the wharf are eleven steam cranes of modern design, and the layout of the lines to serve the wharves is satisfactory. Of the eleven cranes six are, in normal times, detailed for export and five for import. When heavy despatches are taking place, this is varied; eight would probably be engaged on exports and only three on imports. The Railways estimate that, working an eight hour day, this number of cranes can deal with the cargo of six ships, four loading and two discharging. This allows two cranes to each of the four ships loading and three cranes to the two discharging. The rate of handling the different commodities varies; with maize one crane can handle about 300 tons in eight hours, with copper about 250 and with chrome about 400 tons. Thus, on the assumption / that two of the ships were loading maize and the other two chrome and copper, each would be loading about 600 tons a day, which may be considered a fair rate for one ship. With smaller ships and mixed loading the rate would be lower; three cranes would then be occupied in handling the cargo from the two ships discharging. A good deal would, of course, be passing over the Customs wharf. The effect of working 12 hours instead of 8 may be taken as causing an increase of about one-third, because for various reasons, such as changing over, drawing full and replacing empty trucks, and tides, full use of the extra hours worked cannot be obtained. On this basis a third ship loading chrome and copper and a third loading maize could be managed.
Steps are now being taken to add another 500 feet of wharfage, equipped with four cranes. The practical effect of this addition may be taken as the equivalent of two additional ships, when working eight hours a day, or three, when working continuously from 6 a.m. to 6 p.m. To summarise, the wharf is now competent to handle the cargo of six ships during normal hours, or of eight when working twelve hours a day; when extended, it will be able to handle the cargo of eight ships during normal hours, or eleven ships on a twelve hour basis.

During the past heavy traffic season it was not uncommon to have more than eight ships in the harbour for cargo at one time, and at times there have been ten or even more. The maximum was thirteen, but some of these were not discharging or loading appreciable quantities. Eight ships at a time cannot therefore be regarded as an abnormal number to expect at the present time; during the coming maize season the wharf will only be able to meet this situation by working an extra shift, and the proposed extension will only just allow for the same number during normal working hours. The only margin it will possess will be that of working longer hours. This remedy is not altogether a desirable one, although, of course, it must be used when necessary; it is expensive and proportionate work is not obtained from it. As a margin for the increase in traffic which may reasonably be expected, it is quite inadequate.

Looking at the problem from another point of view, the figures for the total tonnage passed over the Railway wharf during the years 1920 to 1924 are as follows:

<table>
<thead>
<tr>
<th>Year</th>
<th>Total tonnage</th>
<th>Percentage of increase</th>
</tr>
</thead>
<tbody>
<tr>
<td>1920</td>
<td>229,186</td>

The increase in four years has been 86 per cent., or an average of 21½ per cent, per year. The rise in 1924 would have been still more marked, had it not been a bad maize year in Southern Rhodesia. The maize shipments were over 50,000 tons less during the last seven months of that year than during the same period of 1923. Had the maize crop been even a normal one, the rise in tonnage would have been over 45 per cent.

Taking the important export traffics* in detail, chrome has risen in the four years mentioned from 50,857 to 157,455 tons, or 210 per cent; copper from 25,807 to 83,144 tons, or 222 per cent., and asbestos from 14,515 to 25,374 tons, or 75 per cent. Lead is the only important mineral which has fallen off, the tonnage having dropped from 16,305 to 8,141, a decrease of about 50 per cent.

* Annual reports of General Manager.
This is, however, unimportant compared to the other minerals, and its place may be taken by zinc. As regards the others, although I understand there is a limit to the world’s demand for chrome, it would be unwise to assume, in face of the steady rise which has taken place hitherto and the possibility of finding new uses for it, that the demand for ore from Rhodesia is suddenly going to stabilize at the present figure. In copper there is every chance of a large increase from the mines in Northern Rhodesia, quite apart from what may be anticipated from the Congo. In the case of asbestos there appears to be no reason to expect that the output should not go on increasing at the same rate. Maize has fluctuations, but over a period of years there is a large increase. Throughout the countries served there has been a much larger acreage placed under cultivation, and the result of his will be seen as soon as a good season occurs, when undoubtedly the figures for 1923 will be passed. / 

The Railways do not deny that the present provision of wharf accommodation is inadequate; it is tacitly admitted, in fact, by the request which they made a year ago to the Mozambique Company to be allowed to build an extra 380 feet of wharfage, now altered to 500 feet. This amounts to an increase in capacity of about 40 per cent., or less than two years’ increase according to the standards of the last four years. If the progress of the last year, or even of the last two years, is maintained, the new wharfage will barely suffice for the increase which will have taken place by the time it is constructed, i.e., the season of 1926–1927, and will be inadequate for the traffic of 1927–1928. It is true that it will be possible to get more work out of the new wharves, as a certain proportion of the length, at any rate, will be in water, which will allow lighters to be worked at all states of the tide. But this does not constitute a large margin for contingencies, and the Railways themselves do not calculate that their average capacity will be increased by more than 40 per cent.

I do not therefore regard the present construction proposal as more than the minimum required to deal with the requirements of the next two to three years; beyond that there is no margin for the expansion of trade, except through the expedient of working extra shifts. In his speech as Chairman at the General Meeting of the Rhodesia Railways Trust, Sir Henry Birchenough is reported to have referred to the extra 500 feet of wharfage as ‘the first section of a large scheme of construction.’ From this it would appear that the Board are also aware that the provision of this 500 feet will not fulfil requirements.

The first thing, therefore, now that the negotiations with the Port of Beira Development Company are completed, is to push ahead with the construction of the new extension, so as to be ready for the opening of the 1926 maize season. There should be no great difficulty in accomplishing this, provided the work is put in hand early and is not delayed further by negotiations. I class the importance of efficient dredging as about on a par with that of more wharfage, and I
I am glad to see that at the same meeting it was stated that this would be taken in hand. I consider that it is a matter of first importance that the question of further extension should not be allowed to wait for the completion of this section. Plans and arrangements should be prepared and any necessary approval obtained well in advance, so that construction is not delayed. Otherwise in three or four years’ time the state of affairs at the port will be little, if at all, better than it is to-day. The form which the further extension should take belongs more properly to Part II. of this report, and is fully discussed there.

As regards the responsibility for the past and present inadequacy of the port, the Railways at present have a wharfage of 905 feet and 94,980 square feet of warehouse accommodation. In 1912 they had 378 feet of wharfage and 41,100 square feet of warehouses. In 1912 57,694 tons were landed and 64,762 shipped at this wharf, a total of 122,456 tons as against 44,734 landed and 381,816 shipped in 1924, a total of 426,550 tons. Thus in these twelve years there has been an increase of 248 per cent. in tonnage handled, of 139 per cent. in wharfage and 131 per cent. in shedding. The facilities have obviously not kept pace with the tonnage to be moved, unless those available in 1912 were much in excess of requirements. This was clearly not the case, as shortly afterwards a scheme of extension was commenced.

The reason which the Railways plead for not having kept abreast of the requirements of the port is that under the Van Laun concession the whole of the railways and harbour works could be expropriated in 1926, the price to be paid being the capital sum which at five per cent. produces an annual return equivalent to the average of the net receipts of the three previous years. If this appeared prejudicial to either party, the indemnity payable might be fixed by agreement or by arbitrators. If the arbitrators did not agree, an umpire was to be appointed by the Portuguese Supreme Tribunal of Justice. The capital sum could be paid down or in annual instalments, also with interest at five per cent., at the choice of the Government. No mention is made as to the amount of the annual instalments. The dates for expropriation were 1916, 1926 and so on. Harbours are admittedly works which take a long time to pay an adequate return on moneys invested.

The Railways contend that under the concession new harbour works would have become liable for expropriation long before the net receipts from them could, if capitalised according to the terms quoted, represent the cost of their construction; that, if resort had been had to arbitration, the decision in the final event would have rested with a Portuguese judge, and that, even if an adequate sum had been fixed by arbitration, the compensation could have been paid by annual instalments, the sum paid each year being entirely at the option of the payer, who was therefore at liberty to fix them if he chose at ludicrously small amounts. They claim that it would have been extremely difficult, if not impossible, to raise money for a large harbour scheme on such conditions. Their
attempts to provide further lighterage berths had been negatived by the refusal of the Mozambique Company to sanction the proposal put forward about two years ago to add another 380 feet, the cause of the refusal being the concession granted to the Port of Beira Development Company.

The force of these contentions cannot be denied.

ROLLING STOCK.

The shortage of rolling stock forms a subject of complaint in the statements of case of the Chamber of Mines and the Association of Chambers of Commerce. In the former a list of the delays caused to the Wankie Colliery by the shortage of trucks is given; in the latter no details are supplied; delays in the past are referred to in general terms and the fear is expressed that the new stock, notified publicly as on order, will be inadequate to meet the expansion of traffic. The Rhodesia Agricultural Union states that the Railway Administration has in the past been considerate in handling seasonal traffic with little delay, although instances have occurred where truck shortage has jeopardised the trade in grain at other than the principal marketing centres. It also expresses the fear that the rolling stock now on order will not fulfil the requirements of expansion.

The General Manager in his reply on this subject admits that ‘the tonnage of traffic which the Railways are handling at the moment is not far from our maximum effort with existing facilities,’ that ‘there is more traffic offering than we can at present accept,’ and that the 12 Garrett engines, 250 steel bogie trucks and 25 bogie cattle trucks on order will enable the Railways to deal adequately and without delay with the extended traffic of 1925–1926, but with no great margin for further expansion. He states that ‘fresh orders on a generous scale are now being considered, and it is certain that demands for a large number of additional engines and trucks will be sent to London shortly.’ He admits that the Railways cannot supply sufficient transport to meet the full requirements of the Wankie Colliery, which includes making up the arrears caused by washaways and heavy rains.

In order to ascertain the situation as it existed before the dislocation of traffic in January of this year, I obtained statements from the Wankie Colliery to show how the truckage which they required had been met in the last two years. These statements show that in 1923 54,000 tons of coal and 117,738 tons of coke were required by the Union Minière, and 54,176 and 118,001 tons respectively were supplied. In 1924 51,500 tons of coal and 130,872 tons of coke were required and 52,255 and 131,109 tons respectively were supplied. This is clear evidence that until the end of 1924 the Colliery obtained all the truckage it
required; nor does it make any complaints on this score prior to that date. The Rhodesia Agricultural Union statement also makes no serious complaint as to the past; on the whole, in fact, it gives a good certificate to the Railways. The only definitely condemnatory statement is from the Association of Chambers of Commerce, but as it advances no facts in support of its accusation, which is itself of a most general character, it is impossible to accept it against the statement of the Rhodesia Agricultural Union and the actual figures in the case of the Wankie Colliery.

Truck supply is a fruitful cause of complaint on every railway, and especially those with seasonal traffics. The traffics on the Rhodesian system are less seasonal, taken as a whole, than on most tropical railways, but even in its case the rise and fall is considerable. It is enabled to adjust the balance to a certain extent by accumulating stocks of chrome ore at Beira, and so restricting that traffic during the maize season. No railway can be expected to carry the full equipment for the peak load; otherwise the stock would lie idle during the rest of the year, with considerable loss to the railway, and hence, indirectly, to the public. What it can be expected to do is to carry the seasonal traffics within a reasonable period so as not to lose markets or expose produce to the weather. It is evident from the statement of the Rhodesia Agricultural Union that the Railways have succeeded on the whole in the past in this respect, and the figures from the Wankie Colliery show that their demands have been fulfilled, too. Nor are there any complaints regarding chrome ore. I think, therefore, that the Railways may be considered as having complied with their obligations in this respect until the end of 1924.

The situation changed with the new year. The washaways and heavy rains dislocated the traffic arrangements seriously; besides the actual stoppages much less work was obtained from the equipment. The increasing traffic demands added to the troubles, with the result, as confessed by the General Manager, that the Railways are still unable to meet the full demands of the Colliery at present.

This critical situation will last until the end of the year, when the first of the new engines is expected to be on the road, but full relief will not be felt until the end of March, when all the new stock ordered should be in service. This, again, will only afford temporary relief; the increasing demands of the Congo and the new ballasting programme will both make heavy demands, and the new orders which are being sent Home shortly should make full provision for these.

It is also important that these orders should be despatched without delay, because, as shown by the time to be taken in the delivery of the locomotives now on order, it is not safe to calculate on engines being available for service in less than nine months to a year from the time of ordering.
ADMINISTRATIVE ORGANISATION.

One of the points to which my attention was directed in the Letter of Instructions was whether, having regard to the requirements of mining, farming, commerce and of the general public, the equipment and administrative organisation of the Railways produce the best commercial results.

The question of equipment has just been dealt with. As a result of my examination of working expenditure and administration, I have already recorded my opinion that the system is generally managed and operated with a good measure of efficiency, and that such points as I had had occasion to criticise were already the objects of special attention by the management. The points to which my criticisms were directed in particular were the necessity for reducing the stocks of stores held, for the introduction of the divisional system of operation, and for the strengthening of the track:

In regard to the port of Beira, I have stated that the present administration leaves much to be desired, in particular in regard to imported goods (but for this the Railways can be held responsible only to a partial degree), that there is an urgent need for proper dredging, that the present wharfage facilities are inadequate, and that the additional 500 feet proposed can only be regarded as the minimum required to deal with the requirements of the next two or three years, after which further extension will be necessary.

I place the need for more equipment, for dredging, for strengthening the track, and for further wharfage at Beira in the first order of urgency. Nothing should be allowed to stand in the way; failure to make provision may, and in all probability would, have most serious results.

In the second order of urgency I place the need for safeguarding the railway where it crosses the Pungwe. My reason for placing it in the second category is that while grave inconvenience is caused by a complete interruption of traffic, especially for such a long period as twenty-four days, the congestion can in time be worked off. The effects of continuous derailments last for several months; the effects of want of dredging and equipment are ever-present as long as the want lasts. Steps should certainly be taken to cure the trouble at the Pungwe, but it should not be allowed to take precedence of the other urgent needs, such, for example, as that for strengthening the track. I am laying stress on this point because it was the latter and not the former which was the main cause of the congestion in the early part of this year. When the Pungwe overflowed during last wet season, the line was breached in several places between miles 32 and 37, and traffic was suspended from the 4th February to the 28th February. It had been breached previously in 1918 and 1923. The trouble is due to a variety of causes; in addition to the flooding of the river itself, which is at its maximum about fourteen miles in width and several feet deep, the effect is increased if
it coincides with high tides. The channel of the river is very unstable, and has shifted under the main bridge since its erection. It is also considered by well-qualified persons that the flooding is not caused by water from the catchment area of the Pungwe alone, but is augmented by the Zambesi overflowing in heavy rainy seasons the low watershed between it and the Pungwe. [...] 

An expenditure of £11,000 as a first instalment has been sanctioned by the Board; with this it is proposed to construct two additional 100 feet spans and raise the bank at the place where it was overtopped last season. This work will be completed before the next rains. The final scheme is, at the time of writing, in course of preparation; when it is completed it is estimated to cost roughly £30,000, including the £11,000 referred to above. The necessity of providing funds for this purpose has been recognised by the Board.

ESTIMATED RESULTS OF WORKING THE PORTION OF THE SYSTEM INSIDE SOUTHERN RHODESIA.

In order to ascertain whether that portion of the railway system contained within the boundaries of Southern Rhodesia might be considered self-supporting, the Railway Administration has prepared the statement given in Appendix XL (not included). This statement was submitted to me during the various stages of its compilation, and I agreed to the final results before they were entered. Where it has been possible to allocate operating expenses at all definitely, this has been done; where it has not been possible, a division based on mileage has been made. The same general principle has been followed in regard to other expenditure. I have already explained how the revenue from goods and mineral traffic was estimated. In the case of passenger traffic it was possible to obtain the proper division of the Mashonaland Railway Company’s receipts direct; for the Rhodesia Railways, Southern Rhodesia was credited with 95 per cent of the takings from the Salisbury-Kalomo section, and those from the Vryburg- Bulawayo section were divided on mileage. On the Beira-Salisbury section a mileage proportion was taken for the receipts due to the Salisbury-Portuguese Border length. The same methods were adopted for livestock and vehicles. In the case of the other sources of revenue, division by mileage has been taken where no closer allocation could be made.

It must be realised that in compiling a hypothetical statement of this character, a good many assumptions have to be made. Division of expenditure by mileage, though the only practical method of estimating in certain cases, is at best only an approximation. For example, on the Rhodesia Railways section from Salisbury-Kalomo, the northern portion from Livingstone to Kalomo is clearly cheaper to run than the portion from Salisbury to Livingstone, but it would be
impossible to gauge how much cheaper it is without a detailed examination of items, which is obviously out of the question. A mileage division was therefore adopted, and in this, as in all the other cases, the assumptions taken have never been unfavourable to Southern Rhodesia, and wherever there has been a doubt it has been given in its favour.

Two items call for comment; the first the deduction of £44,500 for bonus mileage given to the Portuguese portion of the Beira-Salisbury section by the Rhodesia Railways. This has been deducted, as it is assumed that the present agreements remain in force; also, if the Southern Rhodesian portion were cut off it would probably still find it advisable to pay this bonus mileage, for the reasons I have given earlier. The share of pier dues at Beira, now credited to the Beira-Salisbury section, has been included also, because the present working agreement allows for this. The sum included is the portion due to the Salisbury-Umtali section of the Mashonaland Railway Company, plus the proportion due for the short section of the Beira Railway, between Umtali and the Portuguese frontier. / Throughout, this small section, six miles, has been treated as being included in Southern Rhodesia, although it belongs to the Beira Railway Company. The share of port working, calculated in the same manner, is also included on the other side.

The result of this estimate is to show a surplus for the portion in Southern Rhodesia of £37,900. If no bonus mileage was given this would increase to £82,400.

It must not be assumed from this result that if the Southern Rhodesian portion were cut off from the remainder of the system it would support itself. The working expenditure is usually higher in proportion on a smaller system, and the overhead charges weigh more heavily. The portion in Southern Rhodesia, if cut off and maintained as a separate concern, would certainly not realise as large a surplus as is given above, and would probably not prove to be self-supporting.

The surplus of £37,900 for the Southern Rhodesian portion contrasts in rather marked fashion with the figure of £428,983, the combined net profits of the Rhodesia Railways and of the Mashonaland Railway Company for the same year. The comparison shows clearly that the best paying sections of both Railways are those which lie outside the borders of Southern Rhodesia; the advantage to this Colony of maintaining the financial connection is obvious.

I have the honour to be,

Sir,

Your most obedient, humble servant,

F. D. HAMMOND.

NATAL GOVERNMENT RAILWAYS.

REPORT

OF

J. H. SMITH

SPECIAL RAILWAY COMMISSIONER.

UPON THE

ADMINISTRATION, ORGANISATION AND WORKING

OF THE

NATAL GOVERNMENT RAILWAYS.

[...]
To the Hon. the Minister of Lands and Works,  
Colonial Office, Pietermaritzburg, Natal.

Sir,

In pursuance of the arrangement I entered into with the Agent-General on behalf of the Government of Natal, to visit the colony for the purpose of investigating the present administration, organisation, and working of the Railway Department, and to recommend what alteration, if any, it would in my opinion be desirable to make for the more efficient working of the service, I have the honour to state that I left England on the 18th of October, 1902, arrived at Cape Town on the 5th November, and after interviews with the principal Cape Railway officials, proceeded to Johannesburg, where I had the pleasure of meeting Sir Percy Girouard, the Commissioner of the Central South African Railways, arriving at Pietermaritzburg on the 12th November.

After a conference with the Prime Minister, I proceeded to Durban, and commenced my inspection and enquiries into the working of the Natal Railways.

Through the full and ample facilities which were afforded me by the direction of the government, and the ready and courteous assistance rendered by the management, I was enabled to travel over the entire system, to visit and inspect every Station and Goods Shed, the Engine Sheds and Workshops, the Stores and Maintenance Depots, the Pumping and Electric Light Stations, and the Indian and Native quarters. I had also interviews with the General Manager, the Assistant and Traffic Managers, the Chief Accountant, Engineer-in-Chief, Superintending Engineer of Construction, Maintenance Engineer, the late and the present Locomotive Superintendent, and the other officers in the various Departments. I also enquired into the working of the different offices with the staff attached thereto, as well as the Stores Superintendent’s Department. As far as time would permit, on various occasions I also took the opportunity of inspecting the condition of the stores and materials in stock.

During my visit I thought it desirable to obtain interviews with representatives of the traders of Durban, Pietermaritzburg and Ladysmith, and also with the Committee of the Natal Fruit Farmers’ Union.

On leaving Natal en route for England I again visited Johannesburg for the express purpose of enquiring into the working of the office established there by the Government to represent the interests of the Natal Railways.
ENGINEERING DEPARTMENT.

CONDITION OF LINES.

MAIN LINE.

As regards the Main Line, it is well ballasted with broken stone throughout, effectually drained and weeded, and for the greater part sufficiently fenced. The banks and cuttings together with the permanent way have been maintained in first class order, and the whole of the line having now been laid with a rail weighing 78 lbs. to the lineal yard, it is capable of carrying an almost unlimited traffic.

I discussed with the Engineer-in-Chief and the Maintenance Engineer the merits of the method of laying the rails with what is known as ‘broken’ joints, instead of ‘even’ joints, especially having regard to the breakage of the 45 lbs. rails on the Branch Lines.

The system of platelaying adopted by American Engineers, which is almost universal over their 200,000 miles of Railways, is that known as the ‘broken’ joint, and although engineers in different countries have divergent views as to the merits of the plan, it cannot be gainsaid that American engineers have an extensive experience, and that they are quick to grasp the value of any system which will improve the road. It has been successfully demonstrated in America that the derailment of engines and vehicles is far less than was formerly the case, and that the running of the trains is much smoother and more agreeable to passengers.*

BRANCH LINES.

North Coast Branch.

In regard to the branch lines, so far as the permanent way is concerned, they are not in the same satisfactory condition as the main line. They are for a considerable portion of their different lengths ballasted with sand and / laid with rails of 45 lbs. to the lineal yard. I have rarely travelled on any line with so much discomfort as on the North Coast Line. On making enquiries as to the cause, I was informed that the 45 lbs. rails had been in the road for over 20 years, but that it was intended to relay the first section with a heavier rail during the current year, and experience has proved that a fairly heavy rail with good stone or gravel ballast is the most economical in the end.

South Coast Branch.

The above remarks will equally apply to the South Coast Line, which, in my opinion, deserves far more attention than it has received up to the present. Its almost unique and unrivalled position, running as it does for nearly the whole of

* Col. Yorke, in his recent Report to the President of the Board of Trade upon his visit of America, confirms this.
its length along the sea coast, affording views of beautiful lagoons and rivers, and the most delightful bushland scenery, renders the line, from a passenger point of view, the most attractive branch in the Colony, both for holiday makers, health seekers, and for residential purposes. Several pleasure resorts have already been established, and the development of new places cannot fail to become popular, if only the line is brought up to the standard and a train service provided such as the district requires and deserves.

If it is urged that the extent of the present traffic will not warrant a better train service, I can only rejoin that without additional facilities the traffic is never likely to improve. It is the train service after all that develops a district and produces traffic, and although it is quite possible that at first some loss would be sustained, such a district, if fostered and afforded reasonable accommodation, would soon convert a non-paying into a profitable line. It would hardly be credited outside Natal, that it is now impossible for a passenger to travel by rail 77 miles from Durban and to return the same day.

**Richmond and Umzinto Branches.**
The Richmond and Umzinto Branches I found in good order, and I was glad to see that the ballasting of both these branches was being systematically undertaken, to bring them up to a higher standard of efficiency.

**Bluff Branch.**
The Bluff Line, when relaid with the heaviest rails and well ballasted (which will no doubt be an accomplished fact by the time this Report is presented, as the work was proceeding when I left), should develop into an important Branch with the heavy coal traffic which should be dealt with at the Bluff in the future. /

**Orange River Colony Branch.**
The running road was in good order, but the fencing which had been destroyed during the late military operations, and the repair of which was about to be proceeded with, should be completed as soon as possible, as the train in which I travelled was pulled up three times through cattle and horses being on the line.

**Dundee Branch.**
The Dundee Branch I found in good running order, but this line, as well as other branch lines where the 45 lb. or 46 lb. rails are at present laid, I would recommend should be relaid as soon as circumstances will permit, with a rail weighing not less than 60 lbs. to the yard.

**Formation of Main Line and Traffic Capability.**
The existing curves, as well as some of the grades, it appeared to me would admit of material improvement at a moderate cost, and whatever policy may be decided
upon as to the construction of new lines, the improvement of the present line should be kept steadily in view, and a reasonable amount set apart year by year to defray the cost. If the improvement of those places, where the heavy grades and sharp curves meet together, are systematically undertaken and additional crossing places are provided between Durban and Ladysmith, the carrying capacity of the line can be brought up to the practical working and haulage of upwards of 4,000 tons per day. By practical working I mean, apart from the running of the necessary trains, that a sufficient interval of time would be allowed for the effective maintenance of the line.

From diagrams which were prepared for my information, I found that at the present time a goods train service could be provided capable of dealing with 3,000 tons of Up traffic out of Durban per day, and when the new Crossing Place which is nearing completion between Botha’s Hill and Drummond is opened, and the further Crossing Place which is in contemplation, but not yet sanctioned, viz., between Hill Crest and Botha’s Hill is provided, 3,500 tons could be conveyed from Durban daily by 34 trains, or 1,085,000 tons a year of 310 working days.

I ascertained that at the time of my enquiry the traffic sent over the Main Line daily from Point and Durban amounted on the average to about 2,000 tons.

From a return of traffic conveyed for the year ending December 31st, 1902, I found that the gross tonnage dealt with between all stations, including live stock, amounted to 1,808,666 tons, or an average of 5,834 tons per day (excluding Sundays, Christmas, New Year’s day and Good Friday).

Goods Sheds.
At most of the goods sheds, I found that the flooring consisted of timber, and that rats had caused serious damage to the goods lying in the sheds. A concrete flooring should, in all future erections, be provided, and the existing timber floors replaced as early as possible.

Maintenance of Pumps.
At the present time all steam pumps used in connection with the watering arrangements are maintained by the Locomotive Department. They should be under the care of, and maintained by the Engineering Department. Any electrical pumps should be maintained by the Electrical Department.

Rail Creeping.
From a return I called for, I find that during the year 1902, there were 62 cases of ‘creeping’ of rails. On a number of railways an anti-creep chair has been adopted with the very best results, and as far as I have been able to ascertain, there has
been no case of creeping where they have been introduced. I would commend this matter to the attention of the Engineer-in-Chief.

**Station Waiting Rooms.**

At a number of stations the Waiting Rooms are badly designed. It surely cannot be necessary for four or five separate doors to be provided to obtain entrance to the Ladies’ Lavatories.

At some of the new stations the fittings supplied are of a much more expensive character than is necessary. Some of the fire-places, overmantels, furniture, and lamps are better suited to private mansions than Station Waiting Rooms.

**TRAFFIC DEPARTMENT.**

**Control of Stations.**

At a number of the stations visited I found a laxity prevailing which ought not to exist on any well-conducted railway. Some of the station masters and other employees were uncouth in their manner and ill-suited to come into direct contact with the travelling public. A want of discipline was apparent, and the disregard of the rules and regulations laid down for the guidance of the staff was very pronounced.

There were some notable and gratifying exceptions to this state of things, but these only tended to emphasise in my mind the conclusion at which I had no alternative but to arrive in other cases, and which I attribute to a want of close, continuous, and intelligent supervision.

At most of the stations the accounts were well kept, but otherwise disorder was a noticeable feature, and although no doubt at many of the stations the office accommodation is old and inconvenient, no reasonable excuse could be urged for the condition in which many of them were found.

I will instance some of the matters which came most forcibly before me:

**Fire Buckets.**

At some of the more recently-erected stations this important part of the equipment had not been furnished. At others although the buckets were there, they were empty, and in many cases had apparently been so for a considerable time.

**Instructions to the Staff.**

Although proper books are provided for the purpose, in comparatively few cases were the circulars issued from time to time by the different officers properly filed. I found them lying about in all directions, and apparently treated as so much waste paper, instead of being kept in order of date for ready reference.

Other books supplied for a specific purpose, such as the station equipment book, had in many instances not been entered up at all.
At stations, as a rule, where there was the least work to do, the greatest neglect was exhibited.

On calling for the Rule Book, which every servant of the Department ought to have readily available, it was frequently not forthcoming, and in many cases when produced was out of date. / 

I consider that the present system of issuing circulars for the guidance of the officers and staff should be altered. I cannot, for instance, see the utility or necessity for sending to Port Shepstone a circular relating to the working or alteration of the Glencoe Junction Yard.

Any notices which it is necessary to issue for specific purposes should be restricted solely to the places and persons affected.

I noticed that in a number of the circulars issued there was a clause warning the staff of the penalties that would be incurred by a disregard of the instructions.

I think this system of assuming that the staff will not obey the instructions is not that which is best calculated to obtain the strict and willing attention of the staff, and, in my opinion, it is better to assume that the staff will obey instructions and deal with any cases that arise when they are not carried out.

**Lamp Rooms.**

At many of the stations the Lamp Rooms were dirty and badly kept, and, as if to court disaster, accumulations of old books and forms were stacked therein.

**Links.**

There is a regulation that links must not be allowed to lie about the station yards, and that they are to be collected and placed on the stands provided for that purpose, or where there are no stands, that they must be deposited at a place specially set apart. At some stations this regulation was strictly observed, but at other stations the regulation was entirely disregarded, and I found links lying about in all directions. The instructions to Foremen Platelayers to collect any links lying about on their sections are also not carried out.

**Luggage Arrangements at Point.**

During my enquiry a number of complaints were made to me with regard to the difficulties experienced by passengers by the incoming steamers in obtaining possession of their luggage. The arrangements are anything but what they should be, and passengers landing and wishing to proceed on their journey by rail have good cause for complaint when in some cases several days elapse before they receive their luggage.

In three cases into which I personally enquired there was no valid excuse whatever for the detention, and if it is desired that the Port of Durban should not be prejudiced, a radical alteration should be effected in the existing arrangements.
Running of Trains.

From the returns which I had prepared for three months, it appears that out of the total number of Main Line trains, 76 per cent. ran to time; 10 ½ per cent. were from 1 to 5 minutes late; 4 ½ per cent. were 10 minutes late; 3 ½ per cent., 20 minutes; 2 per cent., 30 minutes, and 3 ½ per cent. over 30 minutes late. Of the Branch Line Trains 75 per cent. ran to time; 9 ½ per cent. were from 1 to 5 minutes late; 6 per cent., 10 minutes late; 5 per cent., 20 minutes late; 2 per cent., 30 minutes late, and 2 ½ per cent. over 30 minutes late.

Of the through Up trains to the Transvaal for the same period, 60 ½ per cent. were handed over at the Border to time, 8 ½ per cent. from 1 to 5 minutes late; 7 per cent., 10 minutes; 9 per cent., 20 minutes; 6 per cent., 30 minutes, and 9 per cent. over 30 minutes late.

On the Down journey the trains handed over to this Administration were as under:–

37 ½ per cent. to time; 3 per cent. from 1 to 5 minutes late; 13 ½ per cent., 10 minutes late; 18 per cent., 20 minutes late; 9 per cent., 30 minutes late, and 19 per cent. over 30 minutes late.

During the month of January, the evening Mail from Johannesburg was handed over at the border, 70 minutes late as a daily average. This irregular and bad working reacted on the Natal Service most prejudicially.

Although it is difficult to secure the same amount of punctuality in working over a single line, as with a double line, there is room for considerable improvement.

Signalling.

On the Natal Railways the signalling arrangements are of the most primitive character, and if the Railways were under the control of such an authority as the Board of Trade of Great Britain, I have little doubt that notice would be given to the effect, that in the interests of the public, the safety appliances now required and almost universally adopted, must be provided within a given time, or the working of the railways must cease.

‘Safety and not Speed’ may be a most excellent maxim, but I fail to see why in Natal time should be considered of less value than in any other part of the world.

The watchwords of every railway manager should be ‘expedition,’ ‘efficiency’ and ‘economy,’ and I cannot too strongly impress upon the Government the necessity for giving this matter the earliest consideration with a view not only of increasing the speed of the passenger trains, but of ensuring a greater degree of security than is the case at the present time. Such signals as are at present in use are a delusion, and afford very little protection either to the passengers or the engine drivers. In some cases I am able to say from personal observation, they have been disregarded altogether, and in others that divergent views prevailed between the day and the night staff as to the way in which they should be
treated. With a Main Line properly signalled and points interlocked on the most up-to-date methods, the adoption of automatic exchanges and suitable engines, the mail trains could be expedited between Durban and Charlestown by at least two hours and a half – a matter of no small importance to the travelling public.

Staff Working.
The system which has been adopted and is known as the ‘Electric Train Staff System’ is admirably adapted to the safe working of the Natal railways. Although where human agency has to be reckoned with, it cannot be described as absolutely infallible or as rendering accidents impossible, it is as near perfection as any system that has been introduced.

Stationery.
At few stations, at Home or abroad, have I observed anything worse than the system, or, rather, want of system, in dealing with the stationery. Many of the books and forms I found were stored under counters, in drawers, and on shelves, in the most untidy manner, and without any regard to economical consumption. Requisitions for many of the forms were sent in at the regular periods, although there were already supplies on hand, in some instances sufficient to last for several years. At one station there were some thousands of wagon labels of which 100 only, on the average, were used per month, and this state of things obtained more or less at most of the stations. At few places was the average consumption filled in in the column provided for the purpose, and in very few instances had the Stores Department failed to execute the requisitions exactly as they were made out by the station masters. At some of the stations forms and books had been supplied which were never used, and had apparently been there for several years. No check or control would appear to have been exercised in any quarter.

Tarpsaulins.
While the rule in regard to the care and treatment of tarpaulins is perfectly clear and well-defined, throughout the whole system the instructions appear to be ‘more honoured in the breach than in the observance.’ The general practice was not to fold the sheets carefully and in the prescribed manner as soon as the trucks are unloaded, but for them to be thrown upon the ground and exposed to the weather and rough usage. I was not surprised to find that two fully-loaded trains had been detained for over twelve hours because there were no tarpaulins available to cover the wagons, owing to the want of care and delay in returning them; no supply of sheets however ample would be sufficient to meet the requirements under such conditions.

As bearing upon the foregoing, and as exemplifying my remarks in another place upon the cost of renewing wagon covers, ropes and chains, I may point
out that for the year ending December 31st, 1902, the amount expended under this head was nearly £20,000, whereas on one of the English Railways with a mileage 50 per cent. in excess of the Natal Railways, and a revenue greater by 40 per cent., the cost incurred was under £13,000 per annum. No doubt a portion of the expenditure is due to the state of affairs arising out of the late war, but a large proportion of the amount is undoubtedly due to the destruction of the tarpaulins caused by the careless way in which they are dealt with at the stations.

Uncollected Tickets.

From a return which was called for, I found very serious laxity prevailed in the collection of tickets. On other British and Colonial Railways, if the number of tickets uncollected during any single month amounts to over two per cent., it is known that something is wrong, and, from the monthly returns which are prepared, a careful watch is kept upon the collection.

Upon the Natal Railways, however, it has not been the practice to keep any such return, but, from the figures above referred to, I find that no less than 16·42 per cent. of the tickets issued were never collected. This indicates either great carelessness on the part of the staff responsible for the collecting, or irregularities which ought not to occur. The subject will well repay continuous and systematic enquiry.

Weighing Machines.

At few of the stations was the rule in regard to weighing machines being attended to as a matter of daily routine, carried out. In numerous instances the steel-yards were rusty, and the excuse made in some cases was that it was the business of the Weighbridge Inspector to see to their cleanliness and proper condition. At most of the Goods Sheds the condition of the weighing machines was even worse than on the stations.

Observations and recommendations.

Accumulation of Old Books, Accounts, Correspondence, &c.

At the earliest opportunity I would recommend that a complete clearance throughout the whole system be made of all accumulations going further back than two years.

There can be no good reason for keeping waybills, invoices, or correspondence relating to matters of the time only, for a longer period than that mentioned, encumbering the stations with a mass of absolutely useless documents.

Booking of Seats.

I noticed on several occasions that passengers at Durban who had omitted to book their seats, not being aware of the necessity for so doing, were not allowed to proceed by the mail train, although there were a number of seats vacant in the
carriages. The explanation I received was that these seats were reserved for passengers from Pietermaritzburg, whether they were or were not required. / In accordance with the universal practice passengers from the longest distance are entitled to the preference, and they should be allowed to travel to any station where a train is timed to stop. I question very much the legality of any regulation to the contrary.

**Claims.**

For the year ending the 31st December last no fewer than 6,945 claim were lodged, the main proportion of which were for loss of and damage to goods, while the total amount paid and remaining to be paid amounted to about £17,000.

A very unsatisfactory feature is the growing number of claims, and the amount paid for compensation is very large compared with other Colonial and English Railways. I received strong complaints from the traders as to the inordinate number of losses through pilferage and breakages caused by careless handling, and these complaints were justified, judging by the claims paid.

I saw the Superintendent of the Railway Police, and he assigned as one reason for there being so many claims for goods lost, the errors made by the checkers, and the consequent wrong loading of goods.

If an improvement is not speedily effected, it may become necessary to consider the desirability of establishing a special Railway Police Staff.

The Goods Superintendent at the Point has introduced a very good system of recording the number of errors made by each checker, and there is no doubt that the knowledge that this record is being kept will tend to greater care on their part.

**Convict Traffic.**

I find that on the average upwards of 300 convicts are conveyed daily from Durban to Point and back.

No payment is made for this service to the Railway Department, which should not be expected to perform work gratuitously for other departments. The amount involved is about £1,500 per annum.

**Durban Station.**

The whole of the arrangements and accommodation for dealing with the coloured traffic are very inadequate, and the sooner they are improved the better. / I constantly saw carcases of frozen meat lying on the ground outside the latrines, and the necessity for an alteration is very pressing.

I think it would be advantageous if more European porters were employed on the platforms. Passengers arriving by steamer, and desirous of proceeding by train, are hampered through being unable to make the natives and coolies under-
stand where they wish to go and how they wish their small articles of luggage disposed of.

Complaints were made to me also that when the trains from the Transvaal are very late, passengers often experienced great difficulty in getting their luggage dealt with, owing to the want of sufficient porters.

**Durban Forwarding Parcels Office.**

This is very inconveniently situated, having regard to the distance parcels for despatch by train have to be conveyed between the office and the train. I understand, however, that the existing arrangements are only temporary, and awaiting the adoption of a scheme for improving generally this part of the station.

**Durban and Maritzburg Goods Sheds.**

At neither of these stations are the goods sheds arranged so as to permit of the expeditious and economical handling of traffic.

Whenever the inevitable alterations are carried out, it is to be hoped that the greatest care will be exercised in their design, and that the most modern and best labour-saving appliances will be supplied. I saw on one occasions when at Maritzburg fourteen men engaged in unloading from one of the 33-ton high-sided wagons, a case weighing about 10 cwt., which occupied them fully a quarter of an hour. With a proper crane it could have been transferred from truck to trolley in less than two minutes, and three men at the outside would have been engaged in the work.

**Electric Lighting of Trains.**

I find that experiments have been made and are still in progress with a view of effecting an improvement in the lighting of the passenger trains. The fittings for the system of electric lighting known as ‘Stone’s’ were ordered for 44 carriages of various descriptions. In this case, bearing in mind the largeness of the order, a decision would appear to have been arrived at before it had been sufficiently demonstrated that the system was suited to the particular character of the Natal Railways, and that it would meet all requirements. Upwards of £6,000 has been expended in fitting a number of vehicles to test a system of lighting which there is little doubt will prove ineffectual and unsuitable for the Natal Railways, at any rate with the apparatus which has, up to the present, been provided.

It appears to me that before so large an expenditure was incurred a single coach equipped with the ‘Stone’s’ system would have been amply sufficient to demonstrate its suitability or otherwise, and the experiment should have been carried out at the sole cost of the patentees. It is evident that however satisfactory the system may be on other railways where a high rate of speed can be obtained, it is not, as at present supplied, suited to a railway where, on account of the heavy grades, the speed is necessarily limited.
In regard to what is known as the ‘Accumulator’ system, that appears to answer all requirements. The initial cost is far less than ‘Stone’s,’ the maintenance is much cheaper, while the light afforded is, on the whole, infinitely better.

The cost of fitting up a train consisting of five vehicles with ‘Stone’s’ patent apparatus is about £680, while the cost of fitting four coaches and a van on the ‘Accumulator’ system is about £180.

The ‘Accumulator’ system has also the advantage of adding to the dead weight of the train less than one-half the weight of the ‘Stone’s’ apparatus.

‘Exceptional’ Arrangements.
There are, I consider, far too many ‘exceptional’ arrangements in force on the Natal Railways, both in the Coaching and Goods Departments.

In the former, when once the regulations, which should be carefully revised, have been adopted, they should be adhered to in their entirety.

The same remarks also apply to the goods rates and arrangements. It is not only confusing to the public, but also to the staff, for arrangements involving a departure from the established tariff to be continually introduced.

Fines.
The fines inflicted upon the staff at the present time are credited to working expenses. This is wrong in principle, and the amount should form the nucleus of a fund for the relief of the relatives of employés injured in the execution of their duties.

The head of each Department should be empowered to deal in whatever way he may find to be necessary with the employés in his own Department, but any dissatisfied servant should have the right of appeal to the Commissioner of Railways.

Fruit Traffic.
In regard to representations made by the Committee of the Natal Fruit Farmers Union, I could not but recognise the reasonableness of their application that suitable trucks should be provided for the conveyance of the various fruits, and that greater care should be exercised in the loading and unloading thereof.

When iron trucks are used and covered with tarpaulins, fermentation soon takes place, causing serious loss to the grovers. At the stations from which fruit is mostly sent, it is also desirable that covered accommodation should be provided so that it may be loaded without detriment in all conditions of weather.

The Committee also suggested that it would be desirable for a small charge to be made for the empties returned, and were pleased to hear that I had already arrived at the same conclusion, and decided to make such a recommendation in my Report to the Government.
**Goods Rates and Classification.**

With comparatively few exceptions the goods rates in Natal have been framed so that the same rate per ton per mile for the carriage of merchandise obtains for the last mile as for the first, whereas throughout England, France, and other countries in Europe, Australia, and America, the principle adopted is a 'decreasing rate' per ton per mile for an 'increasing distance.'

As an example how this operates, I may point out that for goods classed as Normal, and conveyed from the Point to Johannesburg, the rate is £7. 13s. 4d. per ton of 2,000 lbs., or 3·78d. per mile for the throughout distance.

On the English railways the following scale may be taken as a fair sample of the basis upon which the rates are calculated for the carriage of goods in the corresponding class:

<table>
<thead>
<tr>
<th>Distance</th>
<th>Rate per ton per mile</th>
</tr>
</thead>
<tbody>
<tr>
<td>Up to 20 miles</td>
<td>4·30d.</td>
</tr>
<tr>
<td>For the next 30 miles</td>
<td>3·90</td>
</tr>
<tr>
<td>” 50 ”</td>
<td>3·80</td>
</tr>
<tr>
<td>Beyond 100 miles</td>
<td>2·90</td>
</tr>
</tbody>
</table>

On the French railways, for similar goods the initial rate for the first 50 miles is 2 1/2d. per ton per mile, and is gradually graded down so that when the distance the goods are carried exceeds 625 miles, it is no higher than 1 1/4d. per ton per mile.

On other Continental railway systems the rates are based upon the following scale:

<table>
<thead>
<tr>
<th>Distance</th>
<th>Rate per ton per mile</th>
</tr>
</thead>
<tbody>
<tr>
<td>Up to 46 miles</td>
<td>1·56d.</td>
</tr>
<tr>
<td>From 47 to 93 miles</td>
<td>1·25</td>
</tr>
<tr>
<td>” 94 ” 124 ”</td>
<td>.94</td>
</tr>
<tr>
<td>” 125 ” 217 ” and over</td>
<td>.62</td>
</tr>
</tbody>
</table>

In America, as is well known, for long distances merchandise is carried at rates which gives an almost infinitesimal sum per ton spread over the entire mileage, but at the same time yield a fair profit.

In Australia the following will serve to show the basis upon which the rates for the carriage of goods in the highest class are calculated:

<table>
<thead>
<tr>
<th>Distance</th>
<th>Rate per ton per mile</th>
</tr>
</thead>
<tbody>
<tr>
<td>For the first 100 miles</td>
<td>5·25d.</td>
</tr>
<tr>
<td>” second ”</td>
<td>4·20</td>
</tr>
<tr>
<td>” third ”</td>
<td>3·675</td>
</tr>
<tr>
<td>” fourth ”</td>
<td>3·15</td>
</tr>
<tr>
<td>From 401 to 500 miles</td>
<td>2·625</td>
</tr>
</tbody>
</table>

On some of the European State-owned railways the rates have been fixed not so much with the object of obtaining the best financial return upon the outlay involved in the construction of the lines, but to develop the resources and trade of the countries.
Throughout the whole of the South African Colonial Railways I would strongly recommend, if it has not already been brought about, that there should be adopted one uniform classification of goods, in accordance with the practice in Great Britain, America, on most of the European railways and in the Australian Colonies, and the antiquated system at present in operation of classifying goods as ‘Normal,’ ‘Intermediate’ and ‘Rough’ abolished.

There are many reasons which could be adduced why such an alteration should be brought into force as early as possible. / Inter-Colonial Relations.

I have referred to this important question of through rates in detail, because the present practice is so entirely opposed to that prevailing elsewhere. There is no single instance of which I am aware in Great Britain where, in the case of through traffic conveyed at agreed rates, the receipts are not divided according to mileage, and there would appear to be no sound reason why the same system should not be adopted in the case of Natal and the Transvaal.

When the Netherlands Company was in existence, masters of the situation dominating the position, and able to dictate their own terms, the position was different, but now that British Colonies alone are concerned, more equitable arrangements should be adopted.

That the cost of living is so great is largely due to the abnormally high rates charged for the conveyance of the necessaries of life, and until a different state of things is brought about, the prosperity and development of the Colonies must be seriously retarded.

I understand that a Conference is to be held for the purpose of considering these and other railway matters, and it is to be hoped that a broad-minded view of the whole position will be taken, to the advantage of all the Colonies concerned, and that the ultimate federation of the railways of South Africa will be borne in mind. But until this is an accomplished fact, I would commend to the notice of the Government the desirability of initiating steps with a view to the pooling of the receipts from the through traffic to the Transvaal.

It cannot be desired that one Colony should profit to the detriment of another Colony, but that all should work in harmony and with the utmost goodwill to each other.

If such an arrangement could be brought about there should be no difficulty in settling the terms, allocating the receipts, and fixing the allowance for working expenses by whichever route the traffic is carried. A body of competent railway men would find no difficulty in adjusting the terms on a basis satisfactory to the different Colonies concerned.

I may instance in support of this statement, that 40 years ago an agreement was entered into between three of the most important railways in England for
a division of the receipts from traffic for which they were all competitors. This agreement is still in operation and has worked with the most beneficial results to all parties.

Mails.
The amount received by the Department from the Post Office for the conveyance of Mail matter, is the same to-day as it was in the year 1892, viz., £7. 10s. per mile.

For the year ending 31st December, 1892, the amount paid to the Department was £2,897, for the year ending 31st December, 1902, £4,505. The postal revenue during the same period increased from £49,433 to £110,277, so that the Railway Department is not receiving an adequate return for the service rendered.

The payment ought not to be less than £12 a mile at the present time, having regard to the increase in the work performed by the Railways for the Postal Department, and seeing that the Railway Department pays no less a sum than £4,500 per annum to the Postal (Telegraph) Department for the maintenance of the wires and appliances used in the working of the Railways.

Maritzburg Ladies’ Waiting Room.
I consider the employment of a Night Attendant for the Ladies’ Waiting Room at Maritzburg is unnecessary.

One is not provided at Durban nor at the Waiting Rooms on the principal stations in England after 8.0 p.m.

Occupation of Ground by Military.
When at Harrismith I saw a large area of ground stacked with Military stores. I presume that some arrangement will be come to with the Military authorities to pay a rental if the occupation is intended to be a lengthy one.

Parcels over 50 lbs. in Weight.
The temporary restrictions in regard to parcels over 50 lbs. in weight not being accepted for conveyance by passenger train, should be put an end to as soon as possible.

If traders are willing to pay for the conveyance by passenger train of ordinary parcels at parcels rates, there should be no limitation whatever to the weight they may desire to send. It simply means throwing away the revenue to be derived from a good paying traffic.
Passenger Fares.
The passenger fares, especially for the long distances, are abnormally high. Three pence per mile first class and two pence per mile second class for the entire distance, are rates that are now but rarely charged in any country.

I would recommend a revision, and that a new set of fares, based on the scale shown below, should be introduced.

<table>
<thead>
<tr>
<th>Miles</th>
<th>1st Class</th>
<th>2nd Class</th>
<th>3rd Class</th>
</tr>
</thead>
<tbody>
<tr>
<td>1 to 100</td>
<td>3d</td>
<td>2d</td>
<td>1d</td>
</tr>
<tr>
<td>101 ” 110</td>
<td>2·95</td>
<td>1·95</td>
<td>1</td>
</tr>
<tr>
<td>111 ” 120</td>
<td>2·90</td>
<td>1·90</td>
<td>1</td>
</tr>
<tr>
<td>121 ” 130</td>
<td>2·85</td>
<td>1·80</td>
<td>1</td>
</tr>
<tr>
<td>131 ” 140</td>
<td>2·80</td>
<td>1·80</td>
<td>1</td>
</tr>
<tr>
<td>141 ” 150</td>
<td>2·75</td>
<td>1·75</td>

</tr>
<tr>
<td>191 ” 200</td>
<td>2·50</td>
<td>1·625</td>
<td>1</td>
</tr>
</tbody>
</table>

Return fares to be a single fare and a half.

Passengers’ Luggage.
The practice which at present prevails of luggage being left by passengers on the platform on arrival at Durban for the Department to look after, should be discontinued. All passengers should be required to claim their luggage on arrival of the train, and if they desire to deposit it in the Cloak Room they should do so under the existing regulations. At the present time the Department takes custody of the luggage, and stores it for the passengers for varying periods.

Although a charge is made for this service, it is a bad practice, and the contract with the passenger having been completed upon his arrival, any / further services required of the Department should be the subject of a new contract.
Passes.
The percentage of passes uncollected was not less than 44 per cent. of the total number issued. This is even still more indicative of the laxity which exists on the part of the collecting staff. It would tend to lesson the number of uncollected passes if separate passes were issued for both the outward and return journeys, instead of one pass covering both journeys, as at present.

It would also appear, from the circulars issued in regard to lost ‘periodical’ passes, that there is great carelessness on the part of the persons to whom they are issued, and only under the most exceptional circumstances should passes be re-issued to those who lose them. I am well aware of the difficulties in carrying out such a regulation in its entirety, but if once it were known that there would be great difficulty in obtaining a re-issue, it would ensure more care on the part of the holders.

The number of uncollected ‘periodical’ passes was as under:–

<table>
<thead>
<tr>
<th>Pass Type</th>
<th>Percentage</th>
</tr>
</thead>
<tbody>
<tr>
<td>Annual ‘All stations’ passes</td>
<td>18·6%</td>
</tr>
<tr>
<td>‘Sectional’ passes</td>
<td>24·3%</td>
</tr>
<tr>
<td>Short period passes</td>
<td>15·4%</td>
</tr>
</tbody>
</table>

A very unsatisfactory state of affairs.

The number of periodical free passes issued is very large, and the list should be most carefully scrutinised and revised.

The number of open passes issued – *i.e.*, passes not bearing the name of any particular person – is far too great, and only under the most special circumstances should they be issued. Such passes are readily transferred, and, during my enquiries, I ascertained that it was by no means a rare occurrence for this to be done. There can be very little security for the Department so long as such passes are in existence. Contractors and others carrying out Departmental works should be required to pay not only their own fares, but those of their workmen. It has been stated that if this were required the cost of the works would be increased, but even if that were so – although I do not admit it would be the case – a bad system would be abolished.

I think it is also desirable that a rule should be laid down that no employé in receipt of less than £250 per annum should be entitled to a first-class pass.

I would further recommend that the head of each department should be empowered to issue single or return journey passes to the employés in his own department, all sectional and periodical passes being issued from the office of the Commissioner.

I find that there are no regulations in force as to the issue of free passes over the Natal Railways, nor have any instructions been issued to the Staff, giving the names of the Officers authorised to sign and issue passes.

The Regulations should stipulate:–
1. The names of the Officers having authority to issue passes.
2. The circumstances under which passes may be given, viz., for business, leave, or special reasons.
3. That monthly returns of all single journey passes issued must be sent to the Accountant, so that he may take steps to see that all such passes have been properly dealt with and collected.
4. That the Officers authorised to issue sectional and periodical passes will, in the same way, be held responsible for the collection of such passes, upon expiry, from the persons to whom they have been issued.

It is the general practice for a circular to be issued at the end of every year advising the Stationmasters, Ticket Collectors, and all concerned as to the description of passes which will be in force for the ensuing year, and, giving the names of the officers authorised to issue and sign them.

The Officers and Employees of the Department who have obtained leave of absence for their annual holiday, and to whom passes are now issued might, I think, have the privilege extended to their wives. I have always found that a little liberality in such cases is much appreciated by the staff, and tends to the creation and maintenance of good feeling.

Pietermaritzburg Passenger Station.
No more inconvenient station so far as the office accommodation is concerned, could have been designed. All the offices and rooms required in connection with the passenger traffic are dark and dismal, requiring artificial light throughout the daytime.

The structural arrangements are certainly not conducive to the health and well being of the staff, while the inconvenience of carrying on the business of the station in such ill-ventilated and ill-lighted rooms can hardly be realised. / 

Private Sidings.
I consider that the conditions upon which any new sidings required for the accommodation of private parties are provided, should be altered, and that the cost of the work upon the land of the Department as well as upon the owner’s land, should be borne entirely by the applicants.

Public and Working Time Tables.
I had intended recommending that a suitable time table for the information of the public should be issued, but I am glad to find that the question has been receiving attention, and the first presentable book of its kind has recently been published and issued. The time table appears to meet the requirements, but its value would be enhanced by the addition of a good map on a comprehensive scale similar to that attached to this Report. I felt very greatly the want of a good and modern map of Natal during the course of my enquiry.
In the small editions descriptive matter of general interest might well be added, and the publication could be improved upon and made much more artistic and attractive than at present.

Arrangements should be made with the Steamship companies trading regularly to and from Durban for a supply of the public time tables as well as the small editions to be placed in charge of the Purser, who, when the vessels left the respective ports outward-bound, should place them upon the tables in the saloons for the information of the passengers.

I found it impossible to obtain any information whatever in regard to the train service in Natal on the steamer by which I travelled.

I consider that the Working Time Tables might also be simplified. At present the highest train number shown in the working book is 536, but the number of trains provided for is about 390, the difference being accounted for by lapsed numbers. Taking however the trains actually run on a given day, the number was only 265 including both Ordinary and Specials. In my opinion too, the letters a.m. and p.m. are preferable to the vertical line now used to show the distinction in the trains running between 12 noon and 12 midnight.

Refreshment Rooms.
These are well-conducted. The food and drinkables supplied are good, the charges are moderate and the attendance satisfactory, while the Contractor and his managers exercise close supervision and attention to details. I found in no single quarter any dissatisfaction, but, on the contrary, approval of the efforts made by the Contractor to provide for the requirements of the travelling public.

When, however, the present tenancy expires and fresh tenders are called for, I would suggest that in addition to the rent that may be offered, the conditions of tender should stipulate for a percentage payment upon the gross receipts, so that the Railway department may participate during the currency of the tenancy in any development and improvement of the traffic that may be brought about through the growing prosperity of the Colony.

This suggestion also applies to the Contracts for the Bookstalls, Advertisements, and Automatic Machines.

With a view also of maintaining the principle that as little traffic as possible should, under any circumstances, be conveyed free of charge, I recommend that, on the expiration of the present Contract, a quarter of the ordinary goods or parcels rate should be charged for the carriage of all provisions sent from or to any Refreshment Room on the Natal Government Railways, Advertisements, and for all articles sold at the Bookstalls, or required for replenishing the Automatic Machines. Unsold articles, books and show cards to be returned to Durban free of charge.
Returned Empties.

I would recommend that a small charge be made for the conveyance of returned empties.

During my Inspection, I found quantities of empties at various stations that had been carried by the Department considerable distances, which the consignees did not think it worth their while to remove.

It was in fact suggested at an interview I had with one of the Trading Associations that such a charge should be made in order to ensure greater care on the part of the servants of the Department in dealing with the empty packages.

Season and Traders’ Tickets.

The basis upon which the Season Ticket rates are framed should be revised.

I do not think it advisable that Season Tickets should be issued for any less period than one month, and that the issue of other Season Tickets should be restricted to quarterly, half-yearly and yearly.

The rates for quarterly and six-monthly tickets are altogether disproportionate to the yearly rate. The monthly rate should be one-twelfth that of the yearly rate, plus 20 per cent; the quarterly rate should be one-fourth that of the yearly rate, plus 15 per cent; and the six-monthly rate half the yearly rate, plus 10 per cent.

The practice of refunding the value of the unexpired period of the tickets should be abolished, and only in the case of the death of the holder, or some very exceptional circumstance, should any portion of the amount paid be refunded.

It would I consider be desirable that season tickets should be issued on a reasonable scale over a minimum distance to traders paying not less than £500 per annum, also to bona fide Insurance Agents and Commercial Travellers.

South African Produce.

Although from my experience I have found that it has been the wish of the respective Governments of the Colonies with which I am acquainted to develop the local industries, either by high protective duties or concessions in the freight rates, it has come to be recognised that such concessions should not be made at the expense of the community at large. In respect to one industry alone, and dealing only with a single case, I find that under existing arrangements there is an absolute loss upon the traffic dealt with, amounting to close upon £1,800 per annum.

In addition to this, the necessity for the abolition of certain of the Colonial produce rates was urged upon me by some of the traders’ representatives, as it was pointed out that in a number of articles described as products of the Colony, the principal ingredients were actually manufactured elsewhere and imported.

The whole of the arrangements in regard to this traffic require the most careful revision, and such regulations laid down as will guard against losses and prevent undue advantage being taken of any concessions made by the Government.
In another case I found a truck occupied practically for a whole day in conveying 15 tons of stone, for which the Department received the sum of half-a-crown.

**Sunday Trains.**

While not an advocate for the employment of unnecessary Sunday labour, I consider that facilities should be afforded to the public who cannot avail themselves on week-days of visiting such well-known sea-side places as Isipingo, Amanzimtoti, Illovo and Umkomaas on the South Coast, and as far as Pinetown on the Main Line, trains being arranged at such suitable hours as would doubtless attract a considerable traffic. Cheap Return fares should be issued at 3/– 1st class, and 2/– second.

The experiment might also be extended to Wests and Return tickets issued at 1/6 1st class, and 1/– second.

**Uniforms and Clothing.**

I think the uniforms and caps supplied to the staff might be very much improved upon, and brought more up to date.

The travelling public attach a great deal of importance to the smart appearance of the staff, as giving a tone to the system generally. Employés to whom it is decided that clothing is to be supplied should be designated, and the articles of uniform specified.

**Locomotive Department.**

**Accidents and Derailments.**

During the year ended 31st December, 1902, there were 161 casualties, of which 26 were fatal. There was no accident attended with loss of life to any passenger, but the number of derailments to engines, wagons, and carriages, and the number of collisions, amounted to no fewer than 986. Out of this number, engines left the rails on 521 different occasions, of which 380 were of the ‘Reid’ class. There were also 411 derailments of wagons, so that it is evident, either that the road was not properly maintained and was out of order, or the engines and wagons were unsuited to the road.

I could find no evidence to warrant the former presumption, so that there is no alternative but to assume the latter.

**Carriage Examination.**

I do not consider the examination of carriages as at present conducted is sufficient, or that it is carried out as it should be.
I travelled from time to time in carriages in which there were a number of defects which ought to have been detected and remedied before the carriage was put into traffic working.

Carriage Sheds.
Throughout the whole of the system there is practically no provision for the protection of the carriage stock, which, having to remain in the open, is exposed to all the varying climatic conditions, rendering the cost of maintenance far heavier than it would be if proper carriage sheds were provided at different points for the protection of the stock.

Carriages.
The carriages now running on the Natal Government Railways are well adapted for the traffic, and would appear to be generally appreciated. The windows and louvres, however, are provided with antiquated and most dangerous fittings. They are expensive, ineffectual for the purpose required, difficult to manipulate, and their use is attended with personal risk. I tried on several occasions to raise or lower both the windows and louvres without success, while it would be almost impossible for ladies to move some of them at all. Appliances of a very simple and effective character are now in use, and have been generally adopted, and the present fittings should be dispensed with at the earliest opportunity.

During my travels I heard the most uncomplimentary remarks made about these appliances, and they certainly deserve all the condemnation which in my hearing they so frequently received.

I find the new carriages that have been delivered, notwithstanding that they are fitted with the electric light apparatus, have also a cumbrous Provision made for their lighting with oil lamps. This is a reflection upon the electric lighting Department, which, from the experience of the past, is not warranted. In no new railway carriage in England will any such duplication of fittings be found.

Cleaning of Waste and Sponge Cloths.
It would pay the Department to provide appliances for dealing with the oily waste and sponge cloths. The residue could be adapted for the various machines in the works, while the cleaned waste could be utilised for engine cleaning and other purposes. /

The consumption of waste is very considerable, and the article so expensive that the adoption of the suggested appliances would be attended with an appreciable saving.
Durban Locomotive Yard.
I think it is a matter for regret that on so invaluable a site for traffic requirements as is occupied by the different shops in connection with the Locomotive Department, new buildings for the latter department should be in course of erection.

Sooner or later the greater portion of the ground upon which the buildings stand will be required to accommodate the passenger traffic, which it is to be hoped that the growing prosperity of the Colony will develop. The present method of dealing with the out-going and in-coming trains can only be regarded as a makeshift.

The accommodation for the Locomotive Department is cramped and confined. The yard is practically open to every person who chooses to enter it, and with materials lying about in all directions a premium would appear to be placed upon dishonesty. However limited and insufficient the accommodation may be, I cannot admit that there is any excuse for the present condition of the Locomotive Yard. A thorough overhauling is required and the scrap heap which would be established if the yard were properly cleared would be of no small dimensions. I have never seen such disorder prevail in any Locomotive yard.

The irregular disposition of the shops necessitates the employment of a larger number of foremen than would be necessary if they had been erected in a modern and systematic manner on a suitable site with a due regard to future extension.

Emission of Smoke at Stations.
On many occasions I noticed that the rule in regard to Engine drivers arranging their fires so as to avoid any unnecessary emission of smoke from their Engines while standing at or passing stations, was disregarded, to the evident annoyance of passengers and the injury of the station buildings.

Engines, Carriages and Wagons Under or Waiting Repairs
In January, out of 225 engines all told, 48 were under or waiting repair, or 21 per cent. This is higher than it should be, the normal rate being from 14 to 15 per cent. / The percentage of the carriage stock under repair or waiting repairs was 12.57, and of the wagon stock 4.76. Both are above the average, which in coaching stock should not exceed 5 per cent. and in wagon stock 3 ½ per cent. I am glad to find that the Locomotive Superintendent fully appreciates the necessity for getting all vehicles out of the shops and into traffic as quickly as possible.

Engine Sheds, Turntables, Pumping Stations.
Some of the engine sheds and turntables are not kept as clean and the pits washed out as they ought to be. The same remark also applies to the pumping stations.
The only explanation I could obtain was that the coolies neglected their duties, but the Inspectors should see that the men employed for specific work attend to it.

Footboards on Carriages.
The carriage footboards on a large proportion of the stock are dangerous as at present constructed, and such carriages would not be allowed to run in England. The steps are continuous, but they would not prevent passengers falling between the platform and the carriages. The platforms throughout should be of uniform height and so built as to admit of the carriage steps clearing them when constructed the recognised and regulation width.

Hose not Properly Secured.
At a number of the stations I noticed that after the engines had taken water no attempt was made to leave the hose properly secured in accordance with the rules.

Johnston’s Buffer.
I find that since 1895 the rolling stock has been almost entirely fitted with Johnston’s Patent Buffers. The number fitted and on order amounts to 2,786 at the time of writing.

The cost of this buffer is £8. 17s. 9d., while the ordinary buffer used on the old stock costs from £3. 16s. 0d. to £4. 2s. 10d. / It is extremely doubtful if the advantages claimed for the Johnston’s buffer warranted its adoption at such a price, and although it cannot be denied that it does possess certain merits, yet I found the working staff did not regard it with entire satisfaction, and a train by which I travelled was detained five minutes before a connection could be made between the engine and carriage.

The buffer was submitted to some of the railway authorities in Australia, and its advantages were not considered commensurate with its cost. I have heard quite recently that the price of the buffers made locally did not exceed 35s. each, and this in a Colony where the prevailing rate of wages is as high as in Natal.

‘Reid’ Engines.
As regards the order which was given for the construction of 99 additional engines of the ‘Reid’ type, I cannot but express the opinion that far too precipitate action was taken in the adoption, after only a few weeks’ trial, of an entirely new class of locomotive, which had taken seven years to design and produce. However pressing the necessities brought about by the disorganization caused through the late war, I consider that at least a twelve months’ effective and continuous trial should have been given, to demonstrate whether the engine possessed all the merits and advantages claimed for it, and the late Locomotive
Engineer, writing, before the experimental engine had even been ordered, stated that it would require at least a six months’ trial before any satisfactory decision could be arrived at.

Neither its adaptability to the road, its effect upon the permanent way, its own wear and tear and cost of repairs, its consumption of coal and stores, could possibly have been determined after only a few weeks’ trial.

While the type of engine may eventually be found to answer the purpose for which it was specially designed – viz., for the haulage of heavier loads at a moderate speed – it is nevertheless a fact that, at the present time, there is no engine suitable for the hauling of the new Corridor trains, one of which has arrived and the other shortly expected.

**Rolling Stock and Engines.**

I recommend that the stock-taking of January 4th, 1903, should be taken as the stock to be maintained and kept intact for the future, and that all renewals or replacements necessary to maintain the stock in accordance with the returns then obtained should be a charge against working expenses. / I would also recommend that, from the same date forward, there should be replaced 2 per cent. of the engine stock per annum, and that the cost of these renewals should be charged against working expenses.

The time has now arrived when it will be necessary to commence the rebuilding and replacement of some of the older engines, and in adopting 2 per cent. as the extent of the replacements, it will be found that this is the general practice pursued by the principal Railway Administrations.

**System of Paying Employees.**

I noticed when in Pietermaritzburg, that under the present system of paying the employees, very considerable time was occupied, and while the labourers were receiving their pay, the machines and mechanics in charge of them were idle.

Some better system should be introduced, so as to avoid the loss of time and waste of power.

**Testing of Crane Chains and Slings.**

I find there are no regulations in force as to the systematic and periodical testing of the crane chains and slings.

Rules should be laid down providing for every chain and sling being sent once a year to the Locomotive Department to be tested.

**Testing Eyesight.**

It appears that there have been in force no regulations for the periodical examination or tests of the eyesight of the enginemen and firemen.
With so imperfect a system of signalling as that which now exists it has not been considered of importance, but with the introduction of proper and up-to-date signals this matter should receive the attention of the Locomotive Superintendent.

**Wagons.**

Before adopting the present 33-ton eight-wheeled high-sided wagon as the standard, I think further enquiry should have been made, and more experience obtained with a view of satisfactorily testing its suitability or otherwise for the traffic required to be carried. I have heard many complaints respecting this description of wagon, and have noticed at various times and places with what difficulties some of the wagons have been loaded and unloaded; one thing is quite certain, that they are far heavier than is necessary, the dead weight hauled being equivalent to 50 per cent. of the carrying capacity. The aim of all Railway Administrations of late years has been to get the lightest vehicle possible, compatible with strength, and on a number of railways, wagons are now running with a carrying capacity of 50 tons, while the dead weight of the wagon is only slightly in excess of 15 tons.

It will be interesting to note that the total carrying capacity of the wagons in use on the Natal Government Railways, assuming them to be fully loaded, which in actual working is impracticable, was at the time of my enquiry 65,606 tons, while the dead weight of the vehicles equalled 36,357 tons, or 55 per cent.

By the adoption of pressed steel underframes, great strength, combined with lightness, is obtained, and when it is not only possible but quite feasible to increase the ratio of paying freight from 45 per cent. to upwards of 75 per cent. the importance of the subject, especially on a system like the Natal Railways cannot be overestimated.*

For the six months ended December 31st, 1902, the total quantity of merchandise conveyed to and from the Transvaal and Orange River Colonies amounted to 212,588 tons. On this basis the total yearly traffic may be assumed at 425,000 tons. With suitable stock as described above, 127,500 tons additional could have been hauled at the same cost.

The cost of the iron wagon is also very high, being not less than £535 per wagon, with freight, insurance and erection charges included.

The maintenance charge during a given time has yet to be ascertained, but it will, I am afraid, be very heavy judging from the number of cases of hot boxes I noticed. The returns for November and December showed that there had been no fewer than 131, while for all classes of vehicles the number was 189.

* See also Col. Yorke’s Report of recent date on this subject.
WORKING EXPENSES.
The working expenses in the Locomotive Department for the year 1902 are out of all reason, and it will devolve upon the Locomotive Superintendent to see that they are reduced to fair proportions.

The cost of running per train mile, compared with 1897, is more than double, while the total expenditure per train mile has increased by no less than 1s. 1.27d.

It is necessary for the most vigilant supervision to be exercised, with a view of bringing the expenses in this Department to a normal condition.

STORES DEPARTMENT.
It is much to be regretted that the arrangements for housing the general stores and other materials are of such a hybrid description. Within such a limited area it is impossible that the different buildings and sheds can be so concentrated and arranged as to permit of effective supervision, and the business of unloading stores and loading up for distribution is attended with difficulty and inconvenience.

While some of the present buildings are well adapted, if there were suitable land available, or it could be secured, the whole Department should be remodelled and additional buildings erected to provide for the more effective reception, custody, and distribution of the stores than is possible at present.

The Stores Department is invariably regarded in all railway systems as the commercial arm of the service, and it is above all things desirable that the officer in charge should be well acquainted with the condition of markets, and keep a close watch on the course of events as being likely to influence prices of the many articles in daily use on every railway. It is also desirable that practical men should be associated with him to assist in the selection, and valuation of the stores purchased.

So far as regards local contracts, the terms of contract should always stipulate that the names of the makers of the different articles are to be furnished in the tenders, so as to render it impossible for articles of an inferior character to be foisted upon the Department.

DISTRICT STOREKEEPERS.
The District Stores at Greyville, Maritzburg, Ladysmith, and Charlestown when established, should be placed in charge of District Storemen, under the supervision and control of the Superintendent of Stores.

A much more effectual check over the consumption would be possible under this arrangement than is the case at present.
Home Indents.

When specifications and drawings are forwarded to the Agent-General they should be of the most complete character, as otherwise considerable difficulty is experienced in concluding contracts and effecting satisfactory purchases at so great a distance from the source of information.

Stationery.

As regards the requisitions for stationery from all Departments, these should be passed through the respective Chief Offices, so that a more effectual control may be obtained.

The lax conditions which I found to prevail at a number of Stations mainly accounts for an increase of no less than 45 per cent. in the cost of stationery supplied during last year, as compared with that of the previous year.

The increase in the traffic for the same period being only 24 per cent., tends to show the necessity for more direct supervision.

Supply of Stores to Stations.

As regards the supply of stores to stations, I think it would lead to greater economy if the general stores were supplied quarterly instead of monthly, and as there is practically no check at the present time upon the requisitions, they should, so far as the Coaching Department is concerned, be transmitted through the office of the Superintendent of the line, and when sanctioned, passed on to the Storekeeper for execution.

In the same way requisitions from the Goods depôts should be passed through the Goods Manager’s Office, and similarly dealt with. The same regulation should also prevail in regard to the Engineering, Locomotive, and other Departments.

Tarpaulins.

I do not consider that the system of dealing with the wagon tarpaulins is correct. The last sheet manufactured was numbered 6224, from which it would reasonably be assumed that that was the number of / sheets available for traffic purposes excepting those under repair or waiting renewal. Such, however, is not the case. I find that the numbering of the sheets commenced originally from 101, then between 4250 and 5001 there was a break, and no sheets bearing those numbers, I was informed were manufactured. The reason for this I was unable to ascertain, as the arrangement was made some years ago, and there are no official records.

It appears also that when a sheet is condemned it is not the practice to replace it with one bearing the same number, but to defer in some cases for as long a period as two years the issue of a new sheet bearing the number of that condemned. For this practice I could obtain no satisfactory explanation.
The tarpaulins actually available for traffic at the end of January numbered 3,594, and those waiting repairs, under repair, or waiting issue, 1,140. With the lapsed numbers of 750 and 100 this would leave a deficiency, according to the stock books, of 640 sheets.

The stock-taking which was appointed for the 4th January last, may disclose the whereabouts of these missing sheets, but the returns not being complete when I left Natal I was unable to pursue the matter further, but as each sheet costs about £10, every means should be adopted to trace them, and to get both the stock and the books in accord.

In future whenever a new wagon is handed over to the Traffic Department a new sheet should be issued with it as a part of its equipment, and the number to be maintained, and the cost charged against working expenses, should be that shewn by the stock-taking of January 4th last, any deficiency also being made good and replaced at the same cost.

**Value of Stocks on Hand.**
The stocks on hand at the end of 1902, were valued at £164,409, which cannot in any way be regarded as excessive, and from the enquiries I made, I found that this amount represented not only the book, but very closely approximated to the actual, value.

The value of the timber in stock was under £10,000, and of the rails, about £8,000. There were on order, rails to the value of £24,000. / It is desirable that advantage should be taken of favourable markets, to augment the stocks of both timber and rails.

**Working Charges.**
In order to cover the working charges of the Stores Department, amounting to about £21,000 per annum, it was formerly the custom to charge a percentage upon the whole value of the Stores passed through the books, so that each of the Departments contributed towards the cost.

For the year ending 31st December, 1902, the value of the stores and materials issued was £1,180,054. In this amount was included the cost of Engines, Rolling Stock, and Permanent Way material. To cover the entire expenses therefore, it would have been necessary to charge about 1 ¼ % upon the value.

The practice now is, however, for the whole of the salaries and incidental expenses to be placed upon the Estimates and voted by Parliament, whilst as regards the wages staff and other expenses, it is still the practice to charge a percentage upon the value of the stores issued to the consuming Departments.

It is not desirable that this diversity of practice should be continued, and the whole of the expenses should either be included in the estimates and voted by Parliament, or each Department should be debited with a percentage on the
value of the Stores supplied to cover all expenses. The latter course is that now adopted by some of the important Railways.

A great deal of detail work is transacted in the Stores Superintendent’s Office, necessitating the employment of a considerable staff. This detail is of little value. A curtailment of it so far as the bookkeeping is concerned, and an entire reorganisation should enable the Department to be worked more economically, and with a less clerical staff, than it is at present. The total European staff numbers 110, consisting of – 1 superintendent, 43 clerks, 22 storemen, 2 storekeepers, 2 foremen, 12 checkers, and 28 sailmakers.

As an example of the foregoing I may remark that the system in operation generally throughout the Departments, of sending in separate requisitions for materials for works required to be carried out at the same place, involves an unnecessary amount of book-keeping which might be well avoided, and the staff of clerks engaged on this account could be more profitably employed in other directions. /

**GENERAL.**

**Branch Line Accounts.**

The cost incurred in keeping separate the statistics of the Branch Lines, is upwards of £1,800 per annum. I fail to see that there is any good reason why this system should be continued, because the lines having been constructed, they should now be treated as part of the whole system, and the useless expenditure mentioned above avoided.

If at any time a special return is required, it can readily be prepared.

**Capital and Revenue.**

While the tendency of many railway administrations hitherto has been to charge much of the expenditure that ought to be debited to working expenses to capital account, for the purpose of producing more immediate satisfactory financial results, I cannot, as a matter of strict railway finance, concur in the course that has been adopted by the Natal Railway Department.

In the year ending December 31st, 1901, no less a sum than £159,328 was charged to the working expenses of the year, the greater part of which should properly have been charged to capital.

The effect of this has been to show that the net revenue was so much less than was actually the case and the working expenses abnormally increased. I take it that the true policy of any Colonial Administration is not to make large profits out of their railways, but to lessen the cost of transport and communication, and thereby assist in developing to the utmost the resources of the Colony and to cheapen the cost of living.
A very good and sound practice now generally adopted is to charge to working expenses the cost of all new buildings or erections not exceeding £300. Any considerable expenditure that may have to be incurred in re-laying existing lines with heavier rails should be spread over several years, and not wholly debited to the working expenses of the year in which the work is carried out.

Two thousand new tarpaulins are in course of delivery at the present time, the cost of which will be about £20,000. This amount it is, I understand, also proposed to charge against working expenses.

Concession Tickets.
The system of issuing concession or privilege tickets to nearly every employé in the Public Service, and to many other persons, requires the most careful revision, and in many instances I think the practice should be abolished altogether.

For the year 1902, the difference in the amount paid to the Department and what it would have received if ordinary fares had been paid was upwards of £3,000.

Filling Vacancies.
I do not like the idea of a circular being issued intimating that there are certain vacancies for station masters, and inviting applications for the posts.

As I have already pointed out, the capabilities of the employés considered eligible for promotion should be known, and a selection made accordingly.

Harbour Facilities.
There can be no question as to the disadvantages experienced at the present time by the Railway Department in dealing with traffic at the Point, on account of the want of facilities and appliances.

Now that the re-laying of the Bluff Line with the heaviest rail is nearly, if not wholly completed, it is to be hoped that with the reclamation of a much greater and a sufficient area to allow of the provision of ample siding accommodation, and the equipment on that side of the best appliances for the coaling of vessels, that the Harbour Authorities will issue such orders as will make it compulsory for all vessels to do their coaling on the Bluff Side instead of at the Point.

I took the opportunity of obtaining the views of several commanders of large trading steamers, and from what they informed me, I have every reason to believe such an alteration would not only be warmly welcomed, but much appreciated. It would also considerably relieve the already congested sidings on the Point Side, enable the ships to load up or discharge with far greater promptitude, and prevent the serious inconvenience, if not liability to damage, which is now experienced when merchandise is being loaded or discharged during coaling operations.
Hours of Duty.
It is desirable that the hours of duty in all the Administrative Offices should be the same throughout all Departments, viz., 9 a.m. to 5 p.m. (with an interval of an hour at mid-day for luncheon), and from 9 to 12 on Saturdays.

Indian and Native Quarters.
At the Native and Indian quarters throughout the line, I would recommend that it should be the duty of the Officer having the supervision of the Indians and Natives, to frequently visit and examine these quarters.

Whatever the customs and habits of the coloured races may be, so long as they are in the occupation of quarters erected and maintained at the expense of the Government, order and cleanliness should be insisted upon, and the quarters should be lime-washed more frequently than at present. The premises I found in some cases to be in a very dirty and disreputable condition, not altogether due to neglect on the part of the occupants.

Insurances.
Although on account of the rates of insurance being so high, the Government decided to accept the risks generally, there is still and amount of between £1,300 and £1,400 paid annually for the insurance of certain buildings and materials. This amount I consider can very well be saved, because the State is a much larger Corporation than an Insurance Company, and can afford to be its own Insurer.

Johannesburg Office.
I spent a day enquiring into the working of this office. The representative of the Natal Railway Department is well qualified for the important position he holds.

He is closely in touch with the traders and importers, and from what I gathered in conversation with some of the agents, he gives every attention to their business, and endeavours by all means in his power to secure traffic through the Port of Durban and over the Natal railways. / It was a wise step on the part of the Government in establishing this Office, and with the development of trade and industries in the Transvaal, it will become of still more importance.

London Office.
I am of opinion that it would be well worth the consideration of the Government to establish in London a commercial office on similar lines. With a representative having a knowledge of the merchants, traders and exporters, both at home and on the continent, able to quote rates, supply information, and canvass for traffic, great benefit to Natal could not fail to result.
NEW LINES.
I recommend that the estimates submitted to Parliament for the construction of any new lines in the future, should in all cases include the cost of providing such additional rolling stock and engine power as it is estimated will be required for the service of the particular line.

OFFICERS’ MEETINGS.
Once a quarter, on days to be fixed at the beginning of every year by the Goods Manager, Superintendent of the Line, Locomotive Superintendent and Engineer-in-Chief, a meeting of the respective divisional Superintendents should be held with a view to any questions that have arisen affecting the working of the line being brought forward. After the various matters have been fully discussed, minutes should be drawn and the officers’ recommendations forwarded to the respective Heads of Departments for submission to, and approval or alteration by the Commissioner.

OVERTIME.
For the year ending 31st December, 1902, the following was the overtime paid in the several Departments:–

<table>
<thead>
<tr>
<th>Department</th>
<th>Overtime Paid</th>
</tr>
</thead>
<tbody>
<tr>
<td>Maintenance Department</td>
<td>£9,000</td>
</tr>
<tr>
<td>Locomotive Department (Works Branch)</td>
<td>£39,000</td>
</tr>
<tr>
<td>Locomotive Department (Running Branch)</td>
<td>£43,000</td>
</tr>
</tbody>
</table>

In the Traffic Department, I was unable to obtain the amount paid, as no separate return is kept, although it is very desirable that this should be done. From the examples given, it is apparent that the amount paid for overtime is far in excess of what it should be, and the working of the staff unduly long hours points either to the necessity for their duties being re-arranged and more evenly distributed, or the employment of additional men.

PIECE-WORK.
Having regard to the character of the labour upon which the Department has so largely to depend, I would be very glad to see, if it could be possibly arranged, a system of paying the men engaged in the loading and un-loading of traffic, a rate per ton instead of a daily wage. I think if it were made perfectly clear how much could be earned by the more expeditious handling of goods, the native would soon appreciate the alteration and infuse a greater amount of energy into his work to the mutual advantage of the Department and himself.
Point Arrangements.
I could not help being struck by the great advantages which would be derived in dealing with the traffic, and in other ways, if the whole area were enclosed similar to the docks in London and elsewhere, and only those persons having business allowed to pass the gates. At present there is but little protection against robbery, and the numerous cases which have been brought before me indicate that it is at the Point where the losses are sustained.

Printing Department.
The operations of this branch of the service should be extended as soon as it is possible to secure a site for the erection of suitable buildings near the General Stores, of which it should form a part.

The results obtained since the Department commenced the execution of part of its own printing, both as regards despatch and economy, have been so satisfactory as to leave no room for doubt, that the earliest extension of the printing works, so as to admit of the whole of the work being done, would be attended with an appreciable saving and convenience to the Department./

Railway and Parliamentary Accounts.
At present the railway accounts are made up to the 31st December in each year, while the Parliamentary accounts and estimates are made up to the 30th June.

It would be found much more convenient if arrangements could be made so that the accounts and estimates were co-terminous.

In New South Wales, Victoria, South Australia and Queensland the railway accounts and the Treasury accounts and estimates are all made up to the 30th of June in each year.

Railway Law No. 9.
Having regard to the fact that this Law has to be renewed yearly, it occurred to me that under its provisions the powers delegated by His Excellency the Governor to the General Manager to fix rates and fares and make bye-laws, &c., might also require renewal, and the Attorney General, whose opinion I solicited, was good enough to advise as follows:-

‘This Delegation is limited to alteration of rates at present fixed, i.e., when the delegation was granted, and does not allow of an increase in said rates.

‘The Delegation is that of a defunct council before Responsible Government was granted. It is incautious to give a standing Delegation.

‘A fresh Delegation should be obtained and renewed from time to time; any important revision should be submitted to executive Council, i.e., Governor in Council and Delegation should so provide.’

This matter will no doubt receive the consideration of the Government.
Recruiting the Staff.
I would recommend that periodical examinations of youths desirous of entering the railway service should be held, say twice a year, or even quarterly, if found necessary. /

The examination should not only be educational, but also physical, so that none but those well qualified, by intelligence and in good health, should be admitted.

If public notice were given by advertisement in the newspapers of the intended examinations – which should be conducted by a certificated teacher coupled with a railway official – I have little doubt there would be a ready response, and that the department would eventually be rewarded by having a well-educated, well-trained, and generally efficient staff.

Sick Leave.
I find it has not been customary to keep returns of the amount paid to the Staff in respect of sick leave. It is very desirable that a record should, in the future, be kept, forming, as it does, one of the privileges of the staff employed by the Railway Department, not usually accorded to persons in the service of private employers.

Smoking.
Throughout the system generally I came across numerous instances in which the rule in regard to the servants of the Department not smoking while on duty was disregarded. So long as there is a rule in regard to that or any other matter, it should be strictly enforced.

Speed of Trains.
The reason for the construction of Railways is that passengers and merchandise may be transferred as speedily as possible from one place to another, and although Permanent Way Engineers are universally anxious to limit the speed of trains as much as possible because of the effect it has in increasing the cost of Maintenance, still that should be the last and not the primary consideration.

It is absolutely necessary for the efficient and speedy working of traffic that the road should always be in such a condition as to be available for any description or weight of engine and Rolling stock that may require to run upon it; the class of engines and rolling stock should certainly not be limited or restricted in any way by the road. /

Superannuation Fund.
It should be made a condition that all persons joining the service after a date to be fixed, if eligible, should become members of the above fund.
The present conditions attached to membership, however, need revision so as to render the fund more attractive, and so that the contributors may receive benefits more commensurate with their payments than are provided by the existing conditions.

The fund should be managed by a Committee composed of a representative from each Department in the service. At the first meeting of the elected representatives, a Sub-Committee should be appointed to revise and report to the full Committee the alterations and new conditions attached to membership which are found necessary.

As an instance of the unpopularity of the fund, as at present constituted, I find that out of a total possible membership in the Railway Department of 4,730, there are now only 615 members.

**Statistics.**

I annex hereto (Appendix A) a comparative table of railway statistics relating to four of the Australian Colonies, New Zealand, Cape Colony and Natal, which I think may prove of interest. The information now furnished is somewhat fuller than when I first issued similar statistics in Australia.

**Traffic and Staff Returns.**

I think it would be found desirable if the weekly statements of traffic sent in by the stations had the necessary provision made so that an explanation could be given on each statement of the reason for any increase or decrease in the traffic or revenue.

The information so given would be found valuable for reference from time to time, and would admit of the information being given in the Annual Report, which latter should also, in addition to the information already afforded, contain a statement giving the yearly traffic received at, and forwarded from, every station on the line, and also a detailed list of the staff employed in all Departments of the Service similar to that prepared at my request, and a copy of which accompanies this Report. – Appendix B.

**INTERVIEWS WITH TRADERS.**

From the interviews which took place between myself and the representatives of the merchants and traders, I gathered that while up to the present time there had been every disposition to make allowances for the want of facilities granted previous to the War, it was the general opinion that matters by this time should have assumed their normal position, and that the traders should not be subjected to the disabilities they were experiencing.

In some instances, also, the want of additional appliances was pointed out.
Complaints were also made to me as to the delay the traders frequently experienced in the settlement of their just and *bonâ fide* claims.

In some cases very strong complaints were made as to the favouritism which it was alleged had been shown in the allotment of tonnage; that goods conveyed at the undamageable rate were not treated with the same care and consideration as those which were charged at the higher rates, and that loss and damage frequently occurred in consequence.

It was further pointed out that where the loading and unloading of trucks with goods charged at rates which included loading and unloading, collection and delivery, when any of these services were performed by the consignor or consignees, no allowance was made.

I called for the papers in these cases and made enquiries in regard to the various points which had been submitted, and ascertained that where additional facilities and accommodation had been asked for, enquiries had been made and, in some instances, the necessary expenditure for the provision of the accommodation authorised.

Owing to the great pressure of traffic which followed close upon the termination of the military operations, there can be no doubt whatever that the merchants experienced the most harassing delays in getting their goods despatched, and I am by no means satisfied that the best arrangements, even under the then existing circumstances, were made to forward the traffic and prevent complaints on the part of the traders.

It was stated not once, but on several occasions, that by the payment of *douceurs* to the subordinates, it was possible to obtain a preference in the despatch of traffic. I was unable to trace any single case of the kind, but I found that as much expedition was not used on all occasions as was possible.

When it is also ascertained upon enquiry that traffic has been delayed through the neglect of some employé of the Department, I think it would be far better that the fact should be frankly acknowledged.

As regards the loading and unloading of traffic by the consignor or consignee or his agents, or the collection and delivery is effected in the same manner, I am of opinion it would be only fair that an allowance of 9d. per ton should be made for the loading or unloading of any goods charged at carted rates, and when the collection or delivery is performed by the consignor or consignee or his agents, that an allowance of 1s. 6d. per ton should be made.
RECOMMENDATIONS FOR THE FUTURE ADMINISTRATION, ORGANISATION AND WORKING OF THE NATAL GOVERNMENT RAILWAYS,

I recommend that the Chief Executive Officer of the Department be known and designated as ‘Commissioner of Railways.’

I have taken into consideration all the surrounding circumstances, and am of opinion that the title will more accurately represent the official position, and that it will commend itself to Parliament, the Public, and the Staff.

While the appointment should be absolutely non-political, the Commissioner would be answerable for the proper and efficient working of the railways to the Minister responsible to Parliament for the Department.

For the success of such an undertaking as the Natal Railways, which is the largest earning, and, at the same time, the largest spending Department of the State, what is required is a Chief and an Administrator unfettered and unhampered by work and details of a routine character, but an officer who can apply his time and energies to the improvement of the service in every direction and the development of the traffic.

With judicious decentralization, and the appointment of well-trained and experienced officers in the Traffic, Engineering, Locomotive and Stores Departments, endowed with ample authority, combined, at the same time, with full responsibility, and the system equipped with the most modern and the best appliances for the saving of labour (which I regard as so essential in a Colony subject, like that of Natal, to a variety of disturbing influences), the service should be so conducted as to give satisfaction to the public, and yield, at the same time, a fair return upon the capital invested in the railways. The successful management of any railway undertaking is not wholly confined within the limits of safe working and the earning of large dividends, but embraces – especially in the Colonies – other important considerations of a commercial, social and political character. /

Secretary for Railways.

This officer would be the means of communication between the Commissioner and all departments of the Service. He must be a fully qualified railway man, as his duties would of necessity bring him into close contact with the public, and upon him would devolve duties of so varied a character that only a man of high attainments would be fitted for the position.

Amongst the secretarial duties he should also keep the history of every salaried officer and clerk from the time of his entering the Service up to date, so that it may be known at once what his qualifications and career are when he may be recommended for promotion.
Appointment of Goods Manager.
In the actual working of the Railways, having regard to the increasing goods traffic, the revenue from which is now considerably in excess of £1,000,000 per annum, I consider that it is essential that an officer should be appointed to act as Goods Manager, and to take full control of everything pertaining to the Goods Department, including rates, claims, and complaints, the Goods Agents and Staff, where such are found to be necessary throughout the system. He should also have control of all cartage arrangements for the collection and delivery of goods traffic.

This officer to be directly responsible to the Commissioner of Railways. An Inspector should be attached to the office of the Goods Manager.

Superintendent of the Line.
For the control of the Passenger Department, an officer whose designation should be ‘Superintendent of the Line’ should be appointed. This officer should arrange for the running of all trains, both passenger and goods, and in his department would be included all excursion arrangements, parcels arrangements, passenger and parcel rates and fares, claims, refunds, complaints, signalling, train working arrangements throughout the Line, the control of station masters, passengers, and parcel agents, and station staff of all grades. / He would also be responsible for the preparation and issue of all time tables, sheets, pamphlets and notices, both to the public and the staff.

This officer would be directly responsible to the Commissioner of Railways. An Inspector to be attached to the Office of the Superintendent of the Line.

Divisional Superintendents.
The system should be divided into four sections and supervised by the following officers at each of the four most convenient centres:–

Four Divisional Traffic Superintendents.
Four Divisional Engineers.
Four Divisional Locomotive Superintendents.

The maps marked B and D indicate my proposition for the re-division of the Traffic and Engineering Districts.

The Locomotive Divisional Superintendents should be stationed in accordance with my recommendation on page 50.

Traffic Department.
The Officers in charge of the divisions indicated on Map B should receive the designation of ‘Divisional Superintendents,’ and be responsible for the proper conduct of both passengers and goods business in their respective Divisions, and report to either the Superintendent of the Line or the Goods Manager upon the questions arising in each Department respectively.
These officers should be held responsible for the working of that traffic throughout their respective Divisions, and control and supervise all indoor and outdoor arrangements at the stations as well as the staff employed thereat.

They should be responsible for the regulation of the daily train service the issue of such notices as may from time to time be found necessary, the examination of the Guards’ journals of trains running locally in and through their own divisions.

The Divisional Superintendents should be required to frequently visit and examine all the stations and offices in their respective divisions.

With a view also of preventing delay, and to meet the views of the trading community, each Divisional Superintendent should have authority to deal with and settle claims for loss of or damage to goods or parcels arising in his Division to the amount of £10.

To each Divisional Superintendent’s Office should be attached an Inspector whose duty it should be to visit the stations and report as to the order and condition in which they are kept, and the business conducted; the working of all vehicles, and generally as to the manner in which the duties of the staff are carried out.

I further recommend the appointment of an officer with the designation of ‘District Goods Manager’ to take control of the traffic at the Point, Durban and the Bluff.

**Engineering Department.**

For the better supervision and more economical maintenance of the line, I would recommend that the system be divided into districts as shown on Map ‘D.’ The Divisional Engineers should reside at the stations which would be found most central and convenient within the respective divisions. These officers should be capable of carrying out all new works authorised, the construction of sidings, the erection of buildings, and such appliances as may require to be provided from time to time.

Clerks of Works, where necessary, together with the Permanent Way Inspectors, should be attached to the office of the Divisional Engineer, and act under his directions.

**Locomotive and Carriage and Wagon Department.**

These Departments will be under the control and supervision of the Locomotive Superintendent.

Having regard to the growing importance of the Locomotive Works, and the number of men now employed, there should be appointed a Works / Manager, who would be responsible to the Locomotive Superintendent, and in like manner, a thoroughly qualified and practical man should be appointed to take the
position of Carriage and Wagon Superintendent, responsible in the same way to the Locomotive Superintendent.

For the control of the Running Sheds and Engine-working over the various sections, Divisional Locomotive Superintendents should be placed at Durban or Greyville, Pietermaritzburg, Ladysmith and Charlestown.

To each of these offices should be attached a Travelling Inspector who should report to his Divisional Superintendent.

There should also be a Chief Inspector attached to and forming part of the office of the Locomotive Superintendent.

**Electrical Department.**

Having regard to the important and growing developments of electricity, both for lighting and power, I am of opinion that this Department should form a separate and independent part of the system, and be placed solely under the charge of the present Electrical Engineer, who would be directly responsible to the Commissioner.

If the Railway system is to be worked with the greatest possible efficiency combined with economy, the electrical appliances will have to be largely augmented, not only in the Traffic Department but also in the Locomotive and other shops, and also applied to the watering arrangements throughout the Line, wherever it is found that electricity can be utilized with a saving on any other system.

**Labour Department.**

This is a department of increasing importance. The procuration and supply of labour so vitally affects the well being of the railways in all branches, and the responsibilities of the officer in charge are of such a character as to warrant his being designated ‘Superintendent of Labour Department,’ directly responsible to the Commissioner of Railways.

To meet the difficulty attending the supply of labour, it would appear to be necessary to adopt one of three courses:—

1. Legislation by the Government, having for its object the increase of taxation upon the Native races, rendering it imperative upon them to labour more continuously in order to obtain the necessary funds to meet this taxation.

2. The introduction of Indian labour under such arrangements, conditions and restrictions as may be found necessary.

3. The importation of white labour. Looking at the fact that at the present time there are thousands of men in London and other large cities seeking employment; men – such as dock labourers who surround the Dock gates daily waiting for work – well qualified for manual labour, and little or nothing else, if accredited agents went amongst these men, and made it known that employ-
ment could be obtained in Natal, that they would be housed on arrival, have all their food supplied, and at the end of the week or the month each man would receive so much cash in addition, I cannot but think that a very considerable number of men would be induced to try their fortunes in Natal, considering their present precarious circumstances. Such an arrangement would necessarily involve the passages of the men being paid, as well as the finding of the necessary accommodation and provisions, as suggested above, on their arrival.

**Railway Organisation and Lines of Responsibility.**
The following diagram will illustrate my proposals for the administration and organisation of the Railways:

**Skeleton Diagram Showing the Proposed Railway Organisation and the Lines of Responsibility.**

**Salaries.**
Above all things it is desirable that the Staff should be so fairly remunerated that a spirit of contentment should prevail, instead of discontent, and having regard to the high cost of living in the Colony, that the scale of salaries should be placed upon such a basis as will induce the salaried and professional members to remain and devote their best energies to the Service.

The Government has already recognised the claims of the uniform staff and the workmen in the different Departments by fixing a rate of wages to be paid in each case. The scale was certainly not illiberal, and as far as I have been able to ascertain, it has given satisfaction to the men engaged in the Railway Department.

The professional and salaried members of the Staff, however, still remain to be dealt with, and in framing the scale of remuneration submitted herewith, I trust it will commend itself to the Government as being fair and equitable. Hitherto this branch of the service has been neglected, and because no radical or combined action has been taken, as in other cases, that is no reason why the claims of that portion of the staff should be any longer disregarded. In their case no matter what stress or strain there may be, they do not receive overtime for the extra hours entailed by the work upon which they may be engaged, which in many instances is almost continuous. No such cases arise with this section of the Staff as I have found in the Locomotive Department where a driver received for the overtime he worked nearly fifty per cent. of his wages in addition. His ordinary wages amounted to £234. 11s. 8d. per annum, and his overtime to £112. 10s. 6d. In the case of a guard also, the result was even more striking. His ordinary wages for a month amounted to £15. 10s. 6d. and overtime and expenses to £13. 18s. 6d. or £29. 9s. 0d. in all.

It is only under the most exceptional circumstances that this state of things could or should be possible, and whatever may have been the difficulties in the
past in getting suitable men, there should be no difficulty in obtaining the services of well trained and qualified men at the present rates of remuneration.

**SCALE OF SALARIES.**

**Commissioner of Railways.**
The remuneration to be paid to this officer I would suggest be left in the hands of the Government, as there are so many special circumstances attached to the appointment as to render it impossible for any specific amount to be decided upon, although I do not think that any Railway man qualified by special training and experience for so responsible a position could be secured at a lower salary than £2,500 per annum, even if at that.

**Secretary.**
The Secretary to the Commissioner should receive £750 per annum, rising by £50 a year to a maximum of £1,000.

**Goods Manager.**
The official holding this position should receive £900 per annum, rising by £75 a year to a maximum of £1,200.

**Superintendent of the Line.**
The Superintendent of the Line should also receive £900 per annum, rising by £75 a year to £1,200.

**Divisional Traffic Superintendents.**
These officers should receive £550 per annum, with yearly increments of £25 to £700.

**District Traffic Superintendent, Johannesburg.**
This officer should receive £550 per annum, with yearly increments of £25, to £700, the present special allowances, amounting to £450, to be continued.

**District Goods Manager.**
The District Goods Manager, having the control of the traffic from and to the Point, Durban, and the Bluff, should also receive £550 per annum, rising by £25 a year to £700.

**Inspectors.**
The inspectors attached to the offices of the Goods Manager and the Superintendent of the Line should receive £350 per annum, with yearly increments of £20, to £450.

The District Inspectors should receive £225 per annum, with yearly increments of £15, to £300.
Stations.
The whole of the Stations should be divided into four classes, according to the character and importance of the work transacted at each place.

The salaries attaching to –

First Class Stations to range from £450, with yearly increases of £25, to £500.
Second Class Stations to range from £300, with yearly increases of £20, to £400.
Third Class Stations to range from £225, with yearly increases of £15 to £300.
Fourth Class Stations to range from £180, with yearly increases of £10 to £220.

Goods Agencies.
The Goods Agents at Durban, Point and Maritzburg to receive £400 per annum, with yearly increases of £25 to £500.

The Goods Agents at Ladysmith and Newcastle to receive £300 per annum, with yearly increases of £25 to £400.

Note. – When the above scales are brought into operation, all allowances which have hitherto been made, such as free quarters, stores, fuel and oil for lighting, to be abolished. A rental in future to be charged sufficient to cover interest on outlay and maintenance for the houses and quarters provided; all fuel and lighting also to be charged for. This practice has now been adopted with most satisfactory results on a number of English and Australian Railways.

In fixing the salaries under this new scale, the minimum to be paid should be the present salary, with the ten per cent. bonus and a sum equivalent to the payment to be made for house and quarters accommodation, stores, fuel and lighting, or allowance in lieu thereof, not exceeding the maximum of the proper class of the station.

Engineering Department.
The Engineer-in-Chief, I recommend, should receive a salary of £1,200 per annum, rising by £100 per annum to £1,500.

The Superintendent Engineer of Construction should receive a salary of £900 per annum, rising by £75 per annum to £1,200.

The Maintenance Engineer should receive a salary of £700 per annum, rising by £50 per annum to £1,000.

The four Divisional Engineers whose appointment I recommend should receive £550 per annum, with yearly increments of £25 up to a maximum of £700. /

The Chief Draughtsman, Construction and Maintenance Accountants should each receive £500 per annum, rising by £25 per annum to £650.
Senior Draughtsmen and Senior Surveyors to receive £350 per annum, rising by £25 per annum to £500.
Assistant Draughtsmen and Assistant Surveyors to receive £250 per annum, rising by £20 per annum to £350.
Junior Draughtsmen and Junior Surveyors to receive £150 per annum, rising by £15 per annum to £225.
Such Clerks of Works as it may be found necessary to appoint to those positions should receive £350 per annum, rising by £20 per annum to £450.
Permanent Way Inspectors on appointment to receive £275 per annum, rising by yearly increments of £15 to £350.

Locomotive Department.
The appointments of Locomotive Superintendent and Assistant Locomotive Superintendent have recently formed the subject of a specific agreement with the officers holding the present positions.
The Superintendent of Carriage and Wagon Department to receive £500 per annum, rising by £25 per annum to £650.
Senior Draughtsmen to receive £350 per annum, rising by £25 per annum to £500.
The Accountant to receive £350 per annum, rising by £20 per annum to £450.
Assistant Draughtsmen to receive £250 per annum, rising by £20 per annum to £350.
Junior Draughtsmen to receive £150 per annum, rising by £15 per annum to £225.
Chief Inspector to receive £350 per annum, rising by £20 per annum to £450.
District Inspectors to receive £225 per annum, rising by £15 per annum to £300.

Chief Accountant’s Department.
The Chief Accountant should receive £700 per annum, rising £50 per annum to £900. / The Audit Accountant should receive £550 per annum, rising by £25 per annum to £650.
The Cashier should receive £550 per annum, rising by £25 per annum to £650.
The Chief Book-keeper should receive £500 per annum, rising by £25 per annum to £650.
Stores Department.
The Stores Superintendent should receive £700 per annum, rising by £50 per annum to £900.

  The Chief Clerk should receive £350 per annum, rising by £20 per annum to £450.

  The Accountant should receive £300 per annum, rising by £20 per annum to £400.

  The Chief Storekeeper should receive £250, rising by £20 per annum to £350.

District Storekeepers should receive £225 per annum, rising by £15 per annum to £300.

  Officer in charge of Printing Department should receive £250 per annum, rising by £20 per annum to £350.

Electrical Department.
The Electrical Engineer should receive £650 per annum, rising by £50 per annum to £900.

  The Assistant Electrical Engineers, Durban and Pietermaritzburg, should receive £350 per annum, rising by £20 per annum to £450.

Labour Department.
The Labour Superintendent should receive £500 per annum, rising by £25 per annum to £650.

Clerical Staff.
Chief Clerks in Administrative Offices only, viz., Secretary’s, Goods Manager’s, Superintendent of Line, Engineer-in-Chief’s, Locomotive Superintendent’s, and Chief Accountant’s should receive £500 per annum, rising by £25 per annum to £650. /

<td>Third</td>
<td>£150</td>
<td>£15 p.a.</td>
</tr>
<tr>
<td>Apprentice</td>
<td>£60</td>
<td>£10 p.a.</td>
</tr>
</tbody>
</table>

Apprentice (after 6 months probation and the passing of a satisfactory examination in duties performed)

  £100

During probationary six months, £3 per month.
Uniform Staff on Salaried List.

Station Foremen (who should in future be designated Station Inspectors), having been placed on the Salaried List, should, on appointment, receive £225 per annum, rising by £15 per annum to £270.

Running Shed and Workshop Foremen in the Locomotive Department on appointment to receive £250 per annum, with a yearly increment of £20 to £350 per annum.

Foremen in Stores Department, if placed on Salaried List, to receive £200 per annum, with a yearly increment of £15 to £260.

Employés to Be Removed from Salaried List.

The Checking Staff should form part of the Wages Staff and receive the following rates of pay:–

Checkers.

First year:

Probationary 3 months ... ... 8/- per day
Remaining 9 months ... ... 9/- '' ''
Second year ... ... ... 10/- '' ''
Third year ... ... ... 11/- '' ''
Fourth year ... ... ... 12/- '' ''

Foremen Checkers.

First year ... ... ... 12/- '' ''
Second year ... ... ... 13/- '' ''
Third year ... ... ... 14/- '' ''

The Employés in the Printing Department, which, as already recommended, should be attached to the Stores Department, should receive the rates of wages prevailing in the trade, with the exception of the officer in charge, who should be attached to the Salaried Staff. /

Notes.

1. The clerical scale I recommend should apply to all Offices and Departments according to rank and the importance of the work, and provides the rate of remuneration to be paid to the staff, who should be placed in the respective classes according with their present salaries, plus the bonus of 10%.

2. In special cases through length of service or superior merit, when the maximum of the class has been reached, and employé at the sole discretion of the Commissioner may be raised to the next higher class.

3. The scale of salaries applicable to each class of Station, Agency, Office or Department should be circulated amongst the members of the staff concerned.
4. I recommend that the positions of Passenger and Parcels Agents should be abolished, and the Station Master at each place should be held responsible for the performance of the duties attaching to these positions.

5. The subjoined list indicates certain alterations in the positions and designations of the various officers, which I recommend as the result of careful consideration of the scheme I have submitted for the reorganisation of the Railway Staff:–

**NEW DESIGNATIONS AND OFFICIAL POSITIONS.**

Commissioner of Railways.

Secretary to Commissioner.

Traffic Dept.

- Goods Manager.
- Superintendent of the Line.
- Divisional Traffic Supts.
- District Goods Manager.
- District Traffic Supt., Johannesburg.
- Goods Agents, Point and Durban.
- Station Inspectors.

Engineering Dept.

- Divisional Engineers.

Locomotive Dept.

- Assistant Locomotive Supt. and Works Manager.
- Divisional Locomotive Supts.
- Superintendent of Carriage and Wagon Dept.
- Locomotive Accountant.

Accountant’s Dept.

- Audit Accountant.
- Travelling Auditors.
These new positions will not necessarily mean the appointment of additional staff, but the promotion, transference, or higher designation of members of the existing staff.

I trust the recommendations I have made in this Report, with the object of securing the efficient working and administration of the Natal Railway Service, will meet with the approval of the Government. They are founded on a lengthened experience of railway working and management, and their adoption would, I have every confidence, be attended with beneficial results to the Colony at large.

In conclusion, I would like to place on record that during the whole of my enquiries I have received the greatest assistance from all the responsible officers of the Department. The promptitude with which the numerous statements and returns I asked for were supplied deserves the most ample acknowledgment. To the General Manager, his Assistants, the Engineer-in-Chief, Superintendent Engineer of Construction, and Maintenance Engineer, my special thanks are due and are most gratefully tendered for the courtesy shewn to me under all circumstances and for the facility with which I was enabled to fulfil my mission.

To Mr. C. W. F. Harrison, who was placed unreservedly at my disposal, and has acted throughout as my Secretary, I am particularly indebted for the most unremitting attention and assistance. The whole of his time, since I began my enquiry up to the present, has been devoted to the work. His accurate knowledge, and his able and intelligent appreciation of railway business has very considerably lightened my labours, and I trust his future career may be attended with all the success it deserves.

I have the honour to be,

Sir,

Your obedient Servant,
## APPENDIX A.

*Note.* – The Indian and Native Labour is a feature of the Service difficult to accurately gauge, as the numbers fluctuate so frequently and it is also difficult to apportion the several numbers to the respective grades in which the Indians and Natives may be employed, but this information is given in the Statement as far as it could be ascertained. Generally speaking, however, Indians and Natives are employed as Labourers in the Locomotive and Maintenance Departments, and as Porters, Pointsmen and Gatekeepers in the Traffic Department, and in any other capacities in the several Departments for which their intelligence proves them suitable.
SOUTH AFRICAN RAILWAY AND HARBOURS AFFAIRS
COMMISSION, 1933.
MEMORANDUM ON
RAILWAY AND HARBOURS WORKING AND FINANCE

By
Professor S. Herbert Frankel,
Head of the Department of Economics & Economic History, Witwatersrand University,
JOHANNESBURG.

(1) This memorandum will endeavour to draw attention to fundamental matters, and will so far as possible avoid questions of detail. It will also endeavour to make certain constructive suggestions as regards future policy. As far as is consistent with the continuity of the Memorandum itself, and in order to prevent undue length, it will endeavour to avoid the repetition of facts or opinions which have been published elsewhere.

It will be necessary to refer somewhat frequently to the writer's book 'The Railway Policy of South Africa'. I beg, therefore, herewith, to submit this publication to the Commission, and to point out that it deals directly with a number of questions falling within the terms of reference.

The book is in certain easily recognizable respects partly out of date, as it was written some six years ago. In the years that have elapsed since its publication, changes in Railways and Harbours affairs have of course been made in various directions. The depression has affected the finances and the staff of the Railways and Harbours, certain rates have had to be increased, and certain financial adjustments (e.g. the over-payment of interest to the Treasury on Capital contributed out of Railway and Harbours revenues) to which I drew attention in
par. 35–45 of my book, have now been made. On the whole, however, the writer is of the opinion that no changes of sufficient importance have occurred to cause him to desire to revise the main conclusions in the book.*

(2) The paramount importance to the economy of the Union of efficient and economical transport, needs little emphasis.

The Economic and Wage Commission estimated that transport was responsible for £16 m. out of a total net national income in 1923 of £186 m. Taken by itself, this comparison seriously understates the real importance of transport. Apart from the fact that it does not include other than Railway transport, it is apt to be misleading because in fact, the real importance of transport cannot be indicated by statistics, which compare its net productivity with that of other industries of the Economy.

This matter is mentioned here, because too frequently the importance of transport undertakings is expressed in some such manner. Attention is directed to their size, or profits, or net revenues in comparison with other industries. All such comparisons miss the main point in regard to transport undertakings, i.e. the direct and indirect effects on the economy as a whole, on the size of its national income, and on the success of the separate enterprises of the economy. In so far as efficient, cheap and economical transport is provided, an immeasurable number of avenues of economic profit are opened up, which at a higher level of transport, could not and would not be exploited.

(3) The size of the net national income of community depends on the intensity of the economic exploitation of all its resources. / In a modern economy such exploitation depends to an enormous degree on the efficiency and cost of transportation. The demand for transport is quite definitely highly elastic, i.e. the cheaper, the more efficient and the speedier it is, the greater will be the proportionate demand for it – even though the demand at the lower railway charge may take longer to develop than in the case of price reductions applying to other

*The Railway Policy of South Africa’ was written as the result of certain investigations which the writer had been asked to undertake. These investigations led him contrary to his original intentions, to write at length on certain aspects of Railway policy in the Union. The book was not intended to be a treatise on Railway economics, or a description of Railway development or working in the Union. It was written primarily for the purpose of calling attention to what the writer considered to be defects of railway policy in South Africa. Much that was satisfactory in regard to Railway and Harbours affairs, or that was not germane to the main purpose of the book had to be omitted. The main object of the book was to press for a thorough examination of railway affairs by overseas experts, the need for which appeared as the previous investigation drew to a conclusion. It should also be noted that the work on which the book was based was undertaken under very difficult circumstances, as the author had practically no other information available than such as is regularly published by the Railways for the use of the public.
goods and services. Moreover, modern communities tend, the wealthier they become, to demand an increasing amount of transport service as an end in itself.

Considerations such as these are frequently overlooked, as for example when attempts are made to judge whether transport service is or is not ‘adequate’. Such a term has in itself no meaning. At one price a certain amount of transport will be ‘adequate’, which at a different price will obviously be the reverse.

(4) There is, in the opinion of the writer, only one basic test of the ‘adequacy’ of transport service and that is whether or not the service is produced with the greatest efficiency, and sold at the lowest possible real economic costs commensurate therewith, and is of the kinds, and is supplied in the quantities which are demanded at that price by the consumers of the transport service. In this connection it will not be amiss to quote an illustration given by Professor Lionel Robbins¹ (Professor of Economics in the University of London) of the confusion between technical potentiality and economic value (that is power to satisfy demand) which is so common. The fallacy he writes:

‘also underlies certain notions at present unduly prevalent with regard to the value of fixed capital. It is sometimes thought that the fact that large sums of money have been sunk in certain forms of fixed capital renders it undesirable, if consumer’s demand changes, or if technical invention renders it possible to satisfy a given consumer’s demand in other more profitable ways, that the capital should fall into disuse. If the satisfaction of demand is assumed as the criterion of economic organisation, this belief is completely fallacious. If I purchase a railway ticket from London to Glasgow, and half-way on my journey I receive a telegram informing me that my appointment must take place in Manchester, it is not rational conduct for me to continue my journey northwards, just because I have ‘sunk capital’ in the ticket is still as ‘technically efficient’ in procuring me the right to go to Glasgow. But my objective has now changed. The power to continue my journey northward is no longer valuable to me. To continue nevertheless would be irrational. In Economics, as Jevons³ remarked, bygones are forever bygones.

‘Exactly similar considerations apply when we are considering the present status of machinery for whose products demand has ceased, or which has ceased to be as profitable, taking everything into account as other kinds of machinery. Although the machinery may be technically as efficient as it was before these changes, if the change in demand or in cost of conditions which led to its supercession had been foreseen, the disposition of resources would have been different. In that sense it is not meaningless to speak of a waste due to ignorance. But once the change has taken place, what has happened before is totally irrelevant – it is waste to take it into further consideration.’

¹ Cf. Robbins: An Essay on the Nature and Significance of Economic Science. Macmillan, 1932. The following extracts may be given to supplement the above quotation: (p. 44).
(5) Interferences, therefore, which either:
(a) prevent the production of transport service at the lowest possible eco-
nomic cost, and its sale at a price suited thereto,

or (b) artificially restrict the kind, or quality, or efficiency of the transporta-
tion service which can be economically supplied

are bound to cause transport services to become inadequate in certain direc-
tions, and are bound further, to have a detrimental effect on the economy as a
whole. The most important factor influencing the efficiency with which, and the
real level of costs at which, a transport undertaking can function, is the nature of
the system under which it is managed, and the influences which determine the
policy of the management.

MANAGEMENT & GENERAL POLICY OF THE SOUTH
AFRICAN RAILWAYS & HARBOURS

(6) It was emphasised before Union and it has been reiterated ever since that the
most important single factor in the Union’s transport policy is the need for the
management of the Railways and Harbours on ‘business principles’. (Cf. Section
127 of the South African Act)

This term as I indicated in ‘The Railway Policy of South Africa’ was not
definitely defined, but it is quite clear that the framers of the Act of Union and
the National Convention intended that it should mean that the Railways and
Harbours were to be managed in the manner technically, and economically best
suited to the efficiency of the undertaking, and that influences not germane
to that efficiency and to the economic conduct of the undertaking were to be
excluded (see pages 55–77 of ‘The Railways Policy of South Africa’)

(7) At Union the members of the National Convention embarked on the
experiment of building up a state undertaking, which should, nevertheless, be
free from the well known evils of state ownership, and direct state management
(i.e. the administration of the undertaking on the lines of the administration
suited to a Government Department). I have indicated in Chapter I of my book
why this experiment failed. Briefly it failed because it was at no time given a real
chance of succeeding, and because the necessary machinery for ensuring success
was not devised.

‘Thus wealth is not wealth because of its substantial qualities. It is wealth because it is
scarce. We cannot define wealth in physical terms as we can define food in terms of vita-
min content or calorific value. It is an essentially relative concept ... So, too, when we
think of productive power in the economic sense, we do not mean something absolute
– something capable of physical computation. We mean power to satisfy given demands.
If the given demand change, then productive power in this sense changes also’. /
In practice the South African Railways and Harbours have for years been, and are to-day administered purely and simply as a department of State and suffer from all the well known evils of the administration of an industrial undertaking on State departmental lines. (Cf. Par. 18-21 Pp. 63–65 of ‘The Railway Policy of South Africa’, and the quotations from / the ‘East Indian Railway Committee’s Report’ p. 109, and also the whole of Chapter 2 of ‘The Railway Policy of South Africa’.) In the final resort, the present method of separating the Railways’ and Harbours’ budget from the general budget of the country, though it has certain advantages, does not alter the basic fact that the Railways and Harbours are run purely on State departmental lines.

(8) All the evils which at Union it was foreseen and feared might hamper the South African Railways and Harbours have in fact been experienced. (Cf. Railway Policy of S. A.)

(9) The paramount importance of freeing public undertakings such as the Railways and Harbours from political, sectional, or district influences of this nature has been emphasised in every country, where the Railways are owned by the State. Commission after commission in these countries (e.g. Austria, India, New Zealand and Canada) has drawn attention to this fact. As recently as 1932 the Royal Commission on Railways and Transportation in Canada reported:—

Page 50. 143. The majority recommendations of the Royal Commission on Railways and Transportation in 1917 were designed to provide safeguards against political interference which is instinctively to be feared in the conduct of public enterprise of the magnitude and character of the Canadian National Railways. But the Government of the day declined to follow the plan for organisation recommended by the Commission, which was in substance to place control in a permanent and self-perpetuating Board of Trustees.

144. There was adopted, instead, the plan which is contained in the Canadian National Railway Act. This Act provides for a Board of Directors to a maximum number of seventeen, appointed by Order in Council, holding office from year to year. Appointment to the office of chairman of the board and president of the company is made by the Government, and concurred in by the board.

145. Under the circumstances, the directors’ functions have been in practice nothing more than advisory. It would seem that they generally gave formal approval to programs of expenditures which they appeared to regard as the main concern of the president and the Government. This left the Railway open to political influence and to public pressure exerted by communities and by associations of business and labour interests.

146. Of direct political interference by ministers and members of Parliament in the detailed operations of the railway, we were assured by the officials there was little or none. It was in the larger sphere of policy that political considerations led to unwise and unnecessary capital expenditures, the result of which was
to create an atmosphere in which the ordinary principles of commercial operation of the railway were lost sight of.

147. The President of the Canadian National Railways, in a considered statement to this commission in the course of its inquiry, expressed the following views:

‘One of the inherent disadvantages of any state-owned enterprise such as the Canadian National Railway, is the problem of political interference – and one might also add public pressure. In making this statement I wish it distinctly understood that I imply no criticism of any party or any government, present or past. I merely state a fundamental and universally admitted condition.’

‘The leaders of all political parties and the people of Canada as a whole are a unit in their desire to prevent political invasion of the Canadian National Railway. But the plain fact is that, irrespective of such wishes and desires, the problem presents difficulties beyond the control of our leaders, be they ever so patriotic or high minded. After all in any form of popular government it must be accepted as axiomatic that the business of government is politics and, irrespective of whether one likes it or not, politics is something with which a government must reckon in all its activities.’

148. The President of the Canadian Pacific appeared to be more concerned over the activities of what he termed ‘politically minded’ executives of the publicly owned railway than he was over straight political pressure for definite ends. He said:

‘We talk a great deal about political interference being damaging to railway operations, and we know that that is true, generally speaking. But when we say it we seem to think that the only political influence is that exercised by a government, or a member of government, or a member of parliament. To my mind the worst comes from the political attitude of men in publicly-owned institutions. Possibly they are not conscious of it, but they become politically minded; their policies and actions have a political tinge, and that, from my standpoint, is more serious as representing the attitude of the corporation than the isolated act of a member of parliament who tries to get a man employed.

‘Years ago the ability of privately-owned railway companies to withstand political pressure was somewhat limited. Today it is nothing like what it was, because we can say ‘no’ to that kind of pressure. But the politics that develop inside an organisation because it is publicly-owned, and not privately-owned, is a serious thing.

‘We spoke of not being able to anticipate what government policies would be towards any railway, and I believe we cannot tell from year to year what the policy of any government would be in respect of its railway property. Providing it owns it, and has a measure of control of its policies, and so long as they are putting up the money we cannot avoid that possibility.’
(10) The experience of the South African Railways and Harbours since Union leads to the conclusion that no basic and permanent improvement, in the service of the South African Railways and Harbours can be expected in the future, unless the present system of management is altered, and unless the South African Railways and Harbours cease to be administered as a department of state. A renewed attempt must be made to carry out the aims of the South African National Convention that the Railways and Harbours should be managed by a body separated from the influences of the government of the day.

Quite apart from the need of increasing the efficiency of the railway system, in the handling, conveyance, and care of freight, it is clear all over the world that the railway industry of the future will be radically different from that of the past. For example, if complete use is to be made of the new forms of transport by road the railways will have to adapt themselves to them. In order to do so they must have a flexible form of organisation and control, and their policy must be guided by imagination and vision. They must eliminate many of the traditional services of the past and concentrate on others, such as express long-distance traffic, which fit into the new scheme of things developing before their eyes. In South Africa they must cut, once and for all, their own and the country’s losses, through the investment of capital (e.g. in branch railway lines) which no longer serves economic purposes commensurate with its cost. At the same time they must incur much new capital expenditure in order to bring about those savings in working without which the re-organisation of the railway system and the reduction of transport costs will not be possible. Above all it must be realised that it is of no advantage to the country if traffic is retained by methods which obstruct new development rather than by those which stimulate it.

11) Apart from the disadvantages of state departmental management referred to above there is no doubt that this form of administration / does not provide the elasticity, enterprise, and adaptability which will be necessary in an ever increasing degree in the future from the lack of which the Union has already suffered considerably in the past. The time is ripe for a frank realisation of the fact that what is needed now, is a managing body with keen initiative, able to plan ahead, able to adapt its plans quickly to new circumstances, able to experiment freely, and able to take complete responsibility unhampered by outside and non economic considerations.

I beg therefore, to put forward once again, proposals which have made in different forms on previous occasions, particularly the Addendum to ‘The Railway Policy of South Africa’ pages 251–262 The Future Control and Management of the South African Railways & Harbours’).
The proposals can be briefly summarised as follows:— *

1. That the South African Railways and Harbours cease to be managed by the State, under the present system of a Minister of Railways and a Railways and Harbours Board;

2. That a Board of Trustees be constituted by Act of Parliament and incorporated as 'The South African Railways and Harbours Company', and that the Trustees be directors of the company;

3. That the ownership of the South African Railways and Harbours be vested in this company;

4. That all matters of policy, of finance, of the service of the debts of the company, and of working conditions connected with the operation of the Railways and Harbours be decided by the directors alone;

5. That it be decided before the incorporation of the Company what amount of debt is to be regarded as Railways and Harbours debt, and to what extent, and in what manner the Government assume responsibility to the Company for any securities, shares or debentures issued or to be issued by it.

The Trustees might be nine in number. The first Trustees could be named in the Act of Parliament constituting the Board. Only five of the Trustees should be full-time members of the / directorate of the company. They should be most carefully chosen.

If any trustee should lose, resign, or vacate the position or office, or qualification in virtue of which he was especially appointed a trustee, his trusteeship should automatically cease. In all other respects the tenure of office of the Trustees should be the same as Judges of the Supreme Court. In order to secure that influence and control of Parliament which is desirable in the constitution of semi-autonomous bodies such as the South African Railways and Harbours Company, the Act or Charter incorporating the company should lay down clearly, and in such detail as is thought desirable, the policy to be pursued by the company. It would therefore define, as in the South Africa Act, the profits, if any, to be allowed. It should certainly contain provisions (as already mooted in the Selborne Memorandum) that the rates charged by the company shall be (a) reasonable and (b) just. The provisions should be similar to those of the famous Interstate Commerce Act. They should be administered by the judicial Railway Rates Tribunal or by a similar body.

The Act of Incorporation should also contain provisions enabling the company to enter into agreements with the Government, or any State Department, under which special rates are charged, or special lines are built for developmental purpose, and under which the company would receive payment from these

bodies for undertaking such functions as it deems beyond its sphere of action. The Act should lay down clearly the powers of the company in these matters, and should restrict its functions in regard to special rates, gratuitous services or uneconomic policies granted for other than railway purposes, unless losses occurring therefrom be refunded to it.

The nominal share capital of the company (other than that offered to the public) should be registered as held in the joint names of each particular trustee and the Minister of Finance for the time being. The trustee should exercise the voting power in the company. The Act of Incorporation would provide that no share could be transferred except to a duly appointed trustee and that the shares are held in trust for the Union of South Africa.

(13) Further details in regard to this proposal are discussed in the Addendum to ‘The Railway Policy of South Africa,’ and on pages 283–288 of Chapter IV, ‘Road and Rail Transport’ of ‘Coming of Age.’ These details should, however, be regarded as given only for the sake of illustration.

The points requiring particular emphasis are that:—

(1) The control and management of the Railways and Harbours should be in the hands of a public semi-autonomous body.

(2) The directing board of such a body should be self-perpetuating and permanent, i.e. none of the members should feel that their reappointment depends upon the good will of the Cabinet or the Government in power.

(14) I should like to add to the scheme outlined the following suggestions:—

(a) That it would strengthen the independence of the new body if part of the shares of the new company were offered to investors in the usual way – particularly so far as new capital is raised.

(b) That at least one (and possibly two) of the directors or trustees be an overseas expert of high standing, who would approach the problem of the future re-organisation of the Railways and Harbours with an open mind, and with modern experience of other Railway systems.

PROBLEMS OF RAILWAYS AND HARBOURS POLICY – CAPITAL AND STAFF.

(15) It will be convenient at this stage to indicate some of the directions in which the continuance of Departmental Administration would prove most detrimental and in which the future management of Railways and Harbours can make great changes with considerable advantage.

Apart from any questions of railway rate policy (which is dealt with later in this Memorandum) the most important problems facing the Railways and Harbours will undoubtedly be connected with the problem of adapting (a) the
present physical plant and its capitalisation and (b) the organisation of the staff, to the needs of the future.

(16) There can be no doubt that a large part of the past investments of railway capital were made in the wrong direction and were unprofitable, or entailed an absolute loss from the beginning, or have become unprofitable owing to economic changes in the Union, or else will become unprofitable if such other means of transport are to be adopted which are in the future interests of the economy of South Africa.

There can also be no doubt that the physical plant of the Railways and Harbours needs expansion and alteration on an extensive scale, if (a) operating costs are to be reduced (b) efficiency is to be increased and the railways system adjusted to modern requirements of freight and passenger transport* (c) other means of transport are to be incorporated in, and adapted to, the Railway system.

(17) So far as possible, the new management of the Railways and Harbours (in whatever way it may be constituted) should be hampered as little as possible by mistakes of the past. The capitalisation of the Railways and its interest obligations to the Treasury, should now be so adjusted that the Railways and Harbours services will not be burdened in the future with an inflated interest charge. The management should be able to plan new developments without the need of raising revenue to cover the cost of past failures – particularly as a very great part of those failures was directly or indirectly, due to the interferences of the Treasury and the Government which / caused important and necessary capital developments (e.g. improvements of railway facilities such as goods yards, stations, etc., which would have reduced operating costs) to be shelved, and uneconomic capital expenditure (e.g. unpayable branch lines) to be substituted in its place. It is doubtful, if such relief is not given, whether that reduction in the general level of rates can be brought about by other means which is sufficient to stimulate traffic and to warrant the improvements in the speeding up of railway service, which are essential for the future development of the Union.

(18) The new management whether it be in the form of a company as suggested above, or not, might with advantage be given authority to raise capital on its own initiative, by the issue of its own securities and bonds. This will be an aid to obtaining additional flexibility in the operation of the Railways and Harbours. The present system of financing does not allow of the easy writing down of losses. If investors could be got to bear part of the risk of Railway and Harbour development this might prove beneficial.

In this connection I should like to express the opinion that the belief that by preventing the Railway Administration from earning ‘profits’ transport is thereby

* E.g. In the adequate mechanisation of clerical and accounting work – in the introduction of labour saving devices – in new methods of packing, removal and delivery of goods etc.
cheapened is fallacious. Experience in South Africa shows quite clearly that such a provision does not necessarily lower the cost of transport in any way. For obviously the matter of real significance is the level of railway rates and charges needed to bring about a balance of railway expenditure and railway earnings. It does not follow that if earnings exclude profits, that they will therefore ensure a low level of railway expenditure. On the contrary it is quite likely that they may do the reverse. A rigid balance between revenue and expenditure tends to be aimed at, and there is apt to be insufficient incentive to lowering expenditure and operating costs. In the place of the scrutiny of the railway accounts by interested shareholders and directors the only check on the Railway Administration at present is that of Parliament (which is almost useless) supplemented by the necessarily rigid outlook of the Treasury and the Auditor General’s Departments.

(19) Just as the management of the Railways and Harbours should in future be relieved of the burdens of past mis-application of capital, so it should be freed from the burden of uneconomic influences in regard to staff policy. It is of very great importance that an industrial undertaking of the magnitude of the Railways and Harbours should be free to build up a loyal, efficient and well trained staff in the manner best suited to the functions of the undertaking. There should be relevant standards of recruiting, promotion, training and dismissal, based on modern principles of labour policy, and uninfluenced by principles that may or may not be suited to the Government service, but are certainly not of the kind leading to maximum efficiency in a commercial undertaking.

Outside pressure leading to the employment of men who would otherwise not be employed by the undertaking, or to the dismissal of men who would otherwise not be dismissed, or to the adoption of labour policies, or scales of remuneration that would otherwise not be adopted, is a cancer in the working of every industrial undertaking.

Moreover, the management should be free to draft into the undertaking experienced senior officials, who may be of service to it. In the past the Railways and Harbours have been starved of new men from outside with experience of modern developments in other Railway systems.

The bureaucratic attitude of self sufficiency has even affected the training of existing members of the railway staff. It is highly significant that a keen servant of the administration, anxious to take a University degree, is not even allowed time off for writing University examinations (other than the time he is willing to sacrifice from his holiday leave). There is not sufficient encouragement for him if he succeeds in completing his studies or scope given for post-graduate work.

The railway managements of America have encouraged young men to make themselves highly proficient by taking advantage of the / economic and commercial courses provided at Universities, and they have held out to them prospects of advancement if they displayed originality, and interest in the administra-
tion of their companies, or in their technical problems. Intimate contact has been established with Universities for special courses in railway administration and policy. As a result of this railway companies have reaped large rewards in improved administration, greater efficiency, better relations between the staff and the administration, and better relations between the staff and the public. Without a similar policy in this country, basic improvements will not be made. Bureaucratic regulation kills the soul of the railway servant. Discontent is driven underground by the stringency of regulations, but it does not disappear, for it remains to affect railway efficiency and operating costs. Up to now, practically no use whatever has been made of the Universities in South Africa by the Railway Administration, only in regard to routine courses at technical colleges has there been some co-operation between the Administration and existing educational authorities.

(20) There can be no doubt that that natural courtesy, friendliness, and good fellowship of the railway staff in South Africa lend themselves particularly, to the application of modern ideas in regard to labour policy. /

RAILWAY RATE POLICY.

(21) The Railway Rate policy of the South African Railways and Harbours Administration has been examined in detail by the writer in Chapter III, pages 142–218 of ‘The Railway Policy of South Africa’. No good purpose would be served by a repetition in this Memorandum of the main conclusions arrived at as a result of that investigation. Those conclusions have been severely criticised, and I therefore beg to be permitted to place on record, that after much further consideration of them, I am compelled to state that, apart from questions of detail, and apart from the portion of the analysis which admittedly consisted of estimates (e.g. the estimates of the possible extent of the reduction in railway rates under various circumstances. I am still of the opinion that the general analysis and the conclusions arrived at, are in principle justified, and applicable to the present rate policy and tariff of the Railways.

(22) I should, however, in regard to the whole analysis, like again to emphasise the following considerations:–

1. The present rate policy and the present railway tariff are in many respects contradictory, and are out of date; they cannot be reconciled with principles of reasonableness in rate making, or with principles that require considerations such as cost of service, weight, convenience of handling, and the value of the commodity to be given adequate attention in the rates classification, and the charges corresponding thereto.

2. The reasons for this state of affairs are not difficult to find. Firstly, adequate legislation has not been passed in South Africa to bring about the construction
of the railway tariff according to given principles of reasonableness, and given principles of rate making, e.g. such as those to which due weight must be given in determining railway rates in Great Britain, (under the Railways Act 1921) or such as those governing the rulings of the Interstate Commission in the United States of America.

Secondly, the Railways have by direct and indirect means, been placed in the position of providing services of various kinds for which they have been inadequately remunerated, and they have suffered from the financial burdens caused by political circumstances, which factors have necessarily made a railway tariff, based on economic considerations and principles of reasonableness an impossibility.

3. The serious economic effects of the situation that has arisen are not usually appreciated. It is of course always taken for granted that diversions of economic resources which are brought about by artificial means (e.g. by unwarrantedly low railway rates) are necessarily beneficial. But the effects of such a policy – e.g. in artificially raising the cost of living, of construction and of production, in curtailing potential economic expansion, and in lowering the average standard of life, are usually hidden and therefore almost always ignored.

I do not think that it is the function of the Railways and Harbours Administration to deliberately cause artificial diversions of economic resources. The point however, of greatest importance in regard to this policy is that it does not permanently ensure cheap and economic transport service – even for the favoured railway users.

4. It is significant that, notwithstanding the large number of attempts which have been made by the Railway Administration to reduce rates for various special railway users, that not only is the average level of railway rates in the Union very high, but that the many so called special rates are not low when compared with the cost at which similar transportation service is rendered in other countries. This leads to the conclusion that, what is needed is a policy which will reduce railway expenditure, increase railway efficiency, and will thus enable the necessary (reduced) railway revenue to be earned on the basis of a commodity classification and a railway tariff, which is constructed according to defined, sound and reasonable rate making principles. Once this is done, special concessions to some, at the expense of added burdens to others, will not be necessary, and the economy of the Union will be saved much arbitrary interference with the natural development of its resources.

5. In order to further the adoption of a reasonable railway tariff, it is essential that a judicial, highly competent and independent body to hear and adjudicate upon complaints in regard to railway rates, facilities and conditions of service, and to supervise railway rate changes, be established. Such a Tribunal will be of great value not only to the public but to the Railway Administration itself.
Firstly, it will remove railway policy from the arena of politics, and from undue pressure by interested parties. The Railway Administration will be able to fix rates and charges in the knowledge that it will have an opportunity of defending them before a higher authority, should they be challenged. On the other hand, the public will be apt to be less suspicious of rate changes, (the need for which is frequently misunderstood) since an impartial machinery for dealing with complaints will be readily available.

Moreover, such a Tribunal will also strengthen the hands of the Railways and Harbours Administration, in that it will be possible for it to refuse to conduct services, or to charge rates, which are unremunerative. The new system will certainly lead to more careful costing and accounting. Special services which political or government pressure may attempt to force upon the railways, at unremunerative rates, as in the past, will if they are not entirely eliminated, at any rate, be easier to evaluate for the purpose of obtaining compensation from the Consolidated Revenue Fund.

6. It is desirable that the Railways and Harbours Administration be given greater freedom in making particular rates, not necessarily applicable to traffic over the whole Railway system. Rates applying only to certain areas, or between certain stations, or to certain railway users, or individual traders should be permitted. If the Railway Rate Tribunal exists, the danger of abuse to which such freedom in rate fixing is open, will be greatly reduced. The provisions in this connection, in the Road and Rail Bill recently introduced in the House of Commons is a valuable one and should be adopted in South Africa. Without a judicial railway rate tribunal such powers cannot be safely granted.

Finally it must be emphasised again that the cost of railway transport in the Union is too high. Perhaps in no other single direction is it more important that the efficiency of the South African economy should be increased immediately, in order that the Union can hold its own in the export markets of the world, for which purpose it is necessary to reduce the cost of living and production. It was realised before Union that the aim of the new unified state owned Railway System should be the reduction of the level of railway rates and of railway transport charges, as these were already at that time recognised to be unduly high.

Yet notwithstanding the great increase in the volume of railway traffic one finds that in 1933 the average level of railway rates is approximately 50% to 90% higher than in 1914 in the first three class rates of the Railway Tariff for distances up to 250 miles, and correspondingly higher for other distances. The rates are also considerably higher for Class IV and even for lower classes (Cf. page 306. Table G of “The Railway Policy of South Africa” – since 1927, to which Table G. refers, the rates have actually been further increased for the higher class rates/ and for coal). The changes which have taken place in a downward direction since 1914 owing to special rates and preferential concessions on certain articles falling into lower class of the tariff do not appear even to compensate for the rate increases in the lower class rates in general.
At the same time the disastrous fall in the world price levels has affected South Africa in the same way as other countries. World price levels in March 1933 were from 30% to 60% below those ruling in 1929, and well below the price levels ruling in 1914. In some countries the fall has been much greater, and throughout the world agricultural export prices have suffered most.

The burden of the Railway Tariff has in South Africa been increased proportionately by the fall in prices. The table attached to this memorandum brings table E on page 303 of ‘The Railway Policy of South Africa’ up to date for most commodities for which the later information could be readily obtained. (The August 1933 Railway Tariff has been used and the September 1933 wholesale prices are from the Monthly Bulletin of Union Statistics.)

The purpose and meaning of the table is explained on page 159 paragraph 126 of ‘The Railway Policy of South Africa’. The new table in addition to illustrating the proportion which railway rates bear to the value of the commodities included, and in addition to giving an indication of the incidence of railway charges for various distances shows (in the last column) the percentage increase in this burden. The large proportion of the price of important commodities that is now due to railway charges is clear from the table. (It should not be forgotten that a large number of these commodities are transported over long distances between 400 and 600 miles and more). The table illustrates the heavy cost of railway transport to the economy of the Union.

An interesting point which is often overlooked, is that the gap between the prices received by the farmer for his agricultural produce, and prices he has to pay for his industrial products and his requirements as a consumer, is very greatly increased by these high and rigid transport costs.

Special concessions for the conveyance of his agricultural exports do not finally cure this situation since they raise the transport costs on the commodities purchased by him. Other primary producers are in a similar position.

The future course of price levels cannot be forecasted, but already in 1927 railway rates were responsible for a too large share of the cost of living and production in the Union, and South Africa has in common with the rest of the world a long way to go before the price levels ruling in 1927 will be again experienced. Drastic measures are necessary in this country, unless transport costs are to prove a serious obstacle to the future development of the Union.

ROAD AND RAIL TRANSPORT.

The future development of the Railway system is intimately bound up with the growth of transport by road motor vehicles, and is inseparable from the policy which is to be adopted towards the carriage of goods and passengers by road. Apparently, the terms of reference of the Railways and Harbours Affairs Commission exclude the general question of road transport, and specific comments on road transport policy as
a whole, will therefore be omitted from this memorandum. (Certain comments on
the general problem and on the Motor Carrier Transportation Act will be found on
pages 290–295 of the chapter on ‘Road and Rail Transport’ previously referred to).

In so far as the Railways are concerned, it is obvious that in the future they
must develop every possible avenue in which road transport is more efficient, less
costly, or more suited to the requirements of passengers, manufacturers, traders,
aricultural producers, or other transport users. So far this has not been sufficiently
realised by the Railways and Harbours Administration. The outworn notion that
the Railways must do everything in their power to convey every ton of traffic,
which can by any means be forced to go by rail, in order to protect the capital
invested in the Railways still holds sway.

This notion has dominated all recent legislation in regard to road transport, so
much so, that an obviously non-economic situation has now arisen, in that to all
intents and purposes, road transport development, other than that undertaken by the
Railways and Harbours Administration itself, has been strangled. The absurdities to
which recent legislation has led can be indicated by the fact that cases have occurred
where manufacturers or traders (who are in South Africa generally prevented from
transporting even their own goods by road – a prohibition which was definitely con-
demned in Great Britain by the Royal Commission on Transport)* have paid railage
on the goods, and have then transported them by road rather than suffer the incon-
venience and loss of time involved in handing them over to the Railways. (This occurs
particularly over short distances in urban or industrial areas – where the old methods
of cartage and delivery of goods from and to railway stations are out of date).

In recent legislation in regard to Motor Transport, it has been entirely overlooked
that one of the most important economic services that can be rendered by motor
transport is increased convenience and speed in areas now served by the railways
alone. It is surely extraordinary that in certain industrial areas a large amount of goods
traffic has to be sent by rail, which it no longer economic to transport in this way.

Co-ordination of transport does not mean the stifling of new developments
because they impose on existing transport undertakings the need for change and
adaptation. As Major H.E. Crawford has expressed it in the memorandum pub-
lished on page 182 of the Final Report of the Royal Commission on Transport

* (Cf Final Report of the Royal Commission on Transport).
Para: 297: ‘Apart from the inconvenience and, in many cases, the economy of operating
his own transport the trader so doing has other advantages. For direct control; he gets
into direct contact with his customers; and he derives advertising value from his vehicles
(Q 4730). From the point of view of competition with other forms of transport whilst
some proportion of the traffic carried by these vehicles may have been abstracted from
rail or other form of transport, we think that in all probability the bulk of it is for local
delivery which in any case is unsuitable for any other mode of conveyance.
Para: 298: ‘We do not propose, however, to make any recommendations regarding the con-
rol or regulation of this particular type of transport which would interfere with its natural
development, since we believe that its future depends on its economic value to traders.’
There is a school of thought which finds the prospect or the final solution of all traffic problems in the creation of monopolies. Set up an ‘authority’ which means more people paid to tell others what they may and may not do. Prohibit competition and so protect the capital tied up in inefficiency. If people desire to travel above ground tell they must to the bowels of the earth, if it please you and would be too much trouble to create the services they desire. Stigmatise as “wasteful” the competition that you fear because it would thrive by giving people the services they ask for, and, having sheltered yourself from any attempt to dispute your monopoly, maintain prices at the level the public must then pay as the price of servitude. To do this is certainly to create uniformity, but it does not help people to get about or goods to be carried.

(24) The problem that has to be faced in South Africa now that a rigid railway monopoly exists, is how a very large and monopolistic transport undertaking can be given sufficient flexibility rapidly to adopt new and more economic transport methods. If this could be ensured one might be tempted to place under the control of one authority (e.g. the Railways and Harbours Company suggested earlier in this memorandum), not only the greater part of road transport, but also the responsibility for the building and financing of the roads necessary therefor.

There is, however, the danger that such a large monopolistic undertaking would fall behind the times in regard to transport development.

For the immediate future at any rate it is probably best that considerable freedom of enterprise should be given private undertakings to develop road transport services. This involves the drastic alteration of the basis on which licences for the carriage of goods are now granted. The obvious bias now existing in favour of the Railway Administration should be done away with. The proposed licencing measures recently adopted in Great Britain could perhaps with advantage be applied to South African conditions.

(25) It would appear advantageous that one central judicial body should in the final resort deal with Railway Rates and with Motor Carrier licences, and with railway charges and facilities, etc. This does not necessarily mean that local licencing authorities could not continue to exist, but the directing policy should be worked out by those with an intimate and expert knowledge of both Road Carrier and Railway, rates and conditions. Otherwise it is not clear how any co-ordination based on adequate economic considerations can be brought about. Moreover, it is only an absolutely impartial, judicial body that can hold the scales evenly between the Railway and Motor Carriers. At the least an appeal should lie from the Central Road Board to the Judicial Railway Rates Tribunal, and the latter should then have the same powers over the Central Road Board (and its policy) as over the Railway and Harbours Administration. In any case the Central Road Board should also contain a number of experts with experience of both Railway and Road transport affairs.
As things stand at present it would appear that the stimulus of competition is essential in South Africa if transport service as a whole is to be made more efficient – and such competition must be protected and regulated by a really impartial authority. At a later stage it may be possible to bring about a greater degree of actual consolidation of Road and Rail transport and this aim should be kept in view.

(26). If freedom to properly constituted private enterprise is given to engage in Road Motor Transport, the future management of the Railways and Harbours will no doubt bring about developments by which the Railways will be conditioned to carry out speedily and efficiently the functions for which they are suited, and will abandon that traffic to the road which it is right and economic, that the motor vehicle should bear. Moreover, large economies will be possible if the Railways continue to operate Motor services and if these are really integrated with the Railway system. The question that remains to be considered here is that of the construction, maintenance and financing of the roads that are necessary for this. It is in my opinion important that the Railways should be charged their proper proportion of the expenses of the roads upon which they operate motor vehicles. It might be possible that instead of taxation to be levied upon the Railways for this purpose, means might be devised, by which the roads bearing specially heavy motor vehicle traffic in conjunction with the Railway system, can be constructed and maintained by the Railway and Harbours Administration itself.

The general question of road construction should not be overlooked. It might be better to associate this work with that of the Road Boards (as recommended by the Road Motor Competition Commission) and they should be assisted by a general body, to plan a national road system, and to deal with the construction and maintenance of the same. It should not be impossible for Provincial authorities to consult with such an expert body in formulating their plans for road construction.

(27). In conclusion, I beg again to put forward the suggestion that a Ministry of Transport and Communication be set up, or at any rate, that the Minister of Railways and Harbours be advised by an Advisory Transportation Council. These bodies should control the general development of all forms of transportation and communication in South Africa, and should receive and publish adequate reports and accounts in regard thereto.

In this way, on the one hand, there will be made possible the independent and more flexible development of the various kinds of transport undertakings, which are necessary for the creation of adequate and cheap transport services / for the economy of the Union, and, on the other hand, the State will be assured of the necessary measure of control over it.

CHAPTER II. – TRAFFIC DEPARTMENT.

4. In the estimates for 1922 an establishment of 1 Traffic Manager and 5 Assistant Traffic Superintendents is laid down, and this number was actually on the strength throughout 1921. The line was split up into three sections, Water Street, Boia and Bo, each in charge of an Assistant Traffic Superintendent; out of the remaining three officials two were on leave and the third acted as Traffic Manager. In April of this year it was decided to retrench two officials on grounds of economy, which left two in the colony, the Traffic Manager and one Assistant Traffic Superintendent stationed at Bo. An African Traffic Inspector acted as Assistant Traffic Superintendent in charge of the Boia Section. The Traffic Manager died at the end of July, so that, at the time of my arrival, there was only one European Traffic official in the colony; the senior Assistant Traffic Superintendent, who was on leave, was cabled for, and by the time I commenced the inspection of the department he had arrived and taken up duty as Acting Traffic Manager. The actual strength of European officials is therefore at the present time three.

The Assistant Traffic Superintendents, in addition to their duties in connection with operation, as explained later, have to deal with claims, enquiries, audit reports, and staff matters in their sections, and have offices and clerical staff for this purpose.

No night running is normally undertaken, no train being shown in the working time table as starting before 5.25 a.m. or arriving at its destination later than 8.9 p.m.

The maximum speed allowed is 25 miles per hour and in the case of the 101 class engine is limited to 15 miles per hour. The average speed of trains on which the working time table is based is approximately 15 miles per hour, being reduced to about 12 miles per hour on the Mountain section.

(A) Operation.

5. In the working time table certain goods trains are shown as fixed, and others as conditional. Each Thursday the Traffic Manager issues a train notice for the following week. All passenger and mixed as well as goods trains are shown on this list, but, naturally, can only be altered when the public time table itself
is changed, which of course occurs only at long intervals. But the goods portion of this notice has also become largely a matter of routine, and the same notice is published for many weeks on end, irrespective of the variations of the traffic. The definite ordering of trains is done by means of cancellations to the weekly train notice, and these are issued the day previous by telegram. These cancellations are issued for the Water Street section by the Traffic Manager and for the other sections by the Assistant Traffic Superintendent at Bo, but the latter also sometimes cancels down trains on the Water Street-Bo section. The information on which both base their cancellations is contained in the yard reports sent in daily in code. A yard census is taken at 7.0 a.m. by all stations; the results are telegraphed in code showing each truck by number in that station, whether empty, disposable or required, detained to be loaded or unloaded, loaded and requiring traction up or down, detained under load over twelve hours, under repair or detained for hot boxes, as well as the number of empties, if any, required in addition. The returns for the whole line are summarised and ready for the information of the Traffic Manager by 10.0 a.m. every morning. I examined the returns and satisfied myself that they were accurate and prompt. The Assistant Traffic Superintendents receive copies from all stations in their sections, and on these returns both they and the Traffic Manager base their cancellations of trains for the following day. The stationmasters decide generally by which trains the trucks are to be despatched, but the Traffic Manager or the Assistant Traffic Superintendents sometimes give special instructions regarding particularly important consignments or trucks to be picked up at intermediate stations. Stationmasters at intermediate stations have power to cut off trucks other than those containing perishables, if they have trucks at their stations of prior date to those on the train or containing perishables. This daily yard report gives the Traffic Manager an accurate idea of the truck situation on the whole line, and also enables him to trace the movement of any individual truck.

Its value is diminished for purposes of prompt action by the fact that it is received at 10 a.m. By that time most of the important trains have started, and so the cancellations and orders based on the report relate to the following day’s movements. Thus trucks which are marked as waiting for traction at 7.0 a.m. will not be moved until the following day, unless the stationmasters happen to be able to find room for them on trains the same day. No doubt they very often can find room, but equally there must be many occasions when they cannot. The system has the disadvantage of dividing the control of movements between the Assistant Traffic Superintendents and the Traffic Manager, and the exact division also is somewhat nebulous. It further entails the maintenance of office establishments for the Assistant Traffic Superintendents, as they have a large share in the control.
6. To obtain a clear idea of how efficiently trucks were being employed in actual practice, I had figures worked out to show the average number of days which elapsed between a truck being loaded at an up-country station and its arrival in Water Street, and I also had the work of several representative trucks tabulated to show how many trips they were doing per month. The process which I adopted was to divide the loading stations into five sections; the 1st section including stations up to and including Boia; the 2nd, stations on the main line beyond Boia up to Bo inclusive; the 3rd, all stations on the main line beyond Bo; the 4th, stations on the branch line up to and including Makump; and the 5th, stations on the branch line beyond Makump. In calculating the time taken for the journey the date of loading was not included; thus, if a truck was loaded on the 1st and arrived at Water Street on the 4th, it was noted as taking three days. On this basis the following table shows the time which trucks from each section should require, and the average time, Sundays excluded, which was taken in actual practice during the months of June, July and August, 1922:–

<table>
<thead>
<tr>
<th>Sections</th>
<th>1st Days 1</th>
<th>2nd Days 2</th>
<th>3rd Days 3</th>
<th>4th Days 2</th>
<th>5th Days 3</th>
</tr>
</thead>
<tbody>
<tr>

<td>August</td>
<td>2</td>
<td>2.8</td>
<td>3.5</td>
<td>3</td>
<td>3.7</td>
</tr>
</tbody>
</table>

This table shows that on the most important sections, the 3rd, 4th and 5th, the returns may be described as on the whole good, but capable of improvement.

The 3rd section, from which over half the trucks were despatched, is the best and shows a marked improvement in the August figures. On the other hand the figures for the number of trips per month were distinctly disappointing; these showed that, out of ten chosen cases, only in two were 3 round trips made per month, in two cases 2 trips and in the remaining six cases 1 or 1 1/2 trips were all that were obtained in a month of 31 days. Investigation of the actual journeys showed that, although the delays were in part on account of hotboxes, the majority were due to waiting loaded three, four or even five days at up-country stations for traction down, or empty at the Government wharf. These figures thus corroborate very clearly the criticism made earlier on the system of controlling movements. While the delays en route were few, both loaded and empty trucks were often allowed to lie at stations for long periods, sometimes for days together, at a time when, owing to the excessive numbers of hotboxes only two-thirds of the stock was in traffic and merchants were complaining of the shortage of wagons. Delays of this nature are the worst, because they cause more waste of truckage than all other causes put together. In this case it was evident that they were not being as closely watched as they should have been.
It is universally recognised that the movement of rolling stock can be controlled best by a central authority which can view the whole system as one; where control is divided, each section can only get a partial view of the picture. The Sierra Leone Railway handles very little more traffic and is very little bigger than the ordinary traffic district; there is therefore all the more reason for not splitting up the control. At the same time, owing to the Railway managing the telegraph system of the country, it has adequate telegraph facilities, and in its present yard reports has the nucleus of an excellent system which would entail very little, if any, more telegraphing than the present one.

7. I recommend that the whole ordering of trains and truck movements should be concentrated in the Traffic Manager’s office. The present system of weekly train notices should be continued, but these notices should be drawn up to comply more closely with what are likely to be the actual requirements. The Locomotive Department would then have a better guide for making their own forward arrangements. As all the commercial firms send to the Traffic Manager by Friday morning the numbers of trucks which they will require at each station the following week for loading kernels, he has an excellent basis on which to frame his programme. In addition, the Assistant Traffic Superintendents and station masters would forward details of other demands likely to be made. The Traffic Manager would send out his notices by Saturday morning, and they would reach the furthest point of the line by 2.30 p.m. on Monday, which would mean that the programme would have to begin on Tuesday morning and end on Monday night.

All stations would send in daily yard reports on the same lines as at present, but the hour of reporting would be noon instead of 7.0 a.m. These reports would show the trucks which will be loaded that day and ready for traction up or down the following morning, those which will be unloaded that day and disposable or required at the station and empties which will be required in addition. The remaining particulars would be similar to those now given. By noon the station-masters should be in a position to know what trucks will be loaded and unloaded that day and their requirements for the morrow. These returns could be summarised in time to allow the Traffic Manager to issue his train cancellations by 3.0 p.m.

Provided the weekly programme is drawn up with care the daily cancellations should be few. If in his telegram the Traffic Manager also showed the total number of trucks which each train was to pick up at intermediate stations, it would ensure room being left for these trucks on the trains and avoid delays. It would also be an advantage if sheds wired him early the engines available for traffic, so as to keep him advised of any alterations in the locomotive situation. With the present ample supply of locomotives and a closer weekly programme this need not be a daily wire, but sheds should notify well in advance cases where
they could not furnish locomotives for the trains notified in the programme. The abolition of the present telegram from sheds to the Chief Mechanical Engineer, giving departure time of trains, as recommended in the following chapter, would more than compensate for these extra telegrams sent from sheds to the Traffic Manager.

The Traffic Manager at the present time actually details trucks to trains in the daily yard report for his own information, although he wires no orders thereon to up-country stations, so that the only extra work thrown on his office would be the issue of the daily train wire.

A control of this nature would be both close and efficient, and would eradicate the present unnecessary delays to loaded and empty trucks. Instead of waiting until the day after trucks are loaded in order to report them ready to move, they would be reported the same day as they were being loaded, and definite arrangements made to move them the following morning. The same saving of time would be effected with wagons being off-loaded.

By amalgamating the Trains section of his office and the Movements section, two clerks could be saved. At the same time, the office of the Assistant Traffic Superintendent at Bo could be closed and that of the Assistant Traffic Superintendent at Boia reduced to one clerk. The whole of the work of controlling traffic would be centralised in the Traffic Manager’s office and the Assistant Traffic Superintendents would have no concern with it. Only one would be required outside Freetown, and he should be constantly on the line, inspecting, reporting to the Traffic Manager and keeping stations up to the mark. His headquarters would be nominally at Boia, but he should receive no returns, paysheets, etc., in fact, nothing which can keep him chained to his office stool.

The staff of 1st Class officials required is dealt with in a separate report.

8. The proportion of open wagons is high, being 242 out of a total of 384 goods vehicles. In the rainy season these require tarpaulins when loaded with palm kernels, because the jute bags used to hold the kernels rot if allowed to remain damp and the kernels themselves suffer if exposed for long. The stock of tarpaulins during the last rainy season was only 117 and some of these which had been purchased locally were too small to cover a truck completely. A further 40 had been cabled for, but could only arrive when the rains were nearly over. The Chamber of Commerce brought to my notice the loss which merchants were liable to suffer from this cause. I consider that their complaints were justified, and it is evident that His Excellency the Governor was of the same opinion, as he cabled for the additional forty mentioned above as soon as the matter was brought to his notice. With this addition the tarpaulins will number 157, as against 242 open wagons, and in certain cases two tarpaulins are required to cover one truck. The proportion of traffic which can be loaded without covering, including locomotive coal, is about 15 per cent. of the whole; as a rough
guide it may be taken, therefore, that tarpaulins are unnecessary for 58 wagons, which leaves 184 requiring them as against a stock of 157 tarpaulins. Forty will still be required to leave a margin for working purposes and for small tarpaulins, and I recommend this number being purchased in time for the next wet season. A small yearly provision will be required each subsequent year to make up loss from fire and deterioration. 

The tarpaulins should be controlled and distributed by the Central office in the same way as trucks. Any goods stock ordered in future years should also be of the covered type until the disproportion of open to covered wagons has been adjusted to the requirements of the traffic.

9. Although charges for demurrage appear to have been enforced in cases where they have been brought to light, in certain cases, noticeably on the Government wharf, merchants have been allowed through oversight and want of strict control at the head office, to retain trucks for seven, eight and even ten days, and use them for their own purposes, such as re-bagging kernels. This particular practice had been stopped before I arrived, but its existence was a sign of the small importance attached to delays during loading and off-loading, which, on the contrary, are the very points which require the closest watch.

10. The yards at all the principal centres, including Cline Town, suffice for the traffic to be handled. The one exception is Water Street. The layout of the whole station, both passenger and goods, is very cramped, awkward and primitive, and although the main goods shed for the receipt and despatch of general goods is commodious and could handle a far bigger traffic than it has ever yet experienced, the shed for wagon loads and special goods consignments is distinctly cramped. Any alteration or improvement, however, would be very expensive, not only on account of the nature of the adjoining ground, but also on account of its high price.

Despite its disadvantages, the yard, layout and sheds are capable of handling, and did handle, in fact, in 1913, a traffic considerably larger than has ever passed since, and therefore any extension at present could not be justified. When trade once again approaches these figures it will be time enough to contemplate alterations, and by that time also the financial situation should be more healthy.

The present working of the yards could be improved, if the shunting was placed on a more systematic basis. This also applies to shunting at the Government wharf. A programme should be laid down for use when coal is not being delivered in bulk. Wagons for the wharf have to be cleared by consignees at Water Street, and this is usually done in the case of wagons arriving in the evening by 8.0 a.m. the following day. The programme should aim at getting these to the wharf by 9.30 a.m.; this would leave the whole day for their off-loading and at the same time prevent congestion at Water Street. The second aim of the wharf programme should be to clear all empties from the wharf the last thing at night,
so that they are ready for despatch up-country next morning. In several cases I noticed that empties had remained all night at the wharf, and so lost a day. When coal is arriving this programme would have to be suspended because the steepness of the gradient on the wharf line limits the load to three trucks, and all other considerations have to be subordinated to keeping up a steady flow to and from the wharf. With this exception, a fixed time table for the use of the shunting engine would induce more regular working and get a better use out of the yards.

11. A noteworthy feature of the department is the absence of statistics; the weekly allocation of trucks for palm kernel traffic, and the monthly return of hotboxes are the only statistics kept regarding its work. This is remarkable, as an operating department is essentially the one which should want to know early exactly what work it has performed, what variations there are in the traffic and how it is progressing. On the other hand, the Accounts Department, which is only remotely interested in operating, keeps full statistics concerning ton-miles, tonnage, / commoditities carried, tonnage despatched from each station, analysis of passenger mileage and station summaries of passenger traffic. These records are compiled annually for the report and are available too late to be of practical use for operating. They possess a certain value in so far as they give a general view of the results of the past year, but are useless as regards helping the Traffic Department to keep in close touch with traffic movements and operation.

The chief object of operating statistics is to enable the work of the Railway to be carried out more efficiently; it is therefore preferable that they should be compiled by the operating departments who are going to use them. It is to their interests to get them out promptly and in the form which will be of most use. I am therefore recommending in Chapter VI. on the Accounts Department that the whole of the statistical work now carried out in that department should be discontinued; instead, the Traffic Department should be responsible for preparing such as are essential for efficient operating and are not prepared at present by the Locomotive Department.

To obtain passenger statistics a copy of the Daily Record of Passenger Traffic should be sent from each station to the head Traffic office. This daily record will under the simplified system of accounting proposed in para. 19 be forwarded daily from all stations to the Accounts Department; this proposal regarding its use for statistics will only entail the taking of an extra carbon copy for use in the Traffic office. These forms will be there abstracted and summarised to arrive at the figures regarding the number of passengers and revenue. Forms similar to those now in use in the Accounts Department can be employed for the purpose. These results can without difficulty be got ready by the 6th of the following month. The figures for passenger mileage need only be worked out annually, as they are not required so promptly, provided the figures for the numbers of passengers and revenue are available in good time. Their compilation monthly also
means considerable additional work. Tonnage, ton-mileage and revenue statistics can be similarly compiled by the Traffic office from a copy of the Daily Record of Station Transactions prepared under the proposed new system of station accounting. This also should be ready by the 6th of the following month.

Statistics regarding commodities can be obtained most easily by making each station forward at the end of the month an abstract showing the principal commodities received and despatched. This would be much simpler for stations to compile than the present abstract, which forms part of the monthly station accounts, and so would be well within their capabilities. Statistics could thus be obtained not only regarding points of despatch, but also points of receipt. At present, the former only are given, and, although useful for export traffic, they are useless for import traffic like salt, for which the station of receipt is the matter of principal interest. The principal commodities are now divided up under 17 heads, and I do not recommend any increase in this number, as it is useless to maintain figures respecting a large number of unimportant traffics.

Train-mileage, engine-mileage and vehicle-mileage are already worked out by the Locomotive Department and therefore it is unnecessary for the Traffic to keep parallel figures. The Locomotive Department, however, should have them ready and forward them to the Traffic Department by the 10th of the following month, and not six weeks later as at present. This is referred to in para. 51, Chapter III.

For this statistical work not more than three clerks will be required in the Traffic Department, a saving of three clerks on the total of six / now employed in the Accounts Department on this work. The statistics branch of the Accounts Department could then be closed and the three best men transferred to the Traffic Department.

12. The journals prepared by the guards are very simple, and contain no detailed information regarding truck numbers, load of trucks or tare. As, however, they will not be used as a basis for statistics under the system outlined above, I am not proposing any alteration. The journals for down trains into Water Street are handed into the Traffic office; those for up trains into Bo, and those for all trains between Bo and Pendembu and on the Kamabai branch are sent into the Assistant Traffic Superintendent’s office at Bo. In theory, the former category are inspected in the Traffic Manager’s office, and the latter in the Assistant Traffic Superintendent’s office, after which they are forwarded to the Traffic Manager. In practice, the inspection appears to have become rather slack; with the centralisation of the control of traffic in the head office, all guards’ journals should be forwarded there by stationmasters at depot stations, and a closer inspection should be instituted.

Telegraphs.

Guards’ Journals.
13. The operation of all telegraphs in the country, except those belonging to the military, is in the hands of the Railway. Practically the whole of the telegraph lines run along the railway; the exceptions are the line from Mano to Sambuya, from which point a line goes to Pujehun and another to Bendu. At the latter place a ferry is maintained by the Railway to convey telegrams to and from Bonthe on Sherbro Island. The station staff act also as telegraph clerks. The Railway benefits considerably by acting in this dual capacity, not only from the monetary point of view, but also because the amount of telegraph traffic passing necessitates a larger number of wires than the Railway would require for its own work alone, and so it has at its command a better system of communication. The Colony as well as the Railway benefits from the saving in staff. With a system widely extended to places off the line it might not be feasible to leave the Railway in complete control, but it is well adapted to conditions likely to exist for the next few years. The results appear to give satisfaction; I received no complaints and the errors are not numerous. The trading community at Bonthe put in a request for either a submarine cable to connect Sherbro Island with the main land, or a small wireless installation to do away with the delays due to the ferry, but the small traffic passing would not justify the adoption of either of these expensive remedies.

14. Traffic is passed by means of the Webb-Thomson electric staff instrument, and in case of failure by line clear messages despatched by telegraph or telephone. The arrangements are normal and call for no comment, except that the regulations are not sufficiently clear as regards the responsibility for giving and taking staff at stations where there are stationmasters and assistant stationmasters on duty at the same time. It should be clearly laid down that the stationmaster while on duty is the only person who is allowed to give and take staff, and when going off duty he should definitely hand over the duty to the assistant stationmaster. For Water Street station the duty should only be performed by the assistant stationmaster on duty and no one else.

15. It is not at present obligatory for stationmasters to know telegraphy. All recruits for the Traffic Department are now being drawn from the Traffic School, where telegraphy is one of the subjects, but some candidates who have not qualified in it are being passed out from the school. I think, therefore, that it should be laid down that in the future no one will be promoted to the rank of stationmaster unless / qualified in telegraphy. It would be of advantage also to encourage those who have already attained that rank to make themselves proficient and in their case I recommend the grant of a special allowance of 10/- a month to stationmasters now holding the rank who are either qualified or qualify in the future. Further economies should result from this as it will enable a reduction to be made in the number of telegraph clerks at smaller stations.
16. Another direction in which economy and greater freedom in movement of staff could be effected would be by amalgamating the telegraph and station clerks and calling them all station clerks. They should all have a full knowledge both of telegraphy and station accounting. Most of them now have both qualifications, and the rule should be made a general one.

17. Three native detectives are employed; their identity is well known to the staff and the public. If the present ones were changed the new ones would be equally well known in a short time. So far they have achieved no results whatever on their own initiative, and I do not think they have saved the Railway any appreciable amount by their presence. I therefore recommend their retrenchment, and, whenever in the future the Railway requires a detective for special work, application should be made to the Police Department.

(B) Consignment of Goods and Station Accounting.

18. The method of consigning goods is generally similar to that in use on the Uganda and the Gold Coast Railways, but has some local variations. The consignor presents a consignment note on forms provided by the Railway, different forms being in use for consignments at Railway Risk and Owner’s Risk. The counter clerk weighs the consignment and enters the weight on the note. The consignor then takes this to the invoice clerk, who enters up details as to rate and freight charges, and the consignor takes it to the cashier and pays the charges. He then brings it back again to the invoice clerk, who makes out the invoice. This is in triplicate with a receipt form attached. The original accompanies the goods to destination, the receipt slip being torn off and handed to the consignor, the second is sent intact to the Traffic Audit, and the third, also intact, is retained in the book. The goods are handed over to the consignor at the receiving station on his presenting the receipt slip given to the consignor. The receipt slip is then attached to the copy of the invoice which has accompanied the goods and both are retained at the receiving station.

The disadvantages of this system of a separate invoice for every consignment from one consignor to one consignee I have described at full length in previous reports. Put briefly, it delays consignors and requires a large expenditure of stationery. In case of small consignments of general goods, the guard has a mass of papers to carry, sort out, and deliver. Where the whole operation of consigning and paying takes place in the goods shed, it congests the sheds and gives opportunities for pilferage. Also, owing to the clerk having to make out the invoice while the consignor is waiting, there is more liability of mistakes in copying owing to his being hurried. To take its place I recommend the method of duplicate consignment notes presented by the consignor. Both copies are completed
as to weights, rate and freight charges by the station clerk, who, on receipt of the money from the consignor, hands him one copy of the consignment note signed as his receipt. / 

The presence of the consignor is no longer necessary, and he can go; he is thus dealt with and his business dispatched quickly. His copy of the consignment note must be handed over by the consignee at the receiving station before he can obtain delivery of the goods.

The station copy of the consignment note is then passed to the invoicing clerk, who enters it on the invoice, only one invoice being required for all consignments from any one station to any other station instead of a separate invoice for practically every consignment. Each invoice is in triplicate, the original being despatched with the goods, the duplicate sent to the Traffic Audit and the triplicate retained in the book with the various consignment notes relating to it attached. The receiving station attaches the copies of the consignment notes handed over by the consignees to the copy of the invoice which has accompanied the goods and retains them for audit purposes. I have discussed this proposal with the Traffic and Accounts Departments, and I understand that both agree that it would be an improvement on the existing method, and more economical. I am of opinion also that by adopting this system and that of daily station accounting described in the following paragraph, considerable reduction could be effected in station staff; for instance, at Water Street two invoice clerks at the most would be required instead of three as at present. The total number of staff which could be retrenched by the adoption of this system is included in those given in paragraph 20.

19. The system of station accounting in force is similar to that in use in England. Each station compiles monthly abstracts of invoices to every other station, the abstracts being in turn summarised and the results carried to a monthly goods balance sheet. In addition to these requirements of the English system, each despatching station sends in daily as described in the preceding paragraph, copies of all invoices for checking as regards undercharges and overcharges. Goods traffic from flag stations where there is no resident staff is handled on what is known on English railways as the ‘Weigh, charge and advise’ system.

Passenger takings and tickets are also accounted for on the English system with a monthly coaching classification showing commencing and closing numbers of all descriptions of tickets, revenue collected from each and all relevant details, which are in turn brought to a monthly coaching balance sheet. In addition each station sends in a daily ticket statement.
The railway regulations lay down that all traffic, except live stock, to Freetown will only be accepted for conveyance ‘freight to pay,’ and that all other traffic must be prepaid. Livestock and goods traffic on the Mountain section must in all cases be prepaid. The presence of ‘to pay’ traffic of itself necessitates the maintenance of elaborate station accounts on the English system. If it were abolished, a much simpler method could be adopted. The regulation insisting on all goods traffic to Freetown being ‘to pay’ dates from the early days of the Railway and the motive underlying its introduction was to prevent the collection of large sums at up-country stations. This, however, was before banking facilities were available up-country, or credit vouchers for firms were instituted. On the Gold Coast Railways all traffic, without exception, is prepaid, the same system being in force as on the Sierra Leone Railway for accepting credit vouchers from firms of standing who are backed by a bank guarantee, accounts being settled weekly. These credit vouchers are treated by the stations despatching the traffic as cash in their accounts. In consequence of this elimination of ‘to pay’ traffic the Gold Coast Railways have been able to introduce a very simple system of station accounting based on a daily in lieu of a monthly balance. Under this system, each station compiles daily a record of station transactions on which are entered in detail all goods parcels and excess fare transactions and to which are attached the necessary documents in support, such as the audit copies of all invoices. Stations only render accounts of traffic despatched not of that received. For coaching traffic a record of passenger traffic is compiled daily showing the commencing and closing numbers of tickets, number issued, rate, amount; a statement in fact very similar to the daily ticket statement now in use on the Sierra Leone Railway. On the record of station transactions is a pro formâ balance sheet to which are carried the results of the records of passenger traffic and station transactions, and a cash remittance statement. If necessary, this balance sheet can be on a separate form. In this way each station balances its accounts daily, the accounts are far simpler, and less liable to errors, any error made is discovered at once by the Traffic Audit Branch, and the station advised instead of having to wait until the end of the month. Instead of the accounts of a large station like Water Street not being ready until the 20th of the following month, they would come in daily and be up to date; this again facilitates the handing over of station accounts at short notice between the outgoing and incoming stationmasters. The outstandings in station accounts would be negligible, and finally and of the most importance, station staffs can be materially reduced owing to the simpler nature of the accounts, the few
forms which have to be compiled, and the fact that the accounting work is spread out evenly over the whole month.

Both the Acting Traffic Manager and the Chief Accountant agree as to the advantages to be obtained from introducing the system.

The introduction of this system necessitates, however, the total abolition of ‘to pay’ traffic. Conditions of traffic on the Gold Coast are very similar to those in Sierra Leone, and I am unable to see any particular condition existing in the latter which would militate against the success of a system which has achieved such admirable results in the other colony.

As the question is one which affects the commercial community I discussed it with the Chamber of Commerce at Freetown. As a result of this discussion, the Chamber has informed me that its members are in entire agreement with my views on the question. I have therefore no hesitation in recommending most strongly that ‘to pay’ traffic should be abolished, and the Gold Coast Railway system of daily station accounting introduced both for coaching and goods.

It will probably be necessary to discontinue the acceptance of goods consignments at flag stations; this only amounts to about £200 a year in all, and as the carry to the nearest station is never long, practically the whole of it would still come to the Railway. Maconkary is the only flag station at which it would be necessary to have a station staff, and as this need only consist of one clerk the additional expenditure would only be at the most £60 a year, as opposed to very large savings which would result in other stations in consequence of the adoption of the scheme.

20. I am of opinion that the following reductions could be made in the station staff; these reductions include those which would result from adopting the simpler methods of consignment and station accounting recommended in the previous paragraph: – /

</table>
The watchmen are used for guarding loaded trucks left over night in stations; at stations named these cases are not frequent, and could be met by hiring watchmen when required.

The adoption of the above recommendations will thus give a saving of 1 stationmaster, 33 clerks, 9 porters, 14 watchmen, 2 trolley boys and 2 messengers, or, assuming the clerks as being all on the £60 a year scale, an annual saving of £2,500.

Certain of these retrenchments could be introduced without waiting for the introduction of centralised control or the new forms of consignment and station accounting. This applies to the closing of Mamunta Station, the retrenchment of approximately 6 of the clerks at up-country stations, and of all the porters, watchmen and trolley boys mentioned. Before leaving the country I made an interim report to His Excellency the Governor detailing these cases, so that no delay need occur in taking action.

(c) Rates for Goods Traffic.

Rates in force. 21. The goods tariff includes five classification rates: –

<table>

<td>5</td>
</tr>
<tr>
<td>3</td>
<td>3 ½</td>
</tr>
</tbody>
</table>

These rates are at a uniform rate per ton-mile throughout, and are at owner’s risk. Where goods are despatched at railway risk 10 per cent. is added to the above figures. In the case of rice and ginger the particular class rate is at railway risk, the owner’s risk rate is 10 per cent. less.

Firewood from beyond Mabang, mile 40, to Water Street is charged one-half third class rate.

A rebate of 5 per cent. is made on full wagonloads of all goods carried on classification rates.

Special rates are quoted for native food stuffs, palm kernels and palm oil. These are zone rates, i.e., the charge from any station within a certain zone to any station within another prescribed zone is at a fixed rate per ton. Railway risk rates are quoted on the two last named at 10 per cent. above special rates.

22. Palm kernels provide over half the goods revenue and more than one-third of the total revenue of the Railway from all sources, excluding telegraphs and telephones. It is by a long way the most important traffic. The present zone rate was introduced in 1915 in place of the uniform ton-mile rate of 2 3/4d.
which was in force previously. Although the new rate was on the whole slightly higher than the old one, especially at stations which happened to be at the end of the zone closest to Freetown, the actual revenue received per ton hauled under the old rate was, owing to various factors, very slightly higher than that received under the new rate. From the point of longest haul, Pendembu, 228 miles, the freight per ton is now 55s. as against 52s. 3d. formerly. This station also handles the largest tonnage of kernels, and so it will be seen that they are being carried at practically the same rate as before the war.

The average price for kernels in Freetown from January to August, 1922, was £12 a ton; it changed later to £10 10s., but the former is the fairer figure as considerable buying was then taking place. The average price in Freetown for the period, January to June, 1914, was £16 a ton. For the same periods the market prices in London were £20 and £18 in 1914 and 1922 respectively, and there is an export duty of £1 a ton now, whereas there was none before the war.

With the price of the commodity in London actually lower than it was before the war, there can be no justification for raising the railway rate. A temporary rise might have been justified during the boom period, but it would undoubtedly have a most serious effect on the trade at present, and lead to a shrinkage in revenue. It can be argued, of course, that if the export duty of £1 per ton were removed, the rate could be raised, but a very large proportion of the kernels exported from the country do not pass over the railway, and the Government naturally prefer a charge which can be levied on the whole of the product and not only on a portion. At the same time, I do not recommend any lowering of the existing rate. The present tendency of all raw commodities is to find a level somewhere in the neighbourhood of, though in general slightly above, the pre-war figures. Kernels have actually gone below the old level, but this is probably temporary and dependent on the adverse exchanges of Central Europe restricting its buying capacity.

The rates before the war enabled a profit of £78,263 to be made on the Revenue Account for 1913. From this loan charges of approximately £52,000 had to be found, as well as any sum required to carry out renewals or extraordinary expenditure. Together these absorbed considerably more than the profit on the revenue account, and 1913 was the best year that the Railway has ever experienced. Consequently, the rate for kernels which provided more than half the revenue, and on which the whole prosperity of the line depended, cannot be regarded as returning too high a profit.

The comparison with the rates now in force on other West African Railways, as given in the table below, shows also that the Sierra Leone rate is lower than its neighbours. I have chosen Mano, mile 107, and Pendembu, mile 228, as the points of despatch, as the former is the nearest point to the coast with any large traffic in kernels and the latter is the longest haul.
Kola Nuts. 23. The next most important export as regards revenue is kola nuts. Prior to 1915 a uniform rate of 7 1/2d. a ton-mile was in force. In the 1915 tariff they were placed in Class B with a uniform rate of 10d. a ton-mile, an increase of one-third. In addition to this there is an export duty of £4 13s. 4d. a ton, and the French colonies, to whom a very large portion of the crop goes, have recently imposed an import tax. Despite these disadvantages and the drop in the price, the traffic on the Railway and the export from the Colony have shown no sign as yet of falling off. Thus, while in 1913 only 661 tons were carried, in 1921 1,568 tons were handled by the Railway, the highest return in its history with the exception of 1919. In the first eight months of 1922 1,392 tons were carried. This trade has thus not only increased considerably since 1913, but was still flourishing up till August of this year, despite the increased charges, and the only inference to be drawn is that the kola merchants in the past must have made very large profits indeed. At the same time although I do not recommend any change at the present moment, the situation is one which requires careful watching, because the full effect of the French import tax may not have made itself felt yet.

If eventually it turns out that this is having a harmful effect, I would submit that it should be met by a reduction in the export tax rather than in the railway rate, because the relief will then be felt by all growers, and not only by those served by the Railway. Also the tax makes a greater charge than the highest railway rate, i.e., that from Pendembu, and therefore there is scope for reduction.

Palm oil. 24. The export traffic which ranks next after kola nuts is palm oil, but its relative importance as compared with palm kernels is shown by the fact that the revenue obtained from it seldom exceeds one-twentieth of that from kernels. Before the war the rate was actually less than that for kernels, although the value per ton of the oil was double that of the kernels. This was adjusted in the 1915 tariff, the palm oil rate being doubled. The rates to Freetown in force at present are 87s. 4d. a ton from all stations, Pendembu, mile 228, to Gerihun, mile 149, inclusive, to Freetown, and 78s. a ton from all stations, Bo, mile 136, to Mano, mile 107, inclusive, to Freetown. This trade is an erratic one, and although the tonnage carried in 1921 was only 611 tons, the lowest on record for many years, this is not attributable to the rate. This is proved by the fact that the tonnage carried during the first eight months of 1922 was 1,431 tons, which averages higher
than any previous year. It is not, like kernels, the principal source of the native’s revenue, and in view of the excellent returns for 1922 there appears no case to reduce the rate, nor does it appear probable that any increase in revenue would result from a reduction.

25. The only other country products which are produced in sufficient quantities to require notice are rice and ginger. These are both carried at owner’s risk on Class 3 rate of 3 1/2d. per ton-mile, less 10 per cent., and enjoying the same rebate as other classification items of 5 per cent. on full wagon loads. Until this year the rebate in force on full wagon loads was 25 per cent. Whilst a 25 per cent. rebate appears to me to be too high, on the other hand 5 per cent. is hardly adequate compensation in the case of country products for the advantage which the Railway gets in having to deal with wagon loads loaded and offloaded by the owner. I would recommend a rebate of 10 per cent. for wagon loads in the case of these two particular items.

26. Turning to the question of imports, the most important of these is salt.

Proposals have been made at various times to increase the present charge of 3 1/2d. per ton-mile, third-class rate at owner’s risk. On reference to former administration reports it will be seen that, taking one year with another, there has been a steady increase, a greater proportionate increase in fact than has taken place in the total imports into the country. Even the returns for 1921, which was an exceptionally bad year, were very little short of those for 1913, and those for the first eight months of 1922 averaged 308 tons a month, which will, if continued for the rest of the year, give a total which will rank second only to that of the record year of 1920.

Salt is a low-priced commodity, and the railway freight forms a high proportion of the total cost. It is consequently very susceptible to any change in rates. To raise the rate at a time like the present, when markets are depressed, and the purchasing power of the native low will certainly mean a loss in revenue. If it is lowered, on the other hand, it is unlikely that any reduction which it is within the scope of the Railway to give would, in view of the import tax, bring in sufficient additional consumers to compensate for the loss on the present tonnage. The steady increase in tonnage which is taking place is a satisfactory sign and shews that, on the whole, the rate is an equitable one. Under these conditions it would be unwise to tamper with it.

27. The table below shews the rates for the principal imported commodities on various railways in Africa. The distances of 107 and 228 miles are chosen, as they represent the first station on the Sierra Leone Railway with a considerable traffic and the station with the longest haul.
Comparisons of this nature are not an infallible guide, owing to the differing conditions in each country and differences in prices and purchasing power. They serve, however, in this case to shew that the rates on the Sierra Leone Railway compare favourably on the whole with other African colonial railways.

28. A striking feature of the classification rates under which all imports, including salt, are booked, is that they are on a uniform rate per ton-mile throughout, irrespective of the length of haul. This is in opposition to the universal practice of tapering the rates, so that the rate per ton-mile over a long haul is less than over a short one. Goods hauled only a short distance can stand a much higher rate per ton-mile than when carried several hundred miles. In the case of the Sierra Leone Railway the maximum haul is only 228 miles; against this the average haul is 133 miles, shewing that the bulk of the traffic has a very long haul, considering the shortness of the line. The table above shews that the rates over the longest haul are not unreasonable. Any adjustment with the object of introducing a taper must therefore be effected by raising the rate per ton-mile for the shorter hauls. This, however, would bring in little extra revenue, as such a small proportion of the traffic is shorthauled. On the other hand, the introduction of tapering rates would mean the preparation of a new tariff book; to compile, print and issue this would probably absorb the whole of the extra revenue gained in the first year or two, especially as additional European staff would be required. The present tariff book is badly arranged, and full of amendments; a new one will in any event have to be issued as soon as funds permit. The wiser
course is therefore to continue the present tariff book and system of rates for a year or two until the financial situation is improved, and then have a thorough revision of the book and introduce a system of tapering rates at the same time.

29. It would be advisable, however, to amend at once the clauses in the conditions of carriage relating to articles of value; those now in force mix up with articles of high value dangerous goods for which special rates and conditions are imposed, and also all goods consigned at special low rates, and generally leave the liability of the Railway as regards the first-named ill-defined. I recommend that the Law Officers of the Crown should be requested to prepare suitable clauses to be brought into force by legislation.

30. Two rates in particular to which my attention was drawn by the Chamber of Commerce where those on spirits and returned empty barrels. On July 1st of this year spirits, wine and beer were placed in Class Special ‘A’ instead of Special ‘B’ as formerly, thus raising the owner’s risk rate from 10d. to 1s.8d. a ton-mile. The freight from Freetown to Pendembu then became 380s. instead of 190s. a ton. The actual increase per bottle amounted to 4 1/4d. at Pendembu. On an article costing at the coast in the case of gin 6s. 8d. a bottle, and in the case of whiskey 9s., an increase of 4 1/4d. will have no serious deterrent effect on sales. Spirits are not what might be called a delicate trade, liable to be upset by a small rise of this nature. It is extremely unlikely that there will be any diminution in the traffic and the Railway will benefit accordingly.

On the other hand the increase per bottle in the case of beer worked out at the same figure. An increase of 4 1/4d. in the case of an article costing 1s. 4d. makes a considerable difference, and will very probably affect the sales to such an extent as to cause a loss in revenue. For these reasons I recommended to His Excellency the Governor that spirits and wines (the sales of the latter are negligible) should be retained in Class Special ‘A,’ but that beer should be restored to Class Special ‘B.’

31. In the case of empty butts, barrels and puncheons, which are used principally for the palm oil traffic, the Chamber of Commerce asked that these be returned free of charge to up-country loading stations. They are at present placed in Class I traffic, thus costing 133s. per ton from Freetown to Pendembu. This traffic is light and bulky, and is therefore one which is not regarded with very favourable eyes by railways. Such a rate as 133s. on the other hand adds considerably to the cost of production of palm oil; in fact it adds on to the cost at the coast a sum equal to one-third of the freight on the oil from loading stations upcountry into Freetown. The excess of down over up traffic means that trucks have to go up empty, and so the cost to the Railway of carrying the empty barrels is small. Whilst I do not think there is sufficient reason for carrying them entirely free of charge, I am of opinion that the present rate is hardly justified, and recommend this item being transferred from Class I to Class II, which will
mean 90s. per ton instead of 133s. from Freetown to Pendembu. Similarly, I consider that shooks and barrel staves should be transferred from Class II to Class III because they form a better load for the Railway, and, as the merchant has to go to the expense of coopering, it is only fair that he should profit by a lower rate than in the case of barrels.

These recommendations have been put before His Excellency the Governor.

32. It will thus be seen that with a few exceptions I am recommending the maintenance of the existing rates. At the present time when markets are struggling to surmount the prevalent depression, and the purchasing power of the native is very low, any increases in rates are liable to have serious effects.

On the other hand there appears to be no individual traffic in which a reduction of the rate would lead to any considerable increase of revenue and the financial situation of the Railway does not justify reductions which have not got a reasonable prospect of showing a profit.

(D) Passenger service and fares.

33. The passenger service on the main line consists of a passenger train three times a week between Water Street and Pendembu and return, stopping the night at Bo on both the forward and return journeys. A mixed train runs three times a week from Water Street to Boia, returning on the following day to Water Street, the up-journey being made on the alternate days to those on which the up passenger train runs. The down mixed train from Boia similarly runs on alternate days to the down passenger train so that there is a daily service between Water Street and Boia. This train continues to Moyamba on Thursdays, and also starts from Moyamba instead of Boia on Mondays.

From Waterloo, a residential district, a train starts daily at 6.25 a.m. for Water Street, returning at 4.35 p.m. except on Saturdays, when it leaves earlier. Between Kissy, a town five miles from Water Street, where many of the African employees of the Government and the commercial firms reside, a special service of two trains a day each way is run in addition to the services quoted above. The first leaves Water Street at 10.35 a.m., runs out to Kissy and returns to Water Street, arriving there at 12.8 p.m.; the second leaves Water Street at 3.45 p.m., reaches Kissy at 4.15 p.m. and Water Street on the return journey at 4.48 p.m. Finally there is a local service of 7 trains a day each way between Cline Town and Water Street so that there is actually a service of 11 trains a day each way between these two stations.

The Mountain section service and fares are reviewed separately in Chapter VII.
34. In February, 1920, the fares for the main and branch line trains were raised respectively to 4 1/2d. a mile for first class, 2 1/4d. a mile for second class and 1 1/2d. a mile for third class passengers.

In June, 1922, it became clear that the very high third class fares in force on the main and branch lines were having a detrimental effect, and that the people who previously travelled were losing the habit.

His Excellency the Governor consequently decided to reduce it from 1 1/2d. to 1d. a mile with effect from July 1st, 1922. The soundness of this decision is emphasised in a very marked manner by the following table which gives the number of third class public passengers and the total revenue from that source for the months of June, July, August and September, 1922. Return tickets are counted as two journeys.

<table>
<thead>
<tr>

</table>

It is possible that the October returns will show a decrease on the figures for June, when the old tariff was in force, but too much attention should not be paid to this. The collection of the rice harvest coupled with the temporary slump in the kernel trade will be the principal factors in this, and a heavier loss would probably have occurred if the rate had been maintained at the higher figure.

35. The introduction of a penny a mile fare brings back the third class rate to the same figure as before the war. The success attendant upon this reduction at once raises the question as to whether the present rate is that best suited to the economic requirements of the country, and therefore the one which is likely to bring in the best return to the Railway. The average native up-country seldom earns more than 6d., 7d. or at the most 9d. a day. The earnings of the majority certainly do not exceed 7d. For this sum at the present the Railway will only carry him and his load of 56 lbs. for 7 miles, whereas he can walk and carry his load 12 miles at least in the day. Thus, for a journey of 84 miles he has to pay to the Railway twelve days’ pay, but can walk it in seven days; the same holds, though in a lesser degree, for the man earning 9d. a day. It is obviously an unsound business proposition for this man to use the Railway. He actually loses money by doing so. The speed of his journey does not compensate for the money he has to pay in order to travel so fast. This class of man also is accustomed to walking long distances and, as time is not the same object as in more civilised countries, there is obviously no inducement to him to travel by rail; in fact the reverse is the case.

The result is that even with the reduced fares the bulk of the population not only cannot afford to travel by railway, but would in fact lose money if they
were to do so. The fact that they do not use the railway was corroborated by the enquiries I made on the spot.

Comparing the rates with those in force in England, an agricultural labourer earns about 5/- a day, for which he can travel 34 miles at present, and when the reductions are made on January 1st, 40 miles. There are many workmen’s fares which are still lower. The agricultural labourer is the lowest paid grade in England, and yet it obviously pays him to go by train rather than walk. He is also quite unaccustomed to walking long distances, and time is an important object.

From the railway point of view it must be remembered that the first aim of any railway undertaking should be to increase its gross revenue. Over 60 per cent. of the expenses are fixed and quite independent of the number of trains run. It is therefore more true of a railway than of any other business concern that its principal object should be to increase its gross takings. This is especially true of the Sierra Leone Railway at the present time, because it has engines and drivers in excess of its requirements of the moment, and the only additional expense of running extra trains would be the cost of coal and oil, a small additional sum for locomotive and wagon repairs, and perhaps a small addition to the wages bill. Finally, as shewn later, the only expense in the matter of rolling stock would be the fitting up of four coaches with lavatory and automatic brake fittings at a cost not exceeding £200. Even, however, if the purchase of new rolling stock had been necessary, it would have been sound policy to incur the expense.

It may be argued that the gross revenue would not be increased, because to do so would mean at least doubling the present number of third class passengers, but the very fact that the bulk of the population living along the railway never use it at all shows that there is every possibility of not only doubling, but trebling the number of third class passengers. It is true that to start with these results will probably not be achieved, because this class has got to get accustomed to using the railway, which will take a little time; it is important, therefore, that the result of any reduction should not only be judged by the results of the first few months; it must be allowed time in which to develop its effect.

Besides the opportunity of increasing the gross revenue, the Railway stands to gain by the increased trade, which is the necessary consequence of increased travelling as has been demonstrated beyond dispute in many countries. With a native population also the opportunities for travel create new wants and these again create more trade.

In conclusion it may be said that so long as the railway fares are so high that the bulk of the population will lose money by travelling by train as compared with walking, the Railway is not meeting the economic requirements of the country, and is not fulfilling its purpose either from the business or the social point of view.
I therefore strongly recommend that the third class fares should be reduced to 1/2d. a mile; at that figure it will just pay a man earning 6d. a day to travel; at any higher rate such as 3/4d. it will not pay any man earning under 9d. a day. I am laying all the more stress on this reduction because the opportunity which it gives of inducing an entirely new class, who never did so before, to use the railway appears to me, after close study, the only means of obtaining a substantial increase in the gross revenue of the Railway. The principal goods traffics, kernels, palm oil and kola, will no doubt show gradual increases, but no sudden rise can be expected. Cocoa and sisal may in the future give good profits, but not for some years to come. By inducing the bulk of the population to travel not only will they add to the revenue, but the wants and demands thus created will induce them to pick and bring to market the large stocks of kernels hitherto untapped.

36. Before discussing the modifications which this will necessitate in the time table it would be advisable to consider the first and second class fares and revenue.

The following table shows the numbers of passengers and total revenue from each class for the months of July, August, and September (excluding Government traffic). In this table the return tickets are counted as two journeys.

</tbody>
</table>

This shews very clearly the preponderating importance of the third class passenger. The second class passengers do not only bring in less revenue than the first class, but are only about one third of the number of the latter. The accommodation provided, however, is out of all proportion to the revenue received; thus on the Water Street-Bo train one and a-half coaches are allotted to the first class, the same to the second class, and three coaches to the third class. One-fourth of the whole accommodation is thus reserved for the second class, a proportion which is quite unjustified; and, in fact, the second class compartments are always nearly empty.
The very small number of second class passengers raises the query as to whether it would be advisable to reduce the fares or abolish the class altogether. The arguments which have been adduced in favour of the former course are that there is a considerable body of non-native Africans who would travel second class in preference to third class if it could afford it. This applies more particularly to those living inside the Colony itself but outside the Freetown area. These people are, however, rather restricted as to the localities they inhabit and their range of travel, and already enjoy lower first and third class fares to and from Kissy so far as local trains are concerned. The wealthier non-native African who travels into the Protectorate usually goes either first or second class already, and the poorer ones who now travel third would probably not travel second even if the fares were reduced. From these facts I am inclined to think that though the number of this class, who would travel second class in preference to third, may give an impression in their own locality of being fairly large, they become very few when examined from the standpoint of the Railway as a whole, and are also probably a good deal more vocal than their numbers justify. This view is also supported by the railway officials I consulted, and I am inclined to think that no extra revenue would be gathered if a reduction was made.

There remains the alternative of abolishing the second class altogether. There is no question that at the present time it certainly does not justify its existence; it occupies a lot of space, entails much empty haulage and pays little revenue. Even taking the extreme case and supposing that the full numbers now travelling second went third at the reduced rate of 1/2d. a mile, the loss in revenue would be only £180 a month, and this would alone nearly be compensated for in the long run by the saving in purchase of rolling stock, gain in haulage, etc. But there is no need to contemplate this extreme case; many of those now travelling second would certainly go first in preference to the discomforts and loss of social status entailed in travelling third. In this it must be remembered that I am referring to the main line train service, although it applies also to a certain extent to the local service.

On the other hand, if the first class fares were reduced to 4d. a mile, quite a number, and probably the large majority, of those now travelling second at 2 1/2d. a mile would go first, sufficient, in fact, to compensate for the loss on those who would travel third. There would, of course, in this case be a small loss in revenue from those who now travel first, but this would be insignificant. In fact, as pointed out earlier, the total revenue from this source is so small compared with that from the third class, and the disadvantages and cost are so great that its disappearance would not be a serious matter.

The introduction of a lower third class fare will entail the allocation of more accommodation for that class. At present the passenger trains between Water Street and Pendembu are all fitted throughout with automatic brakes, and as this
standard of braking has been reached, it would be a pity not to maintain it, but it is not essential. The Bo-Pendembu trains could be run with hand brakes, as was the practice until recently. This could be avoided, however, and the whole of the stock necessary for the increased demand of the third class passengers could be found by a redistribution of the existing vehicles, provided the second class is abolished.

To sum up, the advantages in favour of abolishing second class are that the revenue it returns is incommensurate with the accommodation and expenditure it requires; the loss due to the disappearance of this traffic would be small; by a reduction of the first class fares to 4d. a mile it is probable that little if any loss will be entailed, and by a redistribution of stock a fuller service can be instituted capable of taking an increased third class traffic without lowering the standard of braking passenger trains.

The two proposals, i.e., to reduce third class fares to 1/2d. a mile and to abolish the second class are of course quite independent of each other. If the former is introduced and not the latter, it will only mean that the Bo-Pendembu trains will have, as formerly, to be run on hand brakes until the money can be found to fit more stock with automatic brakes.

37. It will be necessary in order to give effect to these recommendations to run one daily passenger train each way on both sections, Water Street – Bo and Bo – Pendembu. It will probably be necessary to increase this later. Each train will require 2 first and 4 second class carriages, and as four trains will be required this will mean 8 first and 16 third class coaches. A fair allowance as spare for repairs will be 1 first and 2 third class coaches, making a total of 9 first and 18 third class coaches, or 27 vehicles required in all. There are ample baggage vans fitted with automatic brakes so that they do not require special consideration.

The present stock of coaches fitted with automatic brakes and lavatories is 4 first class, 2 composite first and second class, 5 second class and 12 third class coaches. Two of the composite carriages and three of the second class could be converted into first class by gutting the second class portion and putting in chairs and small folding tables. This will provide the 9 first class coaches required; the remaining second class coaches can be converted to third class at very small expense. These, with the 12 existing third class coaches, will provide 14 out of the 18 third class coaches required. The remaining four can be found from the reserve stock and that used for local service. For instance, the institution of a daily train each way will do away with the need for the mixed train from Boia to Water Street and back thrice weekly, and make that stock available. It will, however, require fitting with lavatory accommodation and automatic brakes. Three sets of the former are already in store, and the brake gear can be found by removing and adapting the brake gear now fitted to many of the goods stock, notably the diamond frame bogies, where it is at present serving no useful purpose as the
wagons are not in traffic. Probably the gear to these trucks has only 12 inch as
against the 15 inch cylinder fitted to the coaching stock; the only disadvantage
of this will be slightly less braking power, but it can be used perfectly well and
without danger. The extra first class accommodation provided will allow certain
of this accommodation to be reserved in whatever manner may be considered
advisable. The total cost of this proposal should certainly not exceed £200.

The suppression of the train between Water Street and Boia and return three
times a week will automatically entail the suppression of its extension to Moy-
amba and return once a week. It should be noted that the institution of a daily
passenger train will not improve the communication between Boia and Free-
town, but the principal increase in passengers is to be looked for in the sections
beyond Boia, where the number of trains will be doubled.

38. The service on the branch line consists of a mixed train from Boia to
Makump on Mondays, Wednesdays and Fridays, leaving the / former place on
the arrival of the up passenger train from Water Street. It returns from Makump
on Tuesdays, Thursdays and Saturdays in time to catch the down passenger train
to Water Street at Boia. North of Makump there is a similar mixed train service
to Kamabai, three times a week, returning from Kamabai to Makump on the fol-
lowing days. The important place on this branch is Makene, and all passengers to
there from Water Street have to spend the night at Makump, 16 miles short of
it, and go on the following morning. Similarly they have to spend a night there
on the way down. As opposed to this inconvenience, the service north of Mak-
ene is better than the traffic justifies. A bi-weekly instead of a tri-weekly service
would satisfy all present requirements. The reason for the selection of Makump
as the halt for the night is that an engine shed was erected there when it was the
terminus of the line, and this has influenced the time table ever since, despite the
extension of the railway.

The service which I recommend should take its place is that on Mondays and
Wednesdays the mixed train should continue to Makene and stable there. On
Tuesdays and Thursdays this mixed train should continue as early as possible in
the morning from Makene to Kamabai and return to Boia. The passengers from
this would on the present main line time table proceed to Water Street by the
mixed daily at 9.0 a.m. On Fridays the up mixed train from Boia, instead of sta-
bling at Makene, would return to Makump and stable there, continuing to Boia
the next morning in time to catch the down passenger train.

The main disadvantages which were placed before me against this time table
are that the run from Makene to Kamabai and return to Boia would be very long
for the engine crew. It is not, however, longer either in time or distance, than the
present run from Water Street to Bo. If after reasonable trial it is found too long
in practice, a reserve engine crew can be stationed at Makene to work the engine
between there and Kamabai and back, but this course should not be adopted if it
can be avoided. The second objection is that the engine would have to stable out at a place where there is no fitter to carry out repairs, but against this it must be stated that an engine should be capable of running 208 miles without attention from a fitter.

The advantages are very considerable. On the up journey passengers can get through from Water Street to Makene in a day; the whole of the shed staff at Makump, except two pump boys, can be retrenched as well as the extra train and engine crews stationed there, and the train inspector. The two engines now stationed at Makump can be withdrawn, and, leaving one for reserve at Boia, the second would be spare. All engines on the branch line would be under the constant supervision of the European fitter in charge at Boia. The reduction in staff would mean a saving of at least £400 a year, which does not include any saving in money due to one engine becoming spare and available for work elsewhere. These advantages, in my opinion, completely outweigh the disadvantages, and I accordingly included it amongst the recommendations which I made to His Excellency the Governor before I left the Colony. It is very probable that a better service than the one detailed above could be arranged by alterations to the time table between Water Street and Boia, but one of the chief objects to be sought in such re-arrangement must be the elimination of the engine shed at Makump. The service proposed is based on the existing time table and fares; with the introduction of a 1/2d. third class fare the increase in traffic would probably justify a daily mixed service between Boia and Makene which would, of course, necessitate a modification in the time table now proposed.

39. On the section between Water Street and Kissy not only are / especially between Water Street and Cline Town, between which a passenger has the choice of no less than eleven pairs of trains a day. I endeavoured to obtain definite figures of the number of passengers on these trains, but was unsuccessful. From close personal observation, however, I am of opinion that the importance of this traffic has been overestimated, as well as the revenue obtained from it. The majority of the trains run more than half empty, and a large proportion of the passengers are railway employees at privileged rates. The traffic authorities informed me that practically all the local trains were engined by the locomotives going to or returning from shunting work at Water Street and Government Wharf or work on the Mountain section. So long as this is true there is a profit in running them, as the locomotives are earning money instead of running light, but I am of opinion that this does not hold good in all cases, and as these trains seldom carry enough passengers to cover the extra running costs of fuel and wages of the crew, any train where this condition is not fulfilled is running at a loss and should be cut out.

In particular I think the train to and from Kissy leaving Water Street at 10.35 a.m. could be suppressed as well as the similar train leaving Water Street at 3.45
p.m. The latter carries principally nonnative African Railway and Government officials living at Kissy, many of whom travel on concession tickets. By adjustment of the time table this train could be started slightly later and amalgamated with the one leaving Water Street for Waterloo at 4.35 p.m.

40. The fares for this local service are on the whole lower than on the main line, being 10d. first class and 4d. third class from Water Street to Kissy, a distance of 4 3/4 miles, and 6d. first class and 3d. third class between Water Street and Cline Town, a distance of 2 1/4 miles. There are no cheap second class local fares and it will also be noted that the third class local fares are also somewhat irregular as regards the price per mile. I think there would be an advantage in retaining the cheap first class fares, as the service is essentially a suburban one, and it is in the interests of the Railway to encourage it. With the introduction of a 1/2d. a mile third class fares the local third class fares would have to be reduced to the same figure, and, although the same increase is not to be looked for as on the main line, a small increase in revenue may be anticipated, provided the mistake made in the present tariff of rounding the fare off to the nearest penny is not continued.

These local services are nothing more than tram services, and in tram and omnibus services in England the difference of a half penny in the fare produces a marked difference in the traffic. This has still more force in Africa, where a half penny is a more important thing to the average inhabitant than it is to the man in England; it will buy him nearly half the rice he eats in a day. Fares should be rounded off to the nearest half penny above; thus the third class fare from Kissy to Water Street would be 2 1/2d. and from Water Street to Cline Town 1 1/2d. For this sum it may be possible to get the average native to use the local service, which he does not do at present, and even with the reduced train service there will be ample accommodation for double the numbers now travelling.

Fares on the main system also should be rounded off to the nearest half penny above and not to the next penny.

41. There has been in the past a good deal of correspondence tending to show that there has been a considerable loss of revenue through fraud, either by passengers getting in without buying tickets and hoping to reach their destination before being intercepted and made to pay, or through passengers buying a ticket for a station short of their destination and hoping they will not be caught and made to pay the excess. Many of the up-country stations are unfenced and passengers get on to the trains without tickets and pay their fares to the Inspector on the train. All passengers from flag stations have necessarily to pay on the train. All trains carry train inspectors and this in itself induces passengers, who have no intent whatever to defraud, not to worry about buying a ticket first. I studied this question closely, and came to the opinion that the reports of the revenue lost in this way were exaggerated. In this view I am supported by the European Traffic
and Accountant officials. The former on several occasions, before my inspection was mooted, had stopped trains in section and made surprise checks with quite satisfactory results. On the particular check made by one of the audit staff a sum of over £2 was collected, but there was nothing to show that the whole of this sum would not have been collected in the ordinary course by the train inspector. Leakage occurs to a certain extent on every railway, and no doubt it occurs on the Sierra Leone Railway too, but I am confident that the amount lost would not justify the engagement of extra staff, beyond that now employed, to guard against it. It would certainly not justify the appointment of the one or two European Ticket Inspectors recommended by the Audit Department.

42. It would be advisable, however, to institute a deterrent to passengers getting into trains without first buying tickets. It is only right that such passengers should be called on to pay more, as the Railway has instituted machinery to enable them to buy tickets, and, if they do not choose to avail themselves of it, it is only just that they should be called on to pay an extra fee for the trouble and expense which they cause to the Railway.

Under the Railway Ordinance a person who has not bought a ticket before entering a train is liable to pay the fare from the place from which the train started irrespective of whether any intent to defraud is proved or not. Under English law this does not hold where there is no intent to defraud, and even if it was upheld in the Colony the administrative difficulties in the way of allowing it to be applied by subordinate officials makes it unworkable in practice.

I would suggest that the Railway should be empowered to charge a fee of 25 per cent. of the fare, with a minimum charge of 6d., to all persons who enter a railway carriage for the purpose of travelling without having first bought their tickets, and that legislation be introduced to give effect to this. Exception would have to be made in the case of persons getting in at recognised points such as flag stations, where there is no booking office, and it would be the duty of the train inspector to inspect all tickets before arrival at such points.

104. In my report on the Gold Coast Railways I drew attention to the fact that, while the official ‘Codification of the Powers of the General Manager’ lays down that service on State Railways must differ from service in other Government Departments, in practice this principle is only applied to certain employees in the lower grades.

On the Sierra Leone Railway the same situation exists, and the same paragraph appears in the ‘Codification of the Powers of the General Manager.’ It reads as follows:

‘The retention of the services of the employees on the railway is dependent on the efficiency with which they conduct their several duties. Service on State Railways must from its nature differ from service in other Government Departments, and the efficiency of the staff will, in consequence, have to be measured

Conditions of Service.
by tests similar to those that govern service under railway companies working with a view to profit.’

I would once again urge the unsuitability of the Civil Service Regulations to the conditions of a railway. The very representative committee appointed under the chairmanship of Sir William Acworth to enquire into the administration of Indian Railways recorded a unanimous opinion to the same effect. This unsuitability is frankly recognised in the codification of powers, but is limited in practice to the less important members of the staff. Such grades as stationmasters, engine drivers, artizans and telegraph clerks, provided their salaries are paid out of specific and not block votes, come under the same regulations as the Civil Service. This undoubtedly weakens the authority of the General Manager, and impairs the efficiency of the Railway. Promotion comes to be governed principally by the claims of seniority and not merit. The General Manager has difficulty in dispensing with the services of an employee unless he has committed some flagrant act of inefficiency. These factors must react on the efficiency of the staff, because the lazy man knows that provided he does not commit any gross error he will receive promotion in due course and survive to enjoy a pension while the keen man soon realises that his efforts can only avail to a small extent in promoting him over the heads of his less deserving colleagues.

In the lower grades, such as firemen, turners or fitters, paid from block votes where Civil Service Regulations do not hold, each man knows that his hopes of promotion and more pay depend on his acquiring a better knowledge of his trade and his capacity to show his superior officers that he has done so, and that if he proves himself inefficient it is most unlikely that he will get a higher wage and may be dismissed. These principles should not be confined to the lower grades; they should obtain throughout the service.

105. The question of conditions of service is of necessity intimately connected with that of pensions. Under the existing regulations, once a man has been appointed to any of the posts specifically mentioned in the Estimates and has been confirmed in that post he becomes pensionable. Confirmation usually takes place about three years after first appointment. Once a man is pensionable he acquires certain rights which make it very hard in practice to remove him except on a proven charge of misconduct or inefficiency, and give him a right to compensation if it is required for any other reason to dispense with his services. I have endeavoured in the previous reports I have written on Colonial Railways to point out the objections to the present pensions system. The feeling induced of a prescriptive right to office, the reluctance to reduce or dismiss men who have spent some years in the service but have not maintained their efficiency, the indefiniteness of the Railway’s commitments, all constitute strong arguments against its continuance. That the efficiency of the Railway is thus impaired is illustrated by the number of senior officials who have complained to me how
often men slack off in their work once they are confirmed and regard themselves as settled safely for life. In certain doubtful cases employees are not confirmed in their appointments after the usual period of employment, but are retained on the unconfirmed list. This is hardly fair to the individual, because he may be left unconfirmed, not on account of inefficiency, but because it is uncertain that his post will remain a permanent one. The man is left in a state of complete uncertainty as to his future, and may find at the end that his agreement is terminated after several years’ employment, without receiving any gratuity, whereas under a provident fund scheme he would receive a certain sum from the fund.

The recent retrenchments which it has been necessary to carry out in Sierra Leone brought very vividly to the fore other disadvantages. Men had to be chosen for retrenchment solely on the grounds of whether they had been confirmed or not and entirely irrespective of their merits; a man, however excellent his work might be, provided he was unconfirmed, would have to be retrenched before a man who was distinctly inferior to him because the Railway would have to pay heavy compensation in the latter case.

The very fact that compensation has to be paid to every pensionable man whose services are not required, may and probably does prevent retrenchment being carried out to the proper extent.

None of these disadvantages hold in the case of a provident fund; the Railway knows exactly what its financial liabilities are, and the necessary sums are put by yearly out of revenue so that no unexpected call can arise; each man knows that his continued employment depends on his work and efficiency and a constant stimulus is always present. If at any time the Railway wishes to dispense with the services of an individual it can do so without incurring extra expense, while at the same time the man receives from the Provident Fund, except in cases of dismissal for misconduct, both his own and the Railway’s contribution, plus the accrued interest together with a gratuity in certain cases. He thus has a certain sum varying in amount with the number of years he has spent on the Railway and the wages he has received and with which he can maintain himself until he obtains other employment.

106. As the conditions on the Sierra Leone Railway are practically identical with those on the Gold Coast, I am of opinion that the recommendations which I made in the latter case should apply to the former, both in the case of European and African Staff. The relevant passages of those recommendations were as follows:–

‘I would propose that although candidates shall still be required to pass the Civil Service examination, or its equivalent, / none of the African staff joining after a determined date should be regarded as Civil Servants; for purposes of promotion the staff in each department should be graded according to the appointments and posts they are holding, such as 1st, 2nd and 3rd grade
station-masters, booking clerks, parcels clerks, signallers, 1st and 2nd grade engine-drivers. Promotion from grade to grade would be made by the General Manager and solely by selection, yearly increments inside the respective grades being governed by the same rules as at present.

The General Manager should have the power to appoint, promote, reduce or dismiss all African staff within the limits sanctioned in the Annual Estimates, and subject to the right of appeal to the Governor.

The General Manager already possesses such powers in relation to the non-pensionable staff, and provided no change is made in the existing regulations, they would be applicable automatically to all new staff. No new principle is thus involved.

In lieu of pensions a Provident Fund should be established on the lines of that in force on the Uganda Railway. The basis of this scheme, briefly stated, is that every member contributes 1/12th of his salary per month, and the Railways contribute a sum equivalent to 1/16th of the member's salary, except under certain conditions as to the net revenue of the Railways, when they contribute 1/12th instead of 1/16th. Interest accumulates on these contributions in accordance with the rate decided on yearly, and as the interest received on the whole fund permits. All members of the staff receiving more than a certain salary per month are compulsory members of the Fund; the limit of salary which an employee must get before he is compelled to contribute is fixed approximately to exclude ordinary unskilled labourers. In the event of dismissal the General Manager has the right to withhold all or a portion of the Railways' contribution. The General Manager at his discretion may grant an employee on retirement after 15 years' good service a gratuity from the revenue of the Railways up to half-a-month's salary for each year of service. The above gives the general conditions as applied on the Uganda Railway; they could be modified as required to suit local conditions.

The benefits which the employee would obtain under the scheme are not so great as those he now obtains when he retires on pension and to compensate for this and to prevent the Railways suffering thereby in the quality of candidates for employment in comparison with other Government departments it would be necessary to raise the pay of the Railway staff slightly. Such increase, however, should only be so great as to allow for this disparity and would cost the Railways no more than the present pensions and probably a good deal less.

It would be advisable therefore to consider a scheme which would be applicable to the whole of the staff joining after a certain date.

The above only pretends to be a brief outline, because before any scheme, whether for Europeans, Africans or both, could be adopted it would have to be the subject of lengthy and exhaustive enquiry locally, in order to fix proper grades and scales of pay, and actuarial advice would have to be sought regarding the financial condition of the Provident Fund.
I would suggest the formation of a strong committee in the Colony to carry out the enquiry which should embrace all questions of pay, conditions of service and Provident Fund, dealt with above, and submit definite proposals to His Excellency the Governor. Legislative action would be necessary if it was decided to institute a Provident Fund and these various stages would take up a considerable time.

Any change, however, whether of status or of pension, could not affect any of the permanent staff now employed, except with their own consent, because it would alter the conditions under which they were engaged. The proposal which I have to make would thus affect only those employees joining subsequent to the date of the inception of the scheme and such of the old staff as might elect to come under the new scheme.

In Chapter X. on Finance I am making certain recommendations regarding reductions of pay: these recommendations would be applicable to both the present staff and any joining subsequently to the initiation of a Provident Fund. Any slight increase of pay granted to those coming under the Provident Fund scheme to compensate for their not having pension rights would therefore be additional to the reduced pay, but the reason for its grant would have to be carefully explained to avoid discontent.

107. Another important staff question to which I have devoted a good deal of space in previous reports is that of the necessity for a more general and more frequent interchange of officials between the various Colonial railways. Each railway which I have inspected has strengthened my conviction on this point. To confine a man to a small railway for the whole of his career is both unfair to the man and injurious to the system. Officials of higher rank are often promoted at present from one railway to another; this is certainly all to the good where the railway systems themselves are so small, but such interchanges are even more desirable with the more junior officials. An infusion of new blood in the older and more responsible ranks is a gain, but a constantly renewed supply of new blood which is also young is even a greater gain. I would therefore urge that the question of the promotion of Colonial railway officials and their conditions of service should be reviewed. The objects which should be held in view when the review takes place are that whenever a vacancy occurs on any Colonial railway for District rank, the appointment should not be confined to that particular railway. All Colonial railways should be informed of the vacancy and asked for applications and recommendations. In every case the General Manager in forwarding his recommendations would be required to certify that he would be prepared to accept the candidate as a District Officer on his own railway. Nor would a General Manager be allowed to hold back a recommendation on the grounds that the candidate could not be spared; in such cases he would have to forward the application stating the reasons why he considered the candidate
could not be spared and how soon he would be available if appointed. The selection from the applications thus received would be made at the Colonial Office. By thus introducing a wider system of promotion the officials would obtain a much wider experience and knowledge which, besides being an immediate advantage, could not fail to make its effect felt when they in turn are promoted to the higher administrative posts. /  

CHAPTER IX. – MANAGEMENT AND GENERAL.  

108. One of the most important functions of the management of a railway is not only to keep close control over expenditure, but to see that the best value is being obtained from the money expended. The two are not necessarily synonymous; thus an operating department may show a saving against a particular vote or the estimate for an individual work which would appear at first sight to be an economy. If a comparison be drawn between the actual sum spent and the work done, it may quite likely appear that instead of any economy having been effected, more money has been spent than should have been. 

To both these aspects, namely, prompt control over actual monies expended, and control to ensure that each operating department is obtaining the best value for the monies it is spending, I consider that the Sierra Leone Railway, in common with the majority of the Colonial railways I have inspected, pays insufficient attention. 

The present Governor directly after his arrival instructed all Government departments to compile approximate returns of expenditure for each month by the 10th of the following month. Previously no returns of expenditure were received by the Government or the General Manager until over two months after the end of the month to which they related. 

The new returns are compiled by the various departments of the Railway and submitted by them to the Chief Accountant, who works out from them the total for the whole Railway, which he forwards to the General Manager, who in turn submits it to the Colonial Treasurer. 

But, although the materials are thus already to hand for a close and prompt control over expenditure, proper use is not made of them. The General Manager knows only the total for the Railway. Although the figures for each department are compiled he never sees them, and so is out of touch with the expenditure of departments until he receives much later the audited figures from the Chief Accountant. Departments themselves do not appear to make much use of them beyond seeing that they are keeping inside the Estimates. No attempt is made to compare the results of any one month with those of any other whether of the same or previous years.
As regards ascertaining what results have been attained for the money spent, no attempt is made to do this until the annual statistics are compiled. By this time the information is out of date; it refers to events which have happened such a long time before that it is useless for current operating purposes; it merely gives a general idea of the results of the past year. If a railway or any other commercial concern is to be run efficiently and economically, those in charge must know without delay exactly what they are doing and how much it is costing them to do it. Without such information it is impossible to attain a high standard of efficiency or economy.

On the Sierra Leone Railway it would be an easy matter to obtain this information. Departments already compile their monthly approximate expenditures and I have explained in earlier chapters how the principal statistics required for operating purposes can be obtained by the departments themselves. From these it will be quite simple to work out the cost per train mile, engine mile, ton mile, mile of line open, or whatever unit may be chosen for any particular department. These returns should be prepared by departments ready for presentation to the General Manager at latest by the 10th and preferably by the 6th of the following month. The corresponding figure for the previous month and for the same month of the previous year should be given; where there is an increase per unit in any particular department, the head of the department should not wait to be asked by the General Manager what are the reasons – he should forward with the figures satisfactory explanations for any increases and, where he is unable to find a satisfactory explanation, it should be his duty to search out the cause and eradicate it. In this way any rise in expenditure and cost per unit is at once laid bare and steps can be taken promptly to check it, and there is a constant stimulus to lower the costs of working, month by month, as it then becomes possible to judge the work of departments by their results in terms of money. The General Manager from these should in turn work out and use costs per unit for the whole Railway.

109. I have referred when reviewing the Locomotive and Stores Departments to the entire absence of adequate protection against fire; it is not confined however to these departments. In none of the departmental shops or stores were there any precautions at all against fire; no apparatus was supplied; there were not even the customary buckets of water or sand. No fire brigade had been instituted and no instructions had been issued. Night watchmen were employed but they had been given no orders as to whom to warn or what to do in case of fire. It is dangerous to allow such a situation to continue, and steps should be taken without delay to supply the proper appliances, which need not be costly, to instruct the native staff as to their duties, and institute a proper fire brigade.
110. A minor economy could be effected I consider in the preparation of the Annual Report. At present the head of each department submits a report which is included in the main report.

The majority of the information is thus repeated; for example, the so-called financial position of the Railway is given in both the General Manager’s and the Chief Accountant’s reports; so are the principal figures relating to revenue and expenditure. Both the General Manager’s and the Traffic Manager’s reports repeat in considerable detail the same information respecting the tonnage of commodities carried, passenger traffic, claims and accidents.

The General Manager must naturally refer to the principal features of the working, and if the departments report also they can hardly be silent as regards such of those features as come inside their scope; hence considerable repetition is bound to occur. The General Manager is the person responsible to the Government for the conduct of the Railway and he should be the only person who reports to the Government in respect of it, embodying in his own report such features of the reports submitted to him by his heads of departments as he thinks suitable.

CHAPTER X. – FINANCE.

111. I have had cause to comment in the reports which I have made on other Colonial railways on the form of accounts in use in which the accounts of the Railway are so intermingled with those of the Colony that only a most misleading and imperfect idea can be obtained of the financial situation of the Railway itself. This is well exemplified in the case of the Sierra Leone Government Railway. The only account given in its Annual Report is the revenue account; there are other tables giving details of revenue and expenditure and statistical results, but these are, in no sense of the word, accounts. A statement of capital expenditure is given, but this shows merely the amounts spent on loan account, not the face value of the money thus expended, on which loan charges have to be met. The loan charges which have to be paid annually by the Railway appear nowhere in the accounts of the Railway, and can only be obtained by going through the old ledgers of the Colonial Treasury.

Since 1919, a so-called statement of the financial situation of the Railway has been included in both the General Manager’s and the Chief Accountant’s reports, but this statement is quite incorrect. It gives an average figure of 3 3/4 per cent, as the rate of interest on monies raised by loan, whereas the major portion now on loan is at 4 per cent. The interest is calculated on the actual monies expended, instead of on the face value of the loan, and the figure given for sinking fund charges is incorrect for the same reason. Finally, interest at 4 3/4 per cent, is charged on extraordinary expenditure allotted to Capital Works from
the Colonial Revenue, whereas no interest whatever, of course, is paid on these sums.

The figure thus arrived at as the deficit or profit on working the Railway is not only an imaginary one; it is also incorrect.

The danger of such incorrect figures is shown by the fact that the sum of £61,000, given in the General Manager's Report for 1921 as the deficit between receipts and working expenses, has been quoted by the Secretary of State in the House of Commons as the loss for that year. Other examples of the danger of incomplete accounts are given in the reports of pre-war years; in several of these the Railway is shown as having worked at a profit, whereas if full accounts had been kept it would have been clear that there had been a loss and not a profit. There is finally the question of making allowance annually for depreciation out of revenue, and fuller reference is made to this later.

I wish to make it clear that there is no question in this of whether the Railway should make a profit, pay its way or work at a loss. That is a matter of policy and not of accounting. But, whatever the policy may be, it is essential that the Colony should know whether the Railway is making a profit or not, if it is making a profit the amount of that profit, and if it is working at a loss how much it is costing the country to maintain it. The accounts in their present form do not give this information. The force of this is shown by the fact that, contrary to what would appear from the annual reports and to the view generally held, in no single year since it started has the Railway made any contribution to the revenue of the Colony, after allowance has been made for loan charges and extraordinary expenditure. Nor is the General Manager in any better position than the Colony; although he is responsible for the undertaking he can have no clear idea of its financial position.

The first step to be taken in order to place the accounts on a satisfactory basis is to separate the accounts of the Railway from those of the Colonial Treasury.

The Railway is officially recognised as a commercial undertaking, but it is impossible to run it as such unless it has full and complete accounts of its own, preferably drawn up on the same lines as those of commercial railways. So long as its accounts are intermingled with those of the Treasury, it is impossible to obtain a clear idea of the results of working.

There is no attempt in this to escape from the control of the Treasury; such control is necessary and should be maintained by the same method of Treasury statements as now in force.

In the existing circumstances of the Railway only four accounts are required. These are respectively a Capital Account, a Revenue Account, a Nett Revenue Account and a Balance Sheet.

112. As explained earlier, the statement of Capital Expenditure as given in the General Manager's report only gives the actual monies disbursed in connec-
tion with the work; it takes no account of such matters in regard to loan funds as price of issue and expenses of issuing and managing. I have drawn up a statement of capital expenditure as at 31st December, 1921, given below in Table F/1, in which these various factors have been included and from which a capital account for the Railway can be drawn up without difficulty. I have included in the statement the total sums spent on capital works out of extraordinary expenditure, as at present shown, in the annual report. Quite rightly, a distinction has been kept between extraordinary expenditure on works which it would be legitimate to charge to capital and those which should be charged to revenue, the former being included in the capital expenditure and the latter in the revenue account.

I would draw attention to the difference between the sum of £68,256 shown therein as the figure of loan charges actually paid on account of the Railway for the year 1921, and the imaginary figure of £80,489 given in the statement of the financial position in the annual report.

113. The Revenue account would be on the same lines as that now presented, except in regard to Extraordinary Expenditure. This is at present shewn separately at the end of the expenditure, and is not included in the figures shewing the percentage of working expenses to revenue quoted in the body of the report, although it relates to replacements and minor improvements, essentially items chargeable against ordinary revenue.

These items should be included under their respective heads, but under separate sub-heads, if thought necessary to distinguish them from other expenditure.

To the net revenue account should be carried the balance of the revenue account and it should be debited with the annual loan charges. The balance of this account will give the nett profit or loss on the undertaking, the sum in fact which is either available as profit to the Colony, its owners, or has to be made good by them.

The balance sheet would contain the balances of the net revenue and capital accounts, the balance of any subsidiary funds, such as fines fund or renewals funds, if such were instituted, cash balances, and the railway portion of the balance standing to the credit of the sinking fund (82.56%), which on December 31st, 1921, amounted to £143,919 (market value). It would be simpler not to include the balance of the Railway Stores Suspense Account but to treat that as belonging exclusively to the Colony, the stores therefrom being drawn and paid for by the Railway as required.

114. I referred earlier to the fact that the Railway has never in any single year contributed to the revenue of the Colony, after allowance has been made for loan charges and extraordinary expenditure.

Table No. F/2 shows the total sum which the Colony has found out of its own revenue in order to maintain the Railway since it first started in 1904.

**TABLE No. F/2.**

**Railway Dr. to Government**

(i) Pensions. £
As given by the Colonial Treasurer 19,048

(ii) Loan charges.
Interest 828,898
Sinking Fund 180,251
Interest on advances in anticipation of loans 97,393
1,104,540

Expenses of managing loans (as given by the Colonial Treasurer) 6,549
1,111,089

(iii) Loss on working.
Excess of Expenditure over Revenue from 1899 to 1921, figures supplied by the Colonial Treasurer:–

Expenditure (including Extraordinary Expenditure on both Capital and Revenue works) 2,399,882
Receipts 2,297,388
102,294

Total Railway Dr. to Government £1,232,431

Roughly speaking, therefore, the Colony lost one million and a quarter pounds in eighteen years of open line working.

It is true that £334,824 of the extraordinary expenditure has been spent on capital works, which it would have been legitimate to finance out of loan funds instead of revenue, but against this no allowance has been made for renewals or depreciation, and the sums already due on this account exceed by a large amount the figures given above. Certain renewals have been effected yearly from revenue, but they are very small in comparison with the depreciation which has taken place, and to make good which funds will have to be applied eventually. Even if this figure of £334,824 of extraordinary expenditure be left out there still remains a total of nearly one million pounds as the loss on the working of the Railway for eighteen years.

This again illustrates the unsatisfactory form of the present accounts; if the form which I recommend had been in use, facts of this nature, which it is essential should be known to the Government and the General Manager, if they are to gauge the financial situation correctly, would have been obvious at the first glance.
As it is, not only are they not within current knowledge, but it requires several hours of patient work to disentangle them from the Treasury ledgers and Railway reports.

115. The revenue account for 1921 shews gross takings of £161,765 and total working expenses of £243,484; to the latter have to be added loan charges of £68,256 so that the actual loss on working the Railway was £149,975. If to this be added the extraordinary expenditure out of Colonial revenue on capital works, the Colony was £208,377 out of pocket. This situation is all the more serious, because £69,000 has to be found in the next two years out of revenue to carry out renewals of track as explained in Chapter IV., and after that, although there will probably not be any more large renewals of track required for a few years, considerable sums will have to be set aside to replace the old locomotives, vehicles, tools and plant which will become worn out year by year. Arrangements have been made to find the £36,050 required for the programme of relaying in 1923 out of the revenue of the Colony, but it should be the chief aim of the Railway to cause as small a drain as possible on the Colony’s revenue and eventually to become at least self-supporting.

116. Taking the revenue side of the account first, I have explained when dealing with rates that in the present depressed state of markets any attempt to raise the rates on exports would almost certainly have such a serious effect as to cause a large drop in revenue, and two-thirds of the gross revenue comes from this source. Nor does there appear any prospect in the near future of a large increase in the quantities exported; if markets recover, a gradual yearly increase as in pre-war days may be looked for, but it would be unwise to anticipate anything more. The reduction of the third class passenger fares, and the goods traffic which will arise from it, will, I anticipate, eventually lead to a substantial increase in revenue, but this alone cannot be expected to make up the present annual deficit. The only resource therefore is to endeavour to bring the expenditure down more to a level with the earnings. On comparing the results for 1921 and 1913, it is seen that while the gross revenue for 1921 is only some £6,000 short of that for 1913 (and this is more than accounted for by the falling off of £11,000 in the traffic of palm kernels), the working expenditure has increased by over £130,000 and is two and a half times what it was in 1913. £100,000 of this is accounted for by material, as the issues for 1913 were £77,000, as against £179,000 in 1921. The major portion of this can certainly be attributed to the increase in prices, and with the present fall, especially in the price of coal, a marked improvement will undoubtedly be experienced in subsequent years. But apart from the question of prices there is scope for a reduction in the quantities used. This can best be effected as explained earlier by prompt monthly returns of approximate expenditure and costs per unit so that any rise in these costs in any of the operating departments is at once brought home to the department, and waste is prevented.
£30,000 is thus left representing the increase in working expenditure due to
the increase in the wages bill. This increase is not entirely due to the rise in wages,
as is shown by Table No. F/3 hereunder, which I have had prepared showing the
total number of persons employed in each department for the years 1913, 1914
and 1921, compared with the work performed. The figures for 1921 have been
taken on the most favourable basis to the Railway, because the work performed
is for the year 1921, whilst the numbers employed are the 1922 ones, when the
work had dropped below that of 1921, and there had been no proportional fall
in the numbers employed. / 

Apart from the Engineering Department, in which there has been a notewor-
thy reduction, all departments show considerable increases. This is most serious
in the cases of the Traffic and Locomotive Departments on account of the large
numbers employed; in both cases the rise since 1913 is about 33 per cent.

On the other hand, out of the various units of work given, in no case has the
work increased to the same extent. On the contrary the ratio of the number of
units of work per man has in every case decreased, and in some instances to a very
marked degree, whereas if due economy had been observed the reverse should
have been, the case. It is essentially true of these two operating departments that
it does not require a proportionate increase of staff to work an increased traffic.

I have made definite recommendations in this report which will reduce in a
certain measure the staff employed, but these retrenchments will not alone bring
down the number to the 1913 scale. It is only possible to indicate in certain cases
where offices can be abolished, or the exact staff which should be retrenched.
To take the case of the workshops, an inspecting officer can only point out that
excessive numbers are employed, and that it should be possible to get greater
value from each man; he cannot indicate the exact number of each trade which
can be retrenched. That is only possible to a person like the Works Manager, who
is in daily touch with the work.

It should therefore be incumbent on these two departments to reduce their
staff at least to the 1913 ratio, quite apart from any specific recommendations
made by me. Nor must this scale be considered as the ultimate objective; by the
system of monthly costs per unit for each department it should be reduced to a
figure below this.

The only comment I have to make as regards the Engineering Department
is that it must undoubtedly have been grossly overstaffed in 1913 and still more
so in 1914.

117. While these increases have undoubtedly swollen the total wages bill, the
principal increase lies in the rises in wages and salaries.

The regrading of the African staff which took place when the new scale was
introduced makes it impossible to draw a clear comparison between the previ-
ous and the present scale of wages, but the following examples of the increases

Taking first the largest class, that of unskilled labour, its wage has gone up from 9d. to 1s. 3d. per day, to which figure it was raised in 1919, at a time when prices and cost of living were at their highest, and there was a boom in produce. Although prices have dropped considerably since then and the supply of labour now largely exceeds the demand, there has been no reduction in the rate of wage. I made careful enquiries in various directions, as a result of which I am convinced, and my opinion is corroborated by all the political officers with whom I discussed the matter, that the Railway could obtain as much unskilled labour as it requires outside the Freetown area at 9d. a day. I recommend therefore that this scale should be introduced and that the line up to Waterloo inclusive should be treated as the Freetown area with a rate of 1s. a day. I have chosen Waterloo as the limit of the zone, because outside that zone labourers are only given temporary native houses, and this marks fairly closely the point where the cost of living changes.

I include as unskilled labour those in maintenance gangs, because when taken on they are quite unskilled, and can only be claimed as semi-skilled after they have spent some time on the Railway learning their work. After two years’ service a rise of 3d. a day can be given to pointsmen, maintenance boys, etc., who may be considered as having attained a general proficiency and have become semi-skilled; but this should not be granted to boys engaged on simple labouring work such as grass cutting. Any time already spent in the grade should count towards the increment and those boys who had already worked in maintenance gangs, or similar employment for two years would automatically become eligible for 1s. a day up-country, and 1s. 3d. a day in the Freetown area.

It has been contended that the natives of these grades were given to understand at the time it was introduced that this wage of 1s. 3d. a day was a permanent salary. I can find no documentary evidence either in the published circulars or elsewhere that the Government took the view that it was incumbent on them to maintain this scale for all time, irrespective of any drop in the cost of living, and any verbal assurance which may have been given as to its unchangeable character would appear to have been quite unauthorised. It is also manifestly improbable
that the Government would give such an assurance, nor can any implication to that effect be read into the fact that the rise was effected by issuing a new scale of salaries instead of increasing the war bonus. I am also of opinion that little trouble would be experienced provided the reasons for the reductions were properly explained to those affected a month or six weeks in advance of its inception; force of circumstances and the prevalent unemployment would probably compel them to accept it without demur even if they were inclined to cause trouble.

118. The question of the reduction of wages of African skilled labour and salaried staff and European staff is not so simple as that of unskilled labour. Especially in the case of skilled artizans the only source of supply is the Railway itself, which trains up the staff it requires, and just as there is no outside source of supply so there is no outside demand, or at any rate no appreciable demand for many classes of this labour. It is thus not merely a straightforward question of supply and demand; this is no doubt still the predominating factor, but it is no longer the only factor of moment. A certain amount of weight must be given to the cost of living.

Whilst I do not want to exaggerate this factor it is one which must be taken into account more especially when judging the wages paid to Europeans and non-native Africans, and for this reason I have prepared certain statistics, bearing on the rise which has taken place as affecting European, non-native African and African employees.

These calculations have been based, as regards local commodities, on the average of the figures obtained from the political officers and trading firms and, as regards imported commodities, on the average of the prices obtained from several trading firms to whom my thanks are due for having supplied me with full information not only in respect of present, but also of pre-war prices.

The sources from which I drew my information were thus sufficiently numerous and varied to prevent danger of exaggeration in any particular direction, and to ensure that the bases on which the calculations have been drawn are correct within a narrow margin. The method adopted is the same as that used by the Ministry of Labour.

119. Taking first the case of the native, the three necessities of life are rice, palm oil and cotton goods. In certain cases ‘fu-fu’ is substituted for rice, but this is a cheaper commodity, and so rice has been taken as the standard.

The average price of rice in 1914 was 71d. per bushel, and in 1922 122d. per bushel, an increase of 72 per cent. This price of 122d. per bushel was taken just before the harvest and so in reality represents the average maximum price. Allowing half a bushel a month at prewar figures gives an expenditure of approximately 35d. per month in 1914, and the proportion of expenditure is 35.

The average price of palm oil in 1914 was 81d. and in 1922 70d. per four gallons, or a decrease of 14 per cent. Assuming an allowance of half-gallon a
month at pre-war figures gives an expenditure of approximately 10d. per month in 1914, and a proportion of expenditure of 10.

The average price of cotton per yard was 4 1/2d. in 1914, and 111 1/2d. in 1922, an increase of 155 per cent. Allowing an expenditure of 50s. per annum, or 50d. per month, gives a proportion of expenditure of 50.

Housing does not affect him as he either gets one from the Railway or builds one for himself.

The increase in the cost of living is therefore:

<table>
<thead>
<tr>
<th>Commodity</th>
<th>Proportion of Expenditure</th>
<th>Increase % of 1922 over 1914</th>
<th>Result of Multiplying Column 2 by Column 3</th>

</tr>
</tbody>
</table>

Dividing the total of column 4 by the total of column 2 gives an average increase of 106 per cent. His total monthly expenditure, as above, is 95d. as against a monthly wage of 234d., assuming he works 26 days a month at 9d. a day, or 41 per cent. of his pay. The allowance of rice and palm oil is sufficient for himself, but that for clothing allows for the whole of his family. It is unnecessary to make any allowance for his wife's food as in every case she may be taken as earning at least that much on her own account and probably a good deal more. An increase of 106 per cent. on 41 per cent. of the native's pay gives a net increase on his total pay of 44 per cent. Two points to which attention should be directed are that the rate of pay has been taken at 9d. a day, the figure to which I have recommended the rate of unskilled labour should be reduced and that even on this reduced pay necessities only represent 41 per cent. of the total wage. Thus even from the point of view of cost of living a reduction to 9d. a day is amply justified.

120. Turning next to the question of European salaries as they are simpler than those of the skilled and clerical local staff, I have prepared the following table showing the relative cost of a European's food, fuel and light in the Colony in the years 1914, 1921 and 1922.

This table has been drawn up in accordance with the method adopted by the Ministry of Labour and the same ‘weight numbers’ have been adopted. The term ‘weight numbers’ requires some explanation; it bears necessarily no relation to the actual weight of the commodity consumed; it is merely a number based on the relative importance of the several articles. As explained earlier the prices given are the average of those obtained from several sources and may be considered accurate within a narrow margin.

</tbody>
</table>
It will be seen from these tables that food for Europeans has increased 80.5 per cent. and fuel and light 62 per cent. since 1914.

The Ministry of Labour calculate the following proportions of a family expenditure:

<table>
<thead>
<tr>
<th>Item</th>
<th>Proportion</th>
</tr>
</thead>
<tbody>
<tr>
<td>Food</td>
<td>7 ½</td>
</tr>
<tr>
<td>Rent</td>
<td>2</td>
</tr>
<tr>
<td>Clothing</td>
<td>1 ½</td>
</tr>
<tr>
<td>Fuel and light</td>
<td>1</td>
</tr>
<tr>
<td>Other items</td>
<td>½</td>
</tr>
<tr>
<td>Total</td>
<td>12 ½</td>
</tr>
</tbody>
</table>

Of the above items rent does not enter into the calculation as quarters are provided free, clothing is bought mostly in England, when the home figure would apply, and ‘other items’ would be too insignificant in the case of necessaries to alter the final result materially.

The index number of 1 is too high to apply to fuel and light, as unlike England no fuel is required for heating purposes, and therefore an index number of 1/2 has been substituted. The food index number of course is given its full value of 7 1/2.

If the percentage of rise in cost of food, 80.5 per cent. is multiplied by 7 1/2, and that of fuel, 62 per cent. by 1/2, the result works out at 80 per cent. increase on the total.

This relates to the expenditure of a European in the country; any expenditure in England, such as that on clothing, or a married official keeping up an establishment at home, would be governed by the English figure. This on September 30th, 1922, was 78 per cent. and on October 31st, 1922, 80 per cent., so that it is reasonable to assume an all-round figure of 80 per cent. to represent the increase in the total cost of living both in the Colony and at home since 1914.

While the unemployment prevalent at home makes it probable that candidates could now be obtained for these posts at salaries lower than those in force, on the other hand unemployment is less prevalent amongst the railwaymen than in other trades, and the increases in the wages of grades such as driver, fitter and platelayer have been on English Railways in general 80 per cent. and in some instances more. Also I understand that the wages of £200 and £225 given to European platelayers and artizans before the war were barely sufficient to allow a man to maintain himself properly. This opinion I understand has the congrades of European staff were reduced below the margin of 80 per cent. over the pre-war figure it is doubtful if a suitable stamp of man could be obtained, or, if obtained, would be able to exist properly on the reduced wage.
In the higher wages, the increase on pre-war total emoluments has ranged from 65.1 per cent. down to 36 per cent., and is in all cases less than the rise in the cost of living.

From the point of view of cost of living there is no justification for lowering the salaries below a figure of 80 per cent. in advance of the 1914 rates, and this has all the more force because unlike the native or the non-native African, who have a large margin between their pay and the essential cost of living, there is little margin for the European after he has bought the necessaries of life. /  

From the point of view of supply and demand, owing to the advance in wages of railwaymen at home having been at least as large as that on the Sierra Leone Railway, it is doubtful if the same stamp of man could be obtained for lower wages than at present. Even if it was decided to reduce all wages to the level of an 80 per cent. increase, the saving would only amount to about £300 a year. This would be entirely at the expense of the lowest grades and would create an invidious distinction quite out of proportion to the advantages gained. For these reasons I do not advocate any changes being introduced at present into the scale of European wages. The policy should rather be to limit their numbers while offering sufficient inducement to the proper class of man to come forward as candidates.

121. The case of the non-native African presents more difficulty. When he is drawing a small salary his food differs little, if at all, from that of the native; as he draws more pay he eats more European food, but the staple commodities of his diet remain the same as those of the native, namely, rice and palm oil. Similarly his clothing bill varies with his pay; the more he gets the more clothing he buys.

From the enquiries I have made the minimum of his expenditure appears to be £18 a year on food and £12 a year on clothing, which, with £5 a year for rent, lighting, etc., makes a total minimum expenditure of $35 a year. Assuming that he has a wife and family and his wife is not earning any money, his minimum expenditure would be then about £65 a year.

As this refers more particularly to the salaried grades, such as clerks and traffic staff, it would be appropriate to compare it with their scale of pay. In the case of clerks the commencing salary for probationers is £50 a year, rising to £60 on appointment as a fourth grade clerk after twelve months’ service, provided the examination has been passed. From that point his pay increases £9 yearly on the scale of £60 – £9 – £96, and at the end of five years spent in that grade, provided there is nothing against him, he automatically enters the third grade on the scale of £108 – £9 – £144, so that in eleven years from his original appointment as a probationer, he should be receiving £144 a year or nearly three times his commencing salary.

The contrast between this and the minimum expenditure quoted above is very marked. It shows that the margin between the cost of actual necessities and
pay is very large indeed; for instance, a fourth grade clerk of one year’s service
draws sufficient to provide necessities not only for himself, but also for a wife;
if he has no wife he has a margin of £25, out of a total of £60, to spend on items
other than necessaries.

It would, of course, be unfair to assume a minimum expenditure figure of
£35 a year for the higher grades of clerical staff who may quite legitimately con-
sider themselves entitled to a higher standard of comfort, but the steep scale of
increments, £9 a year in the two lower and £10 a year in the two higher grades,
makes very ample allowance for this, so that, as shown earlier, after 11 years’ ser-
vice, a clerk is earning nearly three times what he received as a probationer and
over twice what he was receiving on definite appointment.

This confirms very directly the information which I received from many
sources that the scale of food and clothing of the non-native African varies much
more according to pay than is the case, for instance, in England. In proportion
as he receives more pay he deserts native produce, buys more European food and
spends more on clothes.

For this reason it is extremely difficult to fix any standard on which to base
definite calculations as to the rise in the cost of living. One / method of ascer-
taining it would be to assume that he spends half his pay on native and half on
European items. On this basis the increase works out at 62 per cent. I think,
however, this method gives too high a result, as the amount which it is necessary
for him to spend approaches much closer to the native than the European figure.

But though it is difficult to fix any figure as in the case of Europeans and
natives, it is clear from the above that the increase does not exceed 60 per cent.
and is probably considerably lower, that the scale of increments is so generous
that in eleven years the pay is doubled and nearly trebled, and that consequently
in all except the lowest grades the salaries given bear practically no relation to the
rise in the cost of living.

In the case of daily paid staff the same factors apply, though to a lesser degree.

A case is thus clearly established for a revision of the scales of pay of all non-
native African staff with a view to their reduction to figures more in consonance
with the present economic conditions.

I would recommend that a committee be formed in the Colony itself for this
purpose, as any specific recommendations which I could make could necessarily
be only general and I did not have time whilst in the Colony to examine into
each appointment and grade, as would be necessary before a final decision could
be reached.

122. I have dealt with the subject of reduction of wages at some length because
therein lies the principal hope of reducing the expenditure. I have recommended
certain definite reductions which may be assessed as in the neighbourhood of
£10,000 a year, and the adoption of methods of procedure in various depart-
Necessity for Reduction of Wages.
ments which will produce greater economy in the employment of material and men and hence result in further reductions, but these decreases of themselves even coupled with the fall in the price of materials, cannot be expected to balance the deficit on the net revenue account of approximately £150,000. I have explained in this report that there is no likelihood of such a large increase in receipts in the immediate future as would make good this deficit; the Railway is carrying and will have to carry half its goods traffic, namely, palm kernels, at the pre-war rate, while its scale of wages has gone up on the average well over 66 per cent. It is therefore clear that it must unfortunately look for a decrease in expenditure rather than an increase in receipts to balance its budget, and there is little hope of its doing this until it gets its scale of salaries back to a level more in consonance with pre-war rates. The figures which I have given above show that there is scope for considerable reduction in the two categories which between them absorb by far the largest proportion of the wages bill. Unless these reductions are effected it will not be possible to get back to results even comparable to those of 1912 and 1913, much less to an entirely satisfactory financial situation, in which the Railway is able to provide for both its loan charges and renewal costs.

123. Rigid economy must also be exercised in respect of extraordinary expenditure; in view of the urgency of the relaying programme all other objects which depend on extraordinary expenditure must be subordinated to it. All proposals for such expenditure should be rigorously excluded unless it can be proved that the public safety will be endangered if the funds are not provided, or that the projects are likely to return an early profit commensurate with the expenditure.

124. Before leaving the subject of finance, reference must be made to the question of renewals and replacements. In common with other Colonial Railways, the Sierra Leone Railway makes no yearly provision / towards depreciation. In principle, replacements are effected out of revenue as they become necessary. The present is an excellent example of the dangers of that policy. In the first fifteen years or so of the life of a railway the sums required to replace items worn out is very small; it is only afterwards that the burden makes itself felt. The Railway is now 18 years old, and so far such renewals as have been necessary have been effected out of Colonial revenue, as, for example, four tank engines and four boilers in the year 1920. The Colony is also financing the £36,000 required for relaying in 1923 from the same source, but a call for so large a sum at a time of such financial stringency must necessarily throw a heavy burden on the Colony’s resources. Practically the whole of the cost of the renewals has to be met at a time when the Colony is least able to bear it. If a renewals fund had been in operation from the start, the years of comparative prosperity would have contributed their quota, and it would not have been necessary to find the whole cost out of the revenue of two or three years.
In existing circumstances, it would be absurd to recommend the institution at present of such a fund, because after the present two years’ programme of relaying has been completed other items such as locomotives, carriages and wagons, etc., will be getting worn out and the cost of replacing them will have to be debited to revenue. But as soon as the financial situation permits I would urge most strongly that a proper renewals fund should be started; the contributions to this should be included in the Annual Estimates and be budgetted for in the same way as any other items of working expenditure.

The sums calculated on present prices which should be set aside annually are given in the following Table No. F/4. These figures would, of course, alter yearly as assets were added or struck off.

The present yearly contribution would thus be approximately £42,000, and the course which I would recommend should be adopted is that, as soon as the finances of the Colony permit, the difference between this figure and that actually included in the Estimates for definite works of replacement which are going to be undertaken during that year should be included in the Estimates and placed to a separate renewals fund. As the capital replaceable assets of the Railway increase, the yearly contribution would have to be increased proportionately, and the percentage as shewn against the various classes would have to be allowed on account of these additions.

125. In this report generally, I have dwelt on the importance of administering the Railway as far as possible on the lines of a commercial concern. Through dint of competition commercial undertakings have been forced to evolve the most efficient and economical methods for the conduct of their business; it may not always be possible in a state undertaking to adopt these in their entirety, but it is certain that the further they are departed from the greater will be the loss in efficiency and economy. In actual practice, it will be found that the occasions
when such departures are necessary will be few, provided that the principle that the State Railway is a commercial concern is not only recognised in theory as at present but is applied in practice, both by the Railway itself and the Colony.

Even a case like the Mountain section, which has been built for administrative purposes, should be regarded from the commercial standpoint which they have to maintain even though they are doing so at a loss, but they take care to know what it is costing them to maintain them, and run them so as to keep that loss as low as possible.

I am not contending that a colonial railway should strive to make as large a profit as possible. That is a matter of policy to be decided by the owners of the Railway, the Colony and its Government. They can decide if they like that the Railway shall make no profit at all; but it is the duty of the Railway administration to run the Railway in accordance with the policy laid down to them as economically as they can, and so as to ensure the greatest amount of net profit. They must also be in a position to inform the Government as to the actual and complete financial results of the undertaking. To carry out these duties it is essential not only that the methods of management, operation, finance, accounting, etc., should be assimilated as closely as possible to those in use on privately owned railways on the lines indicated in the recommendations made in this report, but that the Railway itself must view all questions from the commercial standpoint and should be encouraged by the Government to adopt that attitude in all the problems which it has to face. /

REPORT

ON THE

RAILWAY SYSTEM OF TANGANYIKA.

CHAPTER I. – INTRODUCTORY.

207. The Railways in Tanganyika Territory consist of the Central Railway from Dar-es-Salaam to Kigoma on Lake Tanganyika, and the Tanga Railway from Tanga to Moschi. The latter is connected from Kahé, 332 kilometres from Tanga, to the Uganda Railway by a military railway built during the War, and joining with the latter at Voi.

208. The construction of the Central Railway was originally commenced in 1905 by a German private company, the Ost Afrikanische Eisenbahn-Gesellschaft (O.A.E.-G),1 to whom land and mining concessions were granted. This Company constructed the line as far as Morogoro, kilometre 202, and ran it as a private concern. The German Government decided in 1908 to extend the Railway; it bought up 88 per cent. of the capital of the company, and supplied all capital funds required thereafter for extensions. The O.A.E.-G. was kept in existence to run the Railway, but the land concessions, other than those directly attached to the Railway itself, and the mining concessions were transferred to another private company, the Ost Afrikanische Land-Gesellschaft (O.A.L.-G.), which remained thereafter quite distinct. The Railway itself was completed shortly before the War, and a branch was commenced in 1914 from Tabora, kilometre 841, in a north-westerly direction towards the Kagera River, via St. Michael. About 40 kilometres of this had been completed before the War, but 29 kilometres of the rail were picked up and used by the Belgians in continuing the Katanga Railway to the Lualaba, the sleepers being stacked at Tabora.

The standard of construction of the Central Railway is high. From Dar-es-Salaam as far as kilometre 225 the rail used is of a section weighing 42 lb. to the yard, but from there to Kigoma, kilometre 1,244, a 56 lb. rail of German section

Central Railway.
is used. The heavier rails and sleepers are of excellent design; the line is fully ballasted throughout, except between Tabora and Kigoma. Between these points sufficient ballast to complete up to full section was stacked along the line, and is still available.

The alignment now in use is the final one, as re-aligned by the Germans, except at kilometre 164, where, owing to one of the bridges demolished during the War not having yet been repaired, the original alignment is used.

The maximum gradient throughout is 2 per cent., compensated, in both directions. The maximum radius of curvature is 300 metres, except on the temporary diversion noted above.

The buildings are of solid construction, generally of stone, the larger station premises being double-storeyed, with quarters for the European staff in the upper storey.

From Dar-es-Salaam to Kilossa, kilometre 283, cotton and sisal are grown, and the traffic prospects are good; from Kilossa to Igalula, kilometre 805, except for a few local requirements round Dodoma, the prospects of traffic along the route are poor, the country being mostly bush, and full of tsetse fly. There are fertile areas to the North and South, but they are a considerable distance from the Railway, and cut off from it by 'fly' belts. From Igalula there is a zone of about 100 kilometres to Usoki, kilometre 902, which is fertile and capable of producing traffic. This zone includes Tabora. From Usoki the country again becomes fly-ridden, until within 16 kilometres of the terminus on Lake Tanganyika, kilometre 1,244, the only traffic from the Usoki-Kigoma section being from the salt mines at Nyanza.

The Germans, in fact, in the choice of a route, kept as their sole idea, the easiest line from Dar-es-Salaam to the Lake, traffic possibilities en route being an entirely secondary consideration. The Revenue Account of the Railway prior to the War showed a favourable balance, but this was solely due to the carriage of stores and material for new construction.

The present service of trains is 1 passenger and 1 goods train per week in each direction between Dar-es-Salaam and Kigoma, and 1 mixed train per week in each direction between Dar-es-Salaam and Tabora. In addition, a water train has to be run throughout the line weekly.

209. The Tanga Railway – or, as it was then called, the Usambara Railway – was also commenced originally by a private company. When this got into difficulties the German Government stepped in and took the Railway over, ultimately leasing the line to another private company, the Deutsche Kolonial Eisenbahn Bau-und-Betriebs Gesellschaft, who also were placed in charge of the extension to Moschi, and acted as contractors for the construction.

The first 91 kilometres of this line were laid in a 31 lb. rail, the remainder being 40 lb. Although not up to the same high standard as the Central Railway,
the buildings and construction as a whole are good and substantial, the former being distinctly superior to those on the Uganda Railway.

The maximum gradient is 2.5 per cent. in both directions, and compensated for curvature. The radius of the sharpest curve is 300 metres.

The characteristics of the Tanga Railway, its traffic possibilities and future were discussed in my report on the future of the Voi-Kahé Military Railway, which forms Appendix I. to Part I. of this Report.

The Voi-Kahé Military Railway is for administration purposes regarded as a branch of the Tanga line, and the total kilometrage of the two together is 503; 1 through passenger and 1 goods train a week are run in each direction. The Tanga Railway possesses its own workshops at Tanga, and all Departments of the Railway, including the Accounts, are represented on it.

There is no official, however, appointed to superintend all the services on that line, and any question affecting more than one Department has to be referred to Headquarters at Dar-es-Salaam. The indifferent communications between Tanga and Dar-es-Salaam render such administration difficult and tedious.

210. All the Railways, except the Tabora-Kigoma section, were handed over from the British Military to the Civil Administration on the 1st April, 1919. The physical damage done to the lines had not yet been made good; all efforts had naturally been concentrated on military objects, and the Railway service was regulated with that view. Maintenance of buildings and track was only carried out in so far as it was necessary for those objects, and the work of all the Departments, including the Accounts and Stores, was governed quite rightly by the same principle. Consequently, the Civil Administration, when it took over, had not only the task of straightening out the confusion consequent on the War, but also had to build up a working organization suitable for peace conditions. This task was not simplified by the fact that a permanent appointment to the post of General Manager was not made until late in 1920. / The section Tabora-Kigoma was only handed over in April of the present year by the Belgians; both the track and equipment, when handed over, were in bad condition.

The peace-time organization is thus gradually emerging, and the Railway are still striving to get it into proper working order. In any conclusions as to the methods of administration, allowance must be made for this, especially in any comparison with other Railways, which although they may have been severely tried during the War, have had the advantage of a working organization for many years previously.

211. The Estimates for 1921–22 were originally drawn up in October, 1920, when trade was good, and it was hoped that money would be available for development. As conditions in these respects have changed, it has become necessary to cut down the Estimates to the barest essentials compatible with running the
traffic now in sight, without any allowance for development. The recommendations as to staff and administration which I am putting forward in this Report have been based on this principle.

The majority of these recommendations have already been communicated by me to the General Manager; I understand some of them have already been put into force, and the Estimates now being framed in the Territory are being drawn up generally in accordance therewith.

212. Metric standards were employed by the Germans. It would entail considerable expenditure in re-chaining, purchase of new weighing machines, &c., if these standards were changed, and they have consequently been adopted. It has therefore been necessary to use them in this Report.

CHAPTER II. – TRAFFIC DEPARTMENT.

213. The organization of the Traffic Department is on a district basis; under the Traffic Manager are 3 District Traffic Superintendents, stationed respectively at Morogoro, Tabora and Tanga. In addition, an Assistant Traffic Superintendent is allocated to each district and one to the Traffic Manager’s office. On a line like the Central Railway, over 1,200 kilometres long, it is necessary to have two districts despite the smallness of the traffic. The limited time table, in fact, renders communication and inspection still more difficult, and so reduces the effective work which officials can perform in a given time. It is also necessary to allocate one assistant to each district in order to allow for inspection. To inspect the stations properly under the existing time table entails an absence from Headquarters of at least ten days, during which time the current work of the office has to be performed, and, with the inferior class of staff employed, frequent inspection is essential.

I consider that the establishment actually at work on the Central Railway should consist of two District and two Assistant Traffic Superintendents.

On the Tanga Railway one District and one Assistant Traffic Superintendent are at present allowed. The staff required in this case will depend on the policy adopted as regards this Railway and the Voi-Kahé connection. If the policy recommended by me in Appendix I., Part I., of transferring the administration of the Voi-Kahé line, when reconstructed, to the Uganda Railway and of pulling up the section of the Tanga Railway beyond kilometre 283 is adopted, the Tanga Railway will be only 283 kilometres long, and the traffic can be adequately supervised by an Assistant Traffic Superintendent. Until that takes place the importance of the work justifies the appointment of a District Traffic Superintendent, but I do not think he will need an Assistant in addition.
For the Head Office an Assistant Traffic Superintendent will be required in addition to the Traffic Manager to take charge of the office during the absence of the latter on inspection duty and as general assistant.

The actual establishment thus required at work on the whole system will be 1 Traffic Manager, 3 District Traffic Superintendents, and 3 Assistant Traffic Superintendents, or, when the Tanga line has been reduced, 1 Traffic Manager, 2 District Traffic Superintendents and 4 Assistant Traffic Superintendents, a total of 7 in both cases.

This figure of seven traffic officials at work on the system at the same time appears large at first sight, when compared with the volume of traffic moving, but it is difficult to see how it can be further reduced without interfering with adequate inspection. At the same time, this number could cope with a traffic several times larger than the present. It is one of the unfortunate characteristics of railway working that when traffic is small it is impossible to reduce superintending staff in proportion, and the present case affords a typical example.

To this figure of seven it will be necessary to add 2 Assistant Traffic Superintendents to allow for leave, making a total of 9 in all, as against 11 as shown in the original Estimates for 1921-22. The actual numbers employed at present are 1 Traffic Manager, 3 Districts Traffic Superintendents and 6 Assistant Traffic Superintendents, or 10 in all; under the arrangement recommended it will be necessary to terminate the appointment of one of the Assistant Traffic Superintendents.

214. I do not consider that the present location of the Headquarters of one of the Traffic Districts at Morogoro is very suitable. The most important station in this Districts is Dar-es-Salaam, and the District Traffic Superintendent should be stationed there, in order to keep in touch with the requirements of the public. Otherwise, there is a danger that the detailed traffic working will gradually drift into the hands of the Head Office, who should not be interfering in details. The Head-quarters of the District should therefore be moved into Dar-es-Salaam, as soon as the housing question permits.

The Assistant Traffic Superintendents should similarly be moved to the Headquarters of their respective Districts; their duties should be strictly to assist the District Traffic Superintendents; if stationed elsewhere, there is a tendency for a staff and a system of correspondence to spring up around them.

On the whole, the principle of district organization is well maintained. Up-to-date, no powers to settle claims have been delegated to District officials, but the intention is ultimately to give them powers to settle claims up to 100 florins. I am in agreement with this, but consider that the Traffic Manager’s office should first lay down general rules for guidance, and should scrutinise all claims thus paid in order to preserve uniformity between districts.
215. The stationmasters at the five principal stations on the Central Railway, Dar-es-Salaam, Morogoro, Dodoma, Tabora and Kigoma, are Europeans. There is also a European stationmaster at Tanga. The stationmasters at the remaining stations are all Asiatics with the exception of one African.

The capabilities of the majority of the Asiatics are distinctly inferior; I have noted in my Report on the Uganda Railway that of recent years the men recruited from India have shown a marked falling away from the standard previously obtainable. This inferiority is still more noticeable on the Tanganyika Railways, because the whole staff has only been recruited comparatively recently.

The whole of the signalling staff, on the other hand, with one exception, is African, and it is the policy of the Administration to train the local natives, in order to avoid any necessity for importing such staff. A commencement has already been made, stationmasters being given grants for trained Africans turned out by them. With this policy I entirely agree for the reasons given in Part I. of this Report. The aspect of the question as it affects Tanganyika and the steps which have already been taken are more fully dealt with in Chapter VII. on Staff Questions.

As explained earlier, the Estimates for 1921-22 were drawn up in respect of better traffic and development; there is now, however no necessity for some of the additional posts amongst the subordinate staff allowed for therein. Considerable reductions will be possible in respect of the junior traffic ranks, and I understand these will be shown in the revised Estimates now in course of preparation. Very little actual saving, however, will result, as the majority of the vacancies had not been filled.

216. The inspection of stations appears to receive good attention, the District Traffic Superintendents averaging about 15 days out of the month on inspection duty, and the Assistant Traffic Superintendents the same. I do not consider, however, that District and Assistant Traffic Superintendents pay sufficient attention to obtaining information about future traffic possibilities. As most of the crops are native grown the Traffic officials should make it their business to keep in close touch with the Political Officers, and ascertain from them the crop prospects and the possibilities of developing new traffics. By this means they can keep the Traffic Manager posted as to what the requirements of traffic are likely to be, and in what direction it may be possible to stimulate it.

217. The small amount of traffic running allows little latitude in operation, or scope for improvement.

The working time table is based on an average speed of approximately 25 to 30 kilometres, or 15 to 19 miles per hour. The distance between crossing stations has been increased recently to as much as 60 to 65 kilometres in certain cases, with a view to cutting down staff.
Wood fuel is used, but, instead of the fuel being collected by fuel trains, the traffic trains stop in section at the points where the fuel is collected, and load up. This obviates the necessity for running fuel trains, but is only possible so long as there is little traffic.

The ordering of trains, as on the Uganda Railway, is left in the hands of the District Stationmasters, daily stock reports being forwarded from stations to the District Stationmaster and the Traffic Manager’s office. Where only 1 mixed and 1 goods train are run once a week in each direction, it is obvious that a good turn-round of trucks is impossible; loaded trucks at intermediate stations must wait until there is a train to take them. However excellent the control of traffic and trucks might be, no material change could be effected so long as the traffic remains so small. Nevertheless, I am of opinion that it would be advisable to centralize the ordering of trains so that, although for the moment no great result may be expected, the more suitable system may be in working order in readiness for any increase of traffic. I therefore recommend that train ordering and truck control should be centralized in the Traffic Manager’s office on the lines described in para. 18, Part I. The same general conditions regarding the rendering of stock reports should be established. In this case, the amount of work entailed would not necessitate a separate section being established to deal with it for the present.

The loading of trucks appears satisfactory; this is helped by the method of charging for consignments of not less than a truck load. In the Tariff Book classification, goods for which wagon-load rates are quoted are also classified A, B, and C, according to the minimum weight of a truck load. Goods in category C are considered as capable of being loaded up to the full carrying capacity of a truck, those in category B as up to 80 per cent. of the carrying capacity, and those in category A as up to half the carrying capacity. For example, pressed cotton is in category B; when a trader dispatches a consignment of pressed cotton at wagon-load rates, the weight on which the charges are computed is 80 per cent. of the total carrying capacity of the wagon loaded. It is therefore to the trader’s interest to get the best load into the wagon, and overloading, rather than underloading, has to be guarded against. For the benefit, however, both of the station staff and traders, I think it would be advisable to issue to stations diagrams showing the best method of loading the more general commodities, such as cotton, sisal, ground nuts and country produce, into the various types of trucks.

218. Traffic is worked on the line clear and caution message system, either by telegraph or telephone. Such a method admittedly does not offer a high measure of security, but until the system has passed through the ‘pioneer’ stage, and is carrying a paying traffic, it cannot afford a high standard of safety.
The situation is quite different from that existing on the Uganda Railway; on the latter the number of trains run is about four times as great as on the Tanganyika Railways; further, the arrangements for working traffic on the Mombasa-Nairobi section, the only one on which I had occasion to comment, have been allowed to fall below the standard in force prior to the War. On the Tanganyika Railways the question is whether expenditure should be incurred in installing a better system than has been used formerly. In the present stage of the development of those Railways, I would not feel justified in making such a recommendation. / 

The instructions to the staff are contained in a Rules Book and Traffic Working Orders which were brought out during the military occupation. These are incomplete in certain respects, and on the other hand contain matter which is no longer applicable. A new book to comprise both is now in course of preparation, and will be issued as soon as completed. 

219. The regulations for the reporting of accidents by the Railway to the Government do not appear to be clearly defined. I have explained in para. 22, Part I., the reasons on account of which I consider it desirable in the interests of public safety that the enquiries into serious accidents should not be limited to those held by the Railway Administration, and similarly in this case I recommend that all accidents Class B, i.e., those resulting in serious damage to property, but not loss of life, or injury to persons, should be reported to the Governor, who may, if he sees good cause, convene an independent enquiry, and that in the case of accidents Class A, i.e., those resulting in loss of life or serious injury to persons, it should be the invariable practice of the Governor to convene an independent enquiry. A technical railwayman should be appointed either as a Member of the Court or as technical adviser. These enquiries should be quite distinct from the ordinary Coroner’s inquest.

220. The Railway telegraphs and telephones consist of one telegraph line, tied in at about every third or fourth station to take service messages, and a station to station telephone line for train working. These appear adequate for the traffic.

The maintenance of the lines and instruments is in the hands of the Postal Department; as the Railways were not satisfied with the results, they had brought the matter to the notice of the Postal Department prior to my arrival. Conferences were subsequently held between the two Departments as a consequence of which it is hoped to put such measures into force as will satisfy the Railways’ requirements.

221. Train-kilometrage and vehicle-kilometrage statistics are compiled in the District Stationmasters’ offices from the guards’ journals, and forwarded to the Traffic Manager’s office direct, where the figures for the whole system are com-
Commodities carried are prepared monthly by stations and compiled in the Traffic Manager’s office. The results are available shortly after the end of the month. The only change which I would recommend is that the returns from the District Stationmasters should go first to the District Traffic Superintendents’ offices, and the figures for the District be worked out before submission to the Traffic Manager.

The only traffic statistics maintained by the Accounts Department relate to passengers, tonnage, and passenger and ton kilometrage. The general system of statistics appears simple and prompt.

One of the disadvantages under which the Traffic Department has had to work is the great variety of forms and returns which have been left as a legacy by the Military Administration. During the military occupation the forms required, for example, for goods and coaching balance sheets, muster rolls, &c., were obtained from various Indian Railways. Thus, forms for the same purpose were obtained from two or three different railways; the forms themselves usually differed considerably, and seldom suited the requirements of the Tanganyika Railways. In certain cases forms had to be used for purposes for which they were never intended. These returns and forms are gradually being worked off, and replaced by those drawn up by the Railways, as the limited capacity of the Government Press allows. But there is no doubt that it has been, and still is to a certain extent, a distinct obstacle to the proper rendering of returns and statistics.

222. The salary sheets for the whole Central Railway are made up by the Traffic Manager’s office from muster rolls submitted direct from stations. It would undoubtedly be more in keeping with the district organization if the salary sheets were prepared in the District offices, but it would mean an increase in clerical staff. Also, owing to the large amount of sickness recently, and the consequent numerous changes of staff between District, it has been found simpler to concentrate the work at Headquarters. I am of opinion, therefore, that the present arrangement should continue, but costs and expenditure for districts should be worked out and issued. Owing to the absence of a proper price list and to the arrears in the Accounts Department, it has been impossible to get out approximate monthly costs; as soon as the accounts are in proper working order and a proper price list is issued, costs per unit, both for the whole system and for Districts, should be worked out and be available within two weeks of the end of the month.

The salary sheets for the Tanga Railway are compiled at Tanga; it has been impossible, owing to arrears in the accounts, and the absence of a price list, to get out costs of working, but in this case also when these matters have been straightened out monthly returns of approximate expenditure should be made.

223. The system of consigning and invoicing goods is framed on the Indian model, but is simpler than that employed on the Uganda Railway.
The consignor hands in a consignment note on the form prescribed by the Railways. This is retained by the despatching station, and from it an invoice in triplicate is prepared. One copy is handed to the consignor, one copy is sent with the goods and the third is retained in the book at the despatching station, consignment notes being pasted into it. At the receiving station the goods are retained until the consignee hands over the copy of the invoice which has been given to the consignor, and which the consignor is supposed to have sent by post to the consignee. This copy of the invoice is retained by the receiving station, who forward to the Accounts Department with the goods abstract the copy which was originally forwarded with the goods. If the consignee cannot produce the copy of the invoice he can obtain possession of the goods by signing an indemnity form, provided that the stationmaster is satisfied that he is the rightful consignee.

The disadvantages of this method, as detailed in para. 27, Part I., are the time consignors are kept waiting, the congestion in sheds and liability to pilferage, the heavy expenditure in stationery and the uncertainty of the consignee as to time of arrival. In the case of the Tanganyika Railways the absence of the fourth copy of the invoice, which on the Uganda Railway is sent direct from the despatching station to the Accounts Department, reduces the amount of checking necessary in the Accounts Department, and also to a certain extent the amount of stationary used. Congestion in the sheds is also not so important a factor at present as traffic is so small; but the other disadvantages remain, and when the traffic increases the disadvantages of congestion will also be felt. I therefore recommend the adoption of the system proposed for the Uganda Railway in paras. 27 and 114, Part I., in which consignment notes in duplicate and advice notes are used.

224. Parcels are consigned and invoiced in a similar manner to ordinary goods traffic although the forms are slightly different from those in use for goods. The items involved are nearly all small sums of one or two florins each; the ordinary goods procedure is too complicated for such small sums, and I recommend, as in the case of the Uganda Railway, vide para. 28, Part I., that the stamp system should be introduced. It is admitted that the same perfection of check cannot be obtained under the stamp system, but the saving of clerical labour, not only in the stations, but in the Accounts Department, compensates for any small losses which may occur.

225. Until April 1st, 1921, the Tanganyika Railways accepted traffic only at Owner’s risk; on that date they announced that they were prepared to accept traffic at Railway risk; for this purpose the rates in the Tariff Book are taken as being at Owner’s risk, and 20 per cent. is added for Railway risk. On the Voi-Kahé Military Railway no goods are accepted for carriage at Railway risk, owing to the nature and condition of the Railway.
The conditions of carriage at Railway risk are identical with those in force on the Uganda Railway, as also is the risk note which the consignor has to sign in the case of packages defectively packed or in bad condition, holding the Railways free from all responsibility for the condition in which the goods may be delivered.

For carriage at Owner’s risk the risk note is also similar, with the exception that whereas the Uganda Railway risk note frees the Railway from responsibility ‘except for the loss of a complete consignment or of one or more complete packages forming part of the consignment, due either to the wilful neglect of the Railway Administration or to theft by or the wilful neglect of its servants during transit over the said Railway, provided that the term ‘Wilful neglect’ be not held to include fire, robbery from a running train, or any other unforeseen event or accident,’ the Tanganyika Railways’ risk note limits this liability to the loss of a complete consignment, and omits all reference to the loss of one or more complete packages.

The conditions for the carriages of ‘Excepted articles’ are identical.

Both Owner’s and Railway risk rates are quoted on all goods except in the case of ‘Excepted articles’ and ‘dangerous goods,’ which are of course governed by special regulations.

As no steamers are administered by the Railways, the necessity for special conditions for carriage on steamers has not arisen.

Probably owing to the smallness of the traffic, I received very few complaints as to pilferage and breakage. The small quantity of traffic handled not only means that the amount of pilferage is proportionately diminished, but it further reduces the opportunities, because it can be checked and prevented better when sheds are empty, and there are few people about. Also, owing to there being no large commercial centre up-country, such as Nairobi, pilferage which has occurred on ships before arriving in the country is usually discovered before the goods are put on rail. It is therefore not fair to draw any comparison between the two cases, and the comparative immunity of the Tanganyika Railways should be attributed to the particular circumstances rather to any innate perfection of the system.

I agree that the conditions existing on the Voi-Kahé Military Railway are not such as to permit the Railway to take the full responsibility for goods, as defined under the term ‘Railway risk.’ This Railway was built purely for military reasons, and reconstruction is necessary before it can be considered as suitable for peace-time traffic. Until the reconstruction has been carried out it would be unfair to expect the Railway to assume the full responsibility.

As regards the Owner’s risk conditions, I do not see any adequate reason why the liability of the Railways in respect of the wilful neglect of the Administra-
tion or the theft or wilful neglect of its servants should be limited to the loss of a complete consignment.

The effect of this would be that, for example, in a large consignment, provided the Railways could hand over a single package, they could disclaim all responsibility, even though it might be clearly proved / that the whole of the rest of the consignment had been stolen by the Railways’ servants. This is distinctly harsh on the consignor, and I recommend that the conditions should be amended and the words ‘or for one or more complete packages forming part of the consignment’ should be added in the Owner’s risk note after the words ‘loss of a complete consignment.’

I have drawn attention in my Report on the Uganda Railway to the system of only quoting Railway risk rates for the higher class traffics. The object of this is to ensure that the Railways have a direct interest in seeing that no pilferage or breakage occurs to the more valuable traffics, whilst in transit. Under the Owner’s risk conditions the Railways are not responsible for either and have little incentive to guard against them. The principle is already in force on the Uganda Railway, and the Traffic Manager informs me that he considers that it has had good results, as the staff undoubtedly pay more attention to goods at Railway risk than they do to goods at Owner’s risk. In the tariff which I have framed for that Railway, I have extended this principle to include all articles in the three highest classifications. The same principle is in force also on the South African Railways and the Beira and Mashonaland and Rhodesian Railways. I recommend that it should be applied to the Tanganyika Railways, and that goods in the two highest classes, namely the first and second, except ‘excepted articles,’ should only be accepted at Railway risk, and that the rates quoted for this should be the same as in the present Tariff Book for Owner’s risk.

In the remaining classes the present difference of 20 per cent. between Owner’s and Railway risk appears excessive. The extra responsibility assumed by the Railways in respect of the safety of the articles carried cannot be considered as justifying an extra charge as high as 20 per cent. I am of opinion, that, as in the case of the Uganda Railway, the increased liability is adequately met by charging 10 per cent. on the Owner’s risk rate, and recommend that the existing charges in the Tariff should remain as those at Owner’s risk, and that Railway risk should be 10 per cent. in excess of these.

226. Up to date, ledger accounts for payment of traffic charges have not been instituted. The Belgian Congo Government and one or two of the principal firms are allowed to use the same form of warrant as the Government. These warrants are subsequently redeemed by cash payments. This system has worked all right during the initial stages, but it is not so satisfactory as a proper ledger account. No bond is obtained from the merchant as a guarantee of payment, and should any firm ask for similar treatment it would be difficult to refuse, whatever
might be the standing of the firm, without suspicion of discrimination. There is also the danger of misuse of warrants by subordinate clerks in the firm. For these reasons I recommend the adoption of the ordinary ledger account system, with guarantees from the firms in the shape of bonds.

In the case of the Belgian Congo Government, the necessity for a guarantee might be waived.

227. The passenger traffic, consisting as it does of only 1 mail and 1 mixed train per week each way, is easy to handle and calls for no comment. I received no complaints from the public on the score either of accommodation or cleanliness.

On the Central Railway catering on the mail train is carried out by means of a dining car; no arrangements are at present made for catering on the mixed train, but a bogie dining car is now being built for use on the mixed train, and, when that is in service, the 4-wheeled coach now in use on the mail train will be transferred to the mixed. A 4-wheeled dining car is also being fitted up for the Tanga Railway. / The passenger traffic.

The catering is let to a contractor who now pays £10 a month for the right on the Central Railway, and will pay £5 a month on the Tanga Railway. When the new bogie coach is put into service on the Central Railway a fresh contract will be entered into which should give a higher return than the present one of £10 per month.

The price for each meal is 2 florins. The charges generally appear reasonable and the meals good.

The receipts from the restaurant car contracts should be kept in a separate fund which should be debited with the maintenance and repairs of the vehicles and depreciation charges. /

CHAPTER III.—LOCOMOTIVE DEPARTMENT.

228. The German Government intended to move the Headquarters and central establishments of the Central Railway from Dar-es-Salaam to Tabora, and had already made a move in that direction by erecting workshops at Tabora, instead of extending the existing ones at Dar-es-Salaam. In addition, there are workshops at Tanga for the Tanga Railway, so that the Tanganyika Railway system as it exists to-day has three separate sets of repair shops. This affects the organization of this Department considerably.

At the time of my inspection the Department was organized into three Districts with Headquarters at Dar-es-Salaam, Tabora and Tanga respectively. The District Locomotive Superintendent at Dar-es Salaam was in charge of locomotive running between Dar-es-salaam and Itigi, with running sheds at Dar-es-Salaam, Dodoma, Morogoro and Itigi. The workshops at Dar-es-Salaam also come under this District, and the shed at Dodoma is fitted with a small...
workshop. An Assistant Locomotive Superintendent was stationed at Dodoma, and there were locomotive foremen in charge of running at Dodoma and Dar-es-Salaam, as well as a European night shedman at Dodoma.

Under the District Locomotive Superintendent, Tabora, who is in charge from Itigi to Kigoma, were two Assistant Locomotive Superintendents, one stationed at Kigoma and one in charge of the shops at Tabora. Locomotive foremen in charge of running were posted to Kigoma and Tabora.

At Kigoma the Germans installed a workshop, which, although small, was very complete and well-equipped. These workshops were evidently intended for the repair of craft on the Lake as well as of locomotives; at present there is no work for them and they are never used.

The locomotive arrangements on the Tanganyika Railway were under a District Locomotive Superintendent, having under him an Assistant Locomotive Superintendent. In this District are included, besides the shops at Tanga, the saw-mills at Sigi, the Superintendent of which was responsible to the District Locomotive Superintendent at Tanga.

229. The number of engines on the Central Railway is 53. Of these, 13 were taken over from the Belgians at the same time as the Tabora-Kigoma section; of these 5 are in such bad condition that they are not worth repairing, and the remaining 8 are all in need of extensive boiler repairs as well as heavy repairs to motion etc. In some of the engines there were over twelve inches of sediment in the water space.

Of the 40 engines which were in the possession of the British prior to the taking over of the Tabora-Kigoma section, 29 were in fair running condition at the time of my inspection, 8 were under repair and 3 were waiting repairs.

Under the policy of not expending any sums in anticipation of development or increased traffic, the actual number of 53, or, excluding the 5 worn-out engines at Kigoma, of 48 engines is in excess of requirements. On the four sections between Dar-es-Salaam and Tabora, where the time table shows 4 trains a week each way, 3 engines for each section should suffice to carry out the work, and on the sections between Tabora and Kigoma, 2 engines for each section. To this total of 16 engines should be added a spare engine at each centre, Dar-es-Salaam, Dodoma, Tabora and Kigoma. This gives 20 engines for service on the road or in case of unexpected breakdown. Adding to this a shunting engine for use at Dar-es-Salaam and one at Kigoma raise the total to / 22.

22. Allowing 1 engine under general repairs for every 12 on the road, which permits a general overhaul to every engine once in two years, means an addition of 2 engines always in the shops. The total, thus arrived at, of 24 engines should suffice for all requirements of the present traffic including shunting.

The policy which I recommend should be followed is that the 24 engines which are now in the best condition and of the most suitable types should be
chosen for the current work of the Railway. The remaining engines should be laid up and no attempt should be made to repair them or get them into proper working condition until the prospects of increasing traffic warrant an increase in the general stock of 24. In this way the expense of putting the remaining 24 in thorough repair will be deferred until there is a justifiable expectation of their being required on the road. The same policy should be pursued with regard to wagons.

In these estimates no allowance has been made for any increase in the traffic from the Belgian Congo. When there is a reasonable prospect of obtaining more traffic from this source, extra engines and rolling stock should be repaired and put into service to cope with it. Under the Convention of the 16th March, 1921, the Belgians have the right to put their own wagons on the road, provided they are of approved design, but it is to the interests of the Railway Administration to employ their own stock, especially when they have a surplus.

The question as to the best course to be adopted in the event of the Belgian traffic exceeding that which the present total stock of engines and wagons can handle is dealt with in Chapter X. In either event it would be advisable to obtain from the Belgians a guarantee of a minimum traffic.

On the Tanga Railway the situation is complicated by the presence of the light rail on the lower section, which limits the use of the heavier engines, and also by the uncertainty of the future of the Railway. The same policy in general, however, should be pursued; the number required to haul the existing traffic, with a margin for unexpected breakdown and general repairs, should be determined, and the remainder should be laid up until such time as an increase in traffic warrants their being repaired and put on to the road.

230. The reduction of the number of engines in the sheds would entail a reduction in the running staff; at present the high proportion of time spent by this staff’s space’ is marked. It would also allow a reduction in the numbers of the senior superintending staff.

The establishment of senior superintending staff laid down in the original Estimates for 1921–22 was:–

1 Chief Mechanical Engineer;
3 District Locomotive Superintendents;
1 Workshops Superintendent;
7 Assistant Locomotive Superintendents.

At the time of my inspection the post of Workshops Superintendent was vacant, but on the other hand there were 8 Assistant Locomotive Superintendents on the books in lieu of 7.

I consider the retention of Assistant Locomotive Superintendents at Dodoma and Kigoma unnecessary. The work at neither place is sufficiently important to
justify an Assistant Locomotive Superintendent as well as a Locomotive Foreman.

I think an adequate establishment for the policy detailed above would consist of:

1 Chief Mechanical Engineer;
3 District Locomotive Superintendents (1 each at Dar-es-Salaam, Tabora and Tanga);
5 Assistant Locomotive Superintendents (1 each at Dar-es-Salaam and Tabora, 1 in the Chief Mechanical Engineer’s office, and 2 on leave),

or a total of 9, as against the present establishment of 12. I recommend that the establishment should be reduced accordingly by terminating, as they fall due, the agreements of those in excess whose services can best be dispensed with.

If the Tanga Railway is reduced to a total length of 283 kilometres, I think the presence of a District as opposed to an Assistant Locomotive Superintendent will still be necessary owing to the presence of the workshops, and the difficulty of communicating with Headquarters, which will render it essential to have an experienced official in charge.

231. The general arrangements for returns and statistics appear simple, while on the whole they are well adapted to the requirements. The salary sheets are compiled by Districts and submitted direct to the Accounts Department; monthly returns of train and engine kilometrage statistics are also compiled by Districts and forwarded to the Chief Mechanical Engineer’s office. The only alteration which I would suggest is the abolition of the return of train kilometrage every 10 days; the monthly return from Districts at present contains full particulars of the kilometrage run by each driver and engine, and the stores consumed, and contains all the information that the Chief Mechanical Engineer requires.

Owing to the arrears in the Accounts Department and the absence of a proper price list, it has not been possible up to date to ascertain costs of working per unit. The Chief Mechanical Engineer informs me that as soon as the arrears of accounts have been made up and a complete price list is available he aims at obtaining comparative costs per unit not only for the whole system but also for each District, available within a fortnight to three weeks of the end of the month.

Drivers’ line-clear tickets are checked both in the District and Head Offices; the latter check appears unnecessary.

The engine, boiler and vehicle registers are simple and call for no comment.

232. The fuel used throughout is wood, practically all the requirements of the Central Railway being obtained by contract; on the Tanga Railway about two-thirds are obtained by contract, and the remainder is cut by labour directly employed by the Railway.
The average cost per 100 cubic feet is 3 florins 75 cents on the Central Railway, the average over the whole system, including the Tanga Railway, being 4 florins 25 cents per 100 cubic feet. This compares with a present price of 6 florins 50 cents per 100 cubic feet, and an estimated cost for future contracts of 5 florins per 100 cubic feet on the Uganda Railway.

So long as wood fuel remains at so low a figure as 4 florins 25 cents per 100 cubic feet, or any price close to that, there can be no question of replacing it by oil fuel.

A further factor is the presence of coal indications in the Territory. Such indications have been noted to the North-west of Lake Nyassa and also in an area south from Morogoro and south-west from Ngerengere. If coal is eventually found in paying quantities it would, of course, affect the whole fuel situation of the Railways, and the possibility of its being found in such quantities places any idea of adopting oil still more out of the question.

Meanwhile, there is no doubt that the Railways should continue to use wood fuel. / The stocks on hand average three months’ consumption, which is not excessive.

233. Fuel and oil consumption per train mile for each engine and driver are worked out and are available in good time for action to be taken.

Recently the system of regulating the issue of oil to engines by means of fixed rations has been introduced, and has resulted in marked decrease in consumption. As the drivers become accustomed to it, the Chief Mechanical Engineer intends to reduce further the quantity of the ration issued.

No statistics are kept, however, for oil consumed in the lubrication of vehicle axle-boxes. I think it would be advisable to maintain these so that the consumption can be gauged. It forms an important item of expenditure and so long as it remains unchecked waste is liable to occur.

As on the Uganda Railway, I think the experiment of trying castor oil should be tried; the Railways should do the extraction of the oil, obtaining the beans by local purchase, or by themselves undertaking the cultivation.

234. Inspection appears to be carried out thoroughly and regularly.

235. There are three separate workshops establishments on the system, situated respectively at Dar-es-Salaam, Tabora and Tanga. The largest is the installation at Tabora, where the layout and equipment of the shops are modern and good. The European staff employed there consists of an Assistant Locomotive Superintendent in charge, a boilermaker foreman and a charrmans millwright.

The workshops prepare their own salary sheets, and as soon as the price list of stores is prepared and the arrears in the Accounts Department have been made up, they will be in a position to render returns of approximate expenditure
within a fortnight to three weeks of the end the month, and the system has been devised with this intention.

The various jobs in hand in the shops are carried out under a system of works orders. Separate works orders are given for special jobs, but in the case of ordinary routine work such as heavy repairs to engines, individual works orders are not prepared, although the time worked on each engine is noted. For the reasons given in para. 44, Part I., namely, in order to give the Superintendent in charge a standard of comparison and to let him have a relative idea between what he is spending on individual jobs and what he ought to be spending, I think a simple costing system should be introduced. The existing procedure is in advance of that at present in force on the Uganda Railway, in that the official in charge knows promptly what he is spending in wages, and shortly, when the price list is issued, will know soon after the end of the month what approximately he has spent in every direction during that month. The initiation of a costing system will complete the control by giving him the means of judging the expenditure by the results.

As the salary sheets are already compiled in the works office, the introduction of a costing system, provided it is simple, should not entail a large increase in clerical work.

The shops at Dar-es-Salaam and Tanga are run on similar lines, but in their cases the introduction of a costing system is not of such importance as the shops are smaller, and can be adequately controlled by the general supervision of the foreman in charge. Nevertheless, even in these cases a costing system would help, provided it is not too elaborate, and the best course to pursue would be to wait until the system had been introduced and got into working order at the Tabora shops, and then to introduce it subsequently, modified if necessary, at the other two shops. / 236. Although the bulk of the skilled labour employed both in the running and the workshop branches is Asiatic, there has been a marked decrease recently owing to the difficulty of obtaining suitable drivers and artizans from India. This is in part due to the bad reputation which the climate of Tanganyika, and Dar-es-Salaam in particular, earned in India during the War. The bad quarters provided at Dar-es-Salaam are also partly responsible. The deterioration in the quality of recruits is even more marked on the Tanganyika Railways than on the Uganda Railway, which is attributable, not only to the reasons given above, but also to the want of experience of the agents in this class of business.

The Indian staff is thus not only distinctly inferior in quality, but has recently diminished in numbers. Largely in consequence of this the problem of training the African has reached a stage much in advance of that on the Uganda Railway. The Tanganyika Railway have been assisted in this by the legacy of the German
policy, under which considerable progress had been made in training the natives, although no definite scheme appears to have been in force.

At the present time not only are a good proportion of the engine drivers African, but the whole of the skilled labour employed in the moulding shops at Dar-es-Salaam, including the charge-hands, is African. The tools in the sawmills are practically all run by Africans, and they are also employed on wheel lathes, shaping machines and rough turning. The carriage fitting is done entirely by Africans, under the supervision of a European.

At Tanga the whole of the new carpentry work, some of it requiring a good standard of skill, such as the making of louvred windows for carriages, is done by Africans under the supervision of a Japanese charge hand.

The shortage in the recruits from India had, however, reached such an acute stage prior to my visit that the rate of work in the shops had suffered noticeably. The General Manager, therefore, considered that no time should be lost in putting the training of the African on a proper basis, so that the whole supply of skilled labour required could be obtained locally. With this object he asked for an increase of European foremen and chargemen, because the existing European staff could not undertake the training of natives in addition to their present duties without allowing the work in connection with the latter to fall in arrear. In view of the delay already caused by the deficiency of skilled Asians, it is doubly important that further delay should not be occasioned by diverting European foremen from their present duties.

I examined the question with the General Manager, and in agreement with him proposed to the Governor that the establishment of foremen and chargemen should be raised to 15 to allow for instructors.

I have pointed out in Part I. of this Report the vital importance to these territories of training and providing their own skilled labour, so as no longer to be entirely dependent on another country, and I would therefore urge most strongly that the demands put forward by the Tanganyika Railways should be approved.

While the situation is better in Tanganyika than in Kenya as regards the steps already taken, it is worse in that the difficulty of obtaining suitable recruits from India is already reacting on the output of work.

237. The Locomotive Department are also in charge of the saw-mills situated at Sigi in the Usambara Mountains. These mills are connected with the Tanga Railway by a 75 c.m. line, 23 kilometres long. Both the mills and the line were the property of a private company before the War. They do not form part of the Railway property, and the interest of the Railways in them is confined to their temporary administration. As they are ‘enemy property’ they will presumably eventually be sold by the Custodian of Enemy Property. [...]
238. The Locomotive Department are also charged with the working of the Nyanza Salt Works at Uvinza, kilometre 1132, on the Central Railway. [...] 239. It will be noted that while I have recommended the adoption of the ‘divisional’ organization on the Uganda Railway, I have made no similar recommendation regarding the Railways in Tanganyika. My reasons for not doing so are threefold.

On the Central Railway the whole of the commercial life of the country is centred in Dar-es-Salaam. No up-country centre like Nairobi exists. The headquarters of all the commercial and business concerns are stationed at Dar-es-Salaam. All except a very small fraction of the traffic either emanates from there or is consigned to it. As the Headquarters of the Railways are also there, there is not the same necessity for having at points away from Headquarters officials who can give orders to both the operating departments.

The second reason is that the splitting up of the repair workshops into two, or, if the Tanga Railway be included, three separate shops, necessitates a similar splitting up of the mechanical Department, whether the latter controls the running of locomotives or not. The same saving in staff cannot therefore be looked for as when, as in the case of the Uganda Railway, the shops are concentrated.

The third and most cogent reason is, however, that, after striving against considerable difficulties, the Tanganyika Railways are gradually developing their organization and getting it into working order. To introduce the ‘divisional’ system would mean that a lot of the work already accomplished would have to be thrown into the melting pot. New superintending staff would have to be introduced, and the building up of the organization would have to be commenced over again.

These three reasons have therefore led me to the conclusion that the sounder policy, certainly at the present stage of development, would be to retain the ‘departmental’ organization.

CHAPTER IV. – ENGINEERING DEPARTMENT.

240. As stated in the Introductory Chapter, the Germans, in the construction of the Central Railway and its buildings, maintained a high standard; even in the coastal section of 225 kilometres, where a lighter section of rail was used weighing 42 lb. per yard as against 56 lb. per yard elsewhere, the general standard of construction was high. The same remarks apply to the Tanga Railway, although not to the same degree; in this case a 31 lb. rail was used on the coastal section of 91 kilometres and a 40 lb. rail for the remainder. The construction, both of the track and buildings, though not of the same excellence as on the Central Railway, was, nevertheless, of a superior standard to that adopted on the Uganda Railway.
The buildings and stations are of permanent type, usually of stone; the lines are fully ballasted throughout up to a good section, except between Tabora and Kigoma, where, although the ballast had not yet been laid, the quantity which will eventually be required to ballast up to full section was stacked in preparation.

The characteristics of the Voi-Kahé Military Railway have been described in the Report on that Railway contained in Appendix I, Part I.

241. Considerable damage was done to both Railways during the war; the damage done to the bridges and structures has, for the most part, been already repaired, although in a certain number of cases the girders of bridges are still resting on temporary piers, and some of the water tanks are still on sleeper cribs. Money has been asked for to replace these by permanent structures, but owing to the scarcity of funds, no moneys have yet been made available. It would be economical to provide the sums required for this purpose as early as possible, the yearly cost of maintaining such temporary structures being much in excess of that required if they were permanent.

242. The buildings suffered considerably during the War; the military only maintained in proper condition such as they required for their own purpose, and up to the standard which sufficed for that. Thus in many of the station buildings windows are damaged, doors broken and roofs and ceilings are in a bad state of repair. If left in their present condition these buildings will deteriorate rapidly. The longer they are left as they are, the heavier in proportion will be the cost of ultimately repairing them, and making them habitable. At the moment some are not occupied, but with any revival in trade and increase in traffic, the stations will have to be reopened and the buildings made fit for occupation. Once they have been put into a proper state of repair, the annual cost of maintaining them in a proper state will be small. It is, therefore, the soundest economy to put them into thorough repair now, even if the necessary money has to be found by reduction under other heads. These remarks apply not only to the items included under the ordinary heading of maintenance of buildings, but also to the demands placed under the heading of ‘Special Capital Expenditure on Maintenance and Improvement of Buildings.’ The title of ‘Special Capital Expenditure’ is a misnomer, as the items relate to larger repairs which have been put off.

Although the quarters which were built by the Germans are good, the number is insufficient to house the existing staff, at the larger centres, especially Dar-es-Salaam and Kigoma. The shortage at Dar-es-Salaam refers more particularly to Asiatic employees and appears to be due to the German policy of not providing quarters for them, but making them find their own. The absence of suitable quarters has had a bad effect on the health of the Asiatic staff, and the high percentage of sickness amongst them has been attributed to it. It has also directly affected the recruiting owing to the bad reputation which the town has
gained in India. The amount paid out annually in lodging allowance to Asiatics in Dar-es-Salaam exceeds £3,000; a scheme to house the same number (124 in all) has been prepared and is estimated to cost £22,000. Allowing interest and sinking fund charges at 8 per cent., annual renewal charges at 1½ per cent., and the annual cost of maintenance at 1 per cent. of the original capital cost, the total cost per annum under this scheme will amount to £2,310, or a saving of at least £700 a year over the present cost of lodging allowances. The scheme thus will show a substantial saving in addition to the advantage of providing better housing for the staff and so getting better work from them, and a lower percentage of absence due to sickness. The latter constitutes a considerable pecuniary loss as the Asiatic employee receives full pay for the first 45 days of certified sickness. I therefore recommend most strongly that the scheme should be sanctioned and funds provided.

The absence of quarters at Kigoma is due to the fact that the Germans had not completed their building programme there, and had provided no quarters except one or two in the main station building. Apart from the two senior officials housed in these quarters, the remainder are accommodated in temporary wooden buildings hastily erected by the Belgians. At the time of taking over the roofs were in most cases not even sun-proof; this defect has been remedied, but the buildings, even when thus improved, cannot be described as anything more than shelters. As long as they are housed in such structures the health of the staff and their efficiency is bound to suffer. Moreover, the life of the buildings themselves will at the most be only three or four years, and they will be very expensive to repair. I therefore consider that suitable quarters to replace them should be erected without delay.

The capital expenditure thus incurred will not be wasted whatever policy may be adopted as regards the future of the Railway, because Kigoma is the chief port on Lake Tanganyika and must remain so; not only are the Railway requirements there bound to increase, but it will also be the Headquarters of any Marine service undertaken by the Government.

243. The maintenance of the track itself is excellent except on the first section between Dar-es-Salaam and Ruvu, kilometre 80, and on the section between Tabora and Kigoma. The first-named section is the oldest on the line, and considerable arrears of maintenances had been allowed to accumulate both during and for some time after the War. Special attention is now being directed to it, and it should soon be up to the same standard as the remainder.

The section Tabora-Kigoma was also in a bad state when taken over, but special attention is also being given to it and a marked improvement has already been effected.

244. The maintenance and future of the Tanga Railway and of the Voi-Kahé Military Railway has already been discussed in the report which forms Appendix
I. to Part I. of this Report; an early decision as to the future policy in respect of these Railways would be of advantage as under the present arrangement considerable annual charges are being incurred in maintaining sections which may either be altered or pulled up.

245. The organization of the Engineering Department on the Central Railway comprises three Districts instead of two, as in the case of the Locomotive and Traffic Departments. The Headquarters of these are at Morogoro, Tabora and Kigoma. In the Morogoro District, although the District Engineer is in charge of the maintenance of track in Dar-es-Salaam station and yards, the charge of buildings at Dar-es-Salaam station and yards, the charge of building at Dar-es-Salaam is placed directly under the Chief Engineer.

I am of opinion that the amount of work now existing on the Central Railway does not justify its being split up into three Districts. The actual extent of track to be supervised is 1,244 kilometres which if split up into two Districts, would give to each the control of about 390 miles. / Although the actual length is not exceptional, the scanty train service and the fact that each District is stretched out in one long line means that more time than ordinarily necessary must be taken up in traveling. But, after making allowance for these points, I think that both the small amount of work actually in progress and the stringency of the financial situation demand the elimination of one of the Districts.

If the housing question permits, the Headquarters of the two Districts thus left should be Dar-es-Salaam and Tabora respectively, so as to coincide with the District Headquarters of other Departments. The charge of the buildings at Dar-es-Salaam should be transferred from the Chief Engineer to the District Engineer, because it is not the duty of the Chief Engineer to be supervising detail work, and in doing so he infringes on the proper control by the District Engineer of his District.

For each District one Assistant Engineer in addition to a District Engineer will be necessary.

The maintenance of the Tanga Railway is in charge of a District Engineer, with an Assistant Engineer under him. The actual staff required on this line must depend on the policy adopted with regard to the Voi-Kahé Military Railway. As long as the maintenance of that line has to be undertaken by the Tanga Railway and Assistant Engineer will be required in addition to a District Engineer. If my recommendations as regards the severance of this connection and the pulling up of the northern section of the Tange Railway are adopted, a District Engineer alone will suffice, once the various works have been completed.

Allowing 1 Assistant Engineer for work in the Head Office, the establishment, excluding vacancies for leave, under this arrangement, will, until the work on the Voi-Kahé line has been completed, be:–

1 Chief Engineer;
3 District Engineers;  
4 Assistant Engineers,  
or, allowing 2 vacancies for leave:—  
1 Chief Engineer;  
3 District Engineers;  
6 Assistant Engineers,  
totalling 10 in all. The original Estimates for 1921 – 22 showed:—  
1 Chief Engineer;  
4 District Engineers;  
9 Assistant Engineers,  
or, 14 in all. At the time of my inspection the staff consisted of:—  
1 Chief Engineer;  
3 District Engineers;  
8 Assistant Engineers.

The effect of my recommendations would therefore be to reduce the numbers shown on the establishment by 1 District Engineer and 3 Assistant Engineers, and of those actually employed by 2 Assistant Engineers.

When the work of pulling up the northern section of the Tanganyika line and relaying the coastal section has been completed, the establishment could be further reduced by 1 Assistant Engineer.

The establishment which I have recommended allows for normal maintenance and renewals work; if extensive capital expenditure is undertaken, extra supervision will have to be provided.

In addition to the above reductions, I consider that a European draughtsman as shown in the original Estimates for 1921–22 is not required.

The elimination of one District office will automatically reduce the clerical establishment because, although more work will be thrown on the remaining two Districts, the increase required in their establishments should be less than the total clerical staff now employed in the third District office.

A further direction in which establishments could be reduced, when the arrears of maintenance of buildings have been made up, is in respect of Inspectors and Sub-Inspectors of Works. The establishment in the original Estimates for 1921–22 was 5 Inspectors and 4 Sub-Inspectors. It should be possible when arrears have been made up to reduce these to 3 Inspectors and 3 Sub-Inspectors. If the building scheme which has been recommended for Dar-es-Salaam is approved, extra Inspectors will be required, but they would be a charge against the special funds granted for that purpose.

246. As in the case of the Uganda Railway, I do not consider there is justification for the salary of the Chief Engineer being fixed at £1,200 a year, while the Traffic Manager and Chief Mechanical Engineer receive £1,100. His duties and responsibilities, so long as the construction of new lines is not under him, are no
greater, and I recommend that future holders of the office should receive £1,100 a year. If a large construction scheme is in contemplation, and it is intended to place its execution under the Chief Engineer, the question of once again raising the salary to £1,200 could be reconsidered.

247. The allocation of funds and the control of expenditure appears to be on a satisfactory basis so far as the absence of a proper price list admits. District Engineers forward returns of approximate expenditure on salaries by the 20th of the following month. In the case of Tanga, owing to the bad communications between there and Dar-es-Salaam, the delay is of course longer. When a price list has been issued these returns will include approximate expenditure on stores as well. No schedule of prices is yet in existence for the same reason, but the Chief Engineer has instructed District Engineers to keep accurate and complete records of work done so that a schedule can be compiled as soon as circumstances permit.

248. The average number of men employed per kilometre on maintenance of track is 1·3, or 2·1 men per mile, except on the Tabora-Kigoma section, where extra labour has had to be employed to get the track into proper shape. On certain sections of the Tabora District where the track has already been put into good order the labour on maintenance has been reduced to ×9 men per kilometre, and eventually when the arrears of maintenance have been made up it should be possible to reduce to an all-round average of 1 man per kilometre for the whole line, owing to the excellent standard of construction, and small traffic carried.

The question of the wages paid to this labour is dealt with in Chapter VII. relating to Staff Questions. /
in April, 1919. Subsequently the War Office representatives made lists of the stores remaining on the system, and drew up a valuation amounting to approximately £595,000, including the material constituting the Voi-Kahè Military Railway, which was estimated at approximately £161,000.

The model of Stores Accounting adopted by the Civil Administration, as in the case of the Uganda Railway, was that of the Indian State Railways, in which the priced ledgers are kept by the Accounts Department, and only quantity ledgers by the Stores Department. But whereas the quantity ledgers for all stores held on charge of the Stores Department were in good working order, no priced ledgers were started, nor was any attempt made to draw up a price list. The absence of any prices for articles left over from the German period and of priced invoices for most of the items obtained through the War Office made the proper pricing of stores difficult, but the natural consequence of having no priced list or priced ledgers was that it was impossible to allocate stores to revenue subheads.

This state of affairs lasted until the arrival of the present General Manager in September, 1920. He recognised the bad effects of this situation, and gave instructions for a price list to be prepared, and priced ledgers started. The prices are naturally only approximate, but they enable debits to be made against revenue subheads, which can be amended later when the actual prices are established and after the figures at which the items will be purchased from the War Office have been determined. As regards items purchased since the Civil Administration took over, either through the Crown Agents for the Colonies or through the Agents in India, there is little difficulty in fixing prices.

Priced ledgers were commenced as from 1st April, 1921. Issues made previous to that date are being examined by the Accounts Department, and the necessary adjustments made. A preliminary price list was issued in January, 1921; a more complete one was in course of preparation at the time of my inspection, based so far as possible on actual cost prices, but where these are not available, on the most accurate approximations which can be made. The compilation of the final list must necessarily wait until the purchase price for the various items from the War Office has been determined.

The prices demanded by the War Office representatives are disputed by the General Manager as being excessive; the lists prepared by them have been examined and amended by him. He has revalued the material at what he considers to be fair prices, the total of his revaluation amounting to approximately £283,000 for the whole of the material excluding that on the Voi-Kahè Military Railway, which compares with the price already put forward for the same of £434,000. This question is still under discussion.

While the duties of the Chief Storekeeper, as limited under the Indian State Railway method to responsibility for the quantity of stores held by him, appear to have been carried out, the stores accounting, which is a function of
the Accounts Department, was allowed practically to remain in abeyance until September, 1920. The situation was undoubtedly abnormal and the difficulties great, especially as regards the absence of any exact basis for pricing the stores, as well as shortness of staff, but the longer matters were left in that condition the greater the accumulation of arrears. If an approximate price list had been prepared during the earlier days, allocations could have been made against revenue subheads which could have been adjusted subsequently when the exact prices had been fixed.

Great efforts have been made since to put the organization on to a proper basis and to clear up past arrears. As stated earlier, allocation of expenditure on stores to subheads was instituted as from 1st April, 1921, and all issues prior to that date are being examined and adjusted. For this great credit is due to the Deputy Chief Accountant, who arrived towards the end of 1920, and was acting as Chief Accountant from the time of his arrival until July, 1921.

The taking over of the Tabora-Kigoma section from the Belgians in April, 1921, has added a further complication. All items of material on the section were carefully checked and lists were drawn up and signed by both parties, but no prices were obtainable at the time from the Belgians. It is understood that they are now preparing a priced list, and the General Manager is also having the articles priced. The work of taking over appears to have been carried out in a very thorough manner.

250. The indebtedness of the Railway Administration in relation to the whole of the stores left by the Military Authorities does not appear to be clearly defined. Apart from the question of the actual prices to be paid, which, as I have mentioned earlier, is under discussion, the point arises as to whether the Railways are bound to take over the whole of these stores irrespective of whether they need them or not. In many respects they bear no relation to the actual requirements of the Railways, many of them being quite unsuitable for the present work, or of a type or standard which cannot be used, and of other items, such as metals, the stocks held are far in excess of what the Railways will require for 10 years to come.

The Chief Storekeeper is quite rightly insisting that, in preference to ordering new stocks, Departments must use up articles in stores whenever it is possible to do so, without detriment to the work, although they may not be of the exact type or standard which the Department would choose, and this rule should be rigidly observed. But there is still bound to remain a large residue which cannot be employed by the Railways. The Chief Storekeeper has compiled a list of all articles surplus to a year’s requirements and is endeavouring to dispose of them to other Government Departments and private firms, but it is doubtful if he will be able to get rid of the whole surplus in this manner.
If the Railways are compelled to take over the whole stock they will be saddled, first, with stores which they will never be able to use at all, and secondly, with large surpluses which they will not be able to consume for several years. During this time, however, interest charges will have to be paid on the capital thus expended.

I have been unable to obtain any information as to how far the Railways are definitely committed to purchase the whole of the stocks; neither the General Manager nor the Treasurer of the Territory were able from their records to give me any precise information as to whether or not the late Acting General Manager had finally agreed to take them over in bulk. If he has, it is too late to upset the arrangement, but in fixing the prices, which are still under discussion, adequate reductions should be made to compensate the Railways for thus taking over the stocks in bulk and so relieving the War Office of the trouble and expense of finding purchasers for the various individual items and for taking over certain stores which are of no practical value to the Railways, and other stores which are surplus to their present requirements.

If the Railways are not definitely committed, they should not accept any stores which they cannot eventually use, and should only accept stocks which are surplus to requirements at figures which will compensate for the interest charges which will accrue before they are ultimately used.

251. In addition to the stores listed and held on charge of the Stores Department, there was a considerable quantity of material scattered along the system. This is now being collected and sorted; the permanent way material is being collected at specified stations where it is placed on charge of the local Permanent Way Inspector. The cost of collecting the whole of this material into Stores depôts would have been considerable, and the system adopted appears to give an adequate check.

At many of the larger centres, notably the locomotive workshops at Tabora, large stocks exist which were left over after the Military Administration, but are not and appear never to have been on anyone’s charge. The Locomotive Department has no accurate knowledge of what these stocks consist nor are any lists in existence. At the time of my inspection these stores were being transferred to the District Stores which had recently been started at Tabora. There they were being sorted out and listed. This operation necessarily entails the employment of extra labour and there is a possibility that under the reduced Estimates it may be difficult to find the necessary funds. I would urge, however, that a service of this nature should be given precedence; as long as these stocks remain unsorted the Railways may be purchasing articles which they already possess, but of whose existence they are unaware. The expenditure will thus probably result in a direct saving in money. When the stores have been properly sorted and listed, it should be decided which can be used. These should be taken on charge by the Stores
Department and the remainder should be disposed of, if possible, by sale, or if no buyer can be found, should be converted into scrap. The presence of large quantities of useless stores merely takes up store and shed accommodation which could be more profitably employed.

252. The Stores Department is organized into three Districts, Dar-es-Salaam, Tabora and Tanga, of which the former acts as the Central Stores, all stores on indent from overseas being received there. The Stores at Tabora had only recently been established at the time of my inspection.

The system adopted for the receipt of stores from overseas and for the transfer of stores from Dar-es-Salaam to the District Stores appears to give an adequate check, and calls for no comment.

The procedure for indenting and issue of stores to Departments, although in general similar to that in force on the Uganda Railway, is in certain respects even more elaborate. Only certain officials are permitted to indent; they do so by means of a requisition note made in duplicate. These requisitions have entered on them the appropriate allocation. They must be countersigned by the District Storekeeper before issue is allowed, and are entered in a register under Departments before being sent to the Store-wardens, who make out from them issue / notes in quintuplicate. The five copies of the issue note are used in the following manner:–

1 copy remains for record in the Stores;
1 copy accompanies the goods to the indenting official, and is returned by him as the receipt;
3 copies are sent to the Accounts Department.

These last three copies are priced in the Accounts Department; one is then retained there, and the allocations to the revenue subheads are made from it. The remaining two are sent by the Accounts Department to the Head of the Department to which the indenting official belongs. Of these two copies of the issue note the Head of the Department retains one in order to make the proper entries in his expenditure ledger, and passes the second to the indenting official.

The Accounts Department make out, in addition, daily and monthly summaries in duplicate of issue notes against each indenting official, and send them to the Head of the Department.

When the complete price list has been issued, the intention is to do the pricing of the issue notes in the Stores; this will remove the necessity for the fifth copy of the issue note.

The postings to the quantity ledgers in the District Stores, and to the priced ledgers in the Accounts Department are made from the issue note. These two sets of ledgers should be constantly compared, to avoid any discrepancies creeping in. In addition, each Store-warden maintains a quantity card ledger for the stores for which he is responsible. Frequent comparisons are similarly necessary.
between these card ledgers and the quantity ledgers maintained by the District Stores.

Verification of stocks by verifiers from the Accounts Department is carried out in the ordinary way.

253. From this description it will be seen that the system, even after the Stores Department has commenced to do the pricing and the fifth copy of the issue note has been eliminated, will be very cumbersome, even more cumbersome in fact than that in force on the Uganda Railway.

It has the same disadvantages as the latter regarding the necessity for maintaining two separate sets of ledgers and for checking in the Accounts Department every invoice made out on the Railways, as regards every detail of pricing, nomenclature, &c. It equally possesses the same drawback as regards the delays which take place in rendering accounts for stores against revenue subheads and the large clerical staff it necessitates. The system on the Tanganyika Railways has, in addition, the further complication of the card ledgers maintained by the Store-wardens. Three separate sets of ledgers are thus maintained.

In paras 88–91 of Part I., I have described the objections to the method of stores accounting employed on the Uganda Railway, and have put forward a system to take its place. The system is described in the paragraphs quoted above, and it is, therefore, unnecessary to repeat the details in full here. The main features are that the Accounts Department do not maintain any ledgers, which are, instead, all kept by the Stores Department. The Stores Department do the pricing of articles and issue the price list, and the amendments thereto. At the end of each month the Stores Department send to each indentor a return of stores debitable in triplicate, two copies of which the indentor returns to the Stores Department receipted and allocated. One of these copies is forwarded by the Stores Department to the Accounts Department, and from this the necessary adjustments in the accounts are made. The system provides all the necessary checks while, at the same time, it is simpler, requires fewer staff to work it, and allows returns of approximate expenditure to be compiled early. For these reasons I recommend that it should be adopted on the Tanganyika Railways.

254. It is impossible in the present state of the Stores branch of the Accounts Department, employed as it is in clearing up arrears and preparing a proper price list, to state what ultimate saving in staff can be effected by the adoption of the new system, but on the analogy of the Uganda Railway an appreciable decrease should be possible after allowance has been made for the small increase of staff which will be required in the Stores Department.

255. I would further suggest the introduction of maximum and minimum balances. For every item the maximum and minimum balance, which should be held by each Stores, are determined; the figures are then entered in red ink on the right hand top corner of the ledger folio. The Storekeeper knows at any time
how his stocks stand in relation to the minimum balance, and when they have run down to that figure, he automatically orders more, the maximum balance fixing the limit up to which he should order. In fixing the maxima and minima, allowance must, of course, be made for the time which it usually takes for that particular Stores to receive stores after it has ordered them.

256. The Chief Storekeeper has powers to accept tenders for local purchases up to Florins 100; for purchases above that figure the approval of the General Manager is necessary.

Although up to date no difficulty has been experienced, nor dissatisfaction manifested with this procedure, with any growth in the Railways’ demands for local products there is likelihood of such occurring, and I would, therefore, recommend the institution of a Railway Tender Board, in order to give a certain measure of protection to the General Manager and the Chief Storekeeper. I understand a Government Tender Board is being instituted, but this would be on a larger scale than the one proposed for the Railways. All tenders for stores purchased locally, whether consisting of imported goods or local products, would be opened by the Railway Tender Board, who would consist of at least two members, one representing the Stores Department, and the other the Department interested in the purchase. The Board, after scheduling the Tenders, would make recommendations as to acceptance to the General Manager, in whose hands the final decision would lie. This procedure might be limited to purchases exceeding Florins 100.

257. The salary of the Chief Storekeeper is fixed at £800 a year; this salary is the same as the upper limit obtainable by District officials, such as District Engineers. As the Head of a Department, the responsibilities of the Chief Storekeeper are heavier than those of a District official, and will be increased under the system proposed above, in accordance with which the Stores Department alone will be responsible for the maintenance of all ledgers. I consider that the fact that he has larger responsibilities than a District official should be marked by a higher rate of pay. In the case of the Chief Storekeeper of the Uganda Railway, I have recommended a salary of £900 a year, but as I do not consider the duties of the Chief Storekeeper of the Tanganyika Railways are so onerous, nor his responsibilities so great, I recommend that in future he should receive a salary of £850 per annum. /

CHAPTER VI. – ACCOUNTS DEPARTMENT.

258. When the Civil Administration took over charge of the Railways in April, 1919, the Indian State Railway Code was adopted as the general model for the system of accounting to be adopted.
To initiate a comprehensive system of commercial accounting, when the Railways have already been in operation a year or two under military conditions was bound to be a difficult operation, and in this case the difficulties were increased by the confusion in respect of the stores to which reference has been made in the previous chapter, by shortage and incompetence of staff, and by the necessity for maintaining two sets of accounts, one for the military period up to 1st April, 1919, which had not yet been closed, and the second for the post-war period, subsequent to that date. The settling up between the two regimes further complicated matters, while the position was not improved by the absence of the Chief Accountant on duty in India from April to September, 1919.

Until the arrival of the General Manager in September, 1920, little progress appears to have been made. At that date the accounts for 1919–20 had not yet been closed, no price list for stores or priced ledgers were in existence, and the ration accounts, stretching back to April, 1919, had not been squared up. When the accounts for 1919–20 were presented to the Local Auditor he commented, under date of the 12th March, 1921, that they showed a most unsatisfactory state of affairs, and that there were serious errors in accounting. He further stated that the summaries of stores transactions failed to satisfy the most elementary principles of stores accounting and passed severe comment on the ration accounts.

Other unsatisfactory features in the methods of accounting were the fact that whereas the Colonial Office Regulations call for the preparation of two sets of accounts, namely: the Treasurer’s Cash Account, which reflects only amounts received and disbursed during the particular month under review, and the Railway Account, which shows actual revenue and expenditure relating to that month, irrespective of whether the amounts were actually received or disbursed in that month, no Railway Account had been maintained prior to March, 1920. When an effort was made to start a Railway Account, it was discovered that there were discrepancies in the figures submitted monthly in the Treasurer’s Cash Account, up to the month of July, 1920. These were adjusted in the Treasurer’s Cash Account for August, 1920.

In the fuel accounts, expenditure incurred on the purchase of fuel had been debited direct to the final revenue head, irrespective of whether the fuel had been consumed or not, while, on the other hand, fuel taken over from the military authorities, but not yet paid for, was being consumed without any charge being debited against the final revenue head.

No reconciliation of amounts debited and credited on account of ‘family allotments’ had been made, no ledger reflecting the final results of working had been instituted, and the procedure adopted as regards work done for other Government Departments, sale of stores to private individuals, and the Traffic Account for Earnings, was incomplete.
As the Civil Administration had by that time been established for eighteen months, the situation was distinctly unsatisfactory. In justice to the Chief Accountant, it is only fair to point out that, in addition to the difficulties described earlier, the senior superintending staff in the Accounts Department at that time consisted only of himself and one Assistant Chief Accountant; the latter was in charge of the accounts on the Tanga line, and his services have since been dispensed with on grounds of incompetence. The Chief Accountant himself had had no leave for eleven years, and was immediately afterwards pronounced medically unfit and recommended for instant leave. / 

On the departure of the Chief Accountant on leave, the Head Accounts office at Dar-es-Salaam had to be left in the charge of a subordinate official until the arrival of the newly appointed Deputy Chief Accountant in December. This official tackled the problem with commendable energy, with the result that at the time of my inspection in July, 1921, considerable progress had been made. The accounts for the whole system for January, 1921, were closed during June, 1921; the final accounts for the whole system for February and March, 1921, were waiting for the completion of the Tanga Railway accounts, those for the Central Railway being complete.

Priced ledgers have been started as from 1st April, 1921; and Stores accounts prior to that date are being examined with effect from April, 1919, and the various discrepancies referred to earlier were being or had been examined and adjusted.

The accounts of the Tanga Railway, which, on account of its distance from Headquarters, has its own accounting establishment, were in a worse condition than those of the Central Railway. This was largely due to the fact that out of the superintending accounts staff on that line it had been necessary to dispense with the services of one Assistant Chief Accountant and of one Head Accountant, on account of inefficiency and intemperance respectively.

259. As the accounts of the Railways were only emerging at the time of my visit form a state of confusion, it was impossible to make any close investigation, and therefore my recommendations will be rather of a general nature. Also, until the past arrears have been cleared up, it is difficult to establish what staff is necessary for the approaching financial year. No attempt will be made either to review the purely technical side of the accounting, but only such aspects of it as affect the working of other Departments, or the Railways in general.

In para. 105, Chapter IX., Part I., I have examined at some length the numbers employed in, and the cost of, the Accounts Department of the Uganda Railway, as well as the delays which the accounting methods employed involve. As the same methods, in general, with the exception of certain simplifications in the rendering of invoices from stations, have been adopted on the Tanganyika Railways, it is unnecessary to enter into the same detail of comparisons between System of accounting.
the staff employed in the Accounts Department and the number of stations on
the system, or between the cost of accounting and auditing services of the Rail-
ways and the gross receipts.

These comparisons, moreover, would not, by reason of the smallness of the
traffic, afford such a true criterion as in the case of a Railway which has been in
working order and showing a net revenue balance for fifteen years. The same
characteristics, however, of the large clerical staff employed and the delays
involved are observable in both cases.

The actual staff allowed in the original Estimates for 1921–22 for the
Accounts Department was 126, which is even more marked than the 240
employed on the Uganda Railway, when it is remembered that the Tanganyika
Railways do not attempt to maintain the same elaborate statistics. The figures
taken for the Uganda Railway are exclusive of the Press and Stationery staff,
which are under the Accounts Department on that Railway; in the case of the
Tanganyika Railways these services are not controlled by the Accounts Depart-
ment.

In respect of delays, no men at out-stations are paid before the 15th of the
following month, and many are not paid until the 20th of the month or even
later.

The arrears in the Accounts make it impossible at present for the General
Manager to receive promptly returns of expenditure, whether approximate or
complete, but as the same system is employed as on the /

Uganda Railway, it is reasonable to suppose the position will not be much
better then on that system, even when the accounts have been brought up to
date.

260. The Accounts Department is split up into five main branches – (1)
Cash and Pay; (2) Establishment; (3) Stores; (4) General Audit, and (5) Traffic
Audit and Statistics.

The conditions of employment of Asiatic artizans and clerical labour neces-
sarily increases and complicates the work of the Establishment Branch. For these
men, questions of leave, free passages for both them and their families, family
remittances and, in certain cases, rations, are continually arising, in addition to
the ordinary routine of pay, allowances and deductions and all have to be handled
by this Branch. With the increase in the number of trained Africans employed
this work will decrease, but, so long as Asiatic labour has to be imported, these
complications are bound to remain.

I think, however, that the procedure for submitting salary sheets could be
simplified by adopting that which I have recommended in para. 106, Part I.,
for the Uganda Railway, and under which Departments have only to fill in on
the sheet the number of days worked, the number of days' rations received, and

Organization.
the rates of pay, the deductions being subsequently entered up by the Accounts Department.

261. The records of staff should also be reduced. The only complete file relating to any man on agreement should be maintained by the Department employing him. The Chief Accountant should maintain an Establishment Register, in which such particulars should be entered regarding each man working on agreement as are required, but he should not in addition maintain a separate file for every individual.

262. In paras. 252–254, Chapter V., dealing with Stores and also in paras. 88–91 of Part I., I have dealt with the method of store accounting adopted and the objections thereto, and in the same paragraphs I have detailed the system which I propose should take the place of the existing one.

263. The only sections of the General Audit Branch on which I propose to offer any comment are the Suspense Accounts and the Treasury Cash Working Account.

No Suspense Account is maintained for the Workshops. In the absence of this revenue sub-heads have to be used as Suspense Accounts, which is incorrect. A Workshops Suspense Account should be commenced forthwith.

The Sigi Sawmills and the Nyanza Salt Works, being subsidiary undertakings quite independent of the ordinary functions of the Railway, should each have their own separate account.

I have recommended in para. 111, Part I., that the Treasury Cash Working Account should be abolished on the Uganda Railway, as it entails extra expense and complication, whereas it does not afford any more control than that given by the Revenue Account, which the Railway must keep. The same recommendation holds good in this case.

264. In connection with the Traffic Audit and Statistics Branch, the system of consigning and invoicing goods has been fully examined in para. 223 of this part of my Report, and in paras. 27 and 114, Part I., recommendations for the introduction of a new system are put forward.

Recommendations for the introduction of the stamp system for parcels traffic are put forward in paras. 28 and 113, Part I., as well as in para. 224 of this part.

I have further recommended in para. 226 that ledger accounts should be instituted in order to do away with the somewhat irregular system in force at present, under which certain firms are allowed to make use of the same form of warrant as the Government which is subsequently redeemed by cash payments.

No Clearing Section is required on the Tanganyika Railways, because the only point where they connect with a ‘foreign’ Railway system is on the Voi-Kahé Railway, and the clearing of all traffic interchanged there is effected by the Uganda Railway Accounts Department.
The statistics maintained by the Accounts Department are not excessive; only those relating to the number of passengers, passenger-kilometrage, tons carried and ton-kilometrage are kept. Statistics as to commodities carried are obtained by the Traffic Department direct from stations, and as to vehicle kilometrage from the District Stationmasters I do not recommend any change being made.

265. Owing to the arrears existing in the accounts, it is impossible to state what economies in staff can be effected as a result of these recommendations.

In the case of the Uganda Railway, I have recommended the appointment of an additional Travelling Inspector of Accounts, to allow for additional inspection at out stations under the proposed system. Four Inspectors are already provided under the original Estimates for the Tanganyika Railways for 1921–22, and I am of opinion that, for the present, that number should prove sufficient to cope with any extra inspection required.

CHAPTER VII – STAFF QUESTIONS.

General.

266. I have already noted in para. 215, Chapter II., Traffic Department, and para. 236, Chapter III., Locomotive Department, the progress which has been made up to date in training the African, and more especially in respect of the latter Department the measures which it is proposed to put into force to increase the facilities.

In addition, many of the typists in the Head Offices are Africans, and under the Education scheme it is hoped to provide eventually the whole of the clerical labour required.

The progress which has been made is due partly to the legacy of the German administration, but more to the inadequacy and very poor quality of the recruits from India, which has brought home to those in authority the dangers of a situation where one country is entirely dependent on another for its whole supply of trained and skilled labour.

Whatever may be the reasons, however, the result is that a more advanced stage has been reached in the short time the British Administration has been in force than in the neighbouring Colony. Not only are there more trained natives already at work, but a scheme of developing has been formulated, and demands are being put forward for the necessary European instructors.

For these reasons, and because the requirements are on a much smaller scale, I do not propose to recommend a comprehensive scheme, as I have in the case of the Uganda Railway. As such excellent progress has already been made, I think it would be preferable to allow the project to proceed along the lines proposed by those responsible, granting them the additional expenditure for which they are asking under these heads. Later, if the requirements become greater, or should
the present scheme prove inadequate, a larger and more ambitious one could be initiated.

A point, however, to which particular attention should be paid in any scheme, is that undue importance is not given to clerical as compared with manual attainments. The African already shows a strong predilection for working as a clerk, where he can give full scope to his love of dress. This tendency should be checked by giving pay and privileges at least as good, if not better, to the trained artizan.

267. Although nothing definite appears as yet to have been finally laid down, the proposal has been put forward that the same scheme of pensions as on the Uganda Railway should be made applicable. Under this, certain posts, such as those of General Manager and Heads of Departments, are denoted as pensionable, and of the posts of District and Assistant rank a certain number in each grade are similarly made pensionable.

The inequalities of this system have been explained in para. 138, Part I.

At the same time, no Provident Fund has been established on the Tanganyika Railways, so that, except for the few senior officials, whose appointments it may eventually be decided to make pensionable, no provision for retirement, either for old age or sickness, is made for any members of the staff.

It is now universally recognised in all large railway systems that some scheme of insurance against old age, whether in the shape of pensions, provident fund or superannuation scheme, is necessary, both in the interests of the employers and of the staff. Where the State is the employer it is still more important that provision should be made for its servants who have become permanently incapacitated for work, / whether from old age or sickness. It is, in fact, so generally recognised, that it does not require argument. The absence of any provision of this nature on the Tanganyika Railways has given rise to complaints.

Practice varies as to whether the assistance rendered should take the form of a pensions scheme, or of a Provident Fund.

In para.138, Part I., I have explained in full the objections to the adoption of a pensions scheme general to all Europeans as compared with a provident Fund.

Briefly summarised, these objections are that pensions are not conducive to the highest efficiency, as they induce a spirit of prescriptive right and continuity in office, that there is often reluctance on the part of senior officials to dispense with the services of a man who has not yet become entitled to a pension, whereas under a provident fund he would be entitled to his contributions and the Railways’ bonuses, and that a pension scheme is less elastic. Further, the Railways’ commitments are definite under a Provident Fund scheme, and are met yearly as they arise, whereas under a pensions scheme they are not covered year by year throughout the man’s service, but are met only when he becomes due for pen-
Finally, a general pension scheme entails a far heavier expenditure by the Railway.

For these reasons I have recommended that it should be ruled that no staff joining after the promulgation of the order should be pensionable. In the case of the Tanganyika Railways I recommend that a Provident Fund should be started on the same lines and under similar regulations to those in force on the Uganda Railway, and that all staff (European, Asiatic or African) with a salary of 30 florins a month or over should be compulsory contributors to it, and no staff who join after the date of the institution of the Fund should be regarded as pensionable. Staff who at present hold the appointments which it is proposed should be pensionable should retain their pension rights, and not contribute to the Provident Fund. Staff now on the Railways who may eventually be promoted to posts which it is at present proposed should be pensionable should similarly be regarded as pensionable when so promoted.

It would be unjust to deprive any members of the present staff of the prospect of eventually earning a pension, and although the scheme may not have been actually framed, the prospect undoubtedly existed when they joined, and might be regarded by them as one of the inducements to join; but all staff joining subsequently should certainly be regarded as non-pensionable, whatever appointment on the Railways they may hold eventually. Their case would be covered by the Provident Fund, which would thus, after a certain lapse of time, include everyone from the General Manager down to anyone earning 30 florins a month.

I am proposing the application, so far as circumstances permit, of the Uganda Railway scheme, because it appears well adapted to local requirements, and offers as good terms to the contributors as their particular conditions of service permit.

The initiation of such a scheme will undoubtedly add a considerable sum to the annual expenditure of the Railways, as a contribution will have to be paid equal to one-sixteenth of the salaries of all servants receiving 30 florins a month or over. In the case of the Uganda Railway, it is estimated to cost £15,000 in the year 1922; it is difficult to assess the exact cost in the case of the Tanganyika Railways, but in any event it will not exceed that figure, and will probably be more in the neighbourhood of £10,000. But it is essential, in justice to the servants of the Railways, that a scheme should be put into force at an early date, and that the present indefinite state of affairs, in which no provision whatever is made for their eventual retirement should cease as early as possible.

The fact that the Railways are not yet paying concern cannot be held to absolve the Government from its duty in this respect.

Uniformity between conditions of service on the Uganda and Tanganyika Railways.

268. The present regulations regarding conditions of service on the two systems, the Uganda and the Tanganyika Railways, are generally identical at present, and the conditions are in many respects similar; it follows, therefore, as a matter of course, that my recommendations have, in general, been the same in
both cases. This uniformity will have great advantages in the case of any transfers of staff between the two, or should it be decided to amalgamate both systems at any future date.

Europeans.

269. The following recommendations made in Part I., as regards the European staff of the Uganda Railway, are applicable in the case of the Tanganyika Railways:–

Part. 134 – That consideration should be given, when the question of local allowance is reviewed, not only to the level of prices at that time ruling, as compared with that of August, 1920, but also that injustice is not done to officials already in the Railway, and that the remuneration offered is on the same level as obtaining on other Railways similarly placed.

Para. 135. – That officials should be compelled, if returning to the Colony, to spend one-fifth of their period of leave in professional work.

Para. 136. – Regarding interchange of officials between Colonies on promotion to District rank.

Para. 137. – That in order to do away with any injustices as regard seniority caused by the higher war bonus granted to men married before 1st April, 1920, a seniority list should be drawn up for each grade, treating all as though they were on the basis of the salary which they would have received if unmarried.

Para. 141. – That, although no increased assistance beyond that now granted be given towards passages for wives and children of married officials, officials whose families are in Tanganyika should be permitted to extend their tour of service up to five years, and accumulate leave for that period.

Asiatics.

270. The following recommendations made in Part I., regarding Asiatic staff, hold good as regards the Tanganyika Railways:–

Para. 148. – That the scale of salaries for Asiatics should be reviewed in April, 1922.

Para. 150. – That the decision as to which responsible posts should be held by Asiatics should be left to the discretion of the General Manager.

Part. 151. – That the same recommendations regarding anomalies caused by varying war bonuses apply as in the case of Europeans.

Para. 153. – That in cases of certified illness in East Africa, instead of employees being granted 45 days’ absence on full pay, but only receiving half pay for the whole period if the illness exceeds 45 days, they should be allowed full pay for the first 30 days, and half pay for every day’s illness over 30 for a further 60 days.

Para 158. – That the question of granting facilities for dental treatment for Asiatics should be examined by the Railways.
Para. 161. – That a definite scale of compensation for cases of injury on duty should be drawn up.

Para. 162. – That the form of agreement for artizans should be amended (if this has not already been done) so as to show clearly the members of the artizan’s family for whom he is entitled to free passages on first appointment. / 

AFRICANS.

271. The wages paid to unskilled native labour are 8 florins per month, plus rations. The rations are calculated as being worth 5 florins per month, so that the pay, including rations, amounts to 13 florins per month. The prices for this class of labour in the Political Districts of Tabora and Dodoma were quoted by the Political Officers as not exceeding 10 florins without rations, and being more generally 8 florins without rations. The wages on the Uganda Railway and in the Nairobi District are 5 florins plus rations, and in this comparison it must be remembered that there is a much greater demand for labour in the Nairobi District and a scantier native population.

It is clear from the above figures that the Railways are paying wages for unskilled labour which are considerably in excess of those ruling outside. The Political Officers with whom I discussed the subject were of opinion that it was much higher than warranted by the cost of living, or by the general state of the labour market. The presence of such a high scale of wages is undoubtedly a legacy of the War, but while prices outside have been going down and wages have been falling, the Railways have stayed at the old figure. The effect of maintaining these inflated prices is also bound to make itself felt on the rest of the country, because the Railways are the largest employer of labour.

It is clear, therefore, that a considerable reduction in wages is called for, but such reduction should not be confined to the Railways; it should be extended to other Government Departments, such as the Public Works, who have been hitherto paying the same rates. Otherwise, labour will be attracted from the Railways to the other Departments. It is difficult to state what should be the exact figure, especially as three months have elapsed since the time of my inspection, and prices may have altered in the meantime. It must vary also to a certain extent between Districts. It would be safe, however, to assume that in the ordinary country Districts, unless any marked change has taken place since July, a reduction of at least 3 florins per month is possible. The wage would then be equivalent, including the rations, to 10 florins per month.

In the case of permanent way labour, although it can no longer be called unskilled when it has been trained to the work, a newly joined labourer should certainly be regarded as such, and paid accordingly. As he remains at work and becomes more proficient, he can be rewarded by successive increments, but on first joining he should not receive more pay than the ordinary unskilled labourer.
When reduction takes place, the difficulty could be got over by treating all permanent way labourers who have been in the Railway service less than a year as unskilled, and all who have been longer as having already earned yearly increments according to their length of service.

Any general reduction of wages such as proposed is bound to give rise to temporary difficulties; some of the men will be discontented and leave and a good deal of raw labour will have to be employed on the permanent way in their place. But the present state of traffic and of unemployment affords an excellent time to carry out the change, and any temporary difficulties will be amply repaid by the reduction in working costs. For example, the cost of wages of trackmen in the original Estimates for 1921–22 was given at £44,463; a reduction in wages from 8 florins per month plus rations to 5 florins per month plus rations, would mean a saving of £10,300 under this sub-head alone.

I understand that the General Manager is in general agreement with these proposals and had in fact taken steps to give effect to them prior to my departure from the Territory.

CHAPTER VIII. – PORT WORKING.

272. At both Dar-es-Salaam and Tanga the vessels lie at anchor in the harbour and cargo work is carried out by means of lighters. The lighters are owned by private companies.

The charges for lighterage are Florins 4·62 per B.L. ton for exports, except hides and skins, which are Florins 5·62, and Florins 6·50 per B.L. ton for all imports. These charges include all handling on the wharf. In addition, there is a charge of Florins 1·0 per B.L. ton for wharfage and cranage for both exports and imports. The wharves at both ports, including the sheds and cranes, are controlled by the Customs Department.

The charges are distinctly high, and must react on the possibilities of development in export when trade improves. Apart from the Government itself entering into the lighterage business and buying up the present concerns, it is difficult for it to take any direct steps to reduce the charges. And in the present state of the finances of the Territory, it is impossible to recommend the outlay of the expenditure which would be necessary to buy up the present concerns.

The only direction in which the Government at the moment can give definite assistance is by simplifying and improving the arrangements on the wharf. This can be done by removing the control of the work there from the Customs Department and placing it under the Railways. So long as the Customs Department is left in control another Government Department is unnecessarily interposed between the two carrying agencies, the Railways on the one hand and the lighterage or shipping companies on the other. It means that in the case
of loss or damage there is added yet another agency to whom the merchant has
to address claims, and a further source of delay in settlement. The control of
the whole wharf accommodation, sheds and cranes should be handed over to
the Railways, the Customs Department carrying out such inspection as they
require in the sheds, and having a locked enclosure therein for their own use.
This method is one of general application in the majority of ports.

When this improvement has been carried out, the system at the port will be
similar to that existing at Kilindini before the working of the sheds was handed
over to the agents of the shipping companies. This situation can by no means
be described as an ideal one, but I would hardly feel justified in recommending
that the Government, with the pressing demands on it for funds for other public
services, should at the present time incur the expenditure required to buy up the
lighterage concerns.

With the advent of better trade conditions, the lighterage companies will
probably find it to their advantage to reduce their charges in order to expedite
the development of export trade, and at the same time the fact that the Railway
Headquarters are situated at Dar-es-Salaam should ensure that full attention is
paid to the importance of quick despatch and prompt clearance in the sheds.

CHAPTER IX. – RATES.

273. The goods rates in force on the Tanganyika Railways have been framed
on the old German tariff book in use before the War. The rates are tapering in
accordance with normal practice. The classification contains six classes, with the
first as the highest class. At the time of my inspection the only special rates in
force were for country grains and meals from the Tabora and Dodoma Districts
to Dar-es-Salaam, and for coffee in truckloads from Moschi to Tanga.

For truckload consignments of certain articles lower classification than in
the case of small consignments is granted; the articles are further graded as A, B
or C, according to the maximum weight for charge; for items under heading A
a truckload is charged at half the carrying capacity of the truck supplied; under
heading B at 80 per cent. of the carrying capacity, and under heading C at full
carrying capacity.

Thus, in the case of local dried beans, while small consignments are charged
at Class Rate No. 5, truckloads are granted Class Rate No. 6.B, and the weight
carried is calculated as being 80 per cent. of the capacity of the truck supplied.

It will be seen, therefore, that, with the exception of the two special rates
given above, all exports as well as imports were carried at classification rates.

Exports.

274. While the taper in the rate is sufficient, generally speaking, in the case
of import rates, and also in the case of exports such as cotton, cotton seed and
seisal, which are not produced at a greater distance than 320 kilometres (or 200
miles) from the coast, once exports have to be brought over long distances, such
as Tabora, 841 kilometres, (or 525 miles) or Lake Tanganyika, 1,244 kilometres
(or 775 miles) the taper is insufficient and the rates very soon become prohibi-
tive. For this reason, although a classification rate may suit quite well for a low
grade export which has to be carried only a short distance, once it is necessary
to haul it a long distance, a special rate will be required, in order to enable that
export to compete in the world’s markets.

As explained in the Introductory Chapter, the only zones on the Central
Railway from which exports can be expected are the coastal zone, stretching for
approximately 283 kilometres in from Dar-es-Salaam, the zone of 100 kilomet-
tres on each side of Tabora, and the basin of Lake Tanganyika. For the majority
of the exports, therefore, from the two last-named zones, it is necessary to intro-
duce special zone rates. Such rates should apply only to consignments which are
bona fide for export, the neighbouring Territories of Kenya and Zanzibar not
being included. Consignments for consumption in Dar-es-Salaam would not,
of course, be granted the same special low rates as exports; rates either ‘zone’ or
‘tapering,’ intermediate between the export and the classification rates, should be
framed which would enable such commodities to be marketed at Dar-es-Salaam.

Exports in particular for which I considered special rates were required were
ground nuts and millet from the Tabora District, rice from the Tanganyika
Basin, and ground nuts, palm kernels and oil seeds from the Belgian Congo. The
export of ground nuts from the Tabora District was also aff
 lokted by the tempo-
rary reduction of the ground nut rate on the Uganda Railway system to 70 cents
per 100 lb. from all ports on Victoria Nyanza. As explained in Part I., Chapter
XII., para. 178, these reduced rates were put into force as a temporary measure,
in order, if possible, to enable these commodities to find a market at the low
prices then ruling; unless a low rate was quoted, there was reason to anticipate
that it would be impossible to export them. and thus the traffic would be entirely
lost to the Railways. /

The area to the North of Tabora, where ground nuts are produced, stretches
up to Mwanza, on Victoria Nyanza, so that normally the Northern half of the
area would export via Mwanza, and the Southern via Tabora. If a much reduced
rate is put into force on the Lake steamers, they would naturally attract any traf-
fig which there might be to the detriment of the Central Railway. On the other
hand, if equal export rates to the respective coast ports are quoted from the two
points, Tabora and Mwanza, the traffic will naturally gravitate to whichever of
the two is easiest of access to the point of production, and the most expensive
portion of the journey, the transport by road, will be cut down to a minimum.
For this purpose it was necessary to equalize the export rate between Tabora
and Dar-es-Salaam to the same figure as was obtaining between Mwanza and
Mombasa.
After careful consideration of these factors, special rates were framed in consultation with the General Manager which were submitted by him on the 1st August to His Excellency the Governor for adoption with effect until the end of the year.

In addition, it was proposed that the rates on hides and skins should be reduced from Class 3 to Class 4 in the case of small consignments and from Class 4 to Class 5 in the case of truck loads.

These export rates were made applicable also to produce from the Belgian Congo.

Amended and reduced tariffs for local grains and rice (not for export) to Dar-es-Salaam were put forward at the same time.

275. In any future tariffs which are framed, particular attention will have to be paid to rates on unginned cotton. This commodity gives very bad loading, and cannot stand a heavy rate for transport. At the same time, it is necessary to grant it special rates so that the raw cotton can be taken to the ginneries. On the Central Railway, the maximum distance inland at which cotton is produced in marketable quantities is 280 kilometres. The only ginneries so far established are at Morogoro, kilometre 202, and Ngerengere, kilometre 145. Care should be taken that special rates for raw cotton to ginneries should be granted only over short hauls, say up to a limit of 80 kilometres, because, if special reduced rates are given for raw cotton over long hauls, there will be a tendency to establish ginneries at the coast instead of close to the point of production. The Railways would then lose materially as the only traffic left would be the raw cotton with all its disadvantages of bad loading and low rates.

276. Although in general the taper on the classification rates, and the rates themselves, appear suitable in the case of imported articles, I consider that the following adjustments could be made with advantage.

Agricultural and other machinery is at present placed in the 4th Class. It is in the interests of development that low rates should be granted to this, and I would recommend that it should be placed in the 5th Class, i.e. the lowest but one of the classification rates.

Paints and colours are placed in the highest class rate, which appears too high, bearing in mind the low value of the commodities. I recommend that they be lowered to the 2nd Class. This rate would still be a high one, and it may eventually be found expedient to lower it still further.

Petrol is classed similarly in the 1st, or highest Class. Such a rate is nearly prohibitive for long hauls; for example, the cost per ton from Dar-es-Salaam to Tabora is 357 florins per ton, or from Dar-es-Salaam to Kigoma 490·50 florins per ton. It would pay the Railways to lower this rate substantially. I would recommend that the classification for small consignments should be 2nd and for truckload consignments 3rd. The cost of freight to Tabora and Kigoma would
then be for truckload consignments 163 florins per ton and 209·5 florins per ton respectively.  

*Rice* is produced locally, and it is in the interests of the Railways to stimulate that production. Imported rice is at present placed in the 4th Class, whereas imported wheat is in the 3rd Class. I would recommend that imported rice should be raised from the 4th to the 3rd Class.

*Tea and Tobacco* are at present in the 2nd Class; both are commodities which can stand a high rate, and I think they should be raised to the 1st Class.

*Cotton Goods* are placed now in the 3rd Class; these are articles for which there is a large demand, and an increase in the rate from 3rd to 2nd would not materially affect the demand, while it would mean a distinct gain to the Railways.

*Matches.* For similar reasons I consider Matches should be raised from the 4th to the 2nd Class.

277. In para. 225, Chapter II., relating to the Traffic Department, I have recommended that goods in the two highest classes, namely, the 1st and 2nd, should only be accepted at Railway risk, and that the rates quoted for these should be the same as in the present tariff book, and that for the four lowest classes the rates given should be at Owner’s risk; where a merchant wishes to consign at Railway risk, the rate should be 10 per cent. in excess of the ordinary Owner’s risk rate. The reasons for this recommendation are fully explained in the paragraph quoted, and in para. 29, Part I.

278. On the Tanga Railway, the classification and rates to be finally adopted must depend on the policy decided upon for the future of the Voi-Kahé link. Any portions of this system which are administered by the Uganda Railway or connected therewith should eventually have the same classification and rates; for any portion which is not so connected a separate classification, such as that obtaining on the Central Railway, can be used.

279. The Uganda and Tanganyika Railways at the present time both serve the area lying between Mwanza and Tabora, and in the future, if a steamer service on Lake Tanganyika is developed, the central regions of Urundi may quite possibly be able to export either *via* Victoria Nyanza or Lake Tanganyika. Any attempt at competition between the two systems for such traffic could not be permitted; the Managements must arrange to balance their rates at these points in such a manner that the traffic will go to whichever of the two systems is most conveniently placed to the point of production, and so give the produce the easiest and cheapest route to the sea. In the case of Mwanza this would affect indirectly the rates from other ports on Victoria Nyanza, and in the case of Tabora any intermediate stations to Dar-es-Salaam which handle the same commodities. It is, therefore, of great importance that the two General Managers should consult
each other and come to a mutual agreement before the introduction of any rates
affecting these particular areas. / 

CHAPTER X. – GENERAL.

280. As explained in Chapter I., Introductory, under the German Administra-
tion in force prior to the War, the Ost Afrikanische Eisenbahn-Gesellschaft
(O.A.E.-G.) was kept in existence to run the Central Railway, although practi-
cally the whole capital belonged to the Government. While the land concessions
which had previously been granted to it, when it was a private concern, were
transferred to another company, the O.A.E.-G. itself retained the lands which
it was occupying, and certain other lands which were considered necessary for
future expansion in the neighbourhood of the main line, in connection with
such requirements as housing or shop extensions.

This policy is conceived on sound lines as it recognises that land which may
ultimately be required for railway purposes should not be disposed of without
the knowledge or consent of the authorities responsible for the administration
of the Railways. If these lands are treated on the same footing as ordinary Crown
Lands, they are liable to be disposed of without due attention being paid to the
needs of the Railways, because a Lands Department is apt to regard such mat-
ters from a different viewpoint to the Railways, whose interests will suffer in
consequence.

I recommend that the policy should be continued, and that all lands pre-
viously allocated to the O.A. E.-G. should be definitely earmarked as ‘Railway
lands;’ and it should be recognised that they cannot be alienated for any other
purpose without the consent of the General Manager.

The necessity of making stipulations of this nature was recognised by the
Secretary of State as regards the Uganda Railway; in that case a ruling was given
in 1906 that no lands in the Railway zone could be alienated without previous
consultation with the General Manager, and, in case of disagreement, the matter
had to be referred to the Secretary of State for settlement.

Whether actually administered by the Lands Department or not, it would
be advisable to treat these lands as assets of the Railway, and to credit it with any
profits arising from their disposal, because the Railway should be treated as far
as possible as a separate commercial entity to be run on proper commercial lines.

281. Under the Convention drawn up with the Belgians on the 16th March,
1921, in addition to the Articles granting rights of freedom of transit, exemption
from customs dues for goods in transit, &c., Belgium has the right to employ her
own trucks on the Central Railway for the transport of goods between the Bel-
gian Congo and the sea, provided such trucks comply with the conditions of the
British Authorities regarding weight, dimensions, brakes, &c. The British Gov-
ernment further leases, at a nominal rental, sites at the ports of Dar-es-Salaam and Kigoma to the Belgian Government. These sites can only be utilized for goods in transit, and conditions regarding the general regulation of these sites, buildings thereon and charges which may be made by the Belgian Government for the use of any site or works thereon are also laid down.

Sites at both ports have now been definitely allocated and occupied. The site at Dar-es-Salaam does not call for any comment. At Kigoma, the ‘concession’ constitutes the best portion of the port; being situated between the remainder of the port and the main line, all traffic to or from the former has either to pass through the ‘concession’ or else round the back of it, and then over an awkward back shunt; this makes working difficult. The future prospects of the Central Railway are so closely connected with the traffic to and from the Congo that every means should be seized to foster it, and from this point of view it is a good thing that such an excellent site has been granted, but as traffic increases it will probably be found necessary to press for some modification regarding the landward portion of the site, in order to improve the working facilities to the remainder of the port. As the provision of such facilities would also assist the working of traffic inside the ‘concession’ itself, it should not be difficult to come to some arrangement, but the ultimate necessity for such development should be borne in mind when any question of the erection by the Belgians of permanent structures on this portion of the site is mooted.

282. It is important that the facilities given to British firms wishing to trade with the Congo should not be so inferior as to place them at a disadvantage with foreign firms making use of the ‘concession’. In this connection, the importance of customs regulations and practice should not be lost sight of. Under the Convention, the Belgians have the right to despatch sealed trucks in either direction, and these trucks will be exempt from all British Customs formalities, British Customs Authorities having the right to be present when the seals are affixed. Further, for such goods in transit to or from the Congo through the two ports as do not pass through the conceded site, on preliminary fees, deposit payments, or other pecuniary guarantees may be imposed by the British Customs. In this manner, the passage of goods in transit from firms situated outside the Territory will be expedited; unless British firms situated in the country are given equivalent assistance in Customs formalities their trade with the Congo will be handicapped. It is important, therefore, that all Customs formalities in connection with the despatch of goods to and from the Territory itself, and more especially Dar-es-Salaam, should be made as simple and expeditious as possible; otherwise, the whole trade with the Congo will be deflected to firms situated outside the Territory, many of whom are bound to be foreign, and British trade will suffer.
283. The clause in the Convention which permits the Belgians to place their own trucks on the Railway, provided they comply with the specifications of the British authorities, assumes particular importance at present, owing to the announced intention of the Belgians to embark on a large development scheme in the Congo.

This programme, I am informed, embraces Railway construction, steamer services and water-power schemes, and is calculated to entail an expenditure of approximately £20,000,000. In addition to the import of the material required under this programme, they hope to export about 2,000 tons a month. With their present resources, even after making allowance for the surplus stock of locomotives, the Tanganyika Railways are not in a position to handle so large a traffic. If they are unable to do so, it is open to the Belgians to provide their own trucks for the purpose.

It would not be to the advantage of the Railways to have foreign-owned trucks on the line, because they would have to be kept primarily to the transport of Congo traffic, and would not be generally available for other work. In any event, when used for other traffic, hire would have to be paid to the Belgians for their use, and when used for Belgian traffic, reduced freights only could be charged. There would be further difficulties in respect of the maintenance and repair of these vehicles.

It is, therefore, in general to the interest of the Railways to provide at their own expense the trucks and locomotives required.

At the same time, the Railways cannot launch out into large capital expenditure on rolling stock merely on the vague expectation of a large programme of development which may not materialise. Something more definite than a mere anticipation is required. / The expenditure of so large a sum as twenty million pounds must necessarily occupy some years, and entail the laying down of a definite programme for that period during which the Belgians should be in a position to state what their total traffic requirements are likely to be.

The best course for the Tanganyika Railways to pursue would be to get into touch with the Belgian authorities and to obtain from them a definite guarantee of a certain tonnage, if possible covering the whole period of the programme. On the strength of this the General Manager can calculate what additional locomotives and trucks he will require. If the programme only extends over a short period, such as three or four years, it might be found that the net profits accruing would not compensate the Railway for the purchase of the stock, but this point can only be determined when data are available.

If it is decided that it would pay the Railways to provide the stock themselves, funds should be provided and the Belgians should be asked to enter into a bond to guarantee a certain minimum traffic, as in the case of private firms. If
it is decided that it would not pay the Railway to purchase the new stock, the Belgians should be informed accordingly. It might be advisable also to allow the Belgians to place their own locomotives on the line to be run and maintained by the Railway Administration, although they do not appear under the Convention to be able to claim this right.

284. The Tanga Railway and the Voi-Kahé link form at the present time a distinct and separate system, that is to say their returns, expenditure and accounts are compiled separately. Each branch, Traffic, Locomotive, Engineering and Stores, is under the charge of a District official, and the accounts are drawn up locally by an Assistant Chief Accountant. Each of these District officials is responsible directly to his Departmental chief at Dar-es-Salaam, and any question at issue between Departments has to be referred there. Communication between Tanga and Dar-es-Salaam is maintained by a weekly service of runners, and therefore a long time is bound to elapse before such questions can be settled. I am of opinion that there would be a distinct gain in efficiency if one of the District officials were appointed Local Superintendent, with definite powers delegated to him by the General Manager over other Departments, and also in the matter of claims, dealings with the public, and fines. He could perform these duties without difficulty in addition to those he has already in connection with his District work, and might be granted a duty allowance of £50 a year to compensate for the extra responsibility.

285. I have explained earlier the necessity for mutual agreement between the General Managers of the Uganda and Tanganyika Railways as regards rates from areas which are served by both Railways. It is important also that uniformity should be maintained in such matters as the conditions of carriage, standards, conditions of service and staff questions; moreover, as many of the larger firms are established in both territories, uniformity of conditions tends to simplify and expedite business. I would recommend that an official conference should be held annually between the two General Managers at which all such matters could be discussed; it would be open to either to place on the agenda such items as he considered of mutual interest or importance, and the agenda should be prepared sufficiently in advance to allow both parties to study the questions before the conference begins.

Official minutes should be kept, but any decisions which require ratification by a superior authority would not be binding until such ratification had been given. The conference might be held in alternate years at Nairobi and Dar-es-Salaam.

286. The arrears in the Accounts Department, and more especially in the Stores Branch, at present make it impossible to obtain prompt returns of expenditure. The General Manager informed me that his intention was as soon as the arrears have been made up to have monthly returns of approximate expenditure
prepared, and available for use within a fortnight to three weeks of the end of the period to which they relate. I attach great importance to the value of such returns, and of statistics showing the working costs per unit of work performed, provided they are rendered with sufficient promptness to allow action to be taken without delay; the improvements which I have recommended for adoption in the Accounts and Stores Departments will assist in this direction. These returns can then be compared with the previous month and with corresponding months in previous years, not only for the whole system, but also for individual departments. By this means, a tight hold can be kept over expenditure, and any tendency to extravagance or waste checked promptly.

287. The present state of the accounts and the uncertainty as to the amount which will have to be paid to the Military Administration for stores taken over, make it impossible to enter into any close review of the financial situation.

The outstanding feature is that the revenue falls far short of what is required to meet actual working expenses exclusive of renewals or loan charges.

The loan charges on the Railways are fortunately very light because the only ones which will have to be met are those on the equipments and stores handed over by the Military Administration, and none will have to be paid on the cost of original construction. The Railways may also be called on to pay interest on the funds provided to cover the deficit on working.

The deficit on working for 1921–22 is estimated to be at least £200,000; it is not possible to expect that such a sum can be covered by the economies or recommendations proposed in this Report. The cause for this heavy loss is to be found in the very poor traffic which the two Railways are carrying while the expenses of maintaining a system of 1,747 kilometres (1,092 miles) long are bound to remain high, however reduced the service may be. Although the present depression, of course, is responsible to a certain extent, a return of normal markets could not be expected to right matters.

In the case of the Central Railway the German Administration showed a profit on working prior to the War, but this was due solely to the heavy construction traffic which was being carried. The construction of the main line was only completed in 1914, and by that time the construction of the branch northwards from Tabora had already been begun, and platelaying had commenced. Full credit was given to open lines for the carriage of the large quantities of construction material required, and the revenue thus obtained was the only reason why the Administration was able to show a profit on working the main line. Without this revenue there would have been a heavy loss, though how large it is impossible in the absence of accurate figures to state.

The reason for the poor traffic return is not difficult to find; leaving aside the first 280 kilometres of the coastal zone, where the traffic prospects are good, the Central Railway for the remaining 960 kilometres of its line passes through
country of which, excluding the salt works at Usoki, only 120 kilometres, or approximately one-eighth, can be considered as possible of producing a paying traffic. It is impossible to expect any railway to pay under such geographical conditions, and the prospect of deficits for many years to come will have to be faced. The chief hope of turning these deficits into profits, or at any rate of reducing them, lies in the development of the basin of Lake Tanganyika, and the trade with the Congo. / The opening up of the mineral deposits which are known to exist would have the same effect, but until some more definite information as regards the extent and quality of the latter is obtainable, it would be unwise to indulge in any anticipations regarding the traffic.

The prospects on the Tanganyka Railway are brighter; this Railway has already carried a paying traffic over the first 130 kilometres to Mombo. Over the next 45 kilometres to Buiko, development had been already commenced by the Germans and this section would probably have already reached the remunerative stage, had it not been for the War. Unfortunately, as a result of the War, and the delay in the liquidation of enemy properties, the cultivated areas have reverted to a condition where it is probably harder to clear and replant than in the case of virgin land. It is estimated locally that this section of 175 kilometres will take 5 to 7 years to reach its pre-War output, but there is no doubt that it will eventually once again be a paying proposition throughout its length.

If the recommendations which I have made as regards the future of the Voi-Kahé Military Railway are adopted, the Tanganyka Railway will terminate at kilometre 283; the last 108 kilometres beyond Buiko run along the slopes of the South and Middle Paré Mountains through excellent country, which eventually, when developed, should produce a good paying traffic. It may, therefore, be reasonably anticipated that eventually the Tanganyka Railway will throughout its length produce paying traffic and show a profit on working, but 5 to 7 years must elapse before this can take place, and in the meanwhile the probability of annual deficits must be faced.

For reasons which are fully explained in Appendix I., Part I., I have recommended that the Moschi-Arusha area should be connected to Mombasa, rather than Tanganyka. The prospects of this area are more promising than those of any other area adjoining either the Central or the Tanganyka Railways, and in a few years the Tanganyka Government may reasonably expect, provided markets return to a normal state, to receive a profit on the outlay which it will have to incur in the reconstruction of the Voi-Kahé Railway; but it would be prudent to anticipate a loss during the initial years, and, even when the line is returning a profit, it would be unwise to expect that this profit will be sufficient to compensate for the loss on working the Central Railway.
To sum up, while the Tanga and Voi-Kahé Railways show reasonable prospects of becoming paying concerns, once markets have recovered, and the local effects of the War and the delay in liquidating enemy property have been overcome, the working of the Central Railway must be expected for many years to show annual deficits which will be much larger than any profits which may be expected to accrue from the first two named. The steps which should be taken to foster the trade with the Tanganyika Basin and the Congo, on which the main hope lies of converting the Central Railway into a paying concern, are dealt with in Part III., Future Development.

288. So long as the gross receipts do not cover the ordinary working expenses, it is useless to talk about the establishment of a renewals fund; replacements will have to be effected out of funds found from the budget of the Territory, as and when they become economically necessary. But once the corner has been turned, and gross receipts show an excess over expenditure, I would urge most strongly, both in the interest of the Territory and of the Railways, that proper renewals funds should be started, and replacements should not be allowed to depend on the temporary exigencies of the budget of the Territory, or the capacity of the General Manager to wring money out of the local Treasurer.

The present situation on the Uganda Railway has brought out so clearly the dangers lurking in that policy that it would be very regrettable if the same mistake was repeated in the neighbouring Territory. / [...]

PART III.

FUTURE DEVELOPMENT /  

Report  
ON THE  

FUTURE DEVELOPMENT OF THE RAILWAY SYSTEMS OF KENYA, UGANDA AND TANGANYIKA.

289. In any consideration of the future development of the transportation services in countries like Kenya, Uganda and Tanganyika, whose future prosperity depends solely on their capacity to export raw products, the question of ports is one of the first to demand attention. Whilst during the initial stages simple arrangements suffice, as trade increases and development pushes further afield the need for improved facilities such as are to be found in a modern deep-water port makes itself felt. The benefit of these facilities, once there is sufficient cargo to justify them, should make itself felt in two ways; the cost of handling cargo at the port should be less owing to the decrease in the number of times the goods have to be handled, and freights should become lower as ship-owners are assured of a quick discharge and less delay to shipping. The provision of these facilities, however, is a costly matter, and there must therefore be a considerable trade passing in order to cover expenses and charges on capital. The greater the trade passing through, the lower the handling charges should be, and the lower the handling charges are the greater the distance inland from which it will pay to export. From the shipping point of view also, it is advisable to direct the bulk of the traffic to a few well-equipped ports rather than to a series of small poorly-equipped ones. It thus becomes a necessity to concentrate on one or two big ports, and to direct the policy of railway development accordingly. That portion of the coastal zone which is not close to these ports can continue to use the smaller ports, the goods being brought from there to the main ports by coastal
craft in cases where regular steamers do not call at the ports. As the exports from this zone have only a short distance to be hauled on land, and the comparative cost of their land transport is therefore small, they can stand the additional charges of this extra handling and transhipment.

This necessity for concentrating on a few ports and spending all the money available on them is the principal reason for my recommending that the Voi-Kahé Railway should be reconstructed and made permanent, and that the area round Moschi and Arusha and their hinterland should evacuate its products via Kilindini instead of via Tanga. If Tanga was to be recognised as the port of exit for these regions, sooner or later a demand must arise for improved facilities and heavy capital expenditure, while within 70 miles there would be another port, Kilindini, which already possessed the necessary facilities and on which large sums had already been spent. And in the interval the inhabitants of the regions served would be suffering because, instead of being allowed to make use of a modern port with low charges, they would be compelled to use a port possessing the disadvantages of lighterage and high handling charges.

The policy to be adopted should therefore aim at developing the two principal ports, Kilindini and Dar-es-Salaam, as much as possible, and directing as much of the traffic through them as possible. Tanga would remain as the port for the small area stretching inland as far as Samé, and its existing equipment will suffice for the needs of this district for an indefinite period. Lindi similarly would be the port for the coastal zone which it taps.

290. The two main systems centring on Kilindini and Dar-es-Salaam are best described by the analogy of a large river system. The basin served by the former would include the Moschi and Arusha areas and any subsequent extension towards the South-east corner of Victoria Nyanza; the whole of Uganda and Victoria Nyanza is also included in this ‘basin,’ and the ‘traffic watershed’ between it and the Dar-es-Salaam ‘basin’ would be along a line passing midway between Mwanza and Tabora and to the North of Kondoa Irangi until it finally meets the boundaries of the small Tanga ‘basin.’ The Southern boundary of the Dar-es Salaam basin would correspond very closely with the Eastern watershed of the Rufiji River down as far as the Pangani Rapids.

291. While the line of demarcation between the two systems can thus be laid down it is to the interests of both to push their connections, or at any rate the influence of their connections, as far West as possible in order to attract as much traffic to their respective systems as possible.

If the recommendation which I have made that the Lake Albert Marine and the motor service between Masindi Port and Butiaba is adopted, the Kilindini or Uganda Railway system will have under its control a direct line of communication through to the Belgian Congo. Here, however, it comes into competition with two other routes, one via Rejaf and the Soudan, and the second via Stanley-
ville, the Congo and the Matadi or Brazzaville Railways. The advantages which the Uganda Railway has in competing for the traffic to the goldfields in this area are shorter transport by road, shorter distance to the coast, and the fact that its route will be under one control. The disadvantages are the number of transhipments en route, and, for the time being, the low value of the Belgian currency. While these advantages should be sufficient to secure to the Uganda Railway this traffic for the time being, the situation will no longer be so favourable if the Belgians build either the Moto-Rejaf or Uele Railways.

Both these routes, if and when completed, would be able to offer better terms than the present Uganda Railway route, owing to its numerous points of transhipment, can offer, and therefore the latter must be regarded as a temporary expedient to capture and pin down this increasingly important traffic until a better connection through Uganda is made.

This connection can take either of two routes, connecting Kampala on Victoria Nyanza, with either the North or the South end of Lake Albert. From reconnaissances made in 1911, the feasibility of both routes has been determined.

In comparing the two, the advantages appear to lie altogether on the side of the Southern route. Whereas the Northern route would have to cross the Nile twice, once close to the Murchison Falls and a second time north of Lake Albert; the Southern route has only to cross the Semliki once, probably a much cheaper operation. While the traffic possibilities along the immediate path of both appear about equal, and both would tap equally the well populated area between Kampala and Hoima, the Southern route would open up the promising upland country round Fort Portal, where the best coffee producing land and the only land suitable for white settlement in Uganda is situated. Also, if the Southern route were chosen, the north-west and centre of the Protectorate would still be served by the existing service, whereas if the Northern were selected, the Western areas would not benefit at all. Before coming to a decision, the views of the Belgian Congo Government would have to be obtained, and an agreement would have to be reached with them, so that they could continue the line on their side of the frontier. There do not appear to be any insuperable difficulties in the continuation of either route beyond the frontier, and there is every reason to believe that the Belgian Government would be well disposed towards the construction of a through connection.

With a railway through from Kampala or Port Bell to the Belgian frontier, the Uganda Railway would be in a much better position as regards the goldfields than either of its rivals. Transhipment would still have to be done at Port Bell and Kisumu, but both the other routes would also have two points of transhipment, while the Uganda Railway would have the advantage of a shorter route and unified control right through to the sea.
The importance of a railway along this route was recognised before the war, and funds had been earmarked for construction between Kampala and Mityana, but the war interfered and work was not commenced. I consider that this project is the first which should receive the consideration of the Uganda Government. Under the terms which I have recommended in Para. 199, Chapter XV., Part I., the Uganda Government would be called on to provide the capital necessary, while the branch would be credited with the profits on all traffic brought to the main line as far as destination. The Government would bear any loss on the undertaking during the early years, after working expenditure, renewals and loan charges had been allowed for; this net loss, together with accrued interest thereon, would be repaid to the Protectorate from any net profits subsequently earned by the branch after it had become a paying concern. These terms are much better than those allowed when the Railway from Kampala to Mityana was first contemplated, and to that extent improve it as a financial proposition from the point of view of the Uganda Government.

292. When this railway from Kampala to Toro has been constructed, and as the traffic with Lake Kioga and the Congo increases, the question of continuing the Uasin Gishu branch (now under construction) to Uganda is bound to arise. The distance separating Turbo, the proposed terminus of the Uasin Gishu branch, from Jinja is only 150 miles, and sooner or later this link in the chain is bound to be completed and a through railway built. In all decisions taken respecting the Uasin Gishu branch, or any future extension of it, the fact must be always borne in mind that it is ultimately bound to form the main line to Uganda and the Congo.

Any such branch would probably be constrained by geographical reasons to cross the Victoria Nile close to Jinja, as there are several excellent bridge sites between the Ripon and Owen Falls. As the country to the north of this connection between Turbo and Jinja is better and more populous than to the south, it will probably be found advisable to keep it as far north as the slopes of Mount Elgon and the swamps of the Mpologoma allow, thus passing to the north of Soy and avoiding the vicinity of Victoria Nyanza.

The completion of this connection will leave the portion between Kampala and Jinja as the only link to be built in the through connection to the Congo, although it is possible that the internal development of Uganda will result in this portion being completed before the Turbo-Jinja connection. / 293. Factors which will hasten the demand for these through railways will be a return to normal markets and such an increase in trade from Uganda and the Congo as to warrant an increase in the existing fleet on Victoria Nyanza. At present this fleet is largely in excess of requirements, but when trade has increased to such an extent as to call for the purchase of more steamers, the question will have to be thoroughly examined as to whether Kisumu, with all its disadvantages
of shallow depth, should be retained as the Marine base, or whether the through connection by rail to Jinja should not be undertaken at once, a new Marine base being established at Jinja. So long as Kisumu is the base, small and uneconomical craft have to be used, whereas at all the other principal ports steamers of 12 foot draught could be employed.

With the construction of a through railway, the Marine service would cease to be a portion of the main system carrying the Uganda and Congo traffic, and would merely act as a collecting agency for traffic from the vicinity of the Lake. For this decreased service the fleet, relieved of its duty of carrying the through traffic, might be found to suffice temporarily without any increase, and Kisumu might be retained for the time being as the base. As this service itself increases, or steamers become due for replacement, craft of greater draught could be purchased, and Jinja could form the base, the plant and workshops being transferred from Kisumu. The shallow draught craft and the Nakuru-Kisumu section would then serve merely the vicinity of the Gulf of Kavirondo, and the area tapped by that section of the Railway.

The completion of this programme of development would leave the Railway in possession of a trunk line through to the South end of Lake Albert with a branch service, mixed rail and steamer, as at present to the North, tapping the basin of Lake Kioga and the central portion of Uganda, a deep-draught Marine service based on Jinja serving the main ports on Victoria Nyanza and a shallow-draught Marine service based on Kisumu for the Gulf of Kavirondo and the smaller ports, the last named service probably in time being confined to tugs and lighters.

It is important in view of these possibilities that capital expenditure at Kisumu should be confined for the time being as far as possible to what is removable, such as plant.

294. The extensions which have up to date been proposed within the Colony of Kenya itself are, excluding the Uasin Gishu branch, which has already been decided on, the Nyeri Railway, a branch north from Gilgil to Rumuruti, and the extension of the Uasin Gishu branch to the Trans-Nzoia.

Under the terms for the construction and administration of branch lines which I have recommended in Part I., any loss on working such branches, including adequate allowance for renewals and loan charges, would be borne by the Colony, and such terms would apply in these cases to Kenya, just as in the case of the branches mentioned earlier this loss would have to be borne by Uganda, and in the case of the Voi-Kahé Railway by Tanganyika.

In the Report of the Chief Engineer in charge of Surveys and Construction, the net revenue derived from the Uasin Gishu Branch ten years after completion, including full allowance for profits on traffic on the main line, is estimated at £112,000. This figure makes no allowance for renewals funds. Taking the esti-
mated cost of construction and rolling stock at £2,700,000, the loan charges will amount to £259,848, leaving a deficit of £147,848, excluding the annual sums which will have to be put by for renewals. / 

The question, therefore, is how soon will the Colony be in a position to face, in addition to this, the extra burden which would be imposed by the loss on working any of the other proposed branches during their early years. I do not wish to imply that these projects in themselves may not possess admirable prospects for the future, but during the early years of working there are bound to be losses. I have shown clearly in Part I. that these losses cannot be borne by the Railway finances, and, further, that it is unjust to the other users of the line to expect them to be borne in this manner. The possibility of their commencement must, therefore, await the time when the Government of the Colony considers itself in a position to support these losses in addition to any losses which may still be falling due on the Uasin Gishu branch.

295. The extension of the Moschi-Voi branch in the direction of Arusha must similarly wait until the Tanganyika Government considers it is in a position to bear the initial losses on working the extension in addition to any which may still be resulting from the working of the Moschi-Voi branch. There is, however, a small extension of this branch which deserves special consideration. During the war a short line, 31 kilometres (or about 20 miles) long, was built in the direction of Arusha, from a point on the Tanganyika Railway 10 kilometres (or 6½ miles) south of Moschi. Subsequently, the material, except for the first 6 kilometres, was picked up and sent to another theatre of war.

The trade from the Arusha area is at present handicapped by having to pass through a narrow belt of ‘fly’ country between the Sanja River and Moschi, in consequence of which the cost of transport between Arusha and Moschi is as high as Fls. 4.50 per load of 50 lbs. The Sanja Railway extension passes through and out of this fly-belt, so that if it was relaid the cost of transport from Arusha would be very considerably reduced.

The cost of the reconstruction of this short length is estimated at £4,800 exclusive of the cost of the permanent way material and its freight on the Railway. The quantity of spare permanent way material left by the Military Authorities on the Tanga Railway is far in excess of maintenance requirements; there is in fact sufficient to relay the 25 missing kilometers of the Sanja extension and leave a sufficient margin for maintenance purposes. The price of this material has not yet been fixed, but, whatever the price may be at which it is eventually decided that the Railways have to take it over, the cost of the material will have to remain as a charge against the stores suspense account, and interest charges will have to be paid on that cost price. On the other hand, if it is used in reconstructing the Sanja branch the cost will be transferred to Capital Account, and interest charges will still have to be paid, but the material will be earning revenue, instead
of merely lying idle in the Stores. If, as seems probable, the Railways have to take over this surplus permanent way material, it would certainly appear a sound proposition to use it in this manner especially as, apart from the price of the permanent way material, the cost of reconstruction will only be £4,800, and of freight by rail £2,800, or a total of £7,600. There is the further advantage that this realignment could be used for any subsequent extension to Arusha.

I would therefore recommend that this extension should be sanctioned and put in hand if it is definitely decided that the surplus material has to be taken over.

In considering the possibilities of the Dar-es-Salaam or Central Railways basin, the most striking feature, as pointed out in Part II., is that on the existing trunk line, apart from the coastal zone of 280 kilometres (or 175 miles), and the zone of 100 kilometres (or 60 miles) round Tabora, there are no possibilities of obtaining a paying export traffic until the basin of Lake Tanganyika is reached. The Germans had already commenced a railway from Tabora northwards and then westwards to the elbow of the Kagera River, passing by St. Michael, whence a branch was eventually to be built to Mwanza. The object of this railway was to tap the rich districts of Ruanda and Urundi, and to divert both this and the traffic from the Mwanza District from the Uganda Railway Marine. With the absence of any motive for competition, the _raison d’être_ of this line has disappeared. Rich districts such as the Turanyi lie to the north of the main line, but they are a considerable distance from it, and are separated by belts of fly country forty miles broad, which make the cost of transport very high. At the same time their present possibilities of export would not justify the construction of a railway to them. To the South-west of Ngerengere are coal deposits, and to the South-west of Kilossa are deposits of copper and mica; both, when developed, may produce good paying traffic for the Railways, but until proved and opened up it is impossible to base any expectations on them. The chief hope therefore of the Central Railway must be centred on Lake Tanganyika and the Congo traffic. The big lakes, although they have the disadvantage of acting as obstacles to through railway construction, have the great advantage of forming admirable ‘catchment areas’ for traffic which can be developed at comparatively low cost. On Lake Tanganyika the Belgians have three steamers already at work, while the only British craft are two launches, the ‘Fifi,’ capable of carrying three tons, and the ‘Mwanza,’ which is slightly larger.

In addition to the trade with the Lake Basin and the Congo, the Central Railway, if supplemented by a service on the Lake, forms the natural and shortest route to North Eastern Rhodesia. The present route from the sea to North Eastern Rhodesia is _via_ Beira, Salisbury, Bulawayo and Livingstone, and thence either _via_ Broken Hill with a land carriage to Abercorn of over 500 miles, or _via_ Ndola on the Congo-Rhodesian frontier by land 75 miles to Kabunda, thence
14 days by the River Chambesi, and finally a further 150 miles by land to Abercorn. The distance from Beira to Abercorn by this route is 1,825 miles as against 1,065 from Dar-es-Salaam via Kigoma. The respective distances from London by the two routes are 9,665 and 7,825 miles respectively. As, in addition, Abercorn is only 15 miles from Lake Tanganyika, it is obvious that the natural route to the whole of this portion of North Eastern Rhodesia is via the Central Railway, and it is important in the interest of that Railway that the traffic from this country should be obtained. It is necessary however in order to obtain it that the Government should establish a marine service on Lake Tanganyika.

297. Fortunately the Government is in a position to establish a British service on the Lake at a moderate cost, assuming the necessary funds are provided. Just before the War the Germans put into commission a 600-ton steamer called the ‘Von Goetzen,’ fitted for passenger and cargo work. During the War they sank her in the Malagarassi River; the Belgians attempted to salve her, but only succeeded in getting her round to Kigoma where she again sank. She has now passed into the possession of the Tanganyika Government. The cost of salving and reconditioning is estimated at £35,000, including the repayment to the Belgians of the moneys spent by them. As the cost of a new steamer would be at least £60,000, the opportunity thus offered of inaugurating a British service on the Lake at such low cost is one which should be seized, and I have no hesitation in supporting strongly the request of the Government of Tanganyika that the necessary funds may be granted. The necessary workshop equipment is already installed at Kigoma; a slipway had been built there also by the Germans, but the winding gear had not been erected and is missing.

The Marine Service should be amalgamated with the Railways in order to get the advantages of unified control, through booking and simplified procedure in regard to handling and claims. With the adoption of the recommendation made in Chapter VIII., Part II., that the control of the wharves at Dar-es-Salaam should be placed under the Railways, the latter would then be in entire charge of goods from the time they reached the wharf at Dar-es-Salaam till they were handed over to the consignee at the Lake port.

298. The extent to which the Uganda and Tanganyika Railways can push their influence westwards and induce the traffic from Central Africa to pass by their routes, opens up the question of gauges. Owing to a misunderstanding, or rather through lack of proper ‘liaison,’ the Uganda Railway was built with a metre gauge, whilst the 3 ft. 6 in. gauge was adopted for the Soudan Railways. The Germans followed the example of the Uganda Railways and adopted the metre gauge. The British Railways in South Africa, South-West Africa, Rhodesia, Nyasaland and West Africa, and the Portuguese East African Railways are 3 ft. 6 in., whilst the French Railways in West and Equatorial Africa are metre gauge. The Belgians in the Congo do not appear to have adopted any definite policy; whilst
the continuation of the Broken Hill line from the south up to Bukama is on the 3 ft. 6 in. gauge, the Kongola-Kindu and Ponthierville-Stanleyville Railways are metre gauge. However deplorable the initial mistake may have been of not building all British Railways in Africa to the same gauge, any idea at the present time of changing the gauge of the East African Railways is entirely outside the realm of practical politics. While there remains so much country to be developed by the construction of new lines and there is so little money available to do it with, it would be quite out of the question to spend millions of pounds on a scheme which would bring practically no increase in revenue.

Any proposal to spend money on such a proposition at present would quite rightly meet with the strongest opposition. But as new railways are built in East Africa and the metre gauge system is extended, the cost of replacing it with 3 ft. 6 in. gauge becomes more and more prohibitive, and therefore, whether we like it or not, whether it may or may not be desirable from the strategical or Imperial point of view, commercial considerations will force the East African Railways to remain metre gauge. The objection, no doubt, will be raised that owing to the difficulty of working with mixed gauges Australia is contemplating converting the whole of her railways to one uniform gauge at enormous expense, and that the majority of Sir William Acworth’s Committee recommended that the question of the mixed gauges in India should be reviewed by a Special Commission, but the cases are not parallel. Transhipment for passengers and their luggage presents little difficulty; the main objections to it are the extra cost in handling goods traffic, and the trade either with South Africa or with the Soudan, which will pass by land route, will probably remain for more years than I care to contemplate in this Report at a level which can be easily dealt with by transhipment. But, whether this assumption is correct or not, practical considerations of cost will prevent any change in the East African gauge for many years to come.

As the East African route will be the shortest and best for the Northern Congo, it will be to the advantage of the Belgians that there should be a uniform gauge through from the Point of production to the sea. If the Belgians adopt the 3 ft. 6 in. gauge in the north of the Congo, the obstacle of the transhipment will force on to the Western or North-Eastern routes much of the traffic which would otherwise be able to use the Eastern route at lower cost. It is therefore to the interests of both parties that the metre gauge should be adopted for any railways built in the Northern Congo.

It will be argued that such a policy is directly opposed to the idea of establishing a British railway system on a uniform gauge stretching from the north of Africa to the south, but whatever may be the strategical and sentimental value of that idea, it is to the commercial and material interests of these colonies that as much traffic as possible from their neighbours should pass over their railways
and ports, and their commercial prosperity will form a surer source of strength in the future than the construction of strategic railways.

299. Before closing this review of future development, reference must be made to the trial which the Uganda Government is making of the Stronach-Dutton rail tractor system. The trial is fortunately on a sufficiently large scale to allow a judgment to be formed on the commercial and financial aspects of the system. For this reason it is important that accurate accounts should be kept with full details of expenditure, including renewals and loan charges. The experiment is of great importance, not only to Uganda, but also to Kenya and Tanganyika, because, if it prove commercially successful, it will provide the solution of the problem of light feeder lines to the main railway system, a problem which up to date has never been adequately solved, and will enable fresh areas to be opened up at relatively small expense.

Report
ON THE
RAILWAY SYSTEM
OF
TANGANYIKA TERRITORY
BY
BRIGADIER-GENERAL F. D. HAMMOND. C.B.E., D.S.O. /

[...] 
10th March, 1930. 
[...]

– 309 –
1. The Railway System of Tanganyika Territory consists of a metre gauge railway from Dar-es-Salaam to Kigoma on Lake Tanganyika with a branch from Tabora to Mwanza on Victoria Nyanza, and of another metre gauge railway in the North of the Territory from Tanga to Arusha. There is also a small 2-ft. 6-in. gauge railway running from Tengeni on the Tanga line to Sigi to serve the Institute at Amani, and in the South of the Territory there is a small 2-ft. gauge tramway running inland 78 miles from Lindi.

The total route mileage of the Railways is 1,281 miles of metre, 15 miles of 2-ft. 6-in., and 78 miles of 2 ft. gauge, made up as follows:-

2. In addition to the Railways, other services, usually referred to as the Allied Services, are grouped under the Railway Administration. These consist of the Marine Department, the Dockyard and Slipway, the Harbour and Wharves, the Harbour Extension Works, and the Electricity Department. The work of the Electricity Department is not reviewed in this Report.

[...]

3. The Central line from Dar-es-Salaam to Kigoma is built to a high standard of construction; 662 miles out of 773 being laid with German permanent way with a rail weighing 56 lbs. to the yard and the remaining 111 miles with British standard 55 lb. material. The line is ballasted with stone to a depth of approximately 10 inches for 95 per cent. of its length. The maximum gradient is
2 per cent. compensated against exports and 2-2 per cent. compensated against imports.

The first 100 miles of the Mwanza branch are laid with the lighter German 42 lb. material released from that portion of the Central line which was relaid with 55 lb. British permanent way. The remainder consists of new 45 lb. British standard track. Only a portion of this branch is ballasted with stone. The maximum gradients are 1 per cent. against exports in the direction of Dar-es-Salaam and 1-25 per cent. against imports.

4. Under the Convention of March 16th, 1921, the Belgian Government has leased sites in the ports of Dar-es-Salaam and Kigoma, through which goods in transit to and from the Congo can be handled free of customs dues.

This transit traffic with the Congo is now the most important and most valuable traffic on the Central line. In addition to this there is a considerable export of cotton and sisal from the whole area between Kilosa, mile 177, and Dar-es-Salaam, and of ground-nuts from the stations round Manyoni and Dodoma and from the Mwanza branch.

5. On the Tanga line the original German construction was by no means up to the same high standard as on the Central line. The light German 31 lb. permanent way has, however, now been replaced by British standard 45 lb. material, the remainder of the line being laid with German 40 lb. track. About 95 per cent. of this line is also ballasted with stone to a depth of approximately 10 inches.

Formerly the line only went as far as Moshi, mile 220, with a branch 21 miles long from the Rau River to Sanya. An extension of 53 miles has just been opened from Moshi to Arusha which passes through Sanya, and the short Sanya branch has therefore been pulled up, except for a small section which will serve as a siding to an important sisal plantation. The new line is of 45 lb. British standard permanent way material. At Kahe, mile 208, there is a junction with the Voikahé line which is worked and administered by the Kenya & Uganda Railways.

The maximum gradient on the first section of the Tanga line up to Korogwe, mile 53, is 3-33 per cent. compensated in both directions; from thence to Arusha it is 2 per cent. compensated in both directions.

6. By far the most important traffic on the Tanga line is sisal and sisal tow which, in the year 1928/29, amounted to 16,977 tons, or over two-thirds of the total export tonnage. Although the greater part of this traffic comes from the coastal area, there are large plantations further inland and considerable development is taking place. Coffee is also an important traffic which showed a good increase during the past year; it comes mainly from the Moshi and Arusha area.

7. The headquarters of the Administration are at Dar-es-Salaam, all the principal officers being stationed there. The Tanga line is administered by district officials reporting to the heads of their respective departments at Dar-es-Salaam.
The accounts of the Tanga line are, however, kept distinct, and it is debited with its share of the management and supervision costs as well as with its appropriate loan charges.

The accounts of the Railways, including therein the Allied Services, are in theory kept separate from those of the Territory, the estimates of annual revenue and expenditure and of capital expenditure being presented in a separate volume, but the separation is not complete as some of the assets of the Railways figure also in the assets of the Territory.

8. The Central line was formerly the property of a German Company. In January, 1925, the High Court of Tanganyika Territory assessed the valuation of this line at £614,000. Against this the Tanganyika Government received £580,006 in respect of the interest of the German Government in the Company. The net amount therefore paid for the acquisition of the Central line was £33,994.

As the Tanga line was owned entirely by the German Government, nothing had to be paid to acquire it.

9. Until the financial year 1925/26 the accounts of the two lines had always shown an excess of expenditure over receipts; in that year not only was there a surplus on revenue account, but the net loss after allowing interest on loans only amounted to just over £3,000. In the last financial year 1928/29, there was a surplus on the working of the whole undertaking, including the Allied Services, after paying interest on loans of £122,692. No allowance was, however, made in this for depreciation. The improvement is mainly due to the Central line, which showed a surplus of £140,280 after allowance for interest had been made. On the other hand the Tanga line still showed a loss on revenue account alone before allowing for loan charges.

This is in marked contrast with the situation as it appeared when I reported on these Railways in 1921. Then, although both lines were working at a loss, the prospects of the Tanga line were, according to the opinions of all whom I consulted, considered by far the brighter both on account of the possibilities of the Moshi-Arusha area and because development had already begun along the lower section before the War. The change in the relative positions is well shown in the coaching and goods earnings of the two lines. In the year 1922 these totalled £196 per mile for the Central line and £162 per mile for the Tanga line; in the year 1928/29 they were £583 and £321 per mile respectively. The growth in the former has been due principally to the development of the transit trade with the Congo, and in a lesser degree to the good agricultural development in the area between Kilosa and Kidugallo.

Although overshadowed by the results on the Central line, there has also been excellent development on the Tanga line, but the retention of two outlets for the Moshi and Arusha traffic has meant a division of the receipts coupled with expenditure in operating and maintaining two lines instead of one, while
the upper section of the Tanga line, apart from Moshi itself, has produced up to date insignificant receipts.

10. Although the financial results have thus shown a welcome improvement, the traffic on both lines still remains light. On the Dodoma – Morogoro section the average number of trains per week is fourteen each way, on the Morogoro – Tabora section nine to ten, and on the Tabora – Kigoma and Tabora – Mwanza section four per week each way. On the Tanga line there is an average of fifteen trains a week each way as far as Korogwe; beyond that the average does not exceed six a week each way.

Organisation.

11. The traffic working of these Railways is organised on what is usually called the 'departmental' system. The Traffic Department under the Traffic Manager is in charge of the movement of trains and vehicles and supervises the guards, conductors and station staff, but the Chief Mechanical Engineer is responsible for the supply of motive power and the maintenance of locomotives and rolling stock as well as for the supervision of drivers, firemen and running shed staff. The Traffic Department is also in charge of the commercial side of traffic organisation which includes all dealings with the public, both in regard to coaching and goods, and the booking, consigning and delivery of freight. It also controls the traffic side of the working of the S.S. ‘Liemba’ on Lake Tanganyika; that is to say, it fixes the timetable and is in charge of the receipt, consignment and delivery of goods, of passenger work, and of all rates and fares questions.

CHAPTER II. – ENGINEERING DEPARTMENT.

12. The Engineering Department of the Tanganyika Railways is in charge both of maintenance and of new construction, survey and capital works.

The maintenance includes the upkeep of harbours, wharves and lighthouses as well as the usual maintenance work of a railway.

In 1929/30 the most important capital works were the construction of the extension to Arusha and the relaying of the coastal section of the Tanga line with 45 lb. British standard track. Both were nearing completion at the time of my visit.

The only survey in hand was a further investigation of one section of the proposed Engare Nairobi branch.

As money has been allocated for the Iramba Plateau Railway and application has been made for assistance from the Colonial Development Fund for the construction and survey of other branch lines, as well as for a capital works building programme, it is anticipated that there will be considerable capital works in progress during the next two or three years, and allowance for the expansion required for this must be made in the general organisation of the department.
13. The ordinary maintenance on the Central line was previously organised in two districts; the first with headquarters at Dodoma and in charge from Dar-es-Salaam to Tabora (both exclusive), amounting to 522 miles, and the second with headquarters at Tabora and in charge of the remainder of the Central line, including the Mwanza branch, making in all 487 miles. The Chief Engineer was of the opinion that these districts were too long for adequate supervision, more especially in view of the fact that the Mwanza branch was new and was only fully ballasted for a short distance and that a certain amount of building work was still in progress. A reorganisation into three districts was therefore approved and the staff for it sanctioned in the year 1929/30. It had not come into operation at the time of my visit. Under the new organisation the three districts would be as follows:–

<table>
<thead>
<tr>
<th>Headquarters</th>
<th>Route Mileage</th>
</tr>
</thead>
<tbody>
<tr>
<td>(1) Dar-es-Salaam – Itigi (exclusive)</td>
<td>Dodoma. 385</td>
</tr>
<tr>
<td>(2) Itigi – Kigoma</td>
<td>Tabora. 388</td>
</tr>
<tr>
<td>(3) Tabora (exclusive) – Mwanza</td>
<td>Shinyanga. 236</td>
</tr>
</tbody>
</table>

Dar-es-Salaam itself is in charge of an Assistant Engineer reporting direct to the Chief Engineer. There is a good deal of work at Dar-es-Salaam itself and, if it was included in a district, the headquarters would have to be moved there, which would tie down the District Engineer and make it less easy for him to supervise the remainder of his district. The arrangement appears to be working satisfactorily and in the circumstances I recommend its retention.

Also, I consider that the division into three as opposed to two districts is justified; it has the disadvantage that the district officers of the department are not quartered at the same place as the district officers of the other operating departments, but the train service is so infrequent that it is undoubtedly difficult for a District Engineer to control 500 miles properly, particularly as the new branch requires a good deal of attention. / An Assistant Engineer is allowed at the headquarters of each district.

The Tanga line, including the Arusha extension, forms a single district on the same basis as the others. Its route mileage is 272 or, including the small Sigi line, 287.

14. The subordinate superintendence of works is carried out by European Inspectors of Works in each district, one being allocated to the Assistant Engineer at Dar-es-Salaam. For permanent way the subordinate superintendence consists of Permanent Way Inspectors, some of whom are European and the remainder Indians. Each Permanent Way Inspector is in charge of roughly 75 miles and he has under him two or three Sub. Permanent Way Inspectors, either Asiatic or African. The Sub. Permanent Way Inspectors are usually in charge of five gangs consisting of 12 men, including the headman, the average length detailed to the gang being about five miles. The Permanent Way Inspector is expected to cover
his section about four times a month while the Sub. Permanent Way Inspectors
Can usually cover their sections twice a week, thus seeing each gang four times a
week. This system is adapted from that used on the Indian Railways and appears
to suit the local conditions.

15. But, while I have no fault to find with the organisation, I consider the
numbers employed on track work are excessive, particularly on the Central line.
The average number of headmen, labourers and trolley boys during 1928/29
On the Central line the figures were respectively 2.30 and 2.17 per mile. These
are average figures for the year. On the Central line in March, 1929, 3-26 were
employed per mile. Also all sidings and yards have been included at their full
mileage; usually their mileage is included at one-third of its full length.

The Central line is constructed to a higher standard, particularly in respect
of ballast, than any railway in tropical Africa. The traffic is very light, averaging
in the most crowded section only two trains a day each way; the organisation
admits of ample supervision and the highest speed allowed is 25 miles per hour.
In view of these advantages, the Engineering Department should have little dif-
culty in maintaining a good track with two men a mile as a maximum.

On the Tanganyika line, where the standard of construction is lower, the average
number employed per mile is less, and this is in itself a condemnation of the
Central line, but even here I think it should be possible to effect a reduction to
the same figure of two men a mile.

16. During the War many of the bridges were damaged and were subse-
sequently repaired. All of these have now been replaced, with the exception of
about seven which are still in use. The most serious case, the bridge over the
Pangani at Korogwe, is being replaced during the current year and an item of
£4,000 is included in next year’s estimates for the renewal of others. I agree with
the necessity for this expenditure. A proper register of bridges is maintained.

17. Most of the station buildings, workshops, running sheds, goods sheds
and European quarters are of a permanent character; practically all the unskilled
African staff are housed in temporary huts. These are expensive to maintain as
the men have to be allowed so much time off / in order to build and repair them.
The majority of the Asiatic employees are also drawing housing allowances, and
not only is this costly, but the accommodation available for them is unsatisfac-
tory. A three years’ programme has therefore been established in order to build
Asiatic and African quarters. The total building programme will cost £153,000,
of which in the first year £36,000 will be for permanent quarters for Asiatics and
£18,000 for Africans. I think the expenditure is judicious and will be compens-
ated by the saving in house allowance and in the extra work obtained from the
African staff as well as by increased efficiency. I therefore recommend the alloca-
tion of the funds asked for.
No register of buildings has yet been made and I think it would be advisable to start one as soon as possible, as without a complete register, maintained up to date, confusion and disputes are bound to arise.

18. The control of expenditure appears good and prompt. When the Annual Estimates are finally approved, the Chief Engineer makes a definite allotment to districts, keeping in the case of certain sub-heads a reserve in his own hands in case of contingencies. The District Engineer knows within two or three days of the end of the month his expenditure for that month. The expenditure statements are then forwarded in original to the Chief Engineer, who thus knows by the 8th usually, and never later than the 10th of the month, the expenditure on the Central line. The statement from the Tanga line may be later but this is due to difficulties of communication. I also satisfied myself that the system of monthly progress reports and completion reports was satisfactory.

19. Delay, however, appears to occur in the case of individual works. The District Engineer prepares rough estimates of these when he includes them in his draft estimates for the coming year. If they are approved by the Chief Engineer and the General Manager, they are included in the Estimates for the year. When the Estimates have been finally approved by the Secretary of State, the Chief Engineer informs the District Engineer to that effect and allocates the money. Before work can begin, however, the District Engineer has to prepare and forward to the Chief Engineer a detailed estimate for each specific work, and these have in turn to receive the Chief Engineer’s approval. All this takes time, especially in the case of an isolated district like Tanga, and so a good deal of the financial year has slipped by before work can be started, with the usual result that there is a rush at the end of the financial year to get these works finished. It seems to me that time could be saved if the District Engineers were instructed to prepare detailed estimates for these specific works as soon as the Railway Estimates have passed the Legislative Council. In the case of very large works such as relaying, full estimates will have to be prepared before the work is put forward, and, in the case of the ordinary works items, it is seldom that these are struck out by the Secretary of State, so that there is little danger of time being wasted on detailed estimates which will not be required.

20. The last schedule of prices, which was prepared in 1925, is now out of date. The Chief Engineer says that it is not possible to fix a schedule as the rates of labour fluctuate and the prices of materials are not yet stabilised. As regards the latter point, the prices of materials have not varied so much during the past few years as to disturb a schedule of prices very much; other African railways have managed to keep them with little difficulty. Fluctuations in labour costs have, however, undoubtedly a particular importance in Tanganyika Territory, as rates of labour vary materially not only as between one district and another, but with the seasons. It is a difficulty, however, which I think is surmountable.
The District Engineers have a good deal of estimating to do and each usually keeps his own individual list of costs in order to prepare his estimates. It may or may not be handed over to his successor, or it may be compiled in such a form as to be of little use to the latter, who then has to compile his own list or search through old estimates for appropriate prices. It is therefore in the interests of the District Engineers themselves and of sound estimating that I recommend the compilation of a proper schedule of prices. To allow for fluctuations in labour costs the rates of pay assumed can be quoted so that suitable allowance can be made, or, if such large fluctuations occur between districts as to render this of no use, district schedules should be maintained. The Chief Engineer should lay down the form of the schedules and the information and items to be given in them, and they should be included in the official documents to be handed over by the District Engineer to the officer taking over from him.

21. [...]  

22. The majority of the building work in Dar-es-Salaam has been carried out by contract with satisfactory results and most of the ballast is bought in the same way. In this respect these Railways are fortunate as it is rare on Colonial railways to be able to use contract work to this extent. In Tanga, while it is possible to do the larger works satisfactorily by contract, it has been found better to carry out the smaller works departmentally.

23. The two lines which have been constructed since the present Administration took over charge, the first from Tabora to Mwanza, 237 miles, and the second from Moshi to Arusha, 53 miles, have both been built by local firms under contract. The question has arisen as to whether this method should be adopted for the construction of the new branch railways or whether these should be built departmentally.

In considering the question it must be remembered that on the Tanganyika Railways there is at present no Construction Branch and that it is precisely in the building up of such an organisation that the greatest liability to waste occurs. The whole of the staff has to be engaged specially for the work; of the competence of the individuals or of their suitability for the work and the country there is at the time of engagement usually only a superficial knowledge. They are, however, responsible for much larger expenditure proportionately than the maintenance engineers, and, consequently, before those amongst them who are incompetent can be weeded out, they can and may waste considerable sums of money. The loss entailed in their pay and passages is trifling compared to the sums they can waste through bad work which has to be done over again or through lack of proper supervision. This danger is aggravated by the fact that it is more difficult to get rid of people in government as compared with private employ, especially when it is a question not so much of an individual act as of general incompetence to obtain proper value for money spent. The contractor is better placed than
the government; he is in the position of an established institution with expert knowledge of this particular class of work; he is probably already in touch with all the engineers he will require, except those who are quite junior; he has in all likelihood employed most of them before and is usually in the position to obtain accurate information about the remainder; and he can get rid of any of them at short notice. His system of pay is more elastic and he can give his engineers a financial incentive to carry out the work economically and quickly. Also, losses due to the incompetence of any individual engineer fall on the contractor and not on the government. For these reasons I am of opinion that, when the railway to be built is a straightforward construction job with no complications which are likely to lead to delays and claims and where reliable firms can be found who are prepared to submit tenders on a schedule of prices, it is more economical to employ contractors than to build up a special construction organisation.

The Chief Engineer recommends, however, that future construction should be carried out departmentally with the aid of small contractors. These small contractors would carry out the earthwork and other operations entailing mainly only unskilled labour. It must be remembered that this method was the one used on the construction of the Central line on which the Chief Engineer was employed and therefore is the form with which he is most familiar. Also, in the mind of any keen engineer there is an unconscious bias in favour of carrying out the construction himself. The main substance of the Chief Engineer’s argument is the elimination of the contractor’s profit but this, I think, is outweighed by the advantage which a contractor possesses enabling him to quote a cheaper rate for work than can be attained by a government department.

The General Manager, on the other hand, is by no means averse from letting the whole of one construction to one contracting firm, subject to the provisions which I have mentioned above.

In both cases these somewhat conflicting views have been formed after an experience of two branch lines both built by contract under the supervision of the two officers concerned. The situation is further complicated by the fact that the preparations for the construction of the Iramba Plateau Railway are, I understand, too far advanced to admit of tenders being asked for from British firms without an undue waste of time and consequently of money, thus limiting the possible tenders to local firms. At the same time, if, as I recommend later, a continuous programme of construction, stretching over some years, is introduced, the decision taken as to the method of constructing this railway will probably fix the methods adopted throughout the programme. It would be bad policy to go through the expensive work of building up a construction organisation and then disperse it in order to revert to contract.

The only solution which it is thus open for me to recommend is that tenders should be called for locally. If the General Manager is satisfied / that as a
result he can obtain a contract which is satisfactory both as regards price and as
regards the financial and engineering standard of the contractor, I recommend
that construction by contract should be adopted as the definite policy through-
out the whole programme and that, in future, sufficient time should be allowed
to enable British firms to tender in the ordinary way.

In the absence of a satisfactory tender for the Iramba Plateau line, the only
course will be to form a construction branch and use the departmental method
for the whole programme of new construction.

24. The present establishment of Engineers as allowed in the Estimates for
1930/31 consists of a Chief Engineer, a Senior District Engineer, 5 District and
10 Assistant Engineers. The Senior District Engineer in practice acts as deputy
for the Chief Engineer on the maintenance side. The Chief Engineer, being in
charge of construction and survey as well as maintenance, has necessarily had
to pass a good deal of time away from his headquarters. These duties are not
likely to decrease in the future and I therefore consider the retention of the post
of Senior District Engineer necessary. Allowing, in addition to the two senior
officers, one District Engineer and one Assistant Engineer for each of the four
districts, one Assistant Engineer for Dar-es-Salaam, and one Assistant Engineer
for harbour and lighthouse works, this gives a total of 12 Engineers required
permanently in the country on maintenance work. In addition, 2 Engineers are
required for capital works in view of the programme in hand, making a total of
14 posts.

Under the leave regulations an officer spends roughly 30 months in the
country for every 8 months spent on leave, including the time spent on the
passage to and fro; this means that the number of posts to be filled must be
increased by approximately one-quarter to permit of leave. The total establish-
ment of 17 Engineers is therefore not excessive. For construction and survey
work additional Engineers will have to be engaged according to the programme
undertaken and the method of construction adopted, and they will be paid out
of the funds allotted for those programmes.

25. It was proposed to me that an increase should be made in the salaries of
the Chief Engineer and the Senior District Engineer on the grounds that they
were not as high as those on the Kenya & Uganda Railways. The salary of the
former is at present £1,350 and of the latter £1,050, as against £1,750 in the case
of the Chief Engineer and £1,250 in the case of the Assistant Chief Engineer,
Kenya & Uganda Railways. I regret that I cannot admit either that the responsi-
bilities and work are equal or that the salaries in one colony must necessarily be
regulated by those of its neighbours. The Chief Engineer, as it is, draws £100 a
year more salary than the Chief Mechanical Engineer, the Traffic Manager or the
Chief Accountant. This differentiation is a relic of the days when the Engineer-
ing was considered the most important of the departments, and it often has the
disadvantage that the Chief Engineer merely by virtue of his larger pay acts for the General Manager in the latter’s absence, whether he is the best qualified or not. Where, however, as in this case the Chief Engineer has extra responsibilities in connection with the construction of new lines, I consider that he should receive extra remuneration, but this should take the form of a special construction allowance. I recommend, therefore, that future holders of the office should receive the same salary, £1,250, as the heads of the other three principal departments, and in addition a special construction allowance which should only be paid whilst new lines are actually under construction. / 

CHAPTER III. – LOCOMOTIVE DEPARTMENT.

26. The organisation of the Locomotive Department has been dictated by the fact that it possesses three separate workshops at Dar-es-Salaam, Tabora and Tanga. The German Administration had intended to establish the main workshops of the Central Railway at Tabora and abolish gradually those which already existed at Dar-es-Salaam. In pursuance of this policy they had already constructed and fitted up a workshop at Tabora, which, at the time of my previous Report, was the most modern and best equipped on the system.

The policy of the British Administration has been to install any new machinery and plant at Dar-es-Salaam and enlarge it as required for reasons connected with housing, labour and proximity to the port, but, though no expansion has been carried out at Tabora, the existing facilities have had to be used to their fullest capacity.

At Tanga, owing to the uncertainty connected with the future administration of that railway, the policy has been to spend as little on workshops as was compatible with keeping the current work going.

It has thus been necessary to organise the department in three districts, each with its own workshops. While this dispersion of shops is not economical, the Railway Administration had no other course open to it and I think the decisions to extend Dar-es-Salaam rather than Tabora and to spend as little capital on the shops at Tanga as possible were sound.

Each district is under a District Locomotive Superintendent who is in charge of both running and shops, with, in the case of the Dar-es-Salaam and Tabora Districts, an Assistant Locomotive Superintendent under him. In the Estimates for the year 1930/31 an Assistant Locomotive Superintendent has also been allowed for Tanga owing to the increase in the work there. The Assistant Locomotive Superintendents are occupied mainly with the workshops, while the District Officers attend rather to the general district work, including the running, but there is no hard and fast rule and Assistant Locomotive Superin-
tendents are expected to be prepared to take over charge of the district at any moment.

At headquarters one Assistant Locomotive Superintendent and one Technical Assistant are normally posted to the Chief Mechanical Engineer’s office.

This gives a total number of posts to be filled of 9, or, allowing for leave, 11. This staff, although not excessive, is, I consider, ample for the work.

27. The locomotive situation at the time of my inspection showed that 71 engines were on the books, 51 being on the Central and 20 on the Tanga line. Of the total, 27 were of post-war construction and the remaining 44 were either old German engines or obtained second-hand from overseas during the War. The bulk of the stock is thus either quite new or very old. Out of the 71 engines on the books, 9 were under repair and 2 awaiting repair; this gives a figure of 15 1/2 per cent. under or awaiting repairs. This figure would have been better, had it not been for the fact that there had been a heavy rush of traffic on the Tanga line in order to move the material for the construction of the Arusha extension. This had rather over-streained the capacity of the Locomotive Department and, when it was over, engines had to be brought in for general repairs before the normal time, with the result that two of them had been awaiting repairs for over six months. As 15 per cent. is the usual allowance for engines under repair, these results can be called satisfactory.

28. The average mileage run per engine in service per month for the first quarter of the financial year 1929/30 was 1,627. This figure is below the average which it is normally hoped to obtain, but it would be unfair to expect a normal figure because the traffic is sparse and several of the engines are employed on fuel trains which can only make a small mileage.

For the three heaviest classes of engines, the averages were respectively 2,922, 2,152, and 2,362 miles per month per engine, which can be considered quite good in the circumstances. These results are due to the institution of caboose working on the Dodoma – Tabora and Tabora – Kigoma sections. The locomotive is worked by a double set of enginemen, one crew resting in the caboose whilst the other is on duty. By this means the engines on the Dodoma – Tabora section do a run of 478 miles in about 32 to 38 hours, according to the class of train. It has not so far been found possible owing to a variety of causes, such as variations in loads and unsuitability to traffic requirements, to institute caboose working with advantage on the other sections of the Central line nor on the Tanga line. But, though not for the moment practicable, I think the possibility of extending this method of working to other sections should always be kept in view, as it forms one of the best means of getting the most value out of the heavy capital sunk in the engines.

29. The fuel used is wood except on the Dar-es-Salaam – Morogoro and Tanga – Buiko sections, where wood has become scarce and expensive. The Gen-
eral Manager informed me that after investigation of all the factors involved in using wood, such as the running of fuel trains and labour, it has been decided that it becomes cheaper to burn coal when the cost of wood reaches 11s. 30c. per 100 c. ft. That stage has already been reached on the two sections named. The fuel consumption appears to be watched carefully. The average consumption of wood fuel in 1928/29 on the whole system was 4.64 c. ft. per engine mile. It is difficult to get a standard of comparison as so much depends on the quality of the wood. The coal consumption on the Central line was, during the same year, 64 lbs., and on the Tanga line 58.4 lbs. per mile. The former of these figures is, as the Chief Mechanical Engineer agrees, distinctly high; he attributes it to the native firemen not being well acquainted with the use of coal. I consider that it should be possible to improve both figures.

30. The figures for the consumption of lubricating oil are 6.59 pints per 100 miles on the Central line and 6.32 pints per 100 miles on the Tanga line. These results are satisfactory.

31. In the number of engine failures the figures are by no means so satisfactory. For the past four years they are as follows:

<table>
<thead>
<tr>
<th>Year</th>
<th>Number</th>
<th>Engine miles per failure</th>
</tr>
</thead>
<tbody>
<tr>
<td>1926/27</td>
<td>24</td>
<td>46,694</td>
</tr>
<tr>
<td>1927/28</td>
<td>32</td>
<td>33,540</td>
</tr>
<tr>
<td>1928/29</td>
<td>55</td>
<td>23,451</td>
</tr>
<tr>
<td>1929/30</td>
<td>21</td>
<td>27,308</td>
</tr>
</tbody>
</table>

In presenting these figures to me the Chief Mechanical Engineer called my attention to the increase during the past two or three years and said that it was the subject of considerable concern, especially the fact that such a large proportion proved on investigation to be due to neglect by staff. This was found to be the cause in 33 out of the 55 cases which occurred in 1928/29, and in 7 out of the 21 cases in the first six months of 1929/30. The majority of these cases took place with African drivers. Special inspection measures were being taken to cope with the trouble, but the main cause in the Chief Mechanical Engineer’s view was the difficult stage which the education of the African has reached. I propose to discuss this question generally for all departments in a later chapter and it is therefore only necessary here to say that the experience of the Locomotive Department has been that, after the native has received a certain measure of training, he appears to slacken off, either from lack of ambition or from conceit that he has already learned all that he need, and neither fines nor dismissal appear to act as an efficient deterrent. A certain measure of discontent is also due to the rates of pay for Africans being lower than those received by the Asiatics and
to the fact that, whereas all Asiatic drivers receive mileage allowance, no Africans do. The reason for this difference is that no African driver has yet reached the standard of the worst paid Asiatic. They can consequently only be used on trains which run intermittently and, if they were placed on mileage allowance, the total amount they received would vary violently from month to month with the traffic. This would probably give rise to more discontent than the present arrangement. The experience is a disheartening one, but the Chief Mechanical Engineer has very rightly not been deterred thereby from pursuing the policy of training the African until a higher standard has been reached, which is the only real and final solution of the difficulty. Meanwhile it is sufficient to note that the Department is alive to the state of affairs and that apparently, as a result of the measures taken, there has been a slight improvement during the past six months.

32. Before leaving the question of the training of the African as an engine driver, I wish to point out one direction in which I think an improvement is possible. At present there are European, Asiatic and African drivers. There can be no question yet of dispensing with European drivers; they are necessary not only for the more important duties but also for educational purposes. In fact, owing to the disappointing results with African drivers, it has been necessary to increase the numbers of both European and Asiatic drivers in the Budget for the coming year in order to be ready for the increase in traffic which is expected.

At present none of the African drivers and only a few of the Asiatics can read or write English. The system of passing traffic is by line clear orders transmitted by the telephone and conveyed to the driver and guard by a message written in English authorising them to proceed with their train to the next station. When a driver cannot read, this has to be read out to him by the station-master, the man who has written out the order and has been responsible in part for its transmission. The driver is thus at the mercy of the station-master and, when he arrives at the running-shed and has to return his ticket for the run, he is equally at the mercy of the shed clerk as well as of any fuel clerk whose receipt he has to sign for fuel put on his tender.

At present recruits for African engine drivers are drawn solely from the unskilled workmen who have been employed as cleaners or in the running shed and have been promoted thence to firemen. This is the class in which it is rarest to find any education. Nor is it only in regard to making out and checking returns that education is required for an engine driver. It is one of the most difficult and, beyond dispute, one of the most responsible of the trades on a railway. It is difficult to expect good results so long as the recruits are drawn solely from the worst educated class; it is merely a reflex of the ordinary English system, but in England the cleaner, who is the ordinary recruit, is far better educated nowadays than the best African driver. On the other hand, it will be impossible to get
the better educated native to undertake the manual labour of firing unless it is merely a comparatively short stage in the process of becoming a driver.

I therefore suggest that, just as in the case of the workshop artisans, a regular class of apprentice driver should be formed. They would have to do a certain amount of firing and shed work in the course of their apprenticeship but it should always be kept in view that the object of their apprenticeship is to turn them into drivers and not firemen, and they should be trained with that object and made to attend technical classes like other apprentices. It would probably be better for this reason to concentrate them into one or at the most two classes, one on the Central and one on the Tanga line. At the same time it would be advisable in order to keep both avenues of recruitment open not to draw the whole of the drivers from this source, but to give a few of the annual vacancies to such firemen as pass the approved test. This system has been adopted in Nigeria as the result of the recommendations of the Report which I made in 1924, and an interesting account of the methods adopted is contained in the Annual Report of those Railways for 1929/30.

33. One of the most serious disadvantages with which the Locomotive Department has to cope is the scarcity of water and its bad quality. Owing to the failure during the dry season of several watering stations, improvised tank trucks have to be used over long runs, an expensive arrangement as it means cutting down the paying load. At several points, also, such water as can be obtained is bad; as the source gets low, the water becomes charged with vegetable matter and mud. Though salt is also sometimes present, the water is on the whole fortunately free from acids. The other impurities, however, entail the necessity of special precautions as regards washing out boilers. A special drill has now been obtained in order to try and tap the more deeply seated water and to free the railway from being so dependent on the ordinary surface supplies. A further sum of £10,000 has also been allocated from Loan funds for expenditure on water supply in 1930/31 and an additional £10,000 is included in the probable capital expenditure of the year after. In my opinion these expenditures are thoroughly justified and I consider the work of drilling in order to find a more permanent supply at a lower level should be pushed forward as rapidly as possible.

34. The vehicle situation at the time of my inspection showed that out of a total of 86 passenger vehicles on the books of the whole system, 12, or just under 14 per cent., were under repair and none were awaiting repair. Out of a total of 1,098 goods vehicles, 35 were under repair and none were awaiting repair, a figure of just over 3 per cent. The former figure is on the high side due to the practice of withdrawing passenger vehicles from service every four to six months in order to revarnish them with one coat; this method is found to economise as against repainting which would have to be carried out very frequently in a climate like Tanganyika. The figure for goods vehicles is distinctly good. /
35. The maintenance of vehicles in general is to a good standard and it has been found possible to lengthen the time between the periodical examinations. Passenger stock is only lifted once every year and the axle boxes are repacked every three months. Goods stock is lifted only once in every two years and the boxes repacked every six months. That this economy has not been attended with any evil results is shown by the figures for hot axle boxes, as shown in the following table:

<table>
<thead>
<tr>
<th>Year</th>
<th>Number of Hot Axle Boxes</th>
<th>Number of Vehicle Miles run per Hot Axle Box</th>
</tr>
</thead>
<tbody>
<tr>
<td>1926/27</td>
<td>160</td>
<td>79,561</td>

<td>156</td>
<td>88,216</td>
</tr>
<tr>
<td>1928/29</td>
<td>80</td>
<td>209,756</td>
</tr>
</tbody>
</table>

36. The number of vehicle miles run per pint of axle oil consumed is 680. While I have no complaint to make as regards this particular figure, no regular records of this consumption are kept. The figure quoted above had to be obtained specially for me. I think that this consumption figure should be recorded and watched every month as is done with the figure for the consumption of oil on locomotives.

37. While expenditure and consumption are carefully watched, the system depends mainly upon personal inspection and supervision. The statistics as to the work done and money and stores spent do not reach the Chief Mechanical Engineer’s Office until a long time after the period to which they relate. Thus statistics showing the individual performance of each engine are prepared monthly in considerable detail as regards mileage performed and stores spent, but they are not received in the Chief Mechanical Engineer’s Office until five weeks after the end of the month. He must rely on the personal inspection of his officers to see that waste does not occur; he cannot stop it until it has been in progress for some time. It is fair to say that I saw no indication of undue extravagance, but control through the personal inspection of the senior officers is only possible so long as there is only a small amount of traffic passing. In all business undertakings, once the volume of business has reached any considerable dimensions, the senior officers cannot hope to control solely by personal inspection; they must do so through statistics giving the work done and the cost of doing it either in cash or in stores. And the first essential of these statistics is that they should be live and place the principal officers in possession of the important figures at once so that action can be taken on them without delay. It is significant, too, that the statistics given to me by the Locomotive Department at Tanga were more up to date and complete than those on the Central line.

As I found that the statistics used by the Traffic Department were similarly out of date by the time they reached the Traffic Manager and also that the two departments were in certain cases both preparing the same statistics, I arranged
with the General Manager for the formation of a Statistics Section in the Accounts Department, which would supply to each department the operating statistics which it required. The statistics to be prepared and the dates by which they are to be supplied to the Heads of the Departments are given in the Chapter relating to the Traffic Department. / 

38. Very complete boiler registers are maintained in the Chief Mechanical Engineer’s Office, but practically no records of the engines themselves. I consider that proper engine registers should be started giving the full particulars of each engine as placed in traffic, the mileage worked each month, the date of general or intermediate repairs, any alterations or matter calling for particular notice, and all accidents. In this way a valuable record is kept of the performance of individual engines or types, which is available for reference at any moment.

39. In contrast to the poor engine records, an elaborate card index is kept for the whole of the axles on the line, each axle being numbered. The Chief Mechanical Engineer explained that his reason for establishing this was to watch the total mileage done by each axle and guard against any of them failing from fatigue of material due to excessive mileage. But, long before the axle would fail from this cause, there would normally have been such wear on its journal as to bring that below the scrapping dimensions. It is, in short, a very elaborate safeguard against a contingency which is remote in the extreme, far more remote than many of the contingencies which this and every other Colonial railway has to face every day in the course of normal operation. I know of no other railway which maintains a record for this purpose. I recommend that it should be discontinued and that the two clerks employed on its compilation should be transferred to the Statistics Section which I am recommending should be formed under the Accounts Department.

40. The shops at Dar-es-Salaam have recently been enlarged and a new erecting shed has been added, thus improving not only the facilities for erection but allowing the machine shop also to be made larger. The large stationary jacks installed by the Germans for lifting engines have been taken out and a travelling crane substituted.

Tabora shops have been maintained at approximately the same level of output as when taken over.

At Tanga a few machine tools have been added but otherwise no improvements or additions have been made; the consequence is that with the growth in traffic the shops are now very crowded and have great difficulty in coping with the work. This is accentuated by the fact that this is the only mechanical engineering shop in the North of the Territory and it is frequently called on to execute urgent repairs to machinery, such as that in a sisal factory, work which, in the interests of the Railways themselves, cannot very well be refused. With this policy of spending no capital on the Tanga shops until the future of the line
has been settled I am in entire agreement. If it is to be worked in the future by the Kenya & Uganda Railways, these shops will at once lose their importance and, even if they are maintained, will not be called on to do the same amount of work as in the past. Any capital spent on them would then be wasted.

In the Dar-es-Salaam shops there are five pits; of these one is required for light repairs and one for tenders, leaving three pits available for general overhauls and erections.

The average time taken in the Dar-es-Salaam shops for a general repair to an engine in the past financial year was 3 1/2 months. With the new facilities the Chief Mechanical Engineer hopes to reduce this time to 70 working days, or slightly less than the three months which is usually allowed. Assuming a maximum of twelve engines to be erected a year and each taking a fortnight to erect, the pits will be occupied for 144 working days on this work, leaving the capacity of the shops for general repairs at 10, or perhaps at a pinch 11 per year.

At Tabora the Chief Mechanical Engineer hopes to reduce the time of a general overhaul to three months; allocating one out of the three pits there for light repairs leaves a total of 8 general overhauls a year, or a total for the whole Central line of 18 to 19 general repairs a year.

The system of repairs adopted is to give a light intermediate repair between the general overhauls; the boxes are then done, wheels are replaced or re-turned, and the motion, if in bad condition, receives attention. This repair only takes a few days. The general overhaul is then not undertaken until the locomotive has run 90,000 to 100,000 miles. This is much in excess of the usual mileage which a locomotive is allowed to run on railways of this character before it is shopped. The Chief Mechanical Engineer assures me that as a result of their experience they have found that the engines on this railway, provided they receive the light intermediate repair, do not require a general repair earlier and are in quite a good state when they return after doing 100,000 miles. I saw no reason to dispute this; although there has been an increase in engine failures, investigation shows that these are mainly due to neglect by staff and only a normal proportion to mechanical defects. This exceptionally advantageous situation the Chief Mechanical Engineer attributes mainly to the very heavy standard of construction of the main line.

As against the figure quoted above of 18 to 19 general repairs per year as the capacity of the shops on the Central line, there are at present on the books 52 locomotives. The shops can therefore give a general repair to every locomotive on the Central line every three years with a small margin in hand. The average mileage for all engines has not yet reached 20,000 a year and the maximum mileage per engine is about 35,000; so that in the three years between general repairs the mileage run by engines will not exceed the normal figure and will fall well below the Chief Mechanical Engineer’s figure of 90,000 to 100,000. There is a
further margin in that, if necessary, work on tenders could be removed to the wagon shop and another pit freed for general repairs or erection.

The newly approved Iramba Plateau Railway will not necessitate the purchase of more than three or four new locomotives, so that on this basis the shops, as recently enlarged, can be said to be adequate for the needs of the Central line for several years to come.

41. The situation on the Tanga line is naturally not so good; there are only two pits and, allowing for light repairs and erections, the Chief Mechanical Engineer estimates that only five general repairs can be effected a year. As against this there are 20 engines, so that on the present basis an engine can receive a general overhaul once in four years. I do not, however, recommend any increase in these shops pending the settlement of the final policy to be adopted as regards this line. If it is decided that it is to be run in the future by the Tanganyika Railways, large expenditure will have to be incurred in enlarging and improving them throughout. / 

42. While the work turned out from the shops appears to give no reason for complaint and there does not appear to be any waste of funds, the whole organisation of the three workshops depends solely, as in the case of running, on the personal supervision of the individuals in charge. The Chief Mechanical Engineer knows the expenditure incurred in each shop under each sub-head by the 15th of the month following. Special work or work for other departments or the public is costed, but apart from this not only is there no attempt at ascertaining the cost of any work done but even the ordinary system of work orders is not used. Time and materials for any job are allocated direct to the sub-head in the Estimates, for example, that for Stores for Maintenance of Engines and Rolling Stock, without distinction as to what engine they are for or even whether they are for engines or wagons, and the allocation is in many cases made by the foreman in charge.

The Chief Mechanical Engineer’s defence is that each individual workshop is so small that the officers can ensure by personal supervision that no waste is taking place. Undoubtedly in a small shop waste can be eliminated by careful and constant supervision, but the Tanganyika Railways’ shops, and more particularly the Dar-es-Salaam one, are growing beyond the stage when it is possible for one or even two men to guarantee by personal inspection that due economy is being observed. Moreover, even in small shops if the man in charge has no figures to judge by he can only trust that his supervision is achieving its ends; he has no proof in the shape of figures to show that the cost of doing a certain operation is not increasing, nor that one method of carrying out a work is cheaper than another. The absence of work orders also means that there is no certainty that the expenditure is being allocated correctly, especially when it is in the hands of foremen, who are mainly interested in getting the work done properly and only
indirectly in seeing that the charge is made correctly. When stores are ordered against a particular work order, there is a definite check by the head of the shops on over-ordering; at present there might be seven or eight or even nine issue notes against a sub-head such as that for Maintenance of Engines and Rolling Stock and it is impossible for the man in charge to see whether material has been over-ordered against any particular job or not.

Under the present system, in short, the responsible officer has to rely on constant vigilance in order to check waste; he has no system of figures behind him to help him. The Chief Mechanical Engineer has, in turn, to rely solely on the officer in charge; he has beyond that only the rather hazy check of the total amount spent on each sub-head each month as compared with a general knowledge of the work done.

I do not recommend the institution of any elaborate system of costing, a small locomotive repair shop, owing to the diversity of work, being less adapted to close costing than nearly any other type of shop, but I consider that the cost of the larger works such as the repair, whether heavy or light, or the erection of a locomotive should be kept; the costs of repairs to vehicles could be grouped by classes so that an average is obtained.

I attach even greater importance to the institution of a system of work orders, not only because this forms the first stage in any costing system, but in order to check over-ordering of stores and to ensure correct allocation.

The absence of any system in the Railways’ workshops is the more remarkable because in the Dockyard which is also under the supervision of the Chief Mechanical Engineer an excellent method is in force which could be adapted to the Railway shops.

Owing to the uncertainty of the future of Tanga, I do not recommend any change there for the present.

43. Another direction in which I think the methods employed in the Central line shops could be improved is by the introduction of timing work through the shops. Under this system, when an engine has come into shops and the work required on it has been detailed by the foreman or inspector deputed to examine it, a programme is drawn up showing the dates by which the various tasks have to be completed by each individual shop. This ensures that work will not be held up in one shop because another is behind-hand with its work for that engine. At present the sole method of ensuring that there is no delay is again only the personal supervision of the man in charge. Even if it is not possible to adhere strictly to the programme owing to interruptions caused by emergency work, this is better than no programme at all, because foremen in charge of shops have a better idea of what is ahead of them and can plan their work to better advantage. /
CHAPTER IV. – TRAFFIC DEPARTMENT.

44. The Traffic Department is organised in three districts, two on the Central line with headquarters at Dar-es-Salaam and Tabora respectively and one on the Tanga line.

At the time of my inspection the Dar-es-Salaam district, which comprises from Dar-es-Salaam to Tabora exclusive, was under the charge of the Deputy Traffic Manager who, in addition, assisted the Traffic Manager, more particularly in regard to general operation and rates questions. He also inspected, alternatively with the Traffic Manager, traffic working throughout the Railways, including the Tanga line. There was an Assistant Traffic Superintendent at headquarters and another Assistant Traffic Superintendent at Dodoma. The latter had no office and his duties were mainly inspection.

The Tabora district included the sections from Tabora (inclusive) to Kigoma and Mwanza and was in charge of a Traffic Superintendent.

There was also an Assistant Traffic Superintendent, Kigoma, who, like the one at Dodoma, had no regular office, his principal duties being inspection on the line and supervision of work at Kigoma.

Traffic on the Tanga line was in charge of a Traffic Superintendent with an Assistant Traffic Superintendent to assist him in his office.

The arrangement whereby the Deputy Traffic Manager had dual functions was unsound; he was prevented by the demands of the district work from giving to the Traffic Manager his full time assistance in the many difficult problems connected with the commercial side of traffic working, rates, encouragement and extension of traffic, and dealing with the public.

After consultation with me, the General Manager accordingly included in the Estimates for 1930/31 allowance for another Traffic Superintendent, cutting down at the same time the number of Assistant Traffic Superintendents by one. The establishment of Traffic officers therefore will consist of 10 in all, made up of 1 Traffic Manager, 1 Deputy Traffic Manager, 3 Traffic Superintendents and 5 Assistant Traffic Superintendents, in addition to an Office Superintendent. This cannot be considered excessive in view of the length of the Railways and their division.

45. The operation of traffic and the control of rolling stock are well regulated. Stock reports are despatched from all stations to district headquarters at 6.0 p.m. every evening and orders for working and distribution are despatched from there at 8.0 p.m. The Traffic Superintendent at Tabora informs the Dar-es-Salaam office the same evening of the arrangements he has made; this enables the latter either to rectify them if it thinks fit or to adjust the distribution arrangements. In practice, as a result, the distribution of stock is effected promptly and, considering the nature of the traffic, there is little delay. On the Tanga line there
were complaints from the merchants of shortage of trucks, but on investigation these proved to be due to insufficiency of stock rather than to its not being used to the best advantage. / 

In order to get better use out of trucks, the Railways undertake all off-loading of trucks at Dar-es-Salaam wharf; the work is done on behalf of the Railways by a contractor and a fixed charge of 5s. per four-wheeled, or 10s. per bogie truck, is levied. The system is a good one as it ensures that there is no delay in freeing the vehicles for traffic again and could, from the point of view of the Railways, be adopted with advantage at Tanga. The obstacle to adopting it there is that lighterage and stevedoring agents quote an inclusive charge for transporting certain exports from loaded in trucks at up-country stations to on board ship. The difficulty does not appear, however, an insuperable one and, in view of the advantages to the Railways as shown by the success achieved at Dar-es-Salaam, I would recommend that efforts should be made to initiate the system at Tanga.

46. The mileage obtained from goods vehicles is high but in this the Railways are helped by having an exceptional average haulage for their goods on the Central line, owing to the large proportion of traffic with the Belgian Congo. For this reason any comparison of either the mileage or goods ton mileage per vehicle obtained by these Railways with that achieved by others would not be a fair guide.

47. The average wagon load is good, the loading in 1928/29 on the Central line being 74 per cent. and on the Tanga line 75 per cent. per loaded vehicle.

48. The percentage of non-revenue-earning to total engine mileage is on the other hand high; in 1927/28 out of a total engine mileage of 1,123,829, 236,236 or 21 per cent. was non-revenue-earning; in 1928/29 the total engine mileage was 1,194,774 of which 291,305 was non-revenue-earning or 24-4 per cent. This is owing to the large number of fuel and water trains which have to be run. It will be seen, however, that there has been an increase in the percentage of non-revenue-earning engine mileage in the past year which indicates that there is scope for closer supervision over this aspect of the operation.

49. The despatch and delivery of single consignments is prompt. As a test an average was taken of all consignments from Dar-es-Salaam to Tabora during the month of July, and the transit time, allowing one day for receipt and despatch, worked out at 2 days 14 hours, a good figure, due mainly to the system of having fixed days at the more important stations for the acceptance of traffic for the various sections. Thus, goods are only accepted at Dar-es-Salaam for conveyance to the stations as far as Morogoro inclusive on Mondays, Thursdays and Saturdays. By this means quick delivery can be assured to the merchant; in fact this is incumbent on the Railways as a corollary to the adoption of the system. Good
wagon and train loading are also secured and there is a considerable saving in the amount of goods shed accommodation required.

This system was adopted from the Kenya & Uganda Railways where it was introduced as a result of the recommendation to that effect which I made in 1921. As an illustration of its advantages, the old goods shed at Nairobi, built in 1911, was under the old system of working badly congested in 1921, but as a consequence of the adoption of the ‘shipping day’ system it served without enlargement until 1928 despite the enormous increase in outwards traffic from Nairobi during that time. I have drawn attention to these points because the system is one which could be adopted with advantage by other Colonial railways. The main opposition to its inception comes from merchants, usually owing to the scheme not having been fully explained to them nor its advantages impressed on them. Those who have had experience of it are strongly in its favour.

50. From the foregoing paragraphs it will be seen that the operation of traffic on these Railways gives on the whole satisfactory results. The methods adopted are simple and direct. They depend for their success mainly on personal inspection and personal touch by the superior officer with the subordinate staff. While such a system is admirably suited for a concern which is not handling a large volume of business, it is incapable of adaption when the concern grows to any size. When that takes place, it is no longer possible for the senior officials to assure themselves by personal supervision that the business is progressing satisfactorily, that the means for handling it are being used to the best advantage and that no waste, either of staff or material, is taking place.

In order to be assured on these points they must have early information of the volume of business and of how it is being handled. Personal inspection is still necessary in order to keep the whole concern up to the mark, but it can no longer ensure a definite control of the undertaking; that can only be obtained through a complete and prompt use of statistics. At present the operating both of this and of the Locomotive Department appear, in fact, to be run by personal exertion rather than by system.

In the Traffic Department the statistics obtained are very complete but they are far from prompt. Stations have to compile comprehensive reports every month and very complete operating figures are compiled from the various traffic documents, such as the guards’ journals, but, apart from the train mileage and punctuality of mixed trains statements, the figures relating to the whole system are not ready for the Traffic Manager’s use until many weeks after the period to which they relate. At the time of my visit, for example, the principal statistics for June were not ready until the end of August. This was, I believe, an exceptionally bad case due to shortage of staff, but even in normal circumstances they appear to be seldom ready in less than two months.

Absence of statistics.
To cure the delays which occur in this and the Locomotive Department in the presentation of essential operating statistics, I suggested that the best solution would probably be to form a small Statistics Section in the Accounts Department which would compile the figures required by the operating departments. This arrangement would have the further advantage that it would prevent the waste of labour involved in two departments both preparing the same figures; for example, previously both the Traffic and Locomotive Departments prepared engine mileage figures, which seldom agreed, and further time had to be wasted in reconciling them. Also by concentrating the statistics work it would be possible to use one or two simple calculating machines and thus make a further economy in clerical labour.

A meeting was held by the General Manager of the heads of the departments concerned and it was settled that the system should be put in hand forthwith, the section being reinforced by four clerks, transferred from the Locomotive Department, who are now employed on statistical work at running sheds. With this reinforcement the Acting Chief Accountant said he would not require any addition to the staff allowed in the 1930/31 Estimates. / It was arranged that the section should provide the following statistics:

To be ready within 15 days of the end of the month to which they relate:–

To be ready within 21 days of the end of the month to which they relate:–

1. Net ton miles.
2. Earnings per ton mile.
3. Passenger miles.
4. Earnings per passenger mile.

To be ready within 45 days of the end of the month to which they relate:–

1. Table of financial results.
2. Statement of commodities.

The value of the statistics will be increased if figures are given showing the comparative figures for the previous month and for the same month of the previous year.

51. The present traffic yard at Dar-es-Salaam will be very soon inadequate for the growing traffic. At the time of my arrival it was proposed to replace this by a new yard which was to be roughly at right angles to the main line on a plot of land known as Grasse’s Shamba. The cost had been estimated at £85,000, and
an application for capital funds to this amount had been made to the Colonial Development Fund Advisory Committee, but without any rebate of interest.

A single-ended yard is always expensive and difficult to use; the movements are more complicated and slower, and if any hitch or accident occurs all work may be held up. Delays to train engines are increased and even if there is a double track from the main line to the yard, shunting operations may often have to be interrupted. All this means increased cost, more shunting engines required, more traffic staff, more overtime and mileage allowance to main line drivers.

In laying down a new traffic yard, it is essential above all to pay due regard to the probable requirements of the future. They require a lot of land and, if they are too small or badly designed, they have either to be removed to a new site when traffic expands or extra land has to be bought at a greatly enhanced figure. It is above all a case where an initial mistake entails heavy punishment.

In the report of the Consulting Engineers on the future development of the port a proposed approach railway is shown passing close to Grasse’s Shamba and serving the deep-water wharves which it is proposed shall eventually be sited on both sides of Kurasini Creek. If the configuration of the ground does not prohibit it, a good site for the new yard would appear to be along and in the vicinity of this line as it would be best placed for handling the port traffic which forms the bulk of the work. Part of the Grasse’s Shamba area is marked on the Consulting Engineers’ plan as being earmarked for bulk oil storage, but this is not definite and could no doubt be changed if necessary. It might also be necessary to divert the main road to Pugu, but this again does not appear an insurmountable objection. If this project is not feasible, whether by reason of the ground being too restricted or of unsuitable configuration, there remains the alternative of siting it further out along the main line and parallel to it, or it might even be feasible to combine the two projects. Any of these solutions seem preferable to the present proposal.

But, before a decision is taken, the subject requires to be explored more fully than it has been up to date. Proper schemes with approximate estimates should be prepared showing the lay-out and cost of the various proposals. When these are available, but not before, the advantages and disadvantages, present and future, financial and operating, can be weighed up; to take a decision in the absence of this information would be mere guess work.

The subject, in fact, requires closer study than it has received as yet; as a result of that closer study it may be found necessary to spend a larger sum than the £85,000 originally asked for. In the meanwhile that sum has been allocated by the Colonial Development Fund Advisory Committee, and I would recommend that it should be held in suspense and no expenditure incurred until the possibilities of other alternative schemes have been fully explored.
52. The Tanganyika Railways are one of the few remaining British systems with any considerable mileage in South, East or West Africa which still maintains the traditional British departmental system of operation. The South African, the Kenya & Uganda, the Rhodesian and the Nigerian Railways have all in turn abandoned it and adopted instead the divisional system, in which the movement of trains and the operation of traffic, the running of locomotives and the charge of the locomotive running as well as of the traffic staff, are combined into one department, in which are also included usually the responsibility for running sheds, the mechanical department being responsible only for the workshops and general repairs and maintenance of locomotives and rolling stock therein, as well as for their design and erection.

I do not propose to discuss here the advantages of this system for Colonial railways; it will be sufficient for the present purpose to say that in my opinion far better results can be obtained in the use of staff, locomotives and rolling stock by the divisional than by the departmental system, that all the railways which have adopted it, some of them on my recommendation, agree heartily with that opinion and that there is no instance on record of a railway which has adopted the divisional system reverting to departmental working. / In one respect the economies which the Tanganyika Railways could expect from a change are less than they would be normally. I refer to the possession of three separate workshops. Offices of the Mechanical Department would still have to be retained at all these centres, thus limiting some of the economies which could be made. But, despite this, I think the other economies in the shape of better co-ordination of operation and use of stock would be sufficient to justify the introduction of the divisional system. Another factor, however, enters in. The isolation of the Tanga line at present provides a strong argument in favour of a very complete divisional system including therein the maintenance of way and works, but in the event of that line being worked by the Kenya & Uganda Railways, which has already been recommended by at least two Commissions and will be recommended later in this Report by me, that argument will no longer exist. In fact, a different type of divisional control will be required according to whether that line is to be included or not. A third factor which must be considered is that, on a railway with as small a staff as this, the personalities of the officers who would be called on to introduce the change must be considered.

I understand that the opinion of the General Manager is that, while the divisional system must be adopted eventually, the present time is not opportune. With this opinion I am reluctantly compelled to agree, but I think that it should be the fixed policy of the Administration to endeavour to introduce it at the earliest opportunity. Such an occasion will probably arise when a final verdict has been given as to the future of the Tanga line and the way is clear to decide
the most suitable type of divisional organisation to adopt. I would urge that no effort should be spared to take advantage of the opportunity.

CHAPTER V. – MARINE DEPARTMENT.

[...]

CHAPTER VI. – HARBOURS AND WHARVES.

[...]

CHAPTER VII. – DOCKYARD AND SLIPWAY.

[...]

CHAPTER VIII. – STORES DEPARTMENT.

70. The Main Stores of the Railways are situated at Dar-es-Salaam; District Stores are maintained at Tabora and Tanga. In addition there are at Dar-es-Salaam Sub-Store for detail issue to the Locomotive Workshops, Dockyard and Electrical Department, situated close to the respective shops, yard and powerhouse. The Main Stores at Dar-es-Salaam have only recently been completed at a cost of about £40,000. Previously these stores had been scattered over several buildings, making supervision difficult and expensive. The lay-out and design of the new stores buildings and yard are good and allow ample room for future expansion. The fire precautions are good; hydrants are installed and the staff is trained in the use both of these and of the chemical appliances. There is also an electric alarm to the Workshops where the fire engine is housed.

71. In the Report which I made on these Railways in 1921 I recommended that the stores accounting should be transferred from the Accounts to the Stores Department, leaving the Chief Storekeeper solely responsible to the General Manager for all operations in connection with stores. This has been carried out in full as regards the stores accounting, but in theory the Chief Storekeeper is still responsible to the Chief Accountant, and in practice on the Tanga line the European Sub-Storekeeper is under the Assistant Chief Accountant, who is therefore the local authority responsible for stores matters. I am informed that there were special reasons for maintaining this organisation at an outstation like Tanga, but these reasons no longer exist, especially now that there is telephone communication between there and Dar-es-Salaam, and I recommend that the divorce should be made complete, that the Sub-Storekeeper at Tanga should be made responsible to the Chief Storekeeper, and that the latter should be directly responsible to the General Manager. If the Tanga line is worked by the Kenya &
Uganda Railways, it will not be necessary, of course, for the Tanganyika Railways to maintain any stores or stores organisation there.

72. The bulk of the stores are obtained from Great Britain on indent through the Crown Agents for the Colonies, purchases from this source in 1928/29 being £175,798 out of a total of approximately £218,000. The procedure follows the normal course and calls for no comment.

The largest proportion of the local purchases is for rations, as about 900 – 1,000 labourers of the permanent way and fuel gangs have to be rationed monthly. Here again the procedure, including submission to tender, follows the usual lines.

The indents for requirements at Tanga are prepared locally and then passed through the Chief Storekeeper, and stores from overseas are shipped direct to Tanga. Local purchases at Tanga are sanctioned by the Chief Storekeeper.

73. The stocks of general stores to be held at Dar-es-Salaam are based on maxima and minima which are entered against the items in the priced ledgers. The minimum stock is based upon six months’ consumption; if this minimum is reached, a fresh indent is at once sent to the Crown Agents. Normally, unless the minimum has been reached in the interval, the stocks on hand come up for review at six monthly intervals throughout the year. The new indents would normally be based on the previous six months’ consumption. As it may take a minimum of four months and a maximum of six months from the date of the indent to the date when the goods are received in the Territory, I do not consider a minimum stock of six months’ consumption is too large. /

74. Up to the time of my inspection there were no minimum and maximum stocks fixed for the Tanga Stores. It was explained to me that this was because there was until recently a large quantity of salvage stores there which prevented their getting down to a proper basis until it had been worked off, but that the ordering of new supplies was regulated on the basis of the consumption of the previous six months. The surplus stocks had been worked off by the time of my visit and the general stores held did not appear excessive. Orders were given by the Chief Storekeeper during my inspection to prepare the figures for maximum and minimum stocks based on the same standards as for the main stores and to enter the figures in the ledgers.

75. The District Stores at Tabora and the Sub-Stores at the Dockyard and Workshops are fed from the Main Stores.

The stores have recently been moved into other buildings at Tanga. At the time of my visit there were no fire appliances inside the buildings and only one hose outside; no instructions appeared to have been given to the staff in its use. The General Manager at once gave orders that suitable measures should be taken without delay.

75. The District Stores at Tabora and the Sub-Stores at the Dockyard and Workshops are fed from the Main Stores.
The first is under a District Storekeeper, and up to the time that the Main Stores at Dar-es-Salaam were in working order it was found necessary to maintain there a three months’ stock. The stores are housed in old sheds with, it is right to say, good fire protection by hydrants, but, if the principle of maintaining such large stocks is maintained, new buildings will have to be provided. The Chief Storekeeper was in favour of holding three months’ stock on the grounds that supply by rail to there from Dar-es-Salaam takes a good time and that no reduction could be effected in staff if the stocks were reduced. The General Manager was in favour of reducing stocks to one month’s supply. I agree with the General Manager; I do not think there is any justification for locking up so much capital in stores and buildings.

I consider that, if the minimum stocks are fixed at one month’s consumption and the store is fed monthly on indents from the Main Stores, ample margin is allowed for even such serious interruptions to traffic as were caused by the recent floods. To ensure the time and method of delivery, these stores could be sent by a special stores van on the monthly pay train. Priced ledgers would have to be maintained at Tabora to enable priced issue notes to be made out there and the minimum stocks to be held should be entered in these.

At Tabora there were large stocks of salvage stores, more particularly bolts and nuts, which had not yet been brought into store. In consequence of my recommendation the Chief Storekeeper was arranging to have these reconditioned and brought on to stores charge.

76. [...] 77. The procedure for the issue of stores is good. On the Central line there is a priced list of stores which is issued to all indenting officers; it is reviewed periodically and is kept well up to date. The present classification is that used by the Indian State Railways but, in order to assist indenting in Great Britain, the Crown Agents’ classification is being adopted. This is also simpler and, when it is in force, the Chief Storekeeper will be in a better position to insist on officers indenting according to classification. Two priced issue notes are sent out with the stores, whether delivered by rail or lorry, one copy being receipted and returned by the consignee. With the exception of the Engineering Department who have their own lorries and can collect for themselves, the Stores Department makes all local deliveries in Dar-es-Salaam from the Main Stores by its own light lorries, of which it has two. The monthly summary of issues is sent to indenting officers during the first week of the following month without fail. I was assured by the Acting Chief Engineer that these are usually received by the District Engineers within a few days of the month to which they relate, and they are thus enabled to ascertain their monthly expenditure promptly.

On the Tanga line there is no priced list of stores issued and the system of issue notes was different. Two unpriced issue notes accompany the goods and a
priced issue note for them is sent later. The consignee receipts and returns one of
the unpriced issue notes and retains the priced one. Although not so prompt as
the Central line system, there was no reason to complain of undue delay in the
receipt of summaries of issue notes. To have two systems, however, introduces an
unnecessary complication and the Chief Storekeeper gave orders during my visit
for the adoption of the Main Stores’ system at Tanga.

In view of the work entailed in issuing and printing a priced list of stores, I
recommend that this should be deferred until the future of the Tanga line has
been decided. If it continues to be worked by the Tanganyika Railway Admin-
istration, a priced list should be issued. Unfortunately that for the Main Stores
cannot be used as prices vary.

78. I satisfied myself that there was a proper system of check between stores
and tally cards and between tally cards and ledgers by the officials of the Stores
Department, quite apart from the stock verification by the officials of the
Accounts Department.

79. The Traffic Department on both lines issues traffic stores to stations up
the line; it has its own sub-stores for the purpose under a storekeeper, drawing in
bulk from the Stores Department as required. I think it is better for the Stores
Department to undertake this work; it has trained staff for the purpose and the
work of replenishment would be made simpler. On principle it is sounder to
confine the custody of stores as far as possible to the department whose special
duty it is. The Chief Storekeeper is prepared to undertake the work if he is pro-
vided with a fitted stores van attached to the pay train. If this was arranged, both
the monthly issue of stores to stations and the monthly replenishment of the
Tabora stores could be effected by means of the pay train.

80. Stores and spare parts manufactured by the Locomotive Department for
its own use are not passed through the Stores Department. This is wrong, as the
Locomotive Department can make any article it requires regardless of the cost
and of whether similar articles are held in the Stores or not. The Workshops
should not be allowed to make any spare part or item of stores without an order
from the Stores Department, / except in a case of emergency, and these should be
rare. The procedure should be that, when the Locomotive Department requires
these articles, it should indent on the Stores; if it knows they are not held by the
Stores, it can apply at once for an order to manufacture. When the articles are
made, they should be passed through the Stores books and priced in the same
way as stores supplied from any other source.

81. In certain directions it appeared to me that the Stores Department was
doing unnecessarily elaborate clerical work. Thus it notifies every department of
the arrival of all stores and sends them copies of all orders. All that appears to me
to be necessary is that it should notify a department of the ordering and arrival
of any particular stores which have been specially ordered for that department. It
is the duty of the Stores Department to keep its stores replenished up to normal requirements and it is unnecessary for it to notify other departments that it is carrying out this duty. If any department foresees an unusually heavy demand for any particular item of general stores, it should notify the Stores Department at once; it then becomes the duty of that department to take steps to meet the demand and to notify the other department when and in what manner it is able to fulfil its requirements.

The Tabora and Tanga Stores submit every month to the Chief Storekeeper lists showing the balance on hand of all stores. The Chief Storekeeper says this is necessary in order to let him know the actual position. These are long lists and to prepare them afresh every month entails a lot of work. There is a European in charge of each of these stores, and, provided the system of minimum stocks is properly observed. I cannot see that there is need for the Chief Storekeeper to get all this information every month.

82. The European staff of the Stores Department is 11; allowing for leave, 8 or 9 are always in the country. Of these one is at Tanga, one at Tabora, and one acts as Wharf Supervisor to superintend the receipt of stores from overseas. The Electrical, Workshops and Dockyard Sub-Stores are all in charge of Asians. There are thus normally always five or six Europeans, including the Chief Storekeeper, employed at the Main Stores. While the stores were scattered all over Dar-es-Salaam there may have been a need for all these Europeans, but the main justification for the expenditure of such a large sum of money on the new stores buildings and yard was to make supervision easier and more economical. If there is to be no reduction in staff, it is hard to justify the expenditure of the money. The necessity for this number of Europeans cannot be attributed to the possession of two separate lines because there is only one European normally at Tanga. The turn-over of the department, i.e., the sum of the value of receipts and issues, in 1928/29 amounted to £543,524; the total stock in hand is normally only about £130,000 to £140,000. I consider that, with the excellent facilities now available, a staff of eight to nine Europeans always in the country is out of proportion to the business handled.

The General Manager agrees that the staff is excessive; in order not to delay the Estimates for 1930/31 he did not alter them but proposed instead to reduce the number actually employed by one during the current year and probably by a second in the year after. I think that such a reduction is the minimum called for. A total establishment of 11 will still allow four Europeans permanently for work in the Main Stores and Head Office, which I consider a more than ample provision.
CHAPTER IX. – ACCOUNTS DEPARTMENT.

83. The office of the Chief Accountant and the office of the General Manager have hitherto been amalgamated with a view to economy. I have forwarded a special Report pointing out that with the growth of business this arrangement has outlived its usefulness, and recommending that the two offices should be divorced, separate establishments being laid down for each.

Examination of Colonial railway accounting by a trained accountant.

84. I do not propose to enter into a detailed review of the work of the Accounts Department, because I am informed that it is intended that an accounting expert shall report on the methods of accounting on Colonial railways.

I examined generally, however, the various sections of the Department and satisfied myself that the usual procedure of accounting in force on Colonial Government railways was pursued, that the staff employed to carry out that procedure did not appear excessive, and that the traffic audit, the inspection of station accounts, and the verification of stores were carried out systematically.

For some time past I have been impressed with the necessity for a review of the methods of accounting on Colonial railways by a trained accountant. On most of the railways which I have inspected the system of control has appeared to be cumbrous and extravagant in labour, relying on a multiplicity of checks and counter-checks, which are replaced, I believe, in modern practice by control ledgers and accounts. Not being myself a trained accountant, I have hesitated to criticise it in detail, except in regard to traffic audit of which I can claim some knowledge. My impression has been confirmed by the Report made recently by Sir Arthur Lowes Dickinson at the invitation of the Indian Government on the System of Accounting, Audit and Statistics of the Indian Railways. The accounting methods on Colonial railways have been based to a certain extent on this model, and the criticisms in the Report and the recommendations for improvement appear to me to apply with great force to Colonial railway practice. I therefore feel sure that an inspection by an expert would have beneficial results.

85. I also recommend that the expert should be asked to report on the work of the Railway Audit Department in relation to Colonial railways, just as Sir A. Lowes Dickinson reported on the relations between the Railways and the Auditor General in India.

An auditor of a private railway company is expected, to quote ‘Railways’ by W. V. Wood and Sir Josiah Stamp, ‘to make a reasonable and proper investigation of the Accounts in the interests of the Shareholders, as he acts on their behalf and not on behalf of the Directors. He cannot, by reasons of the magnitude of the work, examine every transaction, and he is authorised by Parliament to employ assistants who, in fact, perform a continuous audit, so that the closing
of the audit follows shortly after the Accounts for the year are completed. The Accounts in a special statutory form, and not merely the Balance Sheet, require to be certified by the Auditors; their certificate stating that the Accounts are a full and true statement of the financial condition of the Company and that the dividends proposed to be paid are, in their judgment, bona fide due. If necessary, this certificate is qualified by directing attention to particular matters which the Auditors think of importance, and the Annual Meeting, when the adoption of the Accounts is considered by the Shareholders, has that certificate before it in the printed Accounts. / 

Unlike the auditor of a private company, the Colonial Audit makes no attempt to carry out what I may call the higher duties of audit; it gives no advice or criticism on financial policy, on such important matters as the course to be observed in respect of depreciation or the use of revenue for financing capital expenditure. Its work is confined principally to carrying out a minute check of all accounting documents, such as those connected with pay and traffic invoices, most of which, if not all, have been checked already by the Accounts Department. The auditors of a private company only make test checks of this nature sufficient to show that the accounting and internal check system of the railway itself are being carried out properly.

The Audit Department thus does not touch at all one, and in many ways the most important, side of what are usually considered an auditor’s duties; while it carries out the rest in far greater detail than has been found necessary in commercial practice.

The difference is expressed to a certain extent in the manner of signing the annual accounts. In place of the comprehensive certificate of private auditors that the accounts present a full and true statement of the Company’s affairs, the Colonial Auditor merely signs the accounts as ‘Examined.’ Such a certificate carries little or no responsibility with it. Incidentally, the annual accounts of the Tanganyika Railways are signed by neither the Chief Accountant nor the Auditor, a rather remarkable omission.

The Tanganyika Railways have to pay for this detailed examination, which private railway companies have found superfluous, £4,000 a year or 1/2 per cent. of their total receipts, a sum entirely out of proportion to the fee which the auditors would receive from a railway company of the same size for a commercially satisfactory audit of its business.

The Audit Department has no option but to carry out this detailed check; it is enjoined by Colonial Regulations. I have no wish to imply that it employs more men or spends more money than is necessary in order to do the work required of it by these Regulations. But it appears to me that, in so far as railways are concerned, the regulations which are framed to protect the interests of the proprietors, the Government, require amendment, and it is because I feel sure
that it should be possible in return for a much smaller expenditure to provide an audit of greater value to the proprietors that I lay stress on the importance of including this question in the terms of reference of the accounting expert.

86. I have explained earlier in paragraph 50 the recommendations which I made locally for the formation of a small Statistics Section in the Accounts Department. It was agreed that these would be put in force at once. The concentration of the work will in itself mean that staff can be economised, and will enable simple calculating machines to be used and so effect further economies. The Acting Chief Accountant stated that he would be able to carry out the extra work without additional staff if four clerks now employed on statistical work in the Locomotive Department were transferred. I think that it would be wise also to examine the work of other branches of the Accounts Department and see whether one or other of the various types of simple and comparatively cheap machines now on the market could not be introduced with advantage.

87. The system for compiling pay-sheets for native labour along the line is to my mind by no means satisfactory. To illustrate what takes place at present I am taking the Engineering Department because its labour is most scattered and therefore presents the greatest difficulty. The muster rolls on which the boys’ attendance is marked are sent in by Permanent Way Inspectors to the District Engineer’s Office on the 20th of the month. The boys are marked in advance on these muster rolls as being present for the remaining ten or eleven days of the month. From these in turn the District Engineer’s Office compiles the salary sheets. This is a long task as the name, number and rate of pay of each boy has to be filled in; the check to see that the distinctive number is right in each case, a point on which great stress is laid for identification purposes, is in particular a lengthy process. These salary sheets are not sent in to Dar-es-Salaam or Tanga but are picked up from the District Engineer’s Offices en route by the pay trains, which usually leave their respective headquarters either on the last day of the month or the first day of the next month. The Permanent Way Inspectors and Gangers, who are present at the pay, notify the officials on the pay train of any deductions which are necessary owing to a boy’s absence after the muster rolls were sent in, and the pay-sheets are endorsed accordingly. By these means all payments along the line have been completed usually not later than the 5th of the month.

The system of entering the boys in the muster roll for ten days or so ahead is, I consider, radically unsound. It reverses the ordinary process in that, if a Permanent Way Inspector or Ganger is careless, if a correction sheet is missing or the Permanent Way Inspector has omitted to visit the gang and check it, the boys get more pay than their due. Any mistake or carelessness acts against the Railways. A more serious objection is that it leaves an opening for carelessness and perhaps for fraud, and teaches the men in charge of labour and their clerks, in most cases
half-educated natives, to enter up imaginary figures in an important accounting document. It cuts at the very root of proper accounting and such teaching often bears unwelcome fruit.

In defence of the present system it is claimed that it was brought in on the demand of the Labour Department which is very insistent that boys must be paid within a day or two of the end of the month and should not be kept waiting for their pay after they have left work. This argument loses much of its force because the boy does not leave work only at the end of the month. The only way of ensuring that he gets his pay the instant he leaves is to give every Permanent Way Inspector an imprest account, which is clearly out of the question.

The Acting Chief Engineer proposed as an alternative that there should be two muster rolls for each month. The first, as now, would be sent in by the Permanent Way Inspector to the District Engineer’s Office by the 20th of the month; from it the District Engineer’s Office would enter on the salary sheets the details of names, numbers and rates, the laborious part of the work. At the end of the month the Permanent Way Inspector would send in the second muster roll which would be for the period from the 21st to the end of the month. To fill in from these on the salary sheets the days worked in the second period and to make up the total is a comparatively easy task which the Acting Chief Engineer estimates should not take more than one day in the District Engineer’s Office. Allowing two days for the muster roll to reach the District Engineer’s Office, one day for completion of the salary sheet, and one day for unforeseen delays, the pay train should always be able to start work at the latest by the morning of the 5th of the month. With three pay trains on the line, as proposed for the future, the payment can be completed in four days. Even if another day is added for possible delays, which makes the large allowance of two days out of nine for unforeseen contingencies, all on the line would receive their pay not later than the 9th and most of them by the 7th. I do not think that this can be considered too long, especially if it is remembered that the bulk of the boys along the line are in employment of a permanent nature.

This scheme was discussed with the General Manager and the heads of the departments more closely concerned. The principal doubt appeared to be that putting back the date of payment would have an unsettling effect on the labour. There is already a certain amount of competition for labour, more particularly on the Tanga line, and plantations have an advantage in that their labour is all concentrated and can be paid at short notice.

The effect on the railway boys could be minimised by introducing the delay in stages and not throwing the whole change on to one month. No final decision was taken, but the Acting Chief Engineer was instructed to make enquiries amongst his officers as to their opinions. It is impossible for one who has spent only two months in the country to gauge the extent to which labour would be
affected, but the present system is so inherently wrong in its principle and teaching that I would urge the Railways to make serious efforts to change it, if it is at all feasible. /

CHAPTER X. – PASSENGER SERVICE AND FARES.

88. The passenger service on the Central line consists of one mail train a week in each direction between Dar-es-Salaam and Kigoma; this connects with the sailings of the ‘Liemba.’ In addition there is a service of five mixed trains from and to Dar-es-Salaam a week, terminating at Kigoma, Tabora, Dodoma, Kilosa and Morogoro respectively, the last named being available for third class passengers only. On the Mwanza branch there are two mixed trains a week each way, one of which connects with the mail train service.

This service appeared adequate and such complaints as I received were directed rather at the want of accommodation on the trains than at the inadequacy of the service.

The majority of the complaints were made by Indian Associations and related to overcrowding in third-class carriages. When I discussed the complaints with the Associations, it became apparent that their main basis was that on night journeys the accommodation was often fully occupied and passengers had therefore to sit up the whole night. Although this cannot be described as comfort, it does not constitute, as I explained to the Associations, a greater degree of discomfort than is experienced by third-class passengers all over the world. The third-class passenger cannot expect lying-down accommodation in return for the low fare he pays. Occasionally, no doubt, overcrowding does occur as on most railways, but the Administration is, I am satisfied, watching the situation and is purchasing more stock to meet the increased demand.

I received one or two complaints as to overcrowding in first-class carriages, and undoubtedly in one or two cases this also occurs. New stock is on order which should remedy it.

89. The actual accommodation provided for first and second-class passengers is of a high standard. In fact in one particular I think the accommodation provided is out of proportion to the fare paid. I refer to the latest second-class carriages. In these all but two of the compartments are two-berth coupés. Except for the fact that they are an inch or two narrower and have no reading lamps at the head of the bunks, these coupés are identical in appointment with the first-class ones. The second-class passengers are also allowed to use the first-class dining saloon. The cost of two second-class fares from Dar-es-Salaam to Kigoma is 249 shillings as against 224 shillings 10 cents for a single first-class fare. The passenger can, therefore, if he books in time, obtain by paying only about 10 per cent. extra a second class compartment to himself whereas, if he went first-
class, he would have to share his compartment, perhaps with a stranger. From the railway point of view he occupies twice the space for the same fare. If the passenger does not care to pay for two fares, he can enjoy at practically half the fare in the second-class the same comforts with a few trifling exceptions as he could obtain in the first-class. This disproportion requires correction; the best method of doing so would be to convert these latest second-class carriages into first-class for use on less important trains.

90. There has been a strong growth of passenger traffic on this line in all classes, the receipts for the year 1928/29 showing an increase of nearly 20 per cent. over the previous year. / Absence of motor competition.

So far the competition of motor traffic has not been felt to any appreciable extent on the Central line. The reason for this is the absence of any good road out of Dar-es-Salaam towards the west, but this situation is almost certain to change with the completion of the bridge over the Ruvu and of the road from Dar-es-Salaam to Morogoro. As this competition affects not only passenger but goods traffic, I am dealing with the general question in Chapter XV, – Future Policy and Development.

91. On the Tanga line the service provided consists of a mail train between Tanga and Moshi twice a week in both directions and a mixed train between Tanga and Korogwe daily, which extends to Buiko on three days in the week. The coastal area for a distance of 50 miles or more inland is well populated and the competition of motor traffic has already made itself felt to a serious extent. In fact the Traffic Superintendent reports the growth of passenger traffic on the Railway as being at a standstill, whereas previously there had been a substantial increase every year.

To combat this competition the Railways have bought two Sentinel rail cars, which should be in service by the time this Report is published. It was proposed to use these cars to run one service a day each way between Tanga and Korogwe. While I am in favour of the use of these cars owing to the cheapness of operating them, I think that the service proposed is too small to get an adequate return out of the capital involved. No profit can be expected if the distance run by each coach is limited to some 50 miles a day. Either the service should be extended beyond Korogwe if the population justifies it or a better service should be given within that zone.

92. The fares charged are 3.456d. a mile for first-class and 1.92d. a mile for second-class passengers. The third-class fares are based on a falling scale ranging from .576d. per mile for distances up to 62 1/2 miles, to an average of .353d. per mile for the maximum distance of 773 miles. Labourers in batches of 10 are granted fares at three-fourths of the above scales. A proposal has been put forward to raise the third class fares to the same level as those on the Kenya & Uganda Railways, which are roughly about 50 per cent. higher. This would
presumably apply only to the longer distance traffic because to raise the short distance fares in the face of the growing motor competition would be suicidal. But even to this I am strongly opposed on account of potential motor competition and because I consider a higher rate than 1/2d. a mile is unsuited to the economic situation of the native passenger and definitely stifles travel. This has been proved in Nigeria and ‘Iraq where, as the result of my recommendations, third-class fares were reduced in the first case from 3/4d. to 1/2d. a mile and in the second case from 1 1/8d. to 1/2d. a mile. In both cases the Administrations have recognised in their Annual Reports the benefits derived from the reductions. To take the opposite step and raise the fares would put a serious check on native travel and this would affect not only passenger but goods receipts, because travel by the native undoubtedly stimulates trade.

93. One step which the Administration might take to stimulate travel would be by the issue of mileage tickets. The prospective passenger under this system buys so many hundred or thousand miles of travel from the railway and he can use that mileage anywhere he chooses on the system and at any time. In return for buying his travel in quantity he gets it at a reduced rate. It has been adopted on many railways with success and is well adapted in particular to the needs of commercial travellers.

94. The catering on the dining cars on both the Central and Tanga lines is done by contract, with different contractors, however, for the two lines. I received unsolicited evidence from more than one member of the travelling public that both the present services were satisfactory.

A proposal was, however, put forward that the Railways should institute a Catering Department of their own. A catering business is always one of the most difficult to run; it depends more than the ordinary department on the personality and experience of the man in charge and these difficulties are accentuated when a new catering department has to be started. Moreover, a railway with so small a traffic as this cannot hope to make a substantial profit out of catering; its first concern must be to give satisfaction to its passengers without losing money in doing so. The present contracts appear to fulfil these conditions. I therefore recommend the retention of the existing arrangement, provided, of course, that the service is not allowed to drop below the present standard.

CHAPTER XI. – GOODS SERVICE AND RATES.

95. The most striking feature of my inspection of the Tanganyika Railways was the absence of complaints about the rates for the carriage of goods, whereas my usual experience has been that they form one of the most frequent and important items on the agenda of meetings with Chambers of Commerce and other public bodies. This is the more remarkable because in the process of assimila-
tion of rates on the Tanganyika and Kenya & Uganda Railways many have been raised quite recently, and also because low transit rates are in force for traffic to and from the Congo. The only complaints, in fact, which I received related to the rates on medicines, confectionery and fertilisers, and a request from the Indian Association at Tabora for the replacement of taper rates by rates based on a uniform charge per mile.

The first three were minor points in which it was not necessary for me to intervene and, but for my presence, would have been settled directly with the General Manager. With the last point I will deal later. In consequence of the general absence of complaint about rates, it will only be necessary for me to refer shortly to the whole subject.

96. The most important feature of the rates structure is the tariff of special transit rates to and from the Congo. Under the Convention of the 16th March, 1921, the Belgian Government has the right to convey goods in transit free from customs dues between its ‘leased site’ areas in Dar-es-Salaam and Kigoma. The exports consist mainly of copper and cassiterites but the imports are varied, a large proportion being railway and constructional material and motor cars.

In order to attract this traffic, to which at least one alternative route is open, it was necessary to quote low rates, and the success attending this is illustrated by the fact that in 1928/29 the receipts from this traffic were more than 40 per cent. of the receipts from the Central line and more than a third of the receipts of the whole Railway System. It is thus to the advantage of the other users of the Railways that these low rates should be granted, because without this traffic the system would certainly be running at a heavy loss and it would be necessary to raise other rates and fares, unless the Government was prepared to grant a large subsidy out of general revenue.

Other routes to the Katanga district of the Congo, where the copper mines are situated, are being opened and the competition will become keener. The General Manager is of the opinion that, while the Railways will not in the face of this competition be able to get any increase in the traffic with this particular area, they will probably be able to hold what they have already and that there will not be any actual decrease in revenue on this head. I think this is a reasonable view of the prospects.

Fortunately large developments, both mineral and agricultural, are taking place in districts of the Congo closer to Tanganyika Territory than Katanga is. The most important of these are to the north and north-west of Lake Tanganyika. The Belgians are also building a railway from Lake Tanganyika to Lake Kivu with a branch to tap the rich and densely populated areas of Ruanda and Urundi. The natural outlet for these developments is via the Central line and it will obviously be the policy of the Tanganyika Railways to attract and foster
this traffic, quoting special rates where it is thought advisable in order to meet competition. / 

97. As a consequence of the consideration given to the question by the Commission on Closer Union, the Kenya & Uganda and Tanganyika Railway Administrations arranged to assimilate their rates as closely as the respective conditions which obtained on the two systems permitted. They have been so far successful in this that at the present time the rates on imports are identical and those on some of the exports have been approximated. Before complete assimilation can be effected, an agreement remains to be reached on the question of preferential rates on local produce. As this is, at the time of writing, under discussion at the Customs Tariff Conference at Nairobi, it will be in opportune to review it in this Report.

Arrangements have also been made between the two Administrations for the introduction of through booking on all classes of traffic, both coaching and goods. This arrangement includes an agreement whereby a person dispatching goods from one system to the other will obtain the same advantage on a tapered rate as if the whole journey was made over one system, each Administration receiving its mileage proportion of the tapered rate. Previously the consignor would have had to pay the sum of the rate to the frontier and of the rate from the frontier to destination, thus losing the advantage of the full taper on the total distance hauled.

98. The Indian Association at Tabora put forward the request that, instead of rates, as now, being tapered and therefore the charge per mile becoming less as the distance increases, each class should be charged at a uniform rate per mile, irrespective of the distance hauled. The reason for this request is that formerly Tabora acted as a distribution centre for the area round Shinyanga and Kahama. Since the branch to Mwanza has been built, it is cheaper with the tapered rates to consign goods direct from Dar-es-Salaam to stations on the branch rather than to send them to Tabora and redistribute from there. Tabora is consequently losing some of its trade and importance.

This result of tapering rates, the concentration of the distributing business at the coast to the detriment of up-country centres, is well known; the example which is most frequently cited is that of Australia. The usual method of curing it is not to revert to the unscientific basis of uniform rates per mile, which penalises by heavy freights those who live at the far end of the line and thus checks development, but to have special low distribution rates for traffic from specified up-country centres, which are thus placed in a position to compete on favourable terms with the coastal towns. In the tariff which I drew up for the Uganda Railway in 1921 to replace the old uniform rate per mile tariff and which remains in its essential features and in most of its principal charges as the tariff now in force, I adopted this method. I can therefore claim to be in favour
of its application, where appropriate, but I do not think that Tabora can claim to be on the same footing as Nairobi or Jinja, or to be an established distributing centre in the same sense as those places were in 1921. Nor does it seem in the interest of the Railways to introduce artificially the complications and extra work and handling of a distributing centre, where it can only be said to have existed in a very modified form previously. It would entail establishing a distributing centre and distribution rates for every new branch line. In certain cases this may be justifiable but, before the Railways can be expected to incur extra expenditure on double handling, clerical staff and extra work, there must be a large established trade which it would be to the detriment of the country to disturb, as would have happened in the case of Nairobi or Jinja. I do not think that Tabora can claim this.

The remedy for the Tabora merchants appears to be to establish agencies at the new centres, like Shinyanga and Bukene. Unfortunately the country to the south, outside what may be called the area of Tabora itself, does not hold out good prospects, thus limiting the possibilities of establishing a distributing trade in that direction, but it provides a further argument against the establishment of Tabora as a distributing centre.

99. [...] 

100. In the tariff system which I drew up for the Uganda Railway the principle was introduced of carrying the more valuable goods, in this case those in the five highest classes, at Railway Risk only; the five lowest classes are at Owner’s Risk, but Railway Risk conditions can be obtained on payment of 10 per cent. additional freight. In my previous Report on the Tanganyika Railways I recommended the adoption of this system there also. I am glad to be able to record that on the Tanganyika Railways it works satisfactorily, and also presumably on the Kenya & Uganda Railways as it is still in force there.

With the terms of the liability which falls on the Railways in the case of carriage at Railway Risk I have no fault to find nor with the margin of 10 per cent. extra charge made for the additional liability incurred by the Railways in carrying at Railway as opposed to Owner’s Risk. I am of opinion, however, that the liability of the Railway under the Owner’s Risk conditions is too limited. The definition reads as follows:–

‘O.R.’ or ‘Owner’s risk’ shall mean that the transport of the goods is undertaken by the Administration on the special condition that the Administration shall not be liable for loss, damage or shortage except upon proof by the consignor that such loss, damage or shortage was occasioned by and through the wilful misconduct or malfeasance of the Administration’s servants.’

Under these conditions the onus lies on the consignor to prove that there has been wilful misconduct by the Administration’s servants. In the absence of definite proof of an act of wilful misconduct the consignor has no legal redress, even
in the extreme case of loss of a whole consignment, whose receipt the Railways admit. This view is upheld by the judgment of the House of Lords in the case of H. C. Smith, Ltd. versus the Great Western Railway Company,\(^6\) where the conditions of carriage were similar to those on the Tanganyika Railways.

I think such conditions are not only unfair to the owner but are in principle unsound from the Railway point of view, because it may lead to a tendency that the loss or damage of articles carried under such conditions is not of great importance. It is fair to say that I saw no such tendency on the Tanganyika Railways. I was assured on the contrary that the Railways pay claims in the case of losses of complete / consignments or complete packages or where it was obvious that there was gross carelessness on the part of the Railway staff. The Railways, in short, recognise the harshness of the conditions but interpret them leniently. It is wrong, however, that the possibility of redress open to the owner should rest solely on whether the Railways adopt a liberal attitude or not. The attitude adopted by the Railways may change in course of time and they may insist on the full rigour of the conditions before they will admit liability.

I would recommend the introduction in their stead of the standard conditions of carriage at Owner’s Risk adopted by the Railway Rates Tribunal of Great Britain. This body was formed under the Railways Act of 1921\(^7\) and, not only does it carry great weight as being impartial and representative, but it had the advantage of hearing the views of both Railways and traders argued in front of it by the best legal brains before it framed the conditions. They read as follows:–

‘The Company shall not be liable for loss, damage, deviation, misdelivery, delay or detention of or to a consignment or any part thereof, except upon proof that the same arose from the wilful misconduct of the Company or their servants. Provided that nothing in this condition shall exempt the Company from any liability they might otherwise incur in the following cases:–

‘(a) Non-delivery of the whole of a consignment or of any separate package forming part of a consignment, properly packed, and addressed in accordance with Condition I hereof, unless such non-delivery is due to accidents to trains or to fire.

‘(b) Pilferage from packages of merchandise protected otherwise than by paper or other packing readily removable by hand, provided the pilferage is pointed out to a servant of the Company on or before delivery.

‘(c) Misdelivery, where merchandise addressed in accordance with Condition I hereof is not tendered to or placed at the disposal of the consignee within 28 days, or in the case of perishable merchandise within a reasonable time, which shall not be less than 72 hours after receipt of the consignment by the Company to whom the same was handed by the sender.
‘Provided, however, that the Company shall not be liable in the said cases of non-delivery, pilferage or misdelivery upon proof by them that the same has not been caused by the negligence or misconduct of the Company or their servants.’

It will be seen that, while in general the onus of proof lies on the owner, the Railway has to prove, in cases where non-delivery of a whole package, obvious petty pilferage or misdelivery has occurred, that it was not due to the negligence or misconduct of its servants. The conditions will, of course, require amendment as regards sub-paragraph (c) in order to suit local circumstances but, apart from that, they appear to me to treat both parties to the contract very fairly. They cannot be said to bear hardly on the Railways and are well adjusted to the more rigorous conditions which are imposed on the Railways for carriage at Railway Risk and in return for which the Railways receive additional compensation.

101.[...]

102. The system of consigning and invoicing goods follows the general lines of the system which I recommended in 1921 should be adopted both here and on the Kenya & Uganda Railways to replace the more cumbrous methods then in force. The main features of the new system are that the consignor presents a single consignment note; these differ according to whether the goods are to be despatched at Railway or Owner’s Risk and have the conditions printed on them. To simplify working, the various types of consignment note are coloured differently. In this way there is no need for separate risk notes. At the bottom of the form is a perforated section printed on the reverse side which is turned up by the booking clerk to lie against the main body of the consignment note. The columns for weights, charges, etc., are printed on the perforated slip as well as on the portion of the main consignment note against which it lies. The booking clerk can thus, with carbon paper, fill in the details and charges on both and has merely to tear off the slip and give it to the consignor as his receipt. This is an ingenious improvement on the method of duplicate consignment notes which I proposed. The invoices are then prepared from the consignment notes, all consignments from that station to any other station being entered on the same invoice form, so far as space allows. The consignment notes are progressively numbered by the dispatching station, and this number is repeated on the invoice and on the package.

The system has the advantage from the point of view of the Railways that it economises staff and stationery and gets the consignor out of the goods shed much more promptly than the old multiple invoice system. The last point is of importance, as the greater the number of people in the goods shed, the greater the risks of and opportunities for pilferage. From the point of view of the consignor it has the advantages that he has fewer documents to prepare and he or his representative is not kept in the goods shed waiting while a separate invoice is being prepared for every destination to which he may be dispatching goods.
I have entered into a little detail in describing the system because I consider it is so admirably adapted to other Colonial railways. I have, in fact, recommended its adoption elsewhere but with little success in certain cases. The opposition to it appears to arise from fear of trying a system novel to Colonial railways, and to be shared by both traders and railway officials. The success which has attended its use on both these and the Kenya & Uganda Railways should act as an inducement to both merchants and traffic officers elsewhere to join in abolishing the old cumbersome, time-wasting methods.

CHAPTER XII. – STAFF QUESTIONS.

103. The most important staff question with which the Tanganyika Railways are faced is the training of the native. From its early days this Administration has taken active measures to train the native to undertake skilled work on the Railways and I was able in my 1921 Report to comment favourably on the progress made, and as a result of my recommendations the establishment of European artisans was increased to enable manual instruction to be given. The high cost of the imported Asiatic, when his passages, leave, housing and allowances have been counted in, has acted as an incentive to persevere in these efforts.

In the Locomotive Department there is a regular scheme for training indentured apprentices, and the training of older natives, who are too old to be apprenticed, is also undertaken. There is a hostel under the Education Department at Dar-es-Salaam where some of the railway apprentices are lodged, and the Locomotive Department has its own hostel at Tabora with accommodation for 37 indentured apprentices. There has been a noticeable improvement in the physique of the boys since these hostels were started. At Tanga the Locomotive Department has 17 apprentices but no hostel. At both Dar-es-Salaam and Tanga a fair number of improvers are passed on from the Education Department to the Railways. In the Traffic Department boys are obtained from the Education Department after they have learnt their elementary education and are then taught telegraphy and station duties in the Railway Telegraph School. At Tanga the Education Department has its own Telegraph Training School and from this the Railways draw some of their recruits. Thirteen were so transferred a year ago and of these it has up to date only been necessary to get rid of one. The Engineering Department has no regular training school or scheme at present.

As a result of the efforts made a certain measure of success has been attained; to take examples, all the guards employed on the Tanga line are African and so are most of the signallers throughout the system. There are also a few good African station-masters and booking clerks. The District Engineer on the Tanga line reports that he has some quite good African sub-permanent way inspectors and carpenters. But in every department I met with the same complaint, that when
the African staff had been trained up to a certain standard they appeared to slacken off, partly owing to lack of ambition, partly from the false idea that they were already entirely proficient. This was the comment of all departments, given independently, and applied both to the clerical staff of the Traffic Department and to the operative staff of the Locomotive Department, who had no clerical training. A further handicap is their objection to being moved away from their own home stations, which extends even to not caring for work such as guards’ or drivers’ which entails absence from home.

While this is disheartening to those who have expended so much effort on training the native, it is encouraging to note that the officers of the Administration do not look upon these results as in any way final. On the contrary, their view, as expressed by the General Manager, is that technical education has reached a dead-centre which will have to be surmounted. The old uneducated African learnt the rudiments of a trade by imitative methods and, considering his limitations, often did excellent work. The present man, who has only the most elementary education, gets a smattering of a trade and thinks he is fully qualified. He is encouraged in this belief by the ease with which he can get a job elsewhere, more especially on motor work. When a better stage of education has been reached, not only will the man be able to absorb his training better but he will have a better appreciation of his own deficiencies, and the Railways will be able to build up a better class of tradesman.

Whether the last-joined apprentices from the Education Department have reached this stage remains to be seen. But, whether they have or not, the Administration does not intend to relax its efforts. It was also encouraging to note the co-operation between the Education Department and the Railways, and the recognition, not only in departments like the Traffic where the progress of employment of the African must obviously depend on the spread of education, but also in other departments where the connection is not so obvious, that the success of any scheme of training the native must depend largely on the success attained by the Education Department.

104. A Provident Fund for the Railways has recently been started and every railway servant with a salary of not less than 60 shillings a month, who is not qualifying for a pension, has to contribute towards it one-twelfth of his monthly salary. On their side the Railways contribute to the Fund the equivalent of 75 per cent. of the man’s contributions, which may be raised up to a limit of 100 per cent., provided the total Railway contribution is not thus raised to more than 1 per cent. of the net earnings. In practice the 75 per cent. level has not yet been passed.

This clause is a feature of the Provident Funds of most Colonial railways and it is rare to find that the condition permitting the full 100 per cent. to be paid is fulfilled; presumably the object of the clause is to hold out an inducement to
railway servants that if they succeed by their efforts in increasing the net earnings they will obtain a better bonus on retirement. As an inducement to better work by the staff, I have no hesitation in saying that this clause has had no effect whatever and I have no doubt that all the General Managers would agree. I do not think that it ever enters into the minds of most of the staff to connect the two things. Very few know of the existence of the clause or how it is worked, and those who do realise how little their individual efforts will avail to obtain a small increase in the bonus which they will receive in a future, which is probably still remote. Furthermore, it is wrong that a large corporation like a Colonial railway should contribute to the Provident Fund which it establishes on behalf of its servants a smaller sum than it forces them to contribute. I know of no railway or large corporation in Great Britain which insists on its employees contributing to its Provident or Superannuation Fund more than it does itself. It is even more unfair in a Government-owned railway to base the bonus on net earnings when the policy of the owners is often directed to keeping net earnings down to a low figure. I therefore recommend most strongly that on the Tanganyika Railways the bonus to be contributed normally by the Railways to the Provident Fund should be equal to that contributed by the employees irrespective of net earnings, and I trust that this principle will be extended to other Colonial railways.

105. On the Tanganyika Railways about 70 of the senior posts are pensionable. The holders of these posts will probably have started their service as contributors to the Provident Fund. When they are promoted to a pensionable post, they receive their part contribution to the Provident Fund with accrued interest, but not the Railway bonus. I have several times in the past pleaded that the system of pensions should be abolished / entirely and that the Provident Fund should be made applicable to all grades from the artisan to the General Manager. The reasons which I have advanced for this recommendation are that under a pension system it is hard to get rid of a man who has a general low level of efficiency. Provided he avoids any gross acts of neglect or inefficiency, he is reasonably safe, and this obtains more particularly when he is within a few years of reaching the age for retiring on pension. If nothing can be given to a man before he reaches a certain age, there is a natural disinclination to get rid of him before that age when he will have, perhaps, no provision for the future whatever. The highest efficiency cannot be reached in such conditions. With a Provident Fund a man can be got rid of whenever the interests of the railway service demand it, irrespective of his standing or his length of service. Another advantage is that with a Provident Fund a railway makes provision year by year for its liability whereas in a pension system the amount of the liability is uncertain and is not provided for as it occurs.

In the Tanganyika Railways it will be comparatively easy to introduce a Provident Fund system because, generally speaking, only Europeans with salaries on
the scale £480-20-£600 and higher are now pensionable. There would be no injustice in laying down that from a fixed date, while all the existing holders of pensionable posts would retain their pension rights, these privileges would not be extended to anyone promoted or appointed in future to these posts. Those who are already in the service and hope to be promoted to these posts would not be injured, because there is no obligation on the Administration to maintain the pay and privileges of a post in the interests of anyone in the service who may have hopes ultimately of attaining that position.

106. It was represented to me that the travelling allowance of the Heads of Railway Departments should be raised from 8/- to 12/- a day to bring it on a level with that drawn by the Heads of some Government Departments and Provincial Commissioners, who are in certain cases on lower salaries, and also to bring it into line with that drawn by the Heads of Departments on the Kenya & Uganda Railways. From the enquiries I made I satisfied myself that on the basis of 8/- a day the Head of a Railway Department is not out of pocket by reason of his having to travel. That to my mind is the proper test and I regret therefore that I cannot recommend an increase which depends solely for its justification on the allowance given in other services.

107. The leave granted to European officials returning to the Territory for duty is 6 days for every month of service in the Territory plus the time taken on the journey to and from England. Taking 2 1/2 years as the usual tour, the official thus gets for every 30 months he spends in the Territory 8 months leave in all, of which 6 are spent in England. It has been decided on medical grounds that this amount of leave is necessary, and with that decision or the wisdom of it I have no wish to dispute. On the contrary on general grounds I think it is a wise policy to grant generous leave terms in a tropical country. But I would submit that it is not an essential part of that decision that in the normal case these officials should be expected to do no work during the whole of the 8 months. The main reason for this length of leave is that it is necessary for them to stay in a temperate climate for a certain period in order to recover from the effects of the tropics, but, while it is necessary that they should be freed from the cares of work for a portion of the time, it does not appear essential that they should remain idle for more than a fifth of their whole service. Actually in the case of senior officers they are called upon to do a good deal of work whilst they are at home on leave, such as conferring with the Crown Agents on technical matters and inspecting candidates for appointment. Also many of the junior officers take advantage of this stay at home to keep ahead of the latest developments in their professions. But the generosity of the leave terms in itself gives the Railways the right to demand that all of its officials and not merely a few should devote some of their time on leave to the Railways’ service, and I include in that term the duty of keeping up to date in their professions.
I therefore recommend that all officials should be compelled to devote one-fifth of the period of leave spent in England to professional work, unless exempted by medical certificate. It is not necessary in this Report to specify the various forms of professional work open to them, but it will be sufficient to say that, apart from work to be done on behalf of the Railways themselves such as the inspection of rolling stock, the British Railways are most courteous in the facilities which they offer to Colonial railway officers to inspect their working and the methods adopted in all branches. In the case of Marine officers, courses for Royal Naval Reserve Officers and Trinity House courses could be taken as equivalent. In every case the official should submit a report on his return on what he has seen or studied and travelling allowances should be paid, which could be withheld at the discretion of the General Manager, if it was clear that the prescribed time had not been spent in a reasonable or satisfactory manner.

108. Another staff question which I have pleaded before without success but, nevertheless, feel is of sufficient importance to raise again, is the need for a freer exchange of officials amongst Colonial railways. There has, more especially of recent years, been a fairly free flow of senior officials between the various railways, but hitherto it has not been extended to any degree to the junior posts. Usually the vacancies in district ranks are filled from the assistants on that railway so that each is practically a water-tight compartment up to district rank. I think that there would be a gain in efficiency if there was a more general range of selection to district rank. Each railway has in every department its own individual problems and difficulties and these are usually tackled in its own particular way. The smaller the railway and the smaller its business, the greater is this tendency. If officers are transferred to other railways on promotion to district rank, they not only are confronted with new problems but they meet new methods of tackling the old ones. The man who is transferred cannot fail to gain in efficiency by the change of outlook and the new range of problems with which he is faced. The objections which will be raised are those of language and knowledge of local conditions. A man who has only just been promoted to district rank should not be too old to acquire a sufficiently good knowledge of a new language for the practical purposes of his work, and knowledge of local conditions should not be allowed to weigh in the balance against the greater experience and efficiency which would be thus obtained.

I would recommend that when any vacancy in district rank occurs the terms and conditions should be circulated to all Colonial railways and applications should be invited. These should be supported by the recommendation of the applicant’s General Manager and a certificate from the latter that he would be prepared to accept the applicant as a district officer on his own railway. These could be then forwarded to the General Manager of the railway on which the vacancy exists for his recommendation, the final decision being left in the hands
of the Colonial Office. This procedure might entail delay in making the appointment but to my mind this is surely of less importance than having a system which affords a better training and experience to the individual.

CHAPTER XIII. – MANAGEMENT AND GENERAL QUESTIONS.

109. As mentioned earlier in Chapter IX, Accounts Department, I have submitted a special Report recommending the separation of the General Manager’s and Chief Accountant’s Offices. In the same Report I have recommended the appointment of a Deputy General Manager.

110. Prior to my arrival in the Territory it had been recognised both by the Government and by the Railway Administration that it was necessary to enlarge the powers delegated to the General Manager. A new set of proposed powers had been prepared and I examined these in detail with the General Manager. As a consequence the draft was amended considerably and a new one was prepared. In forwarding these proposed powers to His Excellency the Governor I recommended their adoption on the grounds that they were such as should properly be granted to the General Manager of a system such as the Tanganyika Railways in the interests of efficiency and discipline and pointed out that they did not exceed those now delegated to the General Manager of the Kenya & Uganda Railways. The latter powers, in fact, formed the basis of the new proposed powers for the General Manager of the Tanganyika Railways, due allowance being made for the difference in the constitution of the controlling authority in the two cases,

111. The situation regarding lands occupied by the Railways requires to be placed on a proper footing. At present these lands are administered by the Land Department; they are treated in the same way as the lands occupied by other Government departments, and the Railway Administration has little or no control over them. This is incorrect, if the announced intention of running the Railways as a business concern is to be maintained. These lands constitute an important asset and, so long as the Railways have no control over their assets, it is impossible to regard them as being run on business lines nor to regard their accounts as being separated from those of the Territory.

The first step to be taken is to decide what are precisely Railway lands. The fairest course would be to decide that these were all lands in active occupation by the previous German Railway Administration, such as the land occupied by the running road, stations, workshops, and all buildings occupied by that Administration. The same principle could be applied as regards the Allied Services. The Railways should pay for any land acquired since at the current rate at the time taken over and, per contra, the Government should pay the Railways for any
Railway lands or buildings, as defined above, which they have taken over since, such as the Railway Hotel at Kigoma now used as a Resident’s house.

There is a further justification for this as the cost of acquiring the Railways from the Custodian of Enemy Property was borne by the Railways and not by the Government.

When new lines are constructed now, the practice is for the Railways to pay only for disturbance when they run through alienated land. If the land is freehold, the Government gives the owner land elsewhere in compensation; if it is leasehold, the lease paid to the Government is reduced proportionately. These costs should be borne by the Railways and not by the Government.

I would recommend however that, even where the land has been alienated, that required for the running road should be expropriated without payment, but compensation should be paid for any disturbance to crops and buildings. For the extra land required for station sites or sidings or for any land in township areas full payment should be made. /

This principle is by no means uncommon in lands awaiting development and does not bear harshly on the people whose land is expropriated. The land occupied by the running road is a narrow strip and the value of the remainder of the property, whether freehold or leasehold, is increased out of all proportion owing to the presence of the railway.

There would be no difficulty in the Railways administering the lands. The Engineering Department, as on many railways, would hold the deeds and carry out the little amount of administration required and it should be able to do that without any increase in staff or cost.

112. The Railways pay for all services rendered by Government Departments such as Legal, Medical, Police, Post Office, Lands and Transport, and on the other hand Government Departments pay the ordinary passenger and goods rates. I am in entire agreement with this principle of paying in full for all services rendered on both sides as without it the declared intention of running the Railways on business lines degenerates into a pretence.

113. I have already related in Chapter XI, on Goods Service and Rates the extent to which rates on the Kenya & Uganda and Tanganyika Railways have been assimilated in accordance with the recommendation of the Commission on Closer Union. Thanks to the close co-operation between the two General Managers, good progress is being made with the standardisation of rules and regulations and equipment.

The most difficult question in regard to equipment is that of braking, as the Kenya & Uganda Railways use the Westinghouse and the Tanganyika Railways the Vacuum brake, which is further complicated by the possibility of the Tanga line being worked by the Kenya & Uganda Railways. The two General Managers have rightly decided that, before any decision can be taken on this important
question, the cost of conversion of either of the two systems should be ascertained, and a joint committee is being appointed to investigate all aspects of the question including cost.

114. One portion of this question of standardisation which has a wider application is that of weights and measures. At present the Tanganyika Railways use the metric system which they inherited from the German Administration. It was represented to me by public bodies that the use of metric weights handicapped them in trade dealings. In my previous Report I recommended the retention of the metric system because at that time no representations were made to me as regards the effect on trade and the financial situation did not justify expenditure on a change which was not being demanded by the trading community. Both these conditions have now been altered and, when in addition the advantages of standardisation are put forward, I think a strong case is made out for the allocation of the £12,000 which the General Manager has asked for in order to introduce British weights and measures.

115. The Annual Report for 1928/29, which has just appeared, is an improvement on its predecessors in so far as the separate reports from every departmental head are replaced by a single report signed by the General Manager, but it still remains in my opinion a most inadequate document. The ten rather meagre pages of which the Report consists, composed largely of several bald though necessary tables, compares most unfavourably with those of any of the other African Railways, such as the South African, the Rhodesian, the Nigerian, the Kenya & Uganda or, even / to go further afield, the ‘Iraq Railways, especially when it is remembered that these pages also chronicle the doings and results of the various Allied Services, the Harbours and Wharves, the Marine, the Dockyard and the Electricity Department. Brevity may be an excellent quality, but it is surely out of place in an annual report to carry it to excess. For instance, the only comment on the railway revenues from public goods traffic, the largest source of income of the system and, it is no exaggeration to say, the main reason of its existence, is ‘On the Central Railway the tonnage of groundnuts and grains fell short of expectation, but cotton showed a considerable increase. The Territory is progressing rapidly, and imports and exports must increase.’ Then follow the tables for the various commodities, which in the case of exports show tonnage but not revenue. Only one page and a quarter is devoted to what is the most important factor to a railway, its receipts, and two-thirds of this is devoted to tables.

A new method of crediting receipts in the Marine Department was adopted in 1928/29, as a consequence of which it showed a loss of £5,719 on Revenue Account for that year as against a profit of £5,525 in the year preceding, and its receipts dropped from £40,349 to £25,050. No explanation whatever is vouchsafed in the Report as to the reason for this; it is not even mentioned and in the
normal way it would be assumed, quite incorrectly, that it was due to loss of business, although even then it would be worth mentioning.

The Annual Report is the only opportunity which the General Manager has, apart from his speech on the Railway Estimates at the Legislative Council, of giving an account of his stewardship. The Railways are the property of the Territory and, quite apart from the fact that it is entitled to full knowledge, it is to the General Manager’s interest to give it reasoned explanations of what has occurred and of what it is hoped to do in the future. If all that the public receives is some statistics, linked with a few bare statements, criticism is bound to arise.

The arrangements of the accounts, tables and statistics also is by no means satisfactory, statements of numbers of passengers and tonnage of goods carried and train and engine mileage being sandwiched between statements relating to accounts. I do not propose to make any recommendation as to the actual statistics which should be presented nor as to the form in which they should be prepared, as this has been the subject of investigation and report by a Committee whose recommendations have been circulated to the various railways and are now under consideration. /

CHAPTER XIV. – FINANCE.

116. The accounts of the Tanganyika Railways are in theory divorced from those of the Territory, but in practice the separation is not complete because some of the assets of the Railways, such as unallocated stores, cash balances and advance accounts, still figure in the accounts of the Territory. Also the actual cash receipts and expenditure appear in the Territory’s accounts whereas the only figure which should appear there is the net balance, whether credit or debit, as arrived at on a commercial and not a Treasury cash basis, after all obligations have been taken to account. Certain points, too, are at issue between the two parties. For both reasons the Railways’ Accounts cannot yet be presented in proper commercial form.

The principal accounts at present consist of Revenue and Expenditure Accounts for each line, the Central, Tanga and Lindi, and for each Allied Service; a Capital Account, a Deficiency Account and a General Account, the last three being common to the whole undertaking. The balances of the various Revenue Accounts are carried to the Deficiency Account, which shows the total deficiency in working since the undertaking began. The Capital Account shows in the ordinary form capital receipts and expenditure. The balances of these accounts are carried to the General Account in which, in addition to the ordinary entries for value of cash and stores on hand and balances of advance and deposit accounts, are also included items representing free grants and loans for deficiency in working. In Tables F/1 and F/2 are given the Capital and General Accounts for the year 1928/29.

Before discussing the form of accounts which should be adopted I think it will be advisable to deal with the points now at issue. When decisions have been given on these points, the way will be clear to complete the divorce between the accounts of the Territory and of the Railways, and to start the latter on full commercial lines without the danger of having to make important alterations subsequently.

117. The first point concerns the amount which should be included in the Capital Account of the Railways to represent the sum paid for the acquisition of the Central line. The High Court valuation in January, 1925, in connection with the purchase of the Central line from the Custodian of Enemy Property amounted to £614,000. The Tanganyika Government received £580,006 in respect of the interest of the German Government in the Railway. The sum therefore actually paid over by the Territory to acquire the Railway was £33,994. As the Tanga line was entirely Government-owned, nothing had to be paid to acquire it. The sum of £33,994 was in turn credited by the Railway Administration to the Tanganyika Treasury. It has been claimed that the figure which should be entered in the Railways’ Capital Account should be the High Court valuation of £614,000, and not the actual sum paid, £33,994.

With this view I cannot agree. If the Territory had paid anything by way of War contribution to acquire the interest of the German Government, the case might be arguable, but it has not done so. If the course proposed was adopted, it would mean that the Territory was making £580,006 out of a business deal with one of its own commercial concerns and forcing that concern to insert an inflated figure in its accounts to justify the transaction. The Territory would, in fact, be floating a concern at nearly twenty times the sum it paid for it, which is hardly the function of a Colonial or Mandated Government.

It is only right, too, that the users of the Railway should obtain some of the benefit of the low purchase price; the whole should not accrue solely to the Government. Moreover, the Railways have up to date made no provision for renewals; in addition to the annual contribution for this purpose, they will have to make good, so far as their future resources permit, the arrears of renewals and past deficiencies in working. To inflict on them in addition an enhanced capital value would be most unfair.

This purchase money of £33,994 has been credited to the Treasury by transfer out of Revenue Account. It is certainly unusual to pay the first cost of a railway out of current revenue, but the whole circumstances of the transaction were exceptional and such a procedure, though unusual, cannot, I think, be called irregular.

118. The Capital Account for 1928/29 was amended by the Chief Accountant at my suggestion and is presented in the annual accounts for 1928/29 in the form above as agreed to between us. In one minor point, which unfortunately
escaped my attention at the time, I think it requires alteration. The heading 'By transfer from Revenue Account – £38,013' includes other small items of capital expenditure from Revenue as well as the sum of £33,994 for purchase. I think this item should be given separately in order to show clearly what the transaction was.

119. The first item on the Creditor side of the Capital Account, 'By Free Grants 1919/20 – 1920/21 – £126,462' is also under dispute. With this is allied the question of the deficits of those years. These items may be summarised as follows:

<table>
<thead>
<tr>
<th></th>
<th>£</th>
</tr>
</thead>
<tbody>
<tr>
<td>Capital Expenditure 1919/20</td>
<td>16,351</td>
</tr>
<tr>
<td>Capital Expenditure 1920/21</td>
<td>49,356</td>
</tr>
<tr>
<td>Tools and Plant 1923/24</td>
<td>60,755</td>
</tr>
<tr>
<td>Capital Expenditure</td>
<td>126,462</td>
</tr>
<tr>
<td>Deficit 1919/20</td>
<td>158,462</td>
</tr>
<tr>
<td>Deficit 1920/21</td>
<td>193,234</td>
</tr>
<tr>
<td>Deficits</td>
<td>351,696</td>
</tr>
<tr>
<td>Total</td>
<td>£478,158</td>
</tr>
</tbody>
</table>

The Lords of the Treasury agreed that the Exchequer grants in aid Tanganyika for the period to 31st March, 1921, were not to be regarded as repayable in due course, vide their letter S. 14,781 of 23rd May, 1922. The free grants in aid thus received were:

<table>
<thead>
<tr>
<th></th>
<th>£</th>
</tr>
</thead>
<tbody>
<tr>
<td>1920/21</td>
<td>316,000</td>
</tr>
<tr>
<td>1921/22</td>
<td>92,109</td>
</tr>
<tr>
<td><strong>Total</strong></td>
<td><strong>£408,109</strong></td>
</tr>
</tbody>
</table>

Owing to the system of book-keeping then in force in the Territory certain items of expenditure proper to the year 1920/21 were not actually paid until much later and therefore failed to benefit by the free grants in aid given by the Imperial Treasury to cover the deficits of the Territory for that year. These sums were as follows:

<table>
<thead>
<tr>
<th></th>
<th>£</th>
</tr>
</thead>
<tbody>
<tr>
<td>King's African Rifles Commitment</td>
<td>36,508</td>
</tr>
<tr>
<td>Paid in 1921/22</td>
<td>218,223</td>
</tr>
<tr>
<td>Paid in 1922/23</td>
<td><strong>£254,731</strong></td>
</tr>
</tbody>
</table>

Finally there was a special item of Railway Tools and Plant, £60,755, which was not paid until 1923/24, but which the Lords of the Treasury, also in their letter S. 14,781 of 23rd May, 1922, agreed should be treated as not repayable.

The Acting Governor's despatch 808 of 6th November, 1922, asked for a grant in aid in 1923/24 to cover this, but as it does not figure in the summary of
free grants in aid given in the Governors despatch 771 of 2nd August, 1929, it was not apparently obtained or was merely a loan in aid and not a grant.

Why this should have been so I have been unable to gather from the files of the Local Secretariat, because the promise of the Lords of the Treasury to give a free grant in aid for this purpose is quite clear.

The Tanganyika Treasury now presents the case in the following way. Free grants in aid amounting to £408,109 have been obtained from the Imperial Treasury. These have been allocated as follows:

<table>
<thead>
<tr>
<th>Description</th>
<th>Amount</th>
</tr>
</thead>
<tbody>
<tr>
<td>King’s African Rifles Commitment as above</td>
<td>254,731</td>
</tr>
<tr>
<td>Railway Tools and Plant</td>
<td>60,755</td>
</tr>
<tr>
<td></td>
<td>£315,486</td>
</tr>
</tbody>
</table>

leaving a balance of £92,623, which can be applied towards the Railway deficits of the years 1919/20 and 1920/21.

The Railways protest against this; their defence may be represented thus. The free grants in aid were made by the Lords of the Treasury to cover the expenses of the Territory as a whole without discrimination between the Territory and the Railways, and by their specific references to the Railways they made clear their intention that the Railways should be free of any debt for the years 1919/20 and 1920/21. The Treasury of the Territory had certain commitments for those years which, owing to the system of book-keeping, were not included in the accounts for the appropriate year. It is wrong that, as a result of this system for which the Railways are in no way responsible and which has since been changed, sums originally intended for the Railways should be re-allocated, that the whole resulting burden should be placed on the Railways and that the Territory should get off scot-free. Further, they can plead that the promise of the Lords of the Treasury to provide a further grant in aid in 1923/24 of £60,755 on account of Tools and Plant has never been implemented. The fault for this may lie with the Tanganyika Treasury; it certainly does not lie with the Railways. Yet the consequences of this failure the Tanganyika Treasury now wish to place entirely on the Railways.

If the Government of the Territory insists on its pound of flesh, it is no doubt entitled to it on the grounds that, although the Lords of the Treasury may have mentioned the Railways in their letter, the grants in aid were made primarily to relieve the Territory of its deficits, irrespective of the departments from which they accrued, and that, as the Railways are a subsidiary undertaking of the Territory, any question of re-allocation of funds is one between it and the Imperial Treasury and not between it and the Railways. But such an attitude can hardly, I think, be described as a generous one, because it leaves the whole of the deficit to fall on the Railways.
It has been proposed that the matter might be referred to the Lords of the Treasury for a statement as to whether they intended that these grants in aid were given for the specific purpose of relieving the Railways of their deficits and capital expenditure for the years 1919/20 and 1920/21 or not. I understand that His Excellency the Governor is agreeable to this being done and I would suggest that reference should be made accordingly.

If this course is adopted, I think that, if my reading of the case is right, it might be represented to the Lords of the Treasury that their promise to make a grant in aid in 1923/24 to cover the cost of Railway Tools and Plant has not yet been fulfilled, and a special plea made for its redemption.

120. If the Lords of the Treasury decline to give a pronouncement as to their intention in making the grants in aid or to make good the promise of a further grant in aid of £60,755, I suggest the following compromise:

<table>
<thead>
<tr>
<th>£</th>
</tr>
</thead>
<tbody>
<tr>
<td>The grants in aid total 408,109</td>
</tr>
<tr>
<td>The Railway Tools and Plant item has been specifically mentioned as to be covered by a grant in aid and therefore has the first right to relief 60,755</td>
</tr>
<tr>
<td>Leaving a balance of £347,354</td>
</tr>
<tr>
<td>The Railway deficits and capital expenditure for the years 1919/20 and 1920/21 amount to £417,403</td>
</tr>
<tr>
<td>And the uncovered commitments of the Territory for the same years i.e., those relating to the King’s African Rifles, amount to 254,731</td>
</tr>
</tbody>
</table>

I suggest that the balance of the grants in aid, £347,354, should be divided up in that proportion. The grants in aid would then be allocated as follows:

<table>
<thead>
<tr>
<th>£</th>
</tr>
</thead>
<tbody>
<tr>
<td>Special King’s African Rifles expenditure 131,638</td>
</tr>
<tr>
<td>Railway Tools and Plant 60,755</td>
</tr>
<tr>
<td>Balance towards Railway deficit and capital expenditure 215,716</td>
</tr>
</tbody>
</table>

This balance of £215,716 should be applied to the deficiency in working rather than to capital. Reason for this is that any free grant, unless specifically allocated as in the case of ‘Railway Tools and Plant,’ should, on principle, be used to wipe out deficits rather than as a capital receipt.

The item in the Capital Account, ‘By Free Grants 1919/20 – 1920/21 – £126,462’, would then be altered to read ‘By Free Grant, Railway Tools and Plant – £60,755’ and ‘By Advance from Tanganyika Treasury – £65,707’, the latter figure being the total of the capital expenditure for those two years. The figure in the General Account, ‘Free Grant for Deficiency in Working – £351,696’, would
be altered to £215,716, and a new item would appear ‘Advance form Tanganyika Treasury to cover Deficiency in working – £135,980.’

121. Another item which requires settlement is that relating to the cash advanced free of interest to the Railways from the Tanganyika Treasury prior to 31st March, 1927. Since then, under a ruling of the / Secretary of State, interest has been charged on sums advanced. The figure outstanding at that date was £151,417 made up as follows:–

<table>
<thead>
<tr>
<th>Description</th>
<th>Amount</th>
</tr>
</thead>
<tbody>
<tr>
<td>Unallocated Stores, Railways</td>
<td>£163,296</td>
</tr>
<tr>
<td>Advance Accounts</td>
<td>£6,179</td>
</tr>
<tr>
<td>Cash Balance</td>
<td>£43,101</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Less Deposit Accounts, Railways</strong></td>
<td><strong>£151,417</strong></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The Tanganyika Treasury claims that this sum should, in the event of the Railways becoming an organisation separate from the Government of Tanganyika, be considered as a loan repayable to that Government. I understand that the Railway Administration does not now dispute this; in fact, an appropriate entry already exists in the General Account. I agree with this view; the question of payment of interest on these advances from the Treasury will be discussed later.

122. There are two further outstanding items which have been met by the Treasury out of the General Revenue of the Territory and do not figure in the Railways’ Accounts. These are:–

1. Interest on Exchequer Loan for the years 1921/22 and 1922/23, £17,237;
2. Interest and Sinking Found charges on Ports and Harbours Capital Expenditure from 1st November, 1925, to 31st March, 1928, £10,070.

The Railway acknowledge indebtedness in both cases, but up to date neither figures in their accounts. In the first case the Treasury recommends that the Railway surpluses in the years 1926/27 and 1927/28 should be applied to reducing the sums due to General Revenue. I think the sounder financial policy would be to use these surpluses for the reduction of the arrears of renewals and allow the sums due to General Revenue to be added to those shown in the General Account under ‘Advances from treasury.’

In the second case the Treasury recommends that the sum of £10,070 should be taken from future surpluses on the Port, Harbours and Wharves Revenue Account and credited to the General Revenue of the country. I think the case here is even stronger than in the former instance to add this to ‘Advances from Treasury’, and apply future surpluses to reduction of arrears of renewals.

123. If my recommendations on these points are accepted and the Lords of the Treasury give a pronouncement in favour of the Railways, the Capital...
Account will appear in the same form as to-day, except for the small alteration necessary to separate the acquisition money for the Railways from the remainder of the sums transferred from Revenue Account. The only alteration in the General Account will be the addition of £17,237 plus £10,070 – £27,307 to the heading ‘Advances from Treasury’.

On the other hand, if a pronouncement is not given and a compromise is made on the lines I have suggested, a new heading ‘Advances from Tanganyika Treasury’ will appear in the Capital Account and a new heading ‘Advance from Tanganyika Treasury to cover deficiency in working in the General Account. I propose that the latter should be maintained as a separate heading from the ordinary one’ Advances from Treasury’ as it will be a large item and the money will have been advanced for a specific purpose. /

I consider that these advances should be considered as loans and, as such, the Territory is undoubtedly entitled to interest on them. The Railways, however, in the future will have not only to make current provision for renewals but also, so far as their resources permit, for arrears of renewals. I think any available surpluses should be applied first to making good these arrears of renewals, and that only when these arrears have been wiped off should the Railways start to pay interest on the advances. I am recommending that the Territory should waive its right temporarily to interest on these earlier advances because I think it is to its advantage as well as the Railways’ that the latter should be strengthened financially. If the Railways become part of an organisation separate from the Government of the Territory, I consider that the advances should be treated as ordinary loans and either be repaid or have interest paid on them.

I would point out that this recommendation should apply only to these special advances and on cash advanced prior to 31st March, 1927. If the Territory consents to this and to my earlier recommendation to let the Railways add some of the outstanding debts to the ‘Advances by Treasury’ instead of insisting on repayment from surpluses, it will be rendering as much assistance to the Railways’ finances as can be expected and it is only right that the Railways should pay interest on advances made after that date.

I have referred already to the necessity for making annual provision for renewals. I do not propose to explain, as I have in earlier reports on other railways, the reason for this as it is now an accepted principle in Colonial railway practice. The Tanganyika Railway Administration also recognises the need, but its net revenue has until recently been too small to allow it to do so.

As the Railways have now shown a gradually increasing balance on revenue account for the past three years and this increase shows a reasonable indication of continuing, I think the time has come to institute a proper Renewals Fund, and with this view the General Manager agrees. At my request the Railways prepared lists of all wasting assets, giving, in the case of assets which were new when
acquired, the date when acquired, the estimated life and the cost of replacement at present prices; and, in the case of assets which were not new when acquired, the date when acquired, the estimated remaining life at that date and the cost of replacing the asset at present prices in the same state as it was when acquired. From these lists tables were prepared showing the total replacement costs of the various classes of assets, the annual contributions which should be made to the Renewals Fund in order to build up the replacement costs within the estimated lives of the assets, and the arrears of renewals which would be outstanding on the assumption that annual contributions started on 1st April, 1930. The summaries of these results are given in Tables F/3 and F/4; the first is for Railway assets only; the second for the assets of the Allied Services, excluding the Electricity Department. In the case of Railway assets which were new when acquired, the lives have been assessed for the various classes of assets by agreement between the Railway Administration and myself, and in the case of assets which were used when acquired the Railways have themselves assessed the life remaining to the asset at the time it was acquired. I am satisfied that the lives in the latter case have not been under-estimated. For example, the original German rails on the Central line which are of very fine quality steel have been given a life of 42 years from the date of acquisition, which is equivalent to a total life of 50 years. In the case of the Allied Services, the lives of nearly all the more important assets had to be assessed individually. /

**Note.** – Replacement costs of used assets as shown in Column (b) are calculated upon estimated life of each asset when acquired. / [...]

Proper renewals registers should be started showing the various assets with full details as to lives, replacement costs, annual contributions and arrears. These details have already been prepared and I understand the General Manager has given orders for these registers to be compiled with a view to starting provision as from 1st April, 1930. A Renewals Fund Account should then be started showing the contributions to the Fund and the withdrawals from it. An ‘Arrears of Renewals Account’ should also be started showing the arrears as on 1st April, 1930, any future additions, and any contributions from surplus revenues in reduction.

Whenever a wasting asset is scrapped or worn out, the total cost of replacing it should be charged to the Fund, irrespective of whether there are arrears against that asset or not. Otherwise part of the replacement cost will be borne by capital and not by revenue. The entry in the ‘Arrears of Renewals Account’ will still be maintained so that the sum may be made good to the Renewals Fund as soon as Railway net revenues permit.

125. From the Renewals Fund will be drawn the contributions to Sinking Fund as it would be incorrect to redeem out of revenue at one and the same time both the assets and the capital with which the assets have been bought.

The tables above show that the annual contribution should be for Railways alone £154,210 and for Allied Services £13,650, making a total of £167,860. The Sinking Fund payments for 1929/30 will be £12,890. Assuming a round fig-
ure for Sinking Fund payments for 1930/31 of £15,000 and deducting this from the total contributions of £167,860 leaves £152,860. As against this the balance on the combined Revenue Account of the whole undertaking for 1928/29 is £122,692. It is hoped that the increase in net revenue for the year 1930/31 will be sufficient to make good this gap of £30,000, but, if not, any short fall in the provision will have to be added to the arrears of renewals.

These will, by 1st April, 1930, amount to £1,309,076; deducting therefrom the Sinking Fund payments made in the years 1927/28, 1928/29 and 1929/30, which, on the same principle as above, should be debited to the Renewals Fund, a final figure of £1,271,119 on account of arrears of renewals is reached. This heavy liability emphasises my plea that the Territory should treat the Railways generously and allow the surplus balances of the years 1926/27 and 1927/28 to be applied to the reduction of arrears instead of being credited to the General Revenue of the Territory and also to waive interest temporarily on this and the other earlier advances.

126. The question of the form in which the Railways’ accounts should be presented remains. At present, besides separate revenue accounts for each railway line, Central, Tanga and Lindi, there are separate revenue accounts for the Lake Steamer Service, the Marine Department, the Wharves, the Dockyard, and the Electricity Department.

The Marine Department Account includes only the expenditure on harbour and lighting services and on the S.S. ‘Azania’ and the receipts from port and light dues, pilotage fees and receipts from the S.S. ‘Azania’.

The revenue and expenditure of the Lake Steamer Service are kept in a separate account.

The Wharves Account contains the wharfage and cranage receipts and customs shed rents from Dar-es-Salaam, Tanga and Mwanza, and expenditure in connection with these wharves.

The System pays for all services received from Government Departments, such as medical and legal, and the cost of all miscellaneous services of this nature as well as of management, supervision and Provident Fund is divided up between each account in proportion.

Finally the appropriate capital charges are debited against each account. The object of this division is in order to be able to keep a clear idea of how each service is doing; also, if at any time it is decided to take away from the undertaking any particular service, the accounts can be disentangled without difficulty. With this I entirely agree. The only amendments which I propose are that the renewals contributions should be entered as ordinary expenditure in the Revenue Accounts.
The balances of these Revenue Accounts should be applied to the reduction of the item ‘Arrears of Renewals’ in the Balance Sheet, until these have been wiped out.

At present only one Capital Account is maintained for the whole undertaking. Funds for capital expenditure, apart from free grants and the relatively small transfer from Revenue Account mentioned above, have been provided by a 5 per cent. Exchequer Loan of £1,337,101, and from that proportion of the proceeds of the Tanganyika 4 1/2 per cent. 1948/68 Guaranteed Stock which was allocated to the Railways. On the former, capital charges are being paid, as opposed to an Exchequer Loan of £449,505 to cover deficiency in working from the year 1921/22 to the year 1926/27 inclusive. The question of interest payments on the latter and of the terms of repayment will come up for consideration in 1933. It is included in the General but not in the Capital Account. On the Tanganyika 4 1/2 per cent. Stock the Railways pay their share of capital charges and management expenses and bear their share of the reduction of the amount realised from the Loan, due to its being issued at a discount and to expenses of issue.

For the same reason as in the case of the Revenue Accounts, I think separate Capital Accounts should be kept for each service. The interest charges paid for the use of capital are already kept separate and the same division should be maintained for the capital itself. The balances of these accounts should be carried to a combined Capital Account for the whole undertaking, the balance of which in turn should be carried to the Balance Sheet.

The Balance Sheet will take the place of the present General Account and will include the items given therein subject to the amendments to the items in that Account recommended earlier.

Thus on the liability side, if it is decided that the Railways should not receive the whole of the grants in aid, an item will appear ‘Advances from Treasury to cover deficiency in working – £135,980,’ with an equivalent reduction under the heading ‘Free Grants.’ The present item ‘Advances from Treasury’ will be increased by £27,307 to cover the unpaid interest charges owing to the Treasury, and the Deficiency Account increased by a similar amount. / 127. Appropriate entries will also appear on each side of the Balance Sheet to show respectively the balance of the Renewals Fund and the sums held against that balance, and finally there will be an item on the liability side of approximately £1,270,000 to represent ‘Arrears of Renewals.’ This will, of course, have to be supported by a similar increase in the Deficiency Account on the opposite side of the Balance Sheet.

However distasteful it may be to show a large deficiency, it is the only sound financial course. Furthermore, it is only right that the Deficiency Account should be increased by this amount because the failure to make provision in the
past has been due to deficiency in revenue during the eleven years which have elapsed since the present Railway Administration started.

128. The obligation to make good these arrears ranks next to the obligation to meet the service of the loans and, the service of the loans having been met in the various Revenue Accounts, any balance standing to the credit of these accounts should be applied to the reduction of the arrears of renewals. No other charge should be allowed to take priority nor should any attempt to whittle down the annual provision for renewals be permitted.

It may be argued that, with over a million pounds of arrears of renewals to be first wiped out, there is little chance of the Territory receiving interest on its earlier advances for some years to come. This is certainly true, but these arrears of renewals represent not only an important but also an urgent question for the Railways. Practically all its stock and assets are either very new or very old. The latter will soon require replacement. The Renewals Fund is only based on the life remaining to these assets when they were acquired. That portion of the replacement cost represented by the earlier life will have to be paid out of capital. If, in addition, owing to the surplus balances having been taken as interest on advances or to repay the advances themselves, the sums in the Renewals Fund are not large enough to pay for its share of the replacement cost, further moneys will have to be borrowed and a further set back given to the financial prosperity of the Railways.

CHAPTER XV. – FUTURE POLICY AND DEVELOPMENT.

129. In the previous Chapter it has been shown that the Tanganyika Railways system in 1930/31 will just be able to meet its annual provision for renewals, provided its net revenue has by then increased by £30,000 and the Treasury of the Territory consents to waive temporarily the execution of certain of its claims. There will still be an outstanding liability for arrears of renewals of over £1 1/4 millions. While these results will show a marked improvement on those of five or six years ago, it is obvious that the undertaking is not yet in a sound financial condition.

This is clearly not due to heavy capital expenditure and, apart from a recommendation respecting the Tanga line which I shall make later, it is obvious that no large economies in working expenditure can be made.

The real cause lies in the small volume of business handled as compared with the mileage to be maintained. The total revenues from all sources, excluding the Electricity Department, for the year 1928/29 were only £772,134 for a mileage of 1,249.

The following table shows how these figures compare with those of other Colonial railways in Africa:

</table>

This table shows clearly the handicap under which the Tanganyika Railways suffer and how necessary it is for them, even more than for the ordinary railway, to increase their gross receipts and to expend capital in doing so.

130. Taking first the Central line, there has already been a notable increase during recent years, coaching and goods receipts for the line having gone up from £333,469 in 1925/26 to £588,284 in 1928/29, an increase of about 75 per cent, in three years. It is true that the Mwanza branch has been added during this period but this only accounts for a fraction of the increase. In fact, owing to bad seasons, the total tonnage carried of groundnuts, which constitute one of the main traffics of this branch, has actually diminished. The other principal exports all show large increases; the tonnage of copper has gone up from 18,817 to 29,997 tons, cotton (ginned, unginned and seed) from 5,652 to 15,226 tons, grains from 8,259 to 15,718 tons, and sisal and sisal tow from 4,404 to 5,052 tons. The variety of the commodities in which these increases have taken place is in itself an excellent augury for further increases in the future. The influence of the increase in exports, both local and transit, is naturally seen in corresponding increases in the tonnage of imports. /  

131. At present the most important traffic on the Central line is that with the Belgian Congo and, as I have explained earlier, special rates are very justly quoted to attract it. The competition for the copper and import trade with the Katanga province of the Belgian Congo will become more acute in the near future when the Lobito Bay line has been completed and the communication with Matadi has been improved. The Katanga – Dar-es-Salaam route suffers from natural disabilities; goods have to be transhipped at four points, and, during low water, traffic on the Lualaba is liable to interruption and is sometimes entirely suspended, as has occurred this year. In face of these factors the General Manager is of opinion that, while the Railways will be able to hold what they now have, they cannot look for any increase. I am inclined to agree with this view.

Fortunately other areas in the Belgian Congo with excellent prospects and situated more closely to Tanganyika Territory are being opened up. At Usum-
bura at the north-east corner of Lake Tanganyika large sisal estates have been started, and between Usumbura and Uvira a large cotton concession has been granted which includes the valley of the Rusisi. At Uvira itself, in the north-west corner of the Lake, a port is now being made and a railway built to connect Lakes Tanganyika and Kivu, as well as a road connection between the principal centres. The provinces of Ruanda and Urundi which will be tapped by these developments are rich and densely populated. To the west of the Lake in the country behind Baraka large mineral developments are reported and further west two or three large cotton concessions have been granted whose normal transport route should be via Baraka. Further south, near the Rhodesian-Congo border, are the copper deposits of Kapulo which it is intended to connect by rail with Moliro on the Lake. As the normal outlet for the whole of this traffic will be via the Central line, there is reasonable justification for expecting a substantial increase in revenue, which will compensate largely for any absence of increase in the traffic with Katanga. I have already referred to the necessity of attracting the traffic by means, if necessary, of special rates. It is equally necessary that the Lake service, the port at Kigoma, and the Central line itself should be equipped to handle it, and that the equipment should be carried out in good time and not lag behind the demand for it. Otherwise the traffic will be discouraged at the outset and very possibly be diverted to other channels from which it will be hard to win it back.

132. [...]  
133. The extension of the port at Kigoma is also of primary importance. I have already pointed out in Chapter VI that the traffic there is rapidly overhauling the means for handling it. The Belgian leased site is already too small for their needs and the British section also requires enlargement. A scheme is, I understand, being prepared by the Consulting Engineers and any decision must await the presentation of their report. Any scheme, too, would have to be carried out in conjunction with the Belgians, who would bear a portion of the cost. Some time must therefore elapse before a decision can be taken, but I would urge that the matter should be pressed forward and funds allocated as soon as a decision has been taken, so that active work can be started without delay, because port works usually take a long time to execute. /

[...]  
134. As regards the other prospects of development on the Central line, the figures quoted above show the increases which have taken place in the last three years in sisal, grains, and cotton. To a person like myself, revisiting the country after eight years, the increase in cultivated land along the railway is striking. The development has obviously not reached its limit by any means; new acreages are being planted and, though the increase may not be so rapid as in the past, there should be a steady progress. The only important commodity which has been dis-
appointing is groundnuts; the tonnage of these, which was 10,845 in 1924/25, fell to 3,853 in 1925/26 and only reached 9,224 in 1928/29. This is attributed partly to a series of bad seasons and partly to the fact that some of the natives in the Mwanza area have turned from groundnuts to cotton. For the latter reason a large increase cannot be expected except at the expense of cotton, but development in agriculture has already taken place amongst the tribes along the main line and, with a steady growth in this and with the return of a few good seasons, it would not be unreasonable to anticipate a moderate increase on the 1924/25 figures.

135. The Tanga line presents a different problem. In 1921 I recommended that the Voi-Kahé section should be maintained and that both it and the short continuation from Kahe to Moshi should be administered by the Uganda Railway, as it then was, that the last 57 miles of track before Kahe is reached should be pulled up and used to relay the light coastal section which was in urgent need of renewal, leaving the Tanga line up as far as Samé to be administered as an isolated section by the Tanganyika Railways, and that Tanga should be regarded as the port only for the zone up to about 150 miles inland, the Moshi and Arusha area having its outlet through Kilindini. This view of Tanga as a subsidiary port was endorsed by the Reports of the Imperial Shipping Committee of 1926 and 1927 on the Harbours of Kilindini and Dar-es-Salaam, in so far as they visualised the diversion of important traffic from the interior of Tanganyika Territory to Kilindini. This has all the stronger application in that when these Reports were made it had already been decided to maintain rail connection between Tanga and Moshi.

I further stated that, if the Kahe-Samé section was not pulled up and physical connection was maintained with the Uganda Railway, it would be preferable to hand over the working of the Tanga line and the port of Tanga to the Uganda Railway. / Tanga line.

It is unfortunate that my recommendations were not adopted. The trade of the Moshi area, and I include therein for this purpose the Arusha area, is insufficient to maintain two railway lines, and its traffic is now divided between them to the detriment of both. The coaching and goods receipts of the Tanga line, including therein those of Moshi, have increased from £45,520 in 1925/26 to £76,965 in 1928/29, or nearly 70 per cent. in three years, which is almost as rapid as the growth on the Central line, despite the fact that the latter has been assisted by the construction of a new feeder line and enjoys a good transit trade. Even with this increase, however, the coaching and goods receipts of the Tanga line only reached in 1928/29 £321 per mile as compared with £583 per mile on the Central line. On the other hand the ordinary working expenditure per mile was slightly higher. In no year up to date have the earnings been large enough to cover the ordinary working expenditure, much less interest charges, which
have so far fortunately been comparatively low. If these are included, the loss on working the line has varied from £30,277 in 1925/26 to £22,095 in 1928/29, the lowest figure which has yet been reached.

If the policy which I advocated had been carried out, this line could not have failed to show much better working results and it would have been spared the expenditure of the greater portion of the £147,000 spent on relaying the coastal section with new track. It is too late now, however, to reverse the policy; both connections will have to be maintained.

Although competition between the two railways is avoided as far as possible by quoting equal rates, competition between the two ports is inevitable and in this competition the smaller port is bound to suffer so long as the larger one takes care not to become congested. The first indications are to be seen in the fact that the Kenya & Uganda Railways handle already the majority of the import trade, which is the more paying, whilst the bulk of the export traffic, which is unre- munerative, goes to Tanga. It is the growth of the latter rather than the former which has entailed the necessity for enlarging the port facilities at Tanga.

136. There is one portion of my original recommendation, however, which can still be carried out, the proposal that the whole Tanga system, port and railway, should be worked by the Kenya & Uganda Railways. This recommendation has since been endorsed by both the East Africa Commission of 1926 and the Commission on Closer Union of 1928. Great economies could be effected by this. In place of the complete and separate accounting staff which it is now necessary to maintain at Tanga the work could be handled by a few additional clerks at Nairobi. It would no longer be necessary to keep large stores at Tanga which lock up capital and require staff to administer them. The locomotive workshops could be abolished and the work handled at Nairobi more economically; if the transfer is not made, the present Tanga workshops will have to be remodelled and largely re-equipped at heavy capital cost. On the traffic side, substantial economies can be effected in working; to take one example, as I have mentioned earlier, the bulk of the imports come to Moshi from Kilindini with the result that empties have to be run from Tanga to Moshi to carry away produce whilst the Kenya & Uganda Railways’ wagons return empty from Moshi to their main system.

The difference in braking would mean that Kenya & Uganda type stock would have to be used throughout, but fewer of these would be required than are now necessary of Tanganyika type. I discussed with / the General Manager of the Tanganyika Railways the disposal of the present rolling stock on the Tanga line. He informed me, after examining the question, that, apart from some of the stock which is now practically worn out and would, in any event, have to be scrapped in a year or two, the remainder could all be transhipped to Dar-es-Salaam. The effect of this transfer of stock to the Central line would be sufficient
to relieve the Railways of capital expenditure on these items for one year but probably not for a longer period. There will thus be no waste or excess of stock and the smaller amount of extra stock which the Kenya & Uganda Railways may have to buy for the Tanga line will be compensated by the saving in new stock on the Central line less the cost of transfer from one line to the other. Even should capital expenditure have to be incurred on this count, the interest charges will be small compared to the economies effected.

If the working of the Tanga line and port were handed over to the Kenya & Uganda Railways, they would still remain the property of the Tanganyika Railways, and the Kenya & Uganda Railways would merely act as their agents for managing it. No capital expenditure could be incurred without the previous approval of the Tanganyika Government and the annual estimates for working it would also have to be approved, the net profit or loss alone appearing in the Tanganyika Railways’ Estimates. Similarly, all rates and alterations to them would have to be approved by the Tanganyika Government. Nor do I see that any difficulty in respect of legislation need arise; the present Kenya & Uganda Railways Ordinance would have to be applied to the system and the usual legislative powers obtained from the Tanganyika Government for this purpose. There is, so far as I can see, no serious legislative or administrative difficulty in doing this, especially as the present Tanganyika Railways Ordinance, modelled on the Indian Ordinance, itself requires revision. The case is, in short, so strong that I can see no valid reason against it, and I would repeat that this view is strongly endorsed by both of the two independent commissions who have reviewed the question in recent years.

137. During my visit the two General Managers were framing in collaboration a scheme for this purpose; the basis of this scheme was that the Kenya & Uganda Railways should take over and work on behalf of the Tanganyika Railways not only the present Tanga line and port, but also the newly completed Moshi-Arusha extension. Both main lines, i.e., the Tanga and Kenya & Uganda Railways, would grant ‘branch line terms’ to traffic emanating from or going to stations on the new extension. The Kenya & Uganda Railways would pay for running rights over the Kahé-Moshi section, but on a different basis from now.

I do not propose to give any details of the scheme because, from the excellent spirit which was apparent in these discussions at which I was present in an unofficial capacity and from the obvious desire of the two parties to come to an arrangement which would be fair to both, there is every reason to hope that an equitable and practicable scheme will be framed. A voluntary solution of this kind will obviously have the best prospects of success. Should the negotiations unfortunately fail or any hitch occur, I would recommend that the matter should be subjected to arbitration.
Given a proper solution to this question, the Tanga line should no longer be a source of loss to the Railway System. There has already been considerable local development, as the traffic figures show; some of the schemes, too, have not yet reached the producing stage. The line should, as a result, soon be able to show a balance after making full provision for current renewals and capital charges. The question, in fact, is of such importance to the future financial prosperity of this line, and hence of the whole system, that no obstacle of terms, rates or legislation should be allowed to stand in the way.

138. To provide for the development of the whole system, the General Manager estimates that the normal capital requirements for the next three years will be as follows:–

<table>
<thead>
<tr>
<th>Year</th>
<th>Amount</th>
</tr>
</thead>
<tbody>
<tr>
<td>1930/31</td>
<td>£422,500</td>
</tr>
<tr>
<td>1931/32</td>
<td>£355,500</td>
</tr>
<tr>
<td>1932/33</td>
<td>£279,100</td>
</tr>
</tbody>
</table>

These sums make no allowance for improving the Tanga workshops and are apart from special items such as the provision of a new lake steamer and the improvements to the harbours and wharves at Dar-es-Salaam and Tanga. The new traffic yard at Dar-es-Salaam is also additional.

On the sums asked for the Railways are prepared to pay interest out of their own revenue and do not ask for assistance from the Colonial Development Fund. The largest items are £650,000 for locomotives and rolling stock, and £153,000 for the programme for building quarters, which includes the provision of permanent quarters for Asiatic and African staff. Both items are spread over the three years. As I have pointed out earlier in this chapter, the hope of financial stability for the system rests on further development and it is necessary that capital should be provided to cope with the development expected and in ample time so as not to retard it or divert it to other channels. I agree that the capital expenditure outlined above is reasonable and justifiable in order to attain this object.

139. These Railways are only just beginning to feel the effects of motor competition. On the Tanga line it has brought the growth of passenger traffic, which previously showed a good increase year by year, to a standstill, but elsewhere it has not made its appearance to any appreciable extent. With the completion of the bridge over the Ruvu, however, it is certain to be seen soon on the Dar-es-Salaam – Morogoro road. There is no time, therefore, to be wasted in deciding on the policy which is to be adopted towards it. The policy which is to control it is one, though, rather for the Government than for the Railways. All the latter can do is to meet it either by improving rates and fares and facilities or by instituting their own combined rail and motor service in competition. If the latter
policy is adopted, the Government lays itself open to the charge of competing with private industry.

The usual arguments that the motor has initial advantages in that it can pick and choose its traffic, leaving the lower paying exports to the railway and undercutting rates for the more remunerative imports, that it only pays a small part of the cost of constructing and maintaining roads over which it runs, all have particular force in this case as it is the Government which owns the Railways and has to find the money to pay for the construction and maintenance of the roads. It is, therefore, all the more to its interest to put a stop to competition. Wasteful competition in transport is bad enough in a fully developed country; in an undeveloped one with insufficient means of transport it is even worse as it means that energy and capital, which could be applied to the greater advantage of the community in opening up new tracts of country, are being absorbed in competition. /  

The extreme alternatives open to the Government are either to adopt the American system of ruling that all transport services must be licensed, licences only being granted for new services when it can be proved that the existing ones do not meet adequately the transport needs of the areas which it is proposed to serve, or it can place the two rivals on a fairer footing by making the motor pay a tax which is sufficient to pay for the total maintenance and capital charges of the roads over which it runs. The former has the drawback that it is rather cumbrous for a new country and the latter is open to the objection that it places a heavy burden on an instrument which is peculiarly fitted for development purposes.

I think it is possible to find a via media by way of a system of road tolls. Until recently road tolls have been looked upon as an anachronism, but with changing means of transport views on this point are changing also. It has the merit in a country like Tanganyika Territory that it can be applied to certain roads and not to others, and it can be varied according to whether the vehicle plies for public transport or not. Thus a stiff toll could be placed on all vehicles using roads competing with the Railways and still higher tolls could be levied on vehicles carrying public passengers or goods thereon, while any roads radiating from the Railways or in districts away from them could be exempted altogether. If this were combined with a moderate vehicle or petrol tax, definite assistance would be given to the man who is genuinely trying to develop the country, but the man who chooses to compete would have to pay in full for the facilities which he requires in order to enable him to do so. This is the lowest figure which he should be called upon to pay; in a new country I think it should be fixed higher so that he would pay also for a share of the upkeep of the development roads in order to give definite encouragement to those who wish to open up the country and definite discouragement to those who merely want to enter into wasteful competition to the detriment of the country as a whole. The collection of a toll
on these good competitive roads should present no difficulties as they could be levied at bridges and drifts where it would be hard to evade them.

140. So far I have dealt only with the development of the system as it exists and the best policy to adopt to that end; the question of its development by the construction of new lines remains to be discussed.

In the letter presenting this Report I have explained that as a definite addition to my terms of reference I was asked to express my views as to the various routes in a southerly direction from the main line discussed by Mr. Gillman, the Chief Engineer of the Railways, in his report. These proposals cannot, however, be dissociated completely from the proposals for railway construction in other parts of the Territory; they are bound to react on each other in several aspects such as finance, labour and priority. I therefore propose to deal with the projects for a Southern railway as a part of the general programme.

The development of the Territory, including its railways, has been the subject of review by a local Committee formed by His Excellency the Governor to put forward proposals for financial assistance under the new Colonial Development Fund. This Committee was sitting while I was at Dar-es-Salaam and I had the advantage of a full discussion with it on the subject of a Southern railway.

The various proposals for the construction of new lines in the Territory are as follows:

(1) Manyoni – Singida line, more properly now described as the Iramba Plateau Railway, as the actual terminus will according to the latest proposals not be at Singida but at Kinyangiri, 22 miles further on. The line will be about 94 miles long and will cost approximately £557,000, excluding interest during construction. A location survey has been made, and the economic survey shows that, five years after completion, the probable annual deficit will be £2,715, after allowing for loan charges. This would be set off by the indirect benefit to the revenues of the Territory, including therein an increase of at least £10,000 a year in customs duties. After consulting His Excellency the Governor, I cabled on October 2nd recommending the allocation of funds for this project. These have now been granted, together with a free grant of interest for two years, which will amount to £30,000.

(2) Sanya – Engare Nairobi line. – This will be about 25 miles long and will cost approximately £130,000. A detailed survey has been made of this railway, but further investigation of one section is now in progress. The economic report by the Chief Engineer, drawn up in co-operation with the Traffic Manager, shows that a profit of £1,000 to £1,200 a year may be expected after 10 years’ working. The former Director of Agriculture, however, reported that there is not enough to go upon in order to decide from agricultural considerations whether a branch railway should be provided for this region or not, and recommended that the question be postponed for at least three years. The report of the Chief Engineer,
which has been carefully prepared on conservative lines, allowing for example for the complete failure of the grain crop every third year, carries more conviction to my mind than the report of the Director of Agriculture. I consider that the anticipated results, as foreshadowed in the Chief Engineer’s report, justify the construction of the line. His Excellency the Governor has asked for funds to be provided and that a free grant of interest for two years, amounting to £14,000, should be made from the Colonial Development Fund. I understand that these funds have now been allocated.

(3) (a) The Arusha – Dodoma line;

(3) (b) The Arusha – Singida line;

I have linked these two proposals together because the section from Arusha to Madukani at the South end of Lake Manyara is common to both. Reconnaissances have been made of both routes, but no detailed survey. The approximate cost of the Arusha – Dodoma line is given as £1,800,000 to £2,000,000 and the distance as 250 miles. The Arusha – Madukani section is roughly 100 miles long; no separate estimate has been made of this section but, if the same average per mile is taken as for the whole line, it would cost roughly £800,000. The Madukani – Singida line would be some 120 miles long, but only a preliminary reconnaissance has been made and no estimate of cost is given.

A question of alternative routes is thus involved; fortunately there is no need to give an early decision in advance of more detailed information, because the most productive section will be that between Arusha and Madukani which is common to both projects. This line would tap the Mbulu highlands and Mbugwe. The former is one of the most promising areas for white settlement. A good deal of land has already been alienated in the highland country as well as in the lower-lying districts served by the line, where considerable areas have been taken up for sisal cultivation. A certain amount of native production is also anticipated.

Judging this on general lines, it can be said that the line shows good signs of promise and serves both European settlement and native production at a cost of roughly between £800,000 and £1,000,000. The General Manager hopes that the Arusha – Dodoma line would pay its way in ten years after completion. This, the best section of it, would therefore probably become a paying proposition in a shorter time. By commencing construction at the Arusha end, not only will the best section be developed first but the trend of development on the alternative routes, Madukani – Dodoma, Madukani – Singida, can be watched and the final decision delayed until a clearer idea has been obtained of their respective merits.

The local Colonial Development Fund Committee made a definite recommendation in favour of the Arusha – Dodoma line on the grounds that it would form part of an ‘Imperial Link’ and only recommended that the connection with the future Singida line should be surveyed, I deal later with the question of an
‘Imperial Link’ and consider that it is premature with the scanty information now available to decide which route should be taken between Madukani and the Central line.

(4) The Mombo – Kilosa line. – This line was surveyed by the Germans and the estimated cost at present day prices is £1,500,000.

The former Director of Agriculture in his evidence before the local Colonial Development Fund Committee laid stress on the greater potential agricultural value of this line over the Arusha – Dodoma line, though it appears doubtful whether in this connection he took into account the possibilities of the Mbulu highlands and the recent sisal developments near Mbugwe.

The General Manager also appears to think it slightly better on economic grounds and hopes that it would pay in between five to ten years after completion as against ten years after completion in the case of the Arusha – Dodoma line. In the Committee he preferred, however, the Arusha – Dodoma route because the Mombo – Kilosa line was too close to the sea and to a coast road.

The Committee decided to recommend the Arusha – Dodoma line for financial assistance under the Loan on the grounds, before mentioned, of its forming part of an ‘Imperial Link,’ and that the extension of sisal production in the North of the area traversed by the Mombo – Kilosa line and of cotton production in the South would automatically provide and pay for branch lines to these areas from the Central and Tanganyika lines respectively.

Apparently the Mombo – Kilosa route would pass through a poor traffic country in its middle section whereas both ends would give good results. On the other hand the Arusha – Central line railway would traverse a stretch of poor country after Madukani had been reached. The argument as to proximity to the coast carries little weight with me as there is no port intermediate between Tanganyika and Dar-es-Salaam to carry the produce from this area. Both this argument and the recommendation of the Committee appear to have been prompted by the idea of a so-called ‘Imperial Link.’

From this comparison of evidence it is difficult to obtain any clear idea of the respective merits of the two routes. It would probably be better to class them at present as about equal from the economic point of view.

(5) The Kahama – Kagera – Uganda line. – This line is not shown on the accompanying map. It would start from Kahama (close to Maveta’s) on the Tabora – Mwanza branch and go in a north-westerly direction to the elbow of the Kagera River near Kaseke and thence to the Uganda border. There is a German survey of the section as far as the Kagera and a rough estimate for the whole line places the cost at £2,500,000.

The local Committee included this line in its proposals on the grounds that the mineral deposits on the Kagera were assuming large proportions and that the
line would to a certain extent tap Ruanda and give a valuable junction with the 
Kenya & Uganda system west of Victoria Nyanza, but placed it last on their list.

The only information I can gather as to the mineral deposits is vague; the 
development in sight at present certainly does not justify a railway. The Belgians 
are already starting construction to tap the larger part of Ruanda from the other 
side, and, with the existing connection between the Kenya & Uganda and Tang-
anyika systems by steamer across Victoria Nyanza, there is no need at present to 
contemplate another connection to the west of it.

I think, therefore, that this can be classed as the least important of the pro-
posals to be discussed.

(6) The Southern Railway. – Before entering into the respective merits of the 
three alternative routes for this railway, I think it would be advisable to dispose 
of the loose generalities which have been associated with the project for a South-
ern line. It has been frequently represented during the last two or three years that 
physical connection should be made between the railways of Kenya & Uganda, 
Tanganyika and Rhodesia. By far the most expensive section of this connection 
would be that between the Tanganyika and Rhodesian systems. The cost to the 
Rhodesian border would be about £5,500,000 and the extension thence to meet 
the Rhodesian system would require at least £4,000,000 more, in both cases 
exclusive of interest during construction. These figures do not include also the 
cost of connecting the Kenya & Uganda Railways with the Tanga and Central 
lines.

The scheme has not been advocated on economic grounds; it has been 
frankly admitted that there is no hope of its paying for many years to come. 
Twenty to twenty-five years after completion is the earliest date given by which 
such a line would start to pay and even longer periods have been quoted to me by 
supporters of the scheme; and the reason for this is obvious. Goods traffic with 
the Union of South Africa will be carried by sea, and goods traffic with Rhodesia 
in the absence of any large mineral discoveries in the north-eastern corner of that 
country will be negligible.

Similarly, its supporters have not claimed that it is necessary on administra-
tive grounds. Excellent precedents could be quoted to show that railways which 
are not economically justified may yet be sometimes necessary for purposes of 
administration. No attempt has been made to prove that this is the case here. 
Nor has the scheme been put forward on strategic grounds. / 

In the absence, therefore, of any of the usual reasons for building railways, 
either economic, administrative or strategic, its advocates have coined a phrase 
and state the expenditure of these millions on a railway from Nairobi to Broken 
Hill is necessary in order to provide an ‘Imperial Link.’ It is noteworthy that in 
the first report recommending the construction of a Southern Railway, that of 
the East Africa Commission of 1926, this phrase does not occur. A Southern
Railway is there recommended as being required for the development of the Territory itself.

What exactly are the functions of an ‘Imperial Link’ I have been unable to discover. I am doubtful if the users of the phrase have themselves any clear idea of what they are. Putting the widest construction on the term, it means that there will be ease of communication between the East African Colonies and the two Rhodesias, and this ease of communication applies solely to passengers because no one pretends that there will be any considerable interchange of goods. The Union of South Africa is excluded because, as in the case of goods, a means of communication already exists, almost as quick, quite as comfortable, and far cheaper – the Sea.

It is strange in these days of motors, aeroplanes, and airships to hear of proposals to spend millions of pounds on railway construction for the purpose of promoting passenger travel in a sparsely populated country. If this is the object, it would cost the Government of Tanganyika less to improve the roads, put a fleet of expensive motors on them, and carry the passengers free rather than incur the high loan charges and heavy operating costs of an ‘Imperial Link’ for this purpose. From the Imperial point of view, from whatever source these charges are met, whether wholly by the Home Treasury or by the Local Treasury or shared between them, nothing could be better calculated to embitter mutual relations than the constant drain, year in, year out, of the large sums required to subsidise a railway built on such a shadowy pretext as this.

The parallel of the Cape to Cairo Railway will be quoted against me, but the positions are exactly reversed. Rhodes invented the phrase, not, as here, to cover up the lack of any economic justification, but to stimulate public interest in a project, each stage of which had a definite economic goal in front of it at the time of its construction – first the goldfields of Rhodesia, next the Wànikie coal mines, and so on.

I have written thus strongly because there is danger in these phrases, as can be seen by the influence which this one has had on such documents as the reports of the local Colonial Development Fund Committee and of the Chief Engineer. Having cleared the subject of these vague, high-sounding titles, let us review the situation as it exists and see what is required in the interests of the Territory in the immediate future and what is likely to be required after that so far as it is possible to foresee it at present.

To the south of the Central line there lies a great expanse of country, 600 miles long by roughly 350 miles wide, which is totally devoid of railways. In this huge space there are areas which will repay development, even though several years may elapse before the stage of repayment is reached. How can these areas be best developed with due regard to economical considerations, the lines chosen being, so far as possible, those which are capable of extension and perhaps
ultimately connection with neighbouring systems, should future circumstances show that this is desirable?

Three main projects have been formulated:–

(a) Dodoma – Iringa – Ilongo – Fife.
(b) Kilosa – Ifakara – Mpanga – Manda.
(c) Kilosa – Ifakara – Mpanga – Ilongo – Fife.

A detailed tacheometric survey has been made of the Dodoma – Iringa section of the first route and of 60 miles from the Rhodesian border north. A reconnaissance has been made of the rest of the line. Only reconnaissances have been made of the other routes, with the exception of the 60 miles mentioned above, which is common to routes (a) and (c).

The length of the Dodoma – Fife line would be approximately 460 miles to the Rhodesian border and cost about £5,500,000. The Dodoma – Iringa section would be 140 miles long and cost £1,100,000. All these figures of cost, as well as those which follow, exclude interest during construction.

The Kilosa – Manda line would be about 470 miles long and, according to Mr. Gillman’s report, would cost about £4,000,000, while the length of the Kilosa – Fife line would be approximately 590 miles and its cost about £6,000,000. The Kilosa – Ifakara section would be about 120 miles long and cost £950,000.

Of these alternatives I propose to discuss the Kilosa – Manda route first. This is the line favoured by Mr. Gillman. As opposed to the Kilosa – Fife line, it will depend for its traffic, apart from the Kilombero Valley, which is common to both, on the Songea district and the basin of Lake Nyasa. It is aimed primarily at tapping the area of a neighbouring colony, and in the traffic of that country the Imperial Government is directly interested through the guarantee by the Nyasaland Government of the debentures of the Trans-Zambesia Railway. This interest will become far greater if it finds the money for the construction of the Zambesi Bridge and of the railway from Blantyre to Lake Nyasa. Any idea of competition for this traffic could not be permitted. Further, this route leaves untouched the whole of the south-west highlands, except in so far as they would be served by steamer across Lake Nyasa; it would tap none of the country west of Ubena and very little, if any, of Ubena itself. Therefore, despite its lower capital cost, I think that the Kilosa – Manda route should be ruled out.

Of the other two, the Dodoma – Fife line, as far as the crossing of the Ruaha, runs through barren country, nor can much traffic be expected until the neighbourhood of Iringa itself is reached. In this area and around Dabaga to the south-east, European settlement is taking place. Thence to the junction with the Kilosa – Fife line further settlement is also taking place at Sau to the east of Bueni.

The first section of the other route, that between Kilosa and Ifakara, is universally acknowledged to be the most promising scheme in the country, with the
possible exception of the Iramba Plateau Railway. It opens up the fertile valley of the Kilombero, which is already well known for its rice. There are excellent possibilities of development both in rice and cotton, either by direct native production or by a concession company on the metayer system like the Sudan Plantations Syndicate. Sugar production also holds out good hopes. The whole valley of the Kilombero can be tapped by means of water transport, either by canoe or by launches and barges, and the possibilities of the latter are now being examined. The General Manager estimates that this section would bring in sufficient revenue in five years after completion to pay interest charges.

From Ifakara the line would follow the valley of the Kilombero and its tributaries, skirting the escarpment of the Uhehe highlands. Unfortunately, although the line would run within 20 miles of Dabaga, the escarpment is so steep that no feasible road could be made for motor traffic. The railway would thus gain no traffic whatever from its western side; it would have to depend entirely on the valley. This is a disadvantage in so far as a large portion of this traffic would probably be attracted to the railway even if it was not extended beyond Ifakara. But, on the other hand, the advance of the railway up the valley would be bound to stimulate production and would free labour from canoe transport to work on the land. From Mpanga west to the junction with the Dodoma – Fife line this railway would serve the European settlement areas of Eastern Ubena and also of Southern Uhehe.

The local Committee has recommended that the Dodoma – Fife route should be chosen as that of the Southern Railway in preference to the Kilosa – Fife on the grounds that, though the latter would reach the paving stage sooner, a branch line only to Iringa would run at a loss. Rail connection with that area could only be justified as part of a through line, and without such connection European settlement would be checked, if not completely stopped. On the other hand, the construction of a branch railway from Kilosa – Ifakara was justified on its own merits and the produce of the Kilombero Valley could be thus evacuated adequately for a very long period in conjunction with water transport.

To disagree with the unanimous recommendation of a strong local Committee, of which the Colonial Treasurer is Chairman and the General Manager of the Railways is a member, is at any time a serious matter; it becomes all the more serious when the fate of a young European settlement is in the balance. It is therefore only after much anxious thought that I have decided that I must oppose this recommendation of the Committee.

The Kilosa – Fife route is admittedly the one which will be the first to reach the stage of paying for itself. From the point of view of cheapness of operation, such advantage as there is also lies with that route. The potential wealth of the Kilombero Valley is not disputed. In the matter of European settlement, of the lands which have been or could be alienated according to the report of the
Land Development Survey, 502 square miles in Ubena and Lupembe and near Mufindi would be better or equally as well served by the Kilosa – Fife as by the Dodoma – Fife line, 406 square miles of alienated or alienable land in the Iringa, Dabaga and Kisinga areas would not be served at all by the Kilosa – Fife line, with the probable exception of the Sau end of the Iringa area, which would be within about 40 to 50 miles of it. I exclude from both the Ukwama area, which is 70 miles due east from Iringa, and, although within less than 20 miles as the crow flies from the Kilosa – Fife line, is cut off from it by the escarpment. / The whole question, therefore, turns round this pocket of land in the neighbourhood of Iringa and Dabaga. Is it justifiable to divert the through line from the route which is admitted even by its opponents to be economically the sounder, merely in order to serve an area which the same people admit would not be able to pay for a branch railway?

It is conceivable that in very exceptional circumstances such a course might be justifiable if these were the only two proposals for railway construction in the Territory. But this is far from being the case; on the contrary, the Dodoma – Iringa section, or for that matter the Dodoma – Soliwaya section, has worse prospects of success than any of the proposals I have enumerated earlier, with the possible exception of the Kahama – Kagera line.

The recommendation of the Committee would give it priority over the Arusha – Madukani, the Madukani – Singida, the Madukani – Dodoma, the Mombo – Kilosa and the Kilosa – Ifakara schemes.

It would not only mean priority in finance. That would be serious enough because, although Imperial assistance might and would probably be granted, that assistance cannot be regarded as unlimited, and the greater the amount absorbed by any one project in any one colony, the less there would presumably be for other projects in the same colony. It means also priority in construction and labour. The General Manager calculates, after consulting the labour authorities, that not more than two sections, each doing 60 miles of construction in a year, could be maintained, or at the very most three. It would take, according to the General Manager’s figures given to the Committee, six years to reach Ilongo. I take Ilongo because obviously with the poor prospects of the Dodoma – Iringa section it is of the essence of the scheme that the line should be pushed on straight away to tap the further areas. Allowing that it has a start of two years because it is the only one where survey is completed, that would mean that all the other more promising proposals would be put back four years. The mere fact that it alone has been surveyed in detail cannot justify such a priority as this.

Thus to the argument that the Dodoma – Fife route would be economically the weaker is added the argument that, by absorbing finance and labour, its adoption would cause a check of four years to the development of the Territory by means of other more promising schemes. To my mind these arguments are
so strong that the interests of one particular district cannot be allowed to stand against them, and I therefore recommend the adoption of the Kilosa – Ifakara – Fife route as that which should be adopted for a Southern Railway.

I realise with regret that this recommendation, if adopted, may mean a definite check to the development of the Iringa area, where European settlement has already made some headway, but, if the figures in the Land Development Survey are accepted, there will only remain in the Central Uhehe, Dabaga and Kasinga areas, apart from the 276 square miles which have already been alienated, a further 130 square miles which are alienable and fit for European settlement.

I wish it to be clearly understood that there is no question here of European settlement against native production. The Kilosa – Fife line will open up areas for European settlement which, although not as large as those on the other route, are only some 100 square miles less, and the Arusha – Madukani line, whose construction I will recommend later in this report, has European settlement as its primary object.

I think it would be suitable here to touch on a point raised by His Excellency the Governor in one of his dispatches. In it he expresses the opinion that ‘if the southern highlands of Tanganyika are to be developed, the key position from the point of railway construction must be found somewhere about Northern Ubena, which represents 352 kilometres of new railway construction from Dodoma as compared with 589 kilometres from Kilosa, the difference in the length of haul on the main line, in favour of the latter, not being extremely material.’

As regards the former figure, I think His Excellency has been led to assume an incorrect kilometrage owing to Mr. Gillman in his report referring to the second division of the Dodoma – Fife survey as being the Kalenga – North Ubena section. This line only enters Ubena at kilometre 375 and I think that the key position as defined by His Excellency should be placed preferably at the junction, which is about kilometre 400. As against this the length to Kilosa would be 590 kilometres, or a difference in favour of the former of 190 kilometres or 120 miles. But the longer route is traffic-producing for practically the whole of its length and over such a line goods can be hauled at much lower rates than over another line without this advantage, even if it is 120 miles shorter. And if this, the most important consideration, is left out and only the length of haulage is considered, I cannot agree that the haul over the main line is not material. The distance in favour of Kilosa is in this case 109 miles, which balances the extra haul over the branch.

Programme of construction.

141. The general programme of construction remains to be discussed. This programme should be based on the idea of constructing 120 miles of railway each year and temporary fluctuations in the revenue of the Territory should not be allowed to interfere with this. On this basis and on the basis that the con-
struction of the Iramba Plateau and Sanya – Engare Nairobi branches have been sanctioned, I think that three survey parties should be put into the field at once to make a detailed survey of the Kilosa – Ifakara, Arusha – Madukani and Mombo – Kilosa routes. I place these in what I consider the order of precedence. I give priority to the Arusha – Madukani line over the Mombo – Kilosa one because, although in the light of present information they may be classed roughly as equal from the economic standpoint, the former will serve both European settlement and native production, whereas the latter does not cater for European settlement at all; neither does the Kilosa – Ifakara line in this, its first section. Further, if the Kilosa – Ifakara and Mombo – Kilosa lines were under construction at the same time, it might be difficult to find sufficient labour for both, as they would apparently draw upon much the same districts for their labour supply.

The construction of the Iramba Plateau Railway will take two years and of the Sanya – Engare Nairobi line six months. Within one year of the start there should be sufficient of the Kilosa – Ifakara line surveyed and located to allow construction to begin. Six months, or perhaps one year, will thus elapse during which only one line is under construction and to this extent the standard of constructing 120 miles a year will not be reached. Taking the latest date, in one and a half years from the start it should be possible to begin the Kilosa – Ifakara line and in two years the Arusha – Madukani line. In three and a half years the Kilosa – Ifakara section will have been finished and work can be started on the Mombo – Kilosa line. Surveys, both engineering and economic, will in the meanwhile have been in progress on the Madukani – Dodoma, Madukani – Singida and Ifakara – Soliwaya lines. In four years’ time these should have been completed and a decision can be taken as to which of the lines from Madukani should receive priority. By that date the Arusha – Madukani line will have been finished and work can be started on whichever of its extensions has been chosen. In five and a half years’ time the Mombo – Kilosa connection will have been built and the Ifakara – Soliwaya line can be started.

This programme must necessarily only be a tentative one. New circumstances may arise at any time which will necessitate the revision of the factors on which it has been based. One of the essential features is that there should always be at least three strong survey parties in the field. Money spent on surveys is amply repaid subsequently in cutting down costs of construction and even more sometimes in cutting down operating costs. It is also important that it should be carried out well in advance; otherwise, when finance becomes available, decisions and sometimes construction have to be delayed until further information and survey have been obtained. The present case of the Southern Railway affords an excellent instance, though it would be rather hard to place the blame for this solely on the shoulders of the Tanganyika Railways. So much attention has been attached to the Dodoma – Fife line and the idea of an Imperial Link that the
farthest 60 miles of that route have actually been surveyed in detail in preference
to the more pressing schemes which lay closer to home.

Government assistance for development lines.

142. This programme of 120 miles a year would mean the addition of from
three-quarters of a million to a million pounds every year to the capital expendi-
ture of the Railways for new construction alone. Also, apart from the Kilosa – Ifakara line, none of the others is expected to be able to pay interest charges in
less than seven to ten years. This is a heavy burden for a system in the financial
situation of the Tanganyika Railways to face, and they should not be asked to
face it unaided – and the aid to which I am referring is not merely such as can
be sought from the Colonial Development Fund but from the Territory itself.
The profit which the Government gains from the development of the Territory
is considerable, as is witnessed in the case of the Iramba Plateau Railway, where a
loss of £2,715 is expected in the fifth year after completion, although full credit
has been given to it for the increase in traffic which it produces on the main line,
whereas the Government will benefit by an increase of £10,000 a year in customs
duties alone. The Railways are, in fact, developing these lands in the interests of
the Territory even more than in their own. It is right, therefore, that the Ter-
ritory should help to bear the burden. The aid which I propose that it should
give is that when a new railway is built which it is estimated will not pay its
way, including capital charges, within five years after completion, the Territory
should pay for all losses until it reaches the paying stage. Where it is estimated
that it will pay in less than five years, the losses incurred in the intervening years
should be borne by the Railways. The Government, if it so required, could be
represented in the assessment of the anticipated revenue. /
EDITORIAL NOTES

Hammond, *Report on the Railway System of Southern Rhodesia*

1. *Lieut.-Colonel Sir John R. Chancellor*: Lieutenant-Colonel Sir John Robert Chancellor (1870–1952), British soldier and colonial official. Governor of Mauritius (1911–16), Trinidad and Tobago (1916–21) and Southern Rhodesia (1923–8) and Principal Assistant Secretary to the Committee of Imperial Defence (1922–3).

2. *ex post facto*: formulated, enacted, or operating retroactively.

Smith, *Report upon the Administration, Organisation and Working of the Natal Government Railways*

1. *ballasted*: Ballast is coarse gravel or crushed rock laid to form the bed of a railway.

2. *the permanent way*: The permanent way is the track of a railway, including the ballast, sleepers, rails, etc.

4. *overmantels*: An overmantel is a structure over a mantelpiece, usually of plaster or carved wood.

5. *Platelayers*: A platelayer is a labourer who lays and maintains railway track.

6. *Electric Train Staff System*: This signalling system was patented by Webb & Thompson in 1889 and licensed to the Railway Signal Co.

7. *Weighbridge*: A weighbridge is a machine for weighing vehicles by means of a metal plate set into a road.

8. *waybills*: A waybill is a document giving details and instructions relating to a shipment of goods.

9. *Purser*: the officer in charge of money matters on board a ship/aircraft.

10. *‘Reid’ class*: These were first used from 1899 and 1903 by the Natal Government Railways (NGR) and were built to the specifications of G. W. Reid, Locomotive Superintendent of the NGR at the end of the nineteenth century. They were later adopted by South African Railways and renamed ‘class H’ engines (D. F. Holland, *Steam Locomotives of the South African Railways, Volume 1: 1859–1910* (Newton Abbot: David & Charles, 1971)).

11. *louvre*: A louvre is a frame with fixed or movable horizontal slats for admitting air and light or preventing the entry of rain.

12. *Turntables*: A turntable is a rotatable platform with a track that is used to turn locomotives. Pumping stations provided the water required by locomotives.
13. **carriage footboards**: A footboard is a board or small raised platform at the entrance of a carriage.

14. **Buffers**: Buffers lessened or absorbed the shock of impact.

Herbert Frankel, *Memorandum*

Hammond, *Report on the Sierra Leone Government Railway*

1. *Royal Engineers*: The Corps of Royal Engineers, commonly known as the *Sappers*, is one of the corps of the British army. It provides military engineering and other technical support.

2. **Demurrage**: Demurrage is the compensation paid for the detention of a ship or freight car during loading/unloading beyond the scheduled time of departure.

3. **pro forma balance sheet**: A financial statement prepared to consider the effects of a potential activity, for example, the purchase of another company.

4. **Puncheons**: A puncheon is a cask with a capacity of from 72 to 120 gallons (273 to 454 litres).

5. **artizans**: An artisan is a skilled manual worker.

6. **firemen, turners or fitters**: A fireman is a stoker. A turner is a person who operates a lathe. A fitter is a worker who assembles and/or adjusts machinery.

7. **After two**: A pointsman is a person who operates railway points. A maintenance boy is a handyman.

8. **fu-fu**: Fu-fu is a thick, dough-like West African food produced by boiling and pounding yam, plantain or cassava.

1. *the Ost Afrikanische Eisenbahn-Gesellschaft (O.A.E.-G)*: The Ostafrikanische Eisenbahngesellschaft (in English the East African Railway Company) was established in 1904 to promote a railway from Dar es Salaam to Lake Tanganyika. See M. Amin, D.

Hammond, *Report on the Railway System of Tanganyika Territory*

1. *firing*: Firing involved shovelling coal into a locomotive's firebox.
2. *axle boxes*: An axle box is the journal box (a housing containing a journal and its bearings) of a rotating axle.
5. *Sentinel rail cars*: a guards van.
6. *Great Western Railway Company*: The Great Western Railway (GWR) was a railway company that linked London with the south-west and west of England and most of Wales. It was founded in 1833. H. C. Smith Ltd versus the Great Western Railway Company is still quoted in common law. It laid down that ‘he who asserts must prove’.
7. *Railways Act of 1921*: The Railways Act of 1921, known as the Grouping Act, was intended to stem the losses of the UK’s railway sector. It sought to dampen internal competition and to retain some of the benefits which the country had derived from a government-controlled railway during and after the First World War.
8. *King’s African Rifles Commitment*: The King’s African Rifles (KAR) was a multi-battalion British colonial regiment raised from the various British possessions in East Africa from 1902. Officers were mostly seconded from the British army. The soldiers were African.

**Impact of Railways**

R. T. Williams, *The Cape to Cairo Railway from the Point of View of African Development* (1922)  

**Editorial Notes**
The operation of lines is discussed in the thematic introduction to Volume 3 of this collection. The sources in this section continue the exploration of how African lines were managed. It begins on a bright note with a description of the celebration held to mark the opening of the Lagos–Ibadan Railway in which the idealistic belief that railways offered a lucrative panacea to the economic and social ills of the world is revealed in all its glory (see Opening of the Lagos–Ibadan Railway for Traffic (1901), below). Harsh reality then makes its appearance and the following seven sources explore the myriad ways in which administrations sought to ensure that works covered their costs or even earned a profit. The South African authorities seek a solution in the perennial private versus public sector ownership debate (see Hoy, State Ownership and Operation of Railways (1919), below). Nigeria investigates how traffic can be increased, the Gold Coast finds financial salvation in cost cutting and the Beira and Mashonaland Railway simply raises railway tariffs, bringing upon itself a wave of criticism from local traders and UK Chambers of Commerce, who claim the policy is destroying business and trade (see Governor Sir W. MacGregor to Mr. Lyttelton (1904 Railway Retrenchment Committee Report and Recommendations (1932); and The Birmingham Chamber of Commerce to Colonial Office (1905), all below). Others seek to engender cooperation and coordination. The Ugandan government examines the possible amalgamation of the protectorate lines with the Uganda Railway and the likely cost savings and cross-subsidization that would arise (see The Governor of Uganda to the Secretary of State (1914), below). The Gold Coast then takes the policy one step further, contemplating an alliance of road and rail services, and the Manse report is more ambitious yet, seeking that holy grail of all governments, the uniform transport policy, in this case the coordination of Kenyan, Tanganyikan and Ugandan rail, road, aerial and water-borne transport (see Mance, Report on the Co-ordination of Transport in Kenya, Uganda and the Tanganyika Territory (1937) and Gurney, Report of the Road-Rail Transport Committee (1945), below). The section ends with two snapshots of British African railways in 1915 and 1927 and a detailed technical review of the locomotives and
rolling stock used upon them (see Mance, *The Railway Systems of West Africa* (1913); Anon., ‘The Railways of Africa’, *Railway Gazette*, 21 November and 5 December 1927, and Anon., ‘Some Typical Modern Locomotives and Rolling Stock for African Railways’, *Railway Gazette* (November 1911), all below).
Monday the 4th of March will always figure as a red letter day in the annals of the history of the Colony, owing to the unique ceremony in connection with the opening of the Lagos-Ibadan section of the railway which took place on that date. The announcement made previously that the ceremony would take place, and that the day would be observed as a public holiday, tended to enhance public interest, and expectation was at its highest. Although the ceremony was fixed to take place at 10 a.m., from early morning the population began to gravitate towards Iddo Island, and as the morning advanced the stir increased and both by land and water there was a continuous stream of people making their way to the Island. The opening for use of the Carter and Denton bridges, while affording great facility to the public, served to impart additional interest and
attraction, and by 10 a.m., an immense concourse of people had collected on
the Island. The terminus and station were gaily adorned with flags, the long car-
riage shed being tastefully decorated with flags and palms and converted into a
huge salle a manger for the entertainment of the people. At 10.30 a.m., a train
gaily decorated steamed in from Abeokuta with the Alake and Council of that
country as passengers. A guard of honour of Hausa\(^2\) soldiers was drawn up at
the entrance to the shed and the distinguished guests having alighted, were con-
ducted by the Hon’ble Acting Colonial Secretary, through the opening made
by the cordon of soldiers into the spacious refreshment hall where they were
received by the / company which numbered thousands and represented every
section of the community. A few minutes later, His Excellency the Governor
accompanied by the Hon. Acting Colonial Secretary and the Private Secretary
and Aid-de-Camp, entered the hall, while the guard presented arms, and the
band played the National Anthem. Shortly after Prince Eleko and the White
Cap Chiefs of Lagos entered the hall. The whole company then sat down to
luncheon, the Alake and Egba\(^3\) Chiefs being accommodated with seats on the
right of the Governor, and over four hundred persons did justice to the good
things provided, while thousands of others were entertained under booths else-
where. After dining, His Excellency in a felicitous speech proposed the toast of
‘His Majesty King Edward the VII.’ His Excellency said:–

[...] Ladies and Gentlemen, – I have asked you to come here to-day to
assist at the inauguration of a great work, to take part in the opening of the Lagos
Railway, by far the most important undertaking of the kind ever carried to com-
pletion on the West Coast of Africa. This day is therefore not only one of deep
significance to Lagos, but it is also an event of much historical interest for the
whole Coast. This inauguration will always be conspicuous as being the first one
of the king on this part of the continent. It will be followed soon by similar
ceremonies in the neighbouring colonies, in Dahomey, in the Gold Coast, and
probably in Southern Nigeria.

HISTORY OF THE RAILWAY.

The first proposal for the construction of a railway here, so far as I have been able
to discover, originated in July 1893 with a body called ‘The Western Syndicate’,
at the head of which was Mr. Alfred L. Jones / of Liverpool. They proposed to
build railways in West Africa and to begin with Lagos. Their idea was to start
from some suitable point on the Lagoon and to proceed to Ibadan by Jebu Ode.
Lord Ripon\(^4\) transmitted the proposal to Sir Gilbert Carter\(^5\) the Governor, in
November 1893, for report. The Governor replied on the 23rd February 1894,
informing the Secretary of State that the Legislative Council was prepared to
vote money for the necessary survey. The Chamber of Commerce also approved of a railway.

The Governor thought the railway should start from Ejinrin of Epe. He added that doubtless it would be ultimately carried to the Niger.

Lord Ripon approved of the survey, 2nd May 1894. His Lordship said the railway might ultimately be extended to Ilorin, and possibly to the Niger.

The preliminary survey was completed in May 1895, and the work of construction was started on both bridges and railway in December of the same year, and this has been continued ever since.

The total length of the line from Iddo Island to Ibadan is 123½ miles, and that we are now opening to traffic.

The work of construction is still going on at Aro, where a bridge is being built to carry a branch line over Ogun to the town wall of Abeokuta. This line will be about three miles in length.

I am glad to be able to inform you that the Secretary of State has given orders that the construction of a steam tramway to connect Lagos with Iddo Island shall be commenced immediately. This tramway will proceed from the railway terminus on Iddo Island across the Carter Bridge to Lagos, and after traversing the town will I hope go along the Marina to its southern end. We may therefore expect that this year will see the railway completed from the South end of Lagos town to Abeokuta and Ibadan.

USE OF THE RAILWAY.

The railway will undoubtedly be of immense use to the three towns of Lagos, Abeokuta, and Ibadan. It may be expected that the coming census will shew a population of some two score thousand people in Lagos, There may be upwards of twice that number in Abeokuta, and as many again in Ibadan as in Abeokuta. The railway traverses a country of considerable fertility.

A point of great interest to you now is whether the railway will pay. I for my part shall be satisfied if it pays working expenses this year. Next year it should do more. Now my own personal opinion is, that the surest way to make the railway pay is to have low rates for carrying both passengers and goods.

Mr. Hill, the Acting General Manager, has prepared table of rates based on a scale that is perhaps unprecedentedly low. It is the only sure way of making the railway useful; if it is not made useful it cannot pay. The policy of Railway management will therefore be cheap rates, and no free passes. The latter are infinite sources of trouble and abuse / wherever there is a state-owned railway. I shall wish to treat all alike as to free passes. I shall authorise no officer to grant a free pass after these opening ceremonies. I shall grant none myself. All therefore have the same treatment in this matter.
THE FINANCES OF CONSTRUCTION.

As the work is not finished I am not able to tell you what the total cost of the railway will amount to, but I may say that for our present purpose we may put it down at a million sterling. You will want to know how this money has been raised. It has been advanced from Imperials funds, and you now owe that money to the Imperial Treasury and are paying interest on it. I do not know whether we could have obtained the money in the market without the guarantee of the Imperial Government. If we could have done so we should have had to pay much more for it.

Now I may tell you that for a generation I have had good opportunities now and then of seeing how the Crown Agents for the Colonies manage financial matters on a large scale. I have often examined their methods and terms very carefully. I can only say that their management, wherever large sums of money are concerned, is excellent. The Railway has been financed by the Crown Agents, under the general guidance of a Secretary of State who is a first class man of business. You should therefore know that your financial interests in this railway matter have been well safeguarded.

THE MANAGEMENT OF CONSTRUCTION.

The general direction of construction has been in the hands of the Messrs. Shelford. I may say I have been surprised by the smallness of the remuneration they have received from this Colony.

Mr. Shelford has had a salary at a rate at which we could not obtain an Assistant Director of Works. He has taken a deep personal interest in this Railway and made it a point of personal honour to carry it to a successful issue in spite of the endless difficulties in the way, for remember it was new work in a new country situated at a great distance. You will therefore join with me in congratulating Mr. Shelford on the opening of this line to-day.

But the most gifted Consulting Engineer could not carry on such a work from London without able men on the spot here. Personally I can speak only of Mr. Knights as Chief Resident Engineer. Mr. Knights has had a difficult task to deal with, and unless he is rigidly self-critical he must feel that on the whole he has had a very unusual degree of success. Mr. Knights is not the man that would ever be wholly satisfied by his own performances, still he should feel that if he has made any small mistakes they are only just enough to remind him that he is after all human though not an ordinary man. You will find for yourselves that this railway is soundly and substantially built. I consider that we have been fortunate in having here the services of Mr. Knights, and in congratulating him I express the hope that he may yet in health and strength take this Railway over the Niger, and with pride and in honour assist at its opening ceremony at Kano.
EXTENSION OF THE RAILWAY.

The Railway is now at Ibadan. The question of the day is whether it is to go further or how far.

At the present moment a Survey party under the leadership of Mr. Gee is engaged in examining the country between Ibadan and Ilorin by way of Oyo and Ogbomosho. I believe this party will carry on the survey as far as Jebba; and will examine the alternative route from Ibadan to Ilorin by way of Ede, Oshogbo, Ilesha and Ikirun. The route from Ibadan to Ilorin by way of Oyo and Ogbomosho I have twice traversed and have found it to be comparatively easy. There the railway would cross rolling undulating country, with no rivers to bridge, no forest to fell, and with plenty of ballast at hand practically all along the line. No great embankments would be required, no very deep cuttings, certainly no tunnels. The consulting Engineers pronounce it not a remarkably easy country because it contains the divide between the Niger on one hand and the Ogun and Oshun on the other. One traversing the ground will not be frightened of the divide for the good reason that it is not easy to find it.

The extension of the line from Ibadan to Ilorin would therefore be comparatively cheap and easy.

THE RESOURCES OF THE COUNTRY.

Now what is the value of the resources of that part of the country that lies between Ilorin and Ibadan? And how far would the trade of Lagos be benefitted by this proposed extension to Ilorin? From personal observation I can speak only of the Oyo-Ogbomosho route. Let me say at once that up to the present no minerals have been discovered there. It is not a forest country, therefore there will be no timber to transport. The palm tree is not common at Oyo; it is somewhat rare at Ogbomosho. There would therefore be no palm oil or palm kernel trade of any consequence. There remain only the agricultural products of the district to fall back on. The soil consists of the average mixture of humus and sand, well adapted for growing maize, cassava, yams, and similar products. It is also probably exceptionally suitable for cotton, which the alternation of wet and dry seasons would perhaps favour. As one approaches Ilorin it is clear the country becomes poorer, and that it could send to Lagos practically nothing save a few beasts, some sheep, goats, cattle, and a few horses. I presume that most of what would be brought to Lagos by the extension of the railway to Ilorin comes to Lagos now, but what comes to Lagos from beyond Oyo cannot at present be very great.

Now if you ask me what in my opinion would be the financial result to this Colony of extending this railway from Ibadan to Ilorin, and no further, I shall tell you in one word, injurious.
Now I dwell on this point for a very particular reason I wish to shew / you that for your country for yourselves and for your children, this question is of vital importance.

Naturally on such matter as the extension of the railway considerable weight is attached to the opinion of the experts consulted.

Now in my humble judgment the opinion of the experts, as at present recorded, involves a very great danger to this Colony. It is, generally this. That in view of the cost of opening up at Lagos a harbour sufficiently commodious to accommodate the trade of the hinterland, another line should start for Northern Nigeria from a different and more suitable part of the coast; that a limited area should be set apart for the Lagos Railway the northern terminus of which should be Ilorin; that it would be courting failure to retain the terminus at Ibadan, and therefore it should be placed at Ilorin. My opinion of the extension to Ilorin and a permanent stoppage there, I have told you. If it is to court failure to stop at Ibadan, it is to ensure financial collapse to go to Ilorin and stop there. I say this deliberately after taking into account the comparatively less cost of the extension from Ibadan to Ilorin. The principal ethnical advantage of an extension to Ibadan as a terminus would be sentimental, ethnical if you like. The country up to Ilorin is Yoruba land; probably the major portion of the inhabitants of Ilorin are also Yoruba. From this point of view the extension from Ibadan to Ilorin is desirable. But it would not pay to run a train once a week between Ibadan and Ilorin were the hinterland supplied by another line. I therefore say emphatically that it is far better to have the terminus at Ibadan than to have it at Ilorin, I do not see how it could fail to upset the finances of this Colony were the terminus to be permanently at that town, situated as it is in a comparatively poor country with but little trade. I am aware that its population has been estimated at 70,000. I should think this an over estimate. It is a dull and lifeless place compared to our great towns. It may at first sight appear paradoxical when I tell you that I am most anxious that this Railway should be extended to Ilorin as soon as possible. It is because the sooner it gets there the sooner it will get to the Niger, and the sooner it reaches the Niger the earlier will be its arrival at the watershed of Lake Tchad.

[...]

POLITICAL ASPECT OF THE RAILWAY.

But the railway itself has also a political side. I presume you are all aware that France is likely to lead railway enterprise in this part of the world. You know of the project of the French railway from the Mediterranean to the bight between Tchad and the Niger. And you also know of the line starting from Porto Novo, which will doubtless be carried through the Dahomey hinterland to tap the same river. This will also be done higher up by the line from Konakry. If therefore we are to
keep our own trade, that is the trade of own more limited hinterland, can there be any better way of doing so than by extending this railway direct from Lagos to the Hausa capital? He would be a dull man that did not see that this line would be of enormous importance in developing and in keeping our own trade. Nothing else could so certainly keep it. For the purposes of defence against armed invasion this railway would be superior to any other. I maintain therefore that for the purposes of commerce and for the purposes of defence this railway would be clearly more advantageous than one starting from any other point on the British Coast.

**EFFECT OF THE EXTENSION ON LAGOS.**

Finally I wish you to consider what would be the result to this place of carrying our railway to the Hausa country. It is said that the territory in question supports some fifteen millions of inhabitants. There is evidence that it contains mineral wealth. If you look at a map of Africa you will see that no other single Colony has behind it a hinterland of equal value and promise. It would be all in vain to push this railway into that country were it a desert. But there we have a great country with numerous and industrious population. You should look on its trade as your heritage; and you should spare no efforts, shrink at no sacrifice, that would secure to you and your children's children, such a splendid possession. If you can only have this railway carried on, as I hope you may, the increase in the value of property here will be enormous: the careers opened out to your sons would be numerous: you would then obtain a degree of comfort and prosperity that you never dreamed of. The subject is however no dream. It is a scheme that is perfectly practicable if you push on the railway stage by stage, and never rest satisfied till your iron horse drinks of the waters of Tchad.

If you love your country, if you love your children and care for their future, let that be your aim. It is a legitimate aspiration which is attainable by the exercise of perseverance combined with wise and prudent management. I now ask you to drink prosperity to the Lagos-Ibadan section of this railway.

**Mr. R. KNIGHTS, Chief Resident Engineer, in responding said:—**

Your Excellency, Ladies and Gentlemen, — [...]  

In the construction of the Railway from Lagos to Ibadan there have been no great engineering difficulties with the exception of bridging the Lagoon here. We have had to contend with many things that were unforeseen, more especially in regard to the depth that the piles in many cases have been screwed down, amounting in several instances to over 40 feet lower than it was anticipated. Then the testing of the piles of the Railway Bridge was a difficult and dangerous operation, as in several of the piers, the piles sunk under the test load, in one as much as 13 feet. In all these the piles were again lengthened and screwed further down and re-tested.
I have heard it stated in Lagos that the Carter Bridge never would be built. Time however has altered that, as the Bridge was commenced in February 1898 and in the space of 20 months the last girder was placed in position. Some difficulties have had to be overcome here again in the sinking of piles in the most treacherous bottom of the Lagoon, but we are gradually becoming master of this difficulty and to-day, the Bridges and Railway to Ibadan are in a state of completion; and with the excellent work that has been done, no Engineer and his Staff need be anything else than proud of their work.

The greatest difficulty in Railway work upon the West Coast is however the deadly fever that decimates our European staff. Upon the work we hand over to-day, to Colonial Government, there have been 217 Europeans employed, out of these 29 have died and 31 have been invalided. This great cost in valuable lives makes one's wishes all the more sincere when to-day we hope and trust that the colony of Lagos has laid the foundation stone for the building up of a vast and mighty Colony.

In conclusion I would wish to thank my Staff for their noble support. No one can build a Railway, the Chief Resident Engineer must have the assistance of every one, and all pull together to bring a work of this magnitude to a successful completion,

I am proud to say, and it will give me the greatest pleasure to report to the Consulting Engineers, that the staff that has been employed has been most loyal and good fellows and I thank them for the way they have helped me, and that hand in hand we have brought the work thus far to a conclusion, we trust to the benefit of the Colony in every way.

Speech of Mr. E. J. Bailey, President of the Lagos Chamber of Commerce:–

Your Excellency, Chiefs, Ladies and Gentlemen, – It has devolved on me as President of the Chamber of Commerce, to represent however unworthily, the vast interests of the commercial community of this colony. It is only a few years since the Railway was not even talked of, and up to quite recently it took from three to fourteen days, according to the season to go to Abeokuta. The Government deserves the public thanks for having provided us with a Railway which will allow public and commercial intercourse between Lagos, Abeokuta and Ibadan in a few hours. It is also to be congratulated on being the first British West African Government to open a Railway of this extent of mileage.

Trade in this Colony has been extremely dull for some considerable time, worse I believe, during the last twelve months than it has ever been, and anything that tends to facilitate communication with the interior and thus enhance trade, cannot fail to be appreciated. I trust that His Excellency the Governor will do all in his power to encourage the natives to use the Railway, bearing in mind when
fixing the tariff, the cost of transit by waterway and the large bulk and little value of some of the produce. Although the Railway may not pay for itself for some years, with prohibitive rates it will never become a commercial success.

There is another point I should like to mention. We sometimes hear of petty troubles in the interior. With the advantage of the Railway His Excellency will be better able to investigate these.

Thus with the Railway in full swing and things working smoothly in the interior, I trust that the much needed improvement in trade will be consummated and that Government and Commerce working hand in hand for the benefit of this, the most important British Colony of west Africa, we shall see the commencement of a new era of prosperity, which will continue undiminished for many years to come.

Speech of Mr. C. A. Sapara Williams, B.L.

Your Excellency, Ladies and Gentlemen, – In the affairs of a community, like individuals, the whole view of a situation should be taken into consideration. We are called upon to-day to start a new life in our relations with the peace and prosperity of our country and fatherland. We are assembled to-day to inaugurate the opening of the railway which has been in the course of construction for sometime. How magnificent and stupendous is the work just completed we are here to-day to see for ourselves. A few years back who amongst us could have ventured to think of the possibility of linking together as we do now, our vast interior countries, so full of unexplored resources and commercial wealth. Of the difficulties of travel even to the nearest places very few are ignorant. How easy it is now to travel from one place to another. Their Majesties the Alake, the Oshile, the Olowu and the Alagura, without doubt, are convinced of this fact also. They will be home again to-day before the day is far spent. But this is not the only aspect of the situation that I wish to give prominence to. What we have to regard is, I say, the great impetus given to commerce in this undertaking. The iron-horse will open up to an inconceivable extent our hinterland, and places yet untapped and uncultivated, will yield fruits of abundant harvest which will be brought down by the trains during our various trading seasons.

Our country has, I am proud to say, not inaptly been designated the Liverpool of West Africa. Our trade, it is true, had in years gone by been hardly rivalled, but at present we are getting exhausted. We have the riches reserved for us by nature, but have not the means wherewith to take possession. Whatever will help to stimulate trade we most willingly welcome. The development of trade and the successful working of the railway will depend to a great extent upon the managerial care with which the Government adapts itself to our conditions as a race, and our methods of appreciation of new and foreign conditions.
of living. We are a people of simple habits. I sincerely hope that the Government
will not look upon this venture in the light of a trading concern, but will, for
our mutual benefit and from the standpoint of educator of the people adopt
tariffs not prohibitive in themselves but fair to our conditions and means. By
way of practical illustration we take the case of Senegal railway which extends
to, I believe, the Upper Niger. At the start, the people in those regions were tur-
bulent and intractable and were of a marauding disposition. It took the French
Government all they could do to reconcile them to the new conditions. But,
to-day, what do we see? By the extension of the line and the new life, and peace
and prosperity abound.

As Yorubas we are an industrial and agricultural people. The railway in every
civilized community is a great lever of commerce, and I doubt not that this rail-
way will turn out a success and will help in the improvement of Yorubaland. /

It is said that when the Olympian divinities wished to regale themselves they
turn their faces to the Aurora Borealis and betake themselves to the swarthy
Ethiopeans of the sunny south. This railway so far as we are concerned, may
be likened to the Olympian divinities, and surrounded in Lagos, as we are by
malarial swamps which no science can do away with, we too should sometimes,
during the unhealthy seasons, with the help of the railway, betake ourselves to
the healthy regions of the Interior, where sitting under our own vine and fig
we will be better able to study nature and improve our conditions. I hope this
undertaking will prove the truth of the adage that peace and commerce advance
side by side; and that to conciliate the people is to give them prosperity by open-
ing outlets for their commerce.

On behalf of the native inhabitants of Lagos I wish this undertaking every
success, and that every one in his own sphere will do his best to make it so.

[...]

Chief Aromire, on behalf of the White Cap Chiefs of Lagos, addressed the
assembly as follows: – We are thankful and appreciate very much what we see.
We had heard a good deal about the Oko Ile (railway) but had no idea of what
it was. It has pleased God however, by placing us under the rule of the late good
Queen, to enable us to realize what a railway means. We are very thankful to the
Governor for giving realization to this great undertaking. By means of the railway
Abeokuta which is distant three days journey can be reached now in four hours,
and Ibadan which occupied a journey of seven days can now be reached in one
day. The change means good and we are thankful for it. It is our hope that God
will bless His Majesty King Edward the VII, and make his reign long and prosper-
ous. We trust that as his late mother loved the African, His Majesty will follow
her example and love the African too. His Excellency the Governor is a fortunate
man in that the duty falls to him to perform the important task of opening the
railway which is so propitious for good. His Excellency knows his duty and does
Opening of the Lagos–Ibadan Railway for Traffic

it well. We will not forget his action in appointing Eleko to succeed the late Oyekan; neither will we forget what we have witnessed here to-day. The man to whom the privilege falls to open the railway is indeed a fortunate man.

[...

Mr. Olukolu, on behalf of the Native Guild of Traders, spoke as follows:
– May God bless the King and the Governor. The railway is a wonderful achievement, and we all are very much pleased and hope it will prove a great help. We are pleased because it will conduce to develop trade which is the life of the country. Both young and old are glad because of this, We trust that Providence will be with the Governor and help him to discover more products to increase trade and so help the people. We are all pleased at the prospect of the railway being opened for traffic.

The company then rose and His Excellency formally declared the Railway open.

At 1 p.m., the Alake and Members of the Egba Council who had entrained, departed for Abeokuta, and shortly after the Governor and a large number of persons started on a trip to Otta. The stations at Ebute Metta and Otta were all gaily decorated with flags and palms while pennons fluttered in the wind on every side. After a short stay at Otta, the train returned with the people back to Iddo where tea was served, after which the company separated and the unique function was brought to a close.

THE CEREMONY AT ABEOKUTA.

According to the programme, a train started early the following morning for Ibadan, conveying over six hundred persons to whom free passes were granted to enable them to be present at the opening ceremonies at Abeokuta and Ibadan. At 12 noon His Excellency the Governor and suite with a number of guests left Iddo Station for Aro. The train steamed into Aro Station at 415 p.m. His Excellency was met at the station by the Alake and Council, and an assembly of five thousand Egbas, with their Chieftains, and with drums and tomtons resounding. The Station was tastefully adorned with palms with flags flaying gaily, while an arch of palms gracefully set off the rail line under which the train passed as it came to a standstill; the fluttering of pennons everywhere denoted a gala day, éclat being added to the scene by the presence of an Hausa guard of honor. The Alake and Council entered the train and after bidding welcome to the Governor were introduced by him to his guests. The feasting of the people assembled was then began, and in numbers varying according as they were allocated, and from various points, there was evidence that the assembled crowd was doing justice to themselves. A shower of rain came on and somewhat interrupted the proceedings, but as there was plenty of shelter available, the people made themselves
comfortable while the drums kept up a loud and continuous tattoo affording enlivenment until nightfall. At 8.30 p.m. the company which included the Alake and Council sat down to dinner in the spacious carriage shed. / 

The Rt. Rev. Bishop Oluwole being called upon to speak, said: Your Excellency, and Gentlemen. The event which we are inaugurating this week will be an important land mark in the history of this country. Those of us who believe in the developing and civilizing power of the railway rejoice to see the Lagos-Ibadan section of the railway in this country an accomplished fact. The great benefit which it is expected to confer on trade by developing the resources of the country was dwelt upon at Iddo yesterday. It has developed other places, and the same result is looked for here. But I do not know whether opinion is really unanimous on this point; whether there is not fear in some minds that this giant that has appeared in the land might after all, prove destructive to trade. When it was an open question whether the railway should come to Abeokuta, one of the objections seriously put before me by an influential Egba was this: that the train takes so much at a time that it would soon exhaust the produce of the country. This objection which seems somewhat amusing in itself, bears upon an important point; it is a way of stating the fact that the railway makes an increasing demand upon industry for which there is as yet so much room in this country; as one goes up and down, from town to town, from village to village, and from hamlet to hamlet, one sees that even the natural products of our soil are not sufficiently collected; one sees that there is much room for cultivation. The railway also makes an increasing demand upon resources some of which have yet to be developed, and some to be discovered, Thus you see that it is a call upon us to multiply the number of producers who will labour hard; a call upon the patriotism of all the natives of this country; all classes, the clergy and schoolmasters, to guide those under their influence, and inculcate the dignity of labour: the wealthy and men of position, to use all the means in their power to use the development of our resources. There is also what a present day poet calls 'the white man's burden.' There is a burden in this respect for the white man. The Government of Lagos has begun to bear its share by the establishment of a Botanic Garden and by contemplating a Model Farm. I was pleased to read in a recent number of one of the local newspapers that Messrs Elder Dempster & Co., have undertaken to encourage cotton industry by promising a liberal prize to any one who should be the first to ship a certain quantity; I hope other firms will follow this good example and encourage industry in some way. But is it only material benefit we are to look for from this railway? May we not expect moral and spiritual benefits from this free and easy intercourse with one another? May we not hope for those influences which produce habits that ennoble a people – truth, honesty, purity and temperance? I pray for God's blessing on this railway. As it joins tribe to tribe and race to race, may it join them for peace and not for
war; for dealings of justice and mercy; for lawful and righteous commerce, and for whatever can elevate the whole man.

Hon. C. J. George, following, spoke as follows:– Your Excellency and Gentlemen: On an important occasion like the present, it behoves that I should express that satisfaction I feel at the happy issue to which the railway undertaking has been brought; and I am indeed very glad to witness the practical reality of a scheme which was but an idea a few years ago. We have to-day been conveyed in the space of four hours, a journey which in former times occupied three days by land and four days by water, and there can be no doubt that the facility thus created will be of great advantage to trade, and much benefit to the country generally. I congratulate His Excellency on his good fortune in being privileged to inaugurate the opening of the railway, and the circumstance deserves to be marked in some especial way so as to associate and perpetuate His Excellency’s name with the great undertaking. We have a Carter and Denton bridge in Lagos, and as a large bridge is now being constructed across the Ogun river at this point, it would be most appropriate if the bridge bore the name of the Governor.

[...]

THE INAUGURATION CEREMONY AT IBADAN.

Nothing could exceed the *eclat* and enthusiasm which characterized the ceremony of the opening of the railway for traffic at Ibadan. The train with the Governor and party started from Aro at 7.50 o’clock on the morning of the 5th instant, and arrived at Sanusi station at 8.35 a.m, Eruwa Road station at 9.20 and 20 minutes later at the beautiful site of Oloke Meji. Here the train stopped for some minutes, and the Governor and party descended from the train to observe the beautiful scenery. The strong bridge spanned the river at a height of about forty feet, the river coursing its way between the two hills from which the place takes its name and which rise to an elevation of 700 and 1000 feet respectively. It is here that the Government contemplate to locate the model farm, and it is hoped that in time a town will appear / on the side of the highest hill, and for which building materials of all sorts abound in profusion. The Governor and party having entered the train a start was again made and Ogunshile station reached at 10.15 and Adio station at 11.15 a.m. All the stations were tastefully decorated, the latter being embellished with beautiful wreaths of evergreen vines, and came in as a fitting prelude to the scene presented at Ibadan where the train arrived 11.58 a.m. As the train approached the Ibadan station a most gorgeous scene was presented. From every available point of the station flags and pennons flew gaily in the breeze, while trees of palms planted here and there, and festoons of palm branches artfully arranged imparted resplendency to the view. The background comprised a concourse of some forty thousand people,
grouped about, under the shady palms and around the many Chieftains, whose large and gaudy umbrellas harmonized with the variegated colours of the dress of the multitude, and who as soon as the iron horse made its appearance, could be seen moving *en masse* along the course of the road and they sent up a loud shout as the train entered the station. The Governor was met by the Resident Mr. F. C. Fuller, and was conducted by him to the group of Chiefs seated near by the station; the guard of honor of Hausa soldiers under Captain J. C. Ralph, presenting arms while the school children assembled sang the National Anthem, as the Governor passed, His Excellency advanced to the Bashorun and greeted him, and was heartily welcomed by the latter, His Excellency greeted the other Chiefs who were introduced by the Resident, and included the Aremo of Oyo, the Balogun, the Otun and Osi Bales, the representative of the Orogun of Ilia, the Bales of Ejigbo, Iragbeji, Ile-ogo, Ara, Igun Iresi, Shudunrin, and Ilawo; the Elerin of Erin, the Atawuja of Oshogbo, the Arigbajo of Igbojo, Olobu of Ilobu, the Timi of Ede, the Akirun of Ikorun, the Alada of Ada, the Bales of Fiditi, Apomu and Lalupon, the Aremo of Ogbonosho, the Aremo fo Oluwo, the Jagun of Oni-Ite, and Ogunshua Bale, of Modakeke. His Excellency, the Bashorun and the Chiefs having been invited into the station, His Excellency introduced the members of his party to the Bashorun. Shortly after, luncheon was served in the carriage shed at which the Bashorun was present while the crowd of people looked on and enjoyed the music of the Band. The party afterwards all repaired to the town, to witness the athletic sports which formed a part of the programme of the inauguration ceremony. Over four thousand people assembled in the open area near the Residency, to witness the sports which included running races, of various kinds. The most amusing of the sports we contest in which young girls competed in running matches with pots filled with water on their heads. One of the young lasses after allowing her pot to fall from her head and become smashed, rushed on to the winning post was much chagrined to find out that she was not to receive a prize. The sports passed off most pleasantly and as night came on there was an almost interminable line of people through the principle thoroughfare wending their way back to their homes.

The sound of the tomtoms early the next morning gave notice that the Bashorun and Chiefs were again on the move, and were about to start for the railway station to continue the programme of inauguration. At 9 o’clock the Governor with the Bashorun and Chiefs and large number of people, started on a trip up the line, and journeyed for a good distance, to the delight of the natives, and returned to the station at about 11 a.m. On the return of the Bashorun he was overwhelmed with greetings by his wives who stroked, patted and petted him and were effusive in their caresses. Shortly after the company partook of luncheon.

State Ownership and Operation of Railways.

A DIGEST OF THE EVIDENCE GIVEN BEFORE A COMMISSION OF INQUIRY IN SOUTH AFRICA.

BY

SIR W. W. HOY,¹

General Manager of Railways and Harbours.

[...]

PART I.

In September, 1916, there was appointed by the Governor-General of the Union of South Africa a Commission whose function it was to be to inquire into and report upon (1) the advisability of State mining; (2) the financing, organisation and control of State mines, if such mines should be created, and (3) any legislative steps required.

[...]

Our special purpose, however, on the present occasion is not to discuss the pros and cons of the question of State mining, but to call attention to, and offer a digest of, some exceptionally interesting evidence given before the Commission by Sir William Wilson / Hoy, General Manager of Railways and Harbours for the Union of South Africa, on, among other subjects, the State ownership and operation of railways. The Commission had invited Sir William to give them information on the following points:
(1) The most suitable means of organising and controlling State mines, if inaugurated.
(2) The South African railways' experience as to the efficiency of official's and men in the railway services, as compared with men in private employ.
(3) The general efficiency of State railways, as compared with privately-owned railways.
(4) How best to secure the most capable officials and men for service on State mines.
(5) The desirability of inaugurating State collieries for supplying the railways and public services generally.
(6) Any general details which might be of use to the Commission. Information on these various points was supplied by Sir William Hoy in the form of a carefully drawn and most informative written statement; a series of appendices relating to railway conditions in various countries of the world, and oral testimony given by him before the Commission. The references to State ownership and operation of railways contained in the statement and appendices are well deserving of attention at a time when the future of railways alike in the United Kingdom and the countries of our Allies is already being regarded as a Question of the Day. We think, therefore, that it may be of interest to our readers and of service to the public at the present juncture if we give the following extracts from. Sir William Hoy's world-survey of State railways in principle and practice, though we do not necessarily concur in all the conclusions at which he arrives, while we would further remind our readers that many changes in the general conditions have taken place since Sir William Hoy made his statement in December, 1916.

In regard to South African experience as to the efficiency of officials and men in the railway service, as compared with private employ, Sir William says:– / they compare favourably with any similar body of men in any railway service or in any private organisation. The Union possesses a staff of railwaymen of which any country may be proud.

Nevertheless, South African experience indicates that certain disadvantages attach to State services, and that much of the time and energy of the staff are taken up with matters with which no private management would be required to deal.

Staff control and discipline in a State concern are so bound up by regulations as to create greater difficulties in handling the staff than are experienced under private management – vide the experience of Belgium, where it is said

that political considerations have so entered into discipline matters that heads of departments prefer to shut their eyes to many faults rather than risk having punishments they inflict cancelled by the intervention of politicians.

It is difficult under a semi-judicial system efficiently to control a large body of men of different grades, such as is employed in a railway service. The service, and discipline regulations on the South African railways are elaborate and cumbersome. While there are excellent motives behind these regulations in the direction of preventing injustice and ensuring impartial consideration of discipline cases, I am satisfied that fair treatment can be secured to the staff without such elaboration.

In large private railways there is practically, the same stability of employment as on a State railway, except that anything in the nature of ‘slacking’ is liable to result in dismissal. In State concerns, however, it is not easy to deal with the man who, while not doing an honest day’s work, carefully steers a course which just keeps him within the regulations. This class of man is fortunately small, and will be found in any concern, but he is better able to indulge his bent in a State than in a private organisation. In short, there is not in State concerns the same elasticity in the control of staff as in private organisations.

On the other hand, with regard to promotion and reward for good work, considerations of seniority play a greater part in a State than in a private concern in governing promotion. A private manager can promote a capable man without regard to seniority; but a State concern has to step guardedly in such matters. It is extremely difficult to demonstrate in concrete fashion that one particular man is more efficient than another, however superior he may be. If seniority be made the sole factor in determining promotion one of the main incentives to efficiency disappears, and the service suffers accordingly. Fortunately, the statutory provisions governing promotion on the South African railways prescribe that preference shall be given to the efficient. On private railways some appointments and promotions are the result of patronage, and even favouritism, and I consider that in the Union railway service an able man has opportunities quite as good as, if not better than, he would have in private employ.

There is a regrettable tendency for individuals in State employ to bring Parliamentary influence to bear in regard to alleged grievances; and in this they are frequently encouraged by legislators anxious to make political capital out of such cases. Minor complaints are, therefore, frequently debated in Parliament purely on political grounds. It is obviously impracticable and undesirable for the machinery of Parliament to be utilised to perform the functions of Appeal Boards already in existence. Parliament has not the time, even if it did have the complete evidence, to do justice either to the men or to the Administration.

The same applies to many other details which, on a private railway, would not be considered sufficiently important to place before the general manager.
Matters, in themselves trifling, assume unwarranted importance by reason of their entry into the arena of politics, and thus occupy much of the time of the principal executive officers which should be devoted to constructive work.

Moreover, undue influence on the executive authority is attended with a broader disability, in that it operates against adequate decentralisation – the essence of efficient organisation. /  

PART II. 

THE GENERAL EFFICIENCY OF STATE RAILWAYS AS COMPARED WITH PRIVATELY-OWNED RAILWAYS.

This is a highly complex problem, involving innumerable considerations, and it is not possible in this evidence to do more than very briefly indicate the main considerations involved.

What constitutes efficiency in railway management? – Considerable vagueness frequently exists as to what actually constitutes efficiency in railway management. It is misleading to judge a railway’s efficiency by particular details, and I conceive that such must be determined by the following broad considerations, viz.:–

(a) the maximum possible development of agricultural, industrial and commercial activity by means of cheap and well designed tariffs, and by efficient and expeditious service;

(b) the full development of passenger traffic by means of cheap fares, comfort and speed of travelling.

The principal means of ensuring relatively cheap railway transport is by economical construction, maintenance and general working. Waste or extravagance in capital or current costs ultimately results in higher traffic. Increased railway traffic diminish traffic and retard industrial development.

Much also depends on the general efficiency of the service provided, and on the manner in which the tariffs are designed with relation to different classes of traffic. Increased traffic decreases the expenditure per unit. Badly designed traffic diminish the volume of traffic, which involves increasing tariffs on the remaining traffic, for the reason that a decrease in traffic increases the expenditure per unit. Operating expenses do not diminish in the same ratio as traffic, owing to the large proportion of ‘fixed’ charges included in railway costs.

Conflict of informed opinion on relative advantages of State versus private railways. – There is much room for diversity of opinion as to the relative advantages of State versus private railways. So much depends on the peculiar conditions of the country concerned. Prior to 1885 Italy alternated between State and private management. In 1885 she definitely changed from State to private / manage-
ment, and in 1905 reverted to State management. In 1844 the British Parliament passed an Act dealing with the State purchase of the railways sanctioned subsequent to 1843, and in 1865 the British Royal Commission reported in favour of the continuance of private management. Japan, after experience of private and State railways side by side, decided to nationalise the whole of her railways.

[...]

Difficulty of instituting reliable statistical comparisons of results of working State and private railways. – It is extremely difficult, if at all practicable, to secure reliable concrete comparisons of the actual results of working State versus private railways. Large profits are possible under wasteful management if favourable conditions exist, e.g., dense traffic and satisfactory grades and curves. On the other hand, small profits, or even no profits, may be earned by a highly efficient railway unfavourably situated with regard to traffic, grades and curves, and costs of labour and materials. No railway unit of expenditure or revenue gives a reliable comparison between one railway and another, as so much depends upon:

(a) costs of fuel, material and labour;
(b) physical character of country, which determines train loads;
(c) density and nature of traffic;
(d) average length of haul;
(e) industrial and railway policy;
(f) competition with alternative means of transport; particularly water transport; and
(g) different values of money in different countries. Most railway authorities are agreed on this point. /

PART III.
ADVANTAGES AND DISADVANTAGES OF STATE CONTROL OF RAILWAYS.

Although it is not possible to form definite conclusions from a statistical analysis of State and private railways, practical experience indicates certain broad advantages and disadvantages attaching to both systems. A brief summary of the position, as it appeals to me, is as follows:

The Main Advantages of State Control.

(a) Railways administered by impartial authority. – The railways of a country are of common concern to all interests in a community. Railway tariffs can be designed so as to develop and encourage certain interests, and to retard or even stifle others. This applies in any country, but in South Africa, owing to the peculiar conditions prevailing, the great distances between producing and consuming points, between ports and interior, and other circumstances, the rail-
way tariffs are probably as important as the Customs tariffs in determining the development of agriculture, industry and commerce. That being so, it is desirable that the fixing of railway tariffs should be in the hands of an impartial authority. In Great Britain and America the railways are prohibited from discriminating in tariffs in favour of particular firms or individuals; but this is not enough to ensure the tariff being designed in the best interests of the State.

(b) **Tariffs on State railways can be designed to harmonise with policy of national development** – Railway tariffs on State lines can more readily be adjusted in harmony with the policy of national development.

Germany’s low export railway tariffs and low through rates from the interior of Germany to foreign ports have undoubtedly been an important factor contributing to the hold she had secured on foreign trade; and it is difficult to resist the view that the State railways of Germany have done more to foster agriculture, industry and exports than any private railways. Germany’s railway policy was framed to assist to the fullest extent in the achievement of her national ambitions. / By means of very low rates, some of which have been criticised (wrongly) as unpayable, the railways of South Africa have developed a relatively large trade in shipment coal, export grain and fruit.

(c) **State better able to finance railways.** – A State can secure money more readily, and at lower interest, than a private company. It is in a better position to finance its railways, not only as regards construction, but in the matter of renewals and improvements in track and equipment. Owing to difficulties in obtaining funds for betterment and upkeep, and to other causes, 41 American railways, with a track of nearly 42,000 miles, were in the hands of the Receivers early in the present year (1916).

Improvements designed to produce economy in operation are constantly necessary on a railway, in order to counteract the steady and universal increase in working costs.

(d) **Profits of State railways are secured for the benefit of the State.** – Under State railways the profits are secured for the benefit of the State. The South African policy, in accordance with the Act of Union, is not to make the railways profit earning. The net profits of the German railways in 1912 were £53,623,000, equal to 6.13 percent, on the capital cost. Taking interest on capital at 3 1/2 per cent., the net profit remaining is in the neighbourhood of £24,000,000. The *sufficient to pay interest at 3 1/2 per cent. on a debt of £685,000,000.* The average rate per ton-mile in Germany in 1912 was less than two-thirds of a penny, with an average haul of 61.8 miles. The average fare per passenger-mile was 45d., less than 1/2d. per mile, the average journey per passenger being 14 1/4 miles. This certainly does not point to high tariffs.
(e) Location of railways better if controlled by State. – The location of railways is a science, and the general design and distribution of a country’s railways should be better, and waste avoided if the work were controlled by a central authority. On the other hand, Australia and other countries afford examples of badly located State railways resulting from undue political pressure.

The military aspect in regard to the location of railways needs no demonstration. It has been strikingly brought home in the present war, and by Lord Kitchener’s report on the defences of Australia.

(f) Construction of lines to open up new country. – A danger exists under private ownership for rich districts to be surfeited with railways, and for undeveloped and remote districts to be badly served. Private enterprise cannot be expected to sink capital in undeveloped or remote districts when a profit is problematical, whereas a State builds railways, irrespective of immediate financial results, in order to develop the country. Canada is perhaps a notable exception, but there the State has aided private companies in developmental work. Many of the branch railways in South Africa would not have been constructed by private enterprise. Regarded as separate railway units, many of them at the commencement were unprofitable; but this consideration is outweighed by the traffic they bring to the main lines, and by the stimulus they impart to the opening up and development of remote districts. In 1912 nearly 2,000,000 tons of public traffic, or 15 per cent., of the total conveyed over the South African railways, emanated from branch lines. The tonnage from branch lines has increased considerably since 1912; but later statistics are not readily available on account of the number of men on active service.

Railways are the pioneers of civilisation in the great waste spaces of the world, and many pioneer railways would never be built except by the State or with State assistance.

(g) Co-operation with other Government Departments. – The administration of a State railway works in co-operation with the great industrial departments of the State in a manner that is impossible to a large number of private railways. Moreover, by its concentration of effort and policy, it is possible for a State railway, properly organised, to do more to foster development than private railways with conflicting interests.

(h) Private railways pre-occupied with conflicting interests. State railways concentrated on State development. – Prior to Union the managements of the three State railways of South Africa spent a considerable portion of their time in discussing and adjusting conflicting interests. There was strong evidence of this conflict of interests in their respective tariff systems. Now that one central authority exists it has the power to decide and act promptly according to the best interests of the Union as a whole. The administration of the Union railways is, therefore, concen-
trated upon development, and a large amount, not merely of waste energy, but of actual stoppage of necessary reforms has disappeared. What happened with three railway administrations in South Africa must clearly occur in an even more pronounced degree where a large number of private competitive railways exist.

(i) Duplication, overlapping and waste resulting from excessive competition amongst private railways. – There is a good deal of duplication, overlapping and waste resulting from competitive private railways. A brief outline of some of the causes is as follows:–

(i) The number of conflicting organisations which tend to higher working costs than are necessary under a central organisation.

(ii) The overlapping and duplication consequent upon the undue multiplication in same town of stations, buildings, depôts, cartage plant, staffs, &c. 

(This is overcome in some instances by the creation of joint companies under separate management. [...]) There are also cases in Great Britain of stations being worked by joint companies – Perth and Carlisle, for example. [...]

(iii) The multiplying of facilities to attract traffic from competitors, e.g. –

(a) Trucks are frequently conveyed direct to destination, for competitive reasons, with very small loads. This involves considerable waste in train mileage and unnecessary expenditure in rolling-stock and operation.

(b) Passenger trains are run between the same points over competitive lines at the same times.

(iv) The separate ownership of the wagon supply:–

Owing to the practice of promptly returning other companies stock to owners, to obviate demurrage charges, inadequate use is made of such stock on return journeys.

Industrial companies’ private wagons, which bear a large proportion to the total, must be promptly returned to particular sending stations, with the result that there is little opportunity for securing loads.

Considerable expenditure involved in shunting and separation of stock of different owners, including provision of extensive marshalling yards and sidings.

Note. – The remarks under this paragraph refer more particularly to Great Britain, though in Holland there is competition, and all the waste that this implies, between the companies working State-owned lines. /

(j) Relative business enterprise of State and private managements. – it is frequently asserted that a State management is inferior in business enterprise to a private management. Although much evidence supports this view, there are many examples that do not. In South Africa it was the State, not private enterprise, that initiated the export grain and fruit trade. [...]

PART IV.
THE MAIN DISADVANTAGES OF STATE CONTROL.

(a) The practical experience of State ownership in different countries demonstrates that it is attended with powerful disadvantages. As to how far the disappointing results have been due to the peculiar local conditions of the countries concerned, to what extent they were preventable, whether equally powerful evils in other directions would have occurred under private ownership, I am not prepared to say. The results plainly indicate that, unless adequate safeguards are devised, grave abuses and disadvantages attach to State ownership.

(b) Experience of other countries:— [...]

(c) Exercise of undue political influence on management with regard to staff conditions, tariffs and general facilities. – Where a large body of men, such as a railway staff, is employed directly by the State, there is a danger of their enlisting the efforts of legislators to secure better wages, shorter hours, improved conditions, &c. It is undoubtedly desirable that the general conditions of the staff should be on a reasonable and just basis, but it is radically unsound that, in a large organisation like a State railway, undue Parliamentary influence should be brought to bear on the executive authority controlling the railways. The enforcement on the management by Parliamentary influences, of changes in staff conditions, demoralises the entire railway service, impairs discipline, prevents good relations between the staff and the management, destroys economical working, and in every way is to be gravely deplored.

(d) Employees resort to political influences. – There is a tendency on State railways for individual employees who feel aggrieved to resort to political influence. The results are harmful alike to employees and management. Efficiency and economy are in the interest of the employees, as waste, extravagance and inefficiency diminish railway profits, and this ultimately reacts on the staff. Economical and efficient working soon disappear if the authority and discipline of the management are undermined by undue external influences.

(e) Position in Australia. [...]

(f) Results of political interference in other lands. [...]

(g) German railways free from political influence. [...]

(i) How difficulties can be mitigated if not overcome. – Much can be done to minimise the disadvantages resulting from political interference. I do not suggest that Parliament should abandon the power of control in matters of high policy – that is neither practicable nor desirable – but I am strongly of opinion that the management should be absolutely free from interference or undue influence in the
The more absolute the power of the executive authority in matters of appointment, promotion, grading and discipline of staff, the more efficient will the staff be.

(j) Tendency to over-centralisation and rigid uniformity on State railways. – There is undoubtedly a tendency towards over-centralisation and rigid uniformity on State railways, and also of excessive rigidity in matters of audit-supervision of expenditure, contracts and revenue. These elements result from the necessity for great scrupulousness on the part of a Government to avoid the possibility of suspicion of partiality or abuse. My own view is that these restrictions are carried too far. Over-centralisation destroys initiative and resource, and, if carried to excess, tends to cripple a large organisation. There is nothing inherent in State organisation to prevent adequate de-centralisation, but the tendency certainly is towards over-centralisation.

PART V.
GENERAL CONCLUSIONS.

The United States private railways, on the average, have the lowest transportation tariffs in the world – a fact partially due to the long hauls on their railways, and also to the aptitude of the Americans in general business enterprise. The British railways possess features of efficiency, particularly in maintenance, speed safety and smooth operation, which compare favourably with any railway. The German railways can also point to peculiar advantages. The part German railways have played in the present war indicates wonderful efficiency and organisation on the operating side, and German industrial development testifies to the soundness of her general railway policy.

Regarded from a purely business standpoint, it would be difficult to achieve better results than are attained by many of the principal private railways, but, as has been indicated, vital importance attaches to the broader aspect of securing the maximum national development.

The wide conflict of practical evidence renders it extremely difficult to decide as to the relative advantages and disadvantages of State and private railways. On the whole, it would seem that the problem is one to be determined according to the geographical position and the industrial, economic, political and social conditions of the particular country concerned, rather than according to the merits claimed for either system in other countries.

The success or otherwise of State railways is influenced largely by the extent to which the management is freed from political influence. It is thus manifest that the problem is governed by many elements other than the purely economic.
After mature consideration of the problem in all its aspects, I am inclined to the view that railways should be laid out, constructed and owned by the State and that with regard to the working, they should either be leased to a private concern, subject to adequate control as to the general tariff policy, &c., as in Holland or India, or matters of policy should be so divorced from executive / control that State management would be freed from interference, political or otherwise, and afforded the same facilities for efficient working as a private company.

Experience shows that politics do creep into all State managements – irrespective of the statutory or other safeguards applied, as in the case of Australia and Italy – and that the only managements immune from interference are the autocracies of Germany and Hungary. While the German system is no doubt too drastic, it has much to commend it as a means of fostering that national development so specially necessary in a new country like South Africa where agriculture and industries require every possible stimulus. What is wanted is some compromise between the two extremes, and I think one could be found.

No difficulty should be experienced in effectually separating policy from management as is done in the operation of the Vryburg-Bulawayo section of the Rhodesian railways. The company lays down the policy, and the S.A.R., by whom the line is worked, is not interfered with in details of management. Neither do politics intervene.

The system of control suggested embraces all the advantages of State ownership and eliminates the disabilities which usually attend State management.

Conclusions With Regard To South Africa.

Subject to what is stated in the last preceding paragraphs in regard to the elimination of interference in management, I am satisfied, having regard to local conditions and experience, that South Africa can best develop its resources and build up a sound national prosperity by having its railways under State control.

The outstanding features of South African conditions affecting railways are:—

(a) The small population in relation to area.
(b) The great distances between —
   (1) chief industrial centres and coast;
   (2) principal centres of population;
   (3) producing and consuming areas.
(c) The absence of canals or navigable waterways.
(d) The vast tracts of undeveloped territory which railways must traverse to reach their objectives.

Private construction served useful purpose. – In South Africa, as elsewhere, private construction has no doubt served a useful purpose, but, broadly speaking,
the operation of railways in South Africa by private companies cannot be said to have been a success. South African conditions are not, however, altogether favourable to the conduct of railways by private enterprise.

**Position of Union railways.** – The Union railways are administered in terms of the South African Act, 1909. The Act prescribes that all profits, after providing for payment of interest, depreciation and betterments, are to be utilised in the reduction of tariffs, due regard being had to agricultural and industrial development within the Union and the promotion by means of cheap transport of the settlement of an agricultural and industrial population in the inland portions of the Union.

Another very important provision in the Act of Union is, that if the railways are required to provide any services or facilities either gratuitously or at an unpayable rate, the loss thereby incurred must, after approval by the auditor, be paid out of consolidated revenue to the railway and harbour fund.

These statutory provisions testify to the far-sighted policy of the framers of the Act of Union and their full effect is perhaps greater than is generally realised. Not only do they remove the danger of the railways being used as an instrument for taxation, but taken together, they minimise to a considerable extent the possibility of railway policy and details of railway management being subordinated to expediency, and at the same time limit the scope for drastic changes in railway policy resulting from changes in government.

**Elimination of provincial control.** – In the elimination of provincial control the South African railways also have a material advantage, say, over the railways in Australia, Canada and the United States. In the United States there are over 40 State legislatures, each wielding extensive powers of control. Each has a separate Railway Commission which imposes conditions and regulations in its own State, while the Inter-State Commerce Commission controls inter-State traffic. This multiplicity of authority has caused much confusion, and rulings have been given which militate against the granting of low competitive rates. The excessive control of these different authorities is undoubtedly pressing severely on the companies. In Canada, employees injured in one State, though belonging to the same company and employed in the same grade, are governed by different laws, with regard to compensation, to employees injured in another State. In Australia the disadvantages of separate State ownership are exemplified in the different gauges – a serious obstacle to railway progress. Hitherto there has been no rail communication between several of the States, but inter-State lines are now under construction by the Commonwealth Government. This introduces another railway authority, and tends further to complicate the position.

**Rates reductions.** – Since Union, reductions in tariffs have been made, estimated to involve a surrender of revenue approximating one and a half million
sterling per annum. Many minor reductions have also been made, the exact financial results of which are not known.

_Broad features of S.A.R. policy._ – The broad features of the tariff policy of the South African railways are low rates for exports, raw materials for manufacture, agricultural produce, minerals and other raw products of the country, with a view to stimulating agricultural and industrial development. Especially low rates are granted for long distance traffic, the flat and tapering rates principles having been largely adopted. Passenger fares have been substantially reduced, particularly for suburban and long distance traffic, and low excursion fares are frequently available, these being supplemented by a vigorous advertising programme. Internal commercial development has also been stimulated by low ‘distribution’ rates, designed to afford inland traders equality of opportunity, as regards railway tariffs, in competing with coastal merchants for the interior trade. / [...]

LAGOS.
Governor Sir W. MACGREGOR\textsuperscript{1} to Mr. LYTTELTON.\textsuperscript{2}
(Received January 28, 1904.)
(No. 16.)
(Extract.)
Government House, Lagos, January 9, 1904.

I have the honour to forward herewith copies of two reports I have received from Mr. Glasier, General Manager of the Railway, prepared by two officers sent out by him to look for means of increasing traffic on the railway.

2. It should be noticed that Mr. Allen in his report, page 1, states that one reason why palm oil and kernels are not carried in greater quantity to Ibadan is excessive tolls.

This reason will now totally disappear.

In your telegram of the 8th instant,\textsuperscript{*} you have sanctioned the abolition of all export tolls. This strikes at the root of the question of tolls as regards all exports of native produce of every kind, and very greatly simplifies the whole question.

\textsuperscript{*} 497: not printed.
Enclosure 1 in No. 94.

Notes:–

Olodo. – This is not a town, but a market place.

Lalupon, Sakuru, Offa Igbo. – Are small villages on route surveyed (eastern). All abound in palm trees.

Iwo. – This is the first town of considerable size and population after leaving Ibadan, and by the immediate extension of the Railway to this place the bulk of kernels going by road through Apomu will be tapped. The routes from Ile, Igbo, Kuta, Ede, Oshogbo, Ikirun, Inisha, Okuku, Erin, and several other towns converged to this town, also the towns of Ilibu, Aragberi, Ejigbo, Ilagbeji, Ifon, all palm trees district, not on the direct road but not far distant across will find their way to Iwo. Even the town of Ikirun is nearer to Iwo than to Ibadan (not more than seven hours).

Offa Proper. – I found on arrival there is, under the Government of Northern Nigeria, no palm trees there. Ikirun and Oshogbo supply Offa Proper, Ilorin, and towns beyond with palm oil for home consumption. After leaving Ikirun palm trees grow sparsely and almost disappear before reaching Offa Proper.

At Iwo, Ede, Oshogbo, Ikirun, I tried to find out the reason why palm oil and kernels are not carried to Ibadan as hitherto, and the three following are reasons given:–

1st. Excessive tolls.
2nd. Reduction price causing loss.
3rd. Marrying season.

I told the principal men in every town that the tolls they complain of have been removed, and as to prices, if they prepare their kernels properly and quite free from shells, they will be paid good prices.

The general marrying season at the aforementioned towns opens annually between October and closes in November or early in December. This is a custom followed at these places and adjacent towns, and occupies three moons, or a little over two months. My mode of addressing the people is to first arouse their interest by painting the advantages to be derived from the Railway, and then conclude that if they do not show that they are industrious by carrying kernels to Ibadan in large quantities as hitherto the white man will not be stimulated to extend the Railway in their / direction soon. All the towns through which I passed are anxious that the Railway be extended in their direction, and promised to commence carrying kernels to Ibadan. I am informed that the supply of kernels is increasing some days since.
Retracing my steps from Offa Proper I passed through Ikirun and got to Ogbomosho, and as I must reach Ikerre and Apomu I enquired whether there is any route across country to Ilesha, and was told there was one, and as Magaji has never travelled in that part of the country, I got a man to lead us part of the way, and he accompanied us as far as River Oshun Ajigun and returned to his town. We crossed the river and entered Ijesha land at Oke Bode, a small village, and Ila Oko, and proceeded to Ilesha. On my arrival at Ilesha I immediately waited upon the Owa, who seemed very anxious that the Railway should be extended in the direction of his town.

The Owa complained that his people carrying kernels to Ibadan and Ejirin have had to pay tolls at 11 places – five strings of cowries at each place – and reckoning that amount with the carriage, four to five days, it does not tend to their advantage. I then replied that I am informed that the tolls have been abolished. I urged him to encourage his people to prepare and take kernels to Ibadan, and that he must also tell them to plant cotton as the whiteman likes cotton too. The Owa replied that some Oginbos have spoken to him about cotton, and that the thing which at present discourages the Ijesha and Ekitis is the tolls. I repeated that I heard that tolls have been abolished. The Owa said he would send and call his chiefs and elders to meet me to-morrow, and that I should tell them all that I said to him. On Saturday, the 20th December, 1903, at 9.0 a.m., the Owa sent to call me, and to say that his chiefs and elders are waiting. I went at once, and found the Owa and his principal men waiting. The Owa then said to me 'Please repeat what you told me yesterday', and I did so. The Odole, one of his principal chiefs, started again with the same story about tolls, and I repeated my reply that I am informed tolls have been abolished. The Owa at once ordered his town crier to ring the bell round the town in the evening, telling his people to begin to carry palm kernels to Ibadan and in large quantities. I have every reason to believe that the people have begun the kernel trade to Ibadan in earnest, as I am informed by a kernel buyer that the supply is now increasing. The Owa was very anxious in expressing that he hopes his people will be freely permitted to carry their produce to the merchants direct, and that they may be under no restrictions, i.e., that there be no compulsion to sell to middlemen.

I promised him that I shall report to the Railway Authorities and he thanked me.

On leaving Ilesha on the 21st December I met lots of Ijesha people returning from Ejirin, and spoke with nearly everyone. I found that most of them went with cash, and did not carry kernels in order to avoid paying tolls.

I told them that tolls have been abolished, and that they should be taking kernels to Ibadan, and nearly every one promised to commence doing so.

On my arrival at Modakeke on the evening of the 21st December, I went straight to the King’s house, but could not see him as he was out visiting. On the morning of the 22nd, I called on him, and found some of the principal men
of his town with him. I urged him to encourage his people to prepare and carry oil and kernels to Ibadan, and he commenced the story about too much tolls. I told him that tolls have been abolished. He then said that the Oni of Ife is still collecting tolls at Iremo gate. I went to Ife, which is about 30 minutes’ walk from Modakeke, I could not see the Oni: he sent to tell me that he would have been glad to see me, but is sorry that he has entered the seven days’ custom of his country, during which he is not to be seen.

I sent to tell him through his messenger that I am not on political mission, but am travelling to encourage people in matters of trade. He sent to say that he is encouraging trade, and that there are lots of palm oil and kernels in his town. I then enquired whether it is true that he is collecting tolls at Iremo Gate. His messenger said it is true, and that he has His Excellency the Governor’s sanction to do so. He receives five strings on every bag of kernels, five strings on every case of gin, and 3d. on every box or case containing goods.

I visited Modakeke Market in the evening, and saw there kernels of very fine quality. The present rate at which the people buy palm kernels at Modakeke Market is 30 strings to 35 strings basket measure, about 15 lbs., or 2s. 6d. per 90 to 100 lbs., but carriage to Ibadan is 2s. per load.

From Modakeke I came to Ashipa, crossed Shasha Stream, and arrived at Gbangan. I am informed by a trader at Gbangan that there is a road across to Iwo, which will occupy about eight hours to get there, and the people will be glad of any means by which the distance to carry loads will be considerably lessened.

From Gbangan I came to Ikire. At Ikire I got the same story about tolls, and I told them as I did at all towns which I passed through that tolls have been abolished, then they mentioned that they have to pay tolls at Apomu. I left Ikire at 7.30, on the 25th, and arrived at Apomu at 8.0 o’clock. I found an officer of the Ibadan Government there, who told me he is collecting tolls at five strings per load going either to Ibadan or Ejirin. I crossed Oshun River at 9.25 (this is said to be the confluence of Oshun River, Oba River and Erinle River), I entered Ibadan 4.0 p.m.

From Ibadan to Ikirun may be said to be one vast forest of palm trees and Ijesha land, Ekiti land, to Ibadan the same may be said without exaggeration.

On Monday, the 28th December, 1903, I started from railhead, and found a very good road being laid out from station to railway. This road goes along track pointed out by Magaji as being surveyed by Mr. Gee, and if the extension be made parallel, or near this road, it will run between the Residency and the Barracks, and by a curve hit the road to Iwo. I reckon the distance from Ibadan to Iwo to be about 30 miles, but considering the windings and turnings of native footpaths, the distance professionally laid out may be less by six to eight miles.

Wm. A. Allen,
Station Master,
Abeokuta.
Governor Sir W. MacGregor to Mr. Lyttelton

Enclosure 2 in No. 94.
LAGOS GOVERNMENT RAILWAY.

Sir,

Ebute Metta, December 15, 1903.

I have the honour to inform you that, in accordance with your instructions I have visited the principal kernel districts in the neighbourhood of Ibadan, and have made enquiries with regard to the markets at which the kernels are sold, and the routes by which they are taken to these markets.

1. I learnt, by enquiries in Ibadan, that tolls are not collected at the gates on kernels brought into the town, but the tolls are paid by the merchants when despatching kernels to the railway. The tolls, therefore, contribute to a certain extent to the low price paid for kernels this year, as the price received by the seller is naturally less, by the amounts of the toll, than it would be were the tolls not in force.

2. I left Ibadan on the Ijebu Ode Road, and proceeded to the village of Odo Ona Kekeri. On the road I passed a large number of caravans returning from Ejirin Market, and found, on enquiry, that they had originally started from Ibadan, or from the districts of Iwo, Oyo, or Ogbonosho. They had either taken money to Ejirin to buy goods, or had carried native soap, native cloth, Egusi, pepper, sheep, or goats. I did not find any who had carried down palm kernels.

At Odo Ona Kekeri I learnt from the Bale and villagers that there were not many kernels in that district, that the crop was poor this year, and that the kernels are bought by native traders who come from Ibadan.

At Lanisa Farm, about two miles from Odo Ona Kekeri, there were a considerable quantity of kernels lying on the ground, but, owing to the low price to be obtained this year at Ibadan, the owner had sold them to a soap maker. A black oil is obtained by heating the kernels (after shelling) over a fire, and this is used in the manufacture of native soap.

At other farms upon this road the owners informed me that their kernels were always sold to traders from Ibadan.

At Orilode, a village near the River Ona, I only saw a very small quantity of kernels, the Bale informed me that it was too early in the season. The kernels in this district are bought by native traders from Ibadan, and none are taken to Ejirin the distance being too great.

The depth of the River Ona at this point is about two feet six inches, but there is no canoe traffic.

3. After returning to Ibadan, I proceeded in an easterly direction towards the town of Apomu. Between Ibadan and the River Oshun I passed a number of rest-houses or small markets – Alagbede, Olode, Adegbaye, Ohan Adekanbi,
Communications in Africa, 1880–1939: Volume 4

and Ideomo. / The women at these places say that, in former years, people from the Ilesha, Ife, Modakeke, and Ikiri districts were accustomed to bring their kernels to these markets for sale, but that this year, this traffic has almost ceased. At Olode Market, a large part of the ground formerly occupied by the kernel traders has been planted with maize, owing to the falling-off in the trade.

This decrease is due to the low price paid for kernels at Ibadan this year, the price being insufficient to induce the people to carry their kernels any distance.

The kernels in this district are all sold in Ibadan. The crop in some places was said to be not as good as last year, and it was stated that, as a general rule, good and bad year alternate, the crop being good one year and poor the next. This appears to be a general opinion in the neighbourhood of Ibadan, and was the reason always given in the districts in which the crop was said to be poor.

4. At Osungere, a large farm village near the River Oshun, there were a considerable number of kernels lying on the ground in shell, but no cracking going on. The people this year pick the nuts principally for the sake of the palm oil, and after obtaining this they keep the kernels in the hope of an improvement in the price. I am informed that kernels in the shell will keep without much deterioration for three years.

At Awaye, another large farm village near Osungere, I found quantities of kernels in shell, lying on the ground or stored in baskets and pots. In only one house was any kernel-cracking being done, but the Bale informed me that at this time last year everyone in the village was busy kernel cracking. The price obtained this year is too low to offer any encouragement to the people, so that either the nuts are left on the trees, or, after picking and extraction of palm oil, the kernels are kept in the shell. Those farmers who need money sell a few kernels, but those who can afford to wait for a better price keep them. No kernels from this district are taken to Ejiri, the distance being too great: they are either sold at Ibadan, or at Olodo, a market on the Iwo Road. In the latter case they would subsequently be taken to Ibadan.

5. After leaving Osungere I crossed the River Oshun. This river is not navigable for canoes, owing to the rapids and cataracts. The ferryman at this point states that there is a great decrease this year in the number of people coming with kernels from Ilesha, Modakeke, &c., to Ibadan.

6. Apomu, a town about one hour’s journey from the River Oshun, is at the head of one of the principal roads from the northern part of the Colony to Ejiri; the other road runs from Ibadan, meeting the road from Apomu near Ijebu Ode.

This town (Apomu) is in Ibadan country, and tolls are collected from all persons passing through with loads, except those coming from Ibadan who have already paid the tolls there. The new tariff, which has been in force about a
Governor Sir W. MacGregor to Mr. Lyttelton

37

month, is the same as that in use at Ibadan, the rate per kernels being five strings per load (about 3/4d.). Before the introduction of a proper tariff the toll was 1d. per load, but was not strictly enforced. The collection of tolls at Apomu appears to inflict a certain amount of hardship upon persons passing through with kernels, and subsequently selling them at Ibadan, as after paying the tolls at Apomu they would still be subject to the reduction in price made by the merchants on account of the tolls at Ibadan (see paragraph 1).

Enquiries in this town, and an examination of the customs books, showed that the great majority of persons passing through this town with kernels took them to Ibadan, and only a small number to Ejirin. Caravans to Ejirin pass through once in eight days, and the customs books showed that on the dates, November 23rd to November 30th, 1903, inclusive 200 loads of kernels passed through Ibadan, and only 15 loads for Ejirin. There is, however, a considerable amount of traffic, other than kernels traffic, going to Ejirin market, principally native soap, cloth, egusi, sheep, and goats. The caravans return with gin, rum, cloth, salt, cutlery, &c. On November 24th to 26th, 1903, being days on which the caravans were returning from Ejirin market, the quantity of gin, rum, salt, and cloth passing through from Ejirin to towns in the hinterland was as follows:—

- Gin, 93 cases.
- Rum, 36 demijohns.  
- Salt, 18 bags.
- Cloth, 1,157 pieces,

and also numerous packages of matches, cutlery, &c. The kernels which go to Ejirin appear to come from the Modakeke and the Ife districts, and I do not find that there is any increase this year; on the contrary, so far as I have been able to learn, there is a falling-off in the kernel trade at Ejirin, as the price there is low.

Ikirun, a town near Apomu, is a great centre for kernel traders. These people go round to the farms buying up the kernels, and sell them again in Ibadan, either to the European firms, or in most cases to native traders. I was informed by some of the Ikirun traders that they had actually lost money on many of their trips this year, owing to the low price obtainable in Ibadan.

The kernel crop in the Ikirun and Apomu districts is said to be good, but so many traders have discontinued their journeys that there is a great falling off in the trade. Some of the farmers take the kernels themselves to Ibadan, but the majority sell to the traders. Many kernels this year have been sold to the soap makers.

At Gbangan, a town on the road from Apomu to Ife, the Bale and people stated that the kernels crop was good, but the price paid at Ibadan offered no inducement to farmers to take their kernels to market. They informed me that no kernels from that district were taken to Ejirin. A man from a farm village near stated that quantities of kernels were lying there.
At Ashipa, a large farm village, I found a considerable quantity of kernels lying on the ground, some of last year crop, and was informed that many were lying on the neighbouring farms. The Bale stated that in former years traders from Ilesha, Ife, and Modakeke were accustomed to buy kernels in Ashipa, and take them on to Ibadan, and also that other traders came out from Ibadan to buy, but that this year very few passed through from Ilesha, and the Ibadan traders had also ceased to come.

The Bale and people of Petumodu, a town near the Ikirun Ife Road, informed me that some kernels from that district were taken to Ibadan, some to Ejirin, but that the traffic to both places had fallen off this year, owing to the drop in prices. The kernels are kept on the farm in the hope of an improvement in the price. At this town I saw a number of kernel traders, who were idle, owing to the depression in the trade.

At Modakeke I found considerable quantities of kernels being sold in the market, others had been bought for the manufacture of soap. All the principal traders in this town take their kernels to Ibadan, but some of the farmers carry small quantities to Ejirin, and some kernels are sold to soap makers. The crop is said to be good.

At Ife the crop is reported to be good, and kernels from that district are taken to Ibadan, very few going to Ejirin.

There is a road from this town through Modakeke and Ishoya to Benin City, but no kernels pass down that way.

At Ilesha the Owa and Chiefs stated that owing to the low price paid for kernels at Ibadan this year it did not pay the people to carry them so far, nor did they take them to Ejirin. They say that a large quantity of kernels would be obtained from that district if the Railway was more accessible. The crop is said to be good this year.

At Oshogbo I was informed that the kernels in that district were all used to native black oil, as there was a lack of carriers to take them to markets.

Ede, a large town between Oshogbo and Iwo is a point through which caravans pass from Ikirun district with kernels for Ibadan. There is, however, a great decrease in the number of caravans this year, owing to the falling off in price. From Ede a road runs direct to Modakeke.

The manufacture of black oil from kernels was in process in many places in this town.

At Kuta, a village near the River Oshun, the Bale said that the crop was not good this year. Kernels from this district are sold at Olodo or Ibadan.

At Illegbo, another village between Ede and Iwo, it was stated that most of the kernels had this year been used to make black oil, and that the crop was not good.
11. At Iwo the kernel crop was said to be poor this year. Kernels are sold either at Olodo or Ibadan. Caravans from Ikirun, Oshogbo, Ede, and Ogbomosho pass through this town to Ejirin, some going through Ikiri and Apomu, others through Ibadan. There is a direct road from this town to Ikiri, also a road to Oyo: it would thus be possible for Oyo people to go to Ejirin without passing through Ibadan, but it is evident from the condition of the road between Iwo and Oyo that it is very little used. So far as I can ascertain from the people of Iwo, no kernels destined for Ejirin pass through that town.

12. There is no kernel trade in the Oyo district, but there are kernel farms between Ijaye (on the Ibadan Oyo Road) and Ibadan, at these farms the people state that the crop this year is a very poor one, and that the decrease in kernel traffic is due to this cause.

13. The information that I have gathered may be summarized as follows:–

(a) That the principal kernel districts are – The country near the Apomu Road between Ibadan and the River Oshun; the neighbourhood of Ikiri and Apomu; and the district of Modakeke, Ishoya, and Ife; and the neighbourhood of Ilesha. There is, I think, no doubt, that with greater facilities for taking the kernels to market there would be a great development of the kernel trade in these districts, and also in those of Ikirun, Oshogbo, Ede, and Iwo.

(b) That the principal routes to Ibadan are – From Ogbomosho, Iperun, Oshogbo, and Ede, through Iwo. From Ilesha, Ife, Modakeke and Ishoya, through Apomu.

(c) That the principal routes to Ejirin are – From Iperun, Oshogbo, Ede and Ogbomosho, partly through Iwo and Ibadan, and Ijebu Ode, and partly through Iwo, Apomu, and Ijebu Ode. From Ilesha, Ife, Modakeke, and Ishoya through Apomu and Ijebu Ode.

(d) That there is no canoe traffic from any of these kernel districts by the River Oshun, Ona or Oni.

(e) That almost the whole kernel trade of these districts goes to Ibadan, only small portion to Ejirin.

(f) That the kernel crop this year has been good in most districts except those in the immediate neighbourhood of Ibadan.

(g) That the decrease in the quantity of kernels brought to Ibadan is due to the low price offered by the merchants, which is not sufficient to pay the people for carrying their kernels a long distance.

(h) That the imposition of tolls at Ibadan, though entirely to the decrease in price of kernels, would not in itself have been sufficient to cause the falling-off in the kernel trade.
(j) That greater railway facilities, and the presence of European traders in the kernel districts would cause a considerable increase in the kernel trade. The kernels now pass through so many lands before reaching the European firms that the farmer himself receives a very small price for them. In this connection I may mention that complaints were made to me, in all the kernel districts that the native traders of Ibadan will not allow farmers and others, who carry their kernels to that town, to sell them direct to the European firms, but intercept the caravans on the way, and compel the people to sell to them instead of to the Europeans.

(k) That there is no increase in the kernel traffic from these districts to Ejirin this year, but that kernels are being sold to the soap-makers, or kept on the farms in the hope of an improvement in the price.

I have, &c.,
R. Bonham Smith,
Traffic Inspector.
The Traffic Superintendent,
Ebute Metta.
**Part I. – INTRODUCTORY.**

1. The Committee was appointed by His Excellency the Governor on the 29th September, 1931, with the following terms of reference:—
   To scrutinize Government expenditure upon and revenue derived from the Railway and Harbours and to make suggestions that will lead to economic improvement.

2. [...]

**Part II. – DEPARTMENTAL EXPENDITURE.**

5. The Committee adopted the method of examining in detail the expenditure of every branch of the Gold Coast Railway and Takoradi Harbour, as classified in the various Abstracts into which the Estimates of the Department are divided. The head of each branch attended while his particular Abstract was
under discussion. The Committee had the advantage of having before them the
draft Estimates of the Department for the year 1932–33, prepared in the form
in which they will shortly be submitted to Government, and were thus able to
approach their task in possession of full knowledge of the prospective economies
which the General Manager himself proposed to effect.

RAILWAY.

ENGINEERING BRANCH, ABSTRACT ‘A.’

6. Mr. F. V. Macdonald, Acting Chief Engineer, attended. In 1932–33 the
following net reductions in expenditure will be effected:–

<table>
<thead>
<tr>
<th></th>
<th>£</th>
</tr>
</thead>
<tbody>
<tr>
<td>Personal Emoluments</td>
<td>3,184</td>
</tr>
<tr>
<td>Other Charges</td>
<td>13,045</td>
</tr>
<tr>
<td>Total</td>
<td>16,229</td>
</tr>
</tbody>
</table>

A proportion of these savings has been accomplished by the reduction of four
European and nine African posts.

The Committee learned from the Acting Chief Engineer that the number of
African foremen platelayers had recently been increased and that they were now
in charge of more than one-third of the total mileage of the line.

7. Of the decrease under Other Charges £10,000 is attributable to a reduction
of daily paid staff and to the rate of wages having been reduced from 1s. 6d. to
1s. 3d. a day. The Acting Chief Engineer agreed to a suggestion that henceforth
all new labour engaged should be paid at the rate of 1s. a day for the first three
months and at 1s. 3d. thereafter should the labourer prove satisfactory and be
retained. It was calculated that a saving of £500 would be effected.

8. In the Legislative Council during September last the Gold Coast Railway had
been adversely criticised and unfavourably contrasted with the Nigeria system on
account of the cost per mile of the maintenance of the line. The General Manager
explained to the satisfaction of the Committee that the criticisms made were not
deserved. He pointed out that the principal factor in considering such figures is
the question of how much track has annually to be relaid and paid for out of funds
provided for maintenance. For example in 1930–31 a large part of the line from
Takoradi Junction to Takoradi Harbour had to be resleepered owing to the dete-
rrioration of wooden sleepers originally put down by the harbour contractors.

9. As regards the comparison between the Gold Coast and the Nigerian fig-
ures in this respect it was explained that the difference in the rates of wages
prevailing in the two Colonies is of itself sufficient to account for the disparity.
In Nigeria the wages of a railway labourer average about 9d. a day while until
recently they have been exactly double this sum in the Gold Coast and even now are 1s. 3d. a day. Furthermore, much of the Nigerian Railway is laid through open country; in the Gold Coast the line for the most part runs through dense forest with the result that the cost of ‘bushing’ and keeping telegraph lines clear of large trees constitutes a very heavy burden. Again, in the Gold Coast there are only ten miles of light railway (Accra-Weshiang), whereas Nigeria has 133 miles of such track. This is a further factor in reducing the maintenance cost per mile in Nigeria. Lastly, in this Colony there is still a number of old-fashioned station buildings made of swish of which the cost of upkeep is disproportionately heavy as compared with permanent structures built of concrete.

LOCOMOTIVE, CARRIAGE AND WAGON BRANCH, ABSTRACT ‘B.’

10. Mr. R. T. Kerr, Chief Mechanical Engineer, attended.

The following savings in Personal Emoluments will be effected in 1932-33:

<table>
<thead>
<tr>
<th></th>
<th>£</th>
</tr>
</thead>
<tbody>
<tr>
<td>Superintendence</td>
<td>1,245</td>
</tr>
<tr>
<td>Running Expenses</td>
<td>1,794</td>
</tr>
<tr>
<td>Maintenance and repair of Locomotives, Rolling Stock and Machinery</td>
<td>3,682</td>
</tr>
<tr>
<td>Maintenance and operation of Electric Plant</td>
<td>745</td>
</tr>
<tr>
<td>Maintenance and operation of Cranes</td>
<td>48</td>
</tr>
<tr>
<td>Total, Personal Emoluments</td>
<td>7,514</td>
</tr>
</tbody>
</table>

This result will be achieved by the retrenchment of 13 European and 12 African appointments, exclusive of six European appointments which have been abolished during 1931–32.

11. The Other Charges of this Branch will be reduced as follows:

<table>
<thead>
<tr>
<th></th>
<th>£</th>
</tr>
</thead>
<tbody>
<tr>
<td>Running Expenses</td>
<td>24,220</td>
</tr>
<tr>
<td>Maintenance and Repairs, Locomotives, Rolling Stock Plant and Machinery</td>
<td>17,800</td>
</tr>
<tr>
<td>Maintenance and operation of Electric Plant</td>
<td>2,900</td>
</tr>
<tr>
<td>Maintenance and operation of Cranes</td>
<td>2,077</td>
</tr>
<tr>
<td>Miscellaneous</td>
<td>2,426</td>
</tr>
<tr>
<td>Total Other Charges</td>
<td>£49,423</td>
</tr>
<tr>
<td>Total for the Abstract</td>
<td>£56,937</td>
</tr>
</tbody>
</table>

12. The Committee noted with satisfaction that the large economies set out above had been rendered possible by careful supervision and constant attention to the introduction of the most modern labour-saving methods and devices in the workshops and by very close estimating for wages, fuel, etc., both in the shops and on the road.

13. This Branch had also been criticised in Legislative Council. Adverse comment was directed towards the number of locomotives – 79 – which the Railway
maintains. The General Manager explained to the Committee that, although owing to the heavy decrease in traffic he had at the moment an excess of engines, they were no more than sufficient to cope with the requirements of the manganese mines at Nsuta in normal times, of the cacao harvest over a certain portion of the year and the general traffic that was forthcoming ordinarily. The seasonal nature of the traffic, even in prosperous times, combined with the irregular demands from Nsuta were disadvantages with which the Gold Coast Railway must always contend.

It was pointed out that decreased running though implying diminished earnings also means that there is a saving on repairs. / 14. It had been stated in the Legislative Council that in the Gold Coast Railway the cost of upkeep of engines, coaches and wagons amounted to 24 per cent of the revenue of the Department as compared with 9 per cent in Nigeria. The Committee learned from the General Manager and the Chief Mechanical Engineer that the cost of the Electrical Department – a revenue-earning undertaking which pays for itself and shows a profit – and of the maintenance and operation of cranes should be deducted from the Gold Coast figure, the percentage being reduced to 10.8 thereby. As in the case of the maintenance of the permanent way the difference between the rate of wages in the Gold Coast and in Nigeria would more than account for the disparity in favour of the latter.

As compared with Nigeria the Gold Coast Railway has to contend with a further disadvantage in that the cost of Udi coal delivered in the Gold Coast is about four times as high as the figure for which the Nigerian Railway can obtain it. Incidentally the Chief Mechanical Engineer informed the Committee that the engines on the Nigerian Railway consume 22 lbs. of fuel per engine-mile more than his engines.

15. The General Manager acquainted the Committee with figures relating to nine comparable railways in the Dominions and Crown Colonies, all of which showed a higher relation of operating costs to earnings than the Gold Coast Railway in spite of substantial reductions in railway rates during the past four years and the fact that in the Central Province Railway there are 100 miles of open lines – one-fifth of the whole – which, admittedly, are not remunerative. In England the working costs of the railways average about 82.18 per cent of their total revenue: the corresponding figure in the Gold Coast is only 55.75 per cent.

16. As a matter of incidental interest it was noted that the Nigerian Railway employs 80 European engine drivers, the corresponding number in the Gold Coast being four which is shortly to be reduced to three.
Traffic Branch, Abstract ‘C.’

17. Mr. W. E. Lewis, Traffic Manager, attended.

The Committee was informed of prospective savings under this branch in 1923–33 amounting to £15,264 made up as follows:–

<table>
<thead>
<tr>
<th></th>
<th>£</th>
</tr>
</thead>
<tbody>
<tr>
<td>Superintendence</td>
<td>5,797</td>
</tr>
<tr>
<td>Station, train and wharf staff</td>
<td>7,111</td>
</tr>
<tr>
<td>Other charges</td>
<td>2,356</td>
</tr>
<tr>
<td><strong>£15,264</strong></td>
<td></td>
</tr>
</tbody>
</table>

Eight European and 51 African posts were to be retrenched and the staff to be retained represents the irreducible minimum with which the line can be operated safely and with reasonable efficiency.

18. The General Manager referred to a statement made at the last meeting of the Legislative Council that there are seven station masters at Sekondi: he assured members that this criticism was not supported by the facts.

19. A further suggestion had been made that there are too many small and unimportant railway stations in the Gold Coast which have no pretensions to paying their way even in good times. It was proved to the satisfaction of the Committee that this is a question which cannot be judged solely in the light of the revenue earned at such stations, but that the provision of ample crossing points is of paramount importance to the safe, efficient and rapid handling of traffic on a single line. Rapidity of handling is especially important at present when the reduction in the traffic staff has rendered it necessary to restrict the running of trains to the hours of daylight only. Further to reduce the efficiency of the service by thus slowing down through-running would have a very injurious effect upon the cacao industry during the harvesting and shipping season. Moreover the slower the traffic the more would passengers seek the omnibus and lorry services.

Further points in this connection were that the revenue shown in Table XIII of the General Manager’s Annual Report for 1930–31 did not reflect passenger traffic which was considerable at some small stations and that the cost of alteration of the electrical instruments and the maintenance cost of the empty station must be set against the savings on Station Staff.

A last point relating particularly to the Sekondi-Kumasi line, in the neighbourhood of which motor roads are not so numerous, is the inconvenience to which the local travelling public would be exposed by the abandonment of even unimportant wayside stations.

20. After hearing the Traffic Manager on the point and examining the figures of recent passenger traffic produced by him the Committee arrived at the conclusion that an increase of traffic facilities would repay the cost; and for that
reason as well as from regard to the convenience of the public they expressed the opinion that the daily passenger train service should be restored throughout the system in place of the thrice weekly service which has been in operation for the past three months. The General Manager concurred with this view and undertook to restore the full service with effect from the 9th November.

**Management, Accounts, Stores, Abstract ‘D.’**

21. Mr. H. Mason, Chief Accountant, and Mr. F. C. Deacon, Chief Storekeeper, attended.

*Management.*

The estimated saving under this Head of the Abstract in 1932-33 will amount to £1,598. This is the result of abolishing the posts of Deputy General Manager, Chief Clerk and one Second Division Clerk.

22. The necessity of retaining three Europeans in the posts of Secretary and two Assistant Secretaries, one of whom is provided for under Management, Takoradi Harbour, Abstract ‘N,’ was exhaustively discussed.

The General Manager explained their duties and stated that the three posts were all the more necessary since the decision to abolish the post of Deputy General Manager. Referring to his frequent absences from Sekondi he stressed the necessity for an appointment in his (the Management) branch the holder of which could give minor routine decisions so as to avoid delay and expense. The General Manager’s suggestion was that the title of the Secretary should be changed to ‘Assistant to the General Manager’ and that his scale of salary should be £720 rising to £920. No additional expense would occur if the present Secretary were to be so appointed. He coupled this with the suggestion that the Assistant Secretaries should in future be entitled ‘Office Assistants,’ remaining on the same salary scale as at present. The Committee during the course of their inquiry had ample evidence of the responsible nature of the Secretary’s duties and the importance of the post being filled by an officer with wide practical experience of railway administration. The disappearance of the post of Deputy General Manager enhanced these considerations. They concurred generally with the General Manager’s proposals and expressed the opinion that it would tend to remove a certain amount of misconception in the public mind if these changes were put into effect.

The Committee recommends that these changes be carried into effect when Estimates are before Legislative Council.

/ The Committee was informed that at the present time there is no African in the Railway Service of sufficiently wide experience of Railway work to render him competent for appointment as Office Assistant (Assistant Secretary). The
Committee recommends unanimously that African officers should be trained to fill such posts and that such an appointment should be made as soon as a competent African officer is forthcoming.

23. In the course of this discussion the Committee took note of the fact that the Management Branch with four Europeans, of whom one is a relieving officer, controls a concern of which the capital face value (including the harbour) exceeds twelve million pounds with an annual turnover of one million pounds and a length of line of over 500 miles. The Committee considered that in these circumstances the Management establishment could not be criticised as extravagant.

Accounts, Abstract ‘D.’

24. The Committee were informed that in 1932–33 savings amounting to £1,800 will be effected by retrenchments, but the actual net reduction in expenditure will be £720, despite a reduction of one European and four African posts.

25. It was noted that the cost of this branch represented about two per cent of the total revenue of the Railway which, though possibly a somewhat high ratio in comparison with the corresponding figures of commercial firms, could hardly be condemned as extravagant. Nevertheless, the proportion of European to African appointments were considered to be too large and the Committee recommends that the possibility of replacing some European Accountants by Africans should be given careful consideration.

26. The Chairman communicated to the Committee the gist of the Secretary of State’s Miscellaneous despatch of the 12th August, 1931 regarding a proposed investigation by Sir A. Lowes Dickinson into the systems of railway accounting and audit in the Colonies, etc. It was decided, therefore, that, apart from the recommendation recorded in the preceding paragraph, this subject should await the result of those inquiries.

Printing Branch, Abstract ‘D.’

27. In 1932–33 there will be net savings totaling £263 accomplished, in a measure, by the reduction of three African posts.

Stores.

28. In this branch there will be a small increase of £40 in 1932–1933 due to increments of salaries.

29. The Chief Storekeeper stressed the following points:–
   (a) That by close supervision in this Branch and very strict control of stocks it is calculated that during the last three years cash to the value of £36,000
Communications in Africa, 1880–1939: Volume 4

has been released which would otherwise have been unprofitably locked up in unnecessarily heavy stocks of unallocated stores.

(b) That the turnover of the Branch averages £300,000 annually and that the value of the stock in hand carried at any one time is usually in the neighbourhood of £69,000.

(c) That the total cost of the unallocated stores represents about six per cent of the revenue of the Railway as compared with 10 per cent on English railways.

Mr. Deacon asserted strongly that any considerable reduction of his staff, e.g. by ten per cent (saving about £700), would seriously impair the efficiency of the storekeeping and that the almost inevitable result would be increased expenditure rather than economy.

30. Certain members of the Committee were of opinion that although six supervision posts might be necessary some of them could be filled by Africans with consequent economy. The Chief Storekeeper stated that the policy of training suitable Africans for these posts was always kept actively in view. The Committee generally welcomed this statement but one member (Mr. Korsah) expressed a sense of disappointment that during the past 25 years or so it had not been found possible to train Africans to fill European appointments in this Department. He desired to recommend definitely that the post of Assistant Chief Storekeeper, or of one of the Assistant Storekeepers, should be abolished.

The Committee make no recommendation on this point of detail which, they felt, must be left to the General Manager as advised by his Chief Storekeeper.

Other Charges.

31. £2,246 will be saved in 1932–33 as compared with the current Estimates. There is likely, however, to be an actual saving of about £2,000 in 1931–32.

Services Rendered by Other Departments – Abstract ‘G.’

32. There will be savings in 1932–33 amounting to £5,630 in respect of services rendered by other departments, but loan and pensions charges will increase by £20,700. The net increase in this Abstract will be, therefore, £15,070.

Summary of Railway Economies.

33. The total estimated expenditure in 1932–33 will be £1,058,102 representing a net decrease of £58,398 as compared with the corresponding figure (£1,116,500) in 1931–32. This decrease would be the greater by some £1,711 were it not that the Railway has assumed charge of Government Transport work at Sekondi and
Takoradi. A set-off of £675 in revenue is anticipated. By this step the retrenchment of one European officer of the Transport Department was made possible.

34. [...]

TAKORADI HARBOUR.

ENGINEERING SUPERINTENDENCE – ABSTRACT ‘K.’

Mr. F. V. Macdonald, Acting Chief Engineer, attended.

35. The total of this Abstract will be reduced in 1932–33 by a net amount of £2,728.

LOCOMOTIVE BRANCH – ABSTRACT ‘L.’

Mr. R. T. Kerr, Chief Mechanical Engineer, attended.

36. In 1932–33 the Chief Mechanical Engineer anticipated savings under this Abstract totalling £4,580.

HARBOUR MASTER’S BRANCH – ABSTRACT ‘M.’

Captain C. R. Hemans, r.n., Harbour Master, attended.

37. The expenditure under this Abstract will be reduced in 1932–33 by £834.

38. The question of reducing the two existing administrative posts (viz., those of Harbour Master and Assistant Harbour Master) was brought to the notice of the Committee by instruction of the Governor. Briefly, the proposal involved –
   (i) abolishing the post of Harbour Master;
   (ii) altering the title of Assistant Harbour Master to that of ‘Port Officer’ with no change in emoluments; and
   (iii) retaining the senior pilot and the two pilots on their existing salaries, the senior pilot to relieve the Port Officer when necessary.

After full discussion the Committee recommends unanimously that no change be made in the existing establishment. Members united in the opinion that the resulting economy was incommensurate with the risk of damage to the harbour itself and to ships that would be incurred thereby. Nor could Takoradi afford to risk its reputation as a safe harbour where ships could expect expeditious treatment. With the reduced staff suggested there would be a considerable danger that at times pilotage would be insufficient as a result of leave and sick casualties.

39. A member of the Committee advocated the appointment of African tug masters. It was pointed out, however, that these posts could only be filled by fully qualified seamen of long experience and that no African possessing the necessary qualifications was at present available.
Management Branch – Abstract ‘N.’

40. The abolition of the post of Deputy General Manager will be reflected in this Abstract amounting to a saving of £212.

Accounts.

Mr. H. Mason, Chief Accountant, attended.

41. During 1932–33 the saving in this Abstract will be £106.

42. The staff of this branch is occupied solely in the collection of harbour dues and the feasibility of transferring this duty to the Customs Department was discussed. The Committee was advised that from the point of view of the Railway there could be no objection to the proposal which, in fact, had everything to recommend it. The Customs Department would collect the dues directly from the shipping companies instead of from the various importers and exporters which is the present practice. The financial effect, if this proposal be adopted, will be the total disappearance of the Accounts section of Abstract ‘N’ from the Estimates, thus achieving a gross saving of about £1,700. It was recognised that the concurrence of the shipping companies with this change in practice would have to be obtained. / The Committee recommends strongly that the subject should be taken up and pressed by Government.

Stores.

Mr. Deacon, Chief Storekeeper, attended.

43. There will be a small increase of £11 in 1932–33 due to increments.

44. The provision under Other Charges for this Abstract in the 1932–33 Estimates shews a decrease of £282.

Services Rendered by Other Departments – Abstract ‘O.’

45. There will be a decrease of £642 in 1932–33. Loan Charges will be reduced by £1,317.

Summary of Takoradi Harbour Economies.

46. It is anticipated that the total cost of the Harbour will be £186,952 in 1932–33 which is £10,690 less than the estimate for the current year. Fixed charges will absorb £153,316 leaving only £33,636 for all working expenses. The Committee was assured by the General Manager that any further pruning would be quite out of the question if reasonably efficient operation was expected.

47. [...]

It is anticipated that in 1932–33 the Expenditure and Revenue of the two undertakings will be as follows:

<table>
<thead>
<tr>
<th></th>
<th>Railway</th>
<th>Takoradi</th>
</tr>
</thead>
<tbody>
<tr>
<td>Expenditure</td>
<td>£1,058,102</td>
<td>£186,952</td>
</tr>
<tr>
<td>Revenue</td>
<td>£810,675</td>
<td>£107,500</td>
</tr>
<tr>
<td>Loss</td>
<td>£247,427</td>
<td>£79,452</td>
</tr>
</tbody>
</table>

49. Far the greater part of this expenditure is on account of fixed charges for Loan Interest, Sinking Fund, Pensions and Renewals Contribution which are beyond the control of the Administration. In the case of the Railway the amount required for these purposes is £631,817 and for the Harbour £153,316, leaving only the sums of £426,285 and £33,636 respectively within which economies can be sought by the General Manager. In these circumstances the Committee desire to record unanimous appreciation of the determined effort towards economy made by the General Manager and his Staff amounting in the case of the Railway to £98,847 and in that of Takoradi Harbour to £9,373.

50. They note that the reductions in staff amount to 16 per cent of the Europeans and 11.6 per cent of the Africans on the Railway: staff reductions in the Harbour establishment account for 13 per cent of the African Staff allowed in the current year’s Estimates.

51. The Committee is prepared to accept the assurance of the General Manager that, failing a general reduction in the scale of personal emoluments – this subject is mentioned later in this Report – no further appreciable reduction in working expenditure can be effected immediately without a dangerous sacrifice of efficiency.

Takoradi Salaries.

52. Items 1, 2, 27, 28, 77, 78, 89 and 90 in the 1931–32 Estimates.

The General Manager explained that these emoluments originated in an endeavour to keep down the overhead costs of harbour working; the total cost is £700 a year which is far less than would be the cost of a separate Harbour Authority. He emphasized that they were salary payments, not allowances, and should be treated in line with all other salaries. The Committee agreed with this view but recommend that, if and when new scales of salary are devised, consideration be given to the advisability of consolidating the salaries of the posts concerned, a lump sum representing the cost of management and supervision being charged against the Harbour Expenditure and shewn in the Railway Rev-
As shewn at the present time these emoluments have the appearance of allowances and are prejudiced thereby in the public estimation.

**PART III. – FINANCIAL POLICY.**

53. In the course of the Committee’s deliberations questions relating to the rates and dues charged by the Railway and Harbour Administrations came frequently under discussion and led eventually to consideration of the financial policy according to which those charges are framed. The same point of policy was raised directly by the President of the Chamber of Mines both in his written and oral evidence.

54. The Committee understood that the basis upon which Railway rates and harbour dues are founded is that the total revenue of each system shall cover all its working expenses and extraordinary expenditure together with all the fixed capital charges which relate to that system. Where a profit over and above those expenses is made it is paid into General Revenue although, according to the Committee’s information rates and dues are not framed with a view to such a contribution to the Colony’s surplus.

55. It was not denied by the General Manager that, as compared with other African railways, certain rates charged on the Railway are high and Mr. Millar made similar assertions with harbour dues on manganese ore at Takoradi in comparison with those charged at a South African port. On the other hand rates over the portions of the Railway are driven to a relatively very low point by the strong competition of competitive road users, while Takoradi revenue suffers from the cheapness with which cargoes can be placed aboard or landed at neighbouring ports both British and French. /

The issues arising out of these facts were –

*Firstly:* whether the policy of framing rates and dues so as to cover all charges, both working and capital, is in the best interests of the Gold Coast and

*Secondly:* what measures, if any, should be taken to reduce the force of competition from motor lorries and cheaper ports.

56. The total cost of a transportation system may be classified as follows: –

\[\text{Recurrent.}\]

\[(a)\] Working expenses;
\[(b)\] Pensions and Gratuities;
\[(c)\] Renewals Fund Contributions;
\[(d)\] Interest on Loans;
\[(e)\] Sinking Fund Contributions.
The Committee considers that there can be no dispute upon the point that the system's revenue must at the very minimum be calculated to cover (a) (b) and (c) above.

In connection with the liability of the Railways to find the whole of the capital charges incurred on its account, the President of the Chamber of Mines (Mr. Millar) took the view in his evidence that the Railway should be made to pay its way but that its liability in respect of both Interest and Sinking Fund should first be largely reduced. The reasons which led him to those conclusions are fully and clearly stated in Appendix II.

The issue which presented itself to the Committee was, however, anterior to Mr. Millar's point and raised the question whether it is essentially necessary for a State-owned railway to aim at producing sufficient revenue to cover all the capital charges which would properly be debited against a railway conducted on commercial lines.

The Committee desires to point out that Railway receipts form only one of several channels through which revenue flows to Government as a result of increased wealth on the part of the community. Most of the Heads of Revenue appearing in the Gold Coast Budget, but particularly Customs and Licences and Internal Revenue, tend to rise or fall pari passu with the quantity of and the prices paid for the raw products exported from the dependency. It does not follow, therefore, of necessity that the country loses as a whole because certain commodities are moved by its transportation systems at rates which are unre-munerative to those systems when capital charges are taken into account, for the revenues flowing back indirectly from their production and sale may be such that it is better for the country as a whole to move such commodities at a loss than to insist on rates which, though sufficient on paper to cover transportation expenses, in practice would tend to diminish or to eliminate their production.

The corollary of this is that, if the Railway is to be required for the benefit of the country to charge rates in certain instances which, though reimbursing it for working expenses do not fully cover the cost of transportation inclusive of capital charges. If it were possible to determine the relation between the value of exports and the indirect revenue received by Government which is created by that value it might also be possible to fix formulae for the relative liabilities of the Railway and Takoradi Harbour on the one hand and of the Colony on the other for the capital charges of those systems. The Committee doubts whether
such a determination is possible – it is certainly beyond its own competency – but does not hesitate to come to the general conclusion that, having regard to the facts that the local transportation systems were built partly for administrative and defensive objects and that from the commercial point of view these systems are only two of several channels through which the Gold Coast derives revenue from the producer’s efforts, general revenue may properly be called on to bear a portion of the capital charges arising from the construction and equipment of those systems.

61. The Committee considers that this question, which is fundamental to the financial policy of the Railway and of Takoradi Harbour, could profitably be examined by an expert economist and commends that suggestion to Government’s consideration. As they view the matter, they are not prepared to recommend an arbitrary allocation of capital expenditure, such as that suggested by Mr. Millar; indeed, if and for so long as rates and dues can be devised which, without injurious reactions upon industry, will produce revenue sufficient to cover interest charges on the loan money spent on the Dependency’s transportation systems, they consider it reasonable that those charges should be so borne. Their contention is that the determining factor in the fixation of rates and dues should be the ability of commodities to bear the rates charged for their carriage rather than the principle that each transportation system must be made to pay its whole way in working expenses and interest.

62. The case of Sinking Fund charges on the Railway Loans is, in the opinion of the Committee, essentially different. They should be borne by the General Revenue of the Dependency in view of the fact that when the loans have been completely amortized the Gold Coast will come into possession of a free Railway system and a free Harbour. The Committee noted that the Sinking Fund contributions account of Takoradi Harbour are borne by the Colony.

63. A further point connected with the financial policy of the transportation systems raised by Mr. Millar (paragraph 5 (a) and (b) of Appendix II) was whether Railway profits, when any, should continue to be paid over to General Revenue which would also bear the system’s losses or whether they should be funded as a Reserve in order to cover losses in leaner years. In this connection Mr. Millar made the further suggestions (1) that all payments of surplus earnings from the Railway made to the Consolidated (i.e. General) Revenue since January 1st, 1921 should be deducted from the capital expenditure on which the Railway should pay Interest and Sinking Fund and (2) that rates should be adjusted so that surplus earnings do not exceed 2½ per cent on the capital invested. The Committee presumes that Mr. Millar intended to suggest a similar policy in respect of Takoradi Harbour.
64. The Committee notes that no such proposal was included in the recommendations made by General Hammond in his 1922 Report. In the Committee's view such a fund would have the obvious advantage to the Colony that its Estimates would cease to be liable to sudden violent dislocation as has occurred recently when an anticipated Revenue item in the Colony’s Estimates of £50,440 has been replaced by an unforeseen expenditure item of £187,000. Moreover, in thus achieving a greater independence of considerations affecting the General Revenue, the General Manager should be in a better position to lay down and maintain rate scales drawn on scientific basis.

65. The Committee therefore commends the suggestion to Government’s consideration. As regards Mr. Millar’s two riders above mentioned, the Committee is of opinion that other factors, such as the losses borne by General Revenue over the period, would have to be taken into account: they are also doubtful whether any good purpose would be served by attempting to lay down a maximum profit, at any rate at this stage.

66. The second issue mentioned in paragraph 55 above was what measures, if any, should be taken to reduce the competition which the Railways suffer from road-using transport and Takoradi Harbour from neighbouring and cheaper ports. As regards the Road versus Rail problem the Committee did not disregard the argument that Government would not be justified in placing even the smallest handicap upon road-borne traffic, with the object of relieving the Railway of some of the stress of competition, in as much as any such measure must raise the cost of production and thereby react unfavourably upon Gold Coast trade. This argument however, disregards the facts that, making all allowance for administrative objections, much of the greater part of the capital expenditure on the Railways and the whole of that on Takoradi Harbour have had the development of production as their aim and, secondly, that whether or no the Railways and the Harbour are used in the marketing of the Colony’s produce, the capital charges thus created, to say nothing of maintenance expenses, have to be met from the wealth produced in the Colony. If the revenue of the two systems is inadequate to meet such capital charges as are considered to be their proper liability the general taxpayer must make good the deficiency. That in itself would constitute a hardship on the taxpayer. If, further, the latter has to bear the recurrent cost of a road system – also designed largely for the producer’s benefit – while the latter escapes from any greater share of both burdens than would descend upon him in his capacity of general taxpayer, the hardship develops into inequity.

67. The Committee devoted considerable thought to the search for a practicable remedy for the unfair competition to which the Railway is subjected by the roads and they greatly regret their inability to discover one. Two members were inclined to support a heavy increase in licence fees for motor lorries but after discussion it was recognized that such a measure, if effective at all, would tend to
restrict the area within which cacao can be grown and transported by such vehicles to the Railway. The problem is essentially one the solution of which must not affect roads feeding the Railway: it follows that no general measure arriving at an increase of the cost of road transportation will serve.

68. Another suggestion put forward was the periodical closing of certain roads to heavy traffic: this was discarded as impracticable. The taxation of heavy traffic using the competitive roads was also proposed; Mr. Millar suggested the lease of their transport rights to firms at specified freight rates and the ordinary toll-gate system also came under discussion.

69. Although by either of these latter measures it would be possible to discriminate between non-competitive and competitive roads and although no other method of achieving that result was suggested, nevertheless the Committee do not recommend the adoption of either.

It was felt that Mr. Millar’s proposal might lead to highly invidious situations, and the Committee feel that the institution of toll-gates would fail to meet general acceptance. Apart from the delay of traffic which would affect all road users and the practical difficulties of selecting positions which would attain the object sought by the measure, an elaborate and expensive inspectorate system would be necessary unless evasion and peculation were to become rife; lastly, any such institution would be and remain the object of general dislike. The most that the Committee can say for it is that in principle it is the best solution in sight: they are too doubtful of its success in practice to recommend its employment.

RAILWAY RATES AND HARBOUR DUES.

70. Certain specific points relating to Railway Rates and Harbour Dues fell to be considered by the Committee. /

(i) Passenger Rates – 3rd Class.

Passenger fares are at present one penny a mile plus 15 per cent and this form of traffic is suffering heavily under road competition. The General Manager who brought the matter before the Committee expressed the belief that no reduction which did not decrease the fare to a figure in the region of three farthings a mile would have any appreciable effect in obtaining for the Railway a greater share of this traffic. He was inclined to favour such a reduction.

The Committee saw no objection to that course and in the circumstances assumed that the General Manager would submit his considered proposal to Government for consideration.
(ii) Rates on manganese ore from Nsuta.

The Committee was informed that the African Manganese Company had already applied to Government for a lower rate on manganese ore from mine to Takoradi, representing that owing to high local transportation costs it was not possible for the Company to quote successfully against the competitors whom it has to meet to-day in a greatly restricted market. The importance to the Gold Coast of the continuance of this industry is, in the opinion of the Committee, too obvious to require to be stressed by them: a very considerable revenue must flow into the Treasury as a result of the Company’s wage payments and the money spent by its employees. It was no part of the Committee’s duty endeavour to ascertain what in the circumstances is the right economic rate to charge on this traffic.

(iii) Rates charged on cacao exported from Ashanti.

Mr. Lewis stated that the total inward and outward goods traffic receipts during 1930–31 would be classified as to origin as follows:–

<table>
<thead>
<tr>
<th>Origin</th>
<th>£</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ashanti: Dunkwa-Kwahu Prahsu inclusive</td>
<td>487,764</td>
</tr>
<tr>
<td>Nsuta</td>
<td>154,761</td>
</tr>
<tr>
<td></td>
<td>£642,525</td>
</tr>
</tbody>
</table>

out of a total goods traffic of approximately £756,548. It would therefore be seen that part of the Railway system as mentioned above contributed no less than 84.9 per cent of the total. Ashanti itself was responsible for 64.4 per cent of the total. This does not take into account passenger traffic, the receipts from which for Ashanti must represent a big percentage of the total earned in this Department.

He asserted that at existing rates all Ashanti traffic to and from the port of Takoradi would travel by road if that form of transportation were possible, a conclusion which proved that existing rates were of penalizing proportions where such could be imposed.

The General Manager did not deny that as a rate on raw produce exported in bulk, the rate on cacao from Kumasi to Takoradi (81s.9d.) was high. He stated, however, that he would be unable to replace by railway earnings the loss which would accrue from even a small reduction of railway rates on cacao from Ashanti. In the circumstances the Committee can make no recommendation for such a reduction at the present time.

(iv) Rates on cacao consigned from Kwahu Prahsu-Konongo Section of the Railway to Takoradi.

The attention of the Committee was directed specifically towards the cacao rate from certain stations in Ashanti on the Accra line to Takoradi. The stations and the rates concerned are the following:–
Akwasiho  70s. a ton.
Kwahu Prasu  74s. a ton.
Bompata  85s. 10d. a ton.
Juaso ...  90s. 11d. a ton.
Konongo  92s. 11d. a ton. /

The rate from Nkawkaw to Accra is 51s. 6d. a ton and the effect of the disparity between it and the other rates named is to encourage the transport of cacao by road from Konongo, Juaso, etc., to Nkawkaw whence it is railed to Accra at a comparatively cheap rate, thus diverting business from the Kumasi-Takoradi line and from Takoradi Harbour which under other circumstances the latter might legitimately hope to secure. Cacao shipped at Takoradi has in addition to bear harbor dues amounting to 3s. 3d. a ton.

(v) As has been stated above no reduction of the rate for cacao from Kumasi to Takoradi (81s. 9d. a ton) can be recommended in present circumstances; but after discussion the Committee agreed that, anomalous though it may appear at first sight, a flat rate of 75s. a ton from all stations between Konongo and Kwahu Prasu inclusive to Takoradi should be introduced, the Kumasi rate being left untouched. Mr. Lewis assured the Committee that, although the Kumasi Chamber of Commerce objected on principle to the present high freight rate from Kumasi and would continue to press for its reduction, they would readily appreciate the motive governing the suggested reduction in the rates for cacao consigned from Konongo-Kwahu Prasu to Takoradi and would not use it as a lever for securing a decrease in the rate from Kumasi.

(iv) Cacao Rates – Táfo-Nsawam to Accra.

A possible anomaly in the rates from stations between Táfo and Nsawam to Accra was also mentioned. After discussion the Committee decided to leave the point to the consideration of the General Manager.

71. The terminal charge (1s. 6d. a ton) at Takoradi was criticised and explained as representing the cost of shunting wagons and facilities for this service. The Committee were informed that a similar charge is levied on all British railways and that at Apapa, Nigeria, it is 2s. 6d. a ton.

The General Manager strongly opposed the abolition of this terminal charge and the Committee accepted his view.

TAKORADI HARBOUR DUES.

72. The President of the Gold Coast Chamber of Mines informed the Committee that in his opinion the harbour dues are too high and in support of his argument quoted figures to show that the port charges on 8,000 tons of manganese ore exported at a South African port amounted £244 10s. whereas the
corresponding figure at Takoradi was £1,549 9s. 1d. In the absence of details as to how they are made up the Committee was not in a position to make a comparative analysis of these figures.

73. It was alleged that excessive charges had the effect of diverting traffic, both imports and exports, to other ports in the Colony. The Committee noted that Takoradi Harbour dues were settled in 1927 by a Committee representative of Government after full consultation with and approval of the mercantile and shipping interests, but they were based on the assumption that Sekondi, Cape Coast and Saltpond would be closed as ports of entry, which assumption had not been realized except in the case of Sekondi. If Cape Coast and Saltpond had ceased to be ports the resulting increase in the trade of Takoradi would in all reasonable probability have permitted the harbour to pay its working expenses and fixed charges. It could not hope at existing charges to compete successfully with surf ports at which no port charges are levied and the expectation that the economic value of the convenience, speed and safety of handling cargo alongside wharves in smooth water would automatically attract most of the trade of Saltpond and Cape Coast had proved by no means fully justified. In this connection it was noted that the shipping companies made no differentiation in their rates for ocean freight on account of this factor.

74. In the Committee’s view the problem at Takoradi Harbour is fundamentally similar to that presented by the Railway, viz., that the port charges were calculated with the object of covering the cost of all the working expenses and fixed charges arising on account of its construction, inclusive of Sinking Fund charges. The Committee is not in a position to state definitely that the Gold Coast as a whole would benefit were the Takoradi Harbour charges to be reduced substantially at the loss of direct harbour revenue: in their opinion this again is a question which requires reference to an expert economist and they commend this suggestion to Government’s consideration.

TRANSHIPMENT CHARGES

75. Mr. Whitfield raised the question of transhipment charges, at present 3s. 3d. per ton for transhipment between ship and ship and 6s. 6d. per ton when cargo has to be put ashore and reshipped. He stated that the effect of this high charge was to exclude business which would accrue profitably were the rate lowered. The General Manager admitted that the point was worthy of full consideration and undertook to investigate it and to report his conclusions to Government. The Committee welcomed this assurance.
RAILWAY RENEWALS FUND.

76. In the Estimates for 1931–32 the sum of £108,854 was provided for renewals, but as an emergency measure in the present crisis payment has been suspended. The corresponding figure for 1932–33 is calculated to be £126,892 and the question has arisen whether provision should be deferred for the second year in succession. The General Manager pointed out that the Fund had only come into existence in 1923–24 while some of the wasting assets of the Railway had been in use for more than 25 years and would inevitably require replacement at an early date. The Fund was therefore not solvent and every deferment enhanced its unsound position. Renewals could not be postponed indefinitely without grave risk to life and property or without creating an uneconomic burden on the future. The Committee were impressed with the gravity of a second suspension of contributions but were not in a position to say whether the financial prospects of the Gold Coast for 1932–33 are grave enough to justify what in normal circumstances would be an indefensibly imprudent step.

[...]

PART V. – GENERAL.

Reduction of Official Emoluments.

78. The President of the Gold Coast Chamber of Mines submitted the following proposals for emolumental reductions:—

(a) That the salaries and wages of future European employees be cut by 25 cent, such cuts not to affect serving officers.

(b) That African salaries and wages be reduced by 50 per cent in the case of men receiving £300 a year or more and that a graduated cut of from 50 per cent to 20 per cent be imposed on salaries ranging from a maximum of £299 to a minimum of £50 per annum respectively.

79. While none of the Committee could entertain these particular suggestions the Unofficial Members are emphatically of the opinion that the financial position of the country requires an immediate reduction in the emoluments of the servants of the Railway and Harbour. In this connection it was stressed that the total provision for Railway emoluments in 1932–33 would be £161,748 plus £508 Transport Service and that the anticipated deficit was some £247,000. In the view of the Unofficial Members, though that situation could not be cured by any cut in emoluments that could be regarded as reasonable, nevertheless, such alleviation as was possible by that method should be applied at once.

80. One member favoured a sliding scale of reductions from a minimum of 2½ per cent on the lowest aggregate earnings to a maximum of 20 per cent on the
highest without racial distinction. He suggested that a scheme be framed on the following lines:

<table>
<thead>
<tr>
<th>£</th>
<th>Per cent.</th>
</tr>
</thead>
<tbody>
<tr>
<td>100–350</td>
<td>2½</td>
</tr>
<tr>
<td>351–500</td>
<td>5</td>
</tr>
<tr>
<td>501–750</td>
<td>7½</td>
</tr>
<tr>
<td>751–1,000</td>
<td>10</td>
</tr>
<tr>
<td>1,001–1,200</td>
<td>15</td>
</tr>
<tr>
<td>1,201 upwards</td>
<td>20</td>
</tr>
</tbody>
</table>

81. Another member advocated a graduated cut in emoluments to be arranged in whatever manner commended itself to Government but to yield the equivalent of 10 per cent on £161,748 plus £508 Transport Service.

82. The Chairman informed the Committee that the whole question of reducing emoluments had been exhaustively examined by the Further (General) Retrenchment Committee and that whatever decision was taken on the Report thereof would, he presumed, apply to the Gold Coast Civil Service as a whole including the employees of the Railway and Harbour. He stated the personal view that though the financial outlook was grave it did not justify a decision to reduce emoluments as from January 1st next. Such a step must have serious reactions in any case and in financial situation in which an emolumental cut was a proper step was quite conceivable in the circumstances in which the Gold Coast found itself. Government should not and would not hesitate to take it if it became necessary: meanwhile the outlook required careful examination at short intervals. The method of such a cut was a subject which required immediate examination by Government: its extent was a matter for determination according to the circumstances of the moment. The Official Members agreed generally with his view.

83. The Unofficial Members recommend that a cut amounting to 10 per cent of total official emoluments be made as from January 1st next; that such a cut be regarded as temporary and variable from time to time with the financial circumstances of the Gold Coast. They further recommend that it be made in such a way as not to injure the pensionable prospects of serving officers.

84. The Committee noted Mr. Millar’s suggestion regarding the salary of future Managers of the Railway (paragraph 5 (h) of Appendix II) but were not prepared to give it their support.
85. The President of Gold Coast Chamber of Mines advocated, in order to decrease the pensions liability, that the possibility of applying some form of compulsory insurance scheme for new European entrants to the service should be investigated and that in any event it should be adopted for Africans. The Committee were informed that Tanganyika and Nigeria already possessed schemes of that kind. The General Manager of the Railway was definitely opposed to any change in the existing pension system as regards the Gold Coast Railway, but two members felt that the possibility of introducing a Provident Fund on a pound for pound contributory basis merited careful consideration by Government.

86. The Committee had before it no figures or other data upon which to found a firm recommendation and, as at present advised, the majority of members felt that no strong case had been made out in favour of the proposal. At the same time it was agreed that the matter should be commended to Government for due consideration as opportunity offers. In this connection Mr. Korsah desired to record his conviction that any attempt to discriminate between the European and African staff would be bitterly resented by the country. All members of the Committee shared this view.

CLOSER RELATIONS BETWEEN THE MANAGEMENT AND THE GENERAL, AND PARTICULARLY THE MERCANTILE, PUBLIC.

87. One member suggested the creation of an Advisory Committee for the purpose of rates revision. The General Manager was not opposed to the suggestion and the Committee advise that it be further explored. The General Manager suggested that a very useful purpose would be served if the Railway was represented in Chambers of Commerce. The Committee was advised that the constitution of the Chambers would not permit officers of the Railway to be admitted to full membership but that they would probably be welcomed as honorary members. The Committee recommended that the General Manager should seek the views of the Chambers of Commerce direct on this point. Mr. Dawson undertook to do so.

BEHAVIOUR OF RAILWAY STAFF TOWARDS PASSENGERS.

88. Mention was made of the criticism which is occasionally directed at the Railway concerning the alleged rough handling of passengers by the Railway Police. Members were assured that this matter was receiving the unremitting attention
of the management and supervisory staff and it was confidently expected that complaints on this score would diminish in future.

CENTRAL PROVINCE BRANCH.

89. The Committee was informed that a pronounced loss was expected on the current year’s working. The Chairman inquired whether any member wished to raise the question of closing this line. Members were unanimous in the opinion that the time had not arrived for the consideration of such a step.

OTHER MISCELLANEOUS SUGGESTIONS.

90. The Committee received some written suggestions from Mr. H. S. W. Shaul: The Committee is unable to endorse Mr. Shaul’s suggestions that a railway line should be constructed from Accra to Takoradi or for flat rates over the Railway for imports and exports irrespective of length of haul.

The Committee agreed with the General Manager’s opinion that seaside excursions from Ashanti would not prove to be a remunerative form of traffic and that neither the financial situation nor the probable volume of traffic that would result justified an experiment in door-to-door service being made at the present time. Mr. Shaul’s other suggestions are dealt with in the course of this Report.

Signed on behalf of and with the authority of the Chairman,
R. H. DAWSON.
SEKONDI,
December, 1931.

Note. – A Memorandum supplementing Mr. M. G. Lewis’ views is published at his request and forms Appendix I to this Report.

APPENDIX I.

Whilst I consider the Report is generally speaking a faithful record of the Committee’s work, I am of the opinion that there are certain essential points arising therefrom that should be given more prominence, and, in this respect, I particularly wish to bring forward the following points.

Management. – I am of opinion that the abolition of one post of Assistant Secretary should be carried out immediately, and that the Committee’s recommendation to train African officers to more responsible positions in this department be energetically pursued.

Accounts. – I consider that no sufficient emphasis has been stressed on the unduly high cost of this department. The proportion of European accountants to African staff is excessive. Admittedly, it is very necessary to have European
accountants to carry out essential supervisory duties, but the proportion at present is unduly high. The figure of 2 per cent mentioned in the report as being the cost of running this department is really not a true comparison if the cost of furlough pay, bungalows, passages and allowances are taken into consideration. If these factors are considered, the percentual figure would be appreciably increased. Mercantile firms in this country have been able to train up an efficient staff of African book-keepers with a minimum of European supervision and the same policy should be carried out by the Railway Accounts Department. If this was done, substantial economies could be effected.

Stores. – Very similar conditions prevail in this department as in the Accounts Department. The proportion of European posts is unduly high, and steps should be taken to reduce the number to not more than three European posts. Admittedly, this is a very important branch of the Railway organisation, but a turnover of £300,000 per annum cannot justify the retention of six European appointments. More responsible African posts, such as storekeepers, should be created. It has been found possible in Mercantile circles to employ African storekeepers in positions involving the responsibility of valuable stocks, and a similar policy could be embarked on by the Railway with advantage, and substantial economies should therefore accrue.

With regard to the Technical Branches of the system, I am not prepared to offer any constructive criticism. The respective Heads of Departments were all emphatic that no further appreciable economies could be put into operation without impairing the safe and efficient running of the system, although at first sight it would appear to me that the number of European Foremen and Workshop Artisans is unduly high. In view, however, of the expressions of opinion of the Heads of Departments and their expert knowledge of the subject, it would be impossible for an ordinary layman to ignore their advice.

Takoradi Harbour. – I was originally of the opinion that the number of European posts in this department was particularly high especially as regards the number of Pilots, Tug Masters and Tug Engineers employed. In view, however, of the expression of opinion by Mr. Whitfield on this subject I do not stress the point but I still consider that the question of the number of Pilots, Tug Masters and Tug Engineers employed should be continually before the Authorities in order to bring about any economies possible. With the limited amount of shipping using the Harbour it would seem that the existing European staff can only be partially occupied in carrying out their duties. To me it is very significant that it has not been found possible to make any reduction in the European appointments of this Department.

The Committee were informed that Tanganyika and Nigeria already possessed schemes of that kind. The General Manager of the Railway was definitely opposed to any change in the existing pension system as regards the Gold Coast Railway, but two members felt that the possibility of introducing a Provident
Fund on a pound for pound contributory basis merited careful consideration by Government.

86. The Committee had before it no figures or other data upon which to found a firm recommendation and, as at present advised, the majority of members felt that no strong case had been made out in favour of the proposal. At the same time it was agreed that the matter should be commended to Government for due consideration as opportunity offers. In this connection Mr. Korsah desired to record his conviction that any attempt to discriminate between the European and African staff would be bitterly resented by the country. All members of the Committee shared this view.

CLOSER RELATIONS BETWEEN THE MANAGEMENT AND THE GENERAL, AND PARTICULARLY THE MERCANTILE, PUBLIC.

87. One member suggested the creation of an Advisory Committee for the purpose of rates revision. The General Manager was not opposed to the suggestion and the Committee advise that it be further explored. The General Manager suggested that a very useful purpose would be served if the Railway was represented in Chambers of Commerce. The Committee was advised that the constitution of the Chambers would not permit officers of the Railway to be admitted to full membership but that they would probably be welcomed as honorary members. The Committee recommended that the General Manager should seek the views of the Chambers of Commerce direct on this point. Mr. Dawson undertook to do so.

BEHAVIOUR OF RAILWAY STAFF TOWARDS PASSENGERS.

88. Mention was made of the criticism which is occasionally directed at the Railway concerning the alleged rough handling of passengers by the Railway Police. Members were assured that this matter was receiving the unremitting attention of the management and supervisory staff and it was confidently expected that complaints on this score would diminish in future.

CENTRAL PROVINCE BRANCH.

89. The Committee was informed that a pronounced loss was expected on the current year’s working. The Chairman inquired whether any member wished to raise the question of closing this line. Members were unanimous in the opinion that the time had not arrived for the consideration of such a step.
OTHER MISCELLANEOUS SUGGESTIONS.

90. The Committee received some written suggestions from Mr. H. S. W. Shaul: The Committee is unable to endorse Mr. Shaul’s suggestions that a railway line should be constructed from Accra to Takoradi or for flat rates over the Railway for imports and exports irrespective of length of haul.

The Committee agreed with the General Manager’s opinion that seaside excursions from Ashanti would not prove to be a remunerative form of traffic and that neither the financial situation nor the probable volume of traffic that would result justified an experiment in door-to-door service being made at the present time. Mr. Shaul’s other suggestions are dealt with in the course of this Report.

Accounts. – The question of the abolition of this Section and to hand over the functions of this Department to the Customs authorities should be pursued as a substantial economy of £1,700 per annum can be effected thereby.

Takoradi Salaries. – I do not agree with the views expressed on page 10 of the Report and consider that the extra emoluments given to certain officers for duties performed in the ordinary course of their employment and charged against Takoradi Harbour expenditure are not justified and should be abolished on the termination of the appointments of the existing holders. This view was taken by me at the meetings of the Committee and I still maintain it.

FINANCIAL POLICY.

I am in general agreement with the remarks embodied in the Report and wish to emphasise that in my opinion the Capital Charges as at present allocated between the Government and the Railways is an unfair burden on the Railway system and one that is not justified. As has been pointed out in the Report at present the fixed charges for Loan Interest, Sinking Fund, etc., absorb the huge sum of £631,000 before anything is earned by the Railway. And when it is realised that the estimated revenue for the year 1932 is £810,000 it can be readily appreciated what an impossible burden is placed on the Railway system if it is expected to earn sufficient to pay all working expenses and overhead charges. To do this or anything approaching it uneconomic Railway freight charges are bound to ensue as is the case particularly with regard to that part of the system operating in Ashanti and to the manganese mines. The rates charged on the haulage of cacao from Ashanti and manganese from Nsuta are excessively high and constitute a burden on these two essential industries from which the Government derives considerable revenue. The rates charged compare most unfavourably with rates charged on other Railway systems operating in West and South Africa and in actual practice amounts to subsidization of the Railway at the expense of these
two industries whilst the rest of the Colony contributes a negligible part. It is therefore in my opinion essential that the Loan Charges as at present payable by the Railway system are drastically revised, so as to permit of economic rates being charged. The Railway system has in the past been materially responsible for the development of the country generally, and from that point of view has been an invaluable asset to the country. The time has now arrived however when a much broader view of the problems which the Railway is faced with have got to be taken, if the future material development of the Colony is taken into consideration. The existing capital value of the Railway system is also another problem which has got to be faced and is no doubt interwoven with the future financial policy of the Railway system. I am therefore in accord with Mr. Millar’s views that something has got to be done in this connection.

I am totally opposed to an increase in the licence fees paid by lorry owners as was suggested at the meetings of the Committee, particularly as regards Ashanti, as already I consider the community in Ashanti are made to carry an unduly high share of the cost of Railway transport and any additional taxation in this direction must react to the detriment of motor transport which is already a heavy charge owing to the long distances over which produce in Ashanti has to be hauled.

I am emphatically of the opinion that it is essential that the emoluments of all Railway employees are reduced immediately so as to permit of a reduction of 10 per cent of the total emoluments paid as soon as possible. This reduction may be temporary or permanent according to the future working results of the system and should be on a graduated scale so that the lower the salary paid the less will be the cut.

At the Committee’s meeting, I favoured the formation of an absolutely independent commission consisting of two Railway experts and a Financial Adviser to thoroughly investigate the problems of the Railways as they exist to-day and for the future. This proposal was not looked on with favour by other members of the Committee but I still consider it is of paramount importance.

The outlook for the Railways as at present constituted is not bright and it would appear that it might become a heavy burden on the general revenue of the Colony; and for that reason I consider that every possible avenue should be explored in order to bring about further economies and avoid the heavy losses which at present appear inevitable. For these reasons I reiterate my opinion that it is incumbent on the Government to appoint an independent commission of experts to investigate the problems the Railway is faced with.

Whilst I consider the Committee did useful work in its recent investigation I consider that from the very nature of its constitution it had a task that was beyond its capabilities. With the exception of the General Manager there was not a single member of the Committee who could profess to be au fait with
Railway matters and hence they were unable to bring any expert knowledge to bear on the problems before them. It might well be that the present Railway system when examined by experts would be drastically altered but it would be only through such an examination that such a decision could be arrived at. It is quite beyond the capabilities of any locally-formed committee.

[...]

M. G. LEWIS.

APPENDIX II.

The Gold Coast Chamber of Mines,
Nsuta, 26th October, 1931.

RAILWAYS AND HARBOUR FURTHER RETRENCHMENT COMMITTEE.

SIR,

In response to the notice appearing in the British Official Wireless Service on the 19th instant and other dates, we have the honour to inform you that we desire to place our views before this Committee. We submit that:

1. The costs of public works such as pioneer railways, harbours, etc., built with the object of opening up the Colony or for the benefit of the community in general should be chargeable to the consolidated revenues unless and until such works can earn sufficient revenue to cover these costs without charging rates for their services in excess of those prevailing in countries which compete with the exports of this Colony.

2. The Gold Coast Railway, for the past 12 or 13 years, has occupied the position of a commercial undertaking. It has functioned almost exclusively as a carrier for the commercial and mining interests and derived its revenue from them, and in order to carry out these obligations economically and efficiently, it must be organized and conducted on modern commercial lines.

3. Takoradi Harbour is covered by paragraphs 1 and 2 in that it was built for the benefit of the Colony in general and is essentially a commercial project. Without imposing prohibitive rates it cannot be expected to furnish sufficient revenue to cover interest charges on capital until the trade of the Colony increases sufficiently to provide a revenue for this purpose.

4. In elaboration of the foregoing propositions, we further submit:
(a) The railway was first built from Sekondi to Kumasi at a time when it was impossible to foresee the subsequent development in cacao and manganese, and at that time would not have been undertaken by private capital.

(b) We believe it will be admitted that it was a pioneer railway intended chiefly to facilitate the administration and to facilitate the administration and to further develop the Colony, and the military necessities and the activities of neighbouring European powers furnished additional reasons for its construction.

(c) As the necessity for its construction was urgent the railway was built rather hurriedly. The lack of topographical information precluded the selection of the most suitable route, whilst the influence of climatic conditions and other considerations resulted in the construction of a pioneer line quite unsuitable for present-day conditions.

(d) When called upon to handle the increasing exports of the Colony it was found to be quite inadequate and had to be practically rebuilt throughout at a cost exceeding £1,240,000.

(e) The Central Province Railway, including surveys, cost £1,194,000 odd, and survey work for proposed railways appears to have cost more than £103,000. This was pioneer work intended to develop the Colony, and for many years could not be expected to furnish the revenue necessary to cover operating and interest charges without imposing excessive freight rates.

(f) The other lines of the Colony were built for a reasonably assured traffic, but they and the rebuilt line from Sekondi to Kumasi were called upon to pay interest, sinking fund and other expenses on the cost of this pioneer work, whilst the surplus earnings were paid into the consolidated revenue. In order to earn these revenues the railway was obliged to charge excessive freight rates which we regard as an unfair tax on the primary producer as they increase the cost of his product and handicap him in competing with the products of other countries.

(g) When the first sections of the railway were built an administration on lines much similar to other Government departments was established. At that time this may have been the most suitable form of control, but since the railway has become essentially a commercial undertaking, this form of administration is a serious hindrance to economical operation.

(h) All commercial undertakings must expect to encounter alternating periods of depression and prosperity and in order to cope successfully with these they must have a flexible organisation which can be readily adjusted to meet the changing conditions.

(i) On the 31st of March last the Railway personnel consisted of 166 Europeans and 4,845 Africans, a proportion of 29 to one. We understand some reduction has since been made in this number. The African appears to
be very well represented in the organisation. On the mines the average proportion is 40 to one.

(j) The salaries of all European officials except the General Manager are, in our opinion, on too liberal a scale. This is especially so in the case of artisans, platelayers, etc., who are paid higher rates for permanent pensionable employment than those paid on the mines for non-permanent and non-pensionable engagements.

(k) Pensionable appointments should carry a smaller salary than non-pensionable, and this salary should be calculated on the amount paid plus the amount of pension.

(l) We regard the payment of a pension as objectionable, in that it frequently destroys initiative and enterprise in the recipient who becomes increasingly inclined to work for safety first and avoid responsibility.

(m) As an alternative, compulsory insurance on an approved endowment plan might be substituted. This would facilitate the operation of the railway on commercial lines.

(n) A group insurance scheme covering death or permanent disablement for all non-pensionable European employees and all European employees with less than 10 years service would not be expensive to operate. /

In conclusion we wish it to be understood that the foregoing remarks imply no criticism of the personnel of the Gold Coast Railway. The work they are now required to do has, in our opinion, outgrown the administrative system and we have pleasure in acknowledging the efforts they have made to carry on under very adverse conditions.

We have, etc.,

C. R. MILLAR, President,
for The Gold Coast Chamber of Mines.

[...]
THE BIRMINGHAM CHAMBER OF COMMERCE to COLONIAL OFFICE.
(Received March 24, 1905.)
[See to Foreign Office: No. 135.]

Sir,

Winchester House, Victoria Square, March 23, 1905.

With reference to your letter of the 7th June, 1904,* and to previous correspondence respecting the rates charged on the Beira and Mashonaland Railways, I am directed to transmit to you herewith, copy (in duplicate) of a report which has been unanimously adopted by the Council, and to ask you to be good enough to lay the same before the Colonial Secretary.

I am also directed to ask if the Colonial Secretary will be good enough to forward a copy to the British South Africa Company,† and to express a hope that he will use his best offices with the company with the view of inducing them to bring about a reduction of the present exorbitant rates charged for the conveyance of merchandise on the said railways.

I am further directed to call your attention to the representation of the Chamber, contained in my letter of the 31st July, 1903,‡ and particularly to that contained in my letter of the 8th December, 1903,§ which the Council desire should again be brought under the notice of the Colonial Secretary.

I am, &c.,

G. HENRY WRIGHT,
Secretary.

* 11561: not printed.
† No. 264 in African No. 717.
‡ No. 434 in African No. 717.
Enclosure in No. 75.

BIRMINGHAM CHAMBER OF COMMERCE (INCORPORATED).  

REPORT OF THE GENERAL PURPOSES COMMITTEE ADOPTED BY THE COUNCIL ON THE 15TH MARCH, 1905.

Beira and Mashonaland Railways.

On the 31st July, 1903, a representation was made by the Chamber to the Colonial Secretary with reference to the excessive rates charged for the conveyance of merchandise on the Beira and Mashonaland Railways, which it was urged operated as a serious hindrance to the proper development of trade and commerce of Rhodesia. A further letter on the subject was sent to the Colonial Secretary on the 8th December, 1903. The correspondence was transmitted by the Colonial Secretary to the British South Africa Company for their observations; and on the 7th June, 1904, the Colonial Secretary forwarded, for the information of the Chamber, copy of a Memorandum prepared by the Mashonaland Railway Company, Limited, which had been sent to him by the British South Africa Company as a reply to the representations of the Chamber. This Memorandum was laid before your Committee, who instructed the Secretary to forward a copy to traders in Rhodesia, and to ask for their observations thereon. These have now come to hand and have been carefully considered by your Committee.

The documents connected with the case are too lengthy to admit of reproduction in this report, but the following shorter statement of the facts and arguments will probably be sufficient to enable the Council to come to a conclusion on the matter.

Merchandise is carried into Rhodesia principally by two routes, viz.: from Port Elizabeth, in the south, and from the Portuguese port of Beira, on the East Coast of Africa. The distance from Port Elizabeth to Gwelo is 1,313 miles, whilst the distance from Beira is only 562 miles. It should be remembered that Gwelo is the meeting point of the southern and eastern railway routes. The complaint of settlers is that although Beira is the natural port of Rhodesia, the rates on the Beira and Mashonaland Railways are fixed at such a level as to make the total cost of conveying merchandise from Beira approximately equal to the total cost of conveying the same from Port Elizabeth. In other words, the rate per ton per mile from Beira to Gwelo is more than double the rate per ton per mile from Port Elizabeth. This is admitted by the Mashonaland Railway Company, who state that the arrangement was entered into by Mr. Rhodes at the request of the people of Rhodesia. The present traders of Salisbury Rhodesia do not admit this,
as they contend that the rates were fixed purposely in order to divert Rhodesian traffic on to the long line from the south. The Mashonaland Railway Company do not attempt to prove their assertion by any documentary evidence, whilst the Rhodesian traders quote a speech delivered by Mr. Rhodes at Port Elizabeth on the 17th September, 1898, just after the Beira Railway had reached Salisbury, from which it seems clear that Mr. Rhodes definitely intended that the Beira and Mashonaland Railways should not enter into competition with the railways entering Rhodesia from the south. In this speech Mr. Rhodes said: ‘It is one of the greatest mistakes for a man to work competing railways; he cannot afford the competition and will probably be working at a loss’. Later on in the same speech he said: ‘I have arranged the railways to the north so that whatever trade we have in the north will have to come through this port, i.e., “Port Elizabeth.” ’ This speech would appear to your Committee to refute the statement of the Mashonaland Railway Company that the arrangement respecting rates was entered into at the request of the people of Rhodesia.

In their Memorandum the Mashonaland Railway Company admit that it is unquestionably true that the base rates on their railways are high, but contend that they are justified by the conditions under which the railway systems were constructed and are worked. Your Committee are prepared to admit that some of the arguments of the Mashonaland Railway Company are reasonable, but from information that has been received from Rhodesia it appears that other arguments are not so well founded.

For instance the high cost of construction is put forward as one of the conditions justifying the high rates. Your Committee are informed that the cost of constructing the broad-gauge line from Beira to Salisbury was about £8,900 a mile; whilst the first 2,250 miles of railway built in Cape Colony averaged £8,580; the Delagoa Bay line £9,000, and the Natal line £11,317 per mile. Again the Mashonaland Railway Company refer to ascending gradients and numerous sharp curves in the railway as conditions resulting in unusually high working costs. Your Committee are informed that so far as physical obstacles are concerned the ascent of the inland plateau has to be faced by every line round the South African coast, and that the most gradual ascent of all is that on the Beira line, on which there is a rise of 3,700 feet at Umtali in a distance of 200 miles. On the Cape Town line there is a rise of no less than 2,400 feet in 36 miles up the Hex River Pass, over the greatest part of which the gradients are 1 in 40 and 1 in 45, with curves of 5 chain radius. On the Port Elizabeth line there is a rise of 5,200 feet in the first 263 miles, while from East London the railway reaches an elevation of 5,600 feet at 207 miles from the coast. The Natal line is said to be the steepest and most tortuous in South Africa, not more than 47 miles of the main line being on the level; in some places the gradient is even 1 in 30, and the curves as sharp as 40 feet radius; the rise in the first 58 miles amounts to over
3,000 feet. On the Delagoa Bay line similar difficulties occur; indeed, so steep is
the ascent of the Elandsberg from Waterfall Onder that the ordinary rails have
to be supplemented by a cog rail. With this information before them your Com-
mittee are of opinion that the cost of construction, maintenance, and working
due to the gradients and curves on the Beira and Mashonaland Railways should
compare favourably with the costs on the other South African Railways, and that
the conditions in this respect do not present any strong argument in justification
of the present excessive rates.

Another argument adduced in justification of the high rates is the sparsity
of populations along the whole route of the railway, resulting in traffic of very
limited dimensions; but the Rhodesian traders point out that in this respect the
Beira Railway is no worse off than the more expensive Delagoa Bay line; and yet
the rates per ton per mile on the former are two and a half times as high as those
charged on the latter railway.

Furthermore, the Rhodesian traders state, as a final reply to the argument
that the high rates on the Beira and Mashonaland Railways are due to high
working costs, that it is instructive to compare these costs with those of the Rho-
desian railways in Matabeleland, from which, taking the figures given in the
recently published reports of the two railway companies for 1903, it is found
that the gross cost per train mile on the Rhodesian railways was 9s. 2.7d., whilst
on the Beira and Mashonaland railways it was only 9s. 3.4d., or practically the
same amount. Yet, notwithstanding this, the high rates on the latter line for 1st
class goods are 75 per cent. higher, and those for 2nd and 3rd class goods about
100 per cent. higher.

An important feature of the Memorandum of the Mashonaland Railway
Company is a comparative statement purporting to show the landed cost and
the actual local price of the approximate amount of imported food consumed
annually by a single man in Salisbury. This statement was prepared in reply to
the Chamber’s contention that the effect of the high railway rates is unduly to
increase the cost of living. For the purpose of this statement 15 articles are taken
and the following result is obtained:–

<table>
<thead>
<tr>
<th>Description</th>
<th>£</th>
<th>s</th>
<th>d</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cost in London, f.o.b.</td>
<td>23</td>
<td>8</td>
<td>11½</td>
</tr>

<td>53</td>
<td>8</td>
<td>3</td>
</tr>
<tr>
<td>Merchants’ profit per cent</td>
<td></td>
<td></td>
<td>46.1</td>
</tr>
</tbody>
</table>

In a note it is explained that buying, commission and bank charges are not
included in the landed cost, and that by ‘merchants’ profit’ is meant the excess of
local sale price over cost price, which, it is explained, is not all profit, as working expenses, loss in transit, deterioration, &c., have to come out of it.

Your Committee considered this comparative statement to be of considerable importance, and a copy was therefore sent out to Rhodesia in order that a further statement should be prepared in respect of precisely the same articles and quantities. The Rhodesian traders availed themselves of the opportunity, and furnished your Committee with the desired particulars, the figures being taken from actual recent consignments, as recorded in the cost books of various local merchants, with the following result:–

<table>
<thead>

<td>26.6</td>
</tr>
</tbody>
</table>

It will be observed that there is a considerable discrepancy between the two statements, and the Rhodesian traders give an explanation as to how the discrepancy arises. For instance, the Mashonaland Railway Company’s figures purport to show that the merchants’ gross profit on bread is 127 per cent. The landed cost at Salisbury of 365 lbs. of bread is stated to be £2 13s. 7 1/2d., and the local price to be £6 1s. 8d. From information furnished by Rhodesian traders it is evident that the former figure represents the landed cost of 365 lbs. of flour, whilst the latter is the sale price of 365 lbs. of bread. So that the comparison is obviously irrelevant, especially when it is also considered that in stating the sale price nothing has been allowed by the Mashonaland Railway Company for the cost of other ingredients and for the labour and other expenses incurred in making the bread. Other defects in the railway company’s statement are made apparent by the Rhodesian traders. For instance, in the case of sugar the cost of freight (as evidenced by the amount paid on an actual consignment) is understated, whilst the sale price is given as 5d. instead of 4d., which, in itself, represents a discrepancy of 20 per cent. Further, in the case of rice, the Rhodesian traders state that the Railway Company have calculated the prime cost and carriage on the common quality of rice, which is imported in large consignments in bags direct from India, whereas the selling price given is that of best Patna, usually imported from England in small quantities, and often in tins. Again, in the case of pepper and mustard, the cost of carriage / appears to have been much under estimated, whilst the sale price is given at 4s. as against the actual price of 2s. 6d. per lb. It may also be remarked that the omission of such charges as buying, commission,
cost of cases, bank charges, and delivery from station, tends to vitiate the result shown in the statement of the railway company.

The Rhodesian traders’ statement shows a gross merchant’s profit of 26.6 per cent., but they state that from estimates that have been prepared it is found that the average cost of distribution in Salisbury, including a small percentage for irrecoverable damages in transit, comes to about 20 per cent. on the landed cost of the goods, which estimate is believed to be rather below than above the mark. Taking the figures, however, as given, it is seen that by selling at retail prices the Rhodesian trader in groceries obtains a profit margin of only 6 1/2 per cent., which, it is contended, is really insufficient to meet such additional items as depreciation, bad debts, and ordinary trade risks. It must also be remembered that in the case of contracts and large orders the sale price is appreciably lower, and still further reduces the net profit of the Rhodesian trader.

Your Committee submit that the details which have been set forth above show, first, that the excessive railway rates charged are not justified by the high working costs; and, secondly, that the contention of the Mashonaland Railway Company that the Rhodesian trader is making exorbitant profits is not well founded.

On the contrary, it is clear from the statement in the railway company’s memorandum, as to the arrangement made by Mr. Rhodes that the object of maintaining the present exorbitant rates is to encourage traffic from the south for the benefit of the Southern Rhodesian railways. The effect of this is to deprive Rhodesia of the advantages which ought to accrue from the natural port, Beira. The discrepancy in the rates from the south as compared with Beira is seen in the following comparative statement, which is given in the Mashonaland Railway Company’s Memorandum. The rate for the carriage of mining machinery from Beira to Salisbury, 374 miles, is £9 15s. 0d. per ton; on the Central South African Railways it would be £5 15s. 0d. per ton. The weight of a 40-stamp mill and of all material for buildings, &c., in connection therewith, would be approximately 900 tons, and nearly all this material would be carried at the rates named. The carriage, therefore, from Beira to Salisbury would be £8,775, whilst for a similar distance on the Central South African Railways it would be £5,175, or £3,600 less. The railway company say that this difference would not appreciably affect a mining company which intended to put up a 40-stamp mill. Your Committee cannot agree with this. Furthermore, it must be remembered that similar differences exist in the carriage of most other articles of merchandise which have to be bought and paid for by the smaller consumer; and it cannot, therefore, be seriously denied that the high railway rates do appreciably restrict Rhodesia’s purchasing power, and do unduly increase the cost of living. Your Committee do not, as the Mashonaland Railway Company appear to think, contend that railway rates alone are responsible for the high cost of living in Rhodesia, but
they do contend that when the rates from Beira, the nearest port to Gwelo (562 miles) are as high as the rates from Port Elizabeth (1,313 miles), then the settlers of Rhodesia are deprived of something which ought in the nature of circumstances to be theirs. According to the Mashonaland Railway Company’s statement the railway rates on foodstuffs for consumption in Salisbury represent 25 per cent. on the landed cost of the goods at Beira, and this, in the opinion of your Committee, is excessive.

The Mashonaland Company, in another part of their Memorandum, contend that reductions in railway rates can only go hand in hand with the development of the country, and the increase in its populations; whilst, on the other hand, the Rhodesian traders believe that cheap transport is a necessary forerunner to healthy colonization and industrial development. With the latter view your Committee are in entire accord.

Your Committee believe that sufficient has now been said to show that Rhodesian traders suffer considerably in consequence of the railway policy adopted by the Beira and Mashonaland Railway Company, and it only remains now to point out that the high rates re-act injuriously on British exports to Rhodesia, because it must be evident that anything which unduly restricts purchasing power restricts also the sale of goods. This applies, of course, not only to foodstuffs but also to mining and building material, stores, ironmongery, hardware, domestic articles, &c. /

Your Committee recommend that a copy of this report be sent to the Colonial Secretary; that he be asked to transmit a copy to the British South Africa Company, who are not only responsible for the good government and development of Rhodesia, but also are practically the owners of the railways; and that he also be asked to use his best offices with the Company with the view of inducing them to bring about a reduction of the present exorbitant rates in order that the people of Rhodesia may have the advantages which should accrue to them from the possession of a line of railway following the nearest route to the sea.

G. Henry Wright,
Secretary.
Birmingham, March 23, 1905.
No. 97.

UGANDA.

THE GOVERNOR to THE SECRETARY OF STATE.

(Received 23rd April, 1914.)

(Confidential.)

Sir,

I have the honour to inform you that the Governor has had under consideration the question of the amalgamation of the Uganda Protectorate Railways with the Uganda Railway on a basis which would allow of a uniform administration, and would at the same time secure to the branch railways in this Protectorate that measure of financial support from the parent line which is properly due to them.

2. The administrative advantages which would be secured by amalgamation are scarcely open to question, and need only be referred to briefly in order to be recognized. The existence of one central administration under a single administrative head ensures economy in time in referring matters to the central authority, and uniformity of policy over the whole system. It greatly simplifies the assimilation of rates and fares throughout, and offers much greater facilities for the quotation of special through rates. It enables the whole accounting business of the railway to be conducted under one administrative control, with a uniform system of forms, regulations, etc., and avoids the necessity of complicated clearing house operations between the various branches. It secures the advantage of a single staff, with uniformity of pay and regulations, the members of which can be posted by the central authority, to the advantage of the system as a whole. Moreover, the free interchangeability of rolling stock over a whole system permits of the rolling stock available being utilized as required to meet
seasonal or other variations of traffic in the various parts without the necessity of providing separately for the branch lines. These are only a few of the advantages which occur to me. Doubtless there are many others which might be adduced by those more competent to speak on railway administration.

3. The financial basis of amalgamation is, however, a matter of some difficulty, which calls for careful consideration. This question has been reviewed in some of its aspects on former occasions, and it will be convenient if I may refer briefly to what has already passed germane to this subject.

4. Sir Hesketh Bell\(^1\) in paragraphs 14–16 of his Confidential despatch of the 20th January, 1908,\(^*\) forwarding the draft Estimates for 1908–09, raised the question of securing for Uganda a proportion of the profits of the Uganda Railway, but Lord Crewe in paragraph 5 of his dispatch, No. 206, of the 26th August, 1908,\(^†\) replied that he was unable to view the proposal with favour. The question of the status of this Protectorate in relation to the railway system was more fully considered, in connexion with the construction of the Busoga Railway, in Sir Percy Girouard’s\(^2\) despatch to the Colonial Office, No. 218, of the 16th April, 1910, and his Confidential despatch of the 12th May, 1910, and Mr. Tomkins’s despatch, No. 142 of the 26th April, 1910.\(^‡\)

5. In his despatch of the 12th May, 1910,\(^§\) Sir Percy Girouard lays stress on the fact that the railway system is the backbone of the two Protectorates and should be operated for the combined advantage of both. With this statement I can only express my entire concurrence, but he proceeds to argue further that the East Africa Protectorate is entitled to the entire profits on the Uganda Railway system, on the ground that that Protectorate has been responsible financially for the parent line and has been obliged to bear the loss incurred in its working during the earlier years of its existence; with this I am not in accord, as Sir Percy Girouard’s argument ignores the fact that the construction of the Uganda Railway was undertaken as much, if not more, in the interests of Uganda for the development of the hinterland, than on behalf of the East Africa Protectorate, and that that Protectorate, as he himself admits, has contributed no more than Uganda towards the charges on the original grant which, I understand, have been met from Imperial funds, free, so far as East Africa was concerned, from all charges for interest and sinking funds.

6. I do not wish, however, to discuss this aspect of the question in the meantime but that of the amalgamation of the railway and marine services of the two Protectorates, and in this I am in full accord with Sir Percy Girouard’s main contention that the railways in both Protectorates should be worked as a

\(^*\) No. 5 in African No. 895.
\(^†\) No. 36 in African No. 895.
\(^‡\) Nos. 136, 176 and 142 in African No. 951.
\(^§\) No. 176 in African No. 951.
homogeneous system, under a single administration, for the combined interests of both. The treatment of existing and future lines as extensions of the Uganda Railway system is the principle adopted by Mr. Winston Churchill in his Confidential memorandum, African 862, dated 30th November, 1906, which formed an enclosure in Lord Elgin’s Confidential despatch of the 21st December, 1906,** and is, in my opinion, the only sound method of dealing with the question.

7. The position at present is that the Uganda Protectorate is called upon to bear the loss incurred in running feeder lines, while the East Africa Protectorate reaps the benefit of the additional profits to the parent line which result from the increased traffic supplied by the feeders. That is to say, the Uganda Protectorate pays for the more expensive parts of the system, whilst East Africa reaps the benefits which are received by the system as a whole. Such a position is plainly unfair to Uganda, and if this policy is allowed to continue it must inevitably block the way for future development, as this Protectorate would obviously be unable to bear the charges for interest and sinking funds on future extensions, which would undoubtedly be run at a loss during their earlier years, unless afforded some assistance from the parent line in return for the increased traffic brought in.

8. This aspect of the question was recently discussed by the Governor in conjunction with the General Manager of the Uganda Railway, whose views are expressed in a letter and memorandum copies of which are enclosed. A copy of a memorandum by Mr. Eastwood, Chief Accountant to the Uganda Railway, containing alternative proposals is also enclosed together with a copy of a minute by the Treasurer of this Protectorate suggesting a system of contribution from the Uganda Railway revenues based on a different principle.

9. The main outlines of the proposals submitted are briefly as follows:–

(a) Mr. Taylor proposes that funds for the construction of branch lines in this Protectorate should be arranged for by Uganda, interest during construction being debitable to capital; the lines to be worked on the same percentage of working expenses to gross earnings as the whole system, the Uganda Railway as home line, to guarantee such minimum net revenue as will meet charges for interest and sinking fund on the capital cost of the branch without expense to Uganda, and to pay such further revenue as may be received from the net earnings of the branch in excess of these charges.

(b) Mr. Eastwood proposes that the Uganda Railway should meet the interest on loans for the construction of the branch lines, but that this Protectorate should bear its own working expenses and sinking fund, and receive the profits or meet the loss incurred in running the branches in Uganda.

(c) Mr. Smith suggests that neither of the foregoing proposals go far enough, but that this Protectorate should receive an annual contribution of at

* 44909: not printed.
least £50,000 from the revenues of the Uganda Railway, but that charges for interest and sinking fund should be met from the revenue of this Protectorate.

10. The General Manager’s proposal contained in 9 (a) commends itself to me as being the most equitable in the interests of both Protectorates, and as most likely to afford the necessary amount of assistance towards future development. Under it the Uganda Protectorate funds would be protected from loss during the unproductive years which must be expected in the early stages of the development of branch lines and would benefit by their net earnings when a profitable stage was reached.

Mr. Eastwood’s proposal in 9 (b), though it might eventually result in greater gain to the revenues of this Protectorate, and would, perhaps, be more advantageous if only the existing branch lines are to be considered, appears to offer the disadvantage that Uganda would be hampered by being obliged to bear the considerable loss on actual working which might be expected in the earlier years of the more considerable extensions of the system which are in contemplation. / The suggestions made by Mr. Smith in 9 (c) present some difficulty, as they depend upon the admission of the principle that part of the profits of the Uganda Railway should accrue to this Protectorate, a point which is referred to in paragraph 4.

11. I recommend, therefore, that the Busoga Railway be absorbed in the Uganda Railway system, on the basis of Mr. Taylor’s proposals, with effect from the 1st April, 1914, and that the Kampala-Port Bell Railway be similarly absorbed, either on that date or as soon as completed; the same principle to be followed in the case of all future extensions.

12. I have not as yet discussed this project with the Governor of East Africa, but in order that an expression of his views may be received at an early date, I have caused a copy of this despatch to be forwarded to him.

13. In conclusion, I may add that this despatch deals more particularly with the amalgamation of the railway services. The amalgamation of the marine services is dealt with in the correspondence terminating with your despatch, No. 596, of the 23rd December, 1912,* with exception of the Albert Marine, which must of necessity remain a separate service until Butiaba on Lake Albert is connected by rail with Masindi Port on Lake Kioga. It is proposed, however, that the Lake Kioga Marine Service should be treated on the same lines as the railways as part of the complete system.

I have, &c.,

H. R. WALLIS,*
Governor’s Deputy.

Enclosure 1 in No. 97.

(Confidential.)

Uganda Railway, General Manager’s Office, Nairobi.

24th February, 1914.

Amalgamation of Railways and Marine Services,
East Africa and Uganda.

Sir,

I had the honour of an interview with His Excellency on my visit to Uganda last month, and the matter was brought up of the amalgamation of the railway and marine services of the two Protectorates, and His Excellency desired that I ask Mr. Eastwood to put up a memorandum on the subject.

2. I enclose copy of a memorandum compiled by me after the interview with His Excellency on 5th January, and I also enclose copy of a memorandum compiled by the Chief Accountant.

3. It will be noticed that Mr. Eastwood goes much further than I, and his proposal is that the Uganda Railway pay all interest on loans, and that any profit on working the several branches go to the respective Protectorates owning the sections.

4. Personally, I am of opinion that the whole working and financial control of the railways and marine services be under one administration, and that the railways and marine services in Uganda be worked as branches of the Uganda Railway, on similar terms as are granted in India.

5. The local Government to arrange for funds for railway construction, but the work to be carried out under the direct control of the General Manager of the Uganda Railway, and the home line to guarantee the loan charges. During construction interest to be debitable to capital.

6. The working arrangement to be that the home line work the branch as part of the system on the same percentage of working expenses to gross earnings as the whole system, and guarantee a minimum net revenue as will meet the charges for interest and sinking fund on the capital cost of the branch, and such further revenue as the net earnings of the branch may exceed these charges.

7. I certainly consider that the amalgamation of the railway service should be arranged for at once on some such basis as outlined above. I understand that before the amalgamation of the two Nigerias that Southern Nigeria guaranteed the interest on railway loans in Northern Nigeria.

I have, &c.,

H. B. Taylor,
General Manager, Uganda Railway.
To the Chief Secretary of the Government. Entebbe, Uganda. / (Confidential.)

Amalgamation of Railways and Marine Services, East Africa and Uganda Protectorates.

His Excellency Sir Frederick Jackson discussed with me the question of the amalgamation of the railways and marine services of East Africa and Uganda.

He stated that the matter had been brought up before by him with the late Mr. Currie, and the matter was to have been gone into at home when they were both on leave, but unfortunately Mr. Currie’s death prevented this.

His Excellency also told me that the matter had been talked over by him with the Chief Accountant, Mr. Eastwood.

The Governor’s opinion is that the full control of the railway and marine services be under one administration, and in this view I concur.

The railway and marine services in Uganda are really feeders to the Uganda Railway, and we get a large portion of our net earnings from the traffic brought to us by them.

The question was discussed of further extensions in Uganda.

One was from Masindi Port to Butiaba, from Mbale to the Lake, and a third extension of the Kampala Railway to the southern end of the Lake Albert. On my view being asked on these extensions I advocated that the only one I could recommend was the extension in the direction of Lake Albert, which I consider very promising indeed, as it ran into excellent country a very few miles from Kampala. In this view His Excellency agreed, and said that a few of the local officers whom he had confidentially consulted were of the same opinion, and he desired that, should this railway be constructed, the construction should be under the direct control of the Uganda Railway.

I do not think we can ask Uganda to spend money freely on such extensions unless the home line give some encouragement in the way of rebate. I certainly consider that the least we should offer is that we work these lines on the same percentage receipts as the whole concern. It is not right that these feeder lines should be worked at a loss to the Uganda Treasury.

The question, of course, is one in which the Government of East Africa is intimately concerned, as at first there must be some slight loss on the working of these feeder lines, but the advantage in the free working of the railway and marine services being absolutely under one financial control is very great indeed, and it will certainly tend to the Uganda Protectorate encouraging branch lines if such terms can be offered by the home line.

The branch line terms in India are: interest is chargeable to capital during construction, and that after the line be opened to traffic the home line work the branch on certain systems, either of guaranteed interest on capital or rebate on the traffic brought to the main line by the branch line.
At present our railway loans bear interest at 3 1/2 per cent., and have a sinking fund at 1 per cent., and I am of opinion that the home line can well afford to guarantee at once the loan charges, and more still, should the whole system earn more than 4 1/2 per cent. This should give great encouragement to Uganda borrowing money for railway extensions. But I consider it most unfair to ask a new country to establish a sinking fund for a productive work like the railway service, which is always kept up to date and in thorough order, at the expense of revenue. It is hard that when a country is just fighting its way it should be doing so much for those who are to come hereafter – some thirty to fifty years hence.

Of course Uganda benefits by the opening out and development of its country in like manner as East Africa benefited the Uganda Railway, which should be considered as a joint railway and not solely as a gift by the English nation to the East Africa Protectorate, for, beyond the minor loans for which East Africa is now financially responsible, the revenue account bears no charge for interest on the main capital cost.

This guarantee of interest on branch lines of course can only be for such extensions as have the approval of the main line authorities, but no doubt the Secretary of State would take control and see that only such lines be constructed in the future which would be directly or indirectly remunerative.

His Excellency informed me that he had been asked by the Secretary of State regarding various extensions in regard to roads and railways, and he had put forward these suggestions, which he hoped East Africa would favour.

Nairobi,
February, 1914.

H. B. Taylor,
General Manager, Uganda Railway.

Memorandum.
(Private and Confidential.)

Uganda Railway, Chief Accountant’s Office, Nairobi,
17th February, 1911.

Amalgamation of Railways and Marine Services, East Africa and Uganda.

The desire of the Uganda Administration is that they should receive some proportion of the profit earned by the traffic they bring to the Uganda Railway, and also assistance in building railways in Uganda.

From a railwayman’s point of view there can be no question as to the desirability and benefits to be gained by the amalgamation of the different services. It spells economy in working, the enlargement of both railway and marine services,
an ever-increasing area of revenue-earning country, a larger available supply of labour, and, most of all, a rising and constant revenue for both Protectorates.

East Africa has the Uganda Railway and the Thika Branch, costing up to the present time, including loans now under expenditure, some £6,600,000. This cost includes also the Uganda Railway Marine on Lake Victoria. Of the amount of £6,600,000, interest is payable upon £535,000 only, the remainder being either the Uganda Railway original grant of £5,550,000, or the amounts that have been passed yearly in the expenditure votes of the East Africa Protectorate.

The Uganda Protectorate have 62 miles of line on the Busoga Railway, seven miles on the Kampala-Port Bell line, a flotilla on Lake Kioga, and steamers on both Lake Victoria and Lake Albert. The total cost is about £250,000, of which £200,000 bears interest at 3 1/2 per cent. and a sinking fund of 1 per cent. Uganda trade has no outlet except the Port of Mombasa, and, consequently practically all traffic, both exports and imports, has to be taken 750 miles to or from the Protectorate to the nearest port of shipment. This means that the Uganda Railway have their maximum mileage charges on all this traffic, and, except in the case of country produce and low freight commodities, such as cotton, it yields a fair profit. But it must be remembered that Uganda pays nothing towards the cost of working the traffic, nor of the expenditure that has been incurred in terminal facilities at the coast port, and on which expenditure involving millions sterling must be incurred to meet the development of the two Protectorates. Uganda has not even provided the port accommodation required in its own territory, and it therefore does not appear either just or equitable that it should derive any share in the profit earned on that part of the railway system that is outside its own territory or jurisdiction. But although it does not appear right that it should not receive part of the profit, there is no reason why the parent line should not assist the Uganda Protectorate in the development of its railways, and by so doing help not only Uganda, but also East Africa, by the increased revenue that must inevitably occur by increased accommodation and facilities.

The way in which it could assist would be by guaranteeing the interest upon any loan that might be raised for the construction of railways or works in connexion with them.

The line in Uganda that is considered most advisable is the line to the southern end of Lake Albert. This not only runs through good country, in which at the present time there is a very large porter transport that it would release, but it would also save the transhipments that would ensue in a line from Masindi to Butiaba. Such a line would be from 150 to 180 miles in length, and when the Nakuru-Mumias line is completed, an extension of about 120 miles from Mumias (?) to Kampala via Jinja would form a trunk line from Mombasa to Lake Albert.

The cost of the Kampala-Lake Albert line, with its equipment of rolling stock, terminals, workshops, etc., etc., should not be estimated at less than £1,000,000.
The Governor of Uganda to the Secretary of State

There would be required a flotilla on Lake Albert, at a cost of, say £150,000.
The present indebtedness is £250,000.
Add improvements on Lake Kioga and extension of flotilla, say £50,000.

£1,450,000 /

Interest on this at 3 ½ per cent. would be £50,750, or, say, in round figures, £50,000 per annum. It is not right that the parent line should bear the cost in another Protectorate of the sinking fund. A sinking fund of 1 per cent., invested at the commencement of each financial year, would repay the original loan in forty-four years, when the line would be free of all liabilities, the interest upon the loan would then cease and be available either as a guarantee for further loans or for an increase of revenue.

Our net revenue for the present year is estimated at £214,000; next year it is put at £330,000, and in view of the immense increase in traffic that would take place in putting all the country between the two lakes into direct communication with the railway, and also all of the country around Lake Albert, a yearly expenditure of £50,000 would more than repay itself within the first few years.

As regards the profit, or any profit-sharing scheme, I think the only equitable system would be for each Protectorate to take the part earned upon its own system. East Africa would bear the interest upon all railway loans, each Protectorate would bear its own working expenses and its sinking fund. It may be put forward that the Uganda Protectorate supplies a great deal of the traffic that contributes so largely to our revenue, but it must be remembered that if it were not for the railway Uganda would be a possession only, and not the probability of a large money-earning Colony.

With our present accommodation, and system, we estimate next year to earn £800,000, with a net revenue of £330,000.

The cost of the Uganda Railway at present is £6,600,000.
Requirements within the next five years, say £3,750,000.
Additional four berths at Kilindini, and a line from Mumias to Sio River £1,000,000.
Cost of Uganda Protectorate System, as given herein £1,450,000.
Additional Line, Sio River to Kampala and necessary equipment £750,000.
Estimated cost in ten years £13,550,000.
The revenue for the year 1914–15, may be divided as coming from:–

East Africa £400,000
Uganda £265,000
German East Africa £135,000
£800,000

East Africa, with its own development and new lines should treble itself in ten years £1,200,000.
The proportion derived from Uganda should at the very least treble itself in ten years £795,000.
Uganda Protectorate traffic on its own system should be at least a third of what it earns on the parent line £265,000.
German East Africa trade, add 50 per cent., say £200,000.
Total estimated revenue in ten years £2,460,000.
Allowing for the cost of interest on loans and sinking fund, put the working expenses at 75 per cent. This would give a net revenue, or profit, of £615,000, say, 4 1/2 per cent. upon the total cost, with the ultimate view that in less than fifty years all the system as proposed would be fully paid for, and there would consequently be an automatic increase in the revenue of over £400,000.

These proposals would eliminate the Uganda Railway Marine as a necessity for our present Uganda traffic, but they could be used for the expansion of trade around the Victoria Lake generally.

B. EASTWOOD.

Enclosure 2 in No. 97.

Memorandum.
(Confidential.)

1. The proposal for the amalgamation of the different services under the control of one Department should, I think, be adopted.

2. There are two statements made by Mr. Eastwood which, I think, should not pass unnoticed. The first is that the port accommodation in our own territory has not been provided by us. Although this is the case it should also be recorded that this Protectorate has spent, and is still spending, large sums directly for the development of trade and in providing steamers on Lakes Albert and Kioga, roads and other facilities for the transport of the traffic carried by the steamers to and from our ports on Lake Victoria, without which expenditure it is reasonable to suppose the large profits earned by the steamers would not have accrued. Further, it would seem unreasonable for us to provide port accommodation when we get no revenue from the traffic carried by the steamers, which, it should be noted, earn the bulk of their profits from trade with ports in the Uganda Protectorate. The second statement is that ‘if it were not for the Uganda Railway, Uganda would be a possession only.’ This of course, applies equally to the East Africa Protectorate.

3. As regards an extension of the main line as far as Kampala, I am of opinion that such an extension is not necessary and would be inexpedient. Steamer transport seems the natural means of transport from the east of Lake Victoria to Buganda.

4. As regards financial adjustments, it is difficult to foresee at present under what scheme this Protectorate would ultimately obtain a reasonable share of the revenue which will be derived from the traffic provided by it.

5. The railway loan charges for which this Protectorate is liable are:–

<table>
<thead>
<tr>
<th>Loan Description</th>
<th>Amount</th>
</tr>
</thead>
<tbody>
<tr>
<td>Busoga Railway Construction Loan</td>
<td>£170,000</td>
</tr>
</tbody>
</table>

Interest 3 ½ per cent, sinking fund 1 per cent. = 4 ½ per cent.
Kampala-Port Bell Railway Construction Loan = £30,000. Interest 3 ½ per cent., sinking fund 1 ½ per cent. = 5 per cent.

6. In addition we have to pay interest at 3 ½ per cent. and sinking fund at 1 ½ per cent. on a loan of £95,000 for improvements in communications in the Eastern Province. The whole of this sum is being spent on improvements which will bring traffic to the Uganda Railway, e.g., rolling stock for the Busoga Railway, lighters, piers and warehouses, roads, sudd-cutting, and telegraph communications.

7. The total charges on our present loans will amount in all to a sum of £13,900.

8. My view is that the Uganda Protectorate should receive an annual contribution from the revenues of the Uganda Railway, and that we pay interest and sinking fund on our loans and take the profits or bear the losses on the railways in our territory. If the principle holds good that the Uganda Railway revenue is utilized towards paying interest on large loans for terminal facilities at Mombasa, the same principle should apply to the smaller loans, such as the one referred to in paragraph 6, which provides equally important facilities in the Uganda Protectorate, whence, according to Mr. Eastwood’s memorandum, one-third of the revenue comes.

9. I do not think, therefore, either of the schemes proposed go far enough. No reference is made to this Protectorate receiving any portion of the profits from the Lake Victoria traffic, the bulk of which, as already stated, is earned on a part of the system which is inside the jurisdiction of the Uganda Protectorate. I think that an annual contribution of a sum of at least £50,000 from the funds of the Uganda Railway to those of the Uganda Protectorate would not be unreasonable, the amount of the contribution to be reconsidered after three years.

10. By accepting only the payment of interest and sinking fund on our railway loans, with the profits suggested either by the General Manager or the Chief Accountant, we should not obtain a reasonable share of the revenue from the main line, which I maintain should be used in just proportions for the development of both Protectorates.

G. D. SMITH,
Treasurer.
11th March, 1914.

Report of the Road-rail Transport Committee

Your Excellency,

We were appointed in April last a Committee to consider and report –

(a) whether in view of the importance of securing cheap and efficient rail and road transport services for both passengers and goods, the existing system by which restrictions are placed on road transport by the Carriage of Goods by Road Ordinance, 1936, should continue;

(b) as to what form of Government control over road services should be introduced so as to assist the development of cheap and efficient road transport, due regard being had to the public interest in the Railway, and to make recommendations.

2. We invited by public notice the submission of evidence and memoranda. The memoranda received are listed in the Appendix and represent a very limited response.

THE LOCAL ROAD-RAIL ISSUE

3. We do not consider it necessary to set out again the whole complex problem of co-ordinating railway and road transport; the comparative disabilities of a railway as a common carrier, with fixed rates, unable to carry from door to door, vulnerable to destructive competition from road transport, but yet an essential means of transport that must be paid for by its users; or the proper advantages of road transport for short-haul traffic, providing flexible and convenient services for both passengers and goods and giving a large amount of direct and indirect employment. These general principles of the problem have been set out often enough. The inevitable general conclusion that the development and operation of railway and road transport services should be controlled by a common repre-
sentative body in the interests of the users of both is found, on examination, to be idealistic to the extent that account has to be taken of actual local conditions and has for this reason to be whittled down to what is necessary and practicable under these conditions. The local situation in the Gold Coast is that as a result of the rapid expansion of road transport in the period following the last war and after examination of the problem by a Committee appointed in 1932 to consider what steps should be taken ‘in view of the serious losses suffered by the Railway during recent years mainly owing to road competition,’ the Carriage of Goods by Road Ordinance was passed in 1936. This Ordinance provides not for licensing but for the prohibition of the carriage of specified goods over scheduled roads. It has been applied so as to prohibit the carriage of cocoa to the coast by road and the carriage of imported goods and beer by road from the coast into Ashanti. There are 16 sections of road to which these prohibitions apply. They are equipped with barriers at which vehicles passing through are inspected and recorded by the Police. This system has now been in use for nearly ten years and in spite of the objections that can be raised to it in principle, in fact it works and is generally understood – and for that reason accepted.

4. During the war two developments have taken place that require mention. First, on account of the general shortage of vehicles, tyres and petrol, road transport has been placed under strict control and reduced in volume. The census taken in January, 1945, showed 3,800 lorries then licensed as compared with 5,000 in 1930. Nearly two-thirds of the present total are of pre-war manufacture. Two thousand eight hundred and fifty were licensed in the Colony and 950 in Ashanti and the Northern Territories. The purposes for which the lorries are used are:

<table>
<thead>
<tr>
<th>Purpose</th>
<th>Number</th>
</tr>
</thead>
<tbody>
<tr>
<td>Passengers and goods</td>
<td>2,533</td>
</tr>
<tr>
<td>Goods only</td>
<td>388</td>

<tr>
<td>Government and Town Councils</td>
<td>360</td>
</tr>
<tr>
<td>Miscellaneous; and insufficient information</td>
<td>316</td>
</tr>
</tbody>
</table>

In addition there are 79 ‘buses’, 41 of which are owned by Town Councils and 38 are owned privately.

It will be seen from the above that about two-thirds of the total number of lorries in the country are used for the general transport of passengers and goods.

The gross weights are:

5. The second development that has taken place is the standardisation of cocoa buying prices at all rail points and Senchi ferry. This system has been introduced as a part of the war-time machinery for the purchase of cocoa by the West African Produce Control Board. Since the producer thus gets the same price for his cocoa at up-country railway stations as he gets for it delivered to the port, there is no inducement to send it by road to the coast. The operation of this scheme by which the purchasing agency pays the transport differentials is not only of considerable benefit to the up-country producer: it also assures to the Railway the transport of the cocoa crop.

6. The cocoa crop is of vital importance to the Railway, as is shown by the following statement of goods revenue for 1943–44:

<table>
<thead>
<tr>

<tr>
<td><strong>Total</strong></td>
<td><strong>£1,148,905</strong></td>
</tr>
</tbody>
</table>

The total Railway Revenue for 1943–44, including Coaching (£402,400) and Miscellaneous (£39,760), amounted to £1,590,975, of which total 25 per cent was goods revenue on cocoa. This percentage is likely to increase as passenger and other goods traffic is lost to road transport in the post-war period – a loss estimated by the Railway Management to amount to not less than £350,000 annually.

7. With the exception of certain areas in the vicinity of the ports, including the surf ports of Cape Coast and Winneba which the Government for its part has said that it is willing to operate if the shipping companies have the inducement to use them, there can be no justification for transporting cocoa by road to any destination other than the nearest rail point. We assume that the present system of standardised cocoa prices will continue, whatever form of controlled marketing is adopted, and if and when it is established for certain that it will continue it would be possible, without risk of loss to the Railway, to remove the present prohibition of the carriage of cocoa over the scheduled road sections. But that state of certainty has not yet been reached and until it is we recommend that the prohibition should remain.

8. We see no reason, however, to retain the existing prohibition on the carriage of imported goods or beer over the 10 road sections to which such a restriction at present applies. No one is likely to wish to transport beer over these sections
to any appreciable extent. But the present prohibition is absolute except with the permission of the Governor in Council. It may often prove desirable to use road transport for imported goods on these routes, and there is little reason to believe that this would cause any appreciable financial loss to the Railway, so long as there are no cocoa-lorries returning empty to pick them up. Such prohibitions are obsolete and unnecessary restrictions in present conditions, and we therefore recommend that in respect of the carriage of imported goods and beer they should be abolished.

9. The policy whereby in the past gaps were deliberately left in the system of road communications, so as to prevent competition with the Railway, has been abandoned.

10. In the case of a Government Railway such as the Gold Coast Railway, we hold the view that the well-known principle of rating according to ‘what the traffic can bear’ must give way to the importance, in the public interest, of charging the lowest possible rate consistent with efficient transport and the avoidance of subsidy from taxation. The Railway rates in the Gold Coast are distinctly high, and the aim should be to reduce them, but we recognise that the possibility of reduction depends mainly on the securing of the cocoa traffic for carriage by rail. It is, moreover, impossible to estimate now with accuracy what the post-war losses of revenue on passengers and other goods traffic will amount to.

11. We do not consider that the Railway should attempt to operate road services, and should prefer to see these left to private enterprise. Nor do traffic demands justify in our view any further Railway construction. We think, therefore, that in present circumstances the answer to the road-rail issue, paragraph (a) of our terms of reference, can be simply expressed as the removal of all the prohibitions at present in force except that applying to cocoa, which should also be abolished as soon as the cocoa traffic is definitely assured to the Railway by its own marketing system or by any other means.

ROAD TRANSPORT

12. The Gold Coast is well equipped with road communications, in comparison with other African territories, and the African has not been slow to develop the owner-driver single lorry transport business as an attractive and remunerative occupation. But the standard of transport provided at present is generally deplorable. The number of passengers carried is governed in practice not by the licensed carrying capacity of the vehicle or by safety regulations but merely by the physical limits of the space into which the passengers, together with the planks on which they sit and the goods and livestock which accompany them, can be squeezed. Passenger transport cannot be separated from goods transport;
the reason why most people want to travel is to accompany their goods and so personally supervise their disposal. There is a very large unsatisfied demand for road transport, both on the main routes and from village to village. As soon as vehicles are available, there will be few villages of any size in the country without at least one African lorry-owner available for hire. This is essentially the small man's industry and any system of licensing the road services that he may operate would involve at once the consideration of several thousands of individual cases and routes and the task, impossible at present, of enforcing the conditions of the licences. An even greater practical objection to attempting to place the whole country under a system of road service licensing is the pronounced seasonal factor whereby the lorries transporting cocoa during the six months' main crop buying season are not needed for that purpose for the remaining half of the year. An illustration of the difficulty of matching licensed road services to the economic needs of a route under local conditions is provided by the case where during the main fishing season a large catch is landed at a small place ordinarily requiring practically no transport. Such an event produces a cry of 'send lorries', and unless the lorries are immediately available (not being delayed by the need for some special permit) the fish are not fit to transport.

13. We consider that the practical difficulties involved in applying any general route licensing system in the Gold Coast would be so great as to outweigh considerably any real advantage that such control would confer.

14. These difficulties do not however apply to the main long-distance routes on which services for the carriage of goods and passengers are regularly operated and on which road services are essential (because the only) means of transport. The standards of efficiency and public safety at present observed on these routes are very low, and they are not likely to be improved so long as the operators who try to improve them (in respect of maintenance and reliability of the vehicles, suitability of accommodation, time-tables, fares and freight rates) are subject to unlimited competition from private vehicles, generally bought on hire-purchase and run to death in a short time. Such competition ultimately generally tends to raise transport costs. The benefits of control of road transport services on a main route have been amply proved by experience. They have not yet been seen in the Gold Coast, because the system has not been tried. It would in our view be a very desirable experiment to make, with a view to demonstrating the benefits and to producing results on which would depend the decision as to how far it should be applied progressively to other routes. The purpose of controlling the selected experimental routes would not be to create any sort of exclusive licence or monopoly. Any person prepared to fulfil the conditions laid down by the licensing authority would be eligible for a licence: the time when the traffic offering is less than the capacity of the licensed services is a long way ahead.
15. We suggest that two routes should be taken for this purpose – Accra-Sekondi and Kumasi-Tamale. Both are important main routes carrying considerable traffic, especially in the carriage of passengers-cum-goods, they do not compete with the Railway (apart from the small stretch between Acera-Nsawam), and there can, therefore, be no ground for suggesting that licensing is being introduced as a medium to drive traffic to the railway.

THE LICENSING AUTHORITY

16. We accordingly recommend that legislation should be introduced to set up a licensing authority for these two routes. The authority should be a Board with membership on the following lines:

Chairman: The Attorney-General or his deputy;
Members: The General Manager of the Railway or his representative;
The Commissioner of Police or his representative;
The Chief Transport Officer or his representative;
Up to three unofficial members appointed by the Governor.

17. The Ordinance should provide that no person shall operate a road service (i.e. a service operated for the carriage of passengers or goods for hire in any motor vehicle: to include the carriage by the owner of the vehicle of goods owned by him in the ordinary course of trade: but not to include a service by the Government) without or except in accordance with a licence issued by the Board. Licences should be annual and free and should be in scheduled form, i.e., to state as conditions –

(i) number, class, and registration number of vehicles;
(ii) freight and seating capacity;
(iii) routes and frequencies;
(iv) classes of goods;
(v) passenger fares and freight rates;
(vi) minimum rate of remuneration of drivers and conductors.

18. The Board should be empowered to refuse to grant or renew a licence on any one or more of the following grounds:

(a) that the route or routes specified in the application are in the opinion of the Board adequately served by other transport services;
(b) that the vehicles are unsuitable or unroadworthy;
(c) that the fares or rates to be charged are excessive;
(d) that the service for which a licence is sought has not been operated with efficiency and with due regard to the interests of the public;
(e) that there has been a breach of any of the conditions of the licence or of any law relating to motor traffic.
These grounds follow the Palestine provisions. An appeal against refusal should lie to the Governor in Council.

19. The Board should be empowered to cancel a licence at any time on being satisfied that there has been a breach of the conditions of the licence or of any law relating to motor traffic. An appeal against cancellation should, as in the case of refusal to grant or renew a licence, lie to the Governor in Council.

20. One difficulty with which the Board will be faced arises from the use of sections only of the route by vehicles joining it from other routes. We have considered whether the Board should be empowered to exempt from licensing operators who wish to use either a specified section or sections or a section not exceeding a mileage to be determined by the Board, but have reached the conclusion that only by complete control of the route could the purpose of licensing be achieved and that all road services plying on the route, for however short a section, should be required to be licensed.

PUBLIC SAFETY

21. It is important to be clear that the licensing of vehicles and drivers under the Motor Traffic Ordinance, the requirements of which derive from safety considerations, is a quite distinct matter from the licensing of persons to operate road transport services by a licensing authority which would have regard primarily to economic and transport considerations. The safety provisions affecting the licensing, registration, and use of commercial vehicles require both to be tightened up and more strictly enforced. We invite attention to the Report of the 1936 Committee on Road Safety in this connection. The width of road surfaces is certainly too narrow, in many cases, for the traffic now operating, and some routes clearly require vehicles heavier than the present limit of 110 cwt. for economic transport.

MUNICIPAL BUS SERVICES

22. Town Councils in the four towns in which they have been established (Accra, Kumasi, Cape Coast and Sekondi) have been empowered by Ordinance to ‘appropriate particular routes, roads and streets to the use of public vehicles employed in the transport services undertaken and conducted by the Council, to the exclusion of the use of such routes, roads and streets by other public vehicles plying for passenger hire; provided always that no such appropriation shall substantially affect to its detriment traffic proceeding to or from towns or villages outside the limits of the town’. Councils are availing themselves of these powers and should be encouraged and helped to operate their own passenger services, but the standard of service provided under this protection will require
watching, to avoid particularly any use of the services mainly as a source of revenue in aid of the rates.

ROAD COSTS AND ROAD TAXATION

23. It may be of interest (if not of practical value) to set out the position regarding expenditure on roads and the revenue derived directly from road transport for the years 1936–44. The expenditure figures, which are the amounts expended under Road Votes plus 20 per cent for overheads and exclude any provisions on account of capital cost before 1936, are:—

<table>
<thead>

</tbody>
</table>

So expressed, revenue exceeded expenditure over the eight years by some £750,000, but the annual capital charge (which the 1932 Committee put at £125,000) would, if included, produce a deficit. We have not thought it necessary to pursue this matter of road costing, but give the figures as they stand for general information.

H. L. G. GURNEY

Colonial Secretary (Chairman).

(EAST AFRICAN TRANSPORT POLICY BOARD)  
Report on Co-ordination of Transport in Kenya, Uganda and the Tanganyika Territory  
BY  
1937  
[...]

*Note.*

100 Cents = 1 Shilling.  
The metric system is used in Tanganyika; English measures in Kenya and Uganda.  
All distances and weights have been reduced to miles and tons of 2,240 lb. /

***

**Terms of Reference.**

1. To advise the Governments of Kenya Colony, the Tanganyika Territory and the Uganda Protectorate upon the problems of co-ordinating and regulating railway, road, aerial and water-borne transport with a view to obtaining the maximum degree of co-ordination and co-operation between these transport services and in such a manner as –
   
   (a) to be fair to all interests concerned;
   
   (b) to avoid inter-territorial competition;
   
   (c) to effect all possible economies in working without impairing efficiency;
   
   and
(d) to further the economic interests and progressive development of the East African Territories as a whole.

ITINERARY.

2 [...] 

GENERAL PRINCIPLES.

Examination of General Principles with Reference to Colonial Conditions.

3. The mission which has been entrusted to me differs from most advisory missions in that the principles which should underlie the recommendations have not yet been determined with certitude. Sir Josiah Stamp, speaking on the road-rail question, recently remarked, ‘The problem of finding a new equilibrium with all the variables involved is almost insoluble’. On the other hand, the conditions of a colonial transport system are extremely simple compared with those in a fully developed country, and for that reason offer a promising field for the examination of transport principles. This more particularly applies to the railway rate structure, which, under colonial conditions, is far more closely related to theoretical principles than in the case of fully developed countries, where innumerable qualifications dictated by special local circumstances have been superimposed in the course of the past century and confuse the present issue. It may be expected therefore that colonial conditions will be more likely to suggest definite conclusions on the question of co-ordinating transport. A disadvantage of this comparative simplicity might be that such conclusions would not rest on a sufficiently wide basis to ensure that they are supported by principles of general application. While therefore a study of road-rail problems in colonies may point the way to principles which are obscured by the complications in more developed countries, the validity of such principles needs to be checked by examining them in the light of the more complicated conditions. In order to facilitate constructive criticism, and in the hope that this report will be / helpful in dealing with the problem in other countries, I have gone somewhat fully into the principles on which my recommendations are founded.

Objective of Transport Co-ordination.

4. Many concise expressions have been used to define the objective of co-ordination of road and rail transport. A typical case is that of the Royal Commission on Transport suggesting that co-ordination means a ‘state of affairs ... whereby every passenger who travelled and every ounce of goods was consigned by the
economical route and form of transport. In this statement a great deal depends on the meaning of the word ‘economical’, and whether it refers to the provider of transport, the user, or the public interest. If to the user, doubtless the word includes the qualification ‘having regard to the value of the service’. In further paragraphs there is reference to the public and national interest and to the greatest benefit of the community as a whole.

5. The report of the Committee of Independent Experts of the International Chamber of Commerce, issued in 1933, states that the principal aims should be ‘to co-ordinate all means of transport in such a way as to secure for each of them the traffic for which it is best suited, and to avoid overlapping, the financial consequences of which the community would ultimately have to bear’. The Committee further adds that ‘the function of the State is not to maintain the status quo or to favour one means of transport at the expense of the other, but to create the requisite conditions for securing the maximum efficiency of all means of transport and to further their evolution in the interests of the general welfare of the community and of technical progress’. Here, again, we have the idea that the primary consideration is the public interest, to which the individual interests of the provider of transport and of the user must be subordinated.

6. The public interest is tremendously concerned with assuring the most efficient transport system, not only for official purposes – administration and defence – but for economic development and the amenities. But it is also concerned with the protection of the individual from injury and exploitation and, at least in Anglo-Saxon countries, with seeing that in principle the cost of transport is borne by the users and not by the general taxpayer. As regards the latter principle, while approaching the problem with a strong bias in favour of its maintenance, it is expedient not to restrict the field of inquiry by ruling out any of the possible solutions from the start.

Two Categories of State Control of Transport.

7. The furtherance of the public interest has led to State control of transport in the past, involving restraints not only on transport undertakings but on the users and the public. It is now generally agreed that some form of State control of the new means of transport – road and air – is equally essential. In considering the references in this report to the control of transport, it is necessary to keep in mind the differences between two categories of regulation. The first relates to matters such as the safety and convenience of the public, as exemplified in the case of road transport by regulations governing the dimensions, weight, upkeep, speed and loading of vehicles, insurance against third party risks, conditions of labour and qualifications of drivers. This type of regulation applies equally to
private and commercial transport, though the rules are frequently tightened up in the case of public transport for payment. The second category relates to the regulation of the exercise of transport, for example by licensing with or without specific obligations. It is this second category of regulation which is the most important in transport co-ordination.

General Grounds for State Control.

8. From these preliminary considerations it may safely be stated that measures are not justified solely to protect any particular means of transport which has outlived or failed to justify its usefulness. On the other hand, where a means of transport is essential in the public interest, it should if possible be capable of being operated on a commercial basis. By a commercial basis is meant the earning of a sufficient return to attract, or in the case of a State transport organization to meet the charges on, fresh capital constantly necessary for healthy development. Evidently, if it cannot be operated on a commercial basis by itself, then the cost must be borne either by the users of other forms of transport or by the general taxpayer.

9. Apart from the structure of the railway tariffs, which will be referred to later, an important result of Government control of railways and ports has been the generalization of normal tariffs and of the obligation to accept traffic, the publication of all tariffs, and the principle of non-discrimination. These features place transport in the category of a public service, in the sense that the public have certain rights and the transport undertakings certain obligations. Such a system implies an averaging out of the normal charges for transport irrespective of the actual cost of particular consignments or journeys, and ensures the certainty of a conveyance or journey being effected under known conditions – an advantage which is not perhaps generally appreciated after a hundred years of enjoyment. It would be difficult to justify any system of transport co-ordination which went back on these advantages to the user. A little reflection will show that transport undertakings cannot fulfil these ‘public service’ obligations unless they are afforded some protection from unregulated competition.

10. On the other hand, it would also be a retrograde step to force passengers or goods to travel by a route or form of transport which is arbitrarily decided for them in each case. Whatever scheme of co-ordination is adopted should aim at establishing a condition under which the user in the exercise of his own free choice will tend to utilize the most economic service from the point of view of the community.

Are East African Railways Obsolete?

11. Before proceeding further it will be as well to dispose of the important question: Is road transport likely to supplant railways? The answer should not depend on the ownership of the means of transport. To examine this question in a country most of whose traffic consists of imports and exports with a long
average haul (average haul Kenya and Uganda Railways 388 miles, Tanganyika Railways 222 miles, as compared with Great Britain 57 miles), the first element is the relative cost of transport by rail and road, assuming for the railways a volume of suitable traffic in the future commensurate with probable developments, and for road transport an improvement in roads such as might be expected to be effected in view of the increasing revenue from motor taxation. The comparative figures should include not only working expenses and overheads, but renewals and interest, or a reasonable dividend, on the capital employed, and, in the case of road transport taxation for road purposes.

12. It is well known to be impossible to calculate an accurate figure for the average cost per ton-mile of operating railway goods traffic, but on the East African railways, in view of the very large proportion of revenue derived from goods traffic, an approximate figure has been worked out which is sufficiently near the mark for the purposes of this report. This figure for 1935 works out at 16.568 cents per ton-mile of public traffic for the Tanganyika Railways. The reason for the Tanganyika figure being so much the higher is solely due to the smaller amount of traffic which has to carry the fixed charges – 235,776 tons compared with 863,096. In the course of time Tanganyika traffic may be expected to increase and thus reduce the total cost per ton-mile. Even as it is, however, it will be seen later that Tanganyika costs are less than 60 per cent of the minimum average cost likely to be reached for main road lorry transport under favourable conditions in East Africa. It is not necessary therefore to explore the case for the maintenance of the railways on grounds other than cheaper cost of working.

13. While, however, it is quite clear that East Africa cannot dispense with its railways, the question is bound to arise as to whether this applies to all the railways or whether certain lines could usefully be replaced by road transport. In general this cannot be determined until a stable scheme of coordination has been arrived at. In East Africa the situation is comparatively simple. While it would be a difficult task for anyone to lay down the lines of a combined transport system in a country like England, starting de novo, the more so on account of the reaction between the possibilities of transport and the location of industries, it is clear that if one were to start afresh in East Africa the general lines of communications would develop very much as at present. There would probably have been fewer short branch lines of railways and in places an improved alignment. With State-owned railways and roads the debt charges on account of expenditure representing assets which are obsolete or which, in the light of subsequent events, might have been provided cheaper or more effectively, remain directly or indirectly a charge on the State until the loans are paid off; but the proportion of railway capital assets which have become obsolete in East Africa is so small as to be capable of being dealt with, in one way or another, by the normal methods of railway accounting. The problem is simplified by the general agreement that the chief transport asset, the railways, is a live one.
Branch Lines.

14. As regards the possible redundancy of some of the existing branch lines: on the Kenya and Uganda Railways, to which this question more particularly applies, an effort has been made to ascertain how far the various branches may be considered as paying. In the formula adopted the branch line, in addition to earnings on the branch, is credited, firstly, with the whole of the main line revenue on traffic arising or terminating on branch lines, less haulage costs and depreciation and loan costs on engines and rolling stock, and, secondly, with the port revenue less actual out-of-pocket costs. This formula is unduly favourable to branch lines to the extent to which this traffic would have been carried to the main line by road if the branch lines had not existed.

15. Most of the branch lines do, in effect, bring to the main line at low rates important tonnages of exports which could not stand road transport rates. The question remains whether the cost of rail transport over a branch line is less than the corresponding road cost. The total tonnage would have to be very low and the branch line overheads in consequence very high for road transport costs to be less than the branch line cost of conveying such traffic to the main line, the more so as the branch line loan charges will have to be met in any case and, if the traffic were diverted to road, fresh loan charges for road improvements might have to be created. The majority of the branch lines referred to above are therefore likely to prove the cheapest form of transport, and even if they result in a loss to the railway any Government subsidy to the railway to compensate for such loss would be less than the corresponding subsidy to road transport. In such cases the branch line should be protected as far as possible against the loss of high-rated traffic.

16. There are, however, cases where the tonnages conveyed by branch lines are small and consist mostly of commodities which could stand the road charges to the main line. Unless such branch lines are likely to be part of a future main line of railway serving extensive areas which may be expected to yield a paying tonnage for the railway, it is worth examining the situation afresh in the light of this report, and of the improvements to roads in the last few years, to see whether by dismantling the branch line the real cost to the Government, including the railway, would not be less than at present, even if some transitional assistance had to be given by the Government to users in specially hard cases. Any proposals to construct additional branch lines should be carefully scrutinized in the light of the above considerations.

17. It will be convenient from this point to deal more especially with the main problem of road and rail co-ordination, returning later to air and water.
Road Transport.

Advantages of Road Transport.

18. It is unnecessary to dilate on the great benefits which have been conferred by the advent of motor transport. It will suffice to refer to its special qualities of flexibility and individuality. The public transporter, owning often only one or two vehicles, without any overhead organization or necessity for uniformity in practice, can adapt himself to the individual requirements of his client, and the private car-owner and ancillary user have attained a degree of independence which has clearly increased the amenities and enlarged the scope of individual business organization.

Control of Private Road Transport.

19. Any control of the private passenger car, other than in matters relating to the first category referred to above, is politically inconceivable in East Africa as elsewhere. On the other hand, it is not difficult in East Africa to differentiate between the circumstances in which the ancillary user should be unrestricted and those in which he might properly come under such restrictions as may be applied to other forms of goods transport.

Road and Rail in East Africa.

The Main Problem.

20. Road competition for passenger traffic is of a comparatively little importance, in view of the small proportion of passenger traffic on the East African railways. The problem has therefore been approached as primarily affecting goods traffic. The reason why in East Africa motor transport, which is an unmixed blessing when away from the railway, introduces a complicated problem when it competes with the railway, may be briefly recapitulated as follows:

A large percentage (over 85 per cent on the Kenya and Uganda Railways) of the goods revenue arises from exports and imports. The imports cannot take place unless purchasing power is created by the exports. The exports cannot compete in world markets unless they are carried by the railways at rates which in some cases barely cover out-of-pocket cost of working. Thus the railways cannot afford to do except on account of the high rates received from imports. With a monopoly this system of rating is inevitable and advantageous to all parties. The railways benefit by maintaining the maximum net revenue, the traders by developing the maximum of trade, and the Government by the increased general revenue through greater prosperity, and, sooner or later in colonies, by not having to subsidize the railways. The import and export regime of East Africa,
like the industrial regime of the more / developed countries, has been built up in the above conditions. Sir Josiah Stamp, recently referring to the effect of road transport on the railway rating system, observed that ‘what was being attacked was the historic structure of industry’. Before the arrival of the motor, from the railway point of view neither class of traffic ‘subsidized’ the other. If, however, the railway monopoly ceases and there is a cheaper alternative for the higher classes of traffic, then if high-class import traffic is constrained by Government action to pass by rail in spite of higher rates, it does in fact subsidize the export traffic. Clearly it pays it to do so if necessary to maintain the purchasing power for imported goods, and there would be no economic hardship in maintaining substantially the present relationship between the transport charges for different commodities. This is a fundamental assumption in support of which local opinions were practically unanimous. Unless, however, this is to be effected through the operation of a railway or combined transport monopoly, the subsidy will have to be collected in some other way, possibly in a different form, requiring Government intervention.

21. It may be mentioned that what is usually referred to as the railway rate structure is not necessarily restricted to the railways. It could be introduced, and in fact would automatically result within limits from a road transport monopoly. Failing such monopoly, the manner in which any subsidy of exports by imports is collected does not in principle depend on the form of transport.

Cost of Running Motor Transport.

22. A great deal has been written in the last few years on the cost of motor transport in colonial countries, with differences in conclusions which are most bewildering until the reasons are found in local conditions and in the various interpretations of what is meant by the cost of working. In the first place, it is necessary to be clear whether the cost of working or the charges for transport are referred to. Frequently cut prices are quoted below the cost of working; sometimes road transport at seasonal peaks can command a price leaving a substantial profit which helps to tide over the slack period. Moreover, in East Africa, the difference in road conditions, ownership of vehicles, fuel used, annual mileage, overheads, and above all load factor, afford wide scope for differences in the cost of working per ton-mile.

23. From information given to me in the course of extensive inquiries in the three territories, I am left with the impression that a road and rail co-ordination plan must start with the assumption that, with a load factor which appears to average about 60 per cent, for regular transport work on main roads, such as they are and are likely to be for many years to come in East Africa, an economic charge giving a fair profit might be as low as 35 and 40 cents per ton-mile for a petrol
lorry and possibly 30 to 35 cents for a diesel lorry, assuming the latter will be taxed
to bring in approximately the same contribution as the equivalent petrol lorry. It
is claimed that still further economies will be possible with the diesel lorry. The
ancillary petrol lorry doing a comparatively small annual mileage on indifferent
roads is not likely to average less than 45 to 50 cents per ton-mile. The traders’
lorry is a class by itself, as it can afford to accept lower rates to obtain a full load,
while the free lance, often working under conditions which would not survive
police inspection, will freely accept quite uneconomic rates for an inferior service.

24. Very few transport operators appear to keep proper accounts of the cost
of working of their vehicles, transport accounts being frequently merged into
the trading accounts of stores, with the result that it is practically impossible to
obtain any reliable figures of the profitability or otherwise of most of the trans-
port carried on in the country. In the absence of any organization representing
motor users, the motor trade or perhaps more appropriately a motor journal
in East Africa would be performing a valuable service in the education of local
transporters if they published from time to time details of the average cost of
operating different classes of vehicles in varying conditions, on the lines of the
‘Tables of Operating Costs’ issued by the Commercial Motor, but adapted to
local circumstances.

Effect of Unrestricted Competition.

25. It is evident from the above figures that if motor transport were under the
same obligation to carry traffic tendered as the railway at the same rates as the
railway for all commodities, viz. an average of 12.68 cents (Kenya and Uganda
Railways) to 18.29 cents (Tanganyika Railways) per ton-mile, it would have to
go out of business and leave the railways alone in the field. If, however, road
transport were allowed to pick and choose and limit itself to the highest classes
of traffic in one direction and the best return load available in / the other, it
could easily undercut the high railway import rates and earn a profit. The rail-
ways would then lose the revenue necessary to balance the low export rates, and,
as any attempt to raise the latter rates beyond the amount determined by world
competitive prices would result in the cessation of exports and hence of imports,
a heavy railway deficit would occur which would have to be made good by the
Government at the expense of the taxpayer, including the importer, who would
in this way lose any temporary advantage obtained by the reduction of rates
for the carriage of imports by road. The only beneficiary would be the motor
transporter, until he was also ruined by cut-throat competition for the dimin-
ishing traffic. It appears to be generally agreed that such a development would
be against the interests of the community, whether as owners of the railways or
as taxpayers, and the user, and my task is thereby greatly facilitated. In short,
uncontrolled and unrestricted competition between rail and road is ruled out as a solution, and some form of regulation of the exercise of transport must be regarded as essential for any transport co-ordination.

Present Road and Rail Regime.

Protection of Railway Monopoly.

26. The present system for safeguarding the higher-rated railway traffic from road competition consists of the prohibition of goods transport other than the local produce of agriculture or stock farming, between specified points on scheduled roads considered to be competitive with the railway. This amounts in principle to restoring the railway monopoly. It is a solution which, consciously or unconsciously, has been tried, at least partially, in many countries and which as might be expected is proving itself quite impracticable, except as a step to other solutions, in more developed countries with a network of railways and roads and traffic movements far more complicated than the predominantly long-haul export and import flow in East Africa. It is, however, fairly effective and simple in the present local conditions, though it will be seen later that the existence of roads slantwise to the railway and of circuitous routes is already introducing in a simplified form some of those complications which, in a much aggravated form, render the system impossible in more developed countries. The system is recognized as lacking in flexibility, and one of the chief objects of my inquiry is to suggest improved means of attaining the same object.

Division of Function. Which is the Economic Route?

27. As already stated, the objective of any system of transport co-ordination is to attain a correct division of function – in this case between road and rail. Here again the comparatively simple conditions in East Africa make it worth while examining the theoretical basis for such division of function, into which the ownership of the means of transport does not enter. It will be, for example, particularly useful, in the case of points some distance from the railway, to have some guide for assessing, on the basis of cost to the community, whether a rail and road route is better than an all road route.

28. Seeing that the fixed working costs of roads and railways, including renewal of fixed assets and loan charges, have to be met in any case, the fundamental basis of comparison between road and rail costs, for the purpose of determining which route is in the economic interest of the community, is that element of the cost which varies with the amount of the traffic. For the railway it is near enough to take this cost at 3 cents per ton-mile at an average for the items referred to
by Sir Felix Pole\(^1\) in his report on Northern Ireland (see Appendix 1), though it must be remembered that the cost of operation of different kinds of traffic under different conditions varies between very wide figures.

29. If comparative figures of out-of-pocket costs for motor transport are worked out, also on the items selected by Sir Felix Pole, it will be noticed that these out-of-pocket costs are a far higher proportion of the total costs than in the case of the railways, the only fixed items being rent and rates, management, insurance and interest. A fairly low estimate of the out-of-pocket cost of working 2-ton diesel and petrol lorries in practice with efficient operation would appear to be in the region of 23 cents per ton-mile for a fully taxed diesel and 28 cents for the petrol lorry, assuming an annual mileage of about 25,000 and a load factor of 60 per cent. Of this, some 4 to 5 cents per ton-mile at most might represent the registration, fuel and other taxes paid towards the upkeep of the roads – which have got to be maintained whether they are used or not. On this basis, the out-of-pocket cost from a community standpoint would not be less than 18 cents per ton-mile compared with 3 cents for the railway. These figures, adapted as necessary to the local conditions of the each particular case, give some idea of the relative cost to an all-pervading transport monopoly of alternative routes. The theoretical analysis in Appendix 2 sufficiently indicates that in so far as cost is concerned most of the traffic by slantwise roads or circuitous routes likely to come into question should pass by rail. The practical conclusion in each case would of course be influenced by local circumstances. The relative value of the service rendered remains to be considered. It will be noted that the correct division of function between road and rail has nothing to do with the rate structure.

**The Combined Monopoly Solution.**

30. A system which would lend itself to the automatic division of traffic on this basis would be a combined monopoly of rail and road transport. This means, for example, that the monopoly should pay for the cost of maintenance of the roads (less contributions from non-transport users) irrespective of the extent to which it uses the roads. In this case the transport undertaking would automatically use whichever form of transport yielded the greatest contribution towards the combined general expenses and capital charges of roads and railways. Where one or other form of transport offered a better service and the choice lay with the user, the rates for conveyance by each of the forms of transport would tend to be fixed so that it paid the transport organization equally well whichever means was used. The traffic would thus be free to choose the most economic route in accordance with the principle that a more expensive service is justified only if the increased value of the service is at least equal to the increased cost. Even if it is found that there are practical reasons against the adoption of
such a policy in its entirety, it is a useful check in dealing with the question of transport co-ordination to ask oneself what would be likely to happen under conditions of a combined monopoly. The chief difficulty of this system arises from the treatment of the ancillary road user, who would have to come under the monopoly, and the chief disadvantage from the possible loss of incentive to continuous improvement in efficiency. The chief advantage would be the automatic maintenance of the present rate structure. It may be stated at once that conditions in East Africa are quite unsuited for this solution. Nor are they any more suited for the analogous solution of a common financial interest between separate road and rail monopolies through a pool, as exemplified in the case of Northern Ireland. It is quite inconceivable to envisage even a compulsory amalgamation of road goods transport undertakings, and any attempt to effect this in East African conditions, except in isolated cases, would lead to chaos in the road and transport industry.

The Toll Solution.

31. It has been noted that a combined monopoly of road and rail transport, or separate rail and road monopolies with pooled financial interest, would if practicable have led automatically to an economic division of traffic between road and rail, with maintenance of the present rate structure. It has also been demonstrated that a simple rail monopoly can substantially be restored in the present conditions in East Africa by the suppression of competitive road transport.

32. The object of the reconstituted rail monopoly, viz. the protection of railway revenue through the maintenance of the present rate structure, could, however, in theory equally well be met if all traffic passing by road in competition with the railways were to pay as toll to the railways the amount which the railways would lose by not carrying the traffic, i.e. the difference between the railway rate and the out-of-pocket cost of working. From the community standpoint this toll should be reduced by the contribution to standing road charges which would be made if the traffic passed by road. This toll would have to be payable whether traffic was carried by a public transport undertaking or by an ancillary user. The conception of toll as the difference between the charges of a transport undertaking and the variable cost of working has been elaborated in his classic work by Colson. If in spite of the toll it paid to send traffic by road, this would prove that the increased value of the road service was worth the increased cost to the community.

33. The levying of a toll was suggested by General Hammond in 1930, and legislation was drafted in Tanganyika in 1931 to give effect to this recommendation. The Bill was, however, withdrawn, I am informed, ‘because of the practical difficulty of closing a road to through traffic at any point or points owing to tracks,
secondary roads and private roads impinging on the restricted roads throughout
the whole length, and the difficulty of differentiating between through and local
traffic; and, further, the difficulty and expense of maintaining checks on the issue
and collection of receipts and tickets issued for tolls, particularly under the Gov-
ernment system of control of public moneys. In the circumstances, the collection
of the theoretical toll, the calculation of which would involve a detailed knowledge
of the present railway classification and the quantity, starting point and destination
of all competitive traffic carried by road, would obviously be out of the question.

34. Nevertheless, the Tanganyika Licensing Act of 1931 and the correspond-
ing Act for Kenya attempted to carry out the principle of the toll by allowing
vehicles to compete with the railway on payment of what was virtually a com-
pounded toll in the form of a high licensing fee, amounting, for instance, to
£330 for a 2-ton lorry for a distance of 284 miles. It can easily be calculated that,
by carrying the highest classes of goods, a lorry could afford to pay these rates
while making a handsome profit, and in fact the Acts were replaced by the pre-
sent Prohibition Acts when it was realized that they simply led to loss of revenue
without effecting any rational division of traffic.

35. It is interesting to note other cases in which the toll principle has been
virtually introduced, notably in Australia. In Queensland heavy goods and
passenger vehicles on routes competitive with the railway are supertaxed to an
extent varying with their capacity. In New South Wales, for journeys over 20
miles, the maximum tax was 3d. per gross ton-mile, the weight of the vehicle
being calculated at tare plus full load capacity. This tax, with a load factor of
60 per cent, might amount to anything up to 10d. per ton-mile carried. It is
not surprising that as a first result most of the operators had to leave the road.
Since then the free distance has been increased to 50 miles, and the Act is being
administered with greater flexibility. No fees are levied on certain kinds of local
produce and reduced fees are charged in cases where rail transport is impracti-
cable or unduly inconvenient. Though more flexible than was the East African
licensing system, these levies do not altogether correspond with the theoretical
toll as defined above. In France the proposed taxes on competitive road trans-
port would appear in principle to correspond more closely with the theoretical
toll. Proposals for toll on the above lines must not be confused with the levying
of tolls on important public works in order that the actual users may bear their
full share of the cost. Nor must the principles of the traffic toll be confused with
the practical difficulties of collecting the same without intolerable hindrances to
movement. These hindrances and the other difficulties referred to rule out the
orthodox toll system as the general solution of road and rail co-ordination, but I
shall have to occasion to refer to it again.
Basis of Solution for East Africa.

36. Thus for East Africa, under present conditions, we are driven back to the protection of the railways monopoly as the basis of a policy for co-ordinating road and rail; and it remains to be seen how far it is possible to borrow elements from the other theoretically sound solutions in order to import flexibility and to permit of adaptation to changing conditions.

Rate Revision.

37. Whatever system of co-ordination is adopted, it is essential to reduce the great disparity between the rates for the higher class goods and a fair commercial rate for the transport of goods by motor. At present first, second and third class rates start at 145.60, 104.16 and 70.56 cents per ton-mile; at 300 miles the rates are still 127.31, 92.99 and 63.84 cents per ton-mile, and even at 700 miles the operation of the taper only reduces the rate to 98.56, 76.16 and 53.76 cents per ton-mile.

38. Apart from the incitement to transport smuggling along prohibited roads parallel with the railway, checked to some extent at present by the bad state of these roads, this disparity results in motor transport conveying high-class goods by long and devious ways, e.g. 140 miles along the coast by dhow from Mombasa to Lamu, and thence 583 miles by inferior roads to Nairobi via Meru and Nyeri, as compared with 330 miles by rail from Mombasa to Nairobi. The first class rate to Nairobi is 408.58 and second class 300.16, whereas at an average of 40 cents the circuitous route of 723 miles would only cost 289.20. The dhow portion averages less than 10 cents per ton-mile.

39. Moreover, although the out-of-pocket cost of rail transport is considerably less than by road, and it is therefore in the general interest that the railway should be used, it will easily pay users in the case of the present high-class goods to employ a longer route with a longer proportion of road mileage (e.g. Lupa area to Dar es Salaam via Dodoma) in preference to a shorter route with a smaller proportion of road mileage (e.g. Lupa area to Dar es Salaam via the new Itigi road). With inevitable development in the road system this question of slantwise road traffic will grow in importance and difficulty unless it is faced at the outset.

40. Even a complete combined road and rail monopoly, including the ancillary user, would probably have to modify its rate structure to a certain extent as a result of the new conditions, and without a complete combined monopoly such a change is inevitable if it is desired to avoid increasing the rigidity of transport control to protect the revenue of the railways on the basis of preserving the railways monopoly.
41. It is important therefore to reduce the above disparity by reducing the higher class rates to a figure more comparable with road transport charges. The loss of revenue would have to be recouped either –

(a) by raising the lower class rates, other than those export rates which are based on world prices, e.g. on such commodities as building materials, machinery, tools, iron and steel; or

(b) by a subsidy out of general revenue, the funds for which might be provided by an increase in Customs duties by primage on the principal imports benefiting from the reduction in railway rates.

The former method in fact implies an acceleration of the alteration of the price structure which is bound to result from the changes in transport charges brought about by the advent of the lorry. Its application could be roughly adjusted to leave unchanged as far as possible the total weight of rail transport costs at present falling on each region served by the railway, and any change of incidence would therefore be local.

42. The latter alternative in effect preserves the present monopoly rate structure and consequently the present price structure by the expedient of levying part of the toll on high class goods through the machinery of the Customs monopoly. The incidence of transport costs would be changed to the extent of placing equally on the whole of the users of high class imports, instead of only on those up-country, the cost of developing a planned export trade. The up-country districts would benefit to the extent of the primage paid by the coastal regions. It might be advanced in support of this alternative that in colonial countries the general community is more directly interested in foreign trade than is the case in more highly developed countries, and that the prosperity of the coastal areas is bound up with up-country development. Some compensating alleviation to the coastal native population might be found possible, if considered essential, through the machinery of provincial taxation, but this might be too uncertain in its incidence to be worth the extra complication.

43. Apart from the natural repugnance for what might be regarded as a special Government subsidy to the railways, I am advised that, at least in Tanganyika, difficulties would arise through the encouragement of local industries, which are not at present taxed, at the expense of Customs revenue, and that further revenue would be lost through a decreased amount of consumption in the coastal areas resulting from the higher duty, and through an increase in smuggling from Zanzibar, where the Customs rates are already much lower than in Tanganyika. Moreover, in virtue of an international agreement, through traffic with the Belgian Congo would benefit from the reduced rates without paying the primage, and this could only be partially compensated by other alterations in
rating this traffic. These difficulties do not arise to the same extent in Kenya, where, moreover, the proportion of coastal consumption of imports is much lower than in Tanganyika. No difficulties would seem to arise in Uganda.

44. This alternative has been briefly analysed, as it is theoretically sound in the conditions of East Africa. It virtually preserves the present rate structure by conforming substantially with the monopoly solution, and only in the matter of machinery borrows the subsidy solution. It is, however, not a solution applicable in more developed countries with less simply defined currents of traffic, and any attempt to apply it in such countries would lead directly to the railways being subsidized by general taxation instead of by the user of high-class goods. It might be sounder therefore, in the long view, to favour the former alternative of raising the rates on the medium and low classes of goods, to compensate for the reduction of high-class rates.

45. It is not easy to suggest what should be the level to which it is desirable that the highest railway rates should be reduced. To avoid undue disturbance to trade and losses on stocks in hand, any reduction in rates should be gradual, and if the corresponding increases are equally gradual the operation of interest charges will reduce the incitement to forestall the changes. Consequently it is perhaps not necessary to fix a final figure from the start; it can, however, be safely said that this figure should not exceed 50 cents per ton-mile if a reasonably flexible scheme of road and rail co-ordination is to be attained (see Appendix 2).

46. The practical results would be that the first, second and third class goods rates would ultimately be merged into a flat rate of 50 cents per ton-mile for all distances up to about 710 miles, after which the third class rate would bifurcate so as not to exceed the existing charges. The effect of solution (a) on certain f.o.r. prices at Nairobi, Kampala, Dodoma and Mwanza, assuming that the increases and reductions of rates balance, has been very tentatively worked out. The reductions in prices of the higher class goods would range from about / 1 ½ per cent to 8 per cent. Unfortunately, here again, Tanganyika, owing to its relatively lower proportion of low-grade imports, cannot effect a balance without disproportionate disturbance in the price levels of some of these imports, including commodities which have been assisted in the past by cheap rates to encourage production. The Kenya and Uganda Railways, on the other hand, could easily introduce the whole change on this basis, with maximum f.o.r. price increases at Nairobi and Kampala of under 6 per cent.

47. In the event of railway finances permitting a reduction in rates, such reductions could appropriately take the form of foregoing part of the increases in the lower rates otherwise necessary. Here again the Kenya and Uganda Railways, with a substantial reserve fund, are favoured by the probability of a consider-
able surplus after meeting renewals and interest charges; in fact, the Kenya and Uganda Railways claim that they could effect the whole of the proposed reductions in high class rates to a maximum of 50 cents per ton-mile within five years from prospective surpluses, assuming the present boom conditions continue for so long – which is perhaps risky. On the other hand, the Tanganyika Railways in 1936 are likely at best to cover interest charges but no depreciation of British assets (£112,000 per annum), and they have at present an accumulated deficit of £440,000 besides arrears of renewals of British assets of over £800,000, so that any railway contribution towards the desired change could only be at the expense of increasing the real deficit.

48. The problem is complicated by the necessity for maintaining within a narrow margin the same rates of Customs duties for all the territories. Moreover, it is desirable as far as possible to avoid increasing by further rate disparities the difficulties already arising at points of contact of the Kenya and Uganda Railways and Tanganyika Railways systems. A similar scheme would therefore have to be adopted for both railways to the extent of the maximum which can be effected by the Tanganyika Government and Railways, possibly by a combination of methods (a) and (b). If on investigation this proves to be less than the extent of the change I have suggested, the Kenya and Uganda Railways would be well advised to utilize their expected surplus to complete the programme.

49. It is interesting to note that Mr. Gibb suggested partial compensation for reductions in railway rates to meet road competition by increasing the harbour charges on those descriptions of traffic which benefit from rate reductions. Tanganyika, with its considerably lower port charges for the higher class imports, might usefully adopt this suggestion to assist, if even only to a small extent, in carrying out the suggested changes.

50. It is recognized that what is suggested is a major change in rating policy. Experience has shown that it is difficult to effect piecemeal increases in railway rates, and any important change should therefore be carried out as part of a general plan, bearing in mind that it is easier to make subsequent adjustments by reductions than by increases. The conditions in East Africa lend themselves to the execution of this important adjustment as a single deliberate measure, coupled with any steps considered necessary to ensure that the benefits of rate reductions are passed on to the users. The alternative is the gradual attrition of the higher rates, as in so many other countries, without compensating revenue, since it will be impossible and undesirable, with improving roads and a more elaborate network of communications, to maintain the rigidity of control necessary to protect the railway revenue at existing rates. The present upswing in
the trade cycle is a favourable time for the change in the permanent interest of transport development in East Africa.

Co-ordination of Road and Rail Transport.

Possibility of Destructive Competition.

51. The modification of the rate structure to the extent suggested will not in itself solve the road-rail question. Even if the maximum rate was adjusted down to what is a fair commercial rate for road transport, and as this varies under different conditions such an adjustment would be impossible, there still remains the fact that it pays competitive transport undertakings, so long as they remain in business, to accept a rate which leaves the barest margin over the out-of-pocket cost of working, rather than lose the traffic; so that if free competition were allowed the railways would be obliged to follow uneconomic rate cutting with a loss of revenue to road and rail which would be against the public interest. Some action will also be required to ensure the maintenance by the railways of an efficient public service as regards generalization or normal rates, obligation to carry, publicity of rates and non-discrimination, and it has already been pointed out that the imposition of such obligations implies a corresponding degree of protection against competition from transport organizations not subjected to the same obligations.

52. Further, there remains the question of the co-ordination of road transport inter se, which affects by far the larger part of the road transport industry. The conclusions of all three recent territorial committees on transport indicate that there has been unduly destructive competition between transport concerns, resulting in financial disaster and in Uganda in a deplorable increase in road accidents through racing for clients. It is hardly necessary to mention that any attempt to regulate the situation by prescribing minimum charges is doomed to failure.

53. My own observations and inquiries bear out the statements in the Kenya Committee’s report that at present in most areas there is not a surplus of transport – a result of greater discrimination in the granting of credit for the hire purchase of vehicles engendered by previous losses, and of the increase in production due to general improvement in the economic situation. Nevertheless, the natural and universal tendency is for road transport to be increased until the situation gets out of hand and leads to renewed losses and deterioration of service unless the development of road transport is guided in the public interest and that of the transport owners themselves.

Licensing Control Recommended.

54. For all these reasons, and also to give time for the proposed rate changes to take effect, it seems necessary for East Africa to follow the established practice in practically every other country by instituting some form of control by licensing
applicable to all forms of transport in order to assist an orderly development in the general interest.

55. If this conclusion is accepted, then it is better to use the present occasion, when the minimum of restriction is likely to be involved, to introduce the new arrangement, rather than to wait until there is a crisis in transport, when the institution of regulation might involve additional hardship in the initial stages.

**The Regulation of Road Transport.**

56. Seeing that the question of the control of road transport is one of the most important aspects of my mission, I have endeavoured to envisage tentatively in some detail how such control might be expected to work in present conditions in East Africa, bearing in mind the necessity for avoiding complicated formalities and for ensuring the freest possible movement of road transport consistent with the extent of regulation considered necessary.

57. The most important duty of the new control organization would have reference to the second category of regulation referred to in para. 7, that is, the regulation of the exercise of transport, for example by licensing with or without specific obligations, on the general lines of the Kenya Road and Rail Report.

**Licensing of Road Transport Competitive with Railway.**

58. With the accepted policy of protecting railway revenue from attacks on the high-rated traffic, it is evident that, while the present prohibition Ordinance would be replaced by the new arrangement, fundamentally the present regime of prohibition will be little changed, and the licensing of regular goods services parallel with the railway will only be resorted to in special cases where the advantage of road transport clearly outweighs the public claim to railway revenue. This will apply, for example, to country delivery services within a certain radius of distribution centres. A licensing system coupled with the proposed reduction on high-class rail rates will afford more flexibility than the present regime for dealing with such cases. At the same time, a possible result will be that certain competitive services at present not covered by the prohibition law will not be licensed.

59. The proposed alterations in the rate structure, involving virtually a flat rate of 50 cents for the first four classes of goods up to some 250 miles, will render it feasible in special cases, as an alternative to a railway-operated service, to permit regular traffic parallel with the railways by reliable firms, on payment of a toll, on the principles already referred to, to safeguard the railway revenue – such toll being far more easily assessed and checked than under the present system of rating, which would make it practically impossible.
60. In dealing with licences for road traffic slantwise to the railways, the Committee might start with the theoretical principle that the natural route is that which involves the least variable cost of working, and that railway revenue has a prima facie case for protection by restriction of road traffic or by tolls if traffic is deviated from a natural route as a result of the operation of the railway rate structure.

61. As regards passenger services parallel with the railway, under 8 per cent of the railways revenue arises from passenger transport. The fewness and unavoidable slowness of the present day railways trains make it inevitable that road services should be licensed to the full extent of the demand, and probably inexpedient that a toll should be levied on the lines suggested for goods traffic. The principles governing licences will therefore be similar to those for any other passenger service as described in para. 74 et seq., with the sole difference that in suitable cases the railways should be given priority for running or participating in such services, if they are prepared to do so and to fulfil the requisite conditions as to services and fares.

**Feeder Goods Services.**

62. The great majority of motor transport is employed on feeder services to the railway. Statistics are not available to show the distribution and employment of goods vehicles. One advantage of the proposed control organization will be that this information will automatically become available. From information given to me during my journeys it seems that, except in the large centres, a large percentage of vehicles is owned by people corresponding to ‘B’ licensees in Great Britain, who have other businesses than transport, and who use their vehicles firstly to supply their own requirements and secondly to fill up with paying traffic or to carry out transport work in the peak season. This applies also to most of the large transport contractors who have stores, estates, hotels, garages, or other occupations besides that of transport.

63. Most of the remaining vehicles are used by their owners for their own purposes only, e.g. ginnery owners, sisal estate owners, settlers, and Government vehicles, corresponding to the ‘C’ licensees of Great Britain. The balance consists of vehicles owned by transport contractors carrying on no other business; some (e.g. in the coastal towns) working from fixed centres, others moving about to follow the seasonal peak load in different areas. For example, after the cotton season in Uganda from January to June, a considerable number of lorries are transferred to Mwanza for the period June to November to deal with the cotton season there.

64. Certain ancillary users, such as cotton ginneries, lay up most of their lorries during the off-season, a practice which appears to be fairly widespread in
certain regions. The ‘B’ category owners and the free-lance transporters try to tide over the slack season by competing for the reduced traffic at cut rates.

65. In these circumstances the problem of the feeder services will probably best be met by carefully dividing each territory into traffic zones corresponding as closely as possible with the normal field of operation of feeder services to one or more railway stations, with separate zones for certain outlying areas. Applications for licences would then be invited from lorry owners desiring to operate in these zones – either as purely ancillary users or wholly or partly for hire. To get over the difficulty of any lorry requiring to serve an area lying over or near the boundary of two zones, any lorry should normally have the right to apply for licences for any two adjacent zones.

66. In the first place, as proposed in the Kenya Report, all applicants proving that they have been functioning in a particular zone would be given a ‘B’ or ‘C’ licence, as the case may be. In this way the control organization would learn the number of lorries normally operating in each zone throughout the year. The number of ‘C’ licences in any zone would be unlimited; the number of ‘B’ licences applied for should form a basis for determining the maximum number of lorries which would be allowed to operate in any area during normal and peak periods. Under present conditions it is unlikely in most zones that this number will be less than the present number.

67. Licences would have to be issued by the local licensing authority up to this number in order of application, subject to special rules which may be decided on as to priority for local storekeepers or producers up to their own requirements, or for previous holders of licences. If in the course of time there was evidence that the number of lorries in any zone was too great or too small, as disclosed partly by applications for and opposition to new licences, and partly by the ruling transport charges compared with other areas, the maximum number of licences would be amended accordingly and the licences adjusted by not replacing those which lapsed or by issuing additional licences, as the case may be, the objective being that there should be on the one hand ample transport at reasonable cost to satisfy all the requirements of the zone, and on the other hand that motor transport should not be allowed to get into an unhealthy condition by being forced to accept uncommercial rates through excessive competition.

68. To be effective, such system must be capable of supervision by the locally available police, most of whom are illiterate except for the reading of numbers. I would therefore suggest that each area should be allotted a distinctive coloured permit plate in one colour or in two colours separated by a vertical or diagonal line. Probably five colours would suffice for all the zones, each territory having a different size plate. Every commercial vehicle should be obliged to have on
it a bracket capable of having three such plates bolted on and effectively sealed. Each plate would have a small identification number. The licensing authority, on issuing an area licence, would issue a corresponding plate and seal the same. If the area license is no longer required it will be returned to the licensing officer, who will break the seal and remove the plate. In this way any local policeman can easily recognize whether a vehicle is outside its own area, and has only to take a note of the registration number and report it to his superior. The third plate is for the rare occasions when a licence for a third area is granted, and for a special plate which would be issued to an ancillary user in addition to the area plates, to indicate that the owner does not carry for hire and is not included in the area quota. A vehicle licensed for trunk road services would carry a special plate and the plate of any area it is authorized to penetrate off the main road. Every commercial or public service vehicle should be licensed and carry the appropriate plate or plates.

Trunk Road Goods Services to Outlying Areas.

69. The possible number of these services is comparatively limited. Less important cases might be dealt with by extending the ‘B’ licences of selected vehicles if necessary to additional zones away from the railway.

70. A different treatment would seem to be called for in the case of trunk road services connecting important areas with the railway or with each other. In such cases licensing is more likely to be for a particular route than for a zone; moreover, the services should have a certain regularity which can be relied on by the users, together with fixed maximum rates and satisfactory conditions of labour. In return for accepting obligations of this nature and varying with the extent of such obligations, protection from irresponsible competition will have to be granted by reserving licences to one or a limited number of responsible firms who can be relied upon to observe the traffic ordinances and to fulfill the desired conditions. These conditions might include common carrier liability. It is worth mentioning that several cases were brought to my notice of responsible user firms refusing to take advantage of cut throat rates and awarding long-term contracts at fair prices to reliable contractors. /

71. The difficulty is that there are likely to be on these routes a number of stores whose owners have in the past exercised transport business besides carrying their own goods. It might be a waste of transport and involve some hardship under present conditions if these owners were prohibited from carrying for payment, but their licences should be limited to the minimum number of vehicles essential to supply the stores, leaving for the present the right to fill up with paid traffic. Additional licences for ancillary users on trunk roads should exclude the right to carry for hire.
72. A desire has been expressed for through booking with the railway, involving through responsibility, where responsibility exists, for loss or damage, and the possibility of obtaining banking advances on combined waybills. This, however, necessitates a fixed road tariff which would be undercut by independent contractors in good weather and would be left to bear the brunt when the roads are heavy after rain – a difficulty only eliminated if the road in question is genuinely an all-weather road. At present the railways do not give credit for freight payment except on deposit accounts or under bankers’ guarantee, but road contractors have sometimes to agree to a credit account to get the business in competition. Application of railway conditions might therefore lose business to a railway road agent. Such an agent would have to give a bond to the railway covering the railway freight collected at destination and for claims which might arise and for which the road contractor was found responsible. It might be possible to combine the mail contract, a bus contract, and the contract for Government transport with the railway agency in establishing a privileged company which would give the necessary fixed rates guarantee and regular service in return for all traffic consigned on through waybills. Possibly the railway might take a financial participation in such a company, but in the present state of development it is by no means certain that this would be advantageous, especially if the railway contractor was free to compete with other contractors for traffic not consigned on through waybills. It would, however, be preferable to the railways starting feeder services of their own, as in the present conditions of East Africa this could only be done with increased cost and reduced flexibility.

73. It is possible that after a time transport contractors licensed on trunk routes might come to an arrangement to prevent undue competitions. The control organization would have the means of preventing such an arrangement being abused, while securing for the users a better service rendered / possible by the absence of uneconomic competition. A future monopoly of trunk roads serving certain areas, with possibly railway participation, or, on competitive roads, a toll arrangement, would enable the railway type of rate structure to be maintained on such roads, and is a solution which should be encouraged as likely to get over the difficulties which may arise from slantwise roads to the more important areas.

Passenger Services.

Omnibus services.

Analysis of Different Cases.

74. The conditions differ so greatly in the three territories that it will be more convenient to take specific examples to illustrate the alternatives before the control organization.
75. The efficiently run municipal omnibus services in Nairobi and Mombasa, with modern vehicles of suitable design for the purpose, are in a class by themselves. Having been granted a monopoly for these towns, they have been able to establish at a fair price a regular, reliable and comfortable service which was commended to me even from quarters where opposition might have been expected.

76. Uganda, with numerous good all-weather roads radiating from Kampala and Jinja to outlying areas in all directions, is provided with an intensive service of Indian and sometimes native-owned buses, whose proprietors − mostly owning one bus acquired on the hire-purchase system − usually enter the business as a side-line to running a store. The drivers are usually Africans. In the absence of any restrictions these buses have increased in numbers to such an extent as to outstrip by far the demand for transport, with the result that there is an excessive capital employed in the business, and in order to be able to meet hire-purchase payments cut-throat rates are quoted and dangerous racing for passengers occurs on the roads, resulting in many serious accidents. Whatever the nominal fare may be, the actual fare usually obtained appears to average about 3 cents per passenger-mile, and even assuming that the policy of waiting whenever there is a chance of more passengers results in the unusually high load factor of 75 per cent, this means a gross revenue of 49 cents per vehicle mile, which I am told is the lowest figure on which it pays to keep in business. Detours are frequently made without warning to the passengers in order to obtain more fares, and it not infrequently happens that passengers are deposited away from or short of their destination − especially if the bus is lucky enough to be approaching Kampala with an overload. The longest life of a bus in these conditions is stated to be one and a half to two years, with a maximum mileage of 70,000. Police supervision in Kampala ensures the buses leaving with efficient tyres, though the spare tyre, when carried − sometimes in the passenger leg-room, where I have also seen a spare tin of petrol − is frequently in a very worn condition. Further, this supervision, by ensuring that buses for each destination start from the crowded bus park at Kampala in rotation, reduces the delay in waiting and alone preserves the scene from chaos.

77. Certain roads round Nairobi resemble conditions in Uganda, with the important difference that a large proportion of the buses are owned by more responsible people, some of whom have met competition by the introduction of diesel buses of larger capacity but with similar type of body. I suspect that the comparative freedom from accidents round Nairobi is due to the better supervision exercised by the larger owners. The proportion of really all-weather roads is a good deal less than in Uganda. Numerous bus services are in operation in the Kisumu and Arusha areas, where the road conditions are decidedly inferior. All these routes are served by several − in some cases twenty or thirty − daily services.
78. An important feature of these services is that many of the buses leave the main road and perform a useful function by penetrating the side roads and tracks – when weather conditions permit – to serve local markets on their respective days and collect and deliver goods and passengers to and from the main centres. This feature is likely to offer a special problem to the control organization in certain cases.

79. In the bus services in Uganda and in the Nairobi area there is no fixed time-table, and buses start when they have obtained a sufficiently full load, the owner frequently being present – at least in Kampala – to decide the commercial problem of whether it will be better to start with some empty seats in the hope of picking up more lucrative passengers, or to fill up at cut-throat prices before starting. No reliable time-table would be possible in the case of buses going into the side roads, where they may be held up for a variety of reasons. In the absence of any obligations, buses are freely removed from service and either transferred to other areas where the temporary demand seems somewhat greater or diverted to goods work if a more paying load is obtainable on any day, or for a longer period, in which case the body may be changed.

80. Apart from the above cases of bus services on frequented roads, there is the quite different case of services running at much less frequent intervals between certain centres, often for mail purposes, e.g. the weekly service in each direction between Arusha and Nairobi, certain services in Uganda, and the buses operating parallel to the railway between Nakuru and Kisumu. Any such services are liable to competition from existing bus services if part of a regular bus route is followed, and above all from lorries running at irregular intervals and carrying passengers on the front seat or in the body of the lorry under conditions which will be referred to later. Without special privileges or some protection, a regular bus service of this kind may find it difficult to compete with the free lance. It is perhaps from this cause that there is no bus service between the Central Railway in Tanganyika and the Lupa mining area with its European population of about 1,000.

Present Type of Bus.

81. A common feature of all bus services in East Africa is the remarkably uniform type of bus which pervades the whole area outside the Nairobi and Mombasa town services. Mounted invariably on a lorry chassis – usually 2 tons in the case of a standard 22-seater bus – the thin wood floor of the body is three feet above road level. It is surmounted by a strong wooden framework supporting on curved, sharp-edged rafters a roof whose internal height in the centre is 4 ft. 1 in. and at the sides 3 ft. 10 in. above the floor. The external width of the body is under 6 ft. – which certainly facilitates passing on narrow roads. The sides are about 2 ft. high, covered with thin sheet aluminium, with curtains above.
The seats are bare planks, with low planks for back-rests, against which some of
the passengers sit back-to-back. The roof, which is some 7 ft. 2 in. above road
level, is used to carry an unknown quantity of personal luggage, ranging from
bananas to bedsteads, but chiefly the former in Uganda, and this, with the high
floor level, leads to the centre of gravity of a loaded bus being high for racing on
narrow roads with doubtful borders. To save money, the maker’s windscreen is
frequently not bought and a wooden frame with ordinary plate glass is substi-
tuted. This and the flimsy woodwork of floor and roof is stated to aggravate the
effect on passengers of the all too frequent accidents in Uganda. I understand
the normal bus body costs about £30 at Nairobi.

82. Buses are licensed for a stated number of passengers, which is designated
on the body. They are permitted to carry / 140 lb. of merchandise for every pas-
senger short of the quota, and it is a common sight in some areas to see half the
bus filled up with sacks of produce, especially in the case of buses visiting outly-
ing areas where neither passengers nor goods justify separate services.

Need for Improved Type of Bus.

83. In considering the future of bus services, it seems important to discrimi-
nate between services on roads which are good enough for an improved type
of bus with a chassis designed for passenger comfort, and services which must
continue to utilize the lorry chassis as the sole chance of getting through in wet
weather. The present East African type of bus has fulfilled a very useful purpose
in promoting the movement of passengers and goods, but it seemed at first
somewhat surprising that not one case was brought to my notice in which an
improved type of bus had been tried. This is presumably due to lack of capital
for experimental vehicles, and to the necessity for avoiding the slightest increase
in expenditure in the present regime of unrestricted competition. With the
improvement of roads during the last few years the development of bus trans-
port is lagging behind. Any measures for improving the service should, in my
view, stipulate for an improved type of bus for operation on all-weather main
road services. It may take some time to evolve the best type of vehicle for local
conditions. Even on good all-weather roads, the height of the floor level, wheel-
base and length of the body may be governed by the clearance necessary to avoid
any risk of fouling steep rises at culverts or steep dips at drifts; and in view of the
desirability of an internal head-room of 5 ft. 6 in., and the necessity for loading
baggage on the roof, careful thought will have to be given to the possibilities
of keeping the centre of gravity of a loaded bus as low as possible. It might be
found worth while employing a lower chassis on certain roads. The body should
be of steel and will have to be strong but light in order to keep down the gross
weight of a loaded four-wheel vehicle to 4 tons. There is considerable scope for
improvement in the springing and tyre equipment. While avoiding all expensive embellishments, careful attention should be paid to the comfort of the passengers. There is no reason why wooden seats for native passengers should not be curved to afford the maximum of comfort. In cases where European passengers are catered for upholstered bucket seats with high backs and arm-rests, or comfortable canvas seats on tubular frames, will probably pay by increased custom and goodwill. On main road / bus services no goods or cumbersome luggage should be carried in the same compartment as the passengers. Passengers sitting by the driver should be separated from him by a suitable partition.

Solution Recommended for Bus Services in Uganda.

84. In the light of the above conditions, I feel that in Uganda there is no chance whatever of any of the existing bus-owners being able, alone or in combination, to organize and finance a regular and satisfactory passenger bus service on the main routes. On the other hand, no responsible undertaking would risk the necessary capital expenditure without the protection of a monopoly for a number of years over a sufficiently extensive mileage to carry the cost of the necessary overheads. In the circumstances I recommend that tenders be called for for such a monopoly, which might comprise in the first place all main roads radiating from Kampala, with such extensions on branch all-weather roads as are considered necessary to maintain at least the present connections. The tenderers might be called on to produce for trial and approval a bus of the type they propose to employ, and to submit preliminary schedules of running times and charges, particulars of the proposed arrangements for servicing and suitable guarantees for execution. It is a big question how near the present prices such an undertaking could quote. As against the upward correction of the present uncommercial rates through removal of competition, and the inevitable extra cost of regular services with their lower load factor, more expensive vehicles and higher working costs due to better conditions of employment, there should be considerable economies in the avoidance of duplicate services. The present passing juncture offers the chance of handing on in the form of improved service instead of reduced cost the savings which should be effected by the employment of diesel vehicles. Uganda is exceptional in that the native has an appreciation of quality which I have not met with in other countries, and I have little doubt that after a year of operation of the new services, assuming efficient organization, the users would not wish to revert to present conditions. The lay-out of the side roads appears to be such that in nearly every case buses licensed to use them can approach within a few miles of Kampala without using the main road. In such cases they could be authorized to enter Kampala provided they do not pick up passengers over the short section of main road traversed. The control organization would be concerned that an excessive number of buses are not licensed on these roads.
85. The introduction of a monopoly in Uganda is facilitated by a notification which was issued early this year to the effect that existing bus licences would be liable to non-renewal after 1st January, 1938. By starting the new system in the western area it will be possible to mitigate hardship to the best of the existing operators by licensing them in limited numbers on the eastern roads. A certain amount of competition between the two systems for survival after the first period of monopoly, which should not be less than five years, would be a spur to efficiency all round.

Possible Solution for Buses in Nairobi Area.

86. The bus area outside Nairobi seems to call for different treatment, chiefly because of the existence of more responsible operators, but also because of the comparatively large proportion of buses which carry out passenger and goods services in outlying roads. A more detailed analysis of the present situation than I had time to carry out may point to the desirability of licensing a limited number of the more responsible bus undertakings for specified schedules, as in Great Britain, on the main roads, with the obligations of regularity, maximum fares and a definite standard of service with improved vehicles. The schedules could be worked out to eliminate competition between licensees with a view to avoiding cut rates. It will probably not be practicable to prevent the present type of bus licensed to operate mixed services off the main roads from picking up local passengers en route, and in that case they might be usefully allowed to pass on the main roads to Nairobi or other centres at periods when purely passenger vehicles would not obtain a paying load.

Assistance to Less Frequent Bus Services.

87. As regards less frequent services running on certain days only, it is clearly not in the public interest to give a monopoly to the extent of obstructing the movement of passengers travelling on other days, and with the present limited facilities for transport in certain areas I should hesitate to restrict the use of authorized accommodation for passengers on the front seat of lorries. It might be possible to encourage regular bus services which are considered desirable by the grant of the monopoly of bus services on specific days, e.g. for the mail contract and the contract for Government stores, together with arrangements for through booking with the railway for passengers, luggage and parcels.

Conveyance of Passengers on Lorries.

88. This practice, which is one of the special problems in Uganda, requires mention if only to illustrate the comparatively primitive conditions of transport in most parts of East Africa. Under existing legislation, the conveyance of pas-
sengers for payment is prohibited except in vehicles licensed as public service 
vehicles and paying a special fee. These vehicles must be ‘suitably constructed for 
the conveyance of passengers.’ It is, however, almost rare to meet a lorry not car-
rying one or more passengers on the load apart from any carried on the seat by the 
driver. This is notably the case in connection with the sale of seed cotton, when 
the native grower proceeding to a market or ginnery insists on accompanying his 
cotton, at the no small risk, in Uganda especially, of being thrown off the lorry 
when the driver races for traffic on bad roads. This wasteful practice is to some 
extent being reduced by the action of Governments in establishing numerous 
markets near the centres of production, and by the action being taken by ginnery-
owners to pool the produce of their areas and concert measures for reducing the 
free-lance carrying of seed cotton. Incidentally, this measure of co-ordination 
has resulted in an appreciable saving in the number of lorries necessary, owing 
to more efficient use. The legal defence by a driver stopped by the police is that 
the passengers are non-paying, either travelling free with their cotton or friends 
being given a lift. Such free conveyance of passengers is not prohibited, provided 
that in Kenya they are carried safely and in the other territories the maximum 
height of 12 ft. is not exceeded. There is no doubt, however, that carrying passen-
gers on top of loads is frequently a source of private income to the driver.

89. The remedy frequently suggested is more effective police supervision, but 
the question arises whether in many cases this traffic not only can but should be 
stopped. There is not a single bus running on the Great North Road between 
the Rhodesian and Nyasaland frontiers and Arusha. Along this road, with its 
branches to Tabora and to Kilosa and Korogwe, there is a constant movement 
of labour for the mining areas and for the sisal and other estates in Central and 
Northern Tanganyika. Is this labour likely to walk up to 700 miles in each direc-
tion? Can one imagine the driver of a lorry refusing a lift, especially if the traveler 
has a shilling in his hand, seeing that the outward and visible extra cost is nil? 
Could any kind of bus service meet the needs of this uncertain traffic at rates the 
prospective travelers are able to pay? I doubt it, as otherwise it would have been 
done before. It may happen / when wages are higher. Some of these passengers 
are carried quite safely in otherwise empty lorries, others dangerously perched 
on top of a full load. Others I have seen travelling in an empty high-sided lorry, 
but preferring to sit dangerously on the edge of the high sides. The problem is 
to deter drivers from carrying passengers dangerously. I venture to suggest the 
following course for local consideration. Apart from whatever decision may be 
arrived at regarding third party insurance, every lorry-owner should be obliged 
on receiving his registration certificate, to deposit Sh. 500 or a banker’s guaran-
tee for this amount with the Registrar as security for the legal liability of himself 
or his driver in the case of claims from paying or non-paying passengers. In the
case of hire-purchase agreements, the deposit could easily be included by the dealer, who would know that, barring accidents, his client would be in funds to make a deposit on the next vehicle when the previous one was scrapped.

90. While the chief care for the safe carriage of passengers would thus be transferred to the owner and through him to the driver, the new regulations might define what, apart from the question of overload, is the safe carrying of passengers on lorries other than the authorized number on the front seat. A possible definition might call for 12 or 18 inches of ‘free-board’ above the floor or load. This would encourage the use of the high-sided lorry, which is already extensively employed in certain areas. The number of passengers who may legally be carried would thus depend on their safety in each particular case. Legal liability for injury to passengers depends on proof of negligence. Conditions in East Africa justify providing that the carrying of passengers contrary to the above regulations constitutes proof of negligence, or at any rate throws the onus of disproving negligence on the driver. I am informed that a driver who let his owner down would find it difficult to get another job – at least in the same locality. The carriage of passengers on lorries should be absolutely prohibited on regular bus lines, except in the case of employees being carried in the course of their duties.

91. An alternative which has been suggested is to license lorries more easily as public service vehicles, but if fitted as a bus their carrying capacity for good is diminished – a serious matter for long journeys – and loading and unloading are more difficult. If not fitted as a bus, the proposal would merely regularize a possibly dangerous practice without any safeguards. Moreover, the present form of passenger insurance / does not cover non-paying passengers. I imagine, however, that the large majority of lorry-owners would simply carry on as at present under any optional scheme.

**Third Party Insurance.**

92. At present the only vehicles which are obliged by law to be insured are public service vehicles (buses and taxis) in Kenya and Uganda, which alone have – somewhat illogically – to insure against third party risks. In Uganda, insurance against injury to passengers is also compulsory. In practice, a large proportion of commercial vehicles are covered by a comprehensive insurance policy as part of a hire-purchase contract, and the more responsible bus owners outside Uganda also insure comprehensively or their passengers. A good many private cars in outlying districts are stated not to be insured at all.

93. A good deal of attention has been given in all three territories to the possibility of introducing compulsory insurance against third party risks for all vehicles. This is definitely recommended by the Kenya Committee, hoped for
by the Tanganyika Committee, but considered not practicable at present by the Uganda Committee. The insurance representatives all say that it is quite feasible at reasonable rates, and that if any vehicles are excluded it would only be those which in the public interest ought not to be allowed on the road. On the other hand, outside Uganda the number of accidents has not been such as to make the demand for third party insurance insistent, though it is generally recommended in commercial circles and by the more responsible road operator who desires to be protected from what he considers to be unfair competition from uninsured vehicles. With compulsory insurance a few of the owners of these uninsured vehicles might be driven out of business. Owing to the size of the insurance market it is unlikely that this will happen unless the vehicles are a danger to the community.

94. The rates for third party insurance are lower than in the United Kingdom, as might be expected from the lower density of traffic. The total involved in insurance premiums would, however, be high and possibly out of proportion to the claims eventuating until a correct premium rate was arrived at as a result of the experience. On the whole, however, I feel the balance is in favour of compulsory third party insurance being introduced, and recommend that this should be done as soon as satisfactory arrangements have been arrived at with the local insurance agencies to premium. At the start it is worth considering the possibility of a low premium for normal cases and special probationary terms for less known risks which might otherwise raise the general rate. As in Great Britain, workmen carried in pursuance of contract of employment should be covered by compulsory third party insurance. Further reference to the insurance question is made under the heading of draft legislation.

Traffic Regulations.

95. All three territorial committees on transport recommended a tightening up of what I have described in para. 7 as the first category of transport regulation, such as is comprised in the Traffic Ordinances and Rules of the three territories, and there was striking unanimity on this point in the opinions expressed to me from all quarters. The subject concerns the protection of reliable road transport operators from irresponsible competition carried out under dangerous conditions more than the co-ordination of road and rail.

96. The observance of traffic rules and regulations is primarily a question of police supervision. The Kenya and Tanganyika Committees proposed to increase the police for this purpose, and even a small section of police specially charged with the repression of traffic offences would not only tend to reduce some of the common offences, such as speeding, overloading and defective brakes, on the more important routes, but would accumulate valuable experience as to the
suitability of the present regulations for local conditions and the best measures for improving them.

97. The existing regulations prescribe that vehicles must be in good running order, and an inspection is in many cases carried out before a vehicle is given its annual licence. This does not prevent a vehicle being tuned up to pass a test and again being unfit for the road within a short period. It is quite impossible for such vehicles to be inspected often enough to ensure their remaining in sound condition. The best thing would be for them to be scrapped, which some of them would be under any scheme of compulsory third party insurance. Meanwhile it will pay at first to concentrate on defects which are a danger to the public, e.g. brakes, tyres, headlights, and steering gear.

98. I have referred before to the advisability of eliminating as far as possible the necessity for the police to read documents as part of the local control of traffic regulations, and have suggested, in connection with regional licensing, a system of coloured plates which can be supervised by a native policeman only literate to the extent of reading numbers. I feel sure that attempts to make native drivers keep any form of register or log-book would prove to be futile, as even if it is found that a driver can fill in a form in his own language, which seems doubtful, the necessary staff to examine these forms could be better employed on other duties, seeing that even in more developed countries a driver evading the regulations is not likely to incriminate himself or his employer on a return. This would not apply to the keeping of books and waybills by responsible firms licensed as common carriers for specific routes, even if the returns were partly required to check observance of traffic regulations. The time-tables to which public service vehicles would be required to operate would tend to keep the speed of these vehicles within the legal limits.

99. The proposed Licensing Commissions would be concerned with promoting uniformity of traffic regulations as between the three territories. It was suggested to me in Tanganyika that the Kenya system of native registration should be introduced in order to facilitate identification of drivers.

Dhows on Lake Victoria.

100. Figures from official sources vary greatly as to the number of dhows operating on Lake Victoria. Taking a mean, the total number would appear to be between 90 and 100, varying from 10 to 50 tons capacity, of which over 80 per cent are registered in Tanganyika and the balance in Kenya. The large majority are owned by Indian and Greek traders, a considerable part of whose traffic consists of their own trade goods or seed cotton for their ginneries. There are very few dhow-owners carrying only for others and they are said to be making very little profit out of it.
101. Most dhows appear to have a peak season of about six months, when the available capacity is fully utilized and good rates are obtained. For the rest of the year rates fall heavily under the stress of competition for the reduced traffic, and the more important owners use the opportunity for the annual overhaul, which takes up to four months, during which considerable parts of the dhow are replaced, so that a dhow in cover scrapped though every part of it may have changed at least three times during the course of twenty years.

102. From figures given to me it appears that the annual cost of a dhow, allowing for its eight months in commission, varies from 1,900 to 4,800 shillings, depending on the size, allowing 5 per cent depreciation on the original cost. With an annual mileage of 6,400, the cost per ton-mile capacity would vary from 1.5 cents to 3 cents, making the cost per ton-mile 2.5 to 5 cents with a 60 per cent load factor. I was told that a dhow-owner could just make a living on 4 cents per ton-mile, but would expect to get 8 cents during the peak season. In contrast to lorry-owners, it is significant that no dhow-owner appears to have failed financially.

103. At present dhows convey chiefly local produce between lake ports, including points to which a ship or tug cannot go. In 1935 the Kenya and Uganda Railways conveyed over 62,000 tons in and out of Kisumu, but only 4,962 tons of traffic between ports other than Kisumu. Dhows must have conveyed many times this latter tonnage of local produce. Dhows do, however, convey an increasing quantity of lower class imports, e.g. cement and corrugated iron, between Kisumu and Port Bell, being helped by the increase of Kenya and Uganda Railways lake rates in connection with the equalization of rates by the two routes from the Coast to Kampala. Traders complain that this dhow competition upsets the stability of transport rates and confuses the market. Dhows are stated to carry locally manufactured sugar and soap to Mwanza at 6 and 15 cents per ton-mile respectively, as compared with the railway charge of 20 and 38 cents (27 cents for 10-ton lots). Dhows can now insure goods against total loss only, and for limited amounts per consignment and cargo. At present there is little sign of their handling high-class cargo, owing to delays in transport – mitigated sometimes by not having to wait a fortnight for a steamer – inability to insure against damage to cargo (a dhow-owner admitted that sometimes 5 per cent was damaged), and the fact that banks give advances on goods sent by the Kenya and Uganda Railways. If the conditions of working are tightened up, as proposed in several quarters, dhows might possibly as a result carry more high-class traffic. Dhows do not usually carry passengers, who travel mostly by canoes. Bukoba traffic is not competed for by dhows, partly because it is too exposed and partly because it is not a convenient collecting centre.
As compared with the above dhow costs, which must be regarded as purely tentative pending verification, the average variable cost of working Kenya and Uganda Railways lake services, taking the items in Appendix D of Sir Felix Pole’s report on Northern Ireland (see Appendix 2), is stated to have been approximately 5.97 cents per actual ton-mile in 1935. In the case of steamers, however, the out-of-pocket cost of additional traffic would in some cases be extremely small.

The proposal was made to me on several occasions to grant the railway protection from dhows similar to that conceded from road transport. The circumstances are somewhat different, in that the dhows can commercially carry many of the lower classes of traffic which could not be touched by motors. It may even be found that they could convey some of the lower classes of exports at rates at which it would pay the Kenya and Uganda Railways to employ them, having in view the Kenya and Uganda Railways’ out-of-pocket costs for such traffic.

From its nature there seems very little chance of the Kenya and Uganda Railways capturing any large proportion of the extensive traffic in local produce which is now being usefully carried by dhows. The Licensing Commission would not therefore find it necessary or desirable to introduce any restrictions in the present number or operation of dhows. It may be found expedient, however, at some future date, in order to protect the railway rate structure, to impose restrictions as to import traffic competitive with the railways, though this should be even less necessary than at present if the Kenya and Uganda Railways could see their way to forgo the arbitrary mileages between Kisumu, Jinja and Port Bell. It should not be difficult to supervise this limitation.

The dhow-owners ask that the lake should be re-surveyed, particularly in the vicinity of minor ports recently opened up. The only organization for doing this appears to be the Kenya and Uganda Railways. They would claim to be reimbursed for any expenditure outside their normal routes, but in so far as the dhows act as a feeder service they are entitled to some consideration from the two railways. The only expenditure on lake navigation in 1935 amounted to £950 by the Kenya and Uganda Railways. The amount paid in special taxation by dhows amounted to £34 in registration fees, in addition to which some £2,615 was paid in wharfage and jetty charges, which at least partly represent payment for facilities provided. It would seem reasonable that sufficient revenue should be raised by registration or other fees to cover the cost of any work on the lake exclusively in the interest of the dhows. The recommending authority for such work might be the proposed transport control organization. It is noted that legislation is likely to be enacted shortly introducing uniform dhow fees for Tanganyika and Kenya.
Air.

108. East African territories are fortunate in being traversed by the bi-weekly Imperial Airways service to the Cape, which at present enables the journey from London to Nairobi to be made in 5 1/2 days, a period which will shortly be reduced to 3 days. These services are subsidized by the three Governments. They are equally fortunate in possessing a most efficient local air service with a clean sheet as regards accidents, which commands universal confidence and has done much to make East Africa and particularly Tanganyika air-minded. This service, in which Imperial Airways now have an important interest, at present holds no monopoly, but receives small subsidies in respect of mail contracts, besides holding a contract with the Tanganyika Government for the provision of planes for charter services. Regular services are run between Nairobi and Lindi, via Mombasa, Tanga and Zanzibar, and from Nairobi to the Geita Mine, via Kisumu, Musoma and Mwanza – a service which incidentally confers an important competitive advantage on the Mombasa route as an outlet for Tanganyika lake ports. In addition, the company carries out a large amount of charter work, particularly for the Tanganyika Government, in virtue of a very fair contract safeguarding the company against loss whilst making it pay the Government to use air transport as much as possible in preference to road transport. The company in question in 1935 flew 462,882 miles and carried 2,371 passengers. Until recently there was a rival company which in 1935 flew 172,893 miles and carried 1,278 passengers, chiefly to and from the mining areas. The latter company has recently gone out of business.

109. It is well known that air services cannot expect to pay unless each plane is fully employed at reasonable rates – which in the case of a regular service means with a satisfactory load factor – and unless the total traffic is sufficient to support the expensive ground service and overheads essential for safe and reliable working. There are many small air services which have gone out of business through non-fulfilment of these conditions. Moreover, the advocates of competition would be the first to complain if the resulting cutting down of costs of working reduced the quality of the service, a risk the Government concerned cannot afford to take in view of the extensive use made of air services by Government officials and the necessity at present to employ single-engined machines for long cross-country journeys.

110. I have no hesitation therefore in recommending, as the best policy for local air services in East Africa, that a monopoly should be offered on suitable terms to the present company for at least five years, thereafter subject to review at not less than two years’ notice, the company to carry out any additional regular services beyond those in the original contract if offered a guarantee of minimum gross revenue per mile specified in the contract, and to have the monopoly of charter services for payment in East Africa, the maximum rates for which would be laid down in the contract.
111. There is no doubt that future air services will compete more and more for the present limited first-class passenger clientele of the railways. In order therefore that the railways may have every inducement to co-operate freely with the air services, and less temptation to hanker after railway air services, I feel strongly that the two railway administrations should be admitted to a participation in the capital of the privileged air company – say, to a combined extent of 30 per cent – and should be represented on the local board, the chairman of which should always be from the air side.

112. The control of air services in matters of safety and convenience of the public (first category of control) is a highly technical matter which would be dealt with in each territory by the officer performing the duties of Director of Civil Aviation. It is evident that the regulations in the three territories should be uniform. It is understood that an expert from Great Britain will shortly be delegated to advise on these questions, which are outside the scope of this report.

113. It is noted that the total Government expenditure on air ground services, chiefly aerodromes, up to date, with total revenue from landing fees, etc., amounts to:

<table>
<thead>
<tr>
<th></th>
<th>Expenditure</th>
<th>Revenue</th>
</tr>
</thead>
<tbody>
<tr>
<td>Kenya</td>
<td>63,900</td>
<td>8,600</td>
</tr>
<tr>
<td>Tanganyika</td>
<td>19,900</td>
<td>2,600</td>
</tr>
<tr>
<td>Uganda</td>
<td>8,100</td>
<td>800</td>
</tr>
</tbody>
</table>

In this respect, air services are, as might be expected, still in the subsidized stage.

**Road Policy.**

**Road Costs and Motor Taxation.**

114. Road vehicles are taxed more lightly in East Africa than in Great Britain. Nevertheless, it is a striking fact that in 1935 the total expenditure on roads, including overheads and loan charges but excluding expenditure on new roads from loan funds, was less in two of the three territories than the revenue from road sources (excluding, to obtain uniformity with the figures available, import duties on motor cycles, bicycles, and kerosene). The figures supplied to me are as follows:

<table>
<thead>
<tr>
<th></th>
<th>Expenditure</th>
<th>Revenue</th>
<th>Revenue Surplus</th>
</tr>
</thead>
<tbody>
<tr>
<td>Kenya</td>
<td>151,474</td>
<td>207,974</td>
<td>56,500</td>
</tr>
<tr>
<td>Tanganyika</td>
<td>109,489</td>
<td>85,519</td>
<td>23,970 (Deficit)</td>
</tr>
<tr>
<td>Uganda</td>
<td>65,673</td>
<td>80,085</td>
<td>14,412</td>
</tr>
</tbody>
</table>
It has been advanced that in these calculations depreciation should be provided for in the case of the more important public works. It is, however, not unsound for replacements to be effected out of current revenue at the expense, if need be, of betterments in years when any particularly heavy renewal has to be carried out.

115. It has also been proposed that the annual expenditure should include an amount representing interest on all expenditure of a capital nature where non-interest-bearing money has been utilized. The difference between capital, betterment and maintenance expenditure is a somewhat shadowy one. The figures of past road expenditure and revenue are difficult to establish, and I am told cannot be relied on for all territories prior to 1923. The extent of the use of the roads apart from taxpaying motor vehicles – the community use – is impossible to assess, though far less in proportion than in more developed countries. In the circumstances, I suggest that if it is desired to arrive at some basis for comparing expenditure for the benefit of motors with revenue from road motor sources, it will be fair to ignore all revenue and expenditure prior to 1923 and to set off interest not represented by loan charges against the community use of roads. / 

116. If on this basis a rough figure is required for the ‘legacy of the past’ or the extent to which road transport has been subsidized in its initial stages, perhaps the simplest way would be to take into account, for the years 1923 to 1935 inclusive, the total expenditure on new construction, betterment and maintenance, including estimated overhead charges and loan service charges on the one hand, and the total revenue from road sources on the other hand. The result is approximately as follows:–

<table>
<thead>
<tr>
<th>Expenditure</th>
<th>Revenue</th>
<th>Difference</th>
</tr>
</thead>
<tbody>
<tr>
<td>£</td>
<td>£</td>
<td>£</td>
</tr>
<tr>
<td>Kenya</td>
<td>2,652,000</td>
<td>1,833,000</td>
</tr>
<tr>
<td>Tanganyika</td>
<td>1,849,000</td>
<td>549,000</td>
</tr>
<tr>
<td>Uganda</td>
<td>1,108,000</td>
<td>590,000</td>
</tr>
</tbody>
</table>

The importance of balancing road revenue with road expenditure as a basis of road and rail co-ordination can easily be exaggerated, particularly if unrestricted competition is ruled out. The chief utility in the present instance appears to be to encourage the Treasurers to claim that at least the Customs duties are part of general revenue, with no obligation on the Government to use it for road purposes in view of the accumulated debit balance still to be wiped off. The precedent of the Road Board in Great Britain would seem to justify the view that there is little significance in relating road expenditure and revenue from road sources in any budgetary accounts. At the same time, I can well imagine that the proposed control organization, having established a rough-and-ready basis for the past, or accepting the above figures, would keep up-to-date records of future road expenditure and revenue from road sources as a guide to the economic cost
of road transport, and I have no doubt that these figures will be used from time to time by the road interests to support claims for better roads, lower taxation, or a larger allocation of traffic.

117. In considering the division of function between road and rail in para. 29, a rough figure was assumed for motor taxation per ton-mile of traffic carried. The following analysis, based on the revenue and expenditure shown in para. 114 and on assumed annual mileages and gross weights of the different classes of vehicles, is of interest in this connection:

<table>
<thead>
<tr>
<th></th>
<th>Kenya</th>
<th>Tanganyika</th>
<th>Uganda</th>
<th>Totals</th>
</tr>
</thead>
<tbody>
<tr>
<td>Vehicle Miles</td>
<td>79,053,000</td>

<td>2.5 cents</td>
<td>2.7 cents</td>
<td>1.1 cents</td>
<td>2.0 cents</td>
</tr>
</tbody>
</table>

In the interest of economic development it is of course undesirable that transport should be taxed for general revenue, though it is open to argument whether, with a properly coordinated transport system, general revenue required to assist one essential form of transport should not where possible be procured from levies on other forms of transport.

118. Incidentally, there seems no reason why the registration taxes in the three territories should not be on the same basis. At present they differ both in method of calculation and amount. Particulars of motor vehicles in the three territories in 1935 are given for reference in Appendix 3.

**The Condition of the Roads.**

119. The roads in East Africa, outside a few of the larger towns, are in no case properly metalled. The normal main road consists of an earth surface carriageway up to 16 feet wide on a graded and drained formation, with permanent bridges, culverts or drifts in steel or concrete. In places where material can be found at hand, and particularly in Uganda, the surface is improved by treatment with gravel or laterite (murrum), this being absolutely essential for an all-weather road in sections running over cotton soil, where it may also be necessary to lay a foundation of corduroy, usually consisting of cross poles from 3 to 6 in. in diameter.
120. The surface of these roads is easily cut up in wet weather, the non-gravel roads being impassable for varying periods after one or two days’ heavy rain. Deep ruts are formed, and to prevent the whole road being destroyed, lorry traffic, and sometimes all traffic, is suspended by order, sometimes for weeks at a time. Gangs, which may be more correctly described as repair than maintenance gangs, go over the surface, filling in ruts by hand or grader, pending which traffic passes astride the deepest ruts as soon as the surface is dry enough to bear it. A well-made gravel road can be kept passable at all times. It was constantly impressed on me that on East African roads an overloaded 3-ton lorry passing at over 30 miles an hour does damage quite out of proportion to the lighter forms of traffic. In the circumstances, the present system of an upper limit to the taxation of lorries, especially in Tanganyika and Uganda, appears to be unduly favourable to the heavier lorries, which are likely to do most damage.

121. Uganda possesses a large mileage of Class 1 and Class 2 all-weather roads scheduled to take vehicles of 4 tons and upwards gross weight, though comparatively few buses and lorries exceed this limit, as they would be unable to pass over the lesser roads for considerable periods.

122. The situation in Tanganyika may be realized by the recommendation made to the Tanganyika Road and Rail Committee that the main roads (in this case the principal trunk road in the Territory) should be constructed so as to enable the use of heavy motor units for at least nine months in the year.

**Suggested Priority of Road Expenditure.**

123. The impression I formed in the course of passing over various roads in the three territories is that on the trunk feeder roads it is more important to begin by building really reliable all-weather roads for lorries up to, say, 2½ tons capacity than to try and provide for heavier vehicles, which add to the cost of maintenance and run the risk of cutting up the roads in wet weather and interrupting regular communications. The saving in the cost of operating the smaller vehicle on an improved and reliable all-weather road surface would be an important set-off to the saving in the cost of operating a larger vehicle with deterioration of the road surface, and there would be the advantage of uniform rates at all times of the year, with increased stability of prices and the possibility of through booking with the railway.

124. The general opinion in Kenya and Tanganyika was in favour of using available funds in the first place to provide additional feeder roads rather than roads parallel with the railway, holding that cheaper road transport for feeder services will widen the area of production. This is a sound policy provided the cost is carefully weighed against the expected advantages. It is no use spend-
ing large sums on a road with a prospective traffic of five vehicles a day. For this reason the more frequent carrying out of traffic censuses on roads likely to be considered for improvement is strongly recommended.

125. The time will come, however, when the interests and convenience of the private car owner, who contributes so large a proportion of the road revenue, will justify the construction of good roads between important centres, even if they are virtually reserved for passenger traffic through the operation of the licensing of goods vehicles. I consider it is more important, however, to bring the chief trunk feeder roads up to an all weather standard for heavier vehicles. In any case there is unlimited scope for using available funds for the improvement of the road system, especially in Kenya and Tanganyika.

Transport Commissions.

126. Assuming that the policy of the control of all forms of transport, by licensing is decided on, the form of organization entrusted with this duty requires very careful consideration.

127. The Road-Rail Reports of Tanganyika and Kenya and the Accidents Report of Uganda, approaching the problem from somewhat different angles, all propose that the executive licensing organization for the territory should be composed of members not seriously interested in transport undertakings, and with this I fully agree. Any organization consisting of a balance of interested parties would have the disadvantage of taking time to acquire an impartial outlook in the public interest, by which time there would be the risk that members might have lost the support of the interests they were selected to represent. Moreover, East Africa is a long way off any association representing the road transport operators, whose interests are not always the same as those of dealers in the motor trade, so that any partisan organization could not be properly representative. A further disadvantage would be the unavoidable size owing to the interests which would claim representation, thus reducing both the chance of agreement and the possibility of finding members of the right calibre.

128. For the licensing authority, which might be designated the Transport Commission in view of the wider aspects of its functions, I recommend a body of five members with a quorum of three for the reasons advanced in the Kenya Report. While the primary qualification for membership should be personal suitability irrespective of whether official or unofficial members are chosen, I envisage appointments on the following lines: One member with legal qualifications, two members commanding the confidence of the European and Indian communities respectively, one official member to watch the interests of the native population, and one member with a general economic outlook, such as
a banker. The chairman need not necessarily be an official member. An active whole-time secretary, recruited from the commercial community or from the official staff, and preferably not previously associated with any form of transport, will be an important element in the functioning of the Commission. The actual issuing of licences in accordance with the broad lines laid down by the Commission would have to be carried out in most cases locally, and, as in Nyasaland, the appropriate authority would seem to be the District Administrative Officers, for whom the procedure would have to be simplified as much as possible.

129. The alternative has been suggested of having a full-time chairman with experience in licensing in other countries, but I consider this expense should be unnecessary, unless experience shows that it is desirable to centralize the details of licensing instead of delegating them to the local authorities, in which case the whole-time chairman would be the licensing authority, at least for goods vehicles, as in Great Britain.

130. East African territories cannot afford too many cooks, and I therefore recommend that these Commissions should not only have executive licensing functions but also act as Advisory Commissions on transport to their respective Governments. Incidentally, it will be desirable to alter the designation of the High Commissioner for Transport to some more accurate designation, such as 'High Commissioner for the Kenya and Uganda Railways and Harbours'.

131. As for the important matter of inter-territorial coordination of transport policy, I recommend that this should be assured by an Advisory Transport Committee consisting of two delegates from each territorial Transport Commission, with a part-time secretary, who might be the Secretary to the Transport Policy Board. If after consideration it is considered desirable at the commencement to import experienced assistance from outside, this might take the form of one advisory expert for the three Governments, functioning as adviser to each of the three Commissions and as chairman of the Advisory Committee. This committee should meet by agreement as often as necessary to concert uniformity of transport practice, and in any case shortly before the annual meeting of the Governors in their capacity of the Transport Policy Board. /

132. The above proposals are designed to reduce to a minimum the machinery necessary for carrying out a combined transport policy. I have endeavoured elsewhere to suggest how the task before the Commissions might be cautiously approached, not only to avoid undue interference with existing transporters but to avoid calling on the members to undertake a lot of detail work.

133. In view of the importance of avoiding the chance of an inequitable decision in particular cases, it is usual to provide for appeal from the decisions of the licensing authority. In the Kenya Report an appeal to the Supreme Court
Draft Legislation.

134. While the general lines of the draft legislation in the Kenya Report would seem to be suitable for the matter dealt with when it is recognized that powers have to be taken which may apply only to exceptional cases, it will evidently be necessary to review the draft in the light of such of the recommendations in this report as may be adopted by the Government. I had occasion to suggest the following as being among the points on which some modifications of the present text seems advisable.

135. ‘A’ licences should be for specific areas or routes, and not general as in Great Britain, or the whole structure of the proposed system of control would be undermined. It may be difficult to stipulate that an ‘A’ licensee must have no other business. Possibly a distinction might be that he accepts the obligations of a Common Carrier.

136. Provision should be made for long-term agreements, e.g. air or bus monopolies. It is understood that such agreements would be confirmed in each case by special legislation.

137. I understand legislation is required in East Africa corresponding with the Law Reform (Miscellaneous Provisions) Act of 1934 in England, to protect the injured party in cases where the person causing the injury is killed in the accident.

138. The provisions regarding third party insurance require special study to bring them right up to date with any British legislation resulting from the report of the committee now considering the question – in particular as regards the protection of the injured party from repudiation of the policy by an insurance company for reasons beyond the injured party’s control.

139. For similar reasons it might be provided that in case of change of ownership of a vehicle the old owner is not released from liability to claims until such
change is registered, and, where prescribed, the name of the new owner substituted on the vehicle.

**Competitive Railway Measures.**

140. I have considered it outside my terms of reference to deal with questions affecting purely railway operation. Until recently both railways have been struggling to avoid losses during the crisis. Now that the Kenya and Uganda Railways are earning substantial profits as a result of a renewed accession of traffic, it may be a question whether they should return all their surpluses in the form of reduced rates or whether some part might now be used to build up goodwill by improved services rightly ruled out under the regime of rigid economy. It occurs to me that the institution, if line capacity can be made available, of a speeded-up daily daylight rail motor service between Mombasa and Nairobi might be a useful step to forestall the day when there will be a good motor road between these places.

**Distribution of Lake Traffic Between Kenya and Uganda Railways and Tanganyika Railways.**

141. This question was raised at the majority of meetings with Chambers of Commerce as a case of co-ordination between rail and rail due for revision. Stated very briefly, the previous history is that until 1928 the only outlet for traffic served by the whole of the lake area was via the Kenya and Uganda Railways and Mombasa. In spite of opposition from the Kenya and Uganda Railways on the grounds that there was insufficient traffic for two separate routes, it was decided as a matter of policy to construct a branch from the Tanganyika Railway at Tabora to Lake Victoria at Mwanza. It is difficult to imagine Dar es Salaam being denied access to the trade of a quarter of the population of Tanganyika Territory, quite apart from the administrative advantages of the Mwanza connection. The question then arose as to what traffic should use the new route, it being evidently necessary to avoid the financial loss which would have resulted from competition between the two transport routes, each of which was, in case of deficit, liable to be subsidized by the British Government or the Local Administration. It was ruled by the Secretary of State in 1928 that such competition at Mwanza should not be allowed to take place, the terms of the decision being ‘that non-competitive rates should be arranged, leaving trade to take its natural course.’

142. This decision was implemented by an agreement virtually permitting the Kenya and Uganda Railways to retain their lake traffic on all points except Mwanza, from which place alone the rate to the coast either to Dar es Salaam or to Mombasa was equalized; whereas the rates from other Tanganyika lake ports, e.g. Bukoba and Kagera River, were made higher via Tanganyika than
via Kenya by the cost of getting traffic across the lake – generally by Kenya and Uganda Railways steamers at local rates. These local rates are of course, owing to the operation of the taper, considerably higher than if a through rate had been quoted from Dar es Salaam for the above ports.

143. Mr. Gibb in his report in 1932 recognized that it would be difficult to perpetuate this arrangement in view of the natural claims of Dar es Salaam and the Tanganyika Railways. He proposed to meet what he considered to be the superior claim of Kenya by a division of traffic under which Kenya would retain the whole of the existing traffic and should take 50 per cent of any additional traffic beyond the existing tonnages, or alternatively that Kenya should have 80 per cent and Tanganyika 20 per cent of the total traffic. Mr. Gibb suggested a rating policy which should favour Mombasa, in compensation for which the Kenya and Uganda Railways should pay the Tanganyika Railways a fine for all tonnage in excess of their pooled proportion carried over their route; such fine being based on the railway profits earned on this traffic and arrived at by deducting from the gross receipts only average out-of-pocket costs pr ton-mile. Owing to the slump and diminution of traffic no action was taken as regards pooling the late traffic.

144. In December, 1934, the Secretary of State, referring to Mr. Gibb’s report and to recommendations of the Governors’ Conferences in October, 1933, and May, 1934, decided that no change should be made in the status quo, but that the questions should be opened when the total traffic from and to the Tanganyika lake ports (exclusive of traffic from Kagera River) again reached a figure of 27,000 tons per annum, which was the tonnage handled by the Kenya and Uganda Railways prior to the building of the Mwanza line. It was left to the Governors’ Conference to reopen the matter at any time, and the Conference was enjoined to keep it under close review in order that the possibilities of some alternative arrangements in future might not be overlooked.

145. The above figure of 27,000 tons was exceeded in 1935 for all Tanganyika ports (except Kagera River), including all purely land traffic to and from Mwanza. The approximate tonnage and traffic revenue by the routes in 1935 was as follows:–

<table>
<thead>
<tr>
<th></th>

</tr>
</tbody>
</table>
146. Of the traffic with Tanganyika ports excluding Mwanza, Bukoba contributed some 11,528 tons of exports, chiefly coffee, for dealing with which superior facilities exist at Mombasa, and 2,117 tons of imports, with a total revenue of £78,749, leaving only 4,863 tons and £23,804 revenue from other sources. It is difficult to see, therefore, how the Tanganyika route can hope to get more than 15 per cent to 20 per cent of the non-Mwanza traffic under any arrangement for some years. It must be remembered that Dar es Salaam wants a fair share of traffic actually to pass through that port. It is to them a secondary, though important, matter that the railway should not be compensated in the event of the rating agreement not leading to the agreed division of traffic. /

147. After very careful consideration of this problem in all its aspects, I am left with the definite impression that too much weight is now being given to the fact that Kenya was first in the field. It seems reasonable that if destructive competition between the two systems is rightly forbidden, this should not mean, especially after the lapse of time which has occurred, that a new and possibly in some cases more convenient route should be prevented by rate discrimination from obtaining a share of traffic hitherto carried by the previously existing route. It seems fairer and economically more sound to revert to the Secretary of State's decision of 1928 whereby absence of competition was taken to imply that the two routes should be allowed to function in accordance with their relative advantages.

148. The suggestion has been made that the policy for the division of lake traffic should be that which would be adopted by a General Manager of a combined Kenya, Uganda and Tanganyika Railway. Such a General Manager would tend to adjust rates so that after paying out-of-pocket expenses (i.e. that part of the working costs which varies with the tonnage carried) the same balance becomes available by either route towards meeting fixed operating charges (including renewals of fixed assets), overheads and interest for the combined systems. One would expect out-of-pocket expenses per ton-mile to be roughly the same on both railways, so that theoretically rates between all points of the lake and the two sea-ports would differ by the difference in the actual mileages from each point to the two ports multiplied by the out-of-pocket cost of working. Practical considerations would force the combined General Manager to take account of the interests of the different areas served by his railways – e.g. the competing claims of Dar es Salaam and Mombasa. Thus the General Manager, in allotting the traffic, might have to take into consideration what the probable situation would have been if the relative claims had been settled through a rate war. As a result it frequently happens in practice elsewhere that the same rate is quoted to competing ports even though there may be an appreciable variation in the distances.
149. Taking the actual railway distances, and the actual steaming distances by Kenya and Uganda Railways steamers in the shortest direction round the lake, as a fair mean between the direct sailings of the supplementary lighter service and the longer route round the lake followed by alternative steamers, the comparative distances from Mombasa and Dar es Salaam to Tanganyika lake ports are as follows:–

<table>
<thead>
<tr>
<th>Miles.</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Mombasa to Bukoba</td>
<td>917</td>
</tr>
<tr>
<td>Dar es Salaam to Bukoba</td>
<td>871</td>
</tr>
<tr>
<td>Distance in favour of Dar es Salaam</td>
<td>46</td>
</tr>
<tr>
<td>Mombasa to Musoma</td>
<td>724</td>
</tr>
<tr>
<td>Dar es Salaam to Musoma</td>
<td>883</td>
</tr>
<tr>
<td>Distance in favour of Mombasa</td>
<td>159</td>
</tr>
<tr>
<td>Mombasa to Mwanza</td>
<td>848</td>
</tr>
<tr>
<td>Dar es Salaam to Mwanza</td>
<td>759</td>
</tr>
<tr>
<td>Distance in favour of Dar es Salaam</td>
<td>89</td>
</tr>
</tbody>
</table>

The distance from Mombasa to Bukakata is 834 miles as compared with Dar es Salaam to Bukakata 954 miles, the distance in favour of Mombasa being 120 miles. From these distances the traffic watershed appears to lie north of Bukoba and south of Musoma.

150. The inclusion of port charges at Mombasa and Dar es Salaam would tend to complicate the issue, in that while export charges are roughly speaking the same at both ports, import charges are on an ad valorem basis at Mombasa and on a flat tonnage basis at Dar es Salaam, resulting in considerably higher charges at Mombasa for certain commodities. The actual out-of-pocket working expenses are considerably less at Mombasa than at Dar es Salaam, but a larger sum is required at Mombasa to meet fixed charges, including interest on the capital cost of the port. Thus the combined General Manager would prefer traffic to pass via Mombasa, while the user would balance the advantage of Mombasa against the extra cost. In the circumstances the General Managers are agreed that port charges should not be taken into consideration in the rating policy for the division of lake traffic. This decision favours Tanganyika slightly. /

151. Taking account of all the above considerations, I recommend the new arrangement should be on the following basis:–

(1) The present Kenya and Uganda Railways rates with Mombasa to apply equally to Dar es Salaam for all Tanganyika ports, except Kagera River, which has always been regarded as a Uganda port. Through booking facilities to apply by both routes. Certain minor rate anomalies on the Tanganyika Railways may have to be adjusted.

(2) The traffic to be allowed to take its natural route.
(3) Through rates and through booking to apply between other lake ports and Dar es Salaam, the through rate being based on the railway taper for the various classes applied to the same lake mileages as are being used by the Kenya and Uganda Railways for tariff purposes; subject to no low class rate being fixed at less than the out-of-pocket cost of working specially calculated for the particular traffic. Division on a mileage basis.

(4) The revenue from traffic with Tanganyika ports to be pooled, division of profits being based on the assumption that 70 per cent of the Mwanza import and export traffic (measured by gross revenue) will pass via Dar es Salaam. ‘Distribution traffic’ to be included. Profit to be calculated by deducting out-of-pocket expenses, as proposed by Mr. Gibb and substantially as defined by Sir Felix Pole, at an agreed average rate, or different rates for different traffics, from gross revenue. This profit to be divided in the above proportions between the two routes, Kenya and Uganda Railways to receive their share of the profits allotted to the Tanganyika route on a mileage basis.

(5) Passengers, luggage, live stock, vehicles and all other traffic to be dealt with on the same basis as goods.

(6) Kenya and Uganda Railways lake service to retain full revenue from purely local traffic between Tanganyika lake ports.

(7) A minor point relating to a small allowance for the use of Tanganyika lake wharves can easily be settled between the Railways.

(8) The whole arrangement to be subject to review after five years, unless the East Africa Transport Policy Board instruct that an earlier review be undertaken.

The above proposals assume that the Tanganyika Railways are not allowed to start any competitive lake service and on the other hand that the Kenya and Uganda Railways lake services are operated so as not to discriminate in any way against the Tanganyika Railways – a condition which will be facilitated by a pooling arrangement on the lines suggested. In the circumstances it should not be necessary for Tanganyika to acquire an interest in the Kenya and Uganda Railways lake steamer services.

152. It is evident that the actual flow of import and export traffic under the above proposals will depend on the trade advantages of the two routes. This is where the Kenya and Uganda Railways will reap the advantage of being the first in the field. For example, it seems clear that practically the whole of the Bukoba coffee would continue to pass to Mombasa, even in the face of a higher rate, on account of the existing facilities for curing and marketing coffee. In the course of time similar facilities may be found to be commercially justified at Dar es Salaam, but it would defeat the policy of transport co-ordination and the spirit
of the proposed arrangement if any attempt were made to subsidize such facilities on a non-commercial basis. On the other hand, commercial activity should not be hampered by the failure to provide, by either route, the usual facilities necessary for dealing with any resulting increase in traffic.

**Division of Traffic of Moshi District Between Mombasa and Tanga.**

153. Recommendations were made by the East Africa Commission in 1925, the East Africa Guarantee Loan Committee in 1926, the Hilton Young Commission in 1928, and by General Hammond in 1930, that the Tanga Line should be handed over to the Kenya and Uganda Railways on terms to be considered. No agreement has been found possible as to the terms for such taking over.

154. With a fresh start, ignoring territorial divisions, one would expect the Moshi area to be served by Mombasa, while Tanga remained a small local port serving a hinterland extending for about 100 miles. General Hammond in 1921 and Mr. Gibb in 1932 proposed to create such a situation by pulling up part of the Moshi-Tanga line and handing over the Arusha-Moshi-Kahe section to the Kenya and Uganda Railways. Mr. Gibb stipulating that in return for the advantages of getting all the traffic the Kenya and Uganda Railways should hand over to the Tanganyika Railways the whole of the revenue of traffic of the Moshi area to and from the coast, less only out-of-pocket costs of hauling, depreciation and a small charge for supervision. The Secretary of State, in his despatch of 4th December, 1934, confirmed the recommendation of the Tanganyika Government that no part of the railway should be dismantled, and noted the opinion of the Governors’ Conference that the present basis of compensation payable to the Tanganyika Railways should stand until there had been an increased volume of trade and traffic on the Voi-Kahe line – pointing out that the Governors’ Conference would naturally keep the matter under review with a view to its being reopened at any time.

155. The present arrangement is that the rates from Moshi to Mombasa and Tanga should be assimilated, running power charges being paid by the Kenya and Uganda Railways over the sections Taveta to Moshi and Moshi to Arusha, together with a ‘branch line contribution’ for traffic conveyed over the Arusha branch. The distance Kahe-Mombasa is 11 miles shorter than Kahe-Tanga, which is 206 miles. The Voi-Kahe line has, however, very steep grades. Since 1933 the import and export traffic to and from the Moshi area over the Voi-Kahe line has increased from £21,310 to £34,605, 47 per cent of tonnage or 57 per cent of revenue passing via Mombasa. Seventy-five per cent of the coffee passes to Mombasa on account of the established curing and marketing facilities; the recent erection of a curing mill at Moshi may, however, operate in favour of Tanga;
practically all sisal goes to Tanga. Imports come from Mombasa in the case of firms established at that port, and from Tanga from certain firms not established at Mombasa. Mombasa favours certain goods on account of shipping facilities; e.g. Japanese vessels and the B.I. Indian service do not call at Tanga.

156. The annual interest charges on the British expenditure on the Tanga line and port amount to £56,198. As regards the German capital, valued at £880,000, no interest is paid, but there is an arrangement that any renewals are to be carried out by capital expenditure. No separate accounts have been kept, but it is understood that the Tanga line has always been a burden to the Tanganyika Railways, and its net earnings do not cover the interest charges and depreciation on the / British assets. If the whole of the present Moshi traffic went to Tanga the additional gross revenue to the Tanganyika Railways might be roughly £40,000 for an additional tonnage of 15,000. The Tanganyika Railways are not in a position financially to claim a lower rate to Tanga with a view to regaining some of this traffic. More drastic action would be against the policy of non-competition and contrary to the interests of the Moshi area.

157. The saving in working expenses by transferring the Tanga line to be worked by the Kenya and Uganda Railways on behalf of the Tanganyika Railways would be too small to be worth any change. If the Kenya and Uganda Railways were to run the Tanga line as part of their system and for their own account, and in consequence introduce throughout the Tanga line the lower rates in force on the Kenya and Uganda Railways, there would be increased loss on the Tanga line. Moreover, as regards rates for the Moshi area, the Kenya and Uganda Railways could not do otherwise than maintain the present equality between Mombasa and Tanga. On the other hand, if the Tanga line were to lose increasing traffic to the Kenya and Uganda Railways without compensation, it would ultimately be much worse off than under the arrangement proposed by Mr. Gibb and accepted by the Kenya and Uganda Railways. The counter-proposal of the Tanganyika Railways is understood to be that the Kenya and Uganda Railways should pay half the profit from the Moshi traffic with Mombasa.

158. Mr. Gibb’s solution being ruled out on general grounds and there being no inducement to the Kenya and Uganda Railways to take over the Tanga line on terms likely to be acceptable to the Tanganyika Government, perhaps the fairest course would be to stabilize the situation by a pooling agreement based on division of net profits from the traffic as between Kahe and Mombasa and Kahe and Tanga, in the proportion of 55 per cent and 45 per cent respectively, calculated on the principle suggested for Lake Victoria traffic, and by eliminating the present branch line contribution paid by the Kenya and Uganda Railways. The present arrangement for running powers would not be affected.
Competition with the Sudan.

159. It should not be overlooked that there appears to be an appreciable and growing competition with the Sudan Railways in connection with certain areas in Uganda. I would draw attention to Mr. Gibb’s recommendation that the railways should settle upon the areas to be served by each and should agree to rates which carry out the policy adopted.

Amalgamation of Kenya and Uganda Railways and Tanganyika Railways.

160. Suggestions were made on several occasions that the Kenya and Uganda Railways and Tanganyika Railways should be amalgamated. The same considerations would, however, appear to apply as for the Tanga line. There is no railway or financial inducement for the Kenya and Uganda Railways to accept a complete financial merger of the two systems, all the benefit of which would – at least, for some years to come – accrue to Tanganyika. It is inconceivable that the Tanganyika Government would agree to any lessening of its control over its main artery of communications for the sake of the minor savings which might result from a combined management, and there seems little hope of agreement on any intermediate basis. Nor would such a single management eliminate the existing problems arising out of the conflicting interests of rival ports. Indeed, under East African conditions, the suspicion of unfair discrimination would probably only be removed by the transfer of the offices of the combined General Manager to some neutral territory! The problems of railway co-ordination are being solved without amalgamation between other competing countries not possessing the advantage of an overruling Secretary of State.

161. For reasons which will be evident from other parts of this report, a complete amalgamation would greatly help the solution of the road-rail question in Tanganyika, but only because of the implied financial assistance from the Kenya and Uganda Railways towards an adjustment of rates on the Tanganyika Railways. In all the circumstances, it seems that Tanganyika must resign itself to looking after the finances of its own railway, and face the possibility that, partly through the setback due to the loss of traffic from the Belgian Congo, the necessity for the minimum rate adjustments to conform with the Kenya and Uganda Railways may still further defer the date when the railway will fully pay its way.

H. O. MANCE.

9th December, 1936.
APPENDIX 1

Extract from the Report of Sir Felix Pole on Transport Conditions in Northern Ireland

The following items of working expenses are suggested as those which vary with the volume of traffic:–

**Railway Companies:**

*Abstract B:*

Maintenance and Renewal of Rolling Stock, including Containers (excluding Superintendence).

*Abstract C:*

Wages Connected with the Running of Locomotives, Diesel Cars and Electric Motors.
- Fuel, including Petrol.
- Electric Current.
- Lubricants.
- Water.
- Other Stores.
- Miscellaneous.

*Abstract D:*

Guards’ Wages and Clothing.
Cleansing, Lubricating and Lighting of Vehicles.

**Road Transport Board:**

Maintenance and Renewal of Road Vehicles (excluding Superintendence).
Omnibus, etc., Tyres.
Maintenance and Renewal of Horses (excluding Superintendence).
Maintenance and Renewal of Sheets for Road Vehicles (excluding Superintendence).
- Wages and Clothing of Drivers, Conductors, etc.
- Depot Overhead Expenses (Engineering) – (Wages of Foremen, Watchmen and Other Miscellaneous Engineering Staff, Lighting, Heating, Cleansing and Maintenance of Equipment).
- Petrol and Other Fuel.
- Cleansing, Lubricating and Inspecting Vehicles and Supplies for Vehicles.
- Licensed Vehicle Duty and Licence Fees.
APPENDIX 2

Theoretical Analysis of Out-of-pocket Costs of Working by Alternative Rail-road and Road Routes; Rates Chargeable With Present Rate Structure, and the Tolls Which Might be Payable to the Railway

See Paragraphs 27–29

Division of Function.

It is assumed that the average out-of-pocket costs to the community are 3 cents per ton-mile for railway operation and as low as 18 cents per ton-mile for road transport; and that a fair average commercial charge for road transport is 36 cents per ton-mile. The exact figures are not important here.

If the starting point is on the railway, and
’d’ is the rail distance to the nearest station to destination:
’a’ is the delivery distance from that station by road;
‘c’ is the throughout distance by road from starting point to destination.

Then, ignoring cost of transhipment, for simplicity and in view of its comparative unimportance for long hauls, it will theoretically be cheaper for the community to use the combined rail and road route so long as 3d + 18a is less than 18c, i.e., so long as ‘d’ is less than 6 (c – a).

If for example ‘d’ is 200 miles and ‘a’ is as much as 400 miles, the out-of-pocket cost will be less to carry goods by the rail and road route so long as ‘c’ is over 433 miles. This shows that most of the traffic by slantwise roads or circuitous routes likely to come into question – except for short distances – should pass by the rail route on the grounds of cost to the community.

Taking a more normal case of a slantwise road at about 45° to the railway, i.e. ‘d’ = 200 miles, ‘a’ = 200 miles, and ‘c’ = 280 miles, the out-of-pocket costs would be 3x200+18x200=4,200 cents for the rail route, and 18x280=5,040 cents for the road route.

Monopoly and Competitive Rates by Alternative Routes.

In this case the present railway rates (for 200 miles) are:

<table>
<thead>
<tr>
<th>Rate</th>
<th>Made Up of</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Out-of-pocket Cost</td>
<td>Plus Toll</td>
</tr>
<tr>
<td></td>
<td>Sh. cts.</td>
<td>Sh. cts.</td>
</tr>
<tr>
<td>Class 1</td>
<td>273 28</td>
<td>6 00</td>
</tr>
<tr>
<td>Class 2</td>
<td>197 12</td>
<td>6 00</td>
</tr>
</tbody>
</table>
A combined monopoly, desirous of earning the same contribution towards fixed charges by either route, would fix rates as follows:—

**Railway Route.**

<table>
<thead>
<tr>
<th></th>
<th>Railway Contribution to Fixed Charges = Toll (Sh. cts.)</th>
<th>Road Contribution to Taxes, Overheads and Profits (Sh. cts.)</th>
<th>Out-of-pocket Costs (Sh. cts.)</th>
<th>Total Rate (Sh. cts.)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Class 1</td>
<td>267 28</td>
<td>+ 18 x 200</td>
<td>+ 3 x 200 + 18 x 200</td>
<td>=345 28</td>
</tr>
<tr>
<td>Class 2</td>
<td>191 12</td>
<td>+ 18 x 200</td>
<td>+ 3 x 200 + 18 x 200</td>
<td>=269 12</td>
</tr>
</tbody>
</table>

The total contribution to non-variable charges amounts to 303.28 for Class 1 and 227.12 for Class 2.

**Road Route.**

The out-of-pocket cost by the road route is 18x280=50.40, so that the corresponding rate charged by a combined monopoly would be: Class 1, 303.28+50.40=353.68; and Class 2, 227.12+50.40= 277.52. The difference between the rates by the two routes equals the difference in the out-of-pocket cost of working.

In practice, road transport, being under separate ownership to the railways, may be taken to fix its charges separately at the assumed fair commercial rate of 36 cents per ton-mile. This will make the total rate by the rail-road route as before 345.28 for Class 1 and 269.12 for Class 2.

If there is no railway monopoly the competitive rate by the road route will be 280 x 36 = 100.80.

If, however, there is a railway monopoly and the road route has to pay the full theoretical toll to the railway, less say 5 cents per ton-mile paid as taxes, then the rates by the road route would become:—

\[
\begin{align*}
\text{Class 1} & \quad 100.80 + (267.28 - 280 \times .05) = 354.08 \\
\text{Class 2} & \quad 100.80 + (191.12 - 280 \times .05) = 277.92
\end{align*}
\]

For the distances and rates assumed this happens to approximate to the rates which would be charged by a combined monopoly.

**Situation if Present High Class Railway Rates Reduced.**

Supposing, however, that the highest railway rate is reduced to 50 cents per ton-mile, both the above rates for the rail-road route become 50 x 200 + 36 x 200 = 172.00. This will evidently reduce the incentive to slantwise road traffic and facilitate its control. Moreover, if such control involves the payment of toll to
the railway, this will be a more tolerable figure and will be simpler to arrange, seeing that the theoretical toll for the first four classes will be at the same rate per ton-mile for the first 250 miles. Moreover, the length of the circuitous route which it will pay competitive road transport to convey first and second class traffic as compared with 200 miles of railway would be reduced from 273.28/.36 = 759 and 197.12/.36 = 548 miles respectively to 100.00/.36 = 278 miles, thus greatly reducing the mileage of roads needing control as being competitive with the railways.

The above analysis is to illustrate a principle. The proposed Transport Commission would act in the light of practical conditions both as regards licensing alternative road services and in cases where it may be found practicable to arrange for tolls as part of a licensing arrangement, but any scheme is more likely to work if theoretical considerations have not been lost sight of.

‡ Kenya Bus Company.
THE RAILWAY SYSTEMS OF WEST AFRICA.

By Captain H.O. Mance, D.S.O., R.E.

On Wednesday, 22nd January, 1913, at 3 p.m.

[...]
advanced in this lecture are personal views and bear no official authority. It is not claimed that they are original. Some of them were first advanced years ago. [...] 

OBJECTS OF RAILWAY CONSTRUCTION IN WEST AFRICA.

Effective Occupation. – One of the first objects of railway construction in West Africa, or for the matter of that in any of our more recently acquired tropical dependencies, is to attain effective occupation. The Uganda Railway was built primarily to stop the slave trade. The Soudan Railway was undertaken to aid in the reconquest of that country. The Senegal-Niger railway was planned to secure for France the basin of the Upper Niger. This method of occupation is far more effective than military conquest. It possesses, however, the disadvantage that the information available is not usually sufficient to enable the railway to be located for the best future welfare of the country. The consideration of effective occupation is therefore in itself a temporary one.

Strategic. – After the pacification of a colony there may remain strategic reasons for the construction of railways, which would play an important part in the event of a Mahommedan rising emanating from one of the uncontrolled regions of North Central Africa. Any general scheme of railway development based on economic grounds will meet such requirements; and these will at most only influence the order in which the component projects are carried out. 

As regards international hostilities, it is not likely that problematical strategical considerations will be allowed to influence a railway policy upon which success in international commercial rivalry may depend.

Development of External Commerce. – A little reflection will show that the development of external commerce should be the paramount object of railway construction, whether looked at from the point of view of affording the inhabitants a fruitful field for energies released from less productive occupations by the advent of ‘Pax Britannica’ or its Continental equivalent; or from the point of view of European trading firms, and manufacturers of goods for native markets who are dependent on cheap transport for the extension of trade; or from the standpoint of the administration, and, above all, the Treasury, out of whose clutches it is the desire of every self-respecting colony to extricate itself by dispensing with a grant-in-aid. West Africa has enormous resources, of which, in many cases, a microscopic portion supplies the local requirements. The prosperity of these countries prior to European occupation varied with the extent of their trade with neighbouring countries, carried on, as it was, under dangers and difficulties. Further increase in prosperity can chiefly be obtained by widening
the markets for the products of the country, and improving the efficiency of pro-
duction, both of which objects are effected by extending the means of transport.

ADMINISTRATION. – Administrative reasons, such as intercommunica-
tion between the different arteries serving outlying portions of a dependency,
or the necessity for access to healthy stations, are permanent reasons, the relative
importance of which, compared with economic development, will vary in differ-
ent localities, and with the state of progress which has been reached.

LOCAL. – Finally, it is possible that railways may be specially built for such
local purposes as to transport labourers and food from populous areas to mining
centres, to connect the more fruitful food-producing countries with areas liable
to famine, and to distribute local coal in competition with imported supplies.
Internal native trade is more likely to be modified by than to influence railway
construction.

Thus we are led to approach the problem of railway location primarily with
the object of fostering external commerce while giving due regard to administra-
tive facilities.

GENERAL FACTORS WHICH GOVERN LOCATION OF
RAILWAYS IN WEST AFRICA.

PORTS. – The first practical consideration which at once presents itself is the
question of ports. West Africa affords a striking example of what can be done in
the way of trade on a surf-bound coast without ports, but it is easily seen that
only the more lucrative forms of trade can survive the inconveniences and extra
cost, both direct and indirect, involved by the primitive method of conveying
cargo between the shore and ocean steamers by surf boats, which in bad weather
may have to suspend operations. It will, therefore, pay to divert railways con-
siderable distances from their shortest route to the coast to / obtain the greater
capacity, reliability, and cheapness afforded to trade by good, or better, ports.

EARLY PROFIT ON WORKING. – No administration is likely to construct a
railway without ensuring, as far as possible, that the immediate return will make
the undertaking pay its way from the commencement. In West Africa, with its
ubiquitous natural resources and possibilities, the limiting factor in the develop-
ment which can be brought about by improved communications is the density
of population, and it will therefore usually pay quickest to build railways in the
more populous districts. The effects of long periods of slave raiding have, how-
ever, altered the distribution of population in a striking degree, so that at present,
population density cannot be regarded as a reliable index to the natural resources
of the various districts to the extent that would be expected in a more settled
country; and in the absence of special influences, it will take several generations to
bring these factors into close relation. It must also be borne in mind when study-
ing population charts, that areas suitable for growing native food-stuffs of low commercial value may support a large population, independently of transport facilities, for the lack of which a district richer in sylvan and mineral wealth, but less suited for producing food staples, may remain comparatively uninhabited.

A portion of a population density chart of West Africa, compiled from the latest available data, has been reproduced on pages 14 and 15 (not included). The data cannot be regarded as final, and the distribution shown will doubtless be considerably modified in the light of further knowledge of the country. Such as they are, however, these figures of population density are well worth study by those interested in West African problems. The depopulated area due to slave-raiding will be seen extending from east to west, between the Hausa States and the coast provinces of Nigeria, and still further to the west in the Northern Territories of the Gold Coast and the Ivory Coast. The scale on the chart shows the density, expressed in the number of inhabitants per square kilometre. This multiplied by two-and-a-half will give, approximately, the number per square mile. The densest areas shown are those with over 100 per square mile, but there are some portions of Southern Nigeria which are far more thickly populated. In the district of Ikot Ekpene the population is estimated at 430 per square mile. It will be noted that Nigeria is by far the most densely populated part of West Africa.

Natural Resources. – Coupled, therefore, with the knowledge of the present distribution of population, it is most important to take stock of potential riches, sylvan, agricultural, and mineral, of the country it is proposed to develop. Perhaps it is for this purpose that our Continental neighbours in West Africa usually send a scientific mission to report on the districts it is contemplated developing by railways.

So far as we have got, our general scheme of railway development will consist of one or more railway systems starting from the best ports and disposed to drain, in the most effective manner, the areas endowed with the greatest resources, whether developed or potential, precedence being given to the more densely populated areas in view of the importance of each portion of the scheme paying its way as it is constructed.

Competition. – How far this latter consideration may be allowed to weigh, will depend a good deal on the point next to be considered, namely, the possibility of competition with existing or future railway systems or water transport. This is not so important in cases where the opposition railway is controlled by the same administration, but where, for example, the railways of two adjoining European Powers are likely to compete for the trade of an important district, everything may have to give way to obtain the cheapest outlet for through traffic. It is always possible to serve rich non-competitive areas, lying off the direct route, by branch lines.

The products of West Africa have, moreover, to compete in European markets with similar commodities from other origins, and the future prosperity of a
colony may lie in commodities, the exploitation of which depends on the cheapness of transport. It may be advanced that a longer line through a richer country can profitably quote lower rates than a more direct line, which cannot reckon on a nucleus of lucrative intermediate traffic; but in the long run, under the stress of competition for a large volume of traffic, assuming equal facilities, rates as a whole will bear relation to the bed rock of working expenses, so that it may well pay to build an unproductive section as part of a general scheme for the best ultimate good of the country.

Physical Configuration. – The same considerations which justify a comparatively unremunerative section may make it worth while undertaking a route which is more costly to construct by reason of physical difficulties, in order to attain lower ultimate expenses. The additional expenditure may be devoted to obtaining a shorter line through more difficult country, or to reducing the ruling grade. It is hardly necessary to point out that the added charge on traffic due to interest on increased capital expenditure remains constant, and the extra cost per ton mile therefore becomes less as the traffic increases, so that at a certain stage of development this extra cost is more than covered by the reduction of working expenses. A happy mean in this respect has been attained in Northern Nigeria on the Baro-Kano Railway. Here expenditure was not stinted where necessary to obtain the best possible grade, but in other respects a cheap line was constructed capable of being improved as traffic increases. This type of line is destined to play an important part in the development of West Africa.

As a general rule, however, it is evident that physical configuration exercises an important influence on the situation of railways.

Political Frontiers. – The weightiest economic considerations may have to give place to the fortuitous disposition of international frontiers. The French had to abandon their original scheme for the line of penetration in French Guinea, as it was found that the most favourable route lay partly within the hinterland allotted to Great Britain. The existence of protective fiscal tariffs may artificially influence the lines of railway development. The case of Sierra Leone and French Guinea may be cited and will be referred to again.

Cross County Lines. – As regards the lines constructed chiefly for administrative purposes, these will be in the nature of cross lines, and will act as feeders to the coast trunk lines. Unless likely to form part of a cross trunk line, deviations from the shortest route will only affect the local area served. It must be remembered when scheming a railway system, that the construction of a connecting link between two systems almost invariably introduces the factor of competition by alternative routes.
EXISTING AND PROPOSED FRENCH RAILWAYS.

Existing French Railways. – I will now briefly review what has been done in the past. Precedence must be given to the French, who had the honour of starting to build the first railway in West Africa, 15 years ahead of any other nation, and who lead to-day with their West African railway policy.

The port of Dakar has wharves along which ocean steamers can berth. It is becoming an important coaling station for South American lines of steamers, and with the adjoining port of Rufisque, is the present outlet of the French Western Soudan.

The Dakar – St. Louis line, 165 miles long, commenced in 1882, completed in 1885, taps the whole of the water-borne trade of the Senegal River, which has no practicable outlet to the ocean by reason of its bad bar.

The Kayes – Bamako – Koulikoro Railway, 346 miles long, originally proposed by Faidherbe in 1863, connects the head of navigation on the Senegal River with the head of the longest navigable reach on the Niger. It was commenced in 1881, and, at the cost of many lives, and after many vicissitudes, was finally completed in 1904, securing to the French the basin of the Upper Niger.

It was decided as early as 1878, when a commission was appointed in France to report on the railway development of French West Africa, that the two above railways should be eventually linked together, and the correctness of this policy has been borne out by the fact that the navigation of the Senegal River to Kayes, though admitting boats with 1,000 tons cargo for a short period of high water, is found to be too uncertain to be relied on as the outlet of the Upper Niger country. A railway is therefore being constructed to link together Thiès and Kayes, and thus cut out the Senegal. This line, which will be about 425 miles long, is being constructed from both ends, and has been completed all but about 180 miles.

A line from Konakri, a comparatively good port, with a wharf for ocean steamers, was started in 1900, and completed to Karoussa (367 miles) in 1910. It is now being extended a further 40 miles to Kankan, whose importance as a commercial centre may be deduced from the fact that 14 European firms were installed there while yet the railway was hundreds of miles away. Both the Niger from Karoussa (250 miles away) and the Milo from Kankan are navigable for small steamboats to Bamako during the high-river months, and by large canoes all the year round. Feeder roads have been constructed from the railway in the most likely directions for future branch lines.

On the Ivory Coast a line 195 miles long has been constructed from Abidjan through the forest belt to Bouaké. Progress was delayed by the native rising early in 1910, when the line was attacked and damaged in places. There is a jetty through the surf at Grand Bassam, and the facilities, which appear to have been very unsatisfactory, have recently been improved. An attempt to form a seaport
at Abidjan by joining the lagoon with the ocean failed and had to be abandoned. As a result the railway terminates on a lagoon, over 20 miles from Grand Bassam, its sea-port. One of the suggestions to get over the difficulty is to extend the railway from Abidjan across the lagoon to Port Bouet, and build one or two jetties at the latter place. Another scheme is to improve Grand Bassam and link it by rail with Abidjan via Bingerville.

In Dahomey a railway 162 miles long exists from Kotonu to Savé, with a branch 20 miles along the coast to Segboroué. A tramway of the same gauge runs from Porto Novo to Sakete, 25 miles long, and now being extended a further 25 miles. Owing to the lack of a harbour at Kotonu, where there is only an iron jetty projecting through the surf, a large proportion of the trade of Porto Novo is sent via the coastal lagoons to Lagos for shipment.

French Programme of Main Line Construction. – The Government appears to have organized the collection of information bearing on the extension of railways, and in May, 1911, the Governor-General of French West Africa proceeded on a tour embracing all the colonies under his jurisdiction. On his return a general scheme of railway and harbour development, estimated to cost over 19 millions sterling, in addition to the funds already voted, was promulgated, to commence which a loan of 150 million francs, or six millions sterling, is being raised. Of this amount £240,000 is allocated to improving the port of Dakar, £120,000 to the port of Konakri, and £40,000 for the survey of and preliminary work on a port on the Ivory Coast. The attached map shows generally the proposed scheme of railways, which is on the lines of one foreshadowed in 1906. Starting from Dakar a main artery will extend via Thiès, Kayes, Bamako, Buguni, Boromo, Wagadugu, Fada N’Gurma, Paraku to Kotonu, a distance of about 2,000 miles. From this main artery two lines will extend to the coast, one from Buguni via Kankan and Kurussa to Konakri, the other from Boromo via Bouaké to Abidjan. Two branches will be built to the Niger. The first from Paraku to Gaya, the head of what may be termed the middle navigable section of the Niger, and the second from Wagadugu to Ansongo at the foot of the longest navigable section of the Niger. It may be mentioned that, in the event of the suggested Trans-African Railway being constructed, to link together Algeria with the Congo Railway system via Lake Chad, a branch would be made either from Selet or In Gessan to Ansongo to connect with the French West African system. Kankan will be connected with Dimbokro on the Ivory Coast Railway by a direct line through Beyla and Daloa, and finally there will be a cross line between the Thiès-Kayes and the French Guinea Railway. The portions of this system, which it is intended to carry out by 1918, out of the forthcoming loan, are shown in Appendix 1. The Governor-General, however, will be able to divert expenditure from one line to another, so that it may be possible, for example, for the line to be continued on from Paraku to the Niger, within the next few
years. This scheme is only intended to provide for the trunk lines of the future railway system of French West Africa. Branch lines will be built to develop special districts as the need arises.

It will be noted that the existing centres of densest population are tapped as far as possible without deflecting the trunk lines from the shortest routes to the interior.

**Consideration of Thiès – Kayes Line.** – The *Thiès – Kayes Railway* was deflected to the southward to tap the rich basin of the Gambia instead of the almost desert hinterland, and to save as much as possible of the trade from being diverted to British channels. A proposal, made in 1907, to go direct from Tamba Counda to Talary, thus shortening the rail journey from the interior by 42 miles, was overruled on the grounds of costing £200,000 more. Possibly the more immediate advantage of the Kayes-Amidé section which has just been commenced, influenced the decision. I cannot help thinking that the future will prove that the more direct route would have been best, with a branch 25 miles long from Kayes to Amidé if necessary. A scheme has been suggested to build a branch line, 13 miles long, from Guinguineo to Kaolak on the Saloum River, which is / navigable at all times, thereby saving some 90 miles as compared with Dakar. It must be remembered, however, that the Gambia River is already navigable for vessels of 13 ft. draft all the year round to McCarthy’s Island, 153 miles from Bathurst, and the depth is now being improved to 15 ft. Nianimaru, some 30 miles below McCarthy’s Island, is stated to be accessible at all times by fully-loaded ocean vessels drawing about 20 feet. It is, therefore, not unreasonable to suppose that a short branch line to McCarthy’s Island, or, better still, to the vicinity of Nianimaru, might make the Gambia the future commercial outlet of French Western Soudan. The saving in the rail journey to McCarthy’s Island as compared with Dakar, would appear to be about 180 miles.

Comparing the Dakar, McCarthy’s Island, and Konakri routes: from Bamako to Dakar via the Thiès – Kayes route will be 810 miles; from Bamako to Konakri via the Niger to Karoussa is 620 miles; or by rail via Buguni will be about 660 miles. The rail journey from Bamako to McCarthy’s Island will be 630 miles, and, had the short cut to Talary been adopted, might have been 590 miles.

Liberia. – In Liberia it is reported that a concession has been granted to a German firm to build a railway from Monrovia to the frontier of French Guinea.

**German Railways.**

Togoland. – Turning to the German colonies, the following lines exist in Togoland: A coast line 28 miles long from Lome to Anecho, completed in 1905; a line from Lome to Agome-Palime 77 miles long, opened in 1907, and a line from Lome to Atakpame, 102 miles long, opened in 1911. A local line north-
wards from Anecho, or eastwards from Tsewie, is projected to develop the rich oil district north of Anecho. The Agome-Palime line will possibly be extended in the future towards Kpandu. It is proposed, when funds permit, to extend the Atakpame line to the interior to serve Sokode and Bassari, and eventually towards Sansanne Mangu to Tchipowa. Unfortunately Togo possesses no good port, the facilities at Lome consisting of an iron pier, as at Kotonu. This pier was badly damaged by the sea in 1911, but is now repaired.

Cameroons. – In the Cameroons the issues are larger, and concern us perhaps more directly. Two railways are being built. The northern line, 100 miles long, from Duala to Ngonsamba, on the lower slopes of the Manenguba mountains, was opened in 1911. The centre line from Duala through Edea is being constructed to Mbalmajo on the river Njong near Widimenge, a distance of 178 miles. Duala is a port comparable with Calabar, and capable of considerable improvement at a slight cost.

There is also a narrow gauge private tramway from Victoria to Soppo, 27 miles long, serving the headquarters of the administration at Buea.

A special mission is now investigating the country with a view to deciding on the best direction for the extension of the northern line. The alternatives appear to be the route approximately shown on the map, and a line more to the east via Joko, Tibati, and Ngaundere. It is proposed to carry this line eventually to Garua, and even to Kusseri, as the Germans seem convinced that the Benue River will not suffice as the outlet for their northern provinces. Captain Mercier, in an article published in November, 1911, in L’Afrique Française, arrived at an opposite conclusion, and recommended connecting the Benue and the Logone rivers by a railway to serve the French Chad and Shari territory. It is perhaps worth going into the matter for ourselves.

The Benue is navigable up to Yola for vessels of 200 tons cargo capacity for three months in the year, and during this period the conveyance of traffic to Garua can be guaranteed by lessening the amount of cargo or using slightly smaller vessels from Yola onwards. Assuming that the Benue fleet is based on Lokoja, to which point boats containing 1,000 tons of cargo have access during the Benue flood season, each vessel can only be counted on to make four return journeys to Yola in the season. Now the whole of the Government fleet, excluding the smaller vessels, has a cargo capacity of about 1,800 tons, representing some 600 tons weight of paying cargo, so that in the three months the Government fleet could at most, if fully employed, bring down 2,400 tons of produce a year, or if the faster vessels made five trips, say, 2,700 tons weight. I doubt if the whole of the existing fleets on the Niger could bring down 7,000 tons a year from Yola and beyond; but nothing like this amount of shipping will be available, as it is obviously out of the question to have special vessels for the Benue traffic only – laying them up for most of the year – and it will only be possible
to withdraw vessels from the Niger service in the case of river carriers who command sufficient business to justify chartering vessels carrying 1,000 tons, known as ‘branch boats,’ for the Niger, during high-water, thus releasing the sternwheelers for the Benue. Under the circumstances, apart from the disadvantage of the short period the river is open every year, the Benue could not cope with the tonnage which may reasonably be expected in the future from the French and German sources, in addition to that originating in Northern Nigeria. Moreover, the distance by river from Garua to Forcados is about 870 miles, and a rate of £6 per ton was charged to the French for this distance. A railway from Garua to Duala might possibly not exceed 500 miles, so that an average rate of 3d. per ton mile would successfully compete with the river. Under the circumstances any road or railway between the Logone and Benue would feed a line to Duala in preference to the River Benue. The railway would also develop the country passed through, and greatly facilitate the administration of the Cameroons. Therefore it will be built and will tap Yola and Eastern Bornu in the absence of a competing line.

The centre line from Duala to Mbalmajo was chosen to develop the central part of the Cameroons in preference to a line from Kribi to Ebolowa, advocated by the merchants at Kribi. The principal objection to Kribi appears to be that it will never be a good port. From Mbalmajo the Njong is navigable all the year to Abong Mbang, only 30 miles from the Dume River, which at high water is navigable downwards for 125 miles to within about 100 miles of Nola on the navigable Sanga. An extension of the centre line via Gamane and Kunde to the navigable Logone, or a branch from the northern line to the Logone, especially if the eastern route is chosen, might capture the trade of French Shari territory more effectively than could be done by a line from the Logone to Garua.

An alternative scheme to the Kribi – Ebolowa line is a railway from Kampo eastwards to compete with the suggested French line from Libreville to Wesso.

SIERRA LEONE AND THE GOLD COAST.

Sierra Leone. – Turning now to the British colonies, we have in Sierra Leone a splendid harbour at Freetown, which will probably some day be provided with wharves for berthing ocean steamers, and a trunk line of 2 ft. 6 in. gauge from Freetown to Pendembu, 228 miles. There is a branch line from Boia junction to Roruks, which is being extended across the Rokelle River towards Makene, a total distance of about 90 miles, about half of which has been completed. Looking at the map, the main line would appear to tap a portion of French Guinea lying east of Sierra Leone and north of Liberia, but a heavy duty is placed on imports into French Guinea through a foreign country, with a view to the imports, and consequently the exports, being diverted via Konakri. This is only possible in the case of valuable commodities like rubber, which can stand the rate via the longer
route. Low grade produce from the hinterland may have to go by the cheapest route or not at all. On the other hand the Konakri railway will continue to divert the trade of the northern provinces until the extension of the northern branch of the Sierra Leone Railway renders effective competition possible.

There is a mountain line six miles long connecting Freetown with the Hill Station, some 900 feet above sea level.

Feeder roads are being constructed to open up the country traversed by the railway. The Sherbro district is well served by several rivers, and the harbour at Bonthe is available for vessels of a draught of 18 feet.

**Gold Coast.** – In the Gold Coast a 3 ft. 6 in. gauge line, 170 miles long, from Sekondi to Coomassi, has been in operation since 1903, and a branch line 20 miles long, from Tarquah to Prestea and Broomassie, was opened in 1911. Sekondi is the best port on the Gold Coast at the present time, being accessible by tugs and lighters instead of surf boats only, as elsewhere, but ocean boats have to discharge and take on cargo in the open roads. This port is now being improved. If it is possible to secure a better harbour with smooth water for ocean boats it would not only be better, but cheaper in the long run, for the colony to make great sacrifices to acquire such a port. A decision on this point must precede the framing of any comprehensive scheme of railways.

Attempts have been made to improve the landing facilities at Accra, but with qualified success, and a railway has been built for about 40 miles from Accra to Mangoase, and though only opened in 1911, is already paying well with cocoa traffic. The problem now is in which direction to extend this latter line, whether to Coomassi, in which case competition with the Sekondi line will at once be introduced, or more or less parallel to the coast to the Sekondi line, in which case most of the traffic will go to Sekondi, or northwards to open up new country. It appears that extensions of either line northwards beyond a certain point will have to traverse a sparsely populated belt, but in the long run a trunk line to the north will probably have to be constructed in view of French and German competitive lines, and if so it will be better to go through first and secure the traffic. The policy up to the present has been to construct trunk roads north of Coomassi, but there is all the difference in the world between trunk lines of roads and a trunk line of railway with feeder lines of roads.

The question of utilizing the Volta River is being investigated, but at the best this could only be regarded as a temporary main line of communication.

**Nigeria.**

**Existing Railways.** – There remains to be considered Nigeria, our most important possession on the West Coast. We find at present a 3 ft. 6 in. line from Lagos, through the large centres of Abeokuta, Ibadan, Oshogbo, and Ilorin to Jebba (307 miles), across the Niger, partly by a bridge and partly by temporary
train ferry, and via Zungeru – the administrative capital of Northern Nigeria – to Minna, where it joins a line from Baro, on the Niger, to Kano, the famous market of the Hausa States. The distance from Lagos to Kano is 712 miles, and from Baro to Minna 111, and Kano 356 miles. A branch 90 miles long has been constructed from Zaria to the Rahamma River towards the principal tinfields, and it is decided to extend this line to the top of the Bauchi plateau in the direction of Bukeru, both to serve the tinfields, and to give access to the healthier uplands. Unfortunately this branch line has been built in a 2 ft. 6 in. gauge, thus saddling the country with what will be an ever-increasing disadvantage unless a decision is faced to alter this line to the standard gauge of Nigeria and banish the 2 ft. 6 in. material out of the country. The French have had one or two narrow escapes in the past of introducing mixed gauges, but have luckily come through without, I believe, a single instance in West Africa.

In Nigeria we have ample scope for building ‘railways in the air.’ Great controversies have taken place in the choice of ports, Warri having been suggested as an alternative to Lagos as the port of the Western line. It has, however, been decided to plump for Lagos, and heavy works are being undertaken with a view to making the bar possible for ocean steamers, which at present transfer passengers to surf boats, and thence to ‘branch boats’ in the open roadstead, and discharge their cargo at Forcados into branch boats for return to Lagos. Forcados, the ocean port for the Niger traffic, is a good harbour, accessible over a 19 ft. bar. From this port two independent lines of sternwheelers serve the Niger and Benue. Baro, the starting point of the Northern Nigerian Railway, has always been accessible during two-and-a-half months by steamers drawing 11 feet and conveying 1,000 tons of cargo; for nine-and-a-half months by sternwheelers drawing four feet and conveying 200 tons of cargo; and all the year round by launches drawing two feet. It will be seen that even without artificial improvements to navigation, the Niger will be a formidable competitor of the Lagos Railway.

**Extensions in Southern Nigeria.** – The dense population of Southern Nigeria will no doubt justify the construction of local lines not forming part of the main arteries of communication with the interior. To the east of the Niger a line some 60 miles long has been surveyed to connect Onitsha with the Udi coalfields, which are believed to be of considerable value. This line, if built, must obviously also connect with other future lines east of the Niger. A future line might run from Warri via Benin, with cross connections between the western line and Onitsha, Lokoja, or Baro. Nor is it likely that the densest population of all round Ikot Ekpene will be left undeveloped; and whether this area will be best served by a line from a secondary coast port such as Bonny or Opobo, or by a line from the head of the permanent Cross River navigation at Itu, will be an interesting point.
The coastal regions will be served by improving the navigation of the network of lagoons.

**Eastern Trunk Line.** – It appears to have been generally accepted that a second trunk line serving the eastern portion of Nigeria should start from Calabar, and to have been assumed that this line would also serve Kano. A branch of the eastern trunk line directed on Kano would be the shortest route to the coast, but would encounter an almost impracticable escarpment running east and west, north of the Benue. It would, however, serve the tinfields, and if in the future such a line is required, a rack section may solve the difficulty as in the case of the Delagoa Bay line to the Transvaal. The eastern port is two days further by sea, so that the Lagos line will always hold its own for passenger traffic. There are, however, already two competing lines from Kano, and the construction of a third may well be deferred till the Sokoto and Yola-Bornu areas have been provided for. Both these areas are likely to be threatened by foreign competitive railways, a fact which renders it necessary to make our trunk lines as direct as possible and ahead of competing lines.

As regards Bornu, it has already been shown that the Benue and Niger cannot compete with a direct railway from the coast to our eastern frontier, and the first consideration in selecting a trunk line to serve competitive areas such as Maidugari and Yola, is that the cost of transport to the coast should not be greater than by the German line from Garua.

Unfortunately the most direct line from Calabar, the inevitable port of Eastern Nigeria, would start by traversing a sparsely populated region, and the Shebshi mountains south-west of Yola might necessitate a detour or lead to Yola being served by a branch line. In the face of more attractive projects in other directions, and in the absence of reliable information regarding the country, there appears to be no immediate prospect of such a trunk line being constructed, but it is hoped that meanwhile local schemes will not be entered on which might clash with the requirements of the future.

**Cross Country Line in Northern Nigeria.** – A cross country line useful for administrative purposes might be made from the Bauchi branch line some 40 miles from Zaria eastwards between the Ninghi Hills and the northern spurs of the Bauchi Highlands, via Nafada, the head of the navigable Gongola (a tributary of the Benue), to join the eastern trunk line, and it would probably pay to construct this line to develop Bornu until such time as the value of the traffic and the prospects of competition justify the eastern trunk line being undertaken.

**Western Trunk Line.** – Turning to the west of Nigeria; Jebba, the point where the Lagos railway crosses the Niger, is the head of the navigable Lower Niger, being accessible by vessels drawing five feet during six months of the year, though for two months the draught available is under two feet. Above Jebba for about 120 miles up to Sekachi, navigation is impeded by a series of rapids quite
impracticable for steam vessels and only passable by large canoes with difficulty during the high water. There is no possibility of improving this section of the river. Above Sekachi the Niger is again navigable up to Gaya in French territory, and to lesser extent up to Kompa, where another series of rapids commences and extends with intervals up to Ansongo, whence the river is again navigable for sternwheelers for about 900 miles to Koulikoro.

The Sokoto River or Gulbin Kebbi joins the Niger opposite Gomba, and small canoes can reach the important market of Jega, on one of its branches, all the year round. This river is, however, unsuitable for a main artery of trade, and is used chiefly for local traffic.

The navigable section of the Niger from Sekachi to Gaya intersects every trade route from Sokoto to the coast, and the first railway to reach this section and start a service of river steamers will have the best chance of securing the Sokoto trade.

As stated before, it is proposed to extend the French Dahomey railway, which at present terminates at Savé, to Paraku and on to Jugu, and with sufficient inducement the line could reach Gaya, the proposed terminus on the Niger, 300 miles from Savé, in 1916.

The population of Sokoto Province is estimated as 1,300,000, and is densest in the regions bounding the Sokoto River and its tributaries.

Another factor in this particular problem is the possible advisability of building a line from, say, the bend of the Lagos Railway, north of Abeokuta to about Ilesha, to prevent trade being diverted to the French Railway. A possible solution of the Sokoto problem would then be to extend this line through Borgu, across the Niger east of Gomba, and so continue to Jega and Sokoto. This would be the shortest route to the coast, but would traverse a practically uninhabited region in central Borgu, whose sparse population is found either along the frontier in the vicinity of the trade route from Sokoto, or along the banks of the Niger. It would involve an expensive bridge over the Niger in the middle of a navigable section, and several miles of bank over swamps north of the Niger.

As regards possible future trade from Borgu, this would probably be retained by a line to Okuta only.

Another solution would be to build a line from Jebba east of the Niger to Sekachi, and thence to Jega and Sokoto. This route to the coast would be longer, but sufficiently short to compete with any likely alternative route. The combined length of line, Abeokuta to Ilesha, and Jebba to Sokoto, would be about the same as Abeokuta to Sokoto via Ilesha. The line from Jebba would serve a larger population en route, and be more convenient for administrative purposes. The deciding factor in favour of the Jebba route may be that the Ilesha line is not so important as other lines in Southern Nigeria, while the Sokoto extension cannot afford to wait.
POSSIBLE EXTENSION TO ZINDER. – The Kano Railway may be extended some day to Zinder, the headquarters of the French Territoire Militaire du Niger. The extension would tap a good grain and groundnut district and existing potash traffic, and while primarily justifiable only as a convenience to the French would doubtless pay its way in a few years time.

STATISTICS ILLUSTRATING THE RESULTS OF WORKING OF WEST AFRICAN RAILWAYS.

The development of traffic due to the construction of railways in West Africa has invariably exceeded all expectations, and it would be rash to assert that any section, however unpromising, would not pay its way. In Appendix 2, I have collected some figures of interest concerning West African railways. It will be seen that in 1911 the Sierra Leone Railway earned over 3 1/2 per cent., the Lagos Railway nearly 4 1/2 per cent., and the Gold Coast Railway 9 per cent. on their respective capital costs. The newly-constructed Baro-Kano Railway will pay its way this year. The first section of the Cameroons Railway started paying its way as soon as it was handed over to open lines. In 1909 the Dakar-St. Louis Railway cleared 11.3 per cent., the Kayes-Niger 2.2 per cent., and the Konakri Railway 3.7 per cent. on the capital cost, and the Ivory Coast and Dahomey Railways, though not yet paying expenses, were showing very rapid improvements in their returns.

FUTURE CONNECTIONS BETWEEN INTERNATIONAL SYSTEMS.

One is led to speculate on the chances of intercommunication at some future date between the British, French, and German systems of transport in West Africa. It may be premised that international systems will not be linked up except for their mutual advantage. The most likely circumstances to fulfil this condition appear to be the desire for the cheapest outlet to the coast, the desire to use the railway of an intervening country for intercommunication between two colonies of the same European power, and the advantage of obtaining cheaper coal from West African sources.

The first of the above reasons might ultimately lead to a line from the Thiès-Kayes to the Gambia, in view of the necessity for the cheapest possible outlet for the comparatively low grade produce of Upper Senegal and Niger. The district of Kissidugu in French Guinea is more likely to be served by a branch railway from the Konakri line from about Suarella, through Farana, than by an extension of the Sierra Leone Railway.

Assuming that a railway is built from the Lagos line in the direction of Ilesha, a likely connection would appear to be between this line and Paraku to facilitate
communication between the remainder of French West Africa and Zinder, via Kano, and also it may be, to supply the French railways with coal from Udi, a possibility worth bearing in mind when designing the cross lines in Nigeria.

A junction with the German railways appears to be less likely, as it is hoped that coal and oil deposits exist locally in the Cameroons.

Suggested Trans-African Railway. – I am afraid there is no time to review the project for building a railway from Algeria via Lake Chad, to connect with the Congo and South African systems. The proposed branch of this line to connect with the French West African system possesses added importance, in view of the recently-adopted policy of raising a native army in French West Africa for service in North Africa. The length of line to be built would be about 1,700 miles from the Algerian Railway to the Chad, and a 600-mile branch to the French West African system. From Lake Chad to Stanleyville would be roughly 1,500 miles more. The total cost is estimated at about 13 million sterling for the line to the Chad and branch to the Niger, and about eight-and-a-half millions for the second portion. A reconnaissance party has recently traversed the whole of the proposed route to the Chad and to the Niger, and is understood to have reported on the physical practicability of the scheme, which, if ever carried out, would attract the railways of all West African colonies to itself. At present the prospect of financing such a line may be very remote, but, apart from a possible discovery of minerals on the proposed route, the world-wide demand for accelerated communication, and the rapidly increasing importance of West and Equatorial Africa, may not inconceivably lead to the project maturing in the next generation.

Standard Gauges of West Africa. – Every junction of a British with a foreign line will involve a break of gauge. It is too much to expect the metre gauge to have been adopted from the commencement in British West African colonies on the chance of future connections with foreign systems, although Sir Walter Egerton, in or about 1904, actually suggested that the 124 miles of Lagos Railway then constructed should be relaid in metre gauge.

CONCLUSION.

It is, I hope, established that for the development of West African colonies by railways, a comprehensive scheme, based on the application of general principles to local conditions, is necessary from the very first, and it is submitted that no deducible conditions of the future are so remote as not to be given some weight in the framing of this general scheme. As the prosperity of a country increases, its arteries of communication become more and more important, and with increasing competition, disadvantages in the channels of transport, comparatively unimportant in the early stages, begin to accentuate themselves and may...
possibly have far-reaching influences, while the immediate considerations which governed the transport policy in the first case may have lost their force.

It is realized that conditions change and fresh information is always coming to hand to alter the data on which the earlier schemes are based, that progress cannot wait indefinitely for facts depending on itself, that lines have been and will be constructed more or less in the dark, that every such line adds to the difficulties of framing the best general scheme, and that a patchwork system may result.

Under the circumstances I venture to assert that the first need is for the systematic collection and co-ordination of data with a view to determining with confidence the future trunk lines of railway. A great deal of information exists in a diffused form, and merely requires focussing to throw valuable light on the subject. Further information will have to be searched for with special reference to railway development, and the man on the spot with full knowledge of local conditions must be trusted to marshal the data and formulate the conclusions. It is not unlikely that the alternatives to choose from may be few. It may be that the route once selected must be closely adhered to, or, on the other hand, that the decision as to alternative routes may be safely reserved, but until the trunk line policy is defined there will always be risk of inconsistency with its attendant evils. Once the question of trunk lines has been settled, every projected and existing line resolves itself into either part of the main line, or a local or feeder line, and further construction can be confidently carried out in the order most profitable.

* About 240 miles completed. Work being carried out both ends. Net revenue Kayes-Ambidédi, 1910, £18 mile
† 48 lb. rail. There is a 20 mile branch to Segboroué.
‡ Surface tramway over easy country. Gross revenue, 1907 £1,556, 1909 £5,303.
§ Now being extended 40 miles to Kankan.
¶ Expenses of working construction traffic have been charged, but no revenue claimed.
** Last nine months only] Entirely native subordinate staff except engine drivers.
†† First six months only. Three trains a week each way.
††† Line reached Edea, 1912.

**Note**. – In 1911 the working of the Thiès-Kayes (Thiès section), Kayes-Ambidédi, Kayes-Niger, Konakri-Karoussa, and Ivory Coast lines resulted in a net revenue of £119,040.
DISCUSSION.

Mr. Frederic Shelford: I thank you very much for the honour which you have conferred upon me, Sir Clement, in asking me to make a few remarks. And in response to the invitation, there are perhaps a few observations which I might make to add to the interest of the paper which we have heard. First, some general conclusions in regard to the African railways.

Competition between River and Railway.

Captain Mance said, at one point in his paper, that the Niger River formed an important competitor with the Nigerian Railway to Lagos. That, of course, remains to be seen, but as a general rule, I think we may take this as the fact, that railways cannot compete with ocean-borne traffic. That, I think, is fairly obvious. With regard to the Cape to Cairo Railway, which has been spoken of, if you were sending goods to the Cape, even if that railway were built, you would hardly expect that it would be cheaper to take them right across Africa than round the Cape by sea. And even with regard to passenger traffic, if a passenger were not in a great hurry I am sure he would find it more comfortable to go by Union Castle steamer than to go across Africa in a jolting train. With regard, however, to the problem of the partially navigable river, that is quite different. The Niger River I have been up at any rate once, with Sir Percy Girouard, and at his request made a rough survey. I found that it is not navigable for any vessel all the year round, at any rate when you get above Lokoja, and even below that it is not very navigable, even for steamers drawing two feet only, because I myself was once stuck on a sand-bar for 36 hours. And under those conditions, when you have valuable commodities to carry, I think it is more likely that they will be sent by rail than by the river. Sir Percy Girouard based a scheme of communication in Nigeria upon the Niger River; he pointed out that that river was not being used at all, or hardly at all, and his idea was to convey goods up and down the river as far as Baro, and from there by the Baro-Kano Railway. It remains to be seen whether Sir Percy Girouard's scheme will work out, because in competition with that you have the Nigerian Railway, which, I think, is more likely to get the traffic.

The Question of Railway Gauges.

I must say a word about the question of railway gauge in West Africa, which Captain Mance has mentioned. Africa has now, in spite of all the efforts of a great many of us, got into a fearful jumble with regard to gauges: South Africa 3 ft. 6 ins.; Egypt 4 ft. 8 1/2 ins. and 3 ft. 6 ins.; Uganda the metre gauge; all the French railways of West Africa the metre gauge; Sierra Leone 2 ft. 6 ins.; Gold
Coast 3 ft. 6 ins.; Nigeria 3 ft. 6 ins., and 2 ft. 6 ins. As far as the last is concerned, I did all / that I possibly could about five years ago, practically unassisted, to prevent the introduction of the 2 ft. 6 in. gauge into Northern Nigeria, but somehow it has managed to arrive. I think the lesson of India, with regard to gauges, is one which should not be forgotten. The state of things in India now is such – I do not know India personally, but I know a good deal of it – that in parts of it you actually have two railways running side by side, one of one gauge and the other of another gauge. The beginning is so insidious, it is like a disease. At one time you want to make a little railway. You have not much money for the purpose; you make out that a 3 ft. 6 in. gauge railway would cost so much, and that a 2 ft. 6 in. gauge one would cost a little less. You yield to temptation – which is always a bad thing – and you go in for the little gauge, 2 ft. 6 ins. Then a time comes a little later, when you want to extend it. That has happened in Northern Nigeria, and this line to the tin fields has to be extended, and you have not the courage to alter the gauge – or I ought to say you may have the courage but I have never seen it shown yet – and so you extend it on the 2 ft. 6 in. gauge again. And so on it creeps, until it is possible you will have in Africa, as you find in India, two railways running side by side of different gauges, and the thing getting hopelessly mixed up.

[...]

Dr. T. Miller Maguire, M.A., LL.D.: I should like to ask a question. Very grave doubts are often expressed as to whether African or American natives have hitherto benefitted in the least by the introduction of European civilization – falsely so-called. I know that Khama protested that railways would ruin Bechuana! Does the gallant Lecturer believe that any material or moral benefit will accrue to the natives by the proposed railways, French and British, which he has so very ably described? Will the male or female natives in the districts traversed by these rapid means of transit not lose more than they will gain? Will they be exploited? Shortly, will any material or moral good to humanity at large arise in these benighted lands from the railways? Is there not a great danger of the natives becoming mere decadent adjuncts of machines, like the poor victims of the 'Manchester School' in Lancashire or Lanarkshire. I would much prefer that my friends should be native warriors than North of England miners. The native women – as they are – must be far superior in every way to the poor sweated girls on coal pit banks, or in factories, or in the Liverpool or Glasgow slums, which I have explored. Will the effects of railways be human degeneracy or improvement? This is a vital matter in my mind, and of strategic importance with regard to the / future of the military forces of West Africa, and of more importance to all of us here than whether the management of these new, and, perchance, deadly innovations, be in the charge of State bureaucrats or of commercial adventurers.

The Chairman, Sir Clement Hill, K.C.B., K.C.M.G., M.P.: It is my pleasant duty to say a few words on this paper. And though I cannot pretend to say
anything on the technical part of it, I can say that it has given me immense pleasure to come here to-day, because all the names which have been mentioned now, the railway termini and the places of interest for the future construction of railways, were names most familiar to me in those great proceedings which took place, and which terminated in 1898, when we were discussing with France the division of these districts. At that time all the explorers and those engaged on the delimitations had to go on foot, and there was hardly a sign of a railway, if such did exist at that time. It is almost impossible to realize that those places were so little in touch then, and yet are so close now. And we are trying to bring them into still closer communication by means of the railway.

**Government and Private Enterprise.**

There is a point which our Lecturer did not touch upon, one which struck me first on reading his paper, and that was, that he only deals with the construction of railways by the Governments of the countries. I know it has been a cardinal principle with the Crown Agents, of this country at all events, and, I daresay, with the Government institutions of other countries, that they can build railways cheaper than commercial companies can, and that therefore they begin by building these railways in these wilder countries, so far as they can, for the Government, instead of putting them out to contract. But I have always held, that – though it may be possible, and though it certainly is desirable, that such a scheme as has been foreshadowed by Captain Mance should be borne in mind by the Governments, and that they should keep their eyes on the strategical and commercial advantages that are to be obtained from the carefully thought out construction of railways in this country – it is nevertheless open to question whether, when we have built railways – if they are to be built cheaper by Government contracts and enterprise – they should not be offered to private companies to develop. Of course, that is a very unpopular view with many people, I know, because there is a great tendency now to nationalize the railways and everything else. At the same time, it seems to me it is very difficult in this country which we have been talking about, to get railways developed. This is not a political question; whichever Government is in power has very great difficulty in coming to the House of Commons and saying I want a large grant of five or six millions so as to carry out a comprehensive scheme of railway development in this or that country. We can remember all the opposition there was to the Uganda Railway, which was built by the Government, not as a commercial enterprise, but to carry out our obligations under the Brussels Act, which constrained us to develop countries that we had taken over and to put down the slave trade. Now, in spite of what Mr. Harcourt has done – and I give him great credit for his wish to develop these railways – he would agree that it is very difficult to come to
the House of Commons and get these large grants whenever developments and feeders are required for certain railways. And it can only be done by the expression of opinion by those who hold the view that it would be conceivably worth while to sell some of these railways, or make them over under certain conditions as to transit rights, etc., with provision that the trade shall not be stifled in any way, so as to see if they could not develop the country quicker than we can by Government enterprise. That has always been more in my mind than anything else when I have heard of these Government railways, or have had, as I did with the Uganda Railway, to take part in their construction. At all events, I think the idea is worth considering.

**The Problem of Native Labour.**

There was nothing in the paper to show us how these railways are built, how we get native labour, what labour there is, how it is employed, whether there is a sufficient supply of it, whether it comes very willingly, or whether any pressure has to be put on the chiefs to cause them to supply it. We know that there are very great risks in the obtaining of native labour in the building of railways: in the construction of the Uganda Railway we could not get any native labour at one time, and we employed 26,000 Indian coolies on the line. Though they enabled us to build the railway, it was a very expensive method of getting labour; we were hampered by all sorts of regulations by the Indian Government, with the object of ensuring that the labourers should be well treated, and at that time we had to press the railway on. But we were unable to get native labour; and I should like to hear, if Captain Mance can tell us, how the supply for the construction of this railway is obtained in West Africa.

**The Lecturer, Captain H. O. Mance, D.S.O., R.E.,** in reply, said: With regard to the navigability of the Niger, time will show to what extent this river can be relied on. If, however, nothing further is done to try to improve the river, the trial cannot be considered a complete one. At present, during low water, the chances of a vessel grounding are as largely dependent on the skill of a native pilot as on the depth of the channel.

**Construction by Government or Companies.**

Referring to the Chairman’s remarks on the subject of the construction of railways by Government, it is hoped that the success of railway construction in Nigeria will be a very good argument in itself for Government continuing to construct railways. I think the Chairman had principally in mind the very important matter which is half the business of constructing railways, and that is the provision of funds. It is to be feared, however, that if companies are allowed to construct railways, they would be concerned more with making them pay
than with the development of the country by them, which is the main object of a Government. As regards the provision of funds, it is not necessary to furnish a very large amount all at once; it would be probably better for the Government to furnish sufficient funds to construct, say, 200 miles of railway a year regularly. That would enable traders to follow up the railway as it is extended, and it would have the added advantage of cheapening construction by retaining the same staff of engineers and foremen on the work. I hope the Chairman’s remarks will be taken to heart in the right quarter, and that money will be forthcoming, because I am certain it will be very well spent, and it will repay itself again and again. / 

Native Labour.

I should have preferred that Mr. Goldsmith, who has written able articles on the subject, should have given us his views on the subject of the employment of native labour on the Nigerian Railways. The system employed in Northern Nigeria has been since strongly recommended in a French paper for introduction into French West Africa. It depends on enlisting the co-operation of the political staff in the administration of labour. This was most successfully accomplished in Northern Nigeria, where the political and railway staffs worked in complete harmony. The principle was, as far as possible, to keep the same organization on the works as in the villages. The natives who worked together were recruited from the same district; they came with their own headmen, and they had their own miniature villages alongside the railways. As far as possible, we employed only those who lived near the work. Labourers were well treated by people who thoroughly understood them, as the railway staff very soon got to know the conditions of the country. The adoption of task-work resulted in a full day’s work being usually completed at an early hour of the afternoon. Wages were paid into each labourer’s own hands in cash by a European paymaster. The result was that the natives knew they could expect actual money for the work they did, and that they could do with it what they liked. We went to considerable trouble – and sometimes it was a great nuisance – to pay these labourers once a week. The question of food supply received constant attention. The only natives who came from the coast were artizans, who could not be obtained locally. A limited quantity of floating labour was also available.

I am unable to give you further information on the subject of coal in Nigeria, but I understand it is considered to have better prospects than the lignite, which is found in the same neighbourhood.

I do not think I can go into the question of whether railway construction tends to improve the condition of the inhabitants. It seems to me that this point is more an ethical one, and is beyond the scope of this lecture. I may, however, be allowed to mention one phase of it. Assuming it is desired to give the natives
the best administration we can; this administration costs money, and, in order to get the money without injustice to the inhabitants, it is necessary to increase their prosperity. That cannot be effected beyond a certain point without means of communication, which will enable them to expand their markets. Therefore, from the point of view of the philanthropist, the improved administration which we feel we can give to these natives – better administration, we think, than that of other great nations – can be obtained indirectly by providing railways.

[...]
THE BEIRA & MASHONALAND & RHODESIA RAILWAYS.

This Railway System comprises 2,462 route-miles of 3-ft. 6-in. Gauge Line, is owned by Six Companies, and runs through Five Distinct Territories, Following a recent inquiry, negotiations between Delegates of the Governments of Southern Rhodesia, Northern Rhodesia and Bechuanaland, and the Owners of the Railways, resulted in Parallel Legislation being passed in the Three Territories, to enable a Railway Commission to be set up to exercise Control of Rates.

Although there are 2,462 miles of open line owned by the various railway companies comprised in the Rhodesian system, the Beira & Mashonaland & Rhodesia Administration only operates 1,865 miles, the South African Railways Administration working the 597 miles running from Vryburg to Bulawayo, including the Matopos branch. Of the total mileage of 2,462 miles, no more than 1,252 miles are situated in Southern Rhodesia, and of the six companies, the Blink-water Railway Company is the only one which is confined to that colony.

The gauge of the whole of the lines is 3 ft. 6 in. The area of the territories served is approximately 440,000 square miles. The capital cost of the combined undertakings approaches £18,000,000, or approximately £7,000 per mile. The railway system of 2,462 miles is a large one to serve the small population of Rhodesia. The approximate number of European inhabitants per mile of railway averages 24, as against about 160 in the Union of South Africa. The considerable native population contributes little as yet towards the revenues of the railway, although in course of time it will become a factor of increasing importance.

For the year ended September 30, 1926, the last date for which figures are available, the Beira & Mashonaland & Rhodesia Railways had satisfactory results. Their earnings amounted to £4,248,610, an increase of £271,073 over the
previous year, while their gross operating expenditure at £2,535,175 showed an
increase of £358,348 over the year 1925. Thus net revenue was £1,713,435, the
operating ratio being 59.67 per cent., which was slightly higher when, compared
with the 54.73 per cent. of the previous year. Various circumstances, outside the
scope of ordinary railway working, were responsible for this position, the chief
cause being the heavy expenditure to repair the track after the unprecedented
floods of January–March, 1926.

History and Development.
The line of railways towards the north from Vryburg was started some 34 years
ago owing to the foresight and driving force of Cecil Rhodes, who from the
outset clearly foresaw that connections with, the seaboard at Beira, as well as
with the Cape system of railways, were essential to the development of the vast
hinterland of Rhodesia, and planned his railway schemes with those objects in
view.

The first section, from Vryburg to Mafeking, was commenced in 1893,
Bulawayo being reached in 1897. Meanwhile, communication was in process of
being established with the seaboard. Salisbury was reached from Beira in May,
1899, the conversion of the line in Mozambique territory from narrow gauge
to 3-ft. 6-in. gauge being completed on August 1, 1900. In October, 1902, con-
nection was established between Salisbury and Bulawayo at a point 50 miles
east of the latter town. The line was then pushed north vigorously to tap the
Wankie coalfields area. The Victoria Falls were reached on April 25, 1904, and
by the beginning of 1906 a further section of about 375 miles up to the Broken
Hill Mines had been completed. The railway finally reached the Congo border
in November, 1909.

[...] The system is essentially centred on Bulawayo, from which there is a line
running south-westerly through the Bechuanaland Protectorate and the Cape
Province down to Vryburg, 597 miles from Bulawayo. A second line extends
in a north-westerly direction from Bulawayo to Victoria Falls, a distance of 280
miles, and then proceeds, roughly, to the north via Kalomo and Broken Hill to
the Congo border, a distance of a little over 500 miles. A third line / runs from
Bulawayo, roughly north-easterly through Heany Junction and Gwelo, at both
of which places there are branches, to Salisbury, some 300 miles distant, and
at Salisbury turns sharply eastwards to Beira, a further distance of 374 miles.
[...] From north to south the railway system extends approximately for 1,100
miles, and from east to west 650 miles. Connections are made at Mafeking and
Vryburg, on the southern line, with the South African system; at Dondo Jun-
ton, near Beira, with the Trans-Zambesia Railway; and on the Congo border at
N’dola with the Katanga Railway.

Results of Working in 1926, and in Five-Yearly Intervals, Beira & Mashonaland & Rhodesia Railways.

The growth of the railway system is illustrated by taking figures at five-yearly intervals. Such figures exclude all results applicable to the line between Broken Hill and the Congo border, which is leased from the Rhodesia-Katanga Junction Railway Company. As represented by the train-miles run, the business of the railways has increased very rapidly. Except for the period covered by the war, every five years has seen an additional million train-miles added. In 1926, aggregate train-miles were more than four times those of 1905.

The mileage of the railways owned by the various railway companies is shown in the following table, which indicates that the railways run through five distinct territories.

### Control

The control of the whole system, with the exception of the Blink-water Railway and the Rhodesia-Katanga Junction Railway & Mineral Company, is in the hands of the British South Africa Company. That company holds approximately 85 per cent. of the shares in the Rhodesia Railways Trust, which in turn holds 7,989 out of a total of 8,000 shares in the Rhodesia Railways Limited, and 449,612 out of a total of 450,000 in the Mashonaland Railway Company.

The British South Africa Company also have control, through voting power, of the Beira Railway Company and the Beira Junction Railway Company.

The Rhodesia-Katanga Junction Company is not controlled by the British South Africa Company, which is, however, represented on the board. The bulk of the ordinary shares were originally issued to the Tanganyika Concessions Limited; but there is no information obtainable locally as to the present own-
ers, beyond the fact that the British South Africa Company has not, either itself or through the various railway companies, a sufficiently large holding to give it control, the Rhodesia and Mashonaland Railways have a lease of the Katanga Junction Company’s lines until 1938. Further, the British South Africa Company have an option to purchase the line – at cost, plus 10 per cent. – in 1928 and every subsequent 5 years.

The following statement sets out the authorised capital, as at September 30, 1928, of the companies comprised in the Rhodesian Railway System, excluding the Rhodesia Katanga Junction Railway:

</tbody>
</table>

Practically the whole of the capital has been raised by debentures.

Chart of Organisation, Beira & Mashonaland & Rhodesia Railways.

The Mashonaland & Rhodesia Railway Companies raised some £13,000,000 by means of debentures and notes, every penny of which was borrowed originally at much lower rates than would otherwise have been possible, on the credit of the British South Africa Company. That company is still contingently liable, under its guarantees, for about £7,000,000 of Mashonaland and Rhodesia Railways’ debentures. £2,000,000 of notes were redeemed on August 1, 1927.

The share capital, viz., £8,000, of the Rhodesia Railways Limited does not and never was intended to bear any relation whatever to the actual value of the undertaking. It was merely a figure chosen for convenience of definition of interests which were in very few hands. Practically the whole of the shares of the Mashonaland and Rhodesia Railway Companies are now held by the Rhodesia Railways Trust Limited, a company formed in 1899, having for its object the amalgamation of the interests of the shareholders in the two first-named companies.

The Beit Railway Trustees, who administer the terms of the will of the late Mr, Alfred Beit for the promotion, construction and furtherance generally of
railways, telegraphs (including wireless telegraphy) and telephones, &c, hold practically the whole of the share capital of the Blinkwater Railway Co. Ltd.

Subsequent to September 30, 1928, the Mashonaland and Rhodesia Railway Companies have made an issue of £6,000,000 6 per cent. debentures for the purposes of:

(a) Redeeming £1,000,000 6 per cent. 10-year joint secured notes.

(b) Purchasing from the Rhodesia Railways Trust Limited engines and rolling-stock of a value of £1,000,000, formerly leased from that company under hire-purchase terms.

(c) Effecting payment for engines, rolling-stock, extensions to existing workshops and plant, and the construction of new works.

(d) Purchasing £1,500,000 of the new 6 per cent. debenture stock recently created by the Beira Railway Company in order to redeem their 4 per cent. debentures and 6 per cent. income debenture stock.

In amplification of (d) above, it should be added that the Beira Railway Company raised £2,000,000 6 per cent. debentures, plus 1 per cent. sinking fund, so as to provide funds to redeem their 4½ per cent. debentures and 6 per cent. income debenture stock. Of this new issue, £1,500,000 was subscribed for by the Mashonaland Railway Co. Ltd.

Organisation and Management.

The control of virtually the whole system by the British South Africa Company has simplified the question of management. The Rhodesian Railways Limited is the managing company for the whole system, except the Vryburg-Bulawayo section. Agreements for this purpose are in force with the Mashonaland Railway Company, the Blinkwater Railway Company, the Beira and the Beira Junction Railway Companies.

Under recent legislation a Railway Commission has been set up for the purpose of controlling rates on the system. Under the legislation which has been passed the Commission is charged with seeing that such rates are charged as will suffice to meet all working expenditure and proper fixed charges and to provide, in addition, a sum to cover a definite contribution for payment of dividends and a sum towards the accumulation of a reserve. Any surplus above these sums is to be devoted to reductions of rates. The Commission comprises a chairman and three members, the first chairman being Mr. E. H. Hiley, C.B.E., and it is understood that Sir W. W. Hoy, the present General Manager of the South African Railways and Harbours, will succeed Mr. Hiley in due course. The General Manager of the Beira & Mashonaland & Rhodesia system is Colonel C. F. Birney, D.S.O.
The working organisation adopted, which was formerly departmental, was recently altered to a form of divisional control. This has been under consideration for some time, and was recommended in General Hammond’s report on the railway system of Southern Rhodesia which was presented to the Legislative Assembly last year.

The new organisation, a chart of which is given on this page, places locomotive running under a Chief Superintendent of Transportation, with mechanical and operating assistants. There are District Superintendents of Transportation at outside centres, each again containing operating and mechanical branches. The shops at Bulawayo and Umtali remain under the Chief Mechanical Engineer, as well as the supervision of all boilers, electric plant, &c, and the latter remains the principal adviser of the General Manager on all mechanical questions. The Engineering Department remains under the Chief Engineer, and is not included (as it is on the neighbouring South African Railways) in the Transportation Department.

The total staff on September 30, 1928, was 19,748, including 3,379 whites and 16,369 natives.

Permanenent Way and Works.

The railways of Rhodesia were built about twenty-five to thirty years ago as pioneer lines, and they have retained until quite recently the chief characteristics of such lines. The ruling factor in the construction of most of this system was the element of speed. For that reason the location of the line followed, generally speaking, the easy country found along the watersheds, thus avoiding the bridging of large rivers. Although construction was on the whole easy, the country traversed is in many parts broken, the most troublesome section being that between Beira and Umtali. The earthworks were extremely light and the formation width for cuttings and embankments very narrow, so narrow that in many places there was no proper room for a cess. Until recently stone ballast was practically unknown, and station buildings were limited to the strict minimum. Stations are still spaced at long intervals, and great use is made of intermediate crossing places with no resident staff.

Political considerations obviously determined the route from the south through the native area of the Bechuanaland Protectorate. The administrative capital having been fixed at Salisbury, the line from Beira went to that point by the route of least resistance. The Bulawayo-Salisbury line followed the watershed, with a deviation to the goldfields around the Globe and Phoenix Mine. The Bulawayo-Livingstone line was built to the Victoria Falls as part of the ‘Cape to Cairo’ system, and later extended to the mines round Broken Hill, and subsequently to the Katanga. Future agricultural production does not seem to have
been considered in choosing the routes of the 'main' lines. Most of the branches, such as the Blinkwater line, the Lomagunda line to Sinoia, and the Mazoe line to Shamva, were built in the first place to give access to some important mines. Some of them, particularly the Mazoe line and the Lomagunda line, have, however, opened up fertile agricultural areas which have developed a substantial traffic.

Although only 1,252 miles out of the 2,462 miles of the system are within Southern Rhodesia, it is nevertheless true that at least 2,000 miles were built to serve Rhodesia, and until the recent big development in the Congo, Rhodesia had difficulty in finding the heavy railway revenue which was essential. On the basis of 2,000 miles of railway, there is one mile of line to every 75 square miles of area, and one mile to every 7½ adult European males (1926).

Until a few years ago the railway system was regarded as a pioneer line, built to reach certain areas as rapidly and cheaply as possible. The situation is now quite different. In the first place the steady growth of the Katanga has shown the desirability of affording, both for the heavy imports into that territory and the exports of copper, a reliable and satisfactory means of transport. The more recent developments in connection with copper, zinc, and lead mines in Northern Rhodesia also call for the provision of further facilities, and a better service. At the same time there has been considerable development in the mineral industry in Southern Rhodesia, particularly in chrome and asbestos, and it appears that copper in certain areas offers further great possibilities. While, therefore, minerals have been responsible in the first instance for the provision of railway facilities, these have in turn led to the opening up of many areas and to great development in agriculture.

This changed aspect has placed upon the railway companies that serve these territories considerable additional obligations to provide a more reliable and more frequent service and more railway facilities generally for their clients. It is true that political considerations, at a time when there was some question as to whether Southern Rhodesia should enter the Union of South Africa, and the doubt which existed since Southern Rhodesia, received her Charter of responsible Government, have been the cause of a cautious policy of railway expenditure and have prevented the undertaking of broad programmes for development and improvement in the future. The situation has been largely cleared up by the negotiations which took place in 1926 in London between representatives of the Government, the Colonial Office, and the owners of the railways, as a result of which a Railway Act has been passed defining the financial position more clearly.

It is therefore possible now for the railway companies to embark upon a well-considered programme of improvements. These include:

\(a\) Regrading those sections of the line where a better gradient can be obtained at moderate cost.
(b) Widening the formation and providing adequate side drainage.
(c) The provision of crushed stone ballast throughout the main line.
(d) Increasing the number of culverts and waterways.
(e) Strengthening the standard of the track by the introduction of more sleepers per rail length, and where this is done the new standard will comprise 2,240 sleepers per mile as compared with 1,920 in the original construction.
(f) Many of the older bridges are being strengthened to take increased loads without restriction.

In addition to the above, a programme of relaying the track is actually in progress. On the Beira Railway a length of 168½ miles between Fontesville and Umtali was originally laid with the 2-ft. gauge, while the Beira Junction Railway, 35½ miles long, was also built on this gauge, but it is many years since these have been converted to the 3-ft. 6-in. gauge, which is standard throughout the country. The programme of rail renewals contemplates carrying out from 70 to 100 miles per annum, the new rails being of 60-lb. section. At the same time sleepers are also being renewed at the rate of some 120 to 150 miles per annum. Most of the line is laid with steel trough sleepers, the latest designs weighing 50 per cent. more than the original ones. In many places wood sleepers are used, the number depending on the output which can be obtained from the local sawmills.

The large increase in rolling-stock, actual or contemplated, involves the provision of increased and more efficient repair facilities, and the main railway shops at Bulawayo are to be enlarged considerably.

The necessity of improving the track by better draining and ballasting has assumed great importance. Rhodesia is often pictured as a dry land. In January, 1926, a station half-way between Beira and Umtali received nearly 9 in. in one day, and 43 in. in nine days. Such heavy rain will destroy anything but a very well-drained track; without ballast the whole formation becomes soft and waterlogged and cannot safely support heavy trains. It has therefore been arranged to ballast the whole main line with crushed stone, at an average cost of something like £600 a mile, or nearly £1,000,000 in all. Stone-crushing plant is installed in several quarries. Experience has also shown that in many bridges the amount of waterway provided in the first instance is insufficient to pass the flood waters under the railway without danger of damage to bridge or banks. There are many other directions in which the increased traffic calls for increased expenditure, such as water supplies, workshops and plant, running sheds and depots, quarters for staff, &c. To give some idea of what is involved in the latter, it may be mentioned that £50,000 was spent on houses for European staff during 1926.

The average length of track maintained by a permanent-way gang on the Rhodesian Railways is a little more than 7 miles, the maximum being about 11 miles,
decreasing to 6 on sharply curved sections. The number of natives employed on the track is about 1.83 per mile, increasing to 2.75 during the rainy season. The European gangers1 average 0.149 to 0.169 per mile.

During the last financial year a large amount of work was done in connection with bridges and culverts. The construction of a 100-ft, span bridge at Mile 34 on the Beira line was completed, and a start was made with the provision of additional waterways to meet flood conditions by utilising the 200-ft, spans of the old bridge over the Kwe Kwe River to provide 100-ft. span bridges at 37 miles 9 chains and 38 miles 4 chains, while certain existing culverts were extended and additional openings constructed at points where they were considered necessary. On the Salisbury-Kalomo section several small bridges were strengthened, the most important being the conversion of a 75-ft. lattice girder bridge over the Gwelo River into a double span by the provision of an intermediate pier. Many other new works were carried out, these including the extension of locomotive running sheds, provision of additional goods-traffic facilities, new station buildings, houses for the staff and an extension to the administrative offices, while a start was made with a scheme of afforestation on certain straight parts of the railway strip in the vicinity of gangers’ cottages, this having for its object the growth of trees suitable for railway sleepers.

Semaphore signalling is confined to home signals regulating the admission of trains to stations, and in one case only, at Bulawayo, route signals indicating to starting trains for which line the road is set. Ordinary practice at the smaller stations and at the whole of the unattended crossing sidings is for warning boards, painted white on the side facing trains to which they refer, and black on the side facing trains with which they are not concerned, to be fixed at a distance of 600 yards from the outermost facing points. These warning boards are treated as caution signals, and drivers of approaching trains must be prepared to stop clear of any obstruction between the warning board and the station or siding. At stations so equipped, shunting operations are allowed to take place while trains are in the section, providing such operations do not involve engines and vehicles approaching nearer than 200 yards to the warning board concerned. Shunting operations at stations and sidings involving the use of the main line are not allowed within 15 min. of the time of arrival of trains.

At the end of September, 1926, the locomotive stock (including shunting engines) numbered 165, with an aggregate tractive effort of 4,236,000 lb., the principal types being shown in the following table:
Anon., 'The Railways of Africa'

</table>

The 12th class and Garratt locomotives were received during the financial year 1926, and enabled the record traffics of that year to be handled expeditiously. The latter engines have been allocated for use on the difficult section lying between Villa Machado and Umtali, where they have proved their ability to haul heavier loads on the steep grades and sharp curves more economically than was hitherto possible. A further 18 engines have recently been ordered to meet the continued increase in the traffics offering.

The coaching stock at the end of 1928 comprised 208 units, the principal types being 35 first-class and 35 second-class saloons, 25 native carriages, and 23 service coaches. On the freight side, there were 2,757 vehicles, this number including 512 45-ton steel open wagons, 550 37-ton steel opens wagons, 338 15-ton sheep trucks. 326 15-ton cattle trucks, and numerous covered wagons brake vans, water tank vehicles, &c. A further 107 45-ton steel open wagons have since been erected and placed in service, but increased traffic requirements have necessitated the ordering of an additional 100 vehicles of the same type.

A 45-ton steel open bogie vehicle is now the standard coal and mineral wagon, and 550 are in commission. A further 300 have just been ordered. It represents the heaviest eight-wheeled vehicle which is allowed on the 60-1b. track. It is 40 ft. long over buffers, has a tare weight of 16 tons and a carrying capacity of 45 tons. On a normal main-line train, after making allowance for the guard’s van, &c., this vehicle gives a ratio of 74 per cent. of paying load, compared to the total weight behind the engine tender. This compares favourably with coal or mineral wagons in other parts of the world.

Bogie livestock wagons have been specially designed to meet the requirements of long-distance cattle traffic. They are 41 ft. 6 in. long, and are divided centrally by a permanent partition to avoid bunching of animals en route. Protection against bruising is provided by padded bumpers at a height of from 3 to 4 ft. around the sides and ends. Speed and comfort are aimed at, and many of the vehicles are fit-

* This figure includes 10 locomotives in course of erection.
ted with carriage underframes and bogies, as they are used largely for conveying special train loads of live cattle from Bulawayo to Durban, a distance of over 1,000 miles. This journey is performed with only one intermediate feeding and watering stop en route. When not required in livestock traffic, they prove very useful in the conveyance of general merchandise, fruit, and maize traffics.

In order to provide comfortable accommodation for passengers travelling by goods train, six ‘composite’ goods guards’ vans have been placed in commission; these vehicles, 41 ft. 6 in. long, have two full-sized six-berth second-class compartments at one end, a native passenger compartment of 12 ft. at the other end, and in the centre, a luggage compartment of 12 ft. 2 in. and guard’s compartment of 4 ft. 5 in. All the compartments are electrically lighted.

Since 1919, all new goods stock placed in commission has been fitted with automatic couplers of the American type, and to-day approximately 37 per cent. of the goods vehicles in service are so fitted. The balance are being converted to the automatic type as opportunity offers.

Workshops.

The principal shops are located at Bulawayo, while there are smaller shops at Umtali. Approximately 432 men are engaged in the shops, the average out-turn of which is 90 locomotives, 100 carriages, and 4,000 wagons. The Bulawayo shops, which are well arranged for their specific function, cover 82 acres of ground, with 152,535 sq. ft. under cover. […]

Passenger and Freight Traffic.

For many years the traffic on the railways consisted of a few passengers and the necessary imported supplies from Beira and the Union of South Africa for the small widely scattered population; there was very limited local traffic between farms, towns and mines. Gold, which was the only important product exported, yielded little railway revenue by its transport, though much by its production. In the last few years there has, however, been a big expansion in traffic both on the passenger and freight sides, the latter principally in Rhodesian and in Congo base metal production.

The principal traffic of the railways consists of minerals. Coal from Wankie to the Congo and to the principal gold mines in Southern Rhodesia provides the largest tonnage (the total output of the colliery now amounting to over 600,000 tons per annum and increasing steadily); other minerals are copper from the Congo, chrome ore from Selukwe and Umvukwe districts, and asbestos from the Shabani area. The immense richly-mineralised area in the heart of Africa, comprising the tipper Congo or Katanga, and probably parts of Northern Rhodesia, is likely to provide more and more sources of traffic for which more than
one line of railway will compete. Maize has so far been considered the staple agricultural crop of the country, the export crop in a normal year being about a million bags. But other and more paying crops are receiving attention; tobacco especially, which has received a great stimulus from the Imperial preference, is going ahead by leaps and bounds.

The systems of consigning and invoicing goods, and of station accounting, are similar to those used in England and the Union of South Africa, the latter being outlined elsewhere. The periods of free storage allowed at stations In order to meet the convenience of farmers and others living at some distance from the stations are as follows: –

<table>
<thead>
<tr>
<th>Distance residing from Station.</th>
<th>When Goods are Handled by Railways and Warehoused or Stored.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Within 2 miles</td>
<td>2 days</td>
</tr>
<tr>
<td>Within 10 miles</td>
<td>&quot;</td>
</tr>
<tr>
<td>Within 20 miles</td>
<td>7 &quot;</td>
</tr>
<tr>
<td>Over 20 miles</td>
<td>14 &quot;</td>
</tr>
</tbody>
</table>

After the expiration of the periods mentioned, storage charges are raised at 9d. per ton per day, when the goods are protected from the weather, and 3d. per ton per day when the goods are kept in the open unprotected.

Of the total freight revenue earned during 1926, over all sections, including the Rhodesia-Katanga Junction Railway, general goods subscribed £1,861,904, railway construction material £126,929, coal and coke £701,161, copper for export £416,638, chrome ore £176,691, asbestos £70,889, and livestock and vehicles £103,976, Passengers, parcels, and luggage brought in £461,874, or 109 per cent. of the total revenue. The aggregate number of passengers carried was 647,802, and the total tonnage of freight 1,777,619, both these figures showing substantial increases as compared with the previous year.

On the main line there are three to four passenger trains each way per week, the larger number running between Salisbury, Bulawayo, and Livingstone. There are also four passenger connections per week to and from Cape Town, Johannesberg, and other parts of the Union of South Africa. A typical passenger train timing is as follows: –

<table>
<thead>
<tr>
<th>Height above Sea Level.</th>
<th>Miles from Beira.</th>
</tr>
</thead>
<tbody>

<td>374 30 Salisbury</td>
</tr>
<tr>
<td>4,469</td>
<td>671 09 Bulawayo</td>
</tr>
</tbody>
</table>
The average load of passenger trains varies between eight bogies (approximate weight, 280 tons) on the Beira-Salisbury line and north of Livingstone, and 14 to 18 bogies (approximate weight, 490 to 830 tons) between Salisbury and Livingstone and also Bulawayo to Mafeking. Practically all main-line passenger trains are equipped with dining cars throughout.

Branch line services usually consist of about three mixed trains per week each way, conveying both passengers and goods.

Mention should be made of the recent large increase in tourist traffic to South Africa and Rhodesia. The magnificent Victoria Falls is one of the principal attractions luring tourists to South Africa, and the railway companies have spared no trouble or expense in providing a first-class hotel near the falls. It is evident that there is an ever-increasing desire on the part of tourists from America and elsewhere to penetrate into the less civilized parts of the world, and the attractions of the falls and the ancient ruins of Zimbabwe, as well as the chance of seeing native life in its primitive setting, have been the causes of a largely increased passenger traffic from overseas. This feature of railway working is receiving attention and new passenger stock is under order.

Lay-out of Bulawayo Station, Beira & Mashonaland & Rhodesia Railways.

A representative goods train timing (through port goods) is as follows: –

</tbody>
</table>

On the main line goods train services vary between three trains and six trains each way per day. Goods trains run at very nearly the same speed as passenger trains. The whole of the stock, both goods and passenger, is equipped with automatic vacuum brakes. The bulk of the goods trains carry through traffic and do not normally perform any shunting work between depots, this being done by specially appointed trains either once per day or every alternate-day according to requirements.

The largest terminal and depot stations, with the number of trains dealt with on the average, are as follows:–

<table>
<thead>
<tr>

</tr>
</tbody>
</table>
Salisbury and Bulawayo goods depots each deal with roughly 20,000 tons of goods forwarded and received per month, and approximately 17,000 tons at Bulawayo and 13,000 tons at Salisbury are handled by the railways.

The sections of greatest traffic density are Umtali to Salisbury, 170 miles, and Wankie to Livingstone, 75 miles, both of which have approximately six trains each way per day. During produce export seasons the train service on the Umtali-Salisbury section exceeds the figure given by approximately two trains each way per day.

On the Umtali-Salisbury section the greatest distance between stations is 45 miles and the shortest 14 miles, the average being 24 miles. The largest number of crossing sidings between any pair of adjacent stations is five. The greatest distance between two crossing points, either station or unattended siding, is 11 miles, and the shortest 4 miles, the average being 8 miles. On the Wankie Livingstone section with a similar traffic density (six trains per day each way), the greatest distance between stations is 38 miles and the shortest 6 miles, the average being 28 miles. The greatest distance between crossing points (either station or unattended siding) is 13 miles and the shortest 5 miles, the average being 7 miles.

Traffic is mainly worked by means of telegraph orders, and crossings are effected at both stations with resident staff and at unattended crossing loop sidings. Only three different kinds of telegraph order are employed, namely, a ‘through’ order, a ‘crossing’ order (which may show up to four or Rye crossings between stations), and a ‘ballast’ order. These orders are actual telegrams received from the next station, and are handed to the drivers and guards of trains without being rewritten. No signatures are received for them, and they serve as authority for the train movements to the next telegraph station and cover all intermediate crossings and passings, &c., which have to be effected en route.

Webb & Thompson’s electric miniature staff working is in force between Beira and Dondo Junction (18 miles), at which point the Trans-Zambesia Railway connects with the Rhodesian system. Intermediate crossing and unattended junction electric staff working is employed on this section. Arrangements are now being made to instal Tyer’s electric key token system on two short sections of the Wankie-Livingstone line.

As ton-mile statistics are not kept for the Vryburg-Bulawayo section, any study of the figures in which this factor of efficiency is used must necessarily be confined to the sections north of Bulawayo. Complete operating statistics for each of those sections are also compiled in the Chief Superintendent’s office at Bulawayo, giving figures for tractive, gross and net ton-mileage, the various relations between them and the train engine-hours, together with average train loads, and train-mileage in relation to train engine-hours. The following were the condensed operating results for the financial year ended September 30, 1926:
Gross ton-miles per train engine-hour 5,631  
Net ton-miles per train engine-hour 2,612  
Train miles per train engine-hour 13  
Average load of trains, gross 426  
Average net load of trains in direction of traffic 66%  
Average load of trains, net 196  
Average load of vehicles (loaded trucks only) 25

Below will be found a few of the outstanding results of the 1926 years working: –

The Port of Beira.

The port of Beira is situated 374 miles from Salisbury and 671 miles from Bulawayo. It is accordingly the nearest and natural outlet for Rhodesia to obtain the most economical results. To show the expansion of the port of Beira, the following approximate figures are given showing the tonnage handled during the year:

<table>

Beira serves, apart from the Mozambique territory and Rhodesia, the Congo and Nyasaland. These countries have made marked progress during the past ten years, and it is believed that the resources now proved are capable of much greater and more rapid expansion in the future, provided facilities at the port of Beira are developed to meet requirements. Beira is purely a lighterage port; ships lie in the main stream of the river, while the lighter wharves are situated on both sides of the Chiveve Creek. The rise and fall of the tide is approximately 20 ft., and the ebb tide runs, at its maximum, at about 5 knots. At ordinary high tide ships drawing 24 ft. can enter the port, but those of greater draught must wait for spring tides. The anchorage, although a long one, is somewhat constricted, and ships have not much room in which to swing to their anchors. The harbour and the Customs wharf are under the authority of the Mozambique Company and not the railways. The exports and most of the rough import goods pass over the railway wharf.

Goods dealt with at the Customs wharf are sorted and checked there, and those for up-country are trolleyed round by the forwarding agents to the railway goods shed, and until then the railways have nothing to do with them. Hitherto this has been the normal method of dealing with imports, but in the last year this method has changed and imports are being more and more dealt with at the railway wharf. This has been possible owing to provision of transit sheds on a portion of the wharf. The whole wharfage front available is, however, very limited and prejudices an expansion of trade at the port. For this reason arrangements have been made to carry out considerable improvements and extensions. These comprise the addition of another 380 ft. of lighterage wharf equipped with four cranes, and 520 ft. of new deep-sea wharf, alongside which ocean-going vessels can be berthed. These extensions, together with a corresponding increase in marshalling and storage sidings at the back of the port area, are estimated to increase the capacity of the port by over 60 per cent. This work is being carried out by a new company formed for the purpose, named the Beira Works Limited,
receiving its powers through a Portuguese company which has obtained the necessary concessions from the Portuguese Government.

The Beira Works Company is also at present busily engaged in dredging, with new equipment, the roadstead in the Pungwe River just outside the wharf, and in deepening the channels, as well as dredging in front of the present railway wharves. The water here is very shallow and consequently the lighters are aground for three or four hours at low tide. At present the railways have a wharfage of 905 ft. and 94,980 sq. ft. of warehouse area. On the wharf are 11 steam cranes of modern design, and the lay-out of the lines to serve the wharves is of a satisfactory type. The rate of handling the different commodities varies. With maize one crane can handle about 300 tons in eight hours; with copper about 250; and with chrome ore about 400.

Under the recent arrangement made with the Beira Works Company, that company has taken over certain wharf and railway facilities within the port area, but arrangements will be made to secure continuity of method, for the railways to work all traffic on shore in close association with the new company.

**Stores, Catering, Medical, &c.**

The Stores Department has its principal depot at Umtali, and it is noted from the report for 1926 that during the year the store, and materials imported from oversea represented £348,106, while those purchased locally cost £289,447. An increase in this latter item over the previous year was shown of £89,729, this principally being accounted for by food for natives, wooden sleepers, and by purchases of certain urgent stores due to the floods on the Beira line holding up supplies in the port. A Purchasing Board holds regular monthly meetings to consider requirements.

Another important department on such a widespread system is that charged with the catering arrangements. In 1926 the department earned a profit of £14,056, and during the year served 222,372 meals, facilities being provided both on the trains and at refreshment rooms. The working of the dining cars (on the turnover) showed a profit of £2,476, the number of meals served being 66,952.

The Medical Department, too, has most important work to perform on a system running through tropical and sub-tropical countries. Much depends upon the incidence of the weather, and as to how far it has been possible to provide the most hygienic conditions, Great care is necessarily taken to supervise the health of the employees, and a principal medical officer with assistants are constantly working on these lines. A recent appointment was that of Inspector of Natives, whose work, it is stated, has proved of great value to the medical officers.
Need for Zambesi Bridge.

As shown in the articles on pages 95–99 there is urgent need for a bridge over the River Zambesi, in order to link up railway communications between Nyasaland and the Port of Beira. Sir William Himbury, Managing Director of the British Cotton-growing Association, in his report on the future of cotton-growing in the Union of South Africa, deals with the question of traffic congestion on the Zambesi, and observes:

After personal inspection of the river here, of the sheds and goods awaiting transit, after obtaining figures and statistics of the quantity dealt with, one is forced to come to the conclusion that the present system is quite impossible. A bridge is necessary. With the construction of a bridge the railway from Blantyre must be pushed northwards towards the Lake, and, if necessary, eventually to Fort Jameson.

Nyasaland, from an agricultural point of view, is, for its size, one of the most interesting colonies in Eastern Africa, its real limitations being its small size and its cramped transport facilities.

THE SHIRE HIGHLANDS RAILWAY.

A line 113 miles long, and located in the Nyasaland Protectorate, this railway is operated in conjunction with the Central Africa and Trans-Zambesia Railways, the supervising personnel covering the three railways.

The Shire Highlands Railway extends from Blantyre to Port Herald – a distance of 113 miles – and has its headquarters at Limbe. Like many other railways of South and East Africa, it is of 3-ft. 6-in. gauge. The line from Blantyre to Chiromo was constructed by private capital under a contract with the Nyasaland Government, dated December 31, 1902, and from Chiromo to Port Herald under a further contract, dated February 11, 1908. The railway was opened for traffic in 1909.

The railway passes through very mountainous country, and from Sankulani to Limbe – about 66 miles – there are curves as sharp as 16 degrees, with an adverse ruling gradient of 1 in 44. This section contains some 500 curves, representing about 30 miles in length, or nearly 50 per cent. of the total mileage. Such curves and gradients naturally reduce the speed of trains, and also limit the load. The speed restriction on up trains is 35 miles an hour between Port Herald and Chiromo, 18 miles an hour from Chiromo to Limbe, and 15 miles an hour from Limbe to Blantyre; while on down trains it is 18 miles an hour from Blantyre to Limbe, 20 miles an hour Limbe to Mikalongwe, 18 Mikalongwe to Chiromo, and 35 from Chiromo to Port Herald. Seasonal wash-outs affect the first 12 miles of the railway from Port Herald, and are a great hindrance to traffic.
Permanent Way.

The permanent way consists of 41 ¼-lb. rails on 76-lb. steel sleepers, and is stone ballasted. There are eight stations on the railway and two, train-crossing loops, viz.:–

The stations are equipped with Morse telegraph instruments, but there is no signalling in operation. Trains are worked under the absolute block system, by means of line clear orders and such special instructions as may be issued in connection with the running of any particular train. The rolling-stock owned by the Shire Highlands Railway consists of 8 locomotives (2 of which are on loan to the Trans-Zambesia Railway), 1 motor trolley, 13 passenger coaches and 50 wagons. The Shire Highlands Railway is, however, the working company for the Central Africa Railway, and has the use of that company's rolling-stock.

Locomotive and Carriage and Wagon Workshops.

The locomotive repair shops, which deal with repairs to the stock of the Shire Highlands and Central Africa Railways, are situated at Limbe, as also are the running shed and the carriage and wagon shops. They consist of a small erecting shop, with one pit, a machine shop, a smith's shop, a small brass foundry, a power house, a carriage and wagon machine shop, and a large open shed where repairs to carriage stock are carried out. A paint shop is in course of erection. The average miles run between overhaul by engines of the two railways in 1928 was in the neighbourhood of 60,000. Prior to 1926, wood fuel was used on Shire Highlands locomotives, but, owing to the difficulty of obtaining supplies, and also to its increased cost, coal was introduced in that year to supplement wood, the engines being gradually converted to coal-burning. From the following mileage figures it will be observed that some 40,000 miles per annum were run by trains conveying supplies of fuel:–
Miles. 1925. 1926.
Train 47,465 68,924
Light 1,658 1,491
Shunting* 2,562 4,651
Ballast 8,217 3,737
Fuel 38,297 41,023
Pay and stores 2,906 2,164
Total 101,105 121,990

Passenger and Goods Traffic.

There are two passenger trains each way weekly, one conveying mails and passengers at full fares, and the other passengers at half-fares. The average number of trains per week is 30, of which about eight are fuel trains and two pay-trains, and, therefore, non-revenue /

[...]

earning. The control of trains is in the hands of a controller at Limbe, who works directly under the orders of the Traffic Superintendent. He is responsible for arranging out-of-course crossings, movements of fuel or ballast trains, the requisitioning of engine power and the distribution of wagons. With such a small traffic comprehensive statistics are not maintained, but these will, no doubt, be introduced at a later date.

Particulars of the traffic dealt with during the last three years are set out below:

The Nyasaland Government has the right to purchase the Shire Highlands Railway, rolling-stock and equipment at any time after 25 years from the date the line was opened for traffic. This right can be exercised in 1934.

* Calculated on basis of 10 m.p.h.
† Short ton of 2,000 lb.
Rates and Fares.

Rates and fares are high when compared with other railways. This is mainly due to the small traffic conveyed, but, with the future development of Nyasaland, it may be possible to effect certain reductions. The cost of working a railway of such a mountainous character is also a factor. Details are set out below:–

**Passenger Fares.**

First class, 6d. per mile. Second class, 2¼d. per mile. Third class ¾d. per mile.

**THE TRANS-ZAMBESIA RAILWAY.**

This line is 157 miles long on the 3-ft. 6-in. gauge and extends from Dondo, Beira & Mashonaland & Rhodesia Railways, to Murraca on the River Zambesi, connecting by Ferry Service with the Central Africa Railway.

The Trans-Zambesia Railway runs through territory held and administered by the Mozambique Company under charter granted by the Portuguese Government. The first concession for constructing the railway was granted by the Mozambique Company in April, 1898, and was transferred to a Belgian Company (the Compagnie du Chemin de Fer de Beira au Zambese) in October, 1912. Difficulties arose in connection with the financing of the construction of the railway, and in August, 1919, a conditional contract was entered into between representatives of the Belgian company and the Crown Agents for the Colonies, acting on behalf of the Nyasaland Government, under which a railway company was to be incorporated in England – with the approval of the Mozambique Company and the Portuguese Government – to acquire the rights of the Belgian Company to construct and work the proposed railway.
The Trans-Zambesia Railway Co. Ltd. was incorporated in England in December, 1919, with power to issue 6 per cent. debentures up to £1,200,000, redeemable by an annual sinking fund in 25 years, commencing five years after the first issue, the whole to be redeemed within 45 years. The Nyasaland Government guaranteed the interest of the debentures for 25 years from date of issue – the company to repay all sums advanced with interest at 5 per cent. – the maximum annual payment to be limited to £72,000 in respect of interest and £30,000 in respect of sinking fund. The Nyasaland Government was allotted 150,000 fully-paid ordinary shares of the 600,000 issued, and have the right to be represented by a Director on the Board, while the Mozambique Company was allotted 200,000 ordinary shares with the right to appoint the Chairman and half the Directors of the Board.

In order to provide further working capital, £200,000 10-year guaranteed notes at 5½ per cent. were issued in August, 1923, to be redeemed at par in 1933, the interest and principal being guaranteed by the Nyasaland Government.

The railway was constructed by contract from Dondo (junction with the Beira & Mashonaland & Rhodesia Railways) – on the Beira Junction Railway, 18 miles from Beira – to Murraca on the south bank of the Zambesi, and was opened for traffic on July 1, 1922.

The distance from Murraca to Dondo is 157 miles, and the Trans-Zambesia Railway has running powers over the Beira Junction Railway for the remaining 18 miles to Beira.

There are three stations – exclusive of Dondo, which is on the Beira Junction Railway – and four crossing places, viz.:

Permanent Way and Signalling.

The railway is laid with 60-lb. rails, with 70-lb. steel sleepers for most of its length. Originally, some 24 miles were laid with local wooden sleepers, but these were found to be unsuitable, and in due course will be relaid with steel sleepers. No ballast has been used, the sleepers being packed with sandy earth taken from alongside the formation.
The ruling gradient is 1 in 80. In the rainy season the Zambesi encroaches over its right bank and seriously affects the line between Caia and Murraca, Murraca station yard being at times under water.

Stations are equipped with Morse telegraph instruments and Murraca is connected with Chindio, on the Central Africa Railway, by means of a twin marine cable 2 miles long. No signalling or interlocking is in operation, trains being worked under the absolute block system with line-clear orders. The control of trains is in the hands of the Traffic Superintendent at Beira.

Locomotives and Boiling-Stock.

The Trans-Zambesia Railway owns 6 locomotives, 2 motor trolleys, 14 carriages, 126 wagons and 1 breakdown crane. There are also two engines on hire from the Shire Highlands Railway. Repairs to rolling-stock are undertaken at Murraca, where there is an open shed, capable of holding one engine, and which does duty as a running shed. The locomotive depot will shortly be removed to Inhamatanga, where a well-equipped running shed is being erected.

Wood fuel exclusively is used on engines. The productive and non-productive mileage run in 1925 and 1926 is set out below:

The decrease in traffic in 1925 was due to failure of the sugar crop.

The passenger fares from Muracca to Dondo are 6d. per mile 1st class, 4d. per mile 2nd class, and 1½d. per mile 3rd class. On the Beira Junction Railway from Dondo to Beira they are slightly lower.

Goods rates are set out below:–

The concession to the Trans-Zambesia Railway Co. Ltd. is in force for a period of 99 years from November 4, 1919, after which the railway reverts to the Portuguese Government. The Mozambique Company has the right to repurchase the concession at any time after 20 years from November 4, 1919.

Ferry Service.

From Muracca on the Trans-Zambesia Railway to Chindio on the Central Africa Railway – about two miles distant – traffic is conveyed across the Zambesia River by means of a ferry service, the property of the Trans-Zambesia Railway.

Shallow draught stern wheel steamers, with limited passenger accommodation, are utilised, and barges – attached one on each side of the steamer – convey the goods traffic. It is not possible for wagons to be taken across the river, and merchandise has to be unloaded, sorted and checked on either bank before tran-

* Short ton of 2,000 lb.
† Short ton of 2,000 lb.
shipment between wagon and *vice versa*. Goods in transit have to be passed by the Portuguese Customs on both sides of the river.

The full load of the barges is 30 tons each, or 60 tons a trip, and the time taken in loading averages about 1½ hours. Customs Manifest and Clearance occupy about one hour; crossing the river, casting loose barges, &c., 1½ hours, and unloading one hour, in all, say, five hours, the round trip being performed in about 10 hours. Owing to floods during the rainy season and to the shallowness of the river and the numerous sandbanks during the dry season, full loads can be conveyed for about four months only during the year. From January to April there is the possibility of goods traffic being held up altogether owing to floods; from May to August the river is at its best from the ferry point of view, but from September to the end of the year the river becomes very shallow and loads have to be reduced from 60 tons per trip to as low as 15 tons.

There is the further factor that the Zambesia is apt to change its channel and it is not possible to maintain permanent sites on its banks as terminals. For this reason a train ferry would not be practicable.

**THE TANGANYIKA RAILWAYS.**

This Government System exceeds 1,000 miles in length, and comprises two detached main lines. Sisal, Ground-nuts and Copper are the Principal Items of Freight Traffic.

TANGANYIKA Territory, on the East Coast of Africa, comprises an area of some 365,000 square miles and is, therefore, three times, as big as the United Kingdom and almost equal to the area of Kenya, Uganda and Nyasaland added together. The population exceeds 4,000,000, and mainly comprises tribes of mixed Bantu race. The railway system, which was taken over from the Germans during the Great War, now extends for a little over 1,000 miles in length and is on the metre gauge. There are two detached single-line railways running out from the coast: the Central Railway runs from Dar-es-Salaam (the capital) to Kigoma on Lake Tanganyika, with a branch from Tabora to Mwanza on Lake Victoria Nyanza, and is 1,244 km. (772½ miles) long. A second main line of 353 km. (219 miles) in length leaves the coast at Tanga, and has been extended beyond Moshi to Arushi on the Sanya River. A line called the Sanya River branch runs out from a point near Moshi, while the Voi-Kahe Railway (92 miles long) runs out to Voi in Kenya Colony, and is now worked as part of the Kenya & Uganda Railway. A line of 64 miles in length towards Tabora has been developed from Mwanza, but was not opened for traffic at the end of the last financial year. Additionally, there is a narrow gauge line in the southern coastal region of the territory called the Lindi Tramway. Marine services are worked on Lakes Victoria Nyanza and Tanganyika.
The total capital cost of the railways up to March 31, 1926, was £5,914,490, nearly £5,000,000 of this amount having been expended on the Central Railway. During the year 1925–26, £297,210 additional capital was spent on the Central Railway, while £52,935 was disbursed on account of the Tanga Railway. Improved results were shown on the working of the railways for the financial year 1925–26, as compared with the previous year. Net revenue for 1925–26 was £388,118 the previous year, while expenditure was £391,276 against £354,965 in 1924–25. As a result, the operating ratio in 1925–26 was 100.80 per cent. as compared with 106.56 per cent. in the of the earnings, the Central line receiving 80.33 per cent. of its net revenue from this source and the Tanga Railway 51.73 per cent. Corresponding percentages for coaching traffic on the two lines were 17.73 and 42.91 respectively. On the expenditure side, locomotive, carriage and wagon expenses accounted for 39.07 per cent. in 1925–26, maintenance of way and works 24.23 per cent., and traffic charges 12.72 per cent. Owing to the deficiency in working the Imperial Treasury has had to remit certain sums to the Territory. In 1919–20 and 1920–21 large free grants were made, but since then repayable loans have been advances, and the total of these now amounts to close on £1,000,000. Deficits on working were an annual occurrence until 1924–5, when for the first time the Central Railway showed a profit which has been increased for 1925–26. In the last financial year a profit on the working of the combined railways was made for the first time.

The railways are organised on a departmental basis, the General Manager, Col. G. A. P. Maxwell, being in control of six separate departments – Engineering, Locomotive, Traffic, Marine, Accounts and Stores – with headquarters at Dar-es-Salaam. The Department of the Port and Marine was absorbed into the railways on November 1, 1925. The work on the wharves was handed over to the Traffic Department, the cranes and dockyard to the Chief Mechanical Engineer’s Department, and the Director of Port and Marine became the Marine Superintendent of the Railway Department. The Engineering Department is subdivided into three districts, two on the Central and one on the Northern Railway. The first district extends from Dar-es-Salaam to Itigi, with headquarters at the former place. The second district extends from itigi to Kigoma with headquarters at Tabora, and the third district extends from Tanga to Moshi, inclusive of the Sanya branch, with headquarters at Tanga. The Chief Mechanical Engineer is assisted by district officers, and has, as an independent supervisor, a Locomotive Running Superintendent.

The total staff employed on March 31, 1926, was 8,513, 182 of these being Europeans, 108 Goans, 674 Indians and 7,549 Africans. The Engineering Department accounts for 4,522 of this total, and the Locomotive Department 2,384, the Traffic Department employing 700 persons.
Permanent Way and Works.

The track mileage maintained on the Tanganyika Railways amounts to 1,127 miles. The number of maintenance sections at the end of the last financial year was 16, their average length being 100 km., with a maximum length of 116 km. and a minimum length of 80 km. On the Central Railway 1.28 track men were employed per kilometer, and on the Northern line 1.15 men per kilometre, including sidings, this representing an average of 1.19 men per km. being laid over easier country, which should make for rapid progress. One of the great troubles has been to obtain sufficient labour, and the contractors have had to resort to the importation of Liberians, Hindu coolies and West Africans.

The rails weigh 30 kg. per metre. The maximum gradient is 2½ per cent. and the minimum radius of curves 120 m. between Lengue and Sao Pedro there is a rack section of the ‘Riggenbach’ type, with gradients of 1 in 16. The line follows a ledge of rock and crosses the canyon three times. The first bridge has five spans and masonry piers, the second on has one span of 138 ft. in length at a height of 60 ft. and the third has four 60 ft. spans.

The rolling-stock comprises 35 locomotives, four rack locomotives, 20 carriages, 293 freight vehicles and rail motor cars.

The Mossamedes Railway.

This railway runs from Mossamedes to the south of the colony, and extends to Lubango on the Chella plateau, a distance of 155 miles, an extension being now in progress through Huila. The line is laid to the 60-cm. gauge. The southern portion of Angola has been difficult to pacify, and one of the reasons for the building of the line was the facility offered for troop transportation to the foot of the Chella plateau, some 100 miles inland. Additionally, the line opens up a region capable of easy colonisation. A Royal Decree of 1905 authorised the railway, and by the end of the following year some 40 miles were open for traffic. A further 25 miles was constructed in accordance with a Decree of 1907, and on the outbreak of war about 100 miles were in service. The southern portion of Angola is the natural outlet for the Otavi district, which is situated in ex-German South-West Africa, and an extension of the railway to Otavi has been projected.

THE RAILWAY OF MAURITIUS.

The island of Mauritius, a British possession, which is about 36 mile in length and 28 in breadth, contains an area of approximately 720 square miles and an estimated population of about 400,000. The railway system which [...] serves a great deal of the island, comprises 120 miles of 4 ft 8½ in. gauge line and 24 miles of 2
ft. 6 in. gauge line. The working results for 1924, the latest figures available, show railway receipts Rs. 5,124,641, including work done for Government departments, and expenditure, excluding charge on debt Rs. 5,183,158. The railways are under Government control and are divided into four systems.

The Midland, which is the main line, runs from Port Louis, the capital, to Mahebourg, via Curepipe, and has to climb to a height of 1,800 ft. and descend to sea level in the Grand River on a fine 5-span bridge, and subsequently has to negotiate many severe gradients, 1 in 50 being frequent, while there is one of 1 in 27 between Petite River and Beau Bassin. At Rose Belle a 10½-mile branch runs south to Souillog on the coast, this carrying a large passenger and sugar-cane traffic from the Savanne district.

The North line extends for 31 miles and runs in a semi-circular direction from Port Louis to Grand River S. E. through fairly level country almost entirely devoted to the production of sugar cane. A short branch, 3¼ miles in length, runs out from Terrerouge to Long Mountain. The Moka Flacq line, which branches off the main line at Rose Hill, runs almost due east for 25¾ miles and joins the southern portion of the northern line at Riviere Seche. The remaining line to Black River leaves the main line at Riviere Seche. The remaining line to Black River leaves the main line at Richelieu Junction line runs south through Tamarin.

The lines are all being passing place at nearly every station. The higher grade railway officials are Europeans, but the stationmasters are Creoles, as are also the guards, while the porters are chiefly natives. The railway workshops are at Plaine Lausanne, 1½ miles from Port Louis on the Midland line.

The rolling-stock comprises 51 locomotives, 200 passenger carriages and 874 freight vehicles for the 4 ft. 8½ in. gauge, and 3 locomotives, 1 carriage and 168 freight vehicles for the 2 ft. 6 in. gauge. The majority of the stock is four-wheeled, but there are a few 8-wheeled bogie wagons in service. There are no special engineering features on the line, except for the one or two bridges noted, the line being laid more or less on the natural surface of the ground.
It is an interesting fact that the vast Continent of Africa, except for a few comparatively small areas, has been developed solely by various European Powers, and that by far the major portion of the country is still subject to their control. This differentiates Africa from the other Continents, and has doubtless been a factor of great importance in connection with transportation developments. Great Britain and France are principally concerned, as each country is directly interested in territories having an aggregate area much larger than Europe, and may, therefore, be said to control two-thirds of the total area (11,500,000 square miles) of the Continent. Belgium, Portugal, Italy and Spain are also involved, so there is ample scope for railway questions to become interwoven with politics of an international character. Except for Great Britain, however, the interests of the different nations are sharply defined from each other. The British Possessions are widely scattered, east, west and south, while Belgium is interested solely in the Congo, Portugal with Angola and Mozambique, and Spain with relatively small areas. France, however, virtually monopolises the whole of Northern Africa, and the greater part of West and Equatorial Africa, Italy controlling Libya, Eritrea and a slice of Somaliland.

On an equal basis for miles of railway per 100 square miles of area as this country, Africa would require to have more than three times the present total for the world! Such a comparison – unfair though it is – clearly shows the great difference...
in the conditions. A contrast with other new countries, such as South America and Australia, is, perhaps, more illuminating, and is given in the above table.

[...]

It has not been a simple task to compile the table, as even where information was available there were disturbing discrepancies to be investigated, but we believe that the figures now presented are accurate within measurable limits. They show that the principal gauge in use is the 3 ft. 6 in. with 20,825 miles, the next the metre with 8,694 miles, and the third, 4 ft. 8 1/2 in., with 4,232, a somewhat similar mileage being divided between the 2 ft. 6 in. and 2 ft. gauges. It is rather unfortunate that there should be two gauges with a difference of only a little over 2 in. in width, more especially as several of the metre-gauge lines will inevitably be linked up with the more rapidly developing 3 ft. 6 in., but in all probability conversion can be made without much inconvenience or expense on the metre-gauge sections of line concerned. In this connection it may be added that as some of the metre-gauge lines in the Belgian Congo are being extended, opportunity is being taken of widening the existing lines to the 3 ft. 6 in. gauge.

As in all new countries, the railways of Africa first developed as long single lines running out into the interior from suitable bases on the coast, this tendency being clearly illustrated in our map. Then branches were added to the main line, and as traffic developed following the provision of railway facilities came the need for connecting the disconnected lines. That, broadly, is the position in Africa to-day. In the north and south a great deal has been done, but both east, west and centre the lines are extremely localised, and a large mileage of new railway will be required to bridge the gaps. Transcontinental connections so far are lacking – except for the east-west route in South Africa – but steps are now in progress for this defect to be remedied, as noted in a separate editorial.

Just as the size of the African systems differs as between the Union of South Africa with 12,624 route-miles and Sierra Leone with 338 miles, so conditions vary between wide limits. In some parts the country is absolute desert, in others of a mountainous character. Some territories are always short of water and others have an abundance through the great rivers. As a result, railway construction is hindered on the one hand by sand and dust storms and on the other owing to the very swampy nature of enormous areas. Then there are great climatic differences, while traffic characteristics in the varying districts also have an influence on railway practice. Quite different methods of working are naturally required in the heavy zones, such as the coalfields of South Africa and Nigeria, the copper region of the Katanga, the manganese district of the Gold Coast, the phosphate areas of Morocco and Tunisia,

</table>

Some of the systems have now been developed to a commendable degree of efficiency, especially when viewed from the standpoint of the conditions under which they have to work, and, as we show in our articles, every effort is being made to raise their standard of efficiency. The re-location of lines and the improvement of operating conditions by means of regrading and the flattening of curves go hand in hand with the employment of stronger track materials, more powerful locomotives and high-capacity rolling-stock. Train control is making rapid progress on several systems, while recent investigations have led to the more or less general adoption of a ‘transportation’ scheme of organisation on most lines. The relatively low operating ratios of the railways in British territories show that keen attention is being paid to the financial aspect – which must, of course, be considered in conjunction with the necessity for encouraging national development – and there seems every reason to expect that these and

* * Includes Senegal, Guinea, Ivory Coast, Togo, Dahomey, &c. and the agricultural zones of the Sudan, Tanyanka and other countries, while the prevalence of heavy seasonal traffics with their intensive demands upon railway facilities has also an important bearing upon railway questions in Africa.
other African railways, in the enlarged sphere they will inevitably fill, will prove to be sound assets to the countries they serve. / 

THE SUDAN GOVERNMENT RAILWAYS AND STEAMERS.

The State Administration Controls 1,728 Route-Miles of 3-ft. 6-in. Gauge Line, operates Steamer Services over 2,435 Miles of River, and has recently introduced Mechanical Road Transport in certain localities. Important Developments are pending in each Phase of Activity.

The Sudan Government Railway system, which now comprises close on 2,000 miles of line, owes its inception to the military railway, which was constructed during the Anglo-Egyptian campaign for the re-conquest of the Sudan, in the years 1896–99.

The Sudan is 1,000,000 square miles in area, or over ten times the size of Great Britain, the total native population being approximately 6,000,000. Great tracts of the territory consist of waterless desert, which are practically uninhabited, the occupied productive regions being confined mainly to the valley of the River Nile and its southern tributaries. The country possesses great natural resources, and with the extension of railway facilities and irrigation works, important developments are taking place, notably in connection with the production of cotton, grain, &c., for shipment.

Early Railways.

The first railway project in the Sudan was launched in the ‘seventies, under the auspices of the Khedive Ismail, whose intention was to construct a line along the Nile from Halfa southwards to Khartoum, and ultimately to El Fasha, the capital of the Darfur Province. This scheme was, however, abandoned owing to its expense when some 30 miles had been laid, and railway development in the Sudan was held back for a quarter of a century. In the year 1896, during the Anglo-Egyptian campaign above mentioned, the first advance of the Army was made possible by the extension of this derelict line along the Nile to Kerma, a distance of about 170 miles. The line, however, was subsequently abandoned, and the track was taken up in 1904.

The military railway (576 miles long) constructed by Lord Kitchener to connect Halfa with Khartoum, in the years 1896–99, was really the beginning of the Sudan system of railways. This line, instead of following the course of the River Nile, cut straight across the Halfa Desert. On the successful termination of the campaign in 1900, the military railway and the Egyptian War Department steamers were handed over to the Sudan Government, and administered by the Civil Service. At that time the only means of communication with the
Sudan was via Egypt, by way of the Egyptian State Railways, terminating at Shellal, and thence by Sudan Government Railway steamer service to Halfa. By this route, three transhipments were necessary between Cairo and Khartoum – (1) at Luxor, where the 4-ft. 8 1/2-in. gauge changed to 3-ft. 6-in.; (2) at Shellal, from rail to river steamer; and (3) at Halfa, from river steamer to Sudan Government Railway. One of these transfers has recently been obviated by the conversion of the Egyptian State Railways between Luxor and Shellal from 3-ft. 6-in. to 4-ft. 8 1/2-in. gauge.

Railway Extensions.

In 1905 the Sudan Government Railway was linked up with the Red Sea by a connecting line (304 miles long) from Atbara to Suakin, a small native port, and early in 1906 the section, 18 miles long, northwards from Sallom Junction to Port Sudan, was opened. At Port Sudan a modern harbour was simultaneously constructed. This route provided direct access to the Sudan by means of the steamship lines passing through the Suez Canal and the Red Sea. In 1905, also, a branch line was thrown out from Abu Hamed to Kareima (138 miles), in order to serve the Dongola Province. Four years later, extensions were commenced from Khartoum southwards, reaching Wad Medani (a distance of 108 miles) in 1909, Kosti (a further 127 miles) in 1910, and El Obeid, the present terminus (a further 190 miles), in the following year. In 1914 a short branch line of 4 1/2 miles was built from Sennar to Makwar in connection with the construction of the Sennar Dam. Further railway development was prevented by the war, and since then the only important extension completed has been the Kassala Railway (217 miles) from Haiya Junction, on the Red Sea line, to Kassala. (The construction of this line was described in the April 9, 1926, issue of The Railway Gazette.)

River Services.

Supplementing the railways, and working in close connection with them, are river steamer services between Shellal and Halfa (an important link in the through communication between Egypt and the Sudan); from Kerma to Kareima, serving the Dongola reach of the Nile; and from Khartoum southwards to Rejaf, &c. These services are mentioned later.
It will be seen that the Sudan Government Railways were constructed primarily for strategical reasons, and it may be said that the effective occupation and control of the country are still dependent upon them.

Map of the Sudan Government Railways, showing 1,728 Route-Miles of Line and 2,435 Miles of River Services.

Under British administration the Sudan is developing rapidly, largely due to the means of communication afforded by the railways and steamers, and a considerable traffic has been created. incidentally, the railways and steamers have become the principal source of revenue to the Sudan Government. Important new commercial enterprises are now in course of active development, which will render the further extension of the railway inevitable.

The capital expenditure on the railways, steamers and ancillary services up to December 31, 1926, amounted to approximately 8 1/2 millions sterling. The development of the railway and ancillary services since the year 1913 is illustrated in the tables on pages 15 and 16.

In 1926 the total earnings of the railway section amounted to £E.1,594,827, as compared with £E.516,876 in the year 1913, an increase of 208.5 per cent. Working expenses increased during the same period from £E.396,496 to £E.952,264, or by 140.2 per cent., but there was a very satisfactory reduction

NOTE:– The Egyptian Pound – £E. = 20s. 6d. /
in the ratio of expenditure to receipts, viz., from 76.7 per cent. in 1913 to 59.7 per cent. last year, and the net profit has risen from £E.120,380 to £E.642,563, or by 433.8 per cent. In 1913 the railways carried 419,681 passengers, compared with 551,408 last year, or an increase of 31.4 per cent. During the same period the tonnage of revenue-earning goods traffic increased from 172,975 to 459,759, or by 165.8 per cent. Train-mileage has grown from 1,110,581 in 1913 to 1,538,725 in 1926, or by 38.6 per cent., whereas the net receipts per train-mile have advanced from 1s. 10.8d. to 7s. 2.5d. – or by 279.4 per cent.

The traffic during the years 1920–25 was considerably augmented by the conveyance of materials required for the construction of the Sennar Dam and the Gezira Irrigation scheme, but, apart from this, there has been a steady development in the general business of the railway.

Since the year 1914, when the control of the work at Port Sudan was transferred from other departments of the Government to that of the railway department, various ancillary services have been brought under the railway administration. Particulars of the working results of these services for the years 1914–26 are given below, but, as will be seen, the figures are not comparable year by year owing to the inclusion of additional services from time to time. The most important item included in the table is that relating to the working at Port Sudan, the rapid development of which receives subsequent reference. Taking the ancillary services as a whole, a good percentage of profit is now recorded, the ratio of working expenses to gross receipts for the year 1926 being 84.6 per cent.

Organisation and Administration.

The railways and steamers are administered as a department of the Sudan Government, under the immediate control of a General Manager (Mr. A. C. Parker), whose headquarters are at Atbara. The organisation is on the departmental principle, as shown in the chart on this page.

The business of the Railways and Steamers Department is transacted through five main departments, viz., Executive, Traffic, Civil Engineering, Mechanical Engineering, and Stores, while the control of the work at Port Sudan is under a Port Manager, responsible directly to the General Manager. The accounting work is a branch of the General Manager’s office, and is under the control of an officer styled Chief Auditor. In order to enable the General Manager to exercise close supervision over the various departments and to co-ordinate their work, a Standing Committee, consisting of the chief officers of the before-mentioned departments, meets at frequent intervals, when all matters of principle affecting the general conduct of the operations of the various departments are discussed.

While the supervisory posts are mainly held by British officials, out of a total staff of 15,084, as at December 31, 1926, only 269 were British, and 217 other European nationalities; 12,948 were Sudanese, 1,530 Egyptians, and 120 other nationalities.

Permanent Way and Works.

On December 31, 1926, there were 1,728 route-miles of line, with a track mileage of 1,891 miles, all on the 3-ft. 6-in. gauge, the whole

Insert Diagram of the running lines being of single track. Generally speaking, the configuration of the country traversed by the railway is flat, except in the region of the Red Sea hills, where there is a continuous rising gradient of 1 in 100 for 50 miles from Sallom Junction to Gebeit, followed by a short stretch of 1 in 125 to Summit, 3,000 ft. above sea level.

Steel-flanged rails, weighing 75 lb. per yard, are now laid on a considerable portion of the system, although 50-lb. rails are employed on the desert section from Halfa to Abu Hamed, the Kareima Line, the Khartoum-El Obeid Section, and the Kassala Line, as well as on one or two minor branch lines. The 50-lb. rail is in 30-ft. lengths, carried on 12 sleepers 6 ft. 6 in. by 8 in. by 4 1/2 in. The 75-lb. rail is in 30-ft. and 36-ft. lengths, the latter being the present standard. The 30-ft. lengths are supported by 12 sleepers, and the 36-ft lengths by 14 sleepers, the dimensions being 7 ft. 6 in. by 9 in. by 5 in. Generally speaking, wood sleepers (pitch pine, Jarrah or Oregon pine) are employed, but in certain districts where the white ant exists, steel sleepers have had to be used. The rails usually rest on a bearing plate which is secured to the sleepers by screws and the rail-joints are staggered. The line across the desert is laid in and ballasted with gravel or sand,
which is also packed tightly under the bottom flange of the rails, thus forming a continuous elastic support; the result is a very smooth running track. Elsewhere, the ballast used depends on the nature of the ground, in certain bad sections stone metalling being supplied.

Apart from four bridges at Atbara, Khartoum, Kosti and Port Sudan, there are no important structures. During the last 25 years, however, a good deal of flood prevention work has been done in the construction of bridges across the numerous khors, or flood watercourses, some of the structures being of considerable size. In a very severe rainy season, wash-outs are not infrequent, these often considerably disorganising the train working.

Renewals are carried out in accordance with a definite annual programme, based on the ascertained, or estimated, life of the various units, e.g., rails, sleepers, bridges, &c., and charged to a Renewals Fund; 95 miles of track were re-sleepered during 1926.

There are at present some 125 stations, and except at the more important, platforms are not provided. The station buildings and lay-out are of a simple character. The main engineering shops are situated at the Railway Headquarters, Atbara.

Signalling and Block Telegraph.

The Tyers Electric Tablet system of single-line block working is in operation throughout the railway, with the exception of the Kassala line, which is operated by the Electric Key Token system.

The wayside stations between Halfa and Atbara, and between Musmar and Port Sudan, are equipped with central ground frames, point rodding throughout the whole length of the station, facing point locks on all main-line facing points, with detectors, and one outer signal at each end of the loop. On the sections between Atbara and Khartoum, and Khartoum and Wad Medani, where there is a heavier traffic, and non-stop trains are run, the stations are also equipped with outer home, home, and starting signals worked from a ground frame at each end of the station. The points are provided with facing point locks, and all points and signals are interlocked.

At junctions and important stations, such as No. 10 Junction, Abu Hamed, Atbara Junction, Port Sudan, Khartoum Central and Sennar, signal cabins or elevated ground frames, and complete interlocking, are provided.

As, however, the traffic on many sections of the line is very light, a complete system of interlocking signals is not necessary, and in many cases only outer home signals, worked by an independent lever from the points at each end of the station (or crossing loop), are provided. The points are worked by tumbler levers. The signals are of the lower quadrant type, and twin target point indica-
tors are provided at a number of stations. The total number of levers in use at the end of 1926 was 1,173.

At present the track capacity of the line is definitely limited owing to the long block sections on the flat, and to the heavy gradients on the Red Sea slopes, where comparatively short sections are occupied by trains for over an hour, and even 90 minutes, on the up grade. Sections 15 to 20 miles in length are quite common on the level, and on the desert sections they are as long as 28 miles in places.

**Locomotives.**

On December 31, 1926, the total locomotive stock of the Sudan Government Railways numbered 139, comprising 117 tender engines and 22 tanks, used for shunting purposes. The majority of the engines are of British manufacture, and are of varying types to suit the conditions of working which obtain in the different sections of the system.

Until recent years the 4-6-0 type has been the most generally employed, as being suitable for general passenger and goods-train working, as well as for the mixed trains which are run on all sections. The tractive effort of these engines ranges from 11,200 lb. to 21,900 lb., and there are now about 50 engines of this type in service. There are 15 ‘Pacifics’ (tractive effort 17,300 lb. saturated or 19,000 lb. superheated) used for general passenger and mixed work on the Halfa (desert) section. These are two-cylinder engines, with 4-ft. 6-in. driving wheels, cylinders 17 in. by 24 in., with a working pressure of 180 lb., and having a total weight of 99 tons. Also, there are 16 2-6-0’s (tractive effort 15,500 lb. and 16,400 lb.), and four 4-4-2 passenger engines (tractive effort 18,200 lb.). These have 5-ft. 2 1/2-in. driving wheels, and cylinders 18 in. by 26 in.

In recent years, with the object of increasing the train loads, some heavier types of engines have been introduced, notably the 2-8-2 ‘Mikado’ engines, of two types—a heavy and a light. The heavy engines, of which there are 12, have 4-ft. 6-in. driving wheels, and cylinders 21 in. by 27 in. They are designed for a working pressure of 180 lb., but are now operated at 160 lb. only. At the latter pressure their tractive effort is 30,000 lb., and the total weight of engine and tender is 130 tons. These are employed on the heavy gradients on the Red Sea line.

The lighter ‘Mikados,’ of which there are 10, were introduced on the Kassala line, in order to suit the lighter 50-lb. rail used on that section, and yet be powerful enough to negotiate the gradient mentioned above. They are, however, now employed more generally. They have 4-ft. 3-in. driving wheels, and cylinders 19 in. by 26 in. At a boiler pressure of 180 lb. these engines have a tractive effort of 26,000 lb. and haul trains of 600 tons. Their total weight is 111 tons.

The latest type of locomotive introduced on the Sudan Government Railways is the ‘Prairie,’ 2-6-2, introduced in 1925, which has proved very satis-
factory in hauling mixed trains up to 900 tons weight with very economical coal consumption. Twelve of these engines are in service. The leading dimensions are:

- Driving wheels, 5-ft. 2 1/2-in. diam.; cylinders, 21 in. diam. by 27-in. stroke; boiler pressure, 180 lb.; tractive effort, 29,000 lb.; total weight, 127 tons 5 cwt. The boilers and general details of these engines are standard with the heavy 'Mikado' type.

There are on order, and nearing completion, 10 further engines of a composite type, for use on the 50-lb. rail, having boilers standard with the light 'Mikados' and all other details standard with the before-mentioned 'Pacifics,' except that the cylinders have a diameter of 18 in. There are also on order four six-wheeled side-tank shunting engines, which are now in process of shipment, and these engines will be shipped completely finished instead of by the usual method of dissembling and packing. (Ten additional fourth-class carriages will be treated in the same way.)

On certain sections of the railway, particularly the Red Sea line, considerable difficulty is experienced in regard to feed water for the locomotive boilers, owing to the very large proportion of solids contained in the well water which has to be used. This necessitated the provision of water-softening plant, and filtrators are being tested out on certain of the locomotives.

The coal employed for locomotive purposes is almost entirely 'Natal,' the consumption per productive train-mile for the past three years being 65.7 lb. in 1924, 64.1 lb. in 1925, and 64.3 lb. in 1926.

Passenger Stock.

The coaching stock at December 31, 1926, comprised 267 vehicles, there being 14 sleeping cars, 3 dining, 3 kitchen and 3 buffet cars, 9 first class, 13 second class, 30 third class, 60 fourth class, 14 composite first and second, and 5 composite second and third-class carriages. In addition, there are 29 baggage and post cars, 4 saloons, a hospital car, and 79 service cars. Accommodation is provided for first, second, third and fourth-class passengers, and dining and sleeping cars are run on the long-distance express and boat trains. The accommodation compares very favourably with that on the British railways.

Generally speaking, the policy has been to use coaching stock built in England, although in recent years a number of carriages have been constructed in the Atbara Works on underframes and bogies purchased in England. There is no general standard of construction, the length of body over buffers varying from 34 ft. and 40 ft. in the case of the fourth-class carriages to 63 ft. in the case of the larger sleeping and buffet cars. The standard width is 9 ft., while the overall height from rail level varies from 10 ft. 11 in. in the case of the fourth-class carriages to 12 ft. 4 in. for the first and second-class carriages. Four-wheel bogies
are provided on the whole of the passenger carriages, and the vacuum brake is fitted to all coaching vehicles.

Except in the case of the third and fourth class (the latter being restricted to the use of Sudanese passengers), all vehicles have side or centre corridors with communicating gangways at each end. Lavatory accommodation is provided on every vehicle, and all are equipped with the Stone system of electric lighting. Electric fans are fixed at each end of the cars, and in each first-class compartment. Only end doors are provided. The first-class carriages have five compartments accommodating 30 passengers, the second class seven compartments, accommodating 42 passengers, and the third class (50-ft. coaches) are of six compartments with the centre corridor arrangement, seating 52 passengers.

All passenger-carrying stock is fitted with outside sunshades over the windows, and in the case of the dining and sleeping cars and first-class carriages the window panes are of tinted glass to counteract the glare of the sun. The vehicles, except the fourth class, are painted white outside, which besides giving them a very smart appearance, is found to be most suitable for deflecting the sun’s rays.

Three types of sleeping car are in use, one having 10 berths in five compartments, another with 14 berths in seven compartments, and a third with seven single-berth and two double-berth compartments. In general, the internal fittings are similar to those provided on British railways, including separate toilet in each compartment, and lavatories at both ends of the car, but the berths are more spacious than those found on the home railways, and are very comfortable. Electric fans are provided in every compartment. A Sudanese attendant is in charge of each car.

There are four luxurious saloons, containing bed and bath rooms, saloon compartment and kitchen, for the use of distinguished guests of the Government and for hire to members of the public. One of these vehicles issued by H.E. the Governor-General when he travels. The length of these coaches ranges from 45 ft. to 65 ft. 9 in. over buffers, and their appointments and equipment are all of the latest design. The service cars, of which there are 79, vary in dimensions and design, those of the departmental heads being white-painted bogie vehicles, provided with office, bed and bathroom, and kitchen. For the use of the Inspectorate Staff of the Traffic, Locomotive and Engineering Departments there are a number of smaller four-wheel service cars.

The dining cars have accommodation for 34 passengers, at tables for two on one side and four on the other of a centre gangway. Side doors are provided at one end and in the centre of the car, in each case opening on to both sides of the line. These cars have no kitchen, and a separate kitchen car is run as a complement. The kitchen cars are furnished with coal-fired cooking ranges, and their equipment includes adequate storage accommodation, with ice chests and filters.
for drinking water. Two of the buffet cars are capable of seating 24 passengers, and the third 18 passengers, and all are self-contained units fitted with a kitchen.

Freight Stock.

Although many smaller wagons are in use, it may be said that the standard capacity of the wagon stock of the Sudan Government Railways is 30 tons. Most of the units were built in England, and erected in the Sudan. At the end of 1926 the total freight stock numbered 1,586 vehicles, of which 413 were open wagons, 590 covered wagons, 155 cattle wagons, 50 flat wagons, 40 oil-fuel tanks, 109 stone, boiler and brake vans, 70 service vehicles, and 159 water tanks.

The standard 30-ton bogie open goods wagon, the tare of which is 46 per cent. of the load, is a well-built vehicle comparing favourably with the latest railway practice, and the same may be said of the 30-ton standard covered wagon. Both types are steelbuilt / vehicles, carried on two four-wheel bogies, the leading dimensions being as follows:

<table>
<thead>
<tr>

</tbody>
</table>

Of the cattle wagons, 74 are of 30 tons capacity, and, in addition, there are 48 25- and 30-ton flat wagons, and 48 25- and 30-ton brake vans. Other large vehicles are 26 1/2-ton bogie oil-tank wagons and 5,000-gallon water-tank wagons, which are necessary to supply water to the desert stations, many of which are waterless, for the use of the resident staff. The water-tank wagons are cylindrical tanks, 30 ft. long by 7 ft. wide, with an inside diameter of 6 ft. 9 in., mounted on steel frames 2 ft. 9 in. from rail level, and carried by two four-wheel bogies. All main-line freight vehicles are fitted with the vacuum brake.

Locomotive, Carriage and Wagon Shops.

The main locomotive, carriage and wagon works are situated at Atbara, and are principally contained in three large steel-framed corrugated-iron buildings. In addition, there is a large stock shed. All the construction work undertaken in the Sudan is carried out in these works, as well as the erection of rolling-stock purchased abroad, and all heavy repairs. A material extension of the works has recently been carried out, consequent upon the additional work which followed the construction of the Kassala line, and the works are now well equipped and
adequate for the requirements for some years to come. The heavy machinery is
driven by electricity. There is also an electrical repair shop for the maintenance
of electrical machinery and electric train-lighting plant.

In addition to the main works at Atbara, there are small repair shops at Khar-
toum Central, Halfa, Gebeit, Port Sudan, Kosti and Abu Hamed, at which light
repairs work is carried out.

Electric power stations for the generation and supply of electrical energy are
operated by the railways at Atbara, Port Sudan, and Halfa. At Atbara a new sta-
tion has recently been constructed, equipped with two 120-kW. Diesel units and
a 250-kW. Allen set. In addition to the railway requirements, the respective towns
are supplied with current for domestic and other lighting purposes.

Passenger Traffic.
The total number of passengers carried during 1926 was 551,408. While this is a
slight decrease compared with the previous year, the reduction was attributable
to the completion of the work on the Sennar Dam, and occurred in the second
and third classes only, there being an increase of 5,251 in the number of fourth-
class passengers.

Four classes of passengers are catered for, the first and second classes being
mainly used by Europeans, and the third and fourth by the natives, the fourth
class being definitely restricted to their use. Although the greater proportion of
the long-distance travel is by Government officials of the various administrative
departments and their families, travelling on business or leave, there has lat-
terly been an appreciable increase in the fourth-class passenger journeys, which
evidences a growing disposition on the part of the native population to use the rail-
ways. There is also a developing tourist business in the winter season, principally
to Khartoum and the south, in addition to which big game and other shooting
parties, to whom special facilities are off
erred, are becoming a regular feature.

Owing to the light nature of the passenger traffic on most sections of the line,
the principle of running mixed trains is closely followed, and, on the busier sec-
tions, viz., Atbara and Khartoum, Khartoum and Wad Medani, and Atbara and
Port Sudan, one passenger service per day in each direction usually suffices. It
is, therefore, possible to secure excellent train loads, and trains of 500–600 tons
are usual. The passenger trains are scheduled at an average speed of 35 miles per
hour, and mixed trains at 30 miles per hour.

Passenger Fares.
The basic fares, as published in the coaching tariff, are quoted at ‘milliemes per
kilometre.’ Converted into English equivalents, they are as shown below:
Anon., ‘The Railways of Africa’ 223

- 249–372 miles: 0.201
- 373–559 miles: 0.160
- Over 559 miles: 0.129 -50 per cent.

For sleeping-car accommodation, a supplement of £E.1 per head per through journey is charged in addition to the first-class fare, but Government officials, their wives and families, are allowed a reduction of 50 per cent.

Various reduced fare facilities are in operation. For example, cheap return holiday tickets are issued, between May 1 and October 31, from Khartoum to Port Sudan and certain intermediate stations, at a single fare and a quarter, available for 14 days. Members of the commercial community in the Sudan and their families are allowed a similar concession at any time of the year when travelling on their annual leave, the tickets being available for six months. A concession is also given for local leave to European members of certain industrial firms in the Sudan, in the form of a rebate of 50 per cent. off the ordinary fare.

Traders who have in the previous complete year paid the railways freight charges to the value of £E.1,500 on their goods are allowed a rebate of 50 per cent. in respect of all rail or steamer journeys made by one specified member of the firm, with an extension of the concession to one other member for each additional £E.1,000 paid in freight charges.

Concessions ranging from 50 to 70 per cent. off the ordinary fares are given to persons importing agricultural labourers, artizans, &c., under approved conditions; to parties of excavators of antiquities, and their labourers; and to missionaries and clerics who work in the Sudan.

Sudan Government officials and their families and servants are allowed free or reduced fare warrants in accordance with the Sudan Government Travelling Regulations; and varying concessions are also allowed to officers and men of the British and Egyptian armies and to officials of neighbouring British territories.

* In 1918, in order to meet post-war conditions, a surcharge of 50 per cent. was imposed on all passenger fares, increased in 1920 to a maximum of 100 per cent. Subsequently, reductions have been made by successive stages to the percentages shown.
Communications in Africa, 1880–1939: Volume 4

travelling on duty or on leave, and to their dependants; these reductions range from 50 to 75 per cent.

Passengers are granted a free allowance of accompanied luggage, varying from 1 cwt. for first class to 1/2 cwt. for fourth class, beyond which allowances excess is payable. All luggage may be registered for a fee of 1s. per package.

Catering and Hotels.

The catering arrangements on the trains and steamers, as well as the management of the railway hotels, are in charge of a Catering Superintendent, who is responsible to the Superintendent of the Line. His headquarters are at Khartoum. The service, which is excellent, is performed by Sudanese staff, supervised by a European train or boat manager. Two hotels are owned and worked by the railway department, viz., at Port Sudan and Khartoum, the latter having been acquired recently in connection with the development of tourist traffic. Both are substantial structures, and provided with modern equipment suitable for a sub-tropical country.

Freight Traffic.

During the year 1926, 459,759 tons of freight traffic were conveyed, exclusive of railway stores and coal. The public traffic consists of the commodities imported for domestic use and consumption, e.g., cotton stuffs, salt, sugar, tea, soap, petroleum, &c., but more particularly of the products of the country conveyed to Port Sudan and Halfa for export, such as dura (wheat), cotton and cotton seed, gum, ground and dom nuts, simsim (millet), cattle and sheep, and hides. There is also a considerable local traffic in grain, dates, &c., which form the principal food of the native population. A large proportion of the traffic is capable of bulk loading, and the fullest advantage has been taken of the opportunity to secure good loads by the provision of high-capacity wagons for the conveyance of such traffics as gum, grain and cotton. The average capacity of all revenue-earning freight stock for the year 1926 was 25.5 tons, and the average load 14.23 tons. With the latest type of ‘Prairie’ class engine, train loads of 800 tons are operated. The areas of production, alike of cotton, grain and gum, are mainly south of Khartoum, so that a long haul is secured for the best-loading traffics. The average length of haul of revenue freight traffic in 1926 was 383 miles, and the average train load 428 tons. No cartage services are performed by the railways, and the traffic is, therefore, entirely ‘station to station.’

Although by no means the only source of supply, cotton is produced in greatest quantities in the area known as the Gezira Plain, situated between the converging Blue and White Niles, south of Khartoum. Ginning factories are provided at convenient points, where the cotton is separated from the seed and
baled ready for conveyance by rail. The principal forwarding station is Meringan, which is situated in the heart of the Gezira.

Gum is produced in the Province of Kordofan, and in the adjoining Provinces of Darfur and Nuba Mountains, where it grows mostly in a wild state, and is gathered by the natives and brought into El Obeid and neighbouring stations. There it is cleaned, sold by auction (under Government supervision) to the gum merchants, and despatched by rail to Port Sudan for export. The trade is a very lucrative one, recent export values being in the region of £35 per ton. A special railway rate of £9 per ton is in operation for truckloads of gum from El Obeid to Port Sudan – a distance of 922 miles.

March and April are the busiest months for export traffic, and then the capacity of the line is taxed heavily, a maximum of five trains per day each way having been reached between Atbara and Port Sudan last year. The theoretical capacity of the line is only six trains every 24 hours – due to the very long block sections. In view of the anticipated increase of traffic, the question of improving the track capacity, either by shortening the longer sections, or by other means, is at present under consideration.

Rates.

The rates tariff in the Sudan is built up in three divisions:— (1) The conveyance charge – generally on the basis of equal rates per ton per mile; (2) the weighing and station service charge; (3) the loading and unloading charge. All carriage charges must be prepaid, except in the case of firms having ledger or credit accounts. The general scale of rates is quoted in ‘Milliemes per 10 kilogrammes per kilometre.’ Converted to English equivalents, the rates per ton per mile are as under:–

<table>

Varying from 40 to 100 per cent., according to traffic.

There are, however, a number of special rates in force, e.g., for agricultural and mining implements and machinery; for gum, grain, and other traffic for export; for specified minimum numbers of cattle and minimum quantities of traffic; and generally for long-distance and through traffic. Also, the surcharge has now been abolished altogether in the case of a number of specific commodities. The

* In 1916, in order to meet war-time conditions, a surtax of 10 per cent. was added, increasing by stages to a maximum of 100 per cent. in 1920. Subsequently, reductions have been effected to the percentages shown.
average earnings per ton-mile in 1926 were 1.591d. These rates do not apply to the steamer services, for which there is a separate tariff, generally on a somewhat higher basis.

Port Sudan.

Port Sudan, the principal seaport of the country, is a natural harbour with easy access from the Red Sea, and well sheltered from the prevailing wind. It was constructed in the year 1906, when the railway was extended from Atbara to the Red Sea. The harbour has an area of approximately 168 acres, varying in depth from 30 ft. to 119 f., and the anchorage and swinging basin area is about 113 acres. The main quay is 2,050 ft. in length, and accommodates five vessels of the class ordinarily using the harbour, and there are also quays of 650 and 300 ft. for the use of the small coasting craft and native sailing boats which bring in salt, &c.

The equipment of the Port includes four electric coal transporters having a travelling range of 810 ft., with a coaling capacity of 120 tons per hour, and there is a re-handling transporter which extends their range from the quay wall from 225 to 450 ft. All coal for railway and other uses is brought into Port Sudan, and there is an increasing bunker trade for shipping. There is also an oil depot for bunkering oil-burning vessels. For general cargo, there are four 4-ton, two 5-ton and one 7-ton electric gantry cranes. Good warehouse and customs accommodation is available, the total floor space being 105,574 square feet. The Port equipment includes an adequate floating plant, a dockyard, and a dockyard workshop.

The development of the Port has been rapid, the number of vessels calling having increased from 315 in 1913 to 825 in 1926; the tonnage of imports from 114,486 tons in 1914 to 197,968 tons in 1926; and the tonnage of exports from 22,912 tons in 1914 to 126,018 tons in 1926. The total quantity of cargo landed and shipped last year was 546,668 tons, and the gross tonnage, including railway goods tonnage handled at the quays, amounted to 989,497 tons.

The Port is now used by the vessels of all the important shipping lines which operate services through the Red Sea. In order to keep pace with the growth of business, extensive additions to the accommodation have recently been undertaken, and are now approaching completion. These include an extension of the main quays and the construction of two new quays with four coal transporters of the latest design, having an average discharge of 80 tons an hour, for dealing with coal traffic.

In view of the increasing activities at Port Sudan, and in order to co-ordinate the work of the various departments there, the control of the whole of the operations was recently placed under an officer styled Port Manager, who is directly responsible to the General Manager for the conduct of the work.
Anon., *The Railways of Africa* 227

### Steamer Services.

The railways are at present confined to the northern half of the Sudan, and extensive river steamer services are also operated by the Railways and Steamers Department. They form a most important adjunct, as they provide the only means of communication with the southern portion of the territory. Services are operated as follows:

<table>
<thead>
<tr>

The steamer services naturally divide into three sections, serving different parts of the Nile. They are quite separate units, and inter-communicate for traffic purposes through the railways.

The accompanying table illustrates the extent to which this important branch of the department has developed since 1913. While the results show a falling-off in traffic during the last few years, this occurred mainly on the Shellal-Halfa Reach, and is due to the development of the Port Sudan route in preference to the Nile route for import and export traffic, as well as for the extensive ‘leave’ traffic. The regular services on the Halfa-Shellal Reach must, however, be maintained in order to convey the Mails.

Working Results of the Sudan Government Steamer Services.

Broadly, the control and operation of the steamer services falls under the appropriate departments of the railway, viz., traffic and provisioning under the Traffic Department, and construction, maintenance, and operation under the Chief Mechanical Engineer. At Khartoum, however, the extensive services are under the supervision of a District Traffic Manager, responsible through the Southern Divisional Superintendent to the Superintendent of the Line. The Chief Mechanical Engineer is represented by a Superintendent Engineer, who not only maintains the fleet, but commissions the boats, and is responsible for their navigation.

At December 31, 1926, the total fleet consisted of 42 stern-wheel steamers, 4 paddle-wheel steamers, 14 tugs, 8 steam launches, 11 petrol, &c., launches, 134 barges, 3 floating docks, 3 dredgers, 10 pontoons, and numerous auxiliary river craft. A detailed description of the craft is not here possible, but the largest vessels are the two mail boats, Sudan and Britain, employed on the Halfa Reach. These are stern-wheelers of 360 gross tons, with a draught of 4 ft. 6 in., and are very commodious craft, equipped with good passenger cabin and saloon accommodation, bathrooms, electric lighting, fans, &c. Owing to the presence of sandbanks on this Reach, the majority of the vessels are restricted to a draught of 3 ft. 6 in., and the Sudan and Britain can be operated only when the river is in flood – from August to March. The largest boats on the Khartoum South service are of 225 tons, and on the Dongola Reach, 185 tons. The majority of the steamers are stern-wheelers, which type of propulsion is most suitable on the Nile.

On the Halfa-Shellal Reach, three services each way per week are run. On the Dongola Reach, where the traffic is light, the passengers and mails are carried by
a weekly service in the winter, and a fortnightly service in the summer. South of Khartoum, the main regular service is the fortnightly postal steamer from Khartoum to Rejaf, with connecting services from Malakal to Meshra-el-Rek in the winter – extended to Wau in the summer. The latter services are chiefly for political and military purposes. There is also a fortnightly intermediate service from Khartoum to Renk. Besides these definite services, operating all the year round, there are regular flood services from May or June to December between Makwar and Roseires, on the Blue Nile, and from Khartoum to Gambela, on the Baro River, within the Abyssinian frontier. In addition, there is continual chartering of steamers by the Provinces and Departments for work in connection with the administration of the country, and by shooting parties. No catering is provided on the Dongola steamers, but on all other advertised sailings an excellent service is maintained by the Catering Department.

A separate rates and fares tariff is in force for each group of steamers, but for the entire service the average receipt per passenger journey last year amounted to 23s. 8.3d., and the average receipt per ton of freight to 42s. 6.4d.

A feature in connection with the operation of the steamer services is the use of barges as auxiliaries both for passenger and goods work. As the vessels are mainly driven by stern paddle wheels, it is not possible to tow the barges, and they are, therefore, lashed alongside and/or propelled in front. On the southern services as many as seven barges are attached to a steamer, one at each side, and five in wedge formation, lashed by special steel mooring ropes, in front. The larger barges have a carrying capacity of 100 tons.

The steamer crews consist of one engineer in charge (British or European), one second engineer, two greasers, four firemen, one navigator, an assistant navigator, and from 6 to 10 sailors. Until recently, the principal fuel consumed by the steamers was wood, but coal has now been substituted on a number of the vessels, with economical results and improved timing. Oil fuel is used to a limited extent, and one of the latest additions to the fleet at Khartoum is a heavy-oil-engined stern-wheel steamer. This vessel was designed to secure economy in running costs, and has fulfilled expectations.

Steamer Dockyards.

There is a dockyard at Halfa for the maintenance of the Halfa-Shellal fleet, and a small dockyard repair shop at Kareima, where the vessels engaged on the Dongola service are repaired. The principal dockyard, however, is at Khartoum North, where a modernised plant exists, capable not only of maintaining the whole of the vessels used on the Khartoum and South services, and the construction and erection of new hulls, but also of carrying out a considerable amount of work for the Irrigation Department. Although in the past a good deal of new work has been
undertaken, in recent years the policy has been to confine the dockyard to main-
tenance work, and to purchase new hulls in England and erect them at Khartoum.

Mechanical Transport.

A recent development on the Sudan Railways is the establishment of a Mechani-
cal Transport Section, under the control, at present, of / the General Manager. Some useful pioneer work has already been accomplished in opening up areas at present inaccessible to rail or steamer services. The more important is that between Rejaf, the southern terminal point of the Nile steamers plying south of Khartoum, and Aba, in the Belgian Congo, thus providing a connecting link between the Sudan and that huge undeveloped country, and an outlet for its produce via the Nile route and Port Sudan. Another motor transport service was inaugurated last December, between Tonga, on the Nile, and Talodi, to bring cotton, &c., from the interior of the Nuba Mountains Province to the river.

Many different types of motor lorry have been tested on these services, the principal being the Thornycroft six-wheel rigid type, which is performing excellent service.

Owing to the fact that huge areas of the Southern Sudan are of a swampy nature, the construction of railways is rendered extremely difficult and costly. Therefore the road services established, which have proved a great success, are doubtless the forerunners of others.

London Office.

The Sudan Railways and Steamers have offices at Wellington House, Bucking-
ham Gate, under the supervision of the Controller, Sudan Government London office. These offices deal with public inquiries, arrange the passages of all Sudan Government officials travelling to and from the Sudan on leave or on business, and, in collaboration with headquarters at Atbara, attend to advertising and publicity matters. Here, also, the Advisory and Inspecting Engineers arrange the contracts for stores and materials purchased in England, and their inspection. In addition, the former deals with the engagement and appointment of all staff required by the Sudan Government Railways and Steamers.

Sennar Dam – Irrigation.

In view of the relative importance of irrigation to the development of the rail-
ways and the country, brief reference may be made to the great irrigation scheme on the Gezira Plain. The plain lies in the triangle formed by the junction of the Blue and White Nile, and, in order to open up this area for the cultivation of cot-
ton, grain, &c., a great dam, 1 5/8 miles long, has been built across the Blue Nile
at Sennar, 170 miles south of Khartoum. It was completed at the close of 1925. The barrage is closed in the flood season, and ponds back the river for a distance of 58 miles, creating a huge storage lake of 636,000,000 cubic m. of water. By means of a main canal, 62 miles long, and a vast network of regulated minor and subsidiary canals, the stored water is distributed as required over the Gezira Plain during the season when the river is low. The irrigation scheme is capable of supplying water to an area of 3,000,000 acres, but, as a first step, 300,000 acres only are being dealt with, 100,000 of which are put under cotton, 100,000 under grain, while 100,000 acres lie fallow each season in rotation. The dam was constructed by the Sudan Government, but the supervision of the cultivation is carried out by the Sudan Plantations Syndicate, which holds a concession from the Government until June, 1950. There is thus a three-party partnership between the Government, the syndicate, and the native cultivator. The proceeds of the crop are divided on a definite percentage basis, the Government at present receiving 37 1/2 per cent., the Syndicate 22 1/2 per cent., and the native cultivator 40 per cent. The latter merely provides the labour – water, seed, and everything else being found for him. The results achieved during the first year since the completion of the dam have fulfilled all expectations, and foreshadow a very large increase in the transport of cotton, cotton seed, and grain by the railways, as also a consequent increase in imports to meet the requirements of the prospering Sudanese landowners.

Future Development.

Brief mention should also be made of the important developments at present taking place at Khartoum and Omdurman. These include the improvement of roads and tramway services and a big electric-power scheme. The most important item, however, is the construction of a bridge across the White Nile connecting Khartoum with the great native town of Omdurman, which possesses the largest market in the country. The bridge, which will consist of seven fixed spans and a swing span, is well advanced, and when completed will afford through connection by road and tramway for goods traffic between the Sudan Government Railways and Omdurman. The only communication at present is by means of a ferry steamer.

The next stage in the extension of the railway system will be the linking up of Kassala with Gedaref and eventually, in all probability, with the southern section of the line at Sennar, passing over the Sennar Dam. Besides opening up a further extensive productive area, such a line would afford an alternative route for the conveyance of the cotton, grain, &c., export traffic to Port Sudan, avoiding the more occupied section between Wad Medani and Atbara, which will be severely taxed during the busy season. The first stage of this new railway has been definitely taken in hand, following the conclusion last summer of the final nego-
tations for a loan for railway development and other Government purposes in the Sudan. This loan is guaranteed by the Home Government under the terms of the Trade Facilities Act. The scheme provides for the extension of the railway from Kassala to Gedaref (135 miles), and the work was commenced in December last. The Gedaref extension necessitates the construction of a steel girder bridge 1,100 ft. long over the River Atbara at Abu Deleig, the contract for which has been let to Dorman, Long & Co. About 14 1/2 miles of track had been laid at the end of last year.

Another probable railway extension is from Rahad to Talodi (at present served by the road transport service from Tonga). The further extension of the railways south-westwards towards the Belgian Congo is the natural sequence of events, but, as has been mentioned, railway construction in this area would be an extremely costly matter, and it is probable that development, at any rate for some years to come, will be confined to road transport.

THE KENYA & UGANDA RAILWAY.

An Interesting Metre-Gauge Railway, 1,128 miles in length, known as ‘The World’s Wonder Line.’ The Railway is State-owned, and since February 3, 1926, has been worked under the control of a High Commissioner of Transport, who is the Governor of Kenya.

The Kenya & Uganda Railway, which now comprises 1,128 route-miles of metre-gauge track, has not had a long history. The original line, called the Uganda Railway, the construction of which did not commence until 1896, was the contribution of Great Britain towards the execution of her obligations under the General Act of the Brussels Conference of July 2, 1890, to which all the Great Powers were parties. When the Brussels Act – constituting a Slave Trade Treaty under Order in Council of May 9, 1892 – came into effect, the authority exercising jurisdiction in the British East African sphere of influence was the Imperial East African Company, working under a charter granted in 1888. This company, although having certain surveys made, did not proceed with the construction of the railway, and following the surrender of its charter to the Imperial Government in 1895. The first rails were laid in July, 1896, and the first train was run through from the coast to the terminus, at Kisumu, on Lake Victoria, on December 26, 1901.

[...]

It is an interesting fact that this railway, which was built purely for sentimental reasons, namely, with the object of breaking the slave trade, should have opened up a large area of comparatively unknown territory which has been found eminently suitable for European settlement, and now comprises a sound commercial undertaking. Kenya Colony comprises a territory with an area of
209,248 square miles, excluding Jubaland (35,812 square miles). The population in 1924 was estimated at 2,475,059, including 11,002 Europeans, 24,771 Asiatics, and 9,753 Arabs: Jubaland has a population of about 16,000. Uganda (area), 110,300 miles, has a total population, estimated in 1924, of 3,145,449, comprising 3,136,769 natives, 7,229 Asiatics, and 1,451 Europeans.

Development of the Railways.

The original railway was from Mombasa to Kisumu, traffic and passengers for Uganda being transported thence by steamship services controlled by the railway and operating round and across Lake Victoria. In 1910 a branch line, then called the Busoga Railway, was built from Jinja, one of the ports on Lake Victoria, to Namasagali, on Lake Kioga, to provide an outlet for traffic from Lakes Kioga and Albert, and traffic from the Cango and Nile district. Recently, owing to the possibilities of development in Kenya and Uganda, the railway has been extended from Nakuru, a point 450 miles from the coast, in a north-easterly direction through the fertile Uasin Gishu plateau, to Mbulamuit, a station midway between Jinja and Namasagali, on the Busoga branch, thus giving a rail alternative to the steamer services from Uganda. This will, in future, be the main Kenya & Uganda Railway. This line crosses the Kenya and Uganda border at Tororo, and taps a large cotton-producing area. It is probable that further extensions in this direction will be built, including a branch line from Tororo to Mbale and Soroti, giving access to the cotton areas on the eastern shores of Lake Kioga. A rail connection is also projected joining Kampala, the business centre of Uganda, with the main line.

Branch lines have been built from Nairobi to Nyeri at the foot of Mount Kenya (112 miles), Magadi Junction to Lake Magadi, the great natural soda lake, providing a connection with the main line for the conveyance of the products of the Magadi Soda Company, and from the main line to Solai, the maize-growing area, and to Kitale, also a rich cereal-producing district. The Voi-Kahe branch is the one-time military railway, and connects the Kenya & Uganda Railway with Tanganyika Territory and the Tanga section of the Tanganyika Railways.

Results of Working.

The following summary shows the growth of the system and the results obtained:

<table>
<thead>
<tr>
<th>Working Expenditure</th>
<th>Net Earnings</th>
</tr>
</thead>
</table>

Anon., 'The Railways of Africa' 233
The Kenya & Uganda Railway, which name was adopted in lieu of “The Uganda Railway,” under the terms of the Kenya and Uganda (Transport) Order in Council, promulgated on February 3, 1926, achieved excellent results on the working for the year 1926. The earnings, for the first time in its history, exceeded £2,000,000, the exact figure being £2,058,710, against £1,993,507 for the previous year, the expenditure for the same periods being £1,216,773 and £1,090,071 respectively. The net receipts were, therefore, £841,937 for 1926 and £903,438 for 1925, an increase in the operating ratio of 4.43 per cent., the net surplus transferred to Betterment Fund, after payment of loan charges, &c., being £207,795 in 1926 against £368,774 during the previous year.

The major portion of the revenue was derived from goods traffic, earnings from this source being £1,634,700. Passenger traffic brought in £256,918, parcels and luggage £51,084, and livestock £10,991. The gross tonnage increased from 1,018,566 to 1,111,193 tons, or 9 per cent.; there was also an increase of 8.5 per cent. in the number of passengers.

The total capital expenditure to December 31, 1926, amounted to £13,338,512, an increase of £1,638,610 compared with the previous year, the major portion of this having been expended on lines under construction and the provision of new rolling-stock.

### Organisation and Administration.

Following a report on the working of the railways a scheme was drawn up for the co-ordination of transport services, and the Secretary of State for the Colonies having approved of the final draft of the Kenya and Uganda (Transport) Order in Council, that Order was brought into operation on February 3, 1926, by joint proclamation of their Excellencies the Governors of Kenya and Uganda. From that date the control, management and working of all railway, port, harbour, wharf and steamship services has been vested in the High Commissioner for Transport, who is the Governor of Kenya; to be administered by him on behalf of both Kenya and Uganda. The High Commissioner is assisted in all matters of policy by a Railway Advisory Council, which is fully representative of Kenya.
and Uganda. The Council comprises two official and two unofficial members for Kenya and two official and two unofficial members for Uganda, with the senior official member for Kenya as chairman.

Early in 1926 the control and working of the Port of Kilindini was placed in the hands of the General Manager of Railways, pending a definite decision by the Secretary of State for the Colonies regarding the future control of the Port. A decision was arrived at early in 1927, as the result of prolonged discussions, and the control is now definitely vested in the General Manager, who reports to the High Commissioner and is assisted by a Port Advisory Board consisting of representatives from Kenya and Uganda and shipping interests.

[...]. The General Manager’s and the Superintendent of the Line’s headquarters staff are combined in one office under the control of the Superintendent, Administrative, who is responsible directly to the General Manager and the Superintendent of the Line. The Superintendent of the Line controls all transportation services, including locomotive running, and is assisted by a Divisional Superintendent in Uganda, and an Assistant Superintendent of the Line and Locomotive Running Superintendent at headquarters. He is also responsible to the General Manager for all rates and fares, a commercial and an operating assistant being stationed at headquarters.

The Chief Engineer, who is also the Deputy General Manager, is in charge of both construction and maintenance of engineering works and the land department. The Mechanical Engineer controls the workshops and is responsible for the maintenance and repair of engines and stock, and jointly controls, with the Superintendent of the Line, the locomotive shed foremen. The Chief Accountant is the principal financial adviser and has the accounts and traffic audit departments under his control. The Marine Superintendent is responsible for the maintenance and navigation of craft on the lakes, the working of the piers being controlled by the Superintendent of the Line, as also the loading and unloading of vessels on the lake. The Port Manager controls the whole of the working at the port of Mombasa, including Kilindini Harbour, Mbaraki, and the old port of Mombasa. The Chief Storekeeper is responsible for the purchase and distribution of all stores, being assisted in regard to purchases by a tender board of senior officials.

The engineering department is divided into four areas, each in charge of a District Engineer, and comprises in all 18 permanent-way inspectors’ sections. The districts are from Mombasa to Makindu and branches, with headquarters at Mombasa; Makindu to Gilgil and branches, with headquarters at Nairobi; Gilgil to Tororo and branches, with headquarters at Nakuru; and Uganda, with headquarters at Jinja (Uganda).

The transportation department is subdivided in the same way with an Assistant Superintendent, assisted by traffic inspectors, in charge of each area. In
Uganda, however, the whole area is in the charge of the Divisional Superintendent, who has an Assistant Superintendent at Jinja.

The Mechanical Engineer’s headquarters are at Nairobi, where the workshops and also the main stores are situated. There are also sub-stores at Kilindini for the reception of stores from overseas and the use of that district; at Kisumu for the marine department; at Kampala for the Port Bell-Kampala Railway; at Jinja for the Busoga Railway; and at Namasagali for the Busoga Railway Marine.

On December 31, 1926, the railway staff numbered 19,046, this being a decrease of 1,576 compared with the previous year. There are 545 Europeans, 2,440 Asians and 2,105 Africans, other than labourers, and 13,956 African labourers. During the year the European staff increased by 10.6 per cent. The artisans employed are exclusively Asiatic and the gangers in charge of the permanent-way gangs are African. A certain number of the Asians and Africans have been trained for simple duties connected with train working, but many of the natives lack a sense of responsibility, and it is a matter of very careful training to make them satisfactory for anything more than labouring.

**Permanent Way and Works.**

While the total route-miles of open lines on the Kenya & Uganda Railway on December 31, 1926, numbered 1,128, the total track mileage, including loops and sidings, amounted to 1,259. The total number of stations and ports on the whole system is 112.

The existing permanent way has been in use for 25 years, and in order to cope with the increasing traffic and to provide a track to carry locomotives with a maximum axle load of 18 tons throughout the whole section between Nairobi and the coast, a programme of relaying with 80-lb. B.S.S. flat-footed rails and steel sleepers with fastenings, weighing 117 lb. each, including 50,000 cub. ft. per mile of ballasting, has been in hand for the past three years. Relaying has now reached Mile 215. It was also found necessary to regrade the line to provide a maximum of 1.18 per cent. compensated, against down traffic. Station yard loops are also being lengthened to 1,400 ft. in order to accommodate longer trains.

A corresponding strengthening of bridges is also involved, and this is being done by replacing the old girders (which were designed for a 10-ton axle load) by heavier girders with trough flooring. In some cases the 40-feet span girders are being quadrupled and new trough flooring fitted to take the ballasted track. Salisbury Bridge, connecting Mombasa Island with the mainland, will eventually be replaced by a combined road and railway bridge consisting of five spans of 60 ft. each in length.

The line is divided into two lengths which may best be described as the ‘plain or surface,’ and the ‘hill sections.’ In the plain sections, Mile 0 to 325, there are
some 630 bridges and other openings, an average of about two per mile. Of these there are about 70 with plate-girder spans varying in length from 6 to 100 ft. Major bridges exist at Tsavo (Mile 131 1/2), Darajani (Mile 174 1/2), Masongaleni (Mile 183), Kefaru (Mile 218 1/2) Stony Athi (Mile 299), and Athi rivers (Mile 309 1/2). The bridges at Tsavo and Stony Athi rivers consist of four plate-girder spans of 60 feet, resting on masonry piers and abutments. Darajani has five spans of 40 feet resting on steel cylinders, Kefaru has four spans of 40 feet on cylinders, and Masongaleni four spans of 40 feet. All these bridges have been strengthened and five major bridges rebuilt. The bridge over the Athi consists of a single Warren truss span of 100 feet with two plate-girder spans of 40 feet on masonry piers and abutments. The main girders in each case are braced together. This is to be replaced with a 100-feet trussed span girder bridge, to be erected on the existing abutments.

In the hill section, between Miles 325 and 589, there are 35 bridges with plate girders of from 10 to 100 feet spans, on either concrete piers and abutments or upon steel cylinders. The largest is that spanning the Morendat river (Mile 394), which consists of one Warren truss span of 100 feet and two plate-girder spans of 20 feet on screw piles and concrete abutments.

The ruling grade on this section is 2 per cent. uncompensated, which represents the heaviest work on the line and reaches an altitude of 8,321 feet at Mau Summit (Mile 489): there are 35 viaducts and a tunnel (at Mile 526) about 170 yards long. The viaducts are all of the same type and consist of trestle bents splayed to a batter of 1-6. The bents are built up of H-irons braced together, carrying 20-feet girders. Between each pair of trestles or bents, or between a trestle and an abutment, rests a 40-feet plate girder. Some of the viaducts have trough flooring and others longitudinal sleepers. In all there are 250 spans of 40 feet and 235 spans of 20 feet, representing a total of about 4,900 lineal yards of viaduct work. New permanent-type station buildings, houses for staff, and goods sheds have been erected at numerous wayside stations.

An up-to-date laundry and ice and mineral water factory are being constructed at Nairobi. These are required to supply bedding and stores for the new corridor stock which is being introduced.

Fuel for locomotive purposes has in the past been mostly wood cut from local forests. Over 25 1/2 miles of sidings, the longest being 10 miles, have been constructed in order to tap supplies.

The Uasin Gishu Line.

This line, which is being extended into Uganda, is laid with 50-lb. B.S.S. flat-footed rails, with steel sleepers and fastenings spaced 12 per 30-feet length of track. The ruling gradient is 1.5 per cent. compensated, and the highest point reached is 9,130 feet above sea level at Mile 70 1/2. The maximum curvature is
ten degrees. The extension is of a somewhat heavy nature, involving heavy banks and heavy cuts in earthwork, and several large bridges up to 60-feet span.

There is also the Nabkoi Viaduct, which consists of ten 20-feet spans and eleven 40-feet spans on trestle bents, the height being 100 feet above the bed of the Nullah. The total weight of the steelwork on this viaduct is 581.69 tons. The steelwork is designed to carry the live loading known as the 'B.B. & C.I.R. 1916 (MG) Standard,' and a speed of 30 m.p.h. was adopted for calculating the stresses due to centrifugal force. The station yards, with their buildings, station machinery, water tanks and towers, are laid out to a standard type. The engine-changing station is at Eldoret, at Mile 124.

Thika-Nyeri Branch.

From Nairobi to Mile 28 the maximum grade on the section has been reduced from 3 per cent. uncompensated to 1.5 per cent. compensated. All temporary wooden bridges have been removed and replaced with steel spans of 40 feet to 60 feet. The extension of the branch from Mile 25 on the old line to Nyeri, a distance of 87 miles, has been completed and handed over for traffic. The distance from Nairobi to Nyeri is 112 miles. The extension of this branch from Nyeri to Naro Moru in the direction of Nanyuki, a distance of 16 miles, is nearing completion.

This branch is laid with 50 lb. per yard rails with steel sleepers and fastenings which have been released from main-line coast sections after relaying. The engine-changing station is at Sagana, 80 miles from Nairobi. The ruling grade is 1.5 per cent. compensated against up and down traffic to Sagana, and from there to Nyeri it is 3 per cent. against up traffic and 2.5 per cent. against down traffic. From Nyeri to Naro Moru, 3 per cent. against up traffic and 1.5 per cent. against down traffic. The maximum degree of curvature is 10 deg., or 573 feet radius to Sagana, and 16 deg. or 359.26 feet radius from Sagana to Naro Moru. The highest altitude reached on this branch is at Naro Moru, being 6,630 feet above sea level. Several large bridges have been built on this line, viz.:—

</tbody>
</table>
The total length of the viaduct at Maragua is 660 feet. The area of opening between abutments is 48,059 square feet. Maximum height of trestle, 100 feet. Total weight of steelwork, 655 tons. Concrete on piers and abutments amounted to 45,000 cub. feet. The station yards are of the standard type lay-out, the buildings being of a permanent type.

The Solai Branch.

From a maize-producing point of view the Lake Solai area is one of the largest in the Colony. The branch takes off the Uasin Gishu branch within Rongai Station (Mile 19) and terminates some 2 2/1 miles due south of Lake Solai, and approximately 300 feet higher than it. The ruling gradient is 1.5 per cent. compensated for curvature at 0.03 per cent. per degree. The maximum curve is 10 deg. and the length of the line is 26.54 miles. Length of sidings, 3.4 miles. The construction was carried out by the Railway Administration, the track being 50 lb. flat-footed rails, laid on steel sleepers, with fastenings released from the main line after relaying with a heavier rail. Lake Solai is a watering and fuelling station. The line was completed and absorbed into open lines on March 13, 1926.

The Kitale Branch.

The construction of this branch was commenced on January 1, 1925. It leaves the Uasin Gishu Branch at Leseru Station Yard (Mile 135) and runs in a northerly direction through the Trans-Nzoia district, to its terminus at Kitale Township, the headquarters of the Trans-Nzoia district. The total length of the line is 40.36 miles, and it is laid with 50 lb. flat-footed type of rail with steel sleepers and fastenings, released from the coast section of main line after relaying.

There are two important bridges on this section spanning the Little Nzoia River at Mile 20 1/2 and the Nzoia River at Mile 27. Both these bridges are one 60-feet and two 40-feet deck span girders on concrete abutments and piers. The ruling gradient is 1.5 per cent. compensated, and the maximum curvature is 10 deg.

Magadi Branch.

This branch was constructed by Pauling & Co. in 1911 for the Magadi Soda Company, and was built in order to convey the soda from Lake Magadi. The junction with the main line is Magadi Junction (Mile 281 1/2), and the track then runs in a westerly direction through the Masai Province and Native Reserve. From Magadi Junction to Kajiado (Mile 26) the line is laid with 50 lb. per yard B.S.S. flat-footed rails on steel sleepers of 75 lb. in weight, there being 2,112 to the mile.
Throughout Kahiado station, which is the engine-changing station and depot, 80 lb. per yard flat-footed rails of British Standard Section are laid on 109-lb. steel sleepers, there being 1,936 to the mile. Similar material is used for the section between Kajiado and the Lake terminus (63 3/4 miles). The curvature is 10 deg. The ruling gradient on the Magadi Junction-Kajiado section are, Up, or in the direction of the Lake, 1.5 per cent. compensated; Down, or in the direction of Magadi Junction, 1.18 per cent. compensated, and on the Kajiado-Lake Magadi section, Up, or in the direction of Kajiado, 2 per cent. compensated, and Down, or in the direction of the Lake, 2 per cent. compensated.

There are several important major bridges and viaducts on this branch, which are as follows:

- Mile 29/9. – One 60-feet deck span on concrete abutments.
- Mile 35/16. – Steel trestle viaduct consisting of twelve 30-feet spans and eleven 15-feet spans on steel trestles with concrete abutments. The permanent way is carried on transverse timber sleepers, let into trough flooring, the viaduct being on a 10-deg. curve.
- Mile 37/17. – Steel trestle viaduct consisting of eight 30-feet and eleven 10-feet spans on steel trestles with concrete abutments, similar in construction to that at Mile 35/16.
- Mile 40/12. – Three 30-feet deck span girders erected on concrete abutments and piers, on a 10-deg. curve.
- Mile 49/16. – Four 40-feet deck span girders erected on concrete abutments and piers.

The station yards are of the Kenya & Uganda Railway standard, the station buildings being built in wood and iron.

**Voi-Kahe Branch.**

This branch was originally constructed as a military line during the war to a junction with the Tanga Railway at Kahe, a length of 91 miles. and was taken over by the Kenya & Uganda Railway Administration at the beginning of 1924, with running powers from Kahe to Moshi. A considerable sum of money has been expended in putting this line in order. Grades have been reduced from 4 to 3 per cent. Many additional water openings have been added and temporary trestles and crib work under bridges have been removed and replaced with concrete. New buildings have been erected at stations.
The Busoga and Kampala Branches.

The Busoga line is situated in Uganda, and forms a connection between Lake Victoria at Jinja and Namasagali, on Lake Kioga, a distance of 61 1/4 miles (metre gauge), with headquarters at Jinja, one of the important ports on the lake. The line is laid with 50-lb. flat-footed rails with steel sleepers and fastenings. There are engine-changing stations and workshops at Jinja and Namasagali. There are no major bridges of any importance, the waterways and openings being pipes and culverts. The ruling gradient is 1 per cent., and the maximum degree of curvature 10 deg. The Kampala line is a short railway that connects Port Bell with Kampala, the commercial capital of Uganda. It is six miles long on the metre-gauge and is built to a ruling gradient of 1 per cent., with a maximum degree of curvature of 10 deg. It is laid with 50-lb. flat-footed rails on steel sleepers and fastenings.

The Uganda Extension.

This is an extension of the Uasin Gishu Line into Uganda, and is divided into two sections: Turbo to Malaba River, length 78 miles; and Malaba River to Mbulamuti, length 105.75 miles. The construction of the Uasin Gishu Branch has given an impulse to the development of the Uasin Gishu District.

Preliminary and detailed surveys were made during 1924, and construction was commenced in April, 1925, the first section of the line from Turbo to Broderick Falls being completed and handed over to traffic on July 1, 1927. The earthworks are practically completed, so also is the construction of the major bridges throughout the whole length of the new extension, which should be completed early in 1928.

The ruling grade is 1 per cent. compensated and the maximum degree of curvature is 10 deg. The Kenya & Uganda Railway standard profile for banks and cuttings has been adopted. Banks are 14 feet in width at formation level, with slopes of 1 1/2 to 1. The permanent way is 50 lb. per yard B.S. section flat-footed rails with steel sleepers and keys weighing 75 lb. each. The average number are sleepers per mile is 2,112. Stations and station buildings all conform to standard type and are built in concrete block with tiled roofs. Cranes, weighing machines, ramps and interlocking signals are being installed. A three-wire air line telegraph is being installed throughout the length of the extension, and also a complete installation of Tyers tablet instruments for line working.

The Soroti Branch.

A survey from Tororo for a proposed branch in the direction of Mbale, Kumi and Soroti, which lies in a north-westerly direction towards the White Nile, was made during 1926. The construction of this line was commenced in February,
1927. The length of the line is 98 1/2 miles, with a ruling gradient of 1 per cent. compensated, and a maximum degree of curvature of 7 deg., or 819-feet radius. The track is metre-gauge and laid with 50-lb. B.S.S. flat-footed rails on steel sleepers and fastenings, weighing 75 lb. each. The major bridges are three spans of 40 feet and ten spans of 60 feet. The others are pipe drains and arch culverts. This branch may ultimately be extended in the direction of the White Nile.

A preliminary survey of the Thomson Falls line has also been completed, and this survey is now being staked out. Surveys have been made for the Kericho to Sotik and Kisumu to Yala, or the proposed line to North Kavirondo.

**Locomotives and Rolling-Stock.**

On December 31, 1926, the Kenya & Uganda Railway had 165 locomotives on the books, the principal being four Garratts of the 4-8-2 + 2-8-4 type, with a tractive effort of 35,500 lb. and an axle load of 10 tons, built by Beyer, Peacock & Co. Ltd. There are also 38 G.D. class 4-8-0 type superheated locomotives with a tractive effort of 20,400 lb., and an axle load of 10 tons, 18 Mallet class 3 0-6-6-0 type with a tractive effort of 23,600 lb., and an axle load of 10 tons, with H.P. cylinders of 15 1/2 in. by 20 in. and L.P. cylinders of 24 1/2 in. by 20 in. The cylinders of the Garratt type are 16 1/2 in. by 22 in. and of the G.D. class 18 in. by 22 in.

There are also 21 shunting tank engines of the 2-6-2 type with 15 in. by 22 in. cylinders, 11.25 tons axle load, and a tractive effort of 13,800 lb. at 75 per cent. Six Mikado engines of the 2-8-2 type with double bogie tenders, built by R. Stephenson & Co. Ltd., are now in course of erection, with driving wheels 4 feet 3 in., 33,467 lb. tractive effort, axle load of 18 tons, and will work on the newly-laid 80-lb. rail between the coast and Makindu.

Most of the engines consume wood fuel, but some are fitted for oil burning, notably those in the Coast area. Coal is not at present available in the Colony, but some is imported and used, principally in the Garratt class, and some of the G.D. type engines.

The coaching stock numbers 305 units, the first-class bogie coaches providing seating accommodation for 24 and sleeping accommodation for 16. The second-class bogies accommodate 16 passengers for sleeping with seating space for 20. The third-class bogies, provided mainly for Africans, accommodate 112. All the stock is non-corridor, but 10 first-class and 10 second-class bogie corridor coaches are in course of erection, with three dining cars complete with modern equipment for comfortable and even luxurious travel.

The freight stock numbers 2,851 vehicles, 680 of these being bogie covered goods wagons with an average carrying capacity of 21 1/2 tons and a tare of 11 tons. Other principal classes are 250 bogie high-sided wagons of 21 1/2 tons average capacity, 81 bogie low-sided wagons of 25 1/4 tons capacity; and 194 low-sided iron trucks of 10 tons capacity. In addition, there are 104 10-ton rail and timber trucks, 92 water tanks of approximately 10 tons capacity, and 47 covered cattle wagons of 10 tons capacity.
Workshops and Equipment.

Extensive locomotive and carriage workshops exist at Nairobi (Headquarters), where heavy and light repairs are carried out. These workshops are, at the present, undergoing a process of modernisation and extension.

Particulars of some of the principal buildings, which are of steel-frame construction, are given below:

<table>
<thead>

<td></td>
<td>270 feet long by 35 feet span.</td>
</tr>
</tbody>
</table>

There is also a large workshop yard with siding facilities and an inspection pit 500 feet long.

A change-over from steam power to electricity has been made, so effecting considerable improvement in the execution of repairs, &c. The existing headquarters offices, consisting of wood and iron buildings, which have done service for 25 years, are now being replaced by a substantial block of stone offices, for which the foundations were commenced at the end of 1926.

The whole of the workshops are electrically driven, the current being of 415-volt, 3-phase, 50-cycle, alternating current, being transformed from E.H.T. 10,000 volts in the railway sub-station.

The out-turn¹ for the years 1925, 1926, and the estimated out-turn for 1927, of locomotives, coaching stock and goods stock, were:

In the machine shop there are some special machines which are capable of dealing with all classes of work, such as a surface grinding machine (Craven Bros. (Manchester) Ltd.); circular grinding machine (Churchill Machine Tool Co.
lapping machine (Beyer, Peacock & Co. Ltd.); crankpin turning machine (Pearn-Richards); universal milling machine (A. J. Parkinson & Sons); vertical milling machine (Kendall & Gent Limited); big 20-in. stroke slotting machine capable of taking a 1/2 in. cut (Buckton & James); 7-feet radial drill, which swings and drills at any angle, and capable of boring a 6-in. diameter hole (Wm. Asquith Limited); and a double tool planer, which is automatic, self-acting, and able to take a 3/4 in. cut on each tool (Armstrong, Whitworth & Co. Ltd.). In addition, there are also tyre-turning lathes, by Dean, Smith & Grace, and Hulse & Co. Ltd., and a journal lathe by James Spencer.

In the smithy there is a battery of steam hammers (Massey, Pilkington & Thwaites). These hammers are 5 cwt., 7 1/2 cwt., 10 cwt., 12 cwt., and two 20 cwt. There is a bolt and nut-making machine (Greenwood & Batley), a forging machine (Ryders), a chain-annealing furnace (New Alldays & Onions Limited), a 20-ton spring-testing / machine (W. & T. Avery Limited), a hydraulic spring and buckle press (Berry), a modern spring-making machine, and a baling and piling furnace (New Alldays & Onions Limited).

The sawmill is fully equipped to deal with all classes of Kenya timber, and the machines, which include a horizontal log band saw, moulding, planing, bandsawing and fretsawing machines, and also all the machines in a well-equipped saw shop capable of dealing with large bandsaws and circular saws, have all been supplied by T. Robinson & Sons Ltd., of Rochdale. A three-chambered timber-drying kiln by Sturtevant is in course of erection, and when completed will be capable of handling 400 tons of timber per annum.

The Marine Department. 

The Marine Department of the Kenya & Uganda Railway administers both the Uganda Railway Marine on Lake Victoria and the Busoga Railway Marine on Lake Kioga. Both are under the charge of the Marine Superintendent at Kisumu, under whose orders is the Superintendent of the Busoga Railway Marine, stationed at Namasagali. On the engineering side there is a Chief Marine Engineer at Kisumu, who is under the Marine Superintendent, and an engineer at Namasagali for the fleet on Lake Kioga.

The Uganda Railway Marine, on Victoria Nyanza, consists of six vessels, ranging from a displacement tonnage of 1,200 to 700; one powerful tug, the Kavirondo, of 400 I.H.P.; one smaller tug, the Percy Anderson, of 120 I.H.P.; one small 50-ton steamer, the Husseni; and one 70-ton steamer, the William Mackinnon, which belongs to the Uganda Government, but is operated on their behalf by the Kenya & Uganda Railway. All the above are single or twinscrew vessels. Their draught is limited to 7 feet, owing to the shallowness of the Gulf of Kavirondo.
A weekly mail and passenger service is maintained, leaving Kisumu every Sunday, calling at Entebbe, Port Bell and Jinja, and returning to Kisumu on the following Thursday; cargo is also carried. This service is performed by the ss. *Clement Hill*, which has cabin accommodation for 30 first-class and 20 second-class passengers and 450 tons of cargo. In addition to this service, the steamers *Usoga* and *Rusinga*, of 1,200 tons, make fortnightly trips round the lake, touching at Mwanza and Bukoba, in Tanganyika territory, Bukakata, Entebbe, Port Bell and Jinja, in Uganda.

Mails, passengers and cargo are carried, and the trip is made alternatively north and south about.

**Port Working.**

Two new deep-water berths were opened at the Port of Mombasa, which includes Kilindini Harbour, in 1926, and ships berthed alongside, commencing with the ss. *Clan Mackenzie*, on July 28, 1926. From that date until the end of 1926, 34 ships were berthed, 36,349 tons of cargo landed, and 8,087 tons shipped direct to and from the quay.

The total area of ground covered by the new quay, transit shed, stacking grounds and roads, is about 13 acres. Further extensions to the port have been authorised, together with modern equipment, which will give facilities for berthing five ships at a time.

**Traffic and Train Working.**

Practically the whole of the railway is now equipped with Tyer's tablet working, and a certain number of stations have been equipped with interlocking apparatus.

Train-ordering, operation and wagon supply are controlled from headquarters at Nairobi, and early in 1926 a modified form of central control was inaugurated. There are at present no long-distance telephones in the Colony, and all communications between the control office and stations are conducted by means of telegraph, the instruments being operated by Africans.

The introduction of the central control system has been fully justified; a steady decrease in train-mileage has been maintained in spite of increases in the tonnage carried and the track-mileage operated. The freight train-mileage for December, 1926, was 127,820, compared with 168,227 for January of the same year, a decrease of 40,407 train-miles, or 24 per cent., and a decrease of 32 per cent. on December, 1925. The total engine-mileage for the year exceeded the estimate by 0.05 per cent., and was only 6.55 per cent. in excess of the mileage for 1925, whereas the tonnage lifted was 10 per cent. in excess of 1925. In December, 1925, the average gross train load was 215 tons; in December, 1926, the net train load was 20 units 118 tons, which gives a gross load of 240 tons, an increase of 25 tons,
or 11.11 per cent. From July, 1926, a record was kept of the average starting point vehicle load, which increased from 9.69 in August to 11.1 tons in December.

In the earlier part of 1926 a system of banking trains from Kilindini to Mazeras was introduced in order to maintain full train loads from the port to Nairobi and to reduce marshalling and shunting costs en route due to break of load. The method proved successful and resulted in reducing the average transit time between the coast and Nairobi, in addition to effecting a decrease in train-mileage.

The engine-miles per engine per day are 90.89. The length of the usual engine section is 100 miles, but in the coast section a system of pooling engines has been introduced extending the engine runs to 207 miles, and has worked quite satisfactorily in spite of the fact that European, Asian, and African drivers are employed. The fuel consumed during 1926 was: coal, 40,989 tons; wood, 91,252 tons; and oil, 7,281 tons.

The principal stations are Mombasa, the terminus at the coast; Nairobi, the seat of Government and the headquarters of the railway, Nakuru, the junction between the Kisumu line and the line to Uganda; Eldoret and Tororo, on the Uganda line; and Kisumu, the terminus, on Lake Victoria.

A mail service is maintained on the main line four days a week, with special boat trains running in conjunction with the arrival of passenger ships at the port; daily mixed services are run in the more thickly populated areas. It is hoped that in the near future it will be possible to introduce a daily mail train service between the coast and Nairobi, the journey being performed in 18 hours.

The freight trains are all conditional, but a service of four trains in each direction is usually maintained between Nairobi and the coast. The tonnage of the principal classes of freight conveyed during the year 1926 were: maize, 48,126 tons; soda ash, 14,023 tons; ginned cotton, 33,976 tons; cotton seed, 34,346 tons; and oil seeds, 17,531 tons.

During the earlier part of 1927 a record tonnage of seasonal crops was handled. A few comparative figures are given below:

A road motor service is maintained in Uganda between Masindi port and town and Butiaba, with headquarters at Masindi port.

The fleet consists of 14 2-ton Albion vans, four 4-ton Albion vans, one Albion passenger van, one 3-ton Daimler van, four 1-ton Morris vans, and six 1-ton trailers. The tonnage carried in 1926 was 7,500 tons, compared with 6,757 in 1925.
Stores Working.

The tonnage of stores and material received from overseas and dealt with by the Stores Department during 1926, excluding locomotive fuel, amounts to 53,088 tons, compared with 78,929 for the preceding year. A large number of the railway staff draw rations, and during 1926, 1,565 Indians and 183,904 Africans were provided with rations issued by the Stores Department.

The total turnover for the year 1926 amounted to £3,562,967. The value of stores on hand at the end of 1926 was £459,041.

THE NIGERIAN RAILWAY.

A System of 1,466 route-miles of 3-feet 6-in. gauge line, and 133 route-miles of 2-feet 6-feet gauge, which links up Kano, via Kaduna, with the ports of Lagos and Port Harcourt. An operating ratio of 59.20 per cent. helps the Administration to show highly satisfactory results. Train Ferries and the working of Coal Mines are included in the Railway Activities.

[...]

The Nigerian railway system, which formerly comprised two disconnected connected systems based on Lagos and Port Harcourt, was recently consolidated by reason of an extension of the Eastern line from Makurdi to Kaduna, where connection is made with the main line from Lagos to Kano. The terminus of the Western line of the Nigerian Railway is on Iddo Island in the Lagos Lagoon; there is no rail connection with the town of Lagos itself. At Iddo are wharves for the reception of the smaller ocean craft and barges, deep-water wharves used for the mail boats being situated at Lagos and Apapa. Four deep-water wharves, capable of taking the largest boats engaged in the West African trade, were completed in 1926 at Apapa, on the opposite shore of the lagoon to Lagos, and the four berths were available for shipping early in 1927. The construction of these wharves was not under the charge of the railway. From Iddo Island the line is carried by a stone causeway to the mainland at Ebute Metta, which is connected to Apapa by a branch line.

Historical Survey.

The system now comprises 1,600 route-miles of line, and is indicated on the map on page 81. Known originally as the Lagos Railway, the first section of line – from Iddo to Ibadan, a distance of 123 (since reduced to 119 1/2) miles – was opened for traffic in 1901, while a few years later, an extension from Ibadan to Iwo, 29 1/2 miles, and forward to Oshogbo, a further 32 1/2 miles, was brought into service. In August, 1908, an extension from Oshogbo to Ilorin, 61 miles, was opened, this line being carried on to Jebba, a section of 59 miles in length, in 1909. From Jebba the line was pushed on in a north-easterly direction to Zungeru, whence a short new section connected with the Baro-Kano Railway at Minna in 1912, and thus provided a through route from the chief centres of trade in Northern Nigeria to the coast at Lagos. The Baro-Karo Railway, 353
miles in length, which was built by the Northern Nigerian Government for military and political purposes, and completed in 1912, connected the capital with the River Niger, on which traffic passed down to the coast. In 1912 this railway and the Lagos Railway were combined under the name of the Nigerian Railway.

Prior to January, 1916, there was no rail connection between the lines north and south of the River Niger at Jebba, and traffic was conveyed across the stream by means of a ferry capable of carrying six large wagons or four passenger coaches at a speed of 7 knots per hour. This method of transport was abandoned in January, 1916, on the completion of a bridge over the River Niger at Jebba, as through rail connection was then established.

In 1913, following the discovery of the Udi coalfields, the construction of an eastern railway, running in a northerly direction, was commenced in sections from Port Harcourt, on the Bonny River, to Makurdi, a distance of 290 miles, on the River Benue. This river is crossed by means of a train ferry, and the line has since been extended to Kaduna, where it connects with the western main line. On this line a branch has been built from Kafanchan to Bukuru, 53 miles, while the line between the latter place and Jos has been converted from the 2-feet 6-in. to the 3-feet 6-in. gauge.

Apart from the Bauchi Light Railway, which runs from Zaria to the tin-fields on the Bauchi plateau, and which comprises 133 miles of line and, with loops and sidings, 140 track-miles of 2-feet 6-in. gauge track, the whole of the system is on the 3-feet 6-in. gauge. The western main line from Iddo Island, in the Lagos Lagoon, extends 704 1/2 miles, while the eastern main line from Port Harcourt to Kaduna is 569 miles long.

Starting from Lagos and proceeding to Kano, the Western line for about the first 200 miles runs through a thickly populated country, the main products being palm kernels, cocoa, palm oil, and cotton. For the next 300 miles the population is scanty and the traffic small, except that the branch to Baro serves a large population, living in a district with good soil and producing much native produce. North of Zaria the population again becomes very dense, the principal exports being groundnuts, hides and skins, and cotton. The Bauchi Light Railway (2-feet 6-in. gauge) serves a cotton-growing district and a small tin-producing area. The railway motor transport services operate from Zaria and convey traffic to and from the large ginneries of the British Cotton-Growing Association, which are at present not served by railway, and also bring in other produce.

On the Eastern division there is a considerable export traffic in palm oil up to a distance of about 90 miles from the coast. At Enugu (151 miles from the coast) there is a railway-owned colliery, the output from which is at present in the neighbourhood of 360,000 tons per annum. This coal is exported via Port Harcourt, and a large tonnage is consumed by the tin mines near Jos, which is at the extreme northerly end of the Eastern division. This is the centre of the
tin fields, and some 11,000 tons of tin per annum are shipped, while the mines import large quantities of material. The eastern line north of the River Benue has only recently been completed, and time must elapse before the country can be fully developed.

The working of the Nigerian Railway and Udi coal mines for the year ending March 31, 1927, was highly satisfactory. The total capital cost of the Nigerian Railway at the end of the financial year was £14,327,361, an average of £11,325 per mile. Gross receipts were £2,396,011, against £2,353,464 the previous year, while the corresponding expenditure figures were £1,418,625 and £1,206,787. The operating ratio in 1926–27 was 59.20 per cent., against 51.28 per cent. in 1925–26. Both passenger and freight traffic showed substantial increases, 2,621,432 passengers being carried in 1926–27 as against 2,413,113 the previous year, and 948,304 tons of freight, as compared with 797,279 tons. The percentage of net profit to capital in 1926–27 was 6.82, against 8.08 the previous year. The results for the past 10 years are given in the table on page 86.

Organisation and Administration.

Like other railways in British African possessions, the railway is administered under the control of the Secretary of State for the Colonies, through the resident Governor. The management in the Colony comprises a General Manager (Mr. E. M. Bland) and the usual departmental chief officers, the system being operated on a compromise between the departmental and divisional schemes. The headquarters of the railway are at Ebute Metta, where also the principal workshops are located. The engineering departments are under the usual technical heads, but the working departments are merged in a Transportation Branch.
The transportation scheme of organisation was brought into force on February 1, 1926. It was formed by the amalgamation of the locomotive running section of the Chief Mechanical Engineer’s Department, the Traffic Department (goods, coaching, and operating), and the Motor Transport Department. The Transportation Department also controls dock working at Lagos and Port Harcourt. The department is under the control of the Superintendent of the Line, with headquarters at Ebute Metta (a suburb of Lagos). He is assisted by two Assistant Superintendents of the Line – one for traffic operation and commercial matters, and one for locomotive working. The line is divided into three divisions, each in charge of a Divisional Superintendent, assisted by Assistant Divisional Superintendents as follows:–

**Western Division.**

Lagos to Zungeru inclusive, 435 miles, with headquarters at Ebute Metta Junction.

**Northern Division.**

Zungeru exclusive to Kano, the Baro Branch, and the Bauchi Light Railway, 524 miles, with headquarters at Zaria. The Motor Transport Department is also under the control of Divisional Superintendent, Zaria.

**Eastern Division.**

Port Harcourt to Jos and Kaduna Junction, 632 miles, with headquarters at Port Harcourt.

So far as the domestic organisation of each division is concerned, this varies slightly [...] It may be of interest to note that, for example, at Offa and Minna, which may be regarded as ‘key points’, one Assistant Locomotive Superintendent and one Assistant Traffic Superintendent were stationed at each point prior to the inauguration of the Transportation Department, whereas one officer now controls both traffic and locomotive work at each place. This officer is responsible for all sections of the work at these points, but has no jurisdiction over other parts of the line, thus enabling him to concentrate on the work done at the key points.

The staff of the divisional offices under the new conditions is less than the combined staff of the former traffic and locomotive district offices, and a substantial saving has been realised in respect of African office staff.

The new organisation has proved a great success, and the following are some of the advantages which have been found to accrue:–

(i) The saving in staff has already been mentioned. The whole organisation is an elastic one and capable of expansion without corresponding expense. For instance, 332 miles of new line were added to the Eastern Division at
the beginning of April, 1927. Under the old organisation, District Locomotive Superintendent’s and District Traffic Superintendent’s offices would have had to be created to control such a length of line as this.

(ii) The use and distribution of engine power has been greatly improved by the amalgamation of the former separately controlled Locomotive and Traffic Departments.

(iii) Train ordering is more scientifically carried out. The number of officers ordering trains has been reduced, and the fusion of interests has enabled a closer relationship to be maintained between the traffic to be moved and the power available.

(iv) As a result of the powers granted to Divisional Superintendents, correspondence has been saved, work accelerated, and the preparation of statistics simplified.

(v) Better supervision has been achieved – firstly, by reason of the alteration in the organisation whereby certain officers have been confined to the control of key points; and secondly, owing to the fact that the Divisional Superintendent is on the spot and the Assistant Divisional Superintendents (Locomotive and Traffic) now belong to the same department and can thus, when inspecting, report upon or put right faults connected with the working of the railway. Under the old organisation each officer confined himself to the work of his own department.

(vi) The fact that an officer with increased powers is in charge of a division has improved discipline, saved time, and ensured the fusion of interests.

The total staff of the railway on March 31, 1927, was 15,624, comprising 425 Europeans, 11,695 African and West Indian staff, 2,722 artisans, &c., and 10,782 labourers.

**Permanent Way and Works.**

The total track maintained, all single line, is 1,600 route-miles and 208 miles of sidings. The system is divided into three sections, with a Divisional Engineer in charge of each under the Chief Engineer. The latter has control of all new works on the system and the location survey of new lines, a programme of about 150 miles per annum having recently been formulated. The construction of new lines is undertaken by a separate department. The rails used throughout are the F.B. type, British standard specification, but for all new lines and relaying the revised British standard is being adopted.

Steel trough sleepers of the key and lug pattern are used, but a new type with a bolt and clip has been adopted recently for new lines and relaying. Native timber sleepers are used for bridges and crossings and are found to give very good service. Most of the line is ballasted with granite stone, the standard for top
ballast being from 1/2 in. to 1 1/2 in. Laterite is used on some sections, more particularly on branch lines.

European foremen supervise sections varying from 30 to 60 miles. These sections are in charge of native gangers, who control lengths of about 4 miles. The average number of trackmen per route-mile is 3-28, and per track-mile, including sidings, is 3-12. Training of native foreman platelayers is making steady progress, and in consequence a gradual decrease in the number of European platelayers takes place every year.

The number of bridges with spans varying from 15 feet to 60 feet is 240, and of 100-foot spans and over there are 16. The largest bridge crosses the Niger river at Jebba, where the river is divided into two channels by Jebba Island. The southern bridge consists of seven through lattice girder spans of 185 feet each between centre of bearings, with three 30-feet concrete arches at each end. The second, which connects the island with the northern bank, consists of two half-through lattice girder spans of 150 feet and two of 105 feet, with two 30-feet arches at each end. At Makurdi, on the Benue river, where it is feared the formation of sand banks will interrupt the working of the train ferry, it is proposed to construct a bridge which will be about half a mile in length.

From Iddo to Ibadan, mile 120, the track is laid with 80-lb. rails, 40 feet in length, with 16 sleepers to the rail length. Maximum gradients are 1 per cent. and 1.25 per cent. respectively, against exports and imports. The maximum curvature is 8 deg., compensated. From Ibadan to Jebba, mile 303, the rails used are 55-lb. section, with 12 sleepers to the 30-feet rail. The maximum gradient is 1.25 per cent. in both directions, the sharpest curve being 8 deg., non-compensated. Between Jebba and Minna, mile 462, the track consists of 45-lb. rails, with 12 sleepers to the 30-feet rail. The maximum gradients are 1.25 per cent. against imports and 1 per cent. against exports, except for a short section of 38 miles between Zungeru and Minna, where grades of 1.25 per cent. occur in both directions. Maximum from Minna to Kano, mile 705. The maximum gradient to Zaria, mile 617, is 1.65 per cent., and from Zaria to Kano, 1.25 per cent. in both directions in each case. The maximum curvature on the lines north of Minna is 10 deg.

The section between Kaduna and Zaria (51 miles) is being realigned and regarded, so as to conform to the standard gradients and curvature of the Eastern system, and 60-lb. track will replace the present 45-lb. material. This work necessitates deviating portions of the line and strengthening bridges, and will permit of the 12 1/2-ton axle-load being worked between Port Harcourt and Zaria, a distance of 619 miles.

The Eastern line runs from Port Harcourt to Kaduna Junction, 569 miles, and is built to standard gradients of 1 per cent. and 1.25 per cent. respectively, against exports and imports. The maximum curvature is 10 deg. 60-lb. rails are
used throughout, those north of Makurdi being 33 feet in length, with 13 sleepers per rail length. On the lines south of Makurdi 30-feet rails are used.

Branches.

A branch four miles long joins the main line at Ebute Metta Junction station with Apapa. It is laid with 80-lb. track, and connects with the deep-water wharves at Apapa, where all freight and mail steamers now call. At Ifo Junction, mile 27, a short branch of three miles is laid with 50-lb. material to Ifo. This branch is to be extended shortly, through Ilaro to Idogo, a distance of 24 miles. A short branch of two miles connects the town of Abeokuta with Aro station, mile 58. A branch 111 miles in length runs from Minna to Baro on the Niger River, and is laid with 45-lb rails. The gradients are 0.7 per cent. in the direction of Baro and 0.8 per cent. towards Minna.

From Zaria a 133 miles 2-feet 6-in. gauge line runs to Jos, the centre of the tin-mining industry. The maximum gradient is 2 per cent. and curvature 12 deg., but on a short section of the hilly country 14-deg. curves are used. Rails used are 30-lb. section, 24 feet long, with nine sleepers per rail length. Jos station is served by another branch line 63 miles long, from the station of Kafanchan, mile 456, on the Eastern system. The gauge is 3 feet 6 in. It is laid with 60-lb., 55-lb. and 50-lb. rails, the latter two classes of rails having been released from the Iddo-Ibadan section. The maximum grade is 2 per cent. and curvature 12 deg. From Enugu a branch line of 6 1/2 miles serves the collieries, which have a big and increasing output.

A branch line is being constructed from Zaria to Gusau, 107 miles, to tap the cotton areas of Sokoto and Katsina Provinces. It is proposed to extend this line northwards to Kaura Namoda, a distance of 33 miles. This branch is being constructed to standard gradients, the standard curve of 8 deg. being observed, and it is expected to be open for traffic as far as Gusau in 1928. The rails are 60 lb., in 33-feet rail lengths. Another branch line is in course of construction from Kano towards Hadeija, and when completed will be about 110 miles in length.

Preparations are being made to relay the section of line from Ibadan to Offa, 95 miles, with 80-lb. permanent way material, thus forming a continuous working section of 215 miles from Iddo with the heavier track, and permitting the employment of engines with an axle load of 16 ½ tons.

Signalling.

Over the greater part of the system single-line working is controlled by the ‘S’ type Webb Thomson miniature electric staff apparatus fitted with pilot locks. Semaphore signals are provided or are in process of being erected at most stations. They consist of one outer and two home signals at each end of the station.
These points and signals are not interlocked from the ground frame; this only operates the signals, and the points are worked by the ordinary throw-over lever and locked when set as required. Until the points are so locked, the signal applying to that particular road cannot be pulled off, and the outer signal cannot be pulled off until one of the home signals has been lowered. At the large stations it is intended to erect comprehensive signalling installations with points interlocked and detected.

**Locomotive and Rolling-Stock.**

On March 31, 1927, the total number of locomotives was 243, there being 230, including 45 shunting engines, for the 3-feet 6-in. gauge, and 13 for the 2-feet 6-in. gauge. A brief list of the different types of engines is given below:

<table>

</table>

Except for shunting engines all are fitted with superheaters, and the newer types with the ‘Pyle’ electric light installation.

The most powerful type is a three-cylinder engine, the total weight of engine and tender in working order being 126 tons. At 85 per cent. of the boiler pressure the tractive effort is 38,557 lb. A feature of interest in connection with the 801 class engines is that they are believed to be the first 3-cylinder simple engines ever to be run on the 3-feet 6-in. gauge.

Five new express engines, four passenger, tank engines, and 12 shunting engines are being added to the above stock.

Running sheds exist roughly every 100 miles, which distance is considered a fair run for engine and crew under the conditions in a tropical country like Nigeria. In some districts the sheds are so spaced that a shuttle is run. The sheds are generally equipped with a hydraulic drop pit, 30-cwt. block and tackle, smiths’ hearths, treadle lathe, hand drilling machine, and hand shaping machine; as well as the usual shed equipment in the matter of tools, stores, &c.
At Zaria, a subsidiary workshop exists capable of dealing with all running repairs to the Bauchi Light Railway engines and mainline engines on the Northern Division. Each division has its own 25-ton breakdown crane and properly equipped tool vans.

Steam pumps are installed or are in the process of being installed throughout the line, the standard being the horizontal outside packed Worthington-Simpson pumps 10 in. by 6 in. by 12 in. The steam supply for driving these pumps is obtained from Spencer Hopwood No. 14 vertical type boilers.

Coal consumption averages 76 lb. per mile, and oil consumption 6-9 pints per 100 miles. Both these figures are considered good as the grades are heavy, the driving wheels of engines are of small diameter, and there are the usual conditions associated with a tropical country.

The coaching stock totals 282 vehicles and includes 15 first-class sleeping cars and nine restaurant cars. Vestibuled stock in all classes is provided for the express trains running in connection with the mail steamers. Electric lighting is in use on all trains, these installations and the fans being of the Vickers’ or Stone types. Additional first and third-class stock is on order to meet the demands of increasing passenger traffic. The coaching stock on the 2-feet 6-in. gauge totals 15 vehicles.

The goods stock totals 3,089 vehicles on the 3-feet 6-in. gauge and 117 on the 2-feet 6-in. gauge. Most of the wagon stock consists of bogie vehicles with 20-ton carrying capacity, there being 70 allsteel wagons of this type. Special wagons with 2,093 cub. feet capacity are provided for such traffic as hides and skins, and cotton, and high-capacity wagons for coal traffic are being introduced. All stock is fitted with A.B.C. couplers and the automatic vacuum / brake. The stock also includes 112 brake vans, 209 special wagons for stone traffic, and two wagons (constructed in the Colony) for exceptional loads such as mining machinery, &c.

Railway Workshops.

Two main workshops have been established, one at Ebute Metta, constructed by Sir W.G. Armstrong, Whitworth & Co. Ltd., and the other at Enugu, constructed by Sir William Arrol & Co. Ltd. The smaller workshops at Port Harcourt, Offa and Minna are being closed down, and only a small shop at Zaria is being retained to deal with the repairs to the 2-feet 6-in. gauge stock. The main shops at Ebute Metta have a total covered area of 216,500 sq. feet, and extensions are in progress which will increase this area by 52,650 sq. feet. The covered area at Enugu is 93,350 sq. feet in extent, and the shops there are equipped in a similar manner to those at Ebute Metta, but on a smaller scale. The power station at Enugu is controlled by the railway, and power both for workshops and colliery is provided. At both shops, carriage and wagon repairs are handled, as well as locomotive repairs. The Ebute Metta shops were designed to deal with 80 engine
overhauls and 700 carriage and wagon repairs per annum, while the Enugu shops were designed to attain half this output. The Ebute Metta workshops comprise two groups. Electric power is supplied from the Public Works power station at Iddo, approximately three miles away. Current is delivered at 3,300 A.C. and converted to 440 D.C. for machine-power purposes and 220 A.C. for lighting. The sub-station where conversion takes place is equipped with 3/500 kW rotary converters and 3/550 kVA transformers supplied by Metropolitan-Vickers Electrical Co. Ltd.

A complete system of up-to-date roof-lighting is installed throughout the shops, all the fittings and equipment having been supplied by Metropolitan-Vickers Electrical Co. Ltd.

The Ebute Metta locomotive shops consist of five bays 500 feet long, four bays being 45 feet wide, and the fifth or erecting shop 55 feet wide. The iron and brass foundries, copper shop, and the smithy are situated in No. 1 bay. Two 30-cwt. cupolas are used to produce cast iron, and the usual pot furnaces are used for the brass foundry. Three ‘Mumford’ moulding machines are used for repetition iron and brass work, metal patterns for which are mounted on plates, for use in the machines. One 5-ton overhead crane is provided in the foundry. In the smithy a spring furnace hydraulic spring buckling and testing machine, a bolt and nut making machine, one 20-cwt. steam hammer, one 20-cwt. Massey electric-pneumatic hammer, and one 5-cwt. hammer of the latter type. Oil-fired furnaces are used for case-hardening and tool-making purposes. There are 12 smiths’ hearths, the vertical flues of which preclude the possibility of overhead cranes, and a number of 2-ton jib cranes are provided for lifting purposes.

No. 2 bay is devoted to the machine shop and includes the brass machine and finishing shop and the tool room. At the south end of the bay are situated two planing machines, one 12 feet by 6 feet by 6 feet, by Craven Bros., and the other 8 feet by 3 feet by 3 feet, by Stirk’s. The machines are arranged in groups, each group driven by an electric motor. There are two lathe groups, consisting of six 8 1/2-in., 10-in. and 12 1/2-in. sliding, surfacing and screw-cutting lathes by Dean, Smith and Grace, Lang’s and other makers, and three ‘Herbert’ hexagon turret lathes. Opposite these lathe groups is a battery of five Craven’s radial drilling machines. Situated next is the milling and shaping machine group.

The grinding shop consists of two piston rod grinders, a slide bar grinder, a double-spindle lapping machine, a motion pin grinder, and a universal grinding machine by Beyer Peacock, with a radial attachment for grinding reversing links. The brass shop is equipped with two 8 1/2 in. brass lathes, one 6-in. lathe, two 10-in. shaping machines, one brass milling machine, a brass boring machine by Craven Bros., and the usual polishing buffs. The tool room consists of a No. 3 Lumsden oscillating tool grinder, and the usual grinding machines for dealing with milling cutters, twist drills and cutting tools generally, and a
6 ¼-in. Lang tool-room lathe completes the equipment. One 5-ton overhead electric crane serves No. 2 bay.

No. 3 bay contains, at the south end, the wheel shop, with three motor-driven wheel lathes and an axle journal lathe by Craven Bros., a wheel quartering machine, and an internal wheel drill. An Alldays & Onions oil-fired tyre heater is situated in this shop served by a 2-ton jib crane. Next to the wheel shop is situated the boiler shop machinery, consisting of two punching and shearing machines, together with an angle-iron bending machine and a battery of two radial drilling machines by Craven Bros., and one vertical drill.

There is also a hydraulic tube-testing machine, a tube-stretching machine, and a motor-driven cold saw. There are two plate rolls, one 6 feet and the other 8 feet, the latter capable of rolling plates up to 5/8 in. thick. A quasi-arc electric welding plant is adjacent to the boiler machine shop, and a Alley and MacLellan air compressor, driven by a 100-H.P. motor, supplies compressed air to the boiler, tender and erecting shops. The north end of No. 3 bay provides accommodation for 14 tenders. This bay is provided with two 5-ton overhead electric cranes.

In No. 4 bay, at the south end, is situated the motion, valves, axle-box and brake gear bays, which are adjacent to the erecting shop. In the northern half of this bay is accommodation for 11 boilers for repairs, and at the extreme end is a 10-feet by 8-feet plate furnace, with four smiths hearths and an annular hearth, with the necessary levelling blocks. Cranage facilities in the four bays consists of two 20-ton overhead electric cranes.

No. 5 bay is the erecting shop, and has accommodation for 20 locomotives. Two 40-ton overhead electric cranes serve this shop, and there is an Avery weighing and balancing machine at the south end. All the overhead cranes in the shops were supplied by Craven Bros.

The carriage and wagon repair shops are situated some 500 yards to the north of the locomotive shops and consist of four bays, each 450 feet long by 55 feet wide. They include a paint shop, carriage repair shop, wagon repair shop and a woodworking machinery and joiner’s shop. The saw mill is situated in line with the wood-working machinery shop, 360 feet north of it, and contains a Robinson log band saw, a Ransome’s log band saw and a log rack saw. The saw-sharpening machines are installed in the saw mill, which is 200 feet by 55 feet. The carriage and wagon shop bays will accommodate 45 vehicles of the standard 40-feet bogie goods type. There are two 15-ton electric overhead cranes in each of the two bays devoted to carriage and wagon repairs and one 15-ton crane in the saw mill.

At the Ebute Metta shops, 27 engines received heavy repairs during the year 1926–27 and 24 engines second-class repairs. Fourteen new engines from England were erected. In the carriage and wagon shops, the out-turn for 1926–27 was: rebuilds 174, general repairs 506, light repairs 26, and new vehicles erected 30.
Considerable additions to the machine shop and boiler shop, in the shape of up-to-date machine tools, have been authorised, together with an hydraulic equipment of flanging presses and riveters. An extension of the woodworking bay, to join up with the saw mill, is proposed, amounting to some 360 feet of extra shop space.

Enugu Workshops.

The Enugu locomotive shops consist of three bays, each 300 feet long, two of which are 45 feet wide and one 55 feet wide, the latter being the erecting shop.

The smithy is situated in the south end of No. 1 bay, and is provided with one 20-cwt. Massey electric pneumatic hammer, a bolt and rivet-making machine, a hydraulic spring buckling machine, seven double smiths' hearths, and the usual case-hardening and tempering furnaces, all of which are oil-fired. The copper-smith's shop is next to the smithy, and the foundry is placed in the north end of No. 1 bay, and has one 30-cwt. iron melting cupola, pot brass furnaces, and a sand mill.

The machine and fitting shop are situated in No. 2 bay, and consist of two wheel lathes by Craven Bros., an axle journal lathe, a wheel press of 200 tons capacity, and a 60-in. tyre boring mill. There is a lathe group consisting of three centre lathes, two hexagon turret lathes, and two bolt and nut-screwing machines. There are also a 9-feet planing machine, a 12-in. slottor, and a 7-feet 8-in. radial drill, / all motor driven. In addition there are two small group drives, with a 6-in. and a 9-in. shaper, a universal milling machine, hack saw, and a cold saw; a grinding group with a piston rod grinder, hole and ink grinding machine, and a motion pin grinder. A small brass finishing shop and tool room is located in this bay, and a 5-ton overhead electric crane is provided.

No. 3 bay contains the boiler and erecting shops. There is accommodation for five engines and five boilers under repair at once in the boiler shop. There is a 7-feet 8-in. radial drill by Craven Bros., a 6-feet 1/2-in. plat roll, a smith's hearth, and a 5-feet annular hearth, with the necessary fan and motor. There is also a motordriven punch and shearing machine. In the erecting shop there is an Alley and MacLellan air compressor, and a locomotive weighing and balancing machine. Two 40-ton electric overhead cranes are provided.

The carriage and wagon shop is situated to the north of the locomotive shop, separated from it by an electrically-driven traverser. This shop consists of three bays, each 200 feet long by 45 feet wide. No. 1 bay contains the woodworking machinery, which consists of a 36-in. circular saw mortising and boring machine, 36-in. vertical band saw, a general joiner, a 48-in. rack saw, a tenoning machine, a panel planer and thicknesser, a double-spindle moulding machine, and the usual saw-sharpening machinery. There is a 5-ton overhead electric crane in this bay. No. 2 bay is the carriage and wagon repair shop, and will accommodate ten vehi-
Anon., ‘The Railways of Africa’ 259

There is a 15-ton electric overhead crane in this bay. No. 3 bay is the paint shop and wagon finishing shop.

There is no saw mill at Enugu, the timber being sent by rail from Port Harcourt, where the saw mill is situated, which consists of a Ransome’s log band saw, driven by a horizontal steam engine and locomotive type boiler.

The output from Enugu locomotive shops during 1926–27 was 11 heavy repairs and 10 second-class repairs, and the carriage and wagon shop turned out 374 rebuilt open low-side wagons, 157 general repairs and 119 light repairs. To cope with the growing traffic, extensions of the machine shop and erecting shop have been authorised to the extent of 125 feet to each bay. It is also proposed to remove the saw mill from Port Harcourt to Enugu, and to change over the mill from steam to electric drive.

Passenger and Goods Traffic.

The principal stations on the Nigerian Railway are at the ports of Lagos and Port Harcourt, where extensive transit sheds and coaling facilities have been provided. Another important station is Apapa (part of the port of Lagos), where four large sheds are provided. At this place all the import and export traffic between the coast and the country stations is handled. Four large steamers can berth at the same time for the purpose of loading and discharging cargo.

Ibadan, 120 miles from Lagos, has a population of 238,094, and exports cocoa, cotton and palm kernels. Minna is the junction for the branch line to Baro, and Kaduna is the junction for the loop line to Jos, Bukuru (tin fields), and the main line to Port Harcourt. It is the capital of the Northern Provinces of Nigeria.

Zaria is an important Emirate in Northern Nigeria. Here there is a ginnery owned and worked by the British Cotton Growing Association, the plant of which is capable of turning out 18,000 bales of pressed and ginned cotton per annum for shipment to the United Kingdom. Other similar ginneries exist on the light railway from Zaria and at various points near Zaria, from which the traffic is brought by railway lorries.

Kano is the present terminus of the railway, and another important Emirate of Northern Nigeria, with a population of 49,938. It is also a centre of the Caravan trade, and the largest ground-nut market in Nigeria, over 100,000 tons being bought for shipment to the United Kingdom last season. Jos is the centre of the tin-mining industry of Nigeria, turning out some 11,000 tons of tin annually for shipment, and also importing large quantities of mining machinery and material. Enugu is the centre of the coal-mining industry, which is under the administration of the railway. There is an outturn of 360,000 tons of coal per annum.
A tri-weekly service of mixed trains is maintained between Lagos and Kano (705 miles), with through carriages to Jos via Kaduna Junction. These trains include first and second-class sleeping cars, restaurant car and third-class vehicles. A well-equipped express train is also run in the same service in connection with the English mail boats. This train is composed of 2 baggage vans, 5 first-class sleeping saloons, 1 restaurant car, 1 store van, 1 third-class vehicle (for servants of first-class passengers only) and 1 brake van. Each sleeping car is 60 feet long, contains six compartments, and is fitted with two lavatories, line cupboards, &c., each compartment being fitted with electric light, a fan and bells. The train is vestibuled throughout, and the restaurant car seats 24 passengers.

The boat express service is as shown below:

The catering on all trains is carried out by a contractor, under control of the railway, the prices for meals being: for breakfast, 3s. 6d.; luncheon, 4s. 6d.; tea 1s. 6d.; and dinner, 5s. 6d. Each restaurant car has cold-storage space, the ice being replenished on the journey from railway ice plants.

The operation of freight trains on the Nigerian Railway presents several difficult features, apart from the peculiar problems of working a heavy traffic over a single line. Firstly, there is the difference in the weight of rail between sections, which alters the maximum axle load. On some sections of the main line the permissible axle load is as low as 10 tons, 16 ½ tons. This involves consider-
able splitting up to trains. A second difficulties is the severity of the gradients on various sections of the main line.

The following loads (units of one loaded 10-ton wagon) are hauled over the various sections:

- Iddo-Ibadan: Up 54 units, Down 66 units.
- Ibadan-Jebba: Up 44 units, Down 44 units.
- Ibadan-Jebba: Up 28 units, Down 28 units.
- Minna-Zaria: Up 20 units, Down 20 units.
- Zaria-Kano: Up 28 units, Down 26 units.
- Port Harcourt-Mada: Up 50 units, Down 50 units.
- Mada-Kafanchan: Up 44 units, Down 54 units.
- Kafanchan-Kaduna Junction: Up 44 units, Down 54 units.
- Kafanchan-Jos: Up 50 units, Down 50 units.

The capacity of a train on the Minna-Kaduna section is thus less than one-third of the capacity of a train on the Lagos-Ibadan section, due to the lighter rail on the former line.

Communication between the office of the Superintendent of the Line and the Divisional Superintendents’ offices is maintained by direct telegraph lines. There are subsidiary direct circuits between the principal points on each division, while local station-to-station circuits are also installed, and there is also telephone communication between each station.

Comprehensive yard reports are received from each station every morning, and from these the goods trains are ordered daily for the following day by the train-ordering officers on each division. As a result of the seasonal nature of the traffic, the work done on particular sections varies considerably at different times of the year, and thus involves very careful distribution of wagons and power. The average haul is 303 miles.

Two important freight trains may be mentioned: one is a cattle train, Kano to Lagos; and the other a kola train, Lagos to Kano – both these trains, which run once a week, travelling to passenger train timings.

Traffic to and from Apapa, Ijora coal wharf, and the main goods depot in Lagos (Iddo) is concentrated in a marshalling yard at Ebute Metta Junction, to and from which point trip working is employed to make up up trains and distribute down trains.

The maximum number of trains run per week in the last busy season was 796, the density of traffic on various sections being as shown below:

Motor transport services acting as feeders to the railway are maintained along roads radiating from Zaria (Northern Division) up to Sokoto, a distance of 250 miles from Zaria. For the last financial year the motor transport section earned £24,145 and ran 257,000 vehicle-miles. The motor fleet consists of Albion lorries and trailers, with three Reo light lorries and inspection vehicles. Three experimental half-track road vehicles (two made by Messrs. Guy and one of the Burford-Kegresse type) are also being run.

The principal exports during the year 1926-27 were: coal, 150,000 tons; ground nuts, 111,895 tons; and palm kernels, 70,326 tons; while the main imports were: salt, 28,491 tons; mineral oils, 11,689 tons; and kolas, 10,271 tons, Ground nuts alone brought in freight revenue to the extent of £470,786.

### Rates and Fares.

Passenger fares are 4d. per mile first class, 1 ¼d. per mile second class, and ½d. per mile third class, 2 cwt. accompanied luggage being carried free for first-class passengers, 1 cwt. for second and 28 lb. for third-class. Goods rates are based on a classification with nine classes. There are very few exceptional rates. As an example of the rates charged, that for ground nuts may be quoted. This is a traffic in Class 3 with an average haul of over 600 miles, and amounting to over 100,000 tons per annum. The rate from Kano to Lagos (705 miles), including terminals, is 89s. 9d., or 1.527d. per ton-mile.

### Consigning and Waybilling of Goods.

The system of consigning and waybilling goods is the same as that generally in use on Colonial railways. The consignor hands in at the despatching station a consignment note on the prescribed form. After the goods have been weighed and payment made, a waybill is prepared in quadruplicate, one copy being handed back to the consignor as his receipt for the goods. This must be handed in by the consignee at the receiving station before he can take delivery, and if it is lost or disfigured, an indemnity note has to be signed. Of the other three copies one is retained by the despatching station and filed along with the consignment note; another is sent to the Traffic Audit branch of the Accounts Department; and the final copy is handed to the guard of the train, who hands it over at the receiving station. The clerk there checks the copy brought by the guard with the copy handed in by the consignee, and then forwards the former to the Traffic

Audit branch and retaining the latter. The station accounts are framed on the principle of a daily balance, a system well suited to the capabilities of the staff. Errors are brought to light promptly, so that the station staff have a better chance of recovering from consignors. There are no outstandings, and station accounts are kept well up to date; transfers of staff can be effected at a moment's notice with a minimum of accounting work at the handing over. It is, of course, only applicable where there is no 'to pay' traffic.

Staff, Safety, &c.

Broadly speaking, all supervision is carried out by Europeans, but endeavours are being made by means of training schools and other schemes for teaching the African to enable him as time goes on to take a larger part in the more responsible work of the railway. Most of the main-line locomotive drivers are European, but by degrees it is hoped to be able to replace them by Africans. All the shunting engines are manned by native drivers.

The following statistics show what a high measure of freedom from accidents the Nigerian Railway enjoys:–

<table>
<thead>
<tr>

</tr>
</tbody>
</table>

The accidents were caused chiefly through passengers attempting to join train in motion.

The railway maintains ice and mineral water plants at many of the principal stations on the system.

Most of the large marshalling yards are, or in the course of the near future will be, illuminated by electricity, the generation of which in some cases is controlled by the Railway Administration.

[...]

THE GOLD COAST RAILWAY.

The First Section of this Line was not Opened until 1901, but the system now comprises nearly 500 miles of 3-feet 6-in. Gauge Track. Manganese Ore and Cocoa are the heaviest items of Freight Traffic.

The Gold Coast Railway forms a rough inverted ‘V’, with its base point at Kumasi, the Ashanti capital, and its extremities at Sekondi and Accra, on the Gulf of Guinea. The area of the Colony Ashanti and Protectorate is about 80,000 miles, the population being a little over 2,000,000 (1921 census). The
line now extends for nearly 500 route-miles, and it is significant of the rapidity of development in this territory that the first section of railway was not opened for service until 1901. Projects for railways in the Colony had, of course, been mooted long before that date, but it was not until 1892 that the question was seriously considered, and the end of 1896 before a survey was ordered. Then Mr. W. Shelford (afterwards Sir William Shelford, K.C.M.G.) was instructed to report upon the country lying between Sekondi and Tarkwa, where for some years gold-mining activities had been in progress, and upon the needs of which the decision to build the railway was based.

From the outset the choice of the coast terminus was the subject of considerable discussion. Both Takoradi and Sekondi were considered, but while it was recognised that the former was a superior location for a deep-water harbour, it was then thought that the traffic would be too light to justify the expenditure involved, so a lighterage harbour at Sekondi was decided upon. It is worthy of note in this connection that Takoradi is now being developed as a deep-water port, the tremendous growth of traffic having rendered such a convenience absolutely essential.

Railway construction on the first section of line commenced in 1898, but progress at first was slow, mainly owing to the shortage of labour. In due course, however, labourers were recruited from Nigeria, and then the last Ashanti war broke out and completely stopped work on the railway until the end of 1900. Railhead eventually reached Tarkwa, 40 miles from Sekondi, in May, 1901. The next section (completed in December, 1902) was from Tarkwa to Obuasi, 85 miles, and the line was then pushed rapidly forward to Kumasi, 168 miles from the coast, the first train reaching the capital city of Ashanti on October 1, 1903.

The next railway to be built, apart from short extensions, was one starting from Accra, the capital of the Colony, and destined ultimately to join the other line at Kumasi. The first section was opened to traffic in 1912, but thereafter progress was slow, and there was for a long time a gap between Tafo and Kumasi. In 1923, however, this gap was spanned, and the through Sekondi-Kumasi-Accra line, 362 miles long, became an accomplished fact. In the same year the construction of the Central Province Railway, from Huni Valley (54 miles from Sekondi) to Kade, 99 miles, was commenced. This has now been completed.

Results of the Working.

Although, as mentioned previously, it was originally considered that traffic volume would be light, this has not proved to be the case, and there has, ever since 1903, been a considerable percentage excess of receipts over working expenses. A table for the past ten years is given below:
Anon., *The Railways of Africa*

Working Results of the Gold Coast Railway. /

The total goods and mineral traffic carried on the railways was 47,388 tons in 1906, 298,593 tons ten years later, and 805,227 tons in 1926–27. Passenger traffic shows a similar extraordinary advance. The number of passengers carried in 1906 was 89,282, 88,442 ten years later, and nearly 1,500,000 during the last financial year. In the year 1926–27 total earning were £583,571. This discloses an operating ratio of 49.54 per cent., which is slightly less than that for the three previous years. It may be added that, of the total earnings, coaching traffic brought in £224,031, goods £894,220, and sundries £38,202.

Control and Organization.

Like all similar railways the Administration of the Gold Coast Railway reports, through the Governor, to the Secretary of State for the Colonies. Its affairs are, therefore, dealt with directly by the Assistant Secretary responsible for the political affairs of West Africa, who, through the medium of his Chief and the Governor of the Colony, acts as the Chairman of the Board of Directors might do in the case of a privately-owned railway. The actual management of the railway system is vested in a General Manager (Mr. R. H. Dawson), who is assisted by the usual departmental officers. Of course, in a country such as the Gold Coast, the number of officers with administrative rank is necessarily large, owing to the need for a goodly proportion being on leave at all times. The ordinary departmental scheme is generally followed in the organization [...].

The headquarters of the railway administration are at Sekondi, where the General Manager and the heads of the various departments are stationed.
Administration is divided into two districts, with headquarters at Sekondi and Accra respectively. The first covers the main line from Sekondi to Akwaseho and the Central Province, Prestea and Inchaban branches, and the second, the main line from Accra to Akwaseho and the Weshiang (2 feet 6 in.) light railway.

The staff employed at the end of 1826–27 was as follows:

</tbody>
</table>

The first lines, being of a pioneer type, were built with light material and originally laid with maximum grades of 2.5 per cent. / and curves of 330-ft. radius, the ruling gradient on the main lines at the end of 1920 being 2 per cent. and the sharpest curve 33-ft. radius. These have necessarily had to be strengthened from time to time to meet increasing traffic requirements.

Many different classes of material were in use. Even now parts of the main line are laid with 45- and 50-lb. per yard rails, but on the extension from Tafo to Kumasi, and on the Central Province line, 60-lb. rail was used; and between Sekondi and Obusi the 50-lb. rails have been replaced by 80-lb. rails. 45- and 50-lb. rails will, however, be in use for some time on parts of the main line and branches, but as the need arises for relaying they will be replaced by 80-lb. or 60-lb. rails as the traffic warrants. Flat-bottomed rails with steel sleepers are used throughout, except at switches and on bridges, where timber sleepers are used.

* Total to Kade.
It has been found, especially on curves, that smoother riding and less wear is obtained by staggered joints, and whenever the need for relaying arises the joints are being altered from square to staggered. The number of sleepers laid varies from 13 to 14 to the 33-ft. rail. Broken stone or gravel is used as ballast wherever possible, and any inferior ballast is gradually being replaced by the above. The standard now adopted for grades is 1.25 per cent. against imports and 1 per cent. against exports, and curves with a minimum radius of 66 ft. All bridges on the main line, Sekondi-Kumasi and Tafo-Kumasi, are now capable of taking 16-ton axle loads.

Owing to the character of the labour the number of men per mile employed on permanent-way maintenance work is greater than would normally be the case, but it is expected that by improved education it will be possible in due course to bring this down to a more suitable figure. It is anticipated that an average on the heavier lines of two men per mile will be sufficient, and that the average length of line supervised by foremen plateayers will be approximately 40 miles.

A great deal of work has been done during the last few years between Sekondi and Kumasi in eliminating curves and reducing grades, thus enabling much heavier and longer trains to be run, the minimum curvature on that section now being 660-ft. radius, and the grades 1 in 80 against imports and 1 in 100 against exports. All the bridges have been replaced by new bridges or strengthened to take a 16-ton axle load. Sidings at stations were also lengthened to take the longer trains. Considerable improvements have also been made in the track conditions to prevent wash-outs and the flooding of the line.

On the Central Province Branch, from Huni Valley to Kade, approximately 99 miles, considerable bridge work has been necessary, one bridge spanning the Pra River at 29 ¼ miles being 480 ft. long from abutment to abutment, with 5 piers. This was built under contract by Sir William Arrol & Co. Ltd. Another bridge, crossing the Birrim River at 83 1/2 miles, is 272 ft. long from abutment to abutment, with two piers, and was built departmentally. This bridge also carries a public road.

So far as extensions are concerned, an instrumental reconnaissance survey to determine the feasibility or otherwise of extending the railway some 350 miles northwards from Kumasi has been carried out, and two routes are under examination.

Locomotive, Carriage and Wagon Shops.

The principal locomotive, carriage and wagon workshops, and the stores are situated at Location, about two miles out of Sekondi, and were opened in 1917, while there is a smaller shop at Accra. The locomotive workshops at Location, which are well appointed and up to date, consist of six bays, 300 ft. long by 65 ft. wide, five of which are ranged side by side. The paint shop is housed in the
sixth bay and the coppersmith’s shop and patternmaker’s shop and store are also contained in separate buildings. All plant is electrically driven, the power house being situated nearby. The plant includes the following equipment:

**Bay No. 1, Boiler Shop.**

Hydraulic accumulator and pumps, 100-ton flanging press, 100-ton horizontal press, 100-ton hydraulic flanger, 80-ton plate-curving machine, 80-ton fixed riveter, &c. (Fielding & Platt Limited); plate rolls (Craven Bros. (Manchester) Ltd. and Pollock & Macnab Limited); plate edge planing machine (Smith Bros. & Co. (Glasgow) Ltd.); 7-ft. portable radial drill (Wm. Asquith Limited); radial drill (Smith & Coventry Limited\(^{[21]}\)); punch and shearing machine (James Bennie & Sons Ltd.); angle-iron bending machine (Rushworth & Co.); cold saw (Clifton & Waddell); oil-fired furnace (New Alldays & Onions Limited); two 15-ton overhead electric cranes (Vaughan Crane Co. Ltd.).

**Bay No. 2, Tank Shop and Millwright Section.**

Sentinel air compressor (Alley & Maclellan Limited\(^{[22]}\)); tube-cutting machines, shaping machine (Atlas Engineering Company); acetylene and electric welding plants (Allen-Liversidge Limited); one 15-ton overhead electric crane (Vaughan Crane Co. Ltd.).

**Bay No. 3, Machine Shop and Tool Room.**

Six, 6¼, 8, 10, 24-in. screw-cutting and sliding surfacing lathes, 2-in. hollow spindle lathes (J. Lang & Sons); 7-in. hollow spindle, 7½-in. screw-cutting and sliding lathes, centring machine, double-headed drilling and boring machine (Loudon Bros. Ltd.); capstan lathe, radial drilling machine, planing machine, 5-ft. 2-in. diam. face-plate double-wheel lathe, slide bar, grinding machine, 300-ton hydraulic wheel press (Craven Bros. (Manchester) Ltd.); 14½-in. axle-turning gap bed lathe (Dean, Smith & Grace); 24 and 27-in. screw-cutting and sliding surfacing gap-bed lathes (Henry Holmes & Co. and Sir W. G. Armstrong, Whitworth & Co. Ltd.); capstan lathe, sensitive drilling machine, milling machine centring machine (Alfred Herbert Limited\(^{[23]}\)); 3-ft. 11-in. diam. face-plate double-wheel lathe, radial drilling machine (Hetherington & Sons Ltd.). axle journal turning lathe (Ward, Haggas & Smith); 48-in. boring mill (J. Butler & Co.); capstan lathe (Roberts Brothers); slotting machine, 18-in. double-headed shaping machine, hacksaw machine (Pollock & Macnab (1919) Limited); link-motion grinder (Beyer, Peacock & Co., Ltd.); planing machine, profiling machine, 18-in. slotting machine, cutter grinder (Wm. Muir & Co. Ltd.); grinding machine, 10 in. by 8 ft., ‘Norton’ 1 1/4 in. by 12-in. automatic keyway cutting and slot-drilling machine (The Atlas Engineering Company);
planing machine, duplex slot-drilling machine, horizontal boring mill, 72-in. boring (Geo. Richards & Co. Ltd.); radial drilling machine, external grinding machine, screwing machine, twist-drill grinder, universal grinder, sensitive drill-}
ning machine (Jones & Shipman Limited); 6-in. cold-saw machine and cold-saw sharpening machine (Clifton & Waddell); copper stay lathe (Hulse & Co. Ltd.); milling machine (Cincinnati Milling Machine Company); hydraulic arbor press 50 tons and hydraulic press 50 tons, Eames 24-in. duplex mill (Webster & Bennett Limited); tool grinder (Selson Engineering Co. Ltd. and Lumsden Machine Co. Ltd.); emery wheels and grinders (K. Johnson & Sons and Mitchell’s Emery Wheels Company); tool-hardening oil furnace (New Alldays & Onions Limited); one 5-ton overhead electric crane (Vaughan Crane Co. Ltd.).

Bay No. 4, Erecting and Fitting Shop.

Air compressor (Consolidated Pneumatic Tool Co. Ltd.); double emery wheel (K. Johnson & Sons); sensitive drilling machine (Jones & Shipman); portable valve-facing machines, cylinder boring machines, crank-turning machines (Beyer, Peacock & Co. Ltd.); two 3-ton overhead electric cranes (Vaughan Crane Co. Ltd.).

Bay No. 5, Foundry and Smith Shop.

Oil furnace for brass (the Consolidated Pneumatic Tool Company); 2-ton cupola for iron (Thwaites & Sons); sand grinder, sand riddle (James Evans & Co. (Manchester) Ltd.); moulding machine (Macnab & Co.); air hammers – 5, 10, and 20-cwt. (B. & S. Massey Limited); hot saw (Craven Bros. (Manchester) Ltd.); oil furnace, tyre furnace (Furnace Construction Co. (Sheffield) Ltd.); tyre furnace (New Alldays & Onions Limited); nut and bolt machine (Horsfalls); one 5-ton overhead electric crane (Vaughan Crane Co. Ltd.).

Coppersmith Shop.

Monometer machine (Monometer Manufacturing Co. Ltd.); hydraulic pipe-bending machines (Muscrove Brothers); pipe benders (Messrs. Hugh Kennedy).

Carriage and Wagon Shop.

A new carriage and wagon shop has recently been constructed at Location and was opened at the end of last year. The carriage and wagon shop measures 200 ft. by 180 ft., and is supplied in addition with a sawmill 300 ft. by 60 ft.

The shops include the following equipment:–

Hydraulic wheel press (Niles Bement-Pond & Co.); 5-cwt. pneumatic hammer (B. & S. Masseyes Limited); boring mill, 48-in. Velomill (John Stirk & Sons
Communications in Africa, 1880–1939: Volume 4

Lmt.); wheel lathe, 3-ft. 11-in. diam. face plates (Craven Bros. (Manchester Ltd.)); 12-in. lathe (John Lang & Sons); axle-journal turning lathe (Hetherington & Sons Ltd.); radial drilling machine and 12-in. lathe (Swift & Sons Ltd.); sensitive drill (E. H. Druce & Co. Ltd.); two 15-ton, two 10-ton, one 2-ton overhead electric cranes (Herbert Morris Limited).

Saw mill.

Log band saw, tendem saw, 4-sider planing machine, panel machine, vertical hollow chisel machine, slot mortising machine, circular rack saw, overhead planing machine, milling machine, log band saw grinder, plane iron grinder, band saw rolls tenoning machine (T. Robinson & Sons Ltd.); circular saws, band saw, gulleting machine, band saw sharpening machine (John MacDowall & Sons); wood lathe (J. Butler & Co.); general joiners (John Pickles & Son); 4-sider planing machine (Ransome & Co. Ltd.); one 5-ton overhead electric crane (Alfred Herbert Limited).

Locomotives and Rolling-Stock.

At the end of the 1926–27 financial year there were 85 locomotives on the books, the principal classes being as follows:

<table>
<thead>
<tr>
<th>Number of Locos</th>
<th>Class</th>
<th>Type</th>
<th>Weight in working order</th>

Coaching stock is represented by 106 units, there being 26 first- and second-class composite cars, 42 third-class cars, nine composite third-brakes, 12 mail, brake and baggage, 17 inspection, pay and specie cars, &c. The freight stock numbers 1,032, the principal types being 256 20-ton steel vans, 231 25-ton low-sided trucks, 103 16-ton wooden low-sided trucks, 52 17-ton steel low-sided trucks, and 153 20-ton wooden vans. On the 2-ft. 6-in. gauge Weshiang line, there were three locomotives, two passenger cars, one inspection car, and 22 freight vehicles. Running sheds are located at Sekondi, Tarkwa, Prestea, Obuasi, Kumasi, Nkawkaw and Accra.

Passenger and Freight Traffic.

As indicated previously, there has been an extraordinary development of traffic on the Gold Coast Railway. This is particularly noticeable on the freight side, but the growth of the passenger business is also worthy of record. Whereas in
1906, there were no more than 89,282 passengers transported by railway, ten years later this number had increased to 888,442 while during the financial year 1926–27, 1,953,917 passengers were carried, including workmen’s trains, which conveyed 501,000. The average fare paid that year was 33.43d., the average journey 29.95 miles, the average number of passengers per passenger train 125, and the average number per passenger vehicle, 22. First-, second- and third-class accommodation is provided, the last being naturally of the greatest volume. Indeed, third-class travel represents well over 95 per cent., with second-class about 3 per cent. and the first class 2 per cent.

Freight traffic has advanced from an insignificant 47,388 tons in 1906 to 805,227 tons in 1926-27, the special features contributing to this growth being the striking development of the cocoa and manganese ore traffics, and the steady progress in the tonnage of mahogany and wood fuel carried by the railway. The principal traffics carried during the year 1926–27 were manganese ore, 394,097 tons, cocoa 149,189 tons, and firewood 107,430 tons, and a growing traffic in general merchandise, native produce, &c.

Operating Statistics.

From an excellent series of statistics given in the Administration Report for the year 1926–27, it is noted that goods earnings represent 77.33 per cent. of total earnings, average freight paid per ton was 22.21s., average train-load was 105 tons, and the average wagon load was 14.61 tons. It may be added that the percentage of freight to capacity hauled was 44.18, while on the passenger side it was 40.22. The very large preponderance of traffic in one direction keeps the percentage of freight to capacity hauled on the low side.

For its length the Gold Coast Railway has not many stations. They average 1 for every 6 miles, and they adequately meet the requirements. Trains are worked on the absolute block system by means of the Webb Thomson apparatus, the miniature type being used on both lines. Last year, 85 per cent. of the main-line passenger trains reached destination on time, against 82 per cent. in the previous year, a very high rate when regard is paid to the fact that it is a single line. The densest portion of the line is between Sekondi and Huni-Valley which embraces the Central Province Branch, Prestea Branch, Inchaban Branch and the heavy manganese traffic from the Insuta Mines.

The speed at which goods trains are timed is, on the Sekondi line, 15 miles per hour, and on the Accra line, 18 miles per hour, passenger-train timings on the two lines being 25 and 20 miles per hour respectively. Goods trains are classified as fixed and conditional, the system of ordering trains being that the fixed daily trains run under ordinary conditions without notice and the conditional trains are ordered from the district offices.
The train ordering for each district is centralised in the district traffic office. Daily stock, &c., reports are wired in from all stations each day, and the district traffic officer is then enabled to arrange his trains and distribute their loads to the best advantage. A useful series of operating statistics is compiled regularly, but as these generally follow accepted practice, it is unnecessary to detail the figures. Special attention may, however, be directed to the fact that the operating ratio was as low as 49.54 per cent.

**Improved Traffic Facilities.**

As a result of the big programme of deviation work, for the purpose of securing a better alignment, and the use of heavier rails and locomotives, it is now possible for train loads of 440 tons to be handled on the Sekondi-Kumasi line against 210 tons prior to the improvements. This is of vital importance in view of the heavy demands of the manganese ore and cocoa traffics which are regularly increasing in volume. Insuta is the originating point of the manganese ore traffic, while most stations are of importance in connection with the cocoa traffic. The through goods trains between Obuasi and Sekondi, where the 80-lb. track enables engines of the 200 class to work, can take 20 vans of cocoa containing 20 tons each, the improved train loading thus effected having proved of great advantage in the handling of this important traffic.

In order to cope with the growing traffic and to make the best use of vehicles and engines a traffic control system (Western Electric train control apparatus) is being installed, and is at present operating between Sekondi and Tarkwa. It will eventually operate as far as Kumasi and is expected to be fully working in the next six months.

**Ports of Sekondi and Accra.**

The port of Sekondi, where ships lie in an open roadstead, is equipped with four jetties provided with steam and electric cranes, cargo being handled by lighters and surf boats. During the year ending March 31, 1927, 489,092 tons of exports were handled and 64,293 tons of imports, excluding about 25,000 tons of coal for railway use and other stores and material. The principal exports were manganese (394,000 tons), cocoa, and timber (mahogany logs). Twenty-two trains are scheduled during the 24 hours in and out of Sekondi.

The congestion at Sekondi will be relieved and quicker and better handling of imports and exports will be effected on the opening of Takoradi Harbour in 1928. This new deep-water harbour is four miles west of Sekondi. The harbour is formed by two breakwaters enclosing between them an area of sheltered water, with the inner face of the lee breakwater constructed as a wharf at which vessels up to a draught of 30 ft. can tie up.
The port of Accra deals with a large export traffic of cocoa and import of general goods almost entirely with surf boats. There is one jetty provided with cranes for handling imported motor-cars, mahogany logs exported, &c. Fifteen trains are scheduled in and out of Accra each day.

**Stores, &c.**

The majority of the material and stores required by the Gold Coast Railway is obtained through the Crown Agents for the Colonies, while a certain amount is obtained locally. Of the material received during 1926–27, totalling about £150,000, £64,000 represented the value of supplies received from the Crown Agents and £72,000 the value of materials purchased locally. In the Stores Department there are seven Europeans, 23 Africans and 60 store boys, &c., the working cost of the department being 5.16 per cent. of the issues.

**THE SIERRA LEONE RAILWAY.**

This 2-ft. 6-in. Gauge System extends for 338 route-miles and connects Freetown with Pendembu and Kamabai. More than Half the Freight Revenue is derived from the Transport of Palm Kernels.

The main line of the Sierra Leone Railway runs in an easterly direction from Freetown to Pendembu, a distance of 227 1/2 miles, the terminus being within a comparatively few miles of the frontiers of Liberia and French Guinea. The first survey was authorised by Lord Ripon, the then Secretary of State for the Colonies, in 1893, and in 1896 the construction of the first section of the line from Freetown to Songo, on the boundary of the Colony and Protectorate, a distance of 32 miles, was begun. The country was difficult from the constructional point of view, and numerous ravines necessitated the building of several steel viaducts in the first few miles. The section up to Songo was completed in December, 1897, and opened for traffic in May, 1899. In 1900 the line was extended to Rotifunk, 55 miles from Freetown, while in 1902 it reached Bo, 136 miles, and in 1905 was completed to Baiima, 220 miles from Freetown. Subsequently the line was extended to Pendembu.

In the meantime, between 1908 and 1916, a branch line, 104 miles long, was constructed from Bauya Junction (64 miles from Freetown) in, roughly, a north-easterly direction to Kamabai. It was originally intended to extend this branch in a northerly direction, but the project was abandoned during the war, and it is unlikely that it will be revived. Any further construction will probably be through the more productive traffic regions to the north-west or east.

In addition to these lines there is a short railway of 5 1/2 miles in length from Freetown to Hill station on the slopes of the mountains which rise steeply from the coast. This mountain railway was opened in 1904, its object being to enable
European Government officials to live in a more healthy locality. The main line rises to its maximum height of 647 ft. above sea level at mile 216, and the mountain railway terminates at a point 748 ft. above the sea, which is its highest point. The total route-mileage is 338 miles.

**Results of Working.**

The railway authorities advise us that there are good prospects of the current year’s total revenue exceeding that of 1925, which was £231,889, and so far is the record for the railway. The total net receipts in 1926, after deducting ordinary and extraordinary (but not capital) expenditure, were £53,135, the operating ratio being 76.75 per cent. Gross revenue was £228,527 and expenditure £175,392. The results for that year are, however, somewhat misleading, owing to a six weeks’ strike of railway employees in Sierra Leone and the general strike and prolonged coal stoppage in England which, of course, affected the Colony to some extent. Particulars of the results of working for the last 10 years are given in the following table:–

*Note.* – The salaries and wages of the staff were improved in 1920 owing to the increased cost of living.

The Sierra Leone Railway is self-contained in its administration and working, but is a Department of Government. The headquarters of the railway are at Freetown, the capital of the Colony. The organisation is of the departmental type [...] it will be seen that the General Manager (Mr. C.R. Webb) also holds the position of Traffic Manager, and has a Deputy Traffic Manager to assist him on that side. The number of permanent staff employed at the end of 1926 was 2,045, of whom 59 were Europeans and 1,986 Africans.

The railway owns, works and maintains the cranes on the jetties and wharves at Freetown. In addition to the locomotive shops and Chief Mechanical Engi-
ner’s office, the office and shops of the Chief Engineer and general stores are at Cline Town, where also most of the European officers of the railway reside. The offices of the General manager, Traffic Manager and Chief Accountant are at or near Water Street station in Freetown.

Permanent Way and works.

The gauge of the line throughout its length is 2 ft. 6 in., with a maximum gradient on the main line of 1 in 50 and a maximum curvature of 330 ft. radius, with the exception of the section in East Street, which is 1 in 40 and a curve at Rock Street, which has a radius of 297 ft. On the mountain line the maximum gradient is 1 in 22, and the greatest curvature 132 ft. radius. The gauge is, of course, narrower than that of other British possessions in West Africa, with the exception of a branch of the same gauge in Nigeria; but as Sierra Leone is entirely isolated from the nearest of these possessions by foreign territory the question of a uniform gauge is not likely to arise.

The permanent way consists of 30 ft. rails of 28 and 30 lb. to the yard on steel sleepers of 35 and 44 lb. and 4 ft. 7 1/4 in. in length. The sleepers are set 2 ft. 6 1/2 in. apart on the straight, and 2 ft. 4 in. on curves, and there is a 2-in. super-elevation on maximum curvature. In the course of extensive relaying which has become necessary 30-lb. rails are being used, and considerable improvements are being made in the way of re-alignment, regrading and the straightening out of the sharper curves. The track is mostly earth-ballasted to a depth of 7 in., gravel ballast being used in parts. The railway is fortunate (particularly in view of the heavy rainfall) in having for the most part a good road bed consisting mostly of laterite gravel. The axle-load is limited to 5 tons.

The maintenance of the track is carried out by gangs of seven or eight labourers in charge of a ganger, who in turn is supervised by a foreman platelayer responsible for about 20 miles of line, which he inspects daily. The line is divided into three sections each in charge of an assistant engineer.

The railway possesses 139 bridges each with spans of 20 ft. or over. Of special note amongst them are the six-span bridge at Sewa, 716 ft. long, the nine-span bridge at Ribbi, 662 ft. long, the five-span bridge at Moa, 633 ft. long, and the ten-span bridge at Taia, 589 ft. long. The structure of these bridges is of steel supported on concrete foundations, and in many cases concrete piers have been used. Many of the bridges are of considerable height, the Orogoo bridge being 74 ft. 3 in. from rail level to bed of river.

Locomotives and Rolling-Stock.

Of the 43 locomotives on the books, three are Garratts, 17 tender engines of the 4-8-0 type and 23 tank engines. The Garratt locomotives are of the 2-6-2 + 2-6-2 type and were introduced in 1926. Their introduction on this line
was of particular interest because it is thought that Sierra Leone was the first Crown Colony to introduce this type of engine, and it is believed that these three locomotives were the first of the type to be made for a 2-ft. 6-in. gauge and an axle-load limit of 5 tons. They have proved very useful and successful. Their maximum load is 200 tons (reduced to 180 tons in the wet season), but it is considered that this will not prove to be their limit under good rail conditions.

The average coal consumption for all locomotives in 1926 was 21.48 lb. per engine-mile, and the consumption of oil 9.4 pints per 100 engine-miles. The rather high average oil consumption is due to the fact that owing to the small wheels the motions and side rods of the locomotives are very near the ground and get covered with dust or mud. The number of engine failures in 1925 was 34, or 1 per 18,419 miles. A comparison with 1926 is not given, owing to the conditions produced by the strike in the latter year, but the figures for the ten months after the strike were better than those for 1925.

The passenger stock consists of 85 vehicles, 10 being first-class coaches, 8 first and second-class composite coaches, 5 second-class coaches, 3 second and third-class composite coaches, 11 baggage and mail vans, 7 saloons and railway officers’ coaches, 1 coach for Government officials, 1 ambulance coach and 1 pay coach. The freight stock numbers 343 units, 182 being covered goods wagons of capacities varying between 8 and 13 tons. 66 low-sided wagons of 8 tons capacity and 54 high-sided wagons (including 9 steel lattice-sided wagons) of 8 tons capacity; and there are 24 8-ton and 1 12-ton flat cars, 4 cattle trucks, 2 breakdown vans, and 1 travelling workshop. All new covered goods wagons are of 13 tons capacity.

The railway workshops are situated at Cline Town on the outskirts of Freetown, and they are now being extended and reorganised. A number of new machines are being installed, and it is hoped that electric power from the new town power station will soon be available. The principal engine depot is also at Cline Town, but there are engine sheds at Bauya, Magburaka, Bo and Pendembu. The whole of the main-line traffic is worked by African enginemen. In addition to the requirements of the railway, the shops, being the only works of the kind in the Colony, are frequently called upon to undertake other work.

**Passenger and Goods Traffic.**

Three classes of passenger traffic are provided for, except on the mountain line, where two classes of accommodation only (first and third) are provided. Seven stations in the Protectorate booked over 7,000 passengers during 1926. The punctuality of passenger trains is good, as in 1926 the average time of arrival of passenger trains at right time and up to 5 minutes late was 91 per cent. The railway is in the happy position – rather unusual in these days – of having no competition worth mentioning either as regards goods or passenger traffic.
By far the most important traffic of the railway consists of palm kernels, which gives more than half the goods revenue. During 1926, 37,089 tons of palm kernels were conveyed, the receipts therefrom amounting to £95,352. Other traffics of importance were palm oil, 2,279 tons; rice, 4,461 tons; salt (imported), 2,858 tons; ginger, 2,794 tons. Nine stations (which do not include the Freetown stations, which deal principally with imports loaded in an upward direction) despatched more than 2,000 tons of goods traffic during the year 1926, the principal traffic points being Pendembu, 8,001 tons, and Blama, 7,245 tons.

The traffic is mainly long-haul, seven of the principal traffic points being at a greater distance from Freetown than half the longest possible haul, and all of them being over 100 miles from the port of Freetown, to which the traffic is conveyed. Very little livestock is dealt with by the railway.

The construction of motor roads in the Protectorate is proceeding. Most of these roads are in the nature of feeders to the railway, and as they increase in length and number they should induce an increase of traffic to the railway. The alternative to motor transport is the slow, expensive and generally unsatisfactory and uneconomical head transport.

Much improvement in the working and running of trains, and in the better and more economical distribution and movement of wagons, has been brought about by the introduction of a Traffic Control Section, which was inaugurated towards the end of 1923, and which will become still more effective when the telephone system (Western Electric) now being installed is completed, and the more important stations and engine depots are brought into direct communication with the Control Office in Freetown. So far telephones have been installed at various places between Freetown and Bo, a distance of 136 miles.

Trains are worked on the electric staff system. The maintenance of the staff instruments is carried out by the Telegraph and Telephone Section, which is in direct charge of a telegraph engineer, who forms part of the Chief Engineer’s staff. The telegraph and telephone system of the Colony is constructed, maintained and operated by the railway. In 1926 the total line mileage was 1,269 miles, as follows:

A further 272 miles of wire, comprising the Traffic Control line to Bo, has since been added. This is a metallic circuit. The maintenance of the lines is rendered difficult owing to damage by tornadoes, and sometimes also by bush fires during the dry season.
THE CAPE TO CAIRO RAILWAY.

An Anglo-African Correspondent Describes the various Steps taken towards Realising Cecil Rhodes’s Dream of Railway Communication between the Cape and Cairo.

THERE was, of course, no thought of Cairo as an objective when, in the late 'fifties, the first tiny link in the great railway chain from Southern Africa to the North was commenced between Cape Town and Wellington. This was a stretch of 57 miles, built to the 4-ft. 8 1/2-in. gauge, but subsequently reduced to 3 ft. 6 in., the first sod of which, it is interesting to recall, was turned by that great statesman, the late Sir George Grey, then Governor of the Cape Colony. This section, which was opened in 1863, was built by the Cape Town, Wellington & Docks Railway Co. Ltd., and was acquired by the Cape Government on January 1, 1873, under Act No. 15 of 1872. Subsequently the line was extended another 60 miles or so to Worcester. The chief engineering difficulties of this first link in the Cape-Cairo railway occur in the mountainous and picturesque region known as Hex River, where the line climbs to an altitude of 3,588 ft., and where there are many sharp gradients and curves and rock cuttings and precipitous embankments. Thereafter – passing Matjesfontein, Beaufort West, De Aar, Kimberley and Vryburg (the last-named being 780 miles from Cape Town) – the track is laid on comparatively smooth ground. Kimberley was reached in 1885 and Vryburg in 1890.

Cutting Africa through the Centre.

That distinguished journalist, the late Mr. W. T. Stead,27 once facetiously observed that but for Mr. Cecil Rhodes, the Cape to Cairo railway would have got itself built in sections and it would never have been discovered that it was a Cape to Cairo line until the last gap had been bridged and the trains were actually running. It is, we believe, a fact that the phrase ‘Cape to Cairo’ was originated by Sir Charles Metcalfe, Bart., the eminent railway engineer, who used it in an article on African railway projects which he wrote in 1889 for an English magazine. But long before that the idea of linking southern and northern Africa by means of a telegraph wire had been conceived by Mr. (afterwards Sir) James Sivewright, who was then in the service of the Cape Government, and that particular project was actually started. It remained, however, for Mr. Rhodes, round about the year 1890, to crystallise the idea of north-south railway communication. At that period, following the marvellous gold discoveries in the Witwatersrand several years before, South Africa was attracting world-wide attention. Mr. Rhodes’s enthusiasm, was, however, based on sound business instinct. He persistently deprecated the popular notion that the railway was being built merely in order that a human being might be able to ‘get in at Cairo and get out at Cape Town.’ Ten years later, writing to Mr. (now Major) Ewart S. Grogan,28 a daring young Cam-
bridge undergraduate, who had actually traversed Africa from south to north, Mr. Rhodes said: ‘The object is to cut Africa through the centre, and the railway will pick up trade all along the route. The junctions to the east and west coasts, which will occur in the future, will be outlets for the traffic obtained along the route of the line as it passes through the centre of Africa. At any rate, up to Bulawayo, where I am now, it has been a payable undertaking, and I still think it will continue to be so as we advance into the far interior. We propose now to go on and cross the Zambesi just below the Victoria Falls. I should like to have the spray of the water over the carriages.’

That letter was written in 1900, two years before the death of the writer.

The preceding decade was a period of great activity in the work of extending the railway from Vryburg to Mafeking and thence to Bulawayo and the Zambesi. The contractors for the work were Pauling & Co. Ltd. (who had built the line from Kimberley to Vryburg) and the engineers were Sir Charles Metcalfe and Sir Douglas Fox. The gauge was to be the same as the Cape line, viz., 3 ft. 6 in., and the British South Africa Company advanced the money required for the construction of the line. The contract price for the Mafeking section was, it is understood, £2,575 per mile.

The Last Lap to Bulawayo.

The Bechuanaland Railway Company – now known as the Rhodesia Railways Limited – had no intention of letting the grass grow under their feet. No sooner was the Mafeking extension completed than the contractors started on the next step towards Cairo, and before the end of 1894 the line to Gaberones, Palapye and Bulawayo was well under way. The Gaberones section was opened in July, 1895, and two years later, with the completion of the line to Bulawayo – 1,360 miles from Cape Town – Mr. Rhodes was enabled to confound his critics by the fact that up to that stage, at any rate, the Cape to Cairo railway was anything but a ‘wild cat’ scheme. The difficulty in getting material through sufficiently quickly retarded construction as the track neared Bulawayo, and it is on record that Mr. Rhodes was so impatient to see the iron horse reach that objective that he offered the contractors an extra £200 per mile to lay a mile of metal a day. The result was that the ‘last lap’ was so hurriedly laid that, with the first heavy rains, the contractors had to face some rather serious washaways. But all that was subsequently remedied, and when once the trains were run into Bulawayo the contractors went back over the line and carefully completed the work in accordance with their contract.
November 4, 1897, was a red-letter day, not only in the history of Bulawayo, but also in that of the railways of South Africa. Leading men from all parts of South Africa, and many eminent person from Great Britain, forgathered in the town to celebrated the occasion. Mr. Rhodes was down with fever, and therefore could not be present, but high tribute to his foresight and energy was paid by Sir Alfred (afterwards Lord) Milner, the High Commissioner, at a banquet given on the occasion. ‘Few events of the century’, wrote Sir Henry M. Stanley, the distinguished explorer, who was present, ‘surpass it in interest and importance’ – marking, as it did, ‘the conclusion of an audacious enterprise’.

Despite this triumphal progress, Mr. Rhodes found it no easy matter, a year or two later, to gain the financial co-operation of the Imperial Government to enable him to extend the railway and the telegraph line from Bulawayo, across the Zambesi in the direction of Abercorn at the southern extremity of Lake Tanganyika – the idea then being to join up with Tabora, in what was then German East Africa but is now Tanganyika Territory. So he went to Berlin to seek the help of the German Government, and was so cordially received by the Kaiser that before he left the German capital he had practically arranged (in spite of newspaper criticism of his scheme) that his telegraph and railway should run through German East Africa, although it was believed that he actually had in his pocket at the time a concession to take his lines through Belgian territory – that is, the Congo, on the west side of Lake Tanganyika. However, soon after his return to London, the financial support he needed was forthcoming from the British South Africa Company and various Rhodesian mining companies, and preparations were at once made to continue the line to the Wankie coalfields, some 200 miles north-west of Bulaway. The work was begun in May, 1901, and completed in September, 1903.

Bridging the Victoria Falls.

From Wankie to the famous Victoria Falls on the River Zambesi is roughly 70 miles. Work thereon was begun in September, 1903, and finished on April 25, 1904, the whole line from Bulawayo to the Falls being opened for traffic on June 20. A few weeks later the first through train from Cape Town started for the north amid enthusiastic demonstrations. Then was commenced what by many is regarded as the most fascinating feature of this particular portion of the Cape to Cairo railway, viz., the construction of the Victoria Falls bridge. It is a record bridge in many respects, being the highest – 420 ft. – in the world, and it was constructed in the short period of 19 weeks. It was designed by Sir Charles Metcalfe, consulting engineer in Africa of the Rhodesia Railways Limited, and Mr. G. A. Hobson, M. Inst. C.E., of the firm of Sir Douglas Fox & Partners. The
work of construction was under the immediate charge of Mr. G. C. Imbault, who had with him a staff of English bridge builders, which never exceeded 25 men, and about 100 native labourers. Mr. Imbault practically superintended the construction of the bridge at Darlington, where it was made by the Cleveland Bridge & Engineering Co. Ltd., and also its erection across the Zambesi. The total length of the bridge is 650 ft., of which the central span accounts for 500 ft. between the pin centres on the two banks, the balance being made up of the two short spans. The two ends of the bridge, which were built from both sides of the gorge simultaneously, met so exactly that there was not a difference between them of an eighth of an inch. The girders were joined on April 1, 1905. Sir Charles Metcalfe once claimed that no other bridge of its size and capacity had ever been built so cheaply. Its erection was not effected without opposition, and it is curious to recall that Mr. Rhodes’s brother, the late Colonel Frank Rhodes, made no secret of his objection to the bridge, the site for which, he declared, ‘had been chosen in a hurry, and without that careful consideration which should be given when dealing with one of the grandest things in the world’.

Laying the Track to Kalomo.

While the Victoria Falls bridge was building, the work of laying the track north to Kalomo was proceeded with, the necessary material being conveyed across the gorge by a ‘Blondin’ transporter, driven by electricity and with a carrying capacity of 5 tons. In a remarkably short time Kalomo was reached, and later on the Kafue River – about half-way between the Falls and Rhodesia Broken Hill – was successfully crossed by a bridge which is the longest of its kind in Africa, running to nearly 1,500 ft., with 13 spans of 100 ft. each, standing on concrete pillars in 16 ft. of water. Thus Rhodesia has the distinction of possessing the highest and the longest railway bridges in the ‘Dark Continent’.

Early in December, 1909, Bwana Mkubwa was the scene of an interesting gathering of railwaymen and others, who were there for the special purpose of celebrating the passage of the first train across the Belgian border. Under a triumphal arch, gaily decorated with flags and situate in the heart of a forest, the last two fish-plates (made of locally smelted copper) were riveted on either rail by two of the leading personages present – namely, Mr. L. A. Wallace, Administrator of North-western Rhodesia, and Baron Wangere, the representative of the Congo. A few minutes later the special engine and train steamed across the border and pulled up in Belgian territory.
Carrying the Line Through the Congo.

There were not wanting those who predicted the breakdown or entire abandonment of the ‘fantastical Cape to Cairo scheme’, following the death of Mr. Rhodes in 1902, but as a matter of fact the work proceeded – slowly, perhaps, but none the less surely. Not a little of this advancement was due to Mr. Robert Williams, an intimate friend of the late Mr. Rhodes, and a commanding figure in the African railway world. It is on record that before Mr. Rhodes died, Mr. Williams promised him he would do his best to ‘carry his line through the Congo by connecting it to the railways of that State’ – Mr. Williams having originally negotiated with the late King Leopold to build the Cape to Cairo railway through the Congo State to the Nile. As readers of The Railway Gazette are well aware, Mr. Williams has also been the leading spirit in connection with the construction of the Benguella Railway which, beginning at Lobito Bay in Portuguese West Africa, will ultimately join the Katanga district in the Belgian Congo and link up with the Cape to Cairo railway at some point north of Elizabethville, probably Kambove. In an interesting paper on the Cape to Cairo railway read by him in London a few years ago, Mr. Williams told how the expeditions he had sent out in 1899 and 1901, under the leadership of his ‘splendid colleague’, the late Mr. George Grey, with the object of discovering a mineral area of sufficient importance to draw the line northwards, had already revealed the great copper wealth of Katanga, besides important gold, tin and diamond deposits.

Railhead at Bukama.

‘Suffice to say’, adds Mr. Williams, ‘that it at length arrived at the Congo frontier and that, thanks to the co-operation of King Leopold and of his great financier, Mons. Jadot, thanks also to the consistent effort of his present Majesty King Albert, the railway has now reached Bukama, on the navigable Congo, with the result that to-day one may travel from Cape Town by train and river steamer, running in direct connection with the trains, to Stanleyville, on the north side of the Congo State – a distance of 3,600 miles, of which 3,000 miles is railway – and to the mouth of the Congo River’.

Of the Cape to Cairo line there remain one or two comparatively small links to complete it and one big one. What Mr. Robert Williams calls the ‘small ones’ are along the Congo River, where steamers at present fill the gap. And there is, of course, the Wadi Halfa-Assuan break in Egypt. The big link is that between Stanleyville, in the Belgian Congo, and El Obeid, in the Sudan. This link will presumably run over part of the Darfur plateau and along the Nile Congo Divide. In the aforesaid paper, Mr. Williams revealed the fact that it had long been his desire to arrange for the systematic investigation of the Sudanese side of this Divide in the hope that possible mineral discoveries would attract the Sudan Railway south-
wards to complete this big link between the Cape and Cairo, ‘and thus at last realise Rhodes’s dream’. The opportunity, he says, at last presented itself, and an expedition was despatched under Major Christy to explore this least known of all the great African Divides. The expedition brought back a vast amount of information, ‘much of it of a most encouraging nature, with plentiful indications of yet another heavily mineralised zone’. Mr. Williams goes on to express the hope that ‘further investigation may succeed in locating / deposits sufficiently large and rich to justify the extension of the Sudan Railway southwards to meet an extension of the Kenya & Uganda Railway on the British side of the Divide and to link up with the northward extension from Stanleyville, on the Belgian side,’ and thus finally complete the railway between the two extremities of the continent.

**Lord Cromer’s View of the Scheme.**

Possibly nowadays a more generous view is taken of the Cape-Cairo railway as such by the powers-that-be in Egypt and the Sudan. Time was when precious little enthusiasm was shown there for Mr. Rhodes’s pet project. The late Lord Cromer, in 1904, officially declared that from a purely engineering point of view the establishment of a continuous railway communication from Cairo to Cape Town ‘would be absolutely impossible,’ and he was quite confident that, in view of the very great physical difficulties which would have to be encountered, the cost of constructing any such railway would be altogether out of proportion to its utility. But communication by rail and river was altogether a different matter, as that meant that ‘it would be no longer necessary to construct a railway across vast marshes lying, roughly, between the fifth and tenth parallels of north latitude. I cannot speak with any authority as regards the difficulties which, in the execution of the revised project, might have to be encountered south of Gondokoro. All I need say is that the Egyptian and Sudanese part of the work is already accomplished. A regular tourist service by rail and river now runs from Cairo to Gondokoro.’

**The Egyptian State Railways.**

An outstanding feature of the northern section of the Cape to Cairo railway was the recent gauge conversion on the Egyptian State Railways. When the winter time-table came into operation on November 1 last year, the Egyptian State Railways for the first time worked the whole of their lines, except for 125 miles on the 2-ft. 6-in. gauge, on the 4-ft. 8 1/2-in. gauge. The majority was previously laid to the standard gauge, but until comparatively recently the section from Luxor to Shellal, which was built as a military railway and afterwards taken over by the State, was on the 3-ft. 6-in. gauge. The line was approximately 160 miles in
length, with 19 stations. The Egyptian State Railways are the subject of a special article published on pages 7–11 herein.

**Rhodes’s Dream near Realisation.**

Whether the Sudan Government Railways will, in due course, follow the example of their Egyptian neighbours and change their present 3-ft. 6-in. gauge to the standard measurement is a moot point. Probably they will prefer to keep their track as it is. It may be interesting to recall that the Sudan Government mail steamers connect with the Egyptian State Railways at Wadi Halfa, whence the railway runs south to Khartoum and so to Sennar and El Obeid. The late Lord Kitchener opened to Khartoum-El Obeid Railway in 1912. El Obeid is distant about 430 miles from Khartoum by railway, about 1,000 miles by railway from Wadi Halfa, and about 2,000 miles by railway and river from Alexandria. Through railway communication between Egypt and the Sudan is not available, for there is still a break in the railway of some 200 miles between Wadi Halfa and Assuan, which has to be traversed by river steamer. As General Sir Reginald Wingate once observed: ‘It is possible that subsidiary lines may connect Stanleyville with Rejaf, following the present motor road connecting the important Belgian gold-mining area at Kilo with the Nile in that vicinity – thus turning the Rapids and Dufil and providing a trade route along the navigable Nile waterway to Khartoum, or to the nearest point on the Sudan railway system at Kosti. But should the recent mineral discoveries prove sufficiently large and rich to justify the extension of the Sudan Railway southwards, there is little doubt that the route to be followed will be as Mr. Robert Williams described: and clearly, through his prescience and indomitable perseverance, the wonderful dream of his great chief, Cecil Rhodes, is far nearer completion than any of us had contemplated.’

‘The Desert has Lost its Terrors.’

Alternative routes from Cape Town to the north have more than once been suggested. Twenty-two years ago when the present writer interviewed Sir Charles Metcalfe on the subject of the Cape-Cairo railway, that gentleman observed that in his opinion in the future there would probably be two lines running from Broken Hill in Rhodesia – one going up through the Congo Free State to Lake Chad and right through French territory, coming out perhaps at Algiers, or some other place on the north coast, the other ‘coming up through German East Africa and ultimately joining up with Khartoum and Cairo.’ The late Mr. H. Wilson Fox, M.P., of the British South Africa Company, also held pronounced views on the subject. More recently Dr. L. Dudley Stamp pleaded in the press for the construction of a line running from Calais to Cape Town – this, of course,
involving an 8-mile tunnel under the Straits of Gibraltar and utilising either the Lake Chad-Stanleyville route on the Congo, or ‘a truly international line’ from the Straits of Gibraltar across the Sahara to Nigeria, thence traversing the Congo to the Katanga mining district. This latter suggestion is specially interesting in view of recent activities in connection with the Trans-Saharan railway and the introduction of a Bill into the French Chamber of Deputies authorising the Government to provide 18 million francs to defray the cost of carrying out a technical survey and preparing the final plans for the construction of a line across the Sahara Desert – a scheme consistently advocated for years past. Truly, as an engineering contemporary recently observed, the desert has lost its terrors.
THE RAILWAY GAZETTE.

SOME TYPICAL MODERN LOCOMOTIVES AND ROLLING STOCK FOR AFRICAN RAILWAYS.

On this and the following pages will be found brief descriptions and photographs (not included) of a number of the latest locomotives and most modern carriage and wagon stock specially designed for service in various parts of Africa. In selecting our illustrations we have endeavoured to give as representative a view as possible of the latest practice in the design of locomotives and rolling stock for African railways, and we are indebted to the various railway administrations, locomotive and rolling stock builders and consulting engineers for the following descriptions and illustrations. In order to avoid repetition we have not published more than one photograph of the same or very similar type of locomotive or rolling stock, and in mentioning the builder’s name under the illustration we wish it clearly understood that, of course, very similar locomotives and vehicles may also have been constructed by other builders, but were we to illustrate each one it would only have the effect of making this number monotonous without adding to its value.

Pacific Type Locomotive, South African Railways.

Enlarged 4-6-2 Type Locomotive, Karoo Section, South African Railway, now being built by the Vulcan Foundry Ltd.¹

The diagram on this page shows one of the enlarged ‘Karoo type’ locomotives which the Vulcan foundry Ltd. have now under construction for the Karoo section of the South African Railways. These engines are of the 4-6-2 type, similar to those designed by Mr. H.M. Beattie, C.M.G., the late locomotive superintendent of the Cape Government Railways. They have outside cylinders 19 in. diameter
by 28-in. stroke and coupled wheels 5 ft. 1 in. diameter. The boiler is of generous proportions and fitted with Belapire firebox. It carries a working pressure of 200 lb. per sq. in. and with the fire-box contains a total heating surface of 2,066 sq. ft., while the grate area is 34`2 sq. ft. These proportions equal, and in some respects exceed, those common for the 4-ft. 8½-in., or standard, gauge, and they represent a very great advance for the 3-ft. 6-in. gauge on which, of course, the South African Railways are laid out. The accompanying drawing, for which we are indebted to the makers, clearly shows the leading characteristics of the design which, as might be expected, is typically British throughout its main particulars, but it is to be noted that in respect of the framing and cab, and also in the provision of a large headlight and ‘cowcatcher’, American practice is followed.

The engine trailing wheels are carried in a truck pivoted by means of a long arm projecting forward to a point near the front end of the fire-box. The latter it will be noticed has sloping front and back plates and mounted on it are safety valves of the ‘pop’ type. The rigid wheelbase of the engine is very short, viz., 10 ft. 8 in. out of a total base of 29 ft. 5 in. The bogie wheels are 2 ft. 6½ in. and the trailing truck wheels 2 ft. 10 in. in diameter on tread. In working order the engine weighs 69 tons.

The tender is mounted on two 4-wheeled bogies each having a wheelbase of 4 ft. 7 in. The total wheelbase is 16 ft. 9 in. The water capacity of the tender is 4,000 gallons and its coal capacity 10 tons.

Pacific Type Locomotives for the Cape Section, South African Railways.

A few years ago there were constructed at the works of Messrs. Beyer, Peacock & Co., Ltd., of Gorton, some 4-6-2 type passenger locomotives for the Cape Government Railways. These at the time represented a considerable advance on the passenger locomotive standards for that country and although they have now been surpassed in point of weight and power capacity by the new superheated locomotives of the same type, also built at Gorton Foundry, and which we also illustrate and describe in this issue, they are nevertheless interesting, if only as showing the development of the type on South African Railways within the space of a few years.

These earlier locomotives were fitted with outside cylinders to which steam was distributed by inside Stephenson motion. The valves of the balanced flat type worked above the cylinders and were actuated by rocking levers for transferring the motion from the inside gear. The boiler was fitted with a round top fire-box in place of the Belpaire box used in the latest engines.

The proportions were smaller throughout as the following table of dimensions will show:-
### 4-6-2 Type Superheated Steam Locomotive, Pacific Type, South African Railways.

We are indebted to Messrs. Beyer, Peacock & Co., Ltd., of the Gorton Foundry, Manchester, for the photographic reproduction on p.82, and the following particulars of the new Pacific type superheated express locomotives, which they have just built for the South African Railways, under the supervision of their Consulting Engineer, Mr. H.G. Humby, M.Inst.C.E. These engines are of an interesting character. They are of large proportions even for the standard gauge, and especially are the dimensions noteworthy when considered in relation to the 3-ft. 6-in. gauge for which the locomotives are constructed.

Pacific type passenger engines are not new in South Africa, and in the preceding article we have given a short illustrated description of an earlier type having the 4-6-2 wheel arrangement built at the Gorton Foundry. These latest locomotives, however, are altogether heavier and more powerful, and the fact of their using superheated, instead of saturated, steam constitutes an advance on previous standards.

[...] The outside cylinders are fitted with piston valves actuated by Walschaerts’ motion, the middle pair of couple wheels being the drivers. A large boiler with extended smokebox and Belpaire fire-box is employed, and a special feature of the construction, which we illustrate on this page, is a large combined stay and

The wheelbase of the engine is 30 ft. 2 in., and the weight in working order 74 tons 9 cwt. The eight-wheeled tender has accommodation for 4,000 gallons of water and 10 tons of coal; the bogie wheels are 2 ft. 9½ in. diameter, and the wheelbase 16 ft. 9 in. In full working order the tender weighs 49½ tons.

These engines may be said to represent a marked development in South African locomotive standards.
2-8-0 Engines, Lagos Government Railway.

These engines, which are illustrated on p. 83, were recently built for the Lagos Government Railway by Messrs. R. & W. Hawthorn, Leslie & Co., Newcastle-on-Tyne. They are of the 2-8-0 type, with double-bogie tenders. The engines have large boilers with Belpaire type fire-boxes, and, as can be seen from the illustration, have cabs on both engine and tender to protect the enginemen from the sun and rain, as the Nigerian climate is both hot and damp. The boiler is carried at the smoke-box end by an iron casting, which also forms the cylinder cross stay and the pony centre support. The cylinders which drive on to the third pair of coupled wheels have Richardson’s balanced slide valves operated by Walschaerts’ type valve gear.

The coupled wheels are compensated throughout, and all are braked, the power being derived from a horizontal steam brake cylinder. Sanding is provided for leading and trailing wheels. The bogies on which the tender is carried have Fox’s patent pressed steel frames.

The tender frame is built of channel sections stiffly braced at the ends and centre, and the tanks are designed to carry 2,000 gallons of water and 125 cub. ft. of fuel (or 2¾ tons coal). Large tool boxes are fitted both on top of tank and in engine cab. The tender is provided with both steam and hand screw brakes. Central buffers and drawgear of the standard type used on the West African Government Railways are fitted.

In the accompanying table are given the leading dimensions of these engines:

Mogul Locomotives for the South African Railways (Hopefield Section).

Some locomotives supplied by the Baldwin Locomotive Works\(^8\) for working on the Hopefield section of the South African Railways are of the Mogul or 2-6-0 pattern, and of one of these we publish an illustration on page 82. The gauge is 2 ft., and the locomotives are naturally restricted in size. They have outside cylinders and bar framing, with a system of spring compensation in accordance with American practice. The boiler is of the straight pattern with extended smokebox, and it contains 68 iron tubes, each 2 in. diameter by 10 ft. 9½ in. long. The total heating surface is 423·8 sq. ft. and the grate area 7·6 sq. ft.

The cylinders drive on the middle pair of coupled wheels, and steam is distributed to them by balanced slide valves working on top. Outside fly cranks are employed and hanging crossheads with double-slide bars are fitted. The cylinders are 11¾ in. diameter by 16-in. stroke, and the coupled wheels have a diameter on tread of 2 ft. 9 in. The wheelbase is 7 ft. for the coupled wheels, and 12 ft. 10 in. for the complete engine. A working pressure of 180 lb. per sq. in. is carried by the boiler.

The tender is of the double-bogie pattern, with a coal space of three tons and water capacity of 1,500 gallons. Engine and tender in working order weigh 33 tons.

[...] 4-8-0 Type Superheater Locomotive, Lagos Railway.

Two 4-8-0 locomotives of the type illustrated on page 83 have recently been delivered by Messrs. Nasmyth, Wilson & Co., Ltd., of Patricroft, near Manchester, to the order of the Lagos Government Railway (Southern Nigeria Line).\(^9\) These locomotives are designed to haul train-loads of 300 to 320 tons on gradients of 1 in 80 and loads of about 220 tons on gradients of 1 in 50. Rails of 50 lb. and 55 lb. per yard respectively are used, and the axle-loads are limited to 10 tons. The superheating apparatus is of the well-known Schmidt type, and Walschaert's mechanical lubricators are fitted. These are the first superheater engines to be put to work on West African Railways. The large smoke tubes for the superheater pipes are of solid drawn steel fixed in the tube plates, and the fire bars are of cast-iron and supported by strong bearers secured to the bottom ring of the box. The link motion is of the Walschaerts' type, and reversing is by means of a
screw fixed on the right-hand side of the engine. The following is a table of the leading dimensions and weights:–

Three additional locomotives identical with the two described and illustrated (with the exception that A.B.C. couplers are included) are now under construction by Messrs. Nasmyth, Wilson & Co., Ltd., for use on the Lagos Railway, where a through rail service is shortly to be inaugurated from the Port of Lagos, the capital of Southern Nigeria, to Minna, the junction with the Baro Kano Railway, 30 hours to be the time occupied in transit.

This weekly mail train, which will connect with both the outward and homeward mail steamers at Lagos, will consist of saloon carriages provided with every modern convenience, including comfortable sleeping accommodation, lavatories and bathrooms, and fitted throughout with electric lights and fans. A restaurant car will be a special feature in connection with this service.

**Tank Locomotive, Lagos Railway.**

By the courtesy of Mr. Frederic Shelford, we illustrate on page 82 an 0-6-0 shunting tank locomotive built by the Hunslet Engine Co., Ltd., Leeds, for the Southern Nigerian Lagos Railway. This engine has cylinders 13 in. by 18 in.; heating surface 531 sq. ft., grate area 9.2 sq. ft., total weight 28 tons.
Speed Indicators and Recorders on African Railways.

An interesting feature of locomotive practice on the South African Railways is the use of speed indicators and recorders, the type mostly used being the Hasler Speed Indicator & Recorder (sold by the Hasler Telegraph Works, of 26, Victoria Street Westminster, S.W.) Such instruments are fitted to locomotives to serve two ends:— (1) As a precautionary measure against the occurrence of accidents due to excessive speed, and (2) as a means of assisting the driver to keep up to his scheduled running times. This subject was dealt with at some length on page 20 of Mr. W. W. Hoy’s Report on South African Railways for the year ending December 31, 1910, and is referred to in this issue.

In the first place, the knowledge that all movements of the engine (speeds attained at any point, time the engine is at work and duration of stops, and distance covered) are being registered on the chart undeniably has a moral effect on the driver, and in particular, is sufficient to deter him from reckless driving on portions of the road where in the interest of safety the speed must be reduced. Again, the indicator needle shows him the actual speed he is making at any moment, and this is of great assistance, particularly at night time, when it is especially difficult to gauge speeds accurately.

In the second place, it sometimes happens that through excess of caution, time is lost through running the trains more slowly than is actually necessary over sections where, by means of notice boards for example, drivers are warned not to exceed a certain speed. Here again, the installation of a speed indicator demonstrates its value, as the train can be kept up to the maximum speed allowable without infringing regulations, or endangering lives. Again, as mentioned above, the duration of all stoppages is clearly shown on the chart, so that loss of time through over long halts is readily detected, and disputes which occasionally occur over the timing of station stops are settled by referring to the speed recorder diagram.

The makers of the Hasler instrument have endeavoured to produce a speed indicator and recorder which will, as nearly as possible, indicate and register the momentary speeds, whilst retaining all the advantages of an entirely mechanical action. It conforms to the changes of speed every second, and the registration of speed is effected every three seconds, so that for all practical purposes the delay in the setting of the needles is negligible. In this respect, the makers justly claim that their instrument reaches a higher standard of accuracy than any other speed indicator and recorder having an entirely mechanical action.

Another great advantage possessed by the Hasler apparatus is that all registrations are punctured into the paper, not traced on the surface with a marker. Hasler diagrams therefore are permanent, and cannot be effaced or falsified in any way.
The instrument is very strongly built to withstand the severe conditions of railway service, and is easy inexpensive to maintain. The driving shaft is geared down so that it rarely makes more than 70 or 75 revolutions per minute, and it will therefore be appreciated that the wear on all moving parts is reduced to a minimum.

NORTH BRITISH LOCOMOTIVES IN AFRICA.

Herewith we give brief particulars of some typical locomotives recently built by the North British Locomotive Co., Ltd., for the South African, Sudan Government, and Nigerian Railway systems respectively, five of which are illustrated on pages 81 and 83.

Mallet Simple Engine with Schmidt Superheater, South African Railways, built by North Locomotive Co., Ltd.

[African Rolling Stock.]

We illustrate on pages 84, 85 and 87 some typical examples of rolling stock built by the Birmingham Railway Carriage & Wagon Company, Ltd., for various parts of Africa. The chief dimensions of these vehicles are given below:

Four-wheeled Open Sheep Wagon, Rhodesia Railways.

Drop-sided Bogie Wagon, South African Railways.

Length over headstock 37 ft 10 in.
Length inside 37 ft 6¼ in.
Width 7 ft 9 in.
Centres of bogies 24 ft.
Bogie wheelbase 4 ft 9 in.
Gauge 3 ft 6 in.
Load 70,000 lb.

Third-Class Carriage, Gold Coast Government Railways.

Length over platform 45 ft
Length over body 40 ft
Width inside 7 ft 5 in.
Centres of bogies 30 ft.
Bogie wheelbase 5 ft 6 in.
Seating capacity Fitted with lavatory 60 passengers, third class
Gauge 3 ft 6 in.

Native Wagon, Rhodesia Railways.

Length over body 32 ft 4 in.
Length inside 31 ft 8 in.
Width inside 7 ft 4 in.
Centres of bogies 21 ft.
Bogie wheelbase 5 ft.
Gauge 3 ft 6 in.
Seating capacity Fitted with lavatory 40 native passengers.

Dining Car, Mashonaland Railways.

One of the illustrations on page 84 shows a dining car lately built by the Gloucester Railway Carriage & Wagon Company, Ltd., to the order of the British South Africa Company, for use on the Mashonaland Railways. The vehicle is most complete in every respect, and very luxuriously fitted. It is divided in the interior into a dining saloon, serving room, and kitchen, and is fitted in addition with store rooms, pantries, refrigerator, and lavatory.

The body framing is of Moulmein teak, with outside linings of the same material. The window openings are fitted with glass frames, louvre frames and dust screens, all movable and fitted with adjustable sash holders.

The end platforms, in addition to the half-screen of timber, are fitted with storm curtains of the usual South African type. The interior paneling of the dining saloon is finished up to the garnish rail in rich dark mahogany, the panels
and mouldings being of the same material, highly polished. Above the garnish rail the panels and mouldings are of white mahogany, half polished, the ceiling being lined with millboard,\textsuperscript{16} enameled white, and decorated in gold. All the fittings are nickel plated.

In the dining saloon there are four long and four short mahogany movable tables, and seats for 24 passengers. The chairs are upholstered in buffalo hide of sealing wax red colour, and an alcove is arranged over each table, between the windows, for the accommodation of some of the table service.

The kitchen is provided with an open and closed coal stove, with a very comprehensive arrangement of ovens, water boiler, hot water tank, steam heated plate rack, and other fittings, and this compartment is well fitted throughout with shelves, plate racks, cupboards, &c. The floors are covered with $\frac{1}{8}$ in. steel plates, and the sides lined with match boarding, enamelled white right up to the roof. There is a good water service on the car from a tank carried on the underframe, and another in the roof.

The underframe is constructed of steel channel bars, trussed in the manner common to the Cape Government Railways, and the vehicle is carried on bogies, also of the Cape Government pattern, \textit{i.e.}, of the spring bolster type constructed of double-plate steel frames and fitted with elliptical bearing springs and auxiliary coil bearing springs. The car is electrically lighted, and electric bells are provided in each compartment, with electric fans in the saloon. The wheels are of the open spoke pattern, 2 ft. 9½ in. on tread, fitted with wrought iron centres and steel tyres and axles. The car is fitted with automatic vacuum brake.

\textbf{Bogie First-Class Carriage, Egyptian State Railways.}

Carriages of the type illustrated on page 87 are 60 ft. 2½ in. long and 9 ft. 3 in. wide outside body, and run on the 4-ft. 8½-in. gauge. The length over platform headstocks is 60 ft., the length over buffers 63 ft. 3¼ in., centres of bogies 42 ft., and the height from floor to roof inside 9 ft. 5¾ in. The carriage illustrated was built by the Metropolitan Amalgamated Railway Carriage & Wagon Co., Ltd.\textsuperscript{17} It is built of teak, has a monitor roof, and presents a symmetrical external appearance. Two side doors open into the vestibule at each end; these are divided from the corridors by sliding doors. It contains six compartments 7 ft. 6 in. long by 6 ft. 3 in. wide, a coupe compartment (all of which are entered by sliding doors from the corridor), lavatory and w.c. compartment at one end. Movable teak windows and louvre frames are provided to all windows. The seating capacity is 39 passengers. The underframes and bogies are of mild steel. The weight of the carriage is 40 tons.
Day Saloon and Sleeping Carriage Train de Luxe, South African Railways.

This carriage illustrated on page 84 is 60 ft. 3 in. long by 8 ft. 6¼ in. over body, 59 ft. 9 in. long on frame, 44 ft. 6 in. centres of bogies, 6 ft. 1 in. wheelbase; the height of body outside is 9 ft. 1½ in., and the total height of car 12 ft. 2 5/16. from rail. It was built by the Metropolitan Amalgamated Railway Carriage & Wagon Co., Ltd. Entrance is effected from either end by folding doors opening inwards to vestibules, and a side door at each end opening into the same; the corridor is divided from the vestibule by a swing door at each end. The car contains a day saloon 12 ft. 6 in. by 6 ft. 0½ in. inside, three double sleeping compartments 7 ft. 3½ in. by 6 ft. 0¼ in., two single sleeping compartments 4 ft. 6 in. by 6 ft. 0½ in., a lavatory and bath-room for gentlemen and two w.c.'s for ladies. Access to all the sleeping compartments and the day saloon is by means of sliding doors opening from corridor, that the gentlemen's lavatory and bath-room and the ladies' w.c.'s are entered by folding doors from the vestibules.

The day saloon is lighted by four windows. It is fitted with two seats occupying the full width of compartment, and upholstered in green buffalo hide; also provided with washtand, two fixed tables each having two folding leaves forming a table 2 ft. 6 in. by 2 ft. 6 in. when open, and two cane arm chairs. Interior finish of wainscot oak, metallic fittings of brass finished nickel plated, and electric light fittings finished in the same manner.

In the three larger sleeping compartments are two seats, the backs of which are convertible into upper berths, the whole being upholstered in green buffalo hide. These compartments are also fitted with washtand similar to that in the day saloon, and a movable table. Sleeping accommodation is provided for four persons. Interior finish is of polished wainscot oak and metallic fittings, electric light fittings of brass, finished nickel plated.

The two smaller sleeping compartments provide sleeping accommodation for only two persons, having one seat the back of which can be converted into upper berth. They are also fitted with a folding table and washtand. Interior finish is of similar description to larger compartments. All the floors of these rooms are covered with linoleum and carpets of a deep green.

The gentlemen's lavatory and bath-room 5ft. 9in. by 6 ft. 0½ in., which is entered from one of the vestibules, is fitted with a shower bath, two wash-basins with marble slab, a fixed cane seat a narrow table with mirror above, brush and comb box, filter and water bottle, clothes hooks, &c.; the floor is covered with tiles, and hot and cold water is provided. Cupboards for linen, &c. are also fitted at each end. Floors of corridor and vestibules are covered with linoleum of parquetry pattern.
The underframes and bogies are of mild steel; vacuum brake and automatic centre couplers are fitted.

[...]

Covered Goods Wagon, Lagos Railway.

By the courtesy of Mr. Frederic Shelford, we illustrate on page 86 an example of some high capacity bogie stock built by the Bristol Carriage & Wagon Works, Ltd., for the Lagos Railway. These wagons are 32 ft. long and have a capacity for 15 tons with tare 8 tons 19 cwts. The bodies and underframes are of timber.

Third-Class Coach, Lagos Railway.

By the courtesy of Mr. Frederic Shelford, we illustrate on page 85 one of a number of bogie third-class carriages, built for the Lagos Railway by the Bristol Wagon & Carriage Works, Ltd. These vehicles have bodies 40 ft. long with two end platforms, each 2 ft. 6 in. The coaches have a seating capacity for 80 passengers, the bodies are of teak with steel underframes and are fitted with vacuum brake.

Passenger Rolling Stock for Natal.

On page 88 we illustrate one out of a complete equipment of carriages and vans supplied for the Natal Government 2-ft. gauge railways by Messrs. Cravens, Ltd., Darnall, Sheffield. The contract was for the supply of first and second-class composite cars, third-class cars, brake vans, native carriages, &c. The stock is 30 ft. long, with a platform at either end, and is mounted on pressed steel bogies. The underframes are made up of steel channels, angles, &c., and provided with vacuum and hand brakes. The bodies are constructed throughout of teak, the finishing of the first-class compartment being in sycamore and walnut, and the seats upholstered in green buffallo hide. The second-class interiors are finished in teak, the upholstery being in black and gold rep. The native carriages are arranged with hinged seats, &c., so that they may be converted into brake vans when required. All the carriages are provided with sliding lights and louvers, and are ventilated by torpedo air extractors. The lighting of the cars is efficiently provided for by Ridsdale roof lamps.

One of the principal orders executed by this firm was for a special corridor train, supplied to the Natal Government Railways, comprising dining and sleeping cars, kitchen cars and brake vans. The cars are 60 ft. 6 in. long, and are mounted on four-wheeled bogies of the built-up type. The underframes are of steel channels, angles, &c., suitably trussed. The body framing of the cars is of specially selected teak with compound steel bracing and steel panels. The combined sleeping and dining cars have seven compartments, each being provided with a removable flap table for use when meals are served. The total seating accom-
accommodation is for 30 passengers; the seats are arranged that they may be converted into sleeping berths, giving sleeping accommodation for 22 passengers. Lavatory compartments are provided at each end of the carriages, and the necessary cupboard accommodation for linen, &c., is to be found at the centre of the cars. The roofs are of the ‘Monitor’ type, having hinged side ventilators. Sliding lights and louvres are fitted, hit-and-miss ventilators being arranged above these lights. The interior finish is tastefully carried out in satin-wood panels with walnut facias, mouldings, &c. Electric lighting is provided, and also fans for keeping a constant circulation of air; in addition Ridsdale roof lamps are fitted, to be used in case of emergency. A comprehensive system of electric bells is provided.

At one end of this vehicle a bathroom is arranged and provided with a copper shower bath and the usual bathroom fittings. Next to this is a lavatory compartment for the use of the staff. At the opposite end of the car are two sleeping compartments, each capable of accommodating four persons, also a cold storage compartment for carrying meat, provisions, &c.

50,000 lb. Wagons, Mashonaland Railway.

The first photograph on page 85 illustrates one of a large number of wagons recently built for the Mashonaland and other railways by Messrs. Cravens, Ltd., Darnall, Sheffield. These wagons are 34 ft. 4 in. long over headstocks, and carry a load of 50,000 lb., the tare being 24,136 lb. The bogies are of the usual standard pressed steel type. The bodies have rounded ends, which can be removed, the sides being formed of three flap doors, supported at intermediate points by removable channel steel stanchions, so that when necessary the vehicles can be used as platform wagons. The automatic vacuum and hand brakes are fitted to these wagons.

THE SOUTH AFRICAN RAILWAYS’ ROYAL TRAIN.

On pages 56 and 57 we give three illustrations of the complete train placed at the disposal of T.R.H. the Duke and Duchess of Connaught and H.R.H. Princess Patricia during their recent visit to South Africa. This train was fully described in the Railway Gazette for January 20 last, but it is interesting to note that all the vehicles comprising it were designed by the staff of the Mechanical Department of the late Central South African Railways, now merged into the South African Railways, and that, with the exception of two carriages which were built at Durban, Natal, all the others, including the two specially designed Royal saloons, were constructed at the Railway Workshops, Pretoria, Transvaal.

The drawing of the train indicates the position of each carriage relative to the others. Each vehicle is 60 ft. 3 in. over the body, and is carried on two four-wheeled
bogies. The roofs are clerestoried, and the electric light is produced by Stone system. The train is also equipped with the Laycock storage steam heating system, and Laycock-Buckeye couplers are fitted throughout. The total length of the train of 10 carriages is 624 ft. 2 in., and the tare weight 727,600 lb., or 363.8 short tons.

The two Royal carriages, one for the Duke and the other for the Duchess of Connaught, were identical in design inside and outside, and were provided with day and night apartments, bathroom, baggage room, and accommodation for a personal servant. The internal decoration consisted of polished woods, the panels being made of Rhodesian teak, the framing of Nyasaland mahogany and the mouldings of Cape Walnut. The photographs, of course, do not convey the pretty effect obtained by this blending of South African timbers in conjunction with the colour and shade of the trimming and carpets. The prevailing colour of the Duke’s apartment was light green, and that of the Duchess’ light blue. To overcome vibration and soften the noise, sandwich floors, consisting of top and bottom boarding, with sawdust packed between, were adopted, and as a further precaution, extra thick cork linoleum was used for laying on the floor. The plan indicates the general arrangement of the apartments and the disposition of the furniture. The fittings throughout these carriages were specially designed to afford every possible comfort to the Royal passengers, and were supplied by Messrs. W. S. Laycock, Ltd., and the furniture generally was also specially selected.

In the van at one end of the train was carried a complete water sterilising plant, capable of supplying absolutely pure drinking water to every member of the train party. A special design of footstep gear to the Royal carriages was fitted, which enabled the footsteps to be folded out, providing an easy ascent and descent. As these steps, if left in the ‘out’ position when the train was moving, might come into contact with fixed structures, a special connection of the locking gear with the train pipe was devised to make it impossible for the brake to be ‘blown-off’ until the steps had been stowed away and locked, inside the loading gauge.

A NEW TYPE OF COMPOSITE FLAT-BOTTOMED SELF-DISCHARGING WAGON FOR THE UNION OF SOUTH AFRICA RAILWAYS.

[...]

For the Union of South Africa Railways, 165 patent composite wagons of the type illustrated in the engravings are now being put into service. These wagons have been specially designed by the Leeds Forge Company, Ltd., of Leeds, to meet the requirements of railways which have different classes of traffic to deal with in opposite directions, or at different times, and in which, hitherto, the wagons used for taking traffic, such as general merchandise, long steel rails or timber in
one direction, have not been suitable for taking the return traffic, such as coal or minerals, and have consequently, had to be returned without any paying load.

[...]

The wagons are made flat-bottomed so as to be suitable for carrying ordinary merchandise, and the greater part of the bottom consists of doors, which can be let down by turning a handle or hand-wheel, so that the bulk of the contents of the wagon, when consisting of minerals, may be automatically discharged. Another valuable feature of the design is that the door operating gear is fitted entirely below the bottom doors, so that doors of any type can be fitted in the sides of the wagon at any point, or for the full length of the wagon, and the side doorways can be made to reach right down to the level of the floor. This object is attained by constructing the solebar or side frame of the wagon of shallow upper and lower members well braced together, the load being discharged between the two members. By this construction, the solebar possesses sufficient strength, while at the same time there is no deep member above the level of the floor to prevent the easy unloading of rails, timber, &c., at the side of the wagon. It will thus be seen that this type of wagon combines the advantages of several different wagons and avoids the necessity of the railway employing a large number of different types of wagons, each of which types could only be used for certain classes of traffic, with the result that they lie idle for considerable periods.

The bottom door-operating gear is so designed that the weight of the doors and the load on them has no tendency whatever to open them; they are held closed by means of vertical links in pairs which butt directly on to supports on the frame. Any tendency for the links to shake in a direction transverse to the wagon is prevented by the operating screw. The doors, therefore, require no separate locking gear and may always be kept perfectly closed. The whole of the bottom doors are opened or closed in one operation, either by means of the handle placed on the shaft at the / end of the wagon, or on the end of the cross-shaft at either side of the wagon, that is to say, there are three points at any one of which the doors can be operated. The method of operating consists of turning the handle one way for opening and the opposite way for closing, and the doors automatically lock themselves when closed through the levers on the operating shafts and the links connecting the levers to the doors coming into a vertical line. Coil springs are placed at certain positions for the purpose of making it easier to lift the doors to close, but these are not necessary for the working and may be omitted, if desired.

The door-operating gear of this type of wagon can be arranged so that it can be worked from both sides of the wagon or from the end of the wagon. The doors may either be arranged so that the whole of them can be opened simultaneously from one shaft, or they may be divided into groups, each group being worked independently by a separate shaft. In official tests, conducted at the builders’
works, it was found that a period of about 3 minutes was occupied on discharging 90 per cent. of the contents, that is to say, in discharging from the full load to the nearly empty wagon, as shown in one of the photographs, while a further 5 minutes was required by two men to clear the contents by means of shovelling. The total load in the wagon during this test was 35 tons 6 cwt. The whole of the sides of the wagon are made removable for use during rail and timber transport.

**AUTOMATIC CENTRAL BUFFER COUPLERS ON AFRICAN RAILWAYS.**

It is an interesting fact that the Governments of Southern and Northern Nigeria have after extended trials decided to abandon their existing type to central buffer and screw coupling, and adopt an automatic central buffer coupler which has proved itself to be entirely satisfactory on other railways.

We refer to the A.B.C. central automatic buffer coupler, Jepson’s patent. The whole of the new stock built in 1911, for the Southern and Northern Nigeria Railways, including the new 2-ft. 6-in. gauge Bauchi Railway, has been fitted with this coupler, and arrangements have been made for equipping the whole of the existing stock on those railways, as quickly as the Authorities in the Colony can carry out the conversion.

It should be noted that the conditions of service are exceptionally severe on these railways, as the minimum radius of curves is 200 ft., and the length of underframes of saloon cars is 56 ft. 3 in. over headstocks, the bogie centres being 41 ft. apart.

The illustrations on this page show locomotive and wagon stock as supplied to the Bauchi Light Railway of Northern Nigeria, a 35-ton bogie tip wagon, and 15-ton covered goods wagon of the Sudan Government Railway.

The wheelbase of the smallest wagons is 8 ft. 6 in., the length over headstocks being 15 ft. It can be readily understood by those who have had experience of the subject that when the long car is coupled to the short wagon, and the 200-ft. radius curve is being traversed by them, the central buffer coupler must be of
exceptional flexibility, and this condition is achieved by the use of the A.B.C. coupler, which at the same time is claimed to be the tightest coupling on the market to-day. The Sudan Government Railway also has over 200 vehicles in service equipped with A.B.C. couplers.

[...]

**West African Railway Expenditure.** – The Secretary of State for the Colonies was recently asked if he would give the figures for the cost per mile for constructing and equipping the Baro-Kano Railway in Northern Nigeria, the railway in the Gold Coast Colony, the Sierra Leone Railway, and the Uganda Railway. Mr. Harcourt said in reply that the capital expenditure up to the present date had been approximately:

<table>
<thead>
<tr>
<th>Railway</th>
<th>Cost (£ per mile)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Baro-Kano Railway</td>
<td>3,650</td>
</tr>
<tr>
<td>Gold Coast (Sekondi-Coomassie)</td>
<td>10,500</td>
</tr>
<tr>
<td>Sierra Leone</td>
<td>4,200</td>
</tr>
<tr>
<td>Uganda</td>
<td>9,700</td>
</tr>
</tbody>
</table>

The above figures included in the case of the last three railways all capital expenditure since they were opened for traffic. The opening of the Baro-Kano Railway for traffic had not yet been announced.

[...]
IMPACT OF RAILWAYS

The impact of railways was immense, affecting the economy and urban geography of the continent and the African way of life. Usually, the sheer cost of construction concentrated the minds of colonial administrators on the development of their fiefdoms. Facing high annual payments on the loan taken out to finance the Uganda Railway, for instance, various Kenyan administrations promoted European settlement of the Highlands and later African production. The exception appears to be Nyasaland whose £5m debt incurred in the building of the protectorate’s network supposedly forced the local government to pursue a policy of labour migration that crippled the local economy.

Development was further promoted via the reduction of transport costs, the expansion of agriculture, mining and trade, and the easing of labour supply problems. Far cheaper than porterage, railways reduced the cost of transporting goods to the coast by relatively large amounts; in the Gold Coast in 1909 and 1925/6 by the equivalent of 2.1 per cent and 9.3 per cent of GDP, respectively. More importantly, they provided farmers with access to export markets, and, to a lesser extent, domestic urban/mining markets. Crops promoted include tobacco, cotton and tea in Nyasaland, grain in the Cape’s high veldt, ground nuts in Nigeria, rubber, cocoa and timber in the Gold Coast, and Kenyan wattle, initially grown as fuel for the Uganda railway and later exported for its tannin. In the east and south of the continent, however, construction disproportionately benefited European farmers. Lines were built through white agricultural areas, circumventing the African reserves, and, in Southern Rhodesia, reserves were deliberately located more than 25 miles from a line, land alongside which was set aside for Europeans. By allowing the mining companies to obtain cheaper food from further afield, railroads also often decimated local African agrarian sectors that had previously supplied the mines, and, in some areas, by extending the distribution of cheap Western imported goods, destroyed a variety of craft industries undertaken by native farmers. Although trains, by expanding markets, caused some crafts, such as bread-making, loom-weaving and pottery, to flourish.

The impact of railways on mining and trade was equally significant. Among the many mineral sectors given a boost the most significant were perhaps Rho-
As regards trade, in West Africa the railroad opened up the interior and allowed European commercial houses to move their activities inland and bypass the African traders who had previously supplied them with cash crops. In East Africa, the shift in trade involved the replacement of Arabs and Swahilis by Indian traders. Originally brought to the colony to construct the Uganda railway, these moved from the coast and set up businesses in the interior, purchasing agricultural produce and selling a vast range of Western goods.

A major problem faced by European, and, to a lesser extent, African employers was the shortage of labour. To some extent, the railways made recruitment even more difficult in that their construction and operation absorbed tens of thousands of workers. Overall, however, they had a positive impact on labour supply. Line construction prepared workers for industrial and mining employment, and the completion of lines released large numbers of head carriers for non-portering work and encouraged Africans to enter waged employment (as well as cash cropping) by allowing the distribution of cheap imported Western goods. More significantly, railways facilitated labour migration. From the start of the century, trains carried large numbers of workers to mines on the Rand and elsewhere, and, to a far lesser extent, to farms and plantations. The use of railroads ensured that labour arrived promptly and in good condition, curtailing the exhaustion and invalidity/loss of life associated with walking, and reduced the pilferage of migrants by farmers and other employers en route. It also reduced costs. The per capita expense of rail transportation was relatively low and mine owners no longer had to maintain roadside way-stations, where migrants were sheltered and fed, and had lower wage bills. Rather than recruiting locally or from a certain area, they could now import workers from distant regions where incomes were relatively low. Furthermore, the greater distance travelled by migrants reduced wastage through desertion.

Drawbacks were the configuration of the rail network, which failed to extend into economically barren regions, where the cheapest workers resided; limited railway capacity, labour being relatively bulky; and the problems of dealing with numerous railway authorities. Each train company had its own timetable and fare regimes, and, in some regions, fares were deliberately raised in order to prevent the loss of workers to employers in other regions. The poor conditions of travel also tended to lead to worker discontent, which could affect productivity. In order to reduce costs, the railway companies packed migrants into unheated and unventilated cattle trucks, known as ‘bombelas’, which lacked seats, lavatories and drinking facilities.

The urban geography of the continent and the way of life of its people were similarly transformed by the railway. The building of lines led to the decline of desian copper, Nigerian tin, South African gold and chrome, and Nigerian and Transvaal/Natal coal, the majority of which was used by the railways themselves.
old trading centres and settlements circumvented by construction; the growth of existing urban centres through which lines travelled; and the establishment of brand new towns around depots and at railway junctions and places of trans-shipment. The Uganda Railway, for instance, spurred the establishment of Nairobi, initially a rail depot, and Nakuru, situated at the junction of the Kisumu and Uganda lines, but contributed to the decline of the old caravan town of Mumias, along with Mombasa and Eldama Ravine.\textsuperscript{18} Railroads, as a form of transportation and by contributing to the decline of local agriculture, and, in South Africa, re-enforcing the capitalization of farming, also encouraged migration to urban areas and determined the geography of these towns/cities.\textsuperscript{19} In South Africa and elsewhere, trains permitted the establishment of the black dormitory townships that surrounded most conurbations – each morning bringing workers into the city and then returning them home at night. The construction of such township lines often being underwritten and the fares subsidized by the state in order to ensure apartheid.\textsuperscript{20}

Segregation, which in South and East Africa was imposed on all trains via the fares charged and colour-specific compartments, was just one of a number of ways railways changed the lives of ordinary Africans.\textsuperscript{21} Railroads facilitated the relief of famine; permitted improvements in health care, the quality of education, policing and the diffusion of information; promoted the formation of intercommunity networks; and altered the subjective view of geographical space, encouraging individuals to regard themselves as members of a region and a country rather than merely a village.\textsuperscript{22} Like all paid work, employment on the construction of lines also enabled young males to become financially independent and to marry earlier and transformed men’s family role into one of breadwinner.\textsuperscript{23} On the distaff side, the railway contributed to the spread of disease, particularly syphilis, and increased the consumption of alcohol with all its damaging consequences.\textsuperscript{24} Alcohol formed a significant proportion of the freight of most lines, and, to tackle the associated problems, the Nigerian railway authorities were forced to place a high tariff on alcoholic freight and prohibit the carriage of spirits beyond Ikirun, ensuring compliance though in-transit checks.\textsuperscript{25}

Notes

15. Pirie, 'Railways and Labour Migration'.

In 1881, when I first went to Africa, there were only 300 miles of the Cape to Cairo Railway constructed – viz., the line connecting Cape Town with Beaufort West. In 1885 it was extended to Kimberley, and here for several years its progress was arrested for political reasons into which I need not enter. But even at this early date the dream had been dreamed of continuing this iron road for thousands of miles northward, through the vast and unknown spaces of Africa.

Rhodes died in 1902, when his railway had advanced only as far as Bulawayo, 1,362 miles from Cape Town and 3,600 miles as the crow flies from Cairo.

Shortly before Rhodes died I promised him I would carry his line forward.
The expeditions I had sent up in 1899 and 1901 under the leadership of my splendid colleague, the late George Grey, brother of Viscount Grey, with the object of discovering a mineral area of sufficient importance to draw the line northwards, had already revealed the great copper wealth of Katanga, besides important gold, tin, and diamond deposits.

I will not weary you with the story of the slow advance of the line to the north. I have told it often elsewhere. Suffice to say that in 1909 it at length arrived at the Congo frontier, and that, thanks to the co-operation of King Leopold and of his great financier, Monsieur Jadot, thanks also to the consistent support of his present Majesty, King Albert, the railway has now reached Bukama, on the navigable Congo, with the result that to-day one may travel from Cape Town, by train and river steamers running in direct connection with the trains, to Stanleyville, on the north side of the Congo State – a distance of / 3,600 miles, of which 3,000 miles is railway – and to the mouth of the Congo River.

Meanwhile another transcontinental railway, traversing Africa from west to east, has been simultaneously coming into being. I refer, of course, to the Benguela Railway, which, with the co-operation of King Leopold of Belgium and of the Portuguese Government, I initiated some twenty years ago, and which, but for the interruption caused by the war, would have already been connected with the Cape to Cairo Railway. In about four years from now these railways will be connected. It will then be possible to cross Africa from Lobito Bay on the west coast to Beira or Mombasa on the east, or, at its junction with the Cape to Cairo line, to run southward to the Cape or northward towards Cairo.

Of the Cape to Cairo line there remain one or two small links to complete it and one big one. The small ones are along the Congo River, where steamers at present fill the gaps. The big link is the one between Stanleyville and El Obeid. This link will run over part of the Darfur Plateau and along the Nile Congo Divide.

It had long been my desire to arrange for the systematic investigation of the Sudanese side of this Divide in the hope that possible mineral discoveries would attract the Sudanese Railway southwards to complete this big link between the Cape and Cairo, and thus at last realize Rhodes’ dream. The opportunity at last presented itself, and during the past year an expedition under Major Christy has been at work exploring this least known of all the great African Divides. The expedition has now returned, bringing with it a vast amount of information, much of it of a most encouraging nature. There are plentiful indications of yet another heavily mineralized zone, and I am hopeful – I cannot say more at present – that the further investigations we are now undertaking may succeed in locating deposits sufficiently large and rich to justify the extension of the Sudanese Railway southwards to meet an extension of the Uganda Railway on the British side of the Divide and to link up with the northward extension now
being made from Stanleyville to the Kilo Gold-Mines on the Belgian side, and thus finally complete the railway between the two extremities of the Continent.

Those of us, therefore, who are alive ten or twelve years hence will probably witness the completion of the great trunk railway line from north to south, popularly spoken of as the Cape to Cairo Railway; and the other trunk line from Lobito Bay and Benguella on the west to Beira on the east, often termed the Benguella to Beira Railway, which, as I said, will be completed within about four years.

Now what does this portend for Africa, and not for Africa only, but for Asia, Europe, and all the world? I venture to say the completion of these railways will be followed by political and economic effects of a very far-reaching character. To begin with, on account of its extraordinary geographical situation, Africa is the pivot on which turn all our trade communications with the East and with Australasia, whether by land or sea or air. All these routes must pass along one or other of the coasts of Africa, or through Africa itself from north to south or west to east. The African Continent is, in fact, a world highway. Nature has made it so. Those are important facts, but they are small when compared with the political and economic influence upon the world of a civilized, educated, and industrialized Africa. And Africa is rapidly becoming civilized and industrialized. Less rapidly, but none the less certainly, Africa is being educated.

Livingstone said that African civilization would come through commerce and industry. This is proving to be the case. The African native is gradually being changed from a warrior to a worker. He no longer comes – as I remember he used to come – to seek work at the mines armed with assegais. He no longer has the fear of being attacked and of having to defend himself on his way to work.

My personal experience of the native of Africa has been, perhaps, as extensive as that of any man. I have had thousands of them in my employ in the various diamond, gold, and copper fields of southern and central Africa, and in the construction of the Cape to Cairo and Benguella to Beira railways. I have travelled long distances with them all over Africa, from Cairo to the Cape, and studied them at close quarters. I have discussed the future prospects of the natives with Rhodes and with some of the greatest administrators and missionaries in Africa, and have witnessed the splendid results achieved by those missionaries, especially in the teaching of useful trades, and I have been struck by the ability of the African native in acquiring those trades. One has only to study the remarkable work of the Tuskegee Institute in Alabama, founded by the late Booker Washington, a liberated slave, to learn what a high level of industrial skill the negro is capable of attaining.

The following quotation from a speech by Booker Washington at the opening of the Atlanta Exposition is most applicable to Africa. Speaking of his race, he said – and this shows a mind of high and lofty order:
‘In all things that are purely social we can be as separate as the fingers, yet one as the hand in all things essential to mutual progress

‘Nearly sixteen millions of hands will aid you in pulling the load upward, or they will pull against you the load downward. We shall constitute one-third and more of the ignorance and crime of the South, or one-third its ... intelligence and progress: we shall contribute one-third to the business and industrial prosperity of the South, or we shall prove a veritable body of death stagnating, depressing, retarding every effort to advance the body politic ... /

‘The wisest among my race understand that the agitation of questions of social equality is the extremest folly, and that progress in the enjoyment of all the privileges that will come to us must be the result of severe and constant struggle rather than of artificial forcing. No race that has anything to contribute to the markets of the world is long in any degree ostracized’,

These are the words of a liberated slave! Instead of the sixteen millions Booker Washington refers to as forming one-third of the Southern States of America, alter the words to 190 millions, and it will apply to Africa.

What then, I ask again, is to be the future of a civilized and industrialized Africa? Observe the progress already made. Sixty years ago Africa was practically an unknown Continent. Livingstone had just published the first of his journals, and was rousing the world to the horrors of the slave trade. Even in 1881, when I went to Africa as a young engineer, the slave trade was rampant in Central Africa, and cannibalism was rife up to very recently. The ‘red road to the West’ as Livingstone called it, along which we are building the Benguella Railway, was littered from end to end with bleaching skulls and bones, less than twenty-five years ago. To-day the slave trade in Central Africa is extinct. The coming of the railways has blotted out this atrocious traffic. In its place have come the civilizing influences of commerce and industry. The African has already been taught in hundreds of thousands to work instead of to fight. Thousands of them have been trained to the trade of carpenters, bricklayers, blacksmiths; others drive locomotives, work the telegraph instruments, and perform other skilled jobs. Many are entering the colleges and passing out as surveyors, architects, and medical men. In short, the African is rapidly becoming civilized. He prints and edits his own newspapers. He is beginning to realize that he is somebody and the native of a very great land called Africa. A national self-consciousness is developing as the result of the railway and other industrial developments. And all this in a short sixty years!

What about the next sixty years? Africa contains the last but also the greatest reserve of raw material for the future requirements of the whole world. It also contains a vast reservoir of the most magnificent labour. Anyone who has had any experience with the native of Africa must admit that he is magnificent human material. He has many good points and many bad. We want to develop the good and eliminate the bad. The African negro is, I affirm, naturally peace-
able, cheerful, almost always singing at his work, imitative, by no means devoid of ability, with the heart of a child, affectionate, with a keen sense of humour, and an unbounded respect for the white man of high character. The mere fact that for many years Livingstone went about scatheless, and that two of his servants voluntarily bore the body of their beloved master hundreds of miles to the coast, at great risk to their lives, to deliver it up to the white man, gives a clue to the character of the native of Africa.

These natives are a gigantic force to reckon with for good or evil. The wise or unwise handling of the millions of natives who people this continent must inevitably have a far-reaching influence on the whole world. Take, for example, the thousands of instances where the black man is capable of doing skilled work. Instead of the white man dictating to the black man what he shall be allowed to earn, as is now being done on the Rand, I would urge the white man to allow the black man to earn the full amount which his abilities and training enable him to earn. All that is possible should be done to secure the black man’s confidence in the white man’s sense of fair play and fair dealing. I foresee real danger in any other policy.

The highest status to which the black man may aspire must be limited only by his education and ability. In our future relations with the African, our aim should be to refrain as far as possible from accentuating the colour bar, but emphasize the vital importance of showing him that harmonious working between all classes and colours is the true secret of success.

Speaking for myself, I believe that the black man in Africa will, for a long time yet to come, be unequal in efficiency to the white man as a skilled workman, or in any position where he will be called upon to manage his fellow-natives. I believe he will long need the guidance of the white man in both his industrial and political development. Nevertheless he has begun to feel his feet, and to think politically.

In a few years, when the two great trunk railway lines to which I have alluded shall cut the continent longitudinally and transversely from sea to sea, Africa will come well within the range of the globe-trotting tourist, and the black man will be brought into still closer contact with the white, and will beyond doubt develop still further those political aspirations which are manifesting themselves even to-day. Already there is heard a demand for voting powers and for self-determination. ‘Africa for the African!’ is the cry. The catching phrase ‘Self-determination!’ launched during the war and offered as a panacea for most political ills, has winged its way into the recesses of Africa. Whether self-determination will always succeed remains to be seen. Self-determination carried to its logical conclusion means anarchy – each unit doing what seems right in its own eyes. As a working political principle it is only practicable if the minority in any unit area is self-disciplined enough to subordinate itself to the will of the
majority. And there seem to be races temperamentally unfit for so-called 'self-determination' by reason of their inability to abide by the principle of majority rule. We need not travel as far as Africa to witness this phenomenon. The demand for self-determination has, however, been created, has gone forth, and cannot be recalled.

What, then, should be our attitude to this coming claim for self-determination on the part of the African? I regard the position of the white man in Africa as that of a trustee for the welfare of the black. In fulfilment of this trust we must assist the African to work out his own salvation. This cannot be done rapidly, and it is doubtful whether it will follow Western democratic ideals. To be successful, democratic Government demands a high level of education, a high standard of political and municipal purity, and a greater degree of experience and self-discipline than the black man is likely to attain in many generations.

We must recognize, however, that self-government is the goal to which the more educated Africans aspire, and that it is no part of the white man's duty to repress that aspiration. That does not mean that we are to yield forthwith to any clamorous demands of a noisy minority of extremists, who are bent less on the welfare of their country than on obtaining an undesirable influence over the great uneducated masses of their countrymen, too ignorant to realize that they are merely dupes in the hands of ambitious, and often unscrupulous, agitators.

It is, unhappily, one of the defects of a democratic Government that it is so easily moved to hasty and ill-considered action by the clamorous demands of a handful of well-organized extremists. We have seen it over and over again in recent years in our own country and elsewhere. We may find the same thing occurring in Africa. Already Egypt, taught by ourselves what good government means, has now been granted the right to manage her own affairs. It remains to be seen whether this grant has been accorded as the result of a genuine demand by the whole Egyptian people, or as a concession to sectionary violence. The success or failure of this experiment will constitute a supremely valuable object-lesson in dealing with future claims for self-determination on the part of other, and perhaps less civilized, of the African peoples. We do not wish to see in Egypt any repetition of the dismal failures in self-government of Hayti, San Domingo, and Liberia. Hence the highest form of statesmanship at home will be demanded in dealing with the African during his growing political pains. We must prepare him for the difficult task of self-government by training him in the ways of law, order, and justice, of industry and commerce, gradually accustoming him to positions of responsibility, and creating in him a tradition of public service.

Our duty is to guide and not to hurry him along the road of self-development.

In the short space at my disposal I cannot do more than lay down these general principles. I feel greatly strengthened, however, in the views I have expressed by Sir Frederick Lugard's valuable treatise entitled, 'The Dual Mandate in
British Tropical Africa,' issued since you invited me to address you, and since I began to formulate my notes for that purpose. I would strongly urge everyone interested in Africa to study Sir Frederick Lugard's volume, in which, with ripe wisdom, and a wealth of knowledge gained by long experience as an administrator, the author works out in detail the problems, and indicates the lines on which the white man may co-operate with and assist the black in his upward path towards self-government.

I associate myself whole-heartedly with one piece of wise counsel given by Sir Frederick Lugard. 'Festina lente,' he says, 'is a motto which the Colonial Office will do well to remember in its dealings with Africa ... The danger of going too fast with native races is even more likely to lead to disappointment, if not to disaster, than the danger of not going fast enough. The pace can best be gauged by those who have intimate acquaintance alike with the strong points and the limitations of the native peoples and rulers with whom they have to deal.'

I endorse every word of this, and hope that the Home Authorities will definitely resolve to be guided in every decision by the opinion of the responsible white men on the spot – by those, in short, who are face to face and in daily contact with the problems to be solved.

In my personal opinion, a step that we should promptly take is towards a Federation of British Africa from the Cape to the Nile, with railway connection all the way, so as to be able to co-ordinate as far as possible one policy towards the black races, and establish some leading principles to guide us in meeting any demand by those under our tutelage for self-determination. As General Smuts said the other day, 'The white man in Africa is on his trial.' From so eminent and sagacious a statesman these words cannot go unheeded. For this reason, as well as for many others, I would gladly see a movement towards the Federation I suggest.

The world has need of Africa, and \textit{per contra} Africa has need of the world. She needs the world's markets; she also needs her own markets. The north will need the products of the south, and the south will need the products of the north.

To a steady development of her commerce and her industries we must look for the ultimate means by which she can, in Livingstone's words, 'be introduced into the body corporate of nations.' The great iron highways we are building are the arteries through which will pulse the new life to which Africa is rapidly awakening. They will be a great asset not only to Africa herself, but through the development of Africa to the whole world.

Sixty years ago the influence of Africa beyond her own borders was nil. What will her influence be at the end of the present century? It is conceivable that you may have a United States of Africa under \textit{one} flag or, possibly groups of States under different flags, united in general commercial policy, and protected by a Monroe doctrine. This is no wild dream.
I ask you therefore to project your vision into the not-too-distant future and think out for yourselves the nature of the political influence in the councils of the world of an Africa composed of Federated States, an Africa seamed with railroads, an Africa in which vast industries have been established, and in which both white and black men are co-operatively interested, an Africa upon whose resources and whose labour the whole world in large measure depends.

I ask you to consider all these possibilities – I might even say probabilities – in view of the boundless natural wealth of the Continent, in view of Africa’s geographical position athwart the highways to the Far East and to Australasia, and last, but not least, in view of her immense, prolific, and readily civilizable population. Having regard to all these elements of greatness, I ask you how otherwise are we to deal with the problems of African development than in the sense that I have indicated?

The Chairman: Sir Reginald Wingate, I am sorry to say, has been unable to be present to-day; but he had the advantage of seeing an advance copy of Mr. Williams’ lecture, and he sent some notes to Colonel Yate, the Honorary Secretary, who will now read them.

Lieut.- Colonel A.C. Yate then read extracts from the following notes sent by General Sir Reginald Wingate, G.C.B. 10

I much regret that I am prevented from leaving Scotland in order to attend the lecture of Mr. Robert Williams, of which I have seen an advance copy – and take a personal part in the discussion. I shall be grateful, therefore, if you would read out any extracts from the enclosed notes you think desirable in the circumstances. I recognize with the lecturer that as Africa received its first civilizing influences from Asia, so will future developments in Africa tend to bring these two great continents still more closely in touch with one another, especially when the great deserts and vast unknown spaces come to be bridged over for thousands of miles by that great iron road which is the theme of the lecturer, and I am sure all will have listened with absorbing interest to what he has to say.

From the material facts which Mr. Williams has placed before us, and from the large and wide views to which he has given such lucid expression, he has furnished us with food for thought in a variety of directions; but to me two points especially emerge:

Firstly, the modesty of the lecturer, who is so largely responsible for the wonderful transformation in the African continent during the last forty years.

Secondly, the vital importance of bringing home to the British / public, through such a lecture, the immense possibilities of Africa in the scheme of world development which Mr. Williams has so concisely summarized in its concluding paragraph.

[...]
An American journalist – Mr. Marcosson, who recently travelled in Central Africa – pays a tribute to Mr. Williams’ work which I cannot refrain from quoting. In his third letter to *The Times*, entitled ‘Wonders of the Congo’, he writes:

‘*British Enterprise.* – I entered the Congo at Sakania, which is on the border of Northern Rhodesia. It is the outpost of the Katanga, the most prosperous province of the colony. The Katanga is one huge mine, principally copper. The pioneer of Katanga exploitation was an Englishman, Robert Williams, the moving spirit in the construction of the Benguela Railway from Lobito Bay (Portuguese Angola) to the Katanga. Late in the nineties he sent George Grey, brother of Sir Edward, now Viscount, Grey, to the Katanga region on a prospecting expedition. There he discovered large deposits of copper, and also tin, lead, iron, coal, platinum, and diamonds. Williams organized the Tanganyika Concessions, which became the instigator of Congo copper-mining. Subsequently, the Union Minière du Haut Congo was formed by leading Belgian colonial capitalists, and the Tanganyika Concessions acquired more than 40 per cent. of its capital. The Union Minière took over all the concessions and discoveries of the British corporation. Within ten years it has grown from a small / prospecting outfit in the wilderness, 250 miles from a railway, to an industry employing at the time of my visit more than 1,000 white men and 15,000 blacks, with four completely equipped mines which produced nearly 30,000 tons of copper in 1917, and a smelter with an annual capacity of 40,000 tons of copper. A concentrator capable of handling 4,000 tons of ore per day is nearing completion’.

With regard to my second point, the importance of bringing home to our people the immense possibilities of Africa in the scheme of world development, it is no easy matter for me to add one word to the admirable record and the sound advice on this subject given by the lecturer, but what specially appeals to me – and I think it must appeal to all interested in empire development – is the immense future opened out by the completion of the Benguela Railway and the final linking up of the Congo railway system with that of the Sudan – thus forging the last link in the dream of that great empire-builder Cecil Rhodes and his able lieutenant Robert Williams, who has so faithfully carried out his promise to his dying chief to ‘carry his line forward’. As he truly says, if we are still alive ten or twelve years hence, we should see the completion of this vast project and the progress in African development which it implies.

Although the period covered by our lecturer extends to forty years back, I would ask you to retrace with me the salient points of the last twenty-five years only – for they are curiously interesting. Mr. Williams points out that the Katanga discoveries at the close of the last century formed another of those ‘milestones’ of mineral deposits whereby the Cape to Cairo Railway would be advanced. Situated on the watershed of the Zambesi and Congo, the Katanga province of the Southern Belgian Congo is the greatest mineralized copper-belt
known to the world. Slowly but surely the great iron spine advanced from the south, and though it took ten years to reach the Congo border, it arrived, in spite of every sort of difficulty and obstacle, financial and other. Simultaneously with this northward advance the Katanga copper-mines also caused Mr. Williams to initiate that other great transcontinental railway scheme from west to east – from Lobito Bay in Portuguese Angola – to connect up with the Cape to Cairo line at Katanga. It was clear that trade must follow the shortest route to the sea.*

The completion of the Benguella line will mean a saving of close on 3,000 miles of transport, and provided the financial difficulties, which are in a fair way of being solved, are finally overcome, it is expected the railway connection between the Atlantic Ocean and the Indian Ocean will be achieved within four years. This railway has been truly called the ‘master key’ of Africa, and I think the term must have been coined by the Germans, for it will be remembered how keenly anxious they were to secure the concession, and how bitterly annoyed they were to find that Robert Williams had forestalled them.

I believe it is now generally admitted that when the main trunk line from north to south is completed, the feeders east and west will follow; but, as we have seen, many of these feeders are already made, or approaching completion. The great gap between the two terminals of the trunk line, Stanleyville and El Obeid, is something like 1,750 miles out of a total of 4,500 miles.

Mr. Williams has made a most important proposal as to how this gap is to be bridged, and I think he is probably right in urging that the prime need is now to extend the railway from the northern terminal further south, though, in all probability, once the route is finally decided upon, work from the south northwards will advance as well.

It is a curious coincidence that with the great activity in pushing the railway northwards, consequent on the Katanga discoveries, a similar activity, but arising from entirely different causes, resulted in pushing the railway southwards into the Sudan almost at the same moment. This is neither the time nor the occasion to describe the development of the Sudan railway system; suffice it to say that within the last twenty-five years the following railway construction has been completed:–

* On this point Sir Frederick Lugard, in his last publication, ‘The Dual Mandate in British Tropical Africa,’ is insistent. At p. 464, footnote 1, he writes: ‘The Cape to Cairo Railway can only be justified in so far as each section has a definite objective which offers reasonable prospects of being remunerative. Railways in Africa must lead by the shortest route to the seaport, and not along its length.’ This statement must be modified by an opinion which I heard expressed by Sir Reginald Wingate a month before this lecture, and by Sir Edgar Bonham-Carter at the lecture – viz., that if grave danger threatened the British Empire in Egypt, or the Sudan, or the Suez Canal, or any where in that quarter, the Cape to Cairo Railway was a channel by which the Overseas Dominions could move forces to the aid of the mother-country. – A. C. Y.
The Wadi-Halfa-Khartoum line, with bridges over the Atbara and Blue Nile (579 miles).

The Khartoum-El Obeid line, with a bridge over the White Nile (428 miles).

The Atbara Junction-Port Sudan line, with a branch to Suakin (305 miles).

The Abu-Hamed-Kareima branch (145 miles).

Thus El Obeid is in direct railway communication (just over 900 miles) with an excellent and up-to-date port on the Red Sea.

Clearly this situation has long been thoroughly grasped by Mr. Williams, and, true to his instinct, he has sought Nature's help to guide him in his selection of the various routes between El Obeid on the north and Stanleyville on the south, where best the gap can be bridged over, and the final link forged of the great north to south chain.

He has sought, and I think he must have found, that missing 'milestone' in the Great Congo Nile Divide to which he refers. Is there not some connection between what he has told us regarding Major Christy’s expedition and the following telegram, which appeared in *The Times* of the 23rd instant, in a message dated Cairo, March 22?

‘An extensive mineralized area has been discovered by prospectors of the Congo-Nile Syndicate, which belongs to the Tanganyika Concessions Group. The discovery is described as of alluvial gold, which is said to have been traced in several rivers. What is believed to be the source of the gold has also been discovered in the form of an auriferous belt of rocks extending several miles. An old working carrying copper and gold has also been discovered, with evidence of an ancient copper-smelting industry in the vicinity’.

If this discovery prove to be the mineralized ‘milestone’ which, magnet-like, is to draw the railway there, then it is clearly somewhere on the great Congo-Nile Divide, and it will imply that – as Mr. Williams says in his lecture – ‘the unfinished link lies between Stanleyville and El Obeid, and that the line will run over part of the Darfur Plateau and along the Nile-Congo Divide’.

It is, of course, possible that subsidiary lines may connect Stanleyville with Rejaf, following the present motor-road connecting the important Belgian gold-mining area at Kilo with the Nile in that vicinity – thus turning the Rapids and Dufilé, and providing a trade route along the navigable Nile waterway to Khartoum, or to the nearest point on the Sudan railway system at Kosti. But should the recent mineral discoveries prove sufficiently large and rich to justify the extension of the Sudan Railway southwards, there is little doubt that the route to be followed will be as Mr. Williams describes; and clearly, through his prescience and indomitable perseverance, the wonderful dream of his great chief, Cecil Rhodes, is far nearer completion than any of us had contemplated.

If a quarter of a century has seen such progress in the once savage Sudan – where in that short space of time the revenue has risen from eight thousand
pounds in 1900 to five million pounds in 1920, and the trade to close on twelve million pounds – and if the British Government has such faith in its cotton-growing possibilities as to guarantee a loan of several million pounds for its development, shall we question the accuracy of Mr. Williams' forecast, that in the not remote future we may have an Africa composed of federated States, seamed with railroads, where vast industries have been established and upon whose resources and labour the whole world may in a large measure depend?

How is this great result being achieved? Surely it is in the main due to that great iron spine which is now nearing completion, with its many arteries and vertebrae already stretching east and west to the two oceans washing the shores of Africa. This marvellous achievement is represented by the Cape-Zambesi express, the Rhodesia-Katanga extension, the Congo-Nile steamer, rail, and motor routes, the Sudan / steamer and railway services, the connection of Stanleyville with El Obeid – in all, a distance of nearly 7,000 miles. Then, forming a sort of cross with the north and south routes, the great transcontinental east to west connection is extending from Lobito Bay to Beira, with eventual through connections via Tanganyika to Dar es Salaam and with the Uganda Railway to Mombasa.

All honour, then, to the great men who have spent their lives and their energies – some, alas! have not lived to participate in the success of their undertakings – and all honour especially to Robert Williams, who, practically single-handed, has built up an organization for the development and transportation to the markets of the world of the rich treasures his vivid imagination has discovered for us in those great mineralized 'milestones' which mark the various stages in the progress of African railways.

The Chairman: I believe Sir Frederick Lugard is present this evening. We should be very grateful if he would favour us with any observations. (Applause.)

Right Hon. Sir Frederick Lugard, P.C., G.C.M.G.: My Lord, Ladies and Gentlemen, — [...]

We recognize to-day how important and essential a part railways play in the rapid material development of a country like Africa, whose exports consist solely of foodstuffs and raw materials, but perhaps their civilizing and educational value has hardly been equally appreciated. Mr. Williams has told us how at first the labourers employed in construction works come with their bows and arrows and spears, and how before long these are discarded. Wild, primitive savages learn to value the regular pay, which enables them to purchase in the camp market the little luxuries of cloth, tobacco, and meat. Volunteers come forward more eagerly, soon they learn to appreciate piecework, and gradually become more skilled. The railway workshop is the most potent institution in Africa for the spread of technical education, and the railway in its various departments offers hundreds, and even thousands, of openings to the youth of the Government
and Mission / schools as clerks, signallers, telegraphists, guards, stationmasters, storekeepers and accountants, etc.

Though I cannot rival Mr. Williams’ forty-one years of African work, my own experience of Africa is sufficiently long and varied to justify me in expressing a hearty concurrence in all that he has said regarding the character of the negro tribes and the incalculable importance of securing their confidence in the justice and fair play of Europeans. I endorse most heartily his view both of the ability of the African and of the limitations which for many a generation preclude the possibility of his being able to stand alone in industrial and political development. The striking quotation which Mr. Williams made from the writings of Booker Washington seems to echo and confirm the views I recently expressed concerning the Colour Question in the Edinburgh, and since the President of the United States did me the honour to quote them and to assert that they presented the true solution of the problem, I may ask your indulgence if I repeat them: ‘Here, then, is the true conception of the inter-relation of colour: complete uniformity in ideals, absolute equality in the paths of knowledge and culture, equal opportunity for those who strive, equal admiration for those who achieve; in matters social and racial a separate path, each pursuing his own inherited traditions, preserving his own race purity and race pride; equality in things spiritual, agreed divergence in the physical and material’. This, too, as I gather from his lecture, is the view held by Mr. Williams. I would, however, like to alter one word in his description of the new spirit which is beginning to show itself among the natives of Africa. It is, I think, rather a racial than a national self-consciousness, and its exponents advocate the prerogatives of race rather than those of tribal affinities.

Mr. Williams has not told us quite as much as I, at any rate, should have liked to hear about the more recent progress and the programme for the immediate future of the Cape to Cairo and the Benguella-Beira railways. I must confess that the latter interests me more than the former, for its object is to open up a fertile plateau abounding in vegetable products, to tap the wonderful mineral deposits of the Katanga district, and to provide a means of conveying them to the nearest seaport by the shortest and cheapest means. Of this great railway Mr. Williams was the originator and constructor. The story of its inception and the difficulties encountered by international rivalries is one of extraordinary interest. In the far future, when Africa becomes civilized and industrialized, internal railways as in Europe will, no doubt, become important and remunerative means of transport, conveying the products and manufactures of one region to another. Or, again, if another Great War should break out (which God forbid), it is impossible to forecast the rôle which railways in Africa, especially those which cross the continent from west to east, / may play; but to-day the great need of Africa is for railways leading from the centre to the seaports, and she has little need of a longitudinal north to south railway. Mr. Williams forecasts an extension of
Communications in Africa, 1880–1939: Volume 4

the Sudanese railways southwards from El Obeid to connect with the line from Stanleyville. It is possible that from the same point a line may some day extend to the Nigerian system at Lake Chad, and, as the ‘Niger to the Nile’, may add one more to the alliterations (Cape to Cairo and Benguela to Beira) which seem to exercise a fascination for the financier.

Sir Edgar Bonham-Carter, K.C.M.G. 11: [...] Dealing with the question of the railway, I have only a few remarks to make. Of course, to those of us who have lived and worked in the Sudan, it is a matter of the very greatest interest. The first object of those who were responsible for railway policy in the Sudan was to provide railway communication between the interior and the Red Sea, this being the shortest and cheapest route for the export and import of goods. This was accomplished by the opening in 1905 of the railway connecting the Halfa-Khartoum Railway with Port Sudan and Suakin. Subsequently the extension of the railway from Khartoum southwards was begun, and, as Mr. Williams stated, in 1912 Lord Kitchener opened the Khartoum-El Obeid Railway. El Obeid is distant about 430 miles from Khartoum by railway, about 1,000 miles by railway from Wadi-Halfa, and about 2,000 miles by railway and river from Alexandria. I need hardly mention that there is not yet complete through railway communication between Egypt and the Sudan: for there is still a break in the railway of about 200 miles between Wadi-Halfa and Aswan, along which one has to travel by river-steamer.

It is not without interest that the White Nile is navigable by river-steamer for a thousand miles south of Khartoum as far as Gondokoro. At one time it seemed likely that, as a preliminary stage in the construction of the Cape to Cairo Railway, the railway would be carried from the south as far as Gondokoro, or to some other point on the upper White Nile, where it would for the time being stop, and transport between that point and Khartoum would be carried on by river steamer. It is interesting, therefore, to hear from Mr. Williams that it is now proposed that the Cape to Cairo Railway shall join the existing Sudan railway system at El Obeid, and that only about 1,700 miles remain to be completed. The amount remaining to be completed is, therefore, a small amount compared with what has already been built.

I will conclude my remarks with a few observations on the utility of the Cape to Cairo Railway, considered from the point of view of the Sudan. In the first place, it is obvious that, strategically, the railway will be of the very greatest importance. In the case of any disturbance in, or foreign aggression to, any British territory through which it passes, it will enable troops to be brought rapidly and easily from South Africa and the other territories which it traverses to the point in danger. Secondly, the railway will be of the highest value in facilitating the internal administration of the Sudan. There are places in the southern parts
of the Sudan to reach which from Khartoum at present necessitates a journey of from a month to six weeks. The railway will enable the same journey to places through which it passes to be completed in not many more hours than the number of days now required. Thirdly, as regards the commercial point of view, I believe that it will be found that there is no great physical difficulty in the making of the railway when it gets into Sudan territory. It will, therefore, be cheaply constructed, and experience in the Sudan has been that, where you can make a railway cheaply, it is extraordinary how soon it will pay its way, even though the population through which it passes may be uncivilized and scanty. In this connection, it is relevant to point out that hitherto the Sudan has been developed, one may say, in a topsy-turvy way. For the northern part of the Sudan, which, because it is closer to the means of communication, has been developed first, is the more desert part. While in the north the Sudan is almost rainless, and vegetation is, generally speaking, confined to a narrow strip along the Nile, the rain increases as one travels south, until on the southern border there is an average rainfall of 40 inches a year, and the whole country is under vegetation. The completion of the Cape to Cairo Railway through Sudan territory will enable the development of the southern portions of the Sudan, which, from a commercial point of view, have hitherto been neglected, to be gradually taken in hand.

Mr. Chairman, I will conclude by again thanking Mr. Williams for his extremely interesting lecture. (Applause.)

Sir Lee Stack\textsuperscript{12} (Governor-General of the Sudan): Mr. Chairman, Ladies and Gentlemen, – I have only landed from the Sudan in the last few days, and came here to listen, not to speak, but I would like to say how much I appreciate the opportunity of hearing Mr. Williams’ lecture, in which he has developed his theory and practice of the route from the Cape to Cairo, and the transverse route from Benguella to Beira. It is interesting to me, because one of the big links, or the big link, is through the Sudan. The Sudan is as yet a poorish country, and we have not been able to develop our communications as fast as we would like to have done; but if the indications of mineral wealth which Mr. Williams has told you about in the Southern Sudan materialize, then the inducement for a railway south-westward from El Obeid is a very great one, and a further stage in bridging that / gap will no doubt be feasible. I also would like to associate myself with Mr. Williams’ sentiment as regards the trusteeship the white man holds towards the black man in Africa. If we develop our possessions in the interests of the native, and not by exploiting him in the interests of ourselves, then I am sure our administration will be successful. You have heard a good deal about the Sudan from Sir Reginald Wingate and Sir Edgar Bonham – Carter, so I will not say anything more about it; but I should like to thank Mr. Robert Williams for his lecture and express the great interest it has been to me.
Mr. Donald Mellor, F.R.G.S.: Mr. Chairman, – I must say I thank Mr. Williams for the lecture. I know what a splendid help he was to the late Cecil Rhodes, and I only hope that the railway will be constructed directly as shown according to the map on the wall. If so, I think it will be a splendid monument to Mr. Williams’ courage, determination, and tact. From what I have read, I know that he has had unforeseen difficulties to face, and that no man who had not got what I may call a bulldog determination to carry on the work that Cecil Rhodes inaugurated could possibly have achieved the work that he has done up to the present time. When Colonel Lugard spoke, he expressed the wish that Mr. Williams might have mentioned more about the railway line. I should have liked to hear more also, because I believe, as regards the Benguella Railway, there have been a great many difficulties. Respecting the pushing forward of this line to the border and its continuation, it all depends upon the Belgian extension from their border to the Katanga district through Lulua. The success of the Benguella line depends on that. If this extension is not made the rest of the railway is no good for the chief purpose for which it has been built. I understand that there are several other schemes that have been broached lately for a line in the Belgian Congo across country for about 900 kilometres, which apparently is an offset against the Benguella line. As regards the line from Stanleyville, as laid down on the map, there have been several schemes for lines from this place in the direction of Lake Albert. I understand that one (the southern route) has been practically dropped, and that another scheme taking a more northerly route, making connection with the Nile (north of Lake Albert), which one of the last speakers mentioned, will replace it. Mr. Williams did not say anything about this; I hope he will not mind my mentioning it. I have worked out an itinerary from Stanleyville to Capetown. It is possible to travel from Stanleyville in accordance with a properly printed timetable to Capetown in twenty-six days, and from Capetown to Stanleyville in about twenty days, because one saves time when going down the river. I greatly appreciate Mr. Williams’ lecture, and I should like to thank him for it. (Applause.) / [...]

**COLONIAL RAILWAYS 1929–1938:**
**AN ECONOMIC REVIEW**

**BY**

JOHN WYATT SPILLER,¹ C.M.G., M. Inst. C.E.

Railway Working Results, 1929–1938.

Nigerian Railway.

The revenue statistics of the Nigerian railway for the 10-year period 1929–1938 are given in Table VII. For purposes of comparison, indexes of the sterling value of world trade and of the foreign trade (imports plus domestic exports) of Nigeria are included.

Table VII.

There was a 9-per-cent. extension of mileage of open lines during the decade, and this should have produced some additional revenue quite apart from changes in industrial conditions. The indexes show that at the bottom of the world slump Nigeria’s foreign trade fell to lower levels proportionately than world trade, but subsequently recovered to a greater extent, the 1937 figure for Nigeria being 10 per cent. above whilst world trade was still 23 per cent, below the 1929 level. Between the middle of 1937 and the middle of 1938 there was a recession in world trade, and Nigeria appears to have suffered from this recession to a remarkable extent, as the value of foreign trade in 1938 was but little more than half its value in 1937. It is difficult to explain, so great a reduction in so short a period, but it would certainly appear that Nigeria’s prosperity is particularly vulnerable to external influence.

During the slump railway revenue did not fall to quite such relatively low levels as foreign trade, and by 1937 goods, gross, and net receipts were all higher

* Before providing for renewals.

– 332 –
than in 1929. Coaching receipts did not show a similar recovery, but the reason for this will be discussed later. If 1937 be compared with 1929, it will be seen that Nigeria’s foreign trade increased by 10 per cent., the railway mileage by 9 per cent., and the gross railway receipts by 5 per cent. Doubtless the development of alternative forms of transport affected railway receipts to some extent, but a more important reason why the railway did not benefit more from increased trade was the reduction in rates. It should be noted that coaching receipts are small in comparison with goods receipts; in 1937 they amounted to only 11½ per cent. of the gross receipts.

In the early years of the depression the net revenue fell more rapidly than the gross revenue; this is the common experience of all railways, as a time-lag usually occurs between a reduction of traffic and a corresponding reduction in working expenses. Moreover some part of railway expenditure is not affected by the volume of traffic.

In Table VIII the goods traffic on the railway has been separated into export, import and internal traffic. The export and import figures are the tonnages dealt with at the ocean ports, and the internal traffic has been calculated by subtracting the export and import tonnages from the total paying tonnage. The figures are exclusive of coal.

Whilst during the depression import traffic fell to one-third, and internal traffic to two-thirds, of the tonnages in 1929, export tonnage suffered no similar reduction, and in fact the volume increased in 1932 and the later years of the decade. Export and import traffics were completely out of balance with respect to volume, but there was no similar disparity between their values. The increase in the export tonnage was mainly due to the marketing of greater quantities of ground nuts, a commodity of low value. Further, the serious decline in the price-level of tropical commodities during the slump reduced the export values, even though the volume was maintained. It was the fall in commodity prices which
was responsible for the reduction in imports and, by reducing the wealth of the country and the amount of money in circulation, caused a diminution of internal trade and traffic.

*Passenger Traffic.* – In Table IX the passenger statistics for 1937 are compared with those for 1929.

-91  -14  +42  -37

Although during the 10-year period coaching receipts never recovered to the 1929 level, this was entirely due to the reduction in fares. Comparing the two peak years 1929 and 1937, the number of first-class passengers was nearly 50 per cent. lower, and the number of third-class passengers nearly 100 per cent. higher in the latter year. The numbers of second-class passengers were approximately equal in the two years. Of the passengers using the railway 99 per cent. travel third class, and the reduction in coaching receipts was due mainly to a reduction in the third-class fare from ½d. to ¼d. per mile. The cheaper fare enabled the railway to retain its passenger traffic in competition with road motors, but did not increase its revenue.

*Goods Traffic.* – In Table X the goods statistics for 1937 are compared with those for 1929.

Percentage-change, 1929 to 1937  
-5  +8  +35  +28  -16

During the years of depression goods receipts never fell below 70 per cent. of the 1929 level, whereas the value of Nigeria’s foreign trade fell to less than half of its value in 1929. Goods traffic is mainly dependent upon foreign trade, and the
The difference between the indexes for foreign trade and goods receipts is due to the fact that, although goods rates may have been reduced, commodity prices fell to a greater extent, with a corresponding reduction in values.

The tonnages of some of the more important commodities carried by rail during the 10 years are shown in Table XI. During the depression coal and cotton fell to less than one-half and tin-concentrates to one-third of the 1929 level, but the other commodities included in the Table did not fall to anything like the same extent. This is in accordance with general experience, as in most countries foodstuffs are affected less than raw materials by changes in industrial activity; they rise less during booms and fall less during slumps. Ground nuts and Kola nuts increased to a remarkable extent during the decade, and even in the worst years of depression; 1932, 1933, and 1934 exceeded the tonnages carried in 1929. Between 1929 and 1937 the world production of ground nuts increased by 42 per cent; but as, in the latter year, the railway transported 64 per cent. more than in 1929, it would appear that production in Nigeria increased considerably more than the world average.

Ground nuts are such an important factor in the railway economy that they deserve more than passing attention. As they are planted yearly by native farmers, production is capable of rapid expansion when the price is attractive. The length of haul to the coast is, however, considerable, and when world prices are low the cost of inland and ocean transport leaves little margin for profit to producers. In the two crop seasons 1936–1937 and 1937–1938 the price at Kano varied between limits of £9 and £3 per ton, and so great a difference must have proved a disturbing element to the growers. The tonnages conveyed in recent years, and the railway revenue therefrom, were as follows:—

</tbody>
</table>
The average cost of rail transport to the coast was about £3 17s. per ton, and the ocean freight charge to Europe was probably not less than £1 7s. per ton. Further transport costs for bagging, loading and discharging, etc., would amount to at least 7s. per ton, so that the total cost of transport from loading-station to a British port would not be less than £5 10s. per ton. In addition, the farmer has to deliver to the railway, and expenses for marketing, middleman's profits, etc., have to be paid. Altogether the total cost of marketing – as distinct from growing – is likely to average £6 10s. a ton, and the difference between this figure and the world market price is what the grower receives. The cost of marketing and transport varies between narrow limits only, but the world market price, which is governed largely by the law of supply and demand, varies widely, and the producer may or may not receive a price that is profitable. The percentages of gross goods receipts attributable to ground-nut traffic during recent years were as follows:—

<table>
<thead>
<tr>
<th>Year</th>
<th>Percentage</th>
</tr>
</thead>
<tbody>
<tr>
<td>1934</td>
<td>50</td>
</tr>
<tr>

</tr>
<tr>
<td>1937</td>
<td>42</td>
</tr>
<tr>
<td>1938</td>
<td>39</td>
</tr>
</tbody>
</table>

These figures indicate the extent to which the railway is dependent upon a single commodity, and it is probably true to state that the price of ground-nuts is the largest single factor affecting the prosperity of the railway.

The principal operating results for the two peak years are tabulated below:—

</tbody>
</table>

Although the work done by the railway in 1937, due to a 91-per-cent. increase in the number of passengers and a 28-per-cent. increase in goods ton-miles, was so much greater than in 1929, railway receipts – in consequence of reduced fares and rates – advanced by only 5 per cent., whilst working expenditure was actually lower.

The year 1937 was the most prosperous in the railway’s history, in spite of a considerable reduction in passenger fares and goods rates since the previous best year (1929); but there had been a number of lean years between, and not until 1936 had railway receipts showed any marked recovery from the slump. In 1937 gross receipts were sufficient to cover working expenses and interest on
capital expenditure, to contribute £427,547 to the renewals fund, and to leave a
net surplus of £231,286 available for reserve.

In order to cover interest charges on capital and enable an adequate contribu-
tion to be made to the renewals fund, about £1,200,000 is needed yearly from
the net receipts, that is, about 90 per cent. of the net receipts in 1929. Table VII
shows that in the 10 years 1929 to 1938 the net receipts averaged only about 75
per cent. of their 1928 value. The average shortage was 15 per cent., or a total
of about £1,800,000 over the 10-year period, which, however, included several
years of exceptionally depressed conditions in world trade and industry which it
may be reasonable to hope may not occur again.

Gold Coast Railway.
The working results of the Gold Coast railway for the 10-year period 1929–
1938 are shown in Table XII.

During part of 1937 the native farmers refused to market their cocoa, as they
considered that the price offered was not adequate. Consequently, there was a
hold-up of cocoa traffic, and it is estimated that 106,000 tons of cocoa which,
in normal circumstances, would have been transported to the coast during the
1937 financial year, was not put on rail until 1938. The value of this traffic was
probably not less than £250,000, and but for the temporary hold-up the goods
receipts for 1937 would have been increased and those for 1938 reduced by this
amount. Moreover, railway receipts were affected in other ways by the cocoa hold-
up, as general trading practically ceased in the areas concerned, and this caused a
reduction in passenger travel and in the movement of imported commodities. It
is not easy to assess the modification necessary to enable the railway revenues of
1937 and 1938 to be adjusted to cover the effects of the hold-up, but it is clear
that without adjustment neither year’s figures are suitable for comparison with
those for 1929, in determining the extent of the recovery from the depression of
the intervening years. In spite of the cocoa hold-up, a record tonnage was handled
by the railway in 1937, and in normal circumstances this would have been a peak
year with respect to gross and net receipts; but the record tonnage was due partly
to a record manganese traffic, which brings in less revenue per ton than cocoa. In
view of the difficulty of estimating the effect of the cocoa hold-up on the 1937 and
1938 results, it is probably best, when making comparisons with 1929, to use the
average of the 1937 and 1938 figures; this average is shown in Table XII.

Table XII shows that the value of foreign trade in the Gold Coast fell to
a greater extent than world trade, but recovered more quickly, and in 1937
exceeded the 1929 value by 15 per cent. As in Nigeria, however, there was a con-
siderable recession in 1938. Coaching receipts were / affected more than goods
receipts during the slump, and with no extension of mileage both gross and net
revenues at the end of the decade showed no improvement over the 1929 lev-
els; but this was due mainly to the reductions in rates and fares, although road
transport had doubtless taken profitable traffic from the railway. The net revenue remained considerably below the 1929 level throughout the greater part of the decade, and although railway revenue appears to have recovered from the slump at an earlier date in the Gold Coast than in Nigeria, it failed to show any real improvement over the 1929 figures.

Although the number of passengers increased by 81 per cent., and the passenger-miles by 72 per cent., the passenger receipts were 24 per cent. lower at the end of the decade, owing to a reduction of 57 per cent. in the average fare. Doubtless the railway was forced to make fare reductions to meet the competition of road transport, but the extent to which users of the railway have benefited from cheaper travel should not be overlooked. There is little doubt that railway receipts have suffered more from the reduction of fares on the traffic retained than from the absolute loss of traffic to road transport. Experience in Nigeria and the Gold Coast – and also in other colonies – shows that colonial railways can retain a large proportion of their passenger traffic if fares are reduced to a sufficiently low level – but without financial gain.

| Difference between 1929 and average of 1937 and 1938 | -2                    | -7              | +17                           | +14                       | -18 /                     

Although at the end of the decade the net goods ton-miles were 14 per cent. more than in 1929, the paying tonnage handled was 2 per cent. less. This was doubtless due to the loss of short-distance traffic to the roads. The increase in net ton-miles was more than balanced by reductions in rates, and goods receipts at the end of the decade were 7 per cent. lower than in 1929. Although the gross receipts did not recover to the 1929 level, the working expenditure was reduced, and in 1936 and 1938 the net receipts exceeded those of 1929. At the end of the decade more traffic was being handled, at lower cost, but the financial results did not show the same improvement as in Nigeria. Moreover, the average rate charged was double that on the Nigerian railway.

The tonnages of the most important commodities carried by rail during the 10 years are shown in Table XV. Coal, wines and spirits, timber, and manganese ore suffered most from the world slump, whilst cocoa varied to only a small extent; but the tonnage at the end of the decade was no larger than at the beginning, whilst, owing to development in the gold mining industry, machinery showed a considerable increase. During the latter years the volume of wines and spirits was less than half that of 1929, reflecting the vulnerability of this class of traffic to the competition of road transport. Cocoa varied only slightly in volume from year to year, whilst timber for export and manganese ore suffered to the full extent from the decline in world industry during the earlier years of the decade; but these products recovered more rapidly, and in 1937 record tonnages were attained. During the 1938 recession in world trade, however, the demand for timber and manganese ore was reduced to such an extent that the tonnages railed to the coast were less than half the 1937 figures.

In 5 of the 10 years included in Table XV more than half of the total tonnage dealt with by the railway consisted of manganese ore. The Gold Coast railway is one of the few colonial railways that has important mineral traffic: the principal demand for the mineral is for the manufacture of steel, and very little is used for other purposes. About 2 tons of manganese ore is required for 100 tons of steel,
and the world consumption of manganese ore will vary directly with the world production of steel. A considerable part of the ore mined in the Gold Coast is shipped to America, and the following figures of steel-ingot production in the United States in 1937, 1938, and 1939 will explain to a large extent why manganese ore traffic on the Gold Coast railway in 1938 was only half the volume in 1937:–

</tbody>
</table>

The railway is largely dependent upon cocoa and manganese ore for its goods receipts, as is evident from the following figures:–

<table>
<thead>
<tr>
<th>Year</th>
<th>Revenue from cocoa (£)</th>
<th>Revenue from manganese ore (£)</th>
<th>Total goods revenue (£)</th>
</tr>
</thead>
<tbody>
<tr>
<td>1936</td>
<td>£341,646</td>
<td>£143,784</td>
<td>£856,897</td>
</tr>
<tr>
<td>1937</td>
<td>£82,447</td>
<td>£183,999</td>
<td>£665,718</td>
</tr>
<tr>
<td>1938</td>
<td>£505,638</td>
<td>£100,554</td>
<td>£942,709</td>
</tr>
</tbody>
</table>

Of these two commodities, which account for something like 55 per cent. of the total goods receipts, cocoa, the more remunerative traffic, is a food the consumption of which is unlikely to vary widely from year to year, but manganese ore is a raw material, and its consumption will vary with steel production, which is often regarded as a yardstick of industrial activity. Moreover, a reduction in demand for the ore is likely to precede a reduction in steel production, as steel-makers will operate on their stocks as soon as there is a diminution in new orders. For this reason it is difficult to foresee a change in the demand.
The principal operating results at the beginning and end of the decade were as follows:

<table>
<thead>
<tr>

</tr>
</tbody>
</table>

Financially the results for 1937 and 1938 were not so satisfactory as for 1929, but more work was done at lower cost, and the reduced receipts were the consequence of cheaper rates and fares.

In 1938 it was necessary to meet the following charges from net receipts:

- Interest and loan charges £349,217
- Sinking-fund contributions £54,448
- Renewals-funds contributions £140,671
- Total £544,336

The average net receipts over the two years 1937 and 1938 were £557,734, and the railway was able, therefore, to meet all charges from its revenue. In considering the financial results of a railway's operations, it does not appear necessary to debit the net receipts with sinking fund charges when an adequate sum is set aside yearly to cover the renewal of wasting assets. By means of the renewals fund the railway and its equipment can be adequately maintained without further capital expenditure, and this is all that a commercially-owned railway attempts to do, as no part of the revenue is set aside for the redemption of capital. It is true that the loans raised for the construction of the railway have eventually to be redeemed, but it can be assumed that the Government will be able to raise further loans, if necessary, as they did when the railway was constructed. If the principle is accepted that the railway is financially sound, provided that its net receipts are sufficient to cover interest charges and renewals contributions, the sum of £490,000 is required annually for this purpose. During the 10 years 1929 to 1938 the net receipts averaged £478,105 yearly, or nearly sufficient to meet the railway’s financial obligations, even though the period included several years of acute world industrial depression.

Funds for the construction and equipment of the railway were provided partly by interest-bearing loans and partly by sums advanced by the Colonial Government from surplus revenue, which are free of interest. Expenditure on capital account reached a maximum in 1937, when it amounted to £9,374,991; but in 1938 capital expenditure was written down by £773,525 by a charge against
the depreciation account, and in the Administration report for 1938–1939 the total capital expenditure is shown as £8,686,238, of which £6,776,699 is represented by interest-bearing loans. In 1928 interest-bearing loans amounted to £8,510,986, with annual charges for interest and sinking fund of £493,443, but loan indebtedness has since been reduced by redemption to £6,776,699, with annual charges of £403,655. There has thus been a reduction in loan indebtedness of £1,734,197, and of annual charges of £89,788, since 1928, with the result that the financial position of the railway has been considerably strengthened. Further, there was a balance of £651,901 in the sinking fund account for the amortization of outstanding loans, leaving little more than £6,000,000 to be provided in the future for the repayment of interest-bearing loans.

Kenya and Uganda Railways.

Indexes showing the revenue earned during the 10-year period 1929–1938 are given in Table XVI.

Railway extensions were in progress at the beginning of the decade, and by 1931 a total of 200 miles had been added to open lines. The foreign trade of Kenya and Uganda did not suffer during the world depression to quite the same extent as did world trade, whilst it recovered more rapidly, and in 1937 was 13 per cent. above the 1929 level; but as in other colonies, there was a recession in 1938.

Owing perhaps to the additional mileage, the goods, gross, and net receipts did not reach quite such low levels during the slump as did those of other Colonial railways, and in 1937 goods receipts were 19 per cent. above and net receipts 45 per cent. above the values in 1929. On the other hand, coaching receipts failed to recover, and in 1937 were still one-third below the 1929 level. They are, however, small in comparison with goods receipts, and in 1937 and 1938 amounted to only 8½ per cent. of the gross receipts.

Passenger Traffic. – In Table XVII the number of passengers and the passenger receipts in 1938, which were slightly higher than in 1937, are compared with 1929. The numbers of passenger-miles in the 2 years are not available, but, owing to the increase in mileage, it is probable that the average length of journey in 1938 was greater than in 1929.

<table>
<thead>

</tr>
</tbody>
</table>

The number of passengers is small in comparison with the mileage of the railway because so much of the territory served is sparsely populated. Fares have been reduced in recent years, and the third-class fare is now a little less than ½ d. per mile.

Goods Traffic. – In Table XVIII the goods statistics for 1938 are compared with those for 1929. Goods receipts were slightly higher in 1937, but the tonnage transported in 1938 was greater.

<table>
<thead>
<tr>

</tr>
</tbody>
</table>

It will be seen that as a result of the longer haul a 10-per-cent. larger tonnage produced a 23-per-cent. increase in receipts, in spite of lower rates; the average rate charged per ton-mile was reduced by 25 per cent. during the 10-year period. Goods receipts were maintained at a higher level relative to other Colonial railways during the years of depression, but it must not be overlooked that 200 miles of new lines were brought into operation during 1930 and 1931. The 66-per-cent. increase in net ton-mileage demonstrates the increased importance of the railway as a medium of transport.

The tonnages of some of the more important commodities carried by rail during the 10 years are shown in Table XIX. Maize and wheat suffered the greatest reduction during the slump, their tonnages being reduced to about one-third of the 1929 figures. Although these cereals are carried at the lowest rates, the long rail haul to the coast prevents profitable marketing abroad when world prices are low. With the exception of maize, wheat, and soda-ash, the tonnages of all the other commodities included in the Table increased considerably during the
latter years of the decade; the tonnages of cotton, cotton-seed, and coffee railed to the coast in 1938 were the highest on record. The total tonnage of goods carried for the public was only 10 per cent. higher in 1938 than in 1929, whilst the domestically-produced commodities included in Table XIX increased by 39 per cent.; the difference in these two percentages was doubtless largely due to the loss of other traffic to road transport.

The highest class rate (class 3) is 6d. per ton-mile, and three other classes, Nos. 4, 5, and 6, exceed 3d. per ton-mile. The total tonnage carried under these rates in 1938 was 93,279. The lower rates include classes Nos. 7, 8, 9, and 10, exceptional rates, and export rates. Class 10 rate is 1.2d. per ton-mile; 165,129 tons of goods were carried at this rate in 1938, whilst 168,125 tons were carried at exceptional rates and 439,488 tons at export rates. Rates are tapered, but in 1938 large tonnages were moved under exceptional rates at ¾d. per ton-mile, and under export rates at little more than ¼d. per ton-mile. Of a total public tonnage of 1,050,881 tons, 93,279 tons were moved at rates exceeding 3d. per ton-mile, 349,989 tons at rates between l.2d and 3d. per ton-mile, and 607,613 tons at the lowest two rates. /

</tbody>
</table>
The number of passengers in 1938 was lower than in 1929; but passenger traffic amounts to only 8½ per cent. of the railway revenue, and the very large increase in public goods ton-mileage was met without any addition to working expenditure.

In 1938 interest-charges on railway loans amounted to £542,119, and £347,560 was contributed to the railway renewals fund. If, therefore, sinking-fund charges are not brought into account, and it is agreed that the railway is financially sound provided that its net receipts are sufficient to cover interest charges and renewals, £889,679 is required annually in addition to working expenses. During the 10 years 1929 to 1938 the average net annual receipts were £1,090,343, or more than sufficient to meet the railway’s financial obligations.

By the end of 1938 capital expenditure reached the sum of £22,340,321, but interest was payable on only £14,035,321 of this amount, the remainder having been obtained from parliamentary grants and other sources. Since 1929 the interest-bearing debt has increased by £1,278,120, and interest charges by £56,250 per annum, but 200 miles of new track has been opened for traffic during the period.

**Tanganyika Railway.**

Indexes showing the revenue earned by the Tanganyika railways during the 10-year period 1929 to 1938 are tabulated in Table XX. There was an addition to open lines during the decade consequent upon the completion of the Kinyanggiri branch.

Tanganyika’s foreign trade fell during the worst period of the world depression to half its value in 1929, and this could not fail to affect railway revenue. Coaching receipts suffered more than goods receipts and – as in other colonies – never recovered to the 1929 level. During the worst 3 years of the depression goods receipts amounted to only about two-thirds of their value in 1929, but recovered subsequently, and in 1937 exceeded the 1929 level. Goods receipts did not, however, increase after the slump to the same extent as foreign trade. The net receipts varied widely during the 10-year period; but the volume of traffic is small in comparison with the length of line, and the railway is physically capable of dealing with a denser traffic. Consequently a moderate increase in traffic can be met without appreciable increase in working expenses, and net receipts increase faster proportionately than gross receipts.

Percentage change, 1929 to 1938:

-7 -19 -2 -9 -10

Although passenger traffic was less in 1938 than in 1929, there has been a large measure of recovery from the worst years of the depression, when passenger traffic dropped to little more than half the volume in 1929. The number of passengers is small considering the mileage of the railway, but in 1938 coaching receipts amounted to 20 per cent. of the gross railway receipts.

**Goods Traffic.** – The two peak years for goods traffic during the decade / were 1930 and 1937. The paying goods tonnage and receipts for these 2 years are shown below; the goods ton-mileage figures for 1930 are not available.

<table>

the peak year at the beginning of the decade, and there has been no increase in
the volume of work done such as has occurred in Nigeria, in the Gold Coast
Colony, and in Kenya and Uganda, although the value of foreign trade was 5
per cent. higher in 1937 than in 1929. Remunerative traffic has been lost to
the roads, whilst a considerable volume of traffic which formerly passed over
the Tanganyika railway to and from the Belgian Congo has been diverted to
Matadi, on the west coast. The extent of this loss is evident from the following
figures:

<table>
<thead>
<tr>
<th>Traffic to and from Belgian territories.</th>
<th>Tons.</th>
<th>Receipts.</th>
</tr>
</thead>
<tbody>
<tr>
<td>1930</td>

</tr>
<tr>
<td>1937</td>
<td>7,413</td>
<td>£72,610</td>
</tr>
</tbody>
</table>

In 1930 this traffic accounted for one-half of the revenue of the Central Line,
and one-third of the total revenue of the railway. As will be shown in a later
paragraph, the tonnage of domestically-produced commodities increased in the
later years in correspondence with the advance in foreign trade, but this did not
entirely compensate for the loss of traffic with the Belgian Congo – a traffic of
maximum length of haul – and for the loss due to road motors.

The tonnages of some of the more important commodities carried by rail
during the 10 years are shown in Table XXII. Cotton, cotton-seed, and timber
suffered most during the slump, but in 1937 all improved on their 1929 ton-
nages. Coffee, hides, and skins and sisal also recorded substantial increases, the
tonnages railed at the end of the decade being double those at the beginning.
Ground nuts varied widely from year to year, and following considerable ton-
nages in 1935, 1936, and 1937, the quantity railed during 1938 was the lowest
in the decade. The total tonnage of the commodities included in Table XXII
was 50 per cent. higher in 1937 than in 1930, indicating a considerable increase
in the –marketing of colonial produce, due mainly to the increased production
of / sisal. But for the lack of confidence consequent upon political uncertainty,
development would, perhaps, have been greater.

In spite of the decrease in traffic, the net receipts were 47 per cent, higher in 1937 than in 1930, owing to the very substantial reduction in working expenditure. The density of traffic is very low in comparison with the other Colonial railways dealt with in this report, as will be seen from the following figures relative to 1938.

<table>

</tr>
</tbody>
</table>

A noteworthy feature of the above figures is the low operating cost per mile of the Tanganyika railway.

The Kinyangiri branch, 94 miles in length, runs in a northerly direction from Manyoni on the Central railway and attains an altitude of more than 5,000 feet; it was opened in 1932. Revenue from the branch increased steadily, if slowly, until 1937, but in 1938 there was a very definite recession, and the receipts
amounted to only a little more than half of the 1937 revenue. Gross receipts have always been sufficient to cover working expenditure, but net receipts have been inadequate to pay loan charges and make provision for renewals. In 1937, which was the best year, the deficit, when all charges were brought into account, amounted to £25,300, and the net loss since the branch was opened was estimated to amount to £230,500 at the end of 1938. The branch passes through a relatively thickly-populated area, but the use made of it has been disappointing. Between 1933 and 1937 the gross receipts increased from £4,900 to £19,500; and even if this rate of improvement be continued in the future, it will be some years before the branch will be self-supporting.

The Moshi-Arusha branch, 54 miles in length, which was completed in 1929, connects with the Northern lines. It is close to the Noi-Hahe link which joins the Northern line with the Kenya and Uganda railway, and is thus served by the two ports of Tanga and Mombasa, with the result that some of the traffic to and from the branch passes over the Kenya and Uganda railway in preference to the Tanganyika railway. Although the gross receipts are more than sufficient to cover working expenses, the net receipts are inadequate to pay loan charges and provide for renewals, and at the end of 1938 the total accrued deficit was estimated to amount to £177,200. Moreover, during recent years revenue has shown little improvement.

The Central and Tanga lines, when taken over on the 1st April, 1919, were valued at £4,894,050, but interest charges, are not paid on this amount. British capital expenditure on the railway subsequent to that date amounted to £4,578,485 at the end of 1938, on which the following charges are payable annually:

<table>
<thead>
<tr>
<th></th>
<th>£</th>
</tr>
</thead>
<tbody>
<tr>
<td>Interest</td>
<td>223,443</td>
</tr>
<tr>
<td>Sinking fund</td>
<td>58,180</td>
</tr>
<tr>
<td>Total</td>
<td>281,623</td>
</tr>
</tbody>
</table>

It is estimated that £97,927 should be contributed annually to a renewals fund, and that, in order that the railway may be self-supporting, £321,372 should be available annually from net receipts for interest and renewals. During the 10-year period 1929 to 1938, the net receipts averaged £203,047 annually, or more than £100,000 per year less than the amount now required. The 10-year period includes the years of the world depression when net receipts were reduced to small proportions, and they do not, perhaps, indicate what may be expected in the future. During the 4 years 1935 to 1938 the net receipts averaged nearly £300,000, that is, sufficient to pay interest charges and to enable a considerable sum to be set aside for renewals. The total interest-bearing capital expenditure on railways, wharves, steamships, etc., is £5,056,624; but the accumulated sink-
ing fund at the end of 1938 amounted to £516,962, leaving about £4,500,000 to be provided in the future for the repayment of interest-bearing loans.

Having regard to the length of the line, the interest charges are not high relative to other Colonial railways, because nearly half of the cost of the system was provided by German capital. Additional traffic is all that is needed to make the railway financially sound and, but for the loss of so much of the Congo traffic, this would have been achieved already. Even now in prosperous years the railway is nearly able to meet its financial obligations from its own resources.

[...]
When the world recovers from the economic malaise from which it at present suffers, it will probably be found that Great Britain will need to find new markets for her manufactures. The efforts to achieve a greater measure of economic independence which so many nations have made in recent years will not be immediately relaxed, and, while the present restrictive effects of exchange variations, quotas, tariff walls, etc., may be modified, it is too much to expect that
international trade will be conducted under the simpler conditions of former years. Where, then, can new markets be found? The colonies and dependencies of the Crown offer a field of vast extent supporting a population of many millions of prospective buyers. Here will be found territories with sound finances, currencies linked to sterling, and none of the restrictions to trading which are found elsewhere. It can be confidently predicted that increased trade with the mother country will follow colonial development.

In recent years considerable sums have been spent by colonial Governments on the construction of new roads and railways, and additional expenditure will be necessary in the future for further development. Both roads and railways will be needed, and, in order that funds allocated for their construction may be spent to the best advantage, it is necessary to determine how each form of transport can best be utilized to provide the facilities required. When comparing road transport with rail transport it is necessary to bring into account:

(a) Construction and maintenance costs.
(b) The cost of moving traffic.
(c) The traffics for which each form of transport is peculiarly suitable.

In many colonies to-day road transport and rail transport are in active competition, and a study of the results of such competition may indicate in some measure the proper sphere of each and show how both should be developed in order that the needs of the community can best be served.

During the past ten years nearly 2,500 miles of new railway have been built by colonial Governments, the principal extensions being in the following territories:

Kenya and Uganda 907 Miles.
Nigeria 779 "
Ceylon 219 "
Tanganyika 200 "
Gold Coast 194 "
Malaya 158 "
Total 2,457 miles

In addition, a very large mileage of new roads was also built.

In the territories enumerated above, which support a population of over 42 millions, there existed, at the end of 1932, 7,394 miles of railway, about 37,500 miles of roads maintained by the Public Works Departments, and, in addition, a large mileage of roads maintained by native administrations, district councils, etc. Not all the roads are usable by motors in the wet season. In the African colonies most of the roads are of the ‘earth’ or ‘dirt’ type, and only a comparatively small mileage has been provided with a metal or gravel surface, while only a small proportion of the metalled roads have received tar treatment. As an example, in Tanganyika only 86 miles of a total of over 12,000 miles of road maintained
Spiller, ‘The Respective Merits of Roads and Railways for Colonial Development’

by the Public Works Department are metalled. In the older colonies a larger mileage of metalled roads exists, and in some cases metalled roads preceded the advent of railways. It will be realized that motor transport cannot be conducted over earth roads with the same ease and freedom from breakdown, nor at the same cost, as on the roads of a higher standard in more developed countries.

**Cost of Railway Construction.**

The cost of building railways will vary widely according to such factors as the physical characteristics of the country traversed, the gauge and weight of rail used, the standard of construction and the cost of labour, but the following examples can be quoted of the cost of constructing railway extensions in recent years:

<table>
<thead>
<tr>

</tbody>
</table>

*Note.* – In the less expensive of the above lines second-hand permanent way was used.

It will be seen that under favourable conditions it is still possible to build metre or 3-feet 6-inch gauge railways at a cost not exceeding £5,000 a mile.

**Cost Of Road Construction.**

In most new countries financial reasons prevent the use of any but local materials for road construction, and in areas where road surfacing materials, such as laterite, gravel, or stone are not available an earth-surfaced road only is possible. With adequate drainage, untreated earth surfacing will support a moderate amount of traffic, although it is difficult to keep in good condition in all weathers, being dusty in dry weather and getting badly cut up in wet weather.

Besides depending upon the width and character of the road, the cost of construction will vary widely according to such factors as the topography of the country, the amount of clearing necessary, and the cost of labour. An earth road may vary from a track where little more has been done than felling and clearing the tree stumps to a properly drained and graded roadway with a carefully selected top surface.
Earth Roads. – In the Gold Coast roads have been constructed by communal (i.e. free) labour under the supervision of the Political Department at a cost of £26 per mile. This is an exceptionally low figure, as the average cost of grading and draining a double-track road in West Africa is from £150 to £200 per mile, while in East Africa the cost is from £200 to £300 per mile. These figures apply only to easy country, and include the cost of culverts, but not bridges of major importance.

Gravel and Broken Stone Roads. – In West Africa a Class I road with gravel or laterite surfacing costs about £400 per mile in easy country, but through heavy forest or more difficult country may cost £800 per mile.

In Uganda road construction is simplified by the existence almost everywhere of a laterite called ‘murram’, which is used for the surfacing, while the natural soil – a red earth – when consolidated forms a hard and compact foundation. A road 18 feet wide with a 6-inch ‘murram’ surfacing costs about £400 per mile, exclusive of major bridges, which are rarely necessary. In Kenya the cost of a similar road is somewhat greater.

Bituminous-Surfaced Roads. – A macadam road is difficult to maintain under tropical conditions for modern high-speed heavy traffic, as the binding material is sucked out and the heavy rains of the wet season disintegrate the surface. Apart from the discomfort due to dust, the loss of material from an untreated gravel- or stone-surfaced road is considerable, and the replacement of the material adds considerably to the cost of maintenance. The surface can be stabilized and the cost of maintenance reduced by the application of a cold bitumen emulsion or a hot mixture of tar and bitumen to the surface. Such treatment is costly, and in West Africa an 18-foot metalled road with tar or bitumen surface would cost at least £1,000 per mile.

Cost of Road Maintenance.
The cost of maintenance will depend mainly on the density of the traffic and the standard of surface which it is necessary to maintain. It will also be affected by climatic conditions. In East Africa many thousands of miles of earth roads are maintained at an average annual cost of less than £20 per mile. In West Africa the cost is higher, and probably approaches £40 per mile; while in Ceylon and Malaya, where the roads are metalled and the traffic is denser, the maintenance costs average £100 per mile.

Traffic-carrying Ability of Roads.
The selection of a suitable road surface should be based primarily on the volume and character of the traffic which the road will have to carry. It is clearly extravagant to provide an expensive surface for a small amount of traffic; while a low-grade surface will be physically incapable of supporting a heavy and intense
traffic. Opinions differ as to the amount of traffic for which various forms of road surfaces are suitable. In America a questionnaire was addressed to a large number of engineers asking how many vehicles a day could be carried by various types of road surfaces. Several hundred replies were received, and the weighted average of the answers gave the following results:

<table>
<thead>
<tr>
<th>Road Surface</th>
<th>Vehicles per Day</th>
</tr>
</thead>
<tbody>
<tr>
<td>Graded earth roads</td>
<td>220</td>
</tr>
<tr>
<td>Sand-clay and top soil roads</td>
<td>360</td>
</tr>
<tr>
<td>Gravel and water-bound macadam</td>
<td>800</td>
</tr>
<tr>
<td>Surface-treated roads</td>
<td>1,500–2,000</td>
</tr>
</tbody>
</table>

In America skilled labour is available, and a high standard of maintenance is possible. In undeveloped countries with native labour it would be unwise to assume that similarly surfaced roads could carry the same densities of traffic. Mr. C. L. Cox, M. Inst. C.E., the Director of Public Works in Nigeria, has expressed the view that under the best conditions a first-class gravel road in Nigeria cannot be maintained to carry a denser traffic than 500 tons a day. In new countries, therefore, probably one-half of the above figures would represent fair maximum loadings.

**The Economics of Road Surfaces.**

The most economical road surface is that which gives the cheapest return to its users, having regard to the cost of construction, the cost of maintenance and the cost of conveying transport over it. While it may not be difficult to estimate the cost of construction, it is more difficult to estimate the cost of maintenance for a given volume of traffic, and still more difficult to strike a balance between the two so that the annual charges are a minimum. The higher the standard of construction the less the cost of maintenance for a given volume of traffic, and vice versa. It will sometimes be found that the saving on interest charges due to the adoption of a low standard of construction is less than the additional cost of maintenance incurred in preserving the road surface. In other words, a higher standard of construction could have been provided in the first place, with all the advantages of additional safety, greater speed, lower cost of operation, and at no greater cost. In Australia it was found that sealing gravel roads with bitumen effected a saving in maintenance costs of £35 per mile per year, which if capitalized would have been more than sufficient to pay the cost of sealing. If, however, the reduced operating costs of the vehicles are taken into account, the total saving was estimated to amount to £150 per mile per year.

While a superior standard of construction will reduce maintenance charges, a still greater saving will be effected in the operating costs of the motor vehicles using the road. The tractive effort per ton (2,240 lbs.) on different road surfaces is approximately:

* Victoria County Roads Board Annual Report, year ended June 30, 1932.
It is obvious that a reduction of tractive effort will decrease fuel consumption, and, in addition, that the better surfaces will reduce tyre wear, permit a higher daily mileage, and reduce depreciation costs by adding to the life of the vehicle. It is not easy to place a value on these benefits, but the Main Roads Board, of New South Wales, who operate a large fleet of cars and trucks, have been able to make a comparison of the costs of vehicle operation according to the class of road used, and the conclusion was reached that operating on bad roads cost at least 1½d more per vehicle-mile travelled.

Careful estimates have also been made in America by Professor T. R. Agg, of the Iowa State College,* and Mr. John A. Johnson, District Engineer, Massachusetts Highways Department,† from the operating costs of transport undertakings over different types of road-way. Professor Agg reached the conclusion that a change from a lower type to a higher type of road surface resulted in a saving of one-eighth of the operating costs on the lower type. Mr. Johnson estimated that the operating costs over different types of roadway from records of Massachusetts vehicle users in cents per mile were as follows:–

<table>
<thead>
<tr>
<th>Type of Road</th>
<th>High</th>
<th>Intermediate</th>
<th>Low</th>
</tr>
</thead>
<tbody>
<tr>
<td>Passenger cars</td>
<td>8×02</td>
<td>9×14</td>
<td>11×56</td>
</tr>
<tr>
<td>Trucks to 1½ tons</td>
<td>11×86</td>
<td>13×88</td>
<td>18×47</td>
</tr>
<tr>
<td>Trucks from 1½ to 3 tons</td>
<td>20×83</td>
<td>24×41</td>
<td>31×05</td>
</tr>
<tr>
<td>Trucks and buses over 3½ tons</td>
<td>31×56</td>
<td>36×97</td>
<td>46×08</td>
</tr>
</tbody>
</table>

The high-type roads were those with a firm, true surface of bitumen, Portland cement mixtures, or blocks in good condition. The intermediate types were plain gravel or water-bound macadam in fair condition. The low types were natural local soil with no surface treatment.

From the above figures it would appear that the cost of operation on earth roads is greater than on macadam roads to the extent of / nearly 2 ½ cents per vehicle mile for passenger cars and over 4 ½ cents per vehicle mile for light lorries. These figures, it must be remembered, are applicable in America, where the cost of cars, accessories, motor spirit, etc., is less than in any other country in the world, and the savings in operating costs due to good roads are likely to be greater elsewhere.

* Engineering News-Record, Vol. 111 (1933), p. 5; and Bulletin 91, Engineering Experiment Station, Iowa State College, 1928.
The above figures are enlightening, and show what a small amount of traffic suffices to justify a good road if the cost of operation is given adequate consideration. In Nigeria it costs £850 a mile more to provide a road with stone metalling and bitumen surfacing than it does to build an earth road. If interest and sinking fund charges are taken at 6 per cent. on the additional cost of constructing the superior type of road surface, the annual charges amount to £51 or 12,240d. Assuming a saving of only 1d. per vehicle mile, a traffic of 34 vehicles a day would suffice to justify the superior type of road. Facts such as these prompted Mr. Thomas H. Macdonald, the Chief of the Bureau of Public Roads, U.S.A., to remark, ‘We pay for good roads whether we have them or not, and we pay less for them if we have them not’.

**Cost of Motor Transport.**

The cost of motor transport will vary widely according to the remoteness of the district from the source of supplies. In some parts of Central Africa petrol costs 7s. 6d. per gallon, while cars and accessories are also expensive.

Apart from the privately-owned car, a considerable measure of competition in the provision of transport facilities will be found in most colonies. In some instances the Government itself owns and operates a large fleet of vehicles, usually as feeders to the State railway system, but occasionally to undertake general haulage work for its own departments. In many districts, too, substantial firms, with European managers, operate transport services, while the native-owned and driven bus and lorry will be found almost everywhere.

Whether a motor service is Government-owned or operated by a firm of substance, it must be conducted on sound economic lines, and its charges must take into account the cost of interest on capital expenditure, depreciation, etc. It must, in addition, pay adequate wages to its staff, provide garages, repair shops, etc., so that its fleet of vehicles can be kept in sound running order. The native bus owner has no overhead charges, the roadside is his garage and the bus is his home. He is willing to work very long hours, and is satisfied if he obtains a bare living from his enterprise. The amount of capital required is small, as wooden seats on a Ford chassis with a timber framework supporting an awning with curtains suffices, and he is generally able to obtain his vehicle on the hire-purchase system by an initial payment of £20. It will be realized how difficult it is for a large motor transport organization operated on sound business principles to compete successfully with a large number of small independent enterprises conducted on uneconomic lines.

It has been said that the cost of motor transport varies widely, but a few examples will be quoted of operating costs which have been published in certain countries.
The Nigerian Railway Department operates a fleet of vehicles providing feeder services to the railway, and in the year ended the 31st March, 1933, the vehicles ran 244,434 miles and carried 3,275 passengers and 11,935 tons of goods. The net loaded or goods ton-miles run were 537,000, at an average cost of 6×18d. per ton-mile, exclusive of interest and renewal charges.

The Kenya and Uganda Railway also operates motor services in the neighbourhood of the Great Lakes, which in 1932 carried 11,204 passengers and 10,074 tons of goods. The average load per lorry-mile was 1×88 tons, and the total ton-miles run were 616,057, at an average cost of 6d. per ton-mile, including depreciation.

The Oversea Mechanical Transport Committee,² appointed in 1928 by the Secretary of State for Dominion Affairs and for the Colonies, has designed a special unit for operation over earth roads. It consists of an 8-wheeled tractor and two 8-wheeled trailers, the tractor carrying a paying load of 3 tons and the trailers of 6 tons each. The unit has been operated over the 240 miles between Kumasi and Tamale in the Gold Coast, and has proved easy to drive and manœuvre. The useful load carried has averaged less than 10 tons, and after making generous allowances for interest, depreciation, repairs, maintenance and supervision the all-in cost of transport has worked out at 5½d. per ton-mile.

The Uganda Public Works Department operates a fleet of cars and lorries for transport purposes, and in 1931 the lorry mileage run was 718,508 miles. The total all-in cost, including depreciation, insurance, etc., amounted to 10½d. per lorry mile. Road motor services are also operated by responsible firms in Uganda at rates approximating to 1s. per ton-mile, but in a number of cases irresponsible competition is carried on at rates as low as from 7d. to 9d. per ton-mile.

In Tanganyika well-established transport companies run regular services of lorries for the transport of passengers, mails, produce, etc., over long distances in districts not provided with railways at charges which vary from 1s. to 2s. per ton-mile. A difference is made in the rates charged according to the season, the rate being less in the dry season, while the highest rates are for the most remote districts. Where competitive with the railway, motor-lorry rates vary from 8d. to 1s. 4d. per ton-mile.

It will be seen from the foregoing that in new countries a motor-transport service run on sound commercial lines is likely to cost at least 6d. per ton-mile, and in remote districts far removed from sources of supply, the cost may amount to 1s. or more per ton-mile. Where there is no railway competition the cost to the public is likely to be at least 1s., and may be considerably more per ton-mile. By means of excessive over-loading native-owned lorries can operate at less than 6d. per ton-mile, while low rates are sometimes quoted in cases where vehicles would otherwise return empty. It is, however, doubtful if road transport can be

* Described in The Engineer, 21 July 1933, p. 55.
operated in the colonies on economic lines at less than 6d. per ton-mile, particularly over earth roads.

**Cost of Rail Transport.**

The charge for motor transport bears a close relation to the cost of service, but this is not so with rail transport. A railway is a ‘common carrier’, and as such is compelled to provide facilities for transporting all kinds of traffic. The greater part of its freight consists of commodities which can only afford to pay low rates, and to compensate for this it has been the practice on all railways to charge for valuable goods, not on the cost of service, but on what it was estimated the traffic would bear. In this way the highly rated freight – which is only a small proportion of the total tonnage transported – bears the greater part, if not the whole, of the overhead costs of the railway, and the low-rated freight is freed from its share of overhead charges. This principle of rating is known as ‘charging what the traffic will bear’, and the late Sir William M. Acworth comments upon it as follows:–

‘This, in principle and outline, is the system of charging what the traffic will bear. It is the system which – the point must be reiterated – is, always has been, and, as far as we can see, always will be adopted on all railways, whether they be State enterprises or private undertakings’.

[...] [As regards] the rate structure of the Kenya and Uganda railway. The various commodities transported are separated into ten different classes, each of which pays a different rate. In addition there are ‘special rates’ and ‘export rates’. /

The charge made for a commodity in Class 1 is from nine to fourteen times that made for a commodity in Class 10, although the actual cost of transport may be the same. It is difficult, therefore, to make any useful comparison between road transport rates and railway rates, but what is of vital importance is the relative cost of movement by railway and by road. It has been shown that road transport costs at least 6d. per ton-mile under favourable circumstances, and may cost 1s. per ton-mile or more in remote districts where there is no competition. These figures represent the actual cost of moving commodities by road. On a railway the cost of movement is the average rate paid per ton-mile, which on certain colonial railways in 1932 was as under:–

<table>
<thead>
<tr>
<th>Railway</th>
<th>Rate per ton-mile</th>
</tr>
</thead>
<tbody>
<tr>
<td>Federated Malay States Railway</td>
<td>1×37 Pence.</td>
</tr>
<tr>
<td>Nigerian Railway</td>
<td>1×72 &quot;</td>
</tr>
<tr>
<td>Kenya and Uganda Railway</td>
<td>1×46 &quot;</td>
</tr>
<tr>
<td>Tanganyika Railway</td>
<td>2×00 &quot;</td>
</tr>
</tbody>
</table>

These average rates were not entirely economic, as in 1932 the net revenues of railways concerned were inadequate to meet the whole of their interest and

depreciation charges. In more prosperous years revenue probably would have been adequate, and it can be fairly assumed that the cost of movement by rail is certainly not more than one-third of the cost of movement by road. / 

Comparisons between Rail and Road Transport.

It will be seen from the foregoing that railway construction in the colonies, even in favourable circumstances, is likely to cost from £3,000 to £5,000 per mile, while an earth road can be built for about £300 per mile. The cost of transport on the road is, however, likely to be at least three times as great as on the railway, and a rail service will be more economical than a road service if the amount of traffic to be transported is sufficient to make the saving on operating expenses justify the cost of constructing and equipping a railway. Whether a railway or a road should be built in new areas where no transport facilities exist will depend primarily on the volume of traffic which is likely to make use of the facilities provided, but roads possess the advantage of allowing the expense of construction and maintenance to be made proportionate to the importance of traffic served where the volume of traffic is small. Roads can be constructed to carry light vehicles, including motor lorries, at much less cost than any type of railway. Owing to the ability of the motor truck to operate on gradients and curves more severe than would be possible on a railway the cost of formation and grading is much less, while the cost of surfacing for a limited amount of traffic would also be less than that of the permanent way of a railway.

Some indication of the classes of traffic which are more suitable for rail transport and of those which can be more conveniently handled by road will be obtained by studying the effects of road competition on railway traffics in districts where roads and railways are in active competition. Since the competitive effect of motor transport is felt most with short hauls, examples of countries of small area will be considered first.

The island of Mauritius is approximately 39 miles long by 27 miles wide, rising to a height of 2,000 feet in the centre, and has a population of 410,000. It possesses a considerable mileage of excellent roads, which run parallel to the railway in many places and short-circuit it at others. Owing to the hilly nature of the island it was necessary, when building the railway, to introduce many severe grades and sharp curves, so that the railway is difficult to operate. These facts establish ideal conditions for road traffic, and during the last ten years the railway has suffered severely from road competition. The island is largely dependent for prosperity on its sugar crop, and, with the exception of the year 1931, when the sugar plantations were badly damaged by a hurricane, the tonnage of sugar produced has not varied to a wider extent in recent years than would be anticipated for a product of the soil. But for the competition of road transport it can be assumed that railway revenue would not have varied widely.
Railway revenue, from the peak year 1923–24 to the 30th June, 1933, [fell] [...] and it would be difficult to present a more depressing picture of the effects of road competition, passenger receipts having fallen to about one-seventh of their value in 1923–24. The island's sugar crop and the tonnages of goods conveyed on the railway during the period from 1923–24 to 1932–33 are shown in Table I; the figures for 1931–32 were adversely affected by the hurricane.

The large reduction in the tonnage of sugar-canes is due to the plantations laying down their own systems of light railways for conveying canes from the fields to the factories, so that the loss of sugar-cane traffic cannot be ascribed to road transport. Of the remainder of its goods traffic (‘Sugar and other commodities’) the railway had retained 83 per cent., showing that in spite of conditions particularly favourable to road transport the island is dependent on its railway for the greater portion of its transport services.

[...]

The Gold Coast, including Ashanti, the Northern Territories and Togoland, has an area of 91,843 square miles with a population of 3,124,202, and railways run from Accra and Sekondi on the coast to the interior. Road competition first began to be felt in 1924–25, and although the number of passengers carried in 1930–31 was approximately the same as in 1924–25, the receipts were about 8 per cent. less, while passenger train-miles run were more than double. Road competition, therefore, had the effect of compelling the railway to augment the local services in order to retain its passenger traffic, and thus of reducing its net earnings from this source.

The railway has, moreover, lost much of its freight traffic. The average export of cacao from Accra for the five years 1927–31 was 96,500 tons, of which the railway in 1924–25 carried approximately 95 per cent., but only 53 per cent. in
1931. Thus in six years there was a fall of over 40,000 tons in cacao freight alone as the result of road competition. In order to retain its traffic the railway has made successive reductions in rates, and the following figures show the modifications which have been made to the rates charged on spirits and cacao between Accra and the more important stations on the Accra-Kumasi line:– /

The ton-mile figures indicate a new policy in railway rating, since the rates are less per ton-mile for short distances than for long distances, whereas in the past it has been usual for railways to reduce their ton-mile rates as the length of haul increased. The motor lorry is, however, more competitive over short distances and the railway rates have been modified accordingly. The effect of motor competition has been, in fact, to modify in principle the rates policy of the railway, and the alteration, though sound from the railway point of view, is difficult to justify, as it penalises districts remote from the coast which are most in need of cheap transport.

Some of the stations on the Central Province railway have more direct access by road to the coastal ports of Winnebah, Saltponds and Cape Coast Castle than by rail to Takoradi Harbour, and road transport is in consequence favourably placed to handle the traffic offering. Railway rates for cacao and goods have in consequence been reduced to less than 3d., and in some cases to less than 2d. per ton-mile from stations on the Central Province railway to Takoradi. Examples of existing rates are given below:– /

Even with these low rates the railway is unable to secure the bulk of the traffic, although it must be remembered that the length of haul by road is less than by rail.

Nigeria has an area of 373,078 square miles, or a little less than the combined areas of the United Kingdom, France and Belgium. Its population is about 19½ millions, and the mileage of its railways is 1,905 miles; N’Guru, the most remote station, being 845 miles from Lagos on the coast. In so large a country it will be realized that road competition cannot be so effective as in small islands like Mauritius and Trinidad. This will be more readily appreciated when it is stated that the average length of haul of goods traffic in Nigeria is 358 miles. The revenue of the railway over the ten-year period, 1923 to 1932, is shown in Table III.

It will be seen that peak conditions occurred in 1929–30, since when passenger receipts have fallen by 46 per cent. and goods receipts by 27 per cent. in spite of a 10 per cent. increase in mileage. It is not possible to say how much of this reduction is due to road competition and how much to the general economic depression from which Nigeria – like the rest of the world – is suffering, but it would certainly seem that passenger receipts are suffering to a greater extent than goods receipts. Passenger receipts were considerably less in 1932–33 than in 1923–24, although the mileage of line open had increased from 1,126 to 1,905 miles. On the other hand, goods receipts increased by 23 per cent. in the same period. During the four-year period, 1925–26 to 1928–29, goods receipts remained fairly constant, but passenger receipts increased substantially, and up to the peak year – 1929–30 – the railway revenue did not suffer seriously from road competition, owing largely to the lack of suitable roads. Extensive road construction has been carried out in recent years, and a part of the loss of revenue since 1929–30 has undoubtedly been due to road competition, but with an average length of haul of 358 miles and an average passenger journey of 29 miles the particular advantages of motor transport have not the same importance as with short hauls.
In order to compete more effectively with motor transport the rates classification was altered in 1931, the highest rate being abolished and many commodities included under the lower classes being absorbed in the lower classes. Special rates for wagon loads of imports were introduced and have achieved considerable success in regaining short-distance traffic from the roads. Mixed consignments of imports with a minimum weight of 5 tons are accepted, and carried at a rate of 1½d. per ton-mile, irrespective of the classification of goods with which the wagon is loaded. For each consignment note, a voucher is issued entitling the owner to load for conveyance to the coast an equal tonnage of produce at a special low rate of 2½d. per ton-mile. With balanced traffic in each direction, the railway earn on the round trip 2d. per ton-mile. Any produce carried in excess of tonnage shown on the vouchers goes at ordinary class rates. This scheme was devised to circumvent motor transport selecting the higher-rated import traffic, whereby they were enabled to undercut the railway class rates on produce for export, and because the total tonnage of export produce cannot be evacuated by road under existing conditions. During the year 1932–33, 14,795 tons of imports and 13,070 tons of exports were carried under these conditions, and the revenue earned was £32,267, while the number of lorries plying for hire for goods transport was reduced.

The rate for ground nuts from Zaria and stations to the north to the coast was fixed at 80s. per ton. During 1932–33, 9,080 tons / were forwarded from N’Guru to the coast – 845 miles – at the above rate, which is slightly under 1.2d. per ton-mile, including handling charges and 14 days’ free storage at the port. To be profitable to the railway the rate should be at least 50 per cent. higher, or 120s. per ton. If to this is added the cost of bags, ocean freight, insurance, agents’ fees and commission, etc., the cost of transport from N’Guru to England would amount to at least £8 per ton. The selling price of ground nuts in England to-day (November, 1933) is £9 6s. 3d. per ton, and it is clear that with ground nuts at their present price the farmer or the railway must go profitless.

In 1932–33, 585,685 tons of goods were carried by the Nigerian railway, the tonnages of the principal commodities being as follows: –

The above commodities, which cannot afford high transport rates, comprise about 82 per cent. of the total railway tonnage.

The Colony and Protectorate of Kenya have an area of about 224,960 square miles and a population of a little over three millions. While, therefore, the area is about three-fifths of that of Nigeria the population is less than one-sixth. The revenue of the Kenya and Uganda railway over the ten-year period 1923 to 1932 is shown in Table IV.

It will be noted that the passenger receipts in 1932 were less than in 1923, although the mileage of line open to traffic had increased from 692 to 1,627 miles. In the same period goods receipts increased from £965,956 to £1,564,966, or by 62 per cent. The peak year for both passengers and goods was in 1929 – the same year as in Nigeria – and there has been a successive fall each year since, the passenger receipts having fallen to 58 per cent, and the goods revenue to 78 per cent. of the 1929 figures. Between the years 1928 and 1932 the number of passengers fell by 49 per cent., but the coaching revenue was only 40 per cent. less, which shows that the greatest loss was in short-distance passengers, that being the traffic which is most susceptible to bus competition. The goods revenue in the same period fell by 16 per cent. The substantial loss in revenue during the last three years is due principally to the world-wide economic depression, but it was estimated that the loss during 1931 due to road competition must have amounted to £70,000 at least, and may have reached an even higher figure. The tonnages carried at the various class rates in 1932, the highest rate being Class 1, were as follows:–
Communications in Africa, 1880–1939: Volume 4

Class | Rate | Tons.
------|------|------
1     |      | 8,517
2     |      | 3,595
3     |      | 27,646
4     |      | 4,516
5     |      | 11,563
6     |      | 58,819 = 8 per cent.
7     |      | 30,833
8     |      | 74,681
9     |      | 101,057
10    |      | 102,422

Exceptional rates | Tons. | 206,069 = 31 per cent.
Export | Tons. | 200,058

Total | Tons. | 664,634 = 92 per cent.

[...] class rates 1 to 3 exceed 6d. per ton-mile, and class rates 1 to 6 exceed 3d. per ton-mile, but in 1932 only 2 per cent. of the total goods tonnage was carried at the / three highest rates and only 8 per cent. of the total goods tonnage at the six highest rates. While only 2 per cent. of the goods tonnage is carried in the three top classes these classes, only a few years ago, contributed 25 per cent. of the total goods revenue, and it will be seen that road competition can seriously reduce the railway’s revenue, even though a very small percentage only of its traffic is carried by motors. The 92 per cent. of the traffic which is carried by rail at less than 3d. per ton-mile should not be susceptible to road competition, but a portion of it is doubtless short-haul traffic in small lots where the convenience of door-to-door delivery justifies transport by road at higher rates. In 1932 the tonnage carried in Classes 1, 2 and 3 was 30 per cent. less than in 1930. Over one-third of the total tonnage was carried at ‘Export’ rates, which are the lowest rates. A noticeable feature of Table IV is the large increase in the mileage of lines open to traffic between the years 1923 and 1932, and the figures in Table V will show how development has followed the increase in transport facilities which the railway has provided.

In these three commodities alone the tonnage carried by railway increased between 1922 and 1930 from 22,403 to 166,462 tons, while the ton-mileage rose from 10.8 millions to 97.2 millions. The average lengths of haul of the three commodities in 1930 were:

These commodities are carried at export rates which for maize and wheat are, in the case of the longest distances, only a farthing per ton-mile. The low cost of carriage in conjunction with the long lead is only possible with rail transport, and proves conclusively that the extensive development which has taken place in the last ten years was only rendered possible by the growth of the railway system.

If Tables III and IV are compared the following points of similarity will be noticed:

(a) A large mileage of new lines was added in the ten-year period.

(b) In spite of the new mileage, passenger receipts were less in 1932 than in 1923.

(c) Although passenger receipts were less, goods receipts increased substantially.

Certain conclusions of a fairly definite character can be drawn from the foregoing. It would appear that drastic reductions of third-class passenger fares will induce travellers to forsake the roads for the railway, but it is doubtful if any appreciable increase in net revenue results therefrom. Moreover, a reduction of railway fares is generally followed by a reduction of bus fares, which makes it doubtful if the railway would permanently retain all the traffic recovered. For short distances the frequency and flexibility of a motor-bus service give it a great advantage over a local railway passenger service. It passes through villages, picks up the passenger at his door and drops him wherever he wishes. Railways, on the other hand, are often remote from the village centres and cannot stop to pick up and set down passengers as often as a bus can. Moreover, a railway cannot provide so frequent a service, especially where, as is usual on colonial railways, the line is of single track. Where roads run parallel to railways it is clear that railways cannot cater for short-distance traffic so satisfactorily as road services; the first-class passenger will travel by private car and the third-class passenger by bus. It should be recognized that the convenience of the community can be better
served by road services. For long journeys a railway provides greater comfort, is less tedious, and possesses distinct advantages over motor transport, particularly where the journey involves the use of restaurant and sleeping cars.

With regard to high-rated goods traffic, motors possess the great advantage that they can in many instances include the collection, transport and delivery of commodities in a single journey and for a single rate. For short journeys the savings effected in time, cost, breakages, and so on, by the elimination of one or two handleds will always give an advantage to the motor, even though the railway / rate may be lower, but this advantage will be reduced as the length of the journey increases. Moreover, it is customary for railway rates per ton-mile to fall as the distance increases, so that the longer the haul the more difficult it is for motor transport to compete economically with rail transport, even for commodities which are included in the higher classes of railway rates. There is, in fact, a certain distance in every country over which a motor can be more economically employed for the highly-rated traffic, but this distance will vary with the character and volume of the commodity, the extent of rehandling and importance of direct delivery, the condition of the roads, gradients, etc. In British Colonies and Protectorates this distance would appear to be from 60 to 100 miles.

With respect to the lowly-rated traffic, road transport is unable to compete economically with the railway even over short distances. In islands of small areas, like Mauritius and Trinidad, it has been shown that 80 per cent. of the goods traffic is not susceptible to road competition, while in countries of large area, like Kenya and Nigeria, the percentage is considerably greater. In spite, therefore, of unrestricted road competition the railways are still providing the bulk of the transport services in the colonies.

Privileged Character of Road Transport.

When considering the effects of road competition it should not be overlooked that road services enjoy privileges which are denied to railways. A road transport undertaking is not a ‘common carrier’, and so can refuse to carry unprofitable traffic. It need not publish its rates and can quote different rates to different customers. It can pick and choose what traffic it will transport and does, in fact, take from the railway only the higher-rated commodities, leaving the railway the obligation of carrying the heavy bulk freight at unprofitable rates. Further, railway rates cover the whole cost of the service, including the cost of maintenance of permanent way, bridges, equipment, etc., but road transport charges do not generally cover the total cost of road upkeep.

Although in the past road transport has not generally paid its fair share of road upkeep, and has to this extent been, in effect, subsidised by the authority which has provided the roads, there can be little doubt that road transport can
well afford to pay the whole cost of road expenditure and still operate profitably in many districts. It would certainly be unwise to assume that increased taxation will have the effect of materially reducing road transport. / 

**Transport Regulation.**

While colonial railways are still efficiently carrying out essential transport services in amount far in excess of that dealt with by road services, their prosperity has been seriously threatened by a very privileged competitor. Road services have been subject to little, if any, regulation in the past, but if free competition between railways and roads is to be allowed in the future and railways are expected to earn sufficient net revenue to pay interest and renewal charges they must be permitted to adjust their rates so as to obtain a fair share of the highly-rated traffic, and this will mean an increase of rates on low-grade traffic to balance a reduction of rates on high-grade traffic. This constitutes an approach to a uniform rate for all kinds of traffic, and the nearer the approach the more readily will railways secure the traffic. It would, however, adversely affect export trade by preventing development, and would be contrary to the general interests of the country, including the interests of the motor transport services, as these rely principally on the carriage of imports which can only be paid for by exports. If railways are to continue to carry export traffic at uneconomic rates while high-rated traffic uses the road, it is doubtful whether they will earn sufficient net revenue to maintain their efficiency, so that some form of subsidy will be needed. The alternative is to place adequate restrictions on road traffic, in order that railways may obtain a fair share of the highly-rated traffic. Since the development and prosperity of any country is dependent upon cheap transport facilities it is desirable that any regulations introduced should not be so restrictive as to prevent the provision of transport facilities which are desirable in the public interest. Some competition may be desirable, but uncontrolled competition between road and railway is likely to result in a reduction in the efficiency of essential transport services. The native bus or lorry owner, with his low standard of living and negligible overhead costs, will, if allowed full freedom for his activities, not only take from the railway much of its most profitable traffic, but eventually drive from the roads any transport organisation which pays a fair wage for a fair day’s work, and conducts its business on sound economic principles. Unrestricted competition is by no means likely to result in the survival of the fittest.

Some measure of regulation is therefore necessary, and this should be designed so that each form of transport can be developed in its proper sphere to handle the traffic for which it is most suitable. Only by intelligent regulation can the duplication of transport services exceeding public requirements be prevented and much wasteful expenditure obviated. Where roads and railways are in active competi-
tion it is suggested that axle-loads should be limited, that motor transport taxation should at least suffice to pay a fair share of the cost of providing and maintaining the roads, and that motor lorries should operate under licence.

If the cost of road construction and maintenance is to be kept low, axle-loads should be restricted to moderate proportions, and pneumatic tyres should be insisted upon for all vehicles. Where rail transport is available for heavy loads there is no justification for costly roads to duplicate the work which the railway can do. A maximum permitted axle-load of 2 tons would cover all private cars and many types of light lorries, and should provide all necessary facilities supplementary to the railway.

If rail transport and road transport are to compete on equal terms, it is clear that road transport should bear its fair share of the cost of providing and maintaining the highways, in the same way that railway rates cover the cost of providing and maintaining the railway. The Salter Commission adopted the principle that the total annual cost of the roads should be distributed between the different categories of users according to the use enjoyed and wear and tear caused by each. In many tropical countries there is no wheeled traffic other than motor traffic, and primitive pathways are all that are needed for pedestrians and head-load transport. In such cases the whole cost of the roads is fairly chargeable to motor transport. Where transport by ox wagon or bullock cart exists, such form of transport should make some contribution to road costs, but if roads suitable for motors are provided it will generally be found that animal transport will eventually be displaced by mechanical transport, and it can be assumed that in all new countries the greater part of road expenditure is fairly chargeable to motor transport.

Where a road runs parallel to a railway motor-lorries should be prohibited on the road, except under licence. If public convenience is to be the first consideration, licence to operate should not be refused where it can be shown that the new service can provide facilities which are measurably superior to existing facilities. On the other hand, if an existing transport agency is competent to provide all the facilities that can be reasonably required, and if its efficiency would be impaired by a competing transport organization, then it is not in the public interest to grant a licence. Moreover, the interests of a country as a whole are best served, and the greatest economy will be secured, by ensuring that the largest possible volume of traffic is carried by the cheapest form of transport, this being measured not by the rates charged, but by the actual cost of movement. There can be little doubt, under colonial conditions, that most traffics are moved more cheaply by rail than by road. If the cost of the licence is high, road traffic will be limited to those commodities which are the most suitable for road transport, namely, short-distance traffic in small lots where door-to-door delivery is of importance. The State can, in fact, limit the amount of traffic using the highway by refusing to grant more than a certain number of licences.
If it is not considered expedient to limit strictly the number of lorry licences it is difficult to see how the railway revenue of pre-competitive days can be restored. Additional revenue will undoubtedly be earned when economic conditions improve, but there will still remain the loss due to the reduction of rates and fares which railway administrations have been forced to make in order to meet road competition, as well as the loss on revenue from passengers and goods which have left the railways for the highways. This must permanently affect railway revenues. The inevitable result of substituting road transport for rail transport will be an increase in the total cost of transport services. To use a means of conveyance which costs 6d. per ton-mile instead of one costing 2d. per ton-mile is not economic, and must result in a loss somewhere; and the greater the use made of the roads the greater the resulting loss. In the past the profits made on high-rated traffic were used by the railway to cover losses on low-rated traffic, but the profits on road services cannot be so used. Additional revenue will be needed to cover railway losses, and it is suggested that motor taxation should contribute towards this additional revenue. In other words, if freedom is to be granted to motor transport to take from the railway its most profitable traffic, should it not share the burden of subsidising the railway’s unprofitable traffic and pay in taxation sufficient to cover road expenditure and contribute to railway losses? In the past colonial Governments have used surplus railway earnings for developmental purposes, including road construction, and it does not appear unreasonable that transport users, with free choice of two alternative forms of transport, should be called upon to pay the cost of providing both forms of transport.

In new countries the funds available for the development of transport services are limited in amount, and it is essential, therefore, that they should be spent to the best advantage. To provide two alternative forms of transport where one will suffice is extravagant, and will delay the provision of transport facilities in areas where none exist. The ideal arrangement is that of railways for the main trunk routes with feeder roads radiating therefrom; but while it is generally agreed that new roads should be built as feeders to the railway system and not parallel thereto, this is difficult to carry out in practice. Where commodities and merchandise require movement in considerable quantities roads will, sooner or later, be found. Moreover, in the future roads will, perhaps, be provided first in districts where transport facilities do not at present exist, the railway following when development justifies its construction. While, therefore, economic development requires both roads and railways, it is not easy to make one complementary to the other.

It is clear from the foregoing that, while road services have captured the bulk of the short-distance passenger traffic, the railways, in spite of unrestricted competition, have only lost a fractional part of their goods traffic, and there can be no question that colonial prosperity is more dependent on an efficient system
of railways than on road transport. Any action which is likely to reduce railway efficiency should therefore be avoided, for railways are as essential to-day as ever, and still remain the most effective means of extending the path of civilization.

The Paper is accompanied by two blue prints, from which the figures in the text have been prepared.

Discussion.

[...]

Sir Henry Fowler remarked that the Paper was a very good statement of the position with regard to motor transport in the Colonies and Dominions. He was himself concerned with that problem. In 1927, the Colonial Ministers who came to this country brought the matter forward, and the Government set up a Committee of which he had the honour to be Chairman, from which resulted the Oversea Mechanical Transport Committee, of which he still had the honour to be a member. The terms of reference to that Committee were, in effect, to consider what could be done by means of mechanical transport to open up undeveloped countries and to feed the railways. He felt that that was one of the points which the Author had not dealt with as fully as he might, and that was what the Committee had in mind in designing the wonderful vehicle – for he thought it was a wonderful vehicle – referred to on p. 553 of the Paper. He would like to thank the Author for the very just and fair way in which the figures of the cost per ton-mile, gained as a result of long experiments carried out in the Gold Coast, were set out in the Paper. The over-all costs were given, including interest, maintenance and renewal, and he thought that, as intended, they were really on a very conservative basis. A second vehicle had been constructed, in the design of which the Committee had benefited considerably by the experience gained with the first one, and had been fitted with a diesel engine. Although the costs of petrol had not been as high as the Author mentioned, he understood that the price taken was 7s. per gallon, which was considerably higher than that paid in the Gold Coast. A diesel engine was not fitted to the first vehicle, because the Committee felt that for development work it would be better to have an engine of which they had more experience. He would like to ask the Author whether the figures that he gave for the cost of rail transport were operating figures only, or whether they included the overhead charges of interest, depreciation, and so on. One factor which had to be borne in mind, more particularly with regard to Africa, which was the continent with which the Oversea Mechanical Transport Committee had been mainly concerned, was that railways already existed between many of the large centres of industry and production. As he had already pointed out, the object of the Committee was to try to open up undeveloped centres, and to connect them where possible with existing railways; because so
Spiller, ‘The Respective Merits of Roads and Railways for Colonial Development’ 375

far as operating costs were concerned the railway was certainly far the cheapest method of transport available at the present time. The first part of the Paper dealt principally with the question of roads. The Committee issued a monthly bulletin which, he thought the Author would agree, was of very great interest and use to those who were dealing with the question of transport abroad, and devoted much space in it to that question, which was very important for motor transport. The vehicle to which he had referred was at present operating in the Gold Coast on a road which was only a little better than an earth road. It had a facing of laterite or gravel, but it would not be regarded as a first-class road for motor transport in this country. He was a little worried to find that on p. 570 the Author suggested that the maximum laden axle-loads of road vehicles should be restricted to 2 tons. He could not think that the Author was ignorant of the fact that the rear-axle load of a 30-cwt. lorry, which was the type chiefly used in African and other colonies, was at least 2½ tons; and he felt it would be most unwise from every point of view to attempt to cut that down by half a ton. There was an engineer present who dealt with colonial bridges, and the Oversea Mechanical Transport Committee had been urging him for some time past that bridges built in future should be calculated for an axle-load of 3 tons, which Sir Henry felt was very reasonable. It had to be realized – he spoke as a railwayman – that it was not possible to drive the motors off the roads, and he felt strongly that what should be done was to make the roads to feed the railways. It was rather late to attempt it in this country, but it was not too late in the colonies. It could not be done, however, if the axle-load were cut down to 2 tons laden, which would prohibit the use of the majority of lorries now employed in the colonies.

Sir John Thornycroft said that he imagined that the object of the Paper was to endeavour to co-ordinate, and not merely to compare, the road vehicle and the railway, so that the most economical transport could be provided for the community. He felt that it was necessary to examine the basic principles even of the rate-structures as the railways used them at the present time before it could be said that one or the other was better. If a company owned a coalmine and wished to make their own mineral railway to transport the coal, they would have to charge what it cost to do so, and it seemed to him, as one who had recently had some connection with railways, that it was extraordinary that it should be assumed that the cost of transporting bulky or low-grade commodities must be met partly at the expense of the more valuable commodities which were of smaller bulk and which cost, as a rule, no more to transport. He wondered, therefore, whether it would not be better to consider the question on the basis that it cost a certain sum to transport the goods by railway and a certain sum to build, maintain and run the railway and to consider the road-vehicle in the same way. For the road-vehicle it was necessary to have some sort of road, but if the traffic-density was small a vehicle of the type to which Sir Henry Fowler had
referred could be used, which needed only a primitive road, and which would actually improve the road by being sent backwards and forwards over it. That had been proved in South Africa, where instead of building branch lines road feeder-services had been organized, on which four or five hundred vehicles had been running for some years. The route mileage of the railways of that country was about 14,000, but in the last 6 or 7 years over 10,000 miles of such feeder-services had been established, which had the same rate-structure as the railways. Many branch lines had been contemplated, but the advent of the big six-wheeled vehicle with pneumatic tires had caused road feeder-services to be adopted instead. A loss on the branch-lines was expected, but the feeder-services / began to pay after the first 2 or 3 years, and they now extended as far afield as Swaziland. The cost was rather less than the figure given in the Paper, being about 4d. per ton-mile, as petrol was fairly cheap. With road feeder-services some commodities might be carried at too high a rate on the road and too low a rate on the rail, or vice versa, but it enabled the whole community to get its goods transported to the coast or to other cities and towns where they were wanted. In South Africa, as at home, trouble had arisen from independent road competition, which was regarded as unfair; but the course suggested by the Author had been taken and legislation had been passed to prevent competitive transport by road parallel with the railway; it could only be done by license and agreement. A farmer or private owner was allowed to come in to a definite railway-station or centre, but was prohibited from working alongside the railway. The railways themselves, however, ran parallel services to get the goods where they were required. There might be 10 or 20 miles of railway-line without a station at all, and it usually happened that the railway had followed the old bullock track, so that there was some parallel working. Near the towns a certain amount of money had been spent on the roads, but not more than 10 per cent. of the 10,000 miles of route over which road feeder-services were being worked was anything better than an earth track; and there could be no doubt that, where the traffic was not above a certain density, the big pneumatic-tired vehicle improved rather than damaged the surface of the road. It was not like many tropical countries with many watercourses to be crossed, though there were some in the Drakensberg Mountains. Bridges were very few; the vehicles went through the rivers, which were only occasionally in flood. In the report of the General Manager of the South African Railways for 1933, several pages were devoted to the unfair animal competition which had arisen recently. Times were hard, so that there was a surplus of oxen and donkeys; and the General Manager said that it was most unfair and that some action must be taken; the railway, having first of all suffered from road-competition and met that by legislation, had now to suffer competition from animal transport. It seemed that more enlightenment was needed on the basic principles on which comparisons should be made.
Brigadier-General Sir H. Osborne Mance congratulated the Author on his Paper, which was the best he had ever read on the question of colonial railways and roads. The Author estimated the cost of the motor transport to be 6d. per ton-mile, and he thought it might be of interest if he quoted from some statistics he had received on the subject of motor-transport rates in Persia, where a considerable mileage was covered by road-services. There was only one rate of over 6d.; for the most part the rates were between 2d. and 4d. per ton-mile. From Mohammerah to Tehran, 748 miles, the rate was 3.7d. in one direction and 1.8d. in the other; from Bushire to Tehran it was 6.7d. in one direction and 2.7d. in the other; while across the Syrian desert, from Damascus to Bagdad, the rate in one direction was about 4½d. and in the other direction about 2¼d. Those figures showed not what the transport cost, but the rates that a native could offer, by overloading his vehicle and forgetting all about depreciation until it was too late. On p. 550 of the Paper, dealing with the economics of road surfaces, reference was made to a saving of £150 per mile per year achieved by improving the surface. He would like to point out, however, that that amount could be recovered only if a system of tolls were instituted, which was not practicable under colonial conditions, or if the operation of road transport over the improved section were a monopoly. He had recently had the honour to be the British member of an independent Committee which was asked to report to the International Chamber of Commerce\(^8\) on the question of road and rail transport. They had concluded that the main factor was not one of taxation, but was that referred to by Sir John Thornycroft, namely, the rate-structure. He cordially advised all those who wished to study the matter to read a French book\(^*\) in which the matter was dealt with very clearly. With a monopoly, the present railway rate-structure was inevitable and advantageous; without a monopoly, it was impossible. If, therefore, it was desired to maintain the present rate-structure for colonial services, it was necessary to create a monopoly, which could best be done by giving the sole right of transport parallel to the railways, except for local and feeder services, to the railways themselves. They could then maintain their present tariff, which was to the advantage of everybody. It was desirable to encourage feeder-services, and for that reason he agreed with Sir Henry Fowler that it would be undesirable to limit the axle-load to the extent referred to in the Paper, because they should be operated with the most efficient machines obtainable. He thought, however, that it would be found necessary to license them, in order to protect sound undertakings from irresponsible competition. If the railways were not to be given a monopoly, but competition were permitted, it would be necessary to give them freedom to fix their own tariffs; but he would draw attention to the

fact that they could not increase the tariffs on the low-grade produce, because ex hypothesi under the present tariff structure those tariffs were as high as the traffic would bear, and if they were increased that traffic would stop. The railways, therefore, could not really increase those tariffs except in special circumstances, where conditions had changed since the tariffs were first fixed. In East Africa there were certain export rates which involved carrying the goods at a loss, but which were profitable because of the return import traffic at high rates. Those export rates could not be raised, because if they were the traffic would not pass, but they would be suppressed under a regime of unrestricted competition, because the railway would not accept a loss on the export traffic if it was not going to get the import traffic with which to recoup itself. Where there was competition between different means of transport, the tendency was to cut the rates down in competition to just above the variable cost of working, and that meant that the railways and the motor undertakings would cut right down to the bone, so that both would tend to become commercially impossible. It was therefore very important that the policy to be adopted should be settled as soon as possible, before that mutually destructive action had taken place. A cardinal principle of British transport policy was that each means of transport should pay its way, and that applied not only to private railways but also to Government-owned railways in the Crown Colonies. That was not the case, however, in some countries; many Continental countries, for instance, used their railways deliberately as an instrument of economic policy, not caring whether they made a profit or not. Germany subsidized canals, railways, motor and other transport services, and other countries did the same. In the last resort railways and even road transport would have to be subsidized in England, if it were necessary in the interests of the country, rather than allowed to go out of business. Experience had shown, however, that in some countries the subsidies were already becoming too heavy a burden on the national budget. For example, in Victoria, Australia, the railways were State-owned, the railway revenue was included in the budgetary revenue, and the railway expenditure in the budgetary expenditure. The railway revenue was about 50 per cent. of the budget revenue, and railway expenditure about 50 per cent. of the budget expenditure; while the interest on the railway debt was roughly 50 per cent. of the interest on the total State debt. If the railway position became such that there was no net revenue, it would be necessary to increase the non-railway taxation of the country by about 25 per cent. That was a very significant figure. He had worked out similar figures for other colonies, and for some of the African colonies he had found the interest on the railway debt to be from 8 per cent. to 16 per cent. of the non-railway budget, which demonstrated the liability which might be incurred if the railways were not allowed to earn anything to cover their interest charges. Of course, Government subsidies meant higher general taxation, unless the Author’s suggestion were adopted and a
special tax imposed on motor-transport to make good the railway losses on high-grade traffic. That suggestion sounded very nice so far as Government railways in colonial conditions were concerned, but, if it were applied to a country with private railways, he imagined it would meet with the execration which awaited any proposal to penalize a new means of transport in order to subsidize shareholders in an obsolete industry! Incidentally, he did not think that there was sufficient gratitude in England to the railway shareholders for saving the country from the additional taxation which would be necessary to meet the interest on the railway debt if the railways were State-owned. However, he thought it was safer to regulate road and rail competition by licence, and this was easier under colonial conditions, as the ancillary services, which caused serious difficulties in connection with any such proposal in a developed country, were comparatively small and doubtless easy to control.

Mr. G. V. O. Bulkeley, of Nigeria, thought that it might be taken as axiomatic that the proper development of the Crown Colonies and Protectorates would depend upon the co-ordination of both railway and road transport, and he proposed to consider a few of the financial and administrative difficulties of effecting that co-ordination. In the Crown Colonies and Protectorates (though not in the Dominions, because the problems there were quite different), the railways had been built by the Governments not to earn dividends but to develop the colonies and the indigenous peoples thereof. In those tropical lands construction was expensive, so that the railways were often heavily capitalized per mile in relation to the average earning-power of the native population which they served. The result of that was almost inevitably an annual deficit on the railway, at any rate while the development of the colony was progressing, and that deficit was usually met by the Government out of the general taxation of the country. If, as the colony developed, the whole of the available traffic were handed to the railway, he thought the rates could in time be cut so low that they would be below the rates at which road motors could economically work. That, however, was not what occurred; the African owner-driver cut in more and more with his vehicle. As the Author had pointed out, his low standard of living, hire-purchase of his vehicle, general lack of maintenance, and almost invariable overloading enabled him to compete unfairly with the Government railway. A further point was that the Government railway, in order to serve as many places as possible, was very seldom the shortest route between two main centres, whereas the road short-circuited them; and that also gave a considerable advantage to the African owner-driver. If he was allowed to multiply, there was produced, sooner or later, a horde of vehicles which, competing with the facilities already given by the Government railway, caused an uneconomic glut of transport in various districts. That had already occurred in Nigeria; for instance, there were several hundred road motor-vehicles plying between Ibadan and the
coast, about a hundred miles away. Another factor which helped the owner-driver in those countries was that the centres for marketing produce were not stable, so that as time went on they might migrate to places perhaps 20 or 30 miles from the railway, which again gave the road vehicle a shorter route to the port than the railway could provide. It might be said that it should be quite easy to evolve a co-ordinated system under which the revenue of the railway would be safeguarded and the road given its proper sphere; but in fact the interests of the African tended to prevent that being fully done. It would be appreciated that the cardinal principle of all the Governments of the Crown Colonies and Protectorates was the development of the native himself; and, although the Government owned the railway, they were loth to legislate in a way which would interfere with any legitimate earning-power of the native. Colonial Governments were therefore faced with a difficult problem in dealing with the co-ordination of road motor-vehicles and the Government railway. Recurring railway deficits, however, combined with the prolonged trade depression, had made it necessary for Colonial Governments to act. A sound public opinion was all-important. In Kenya, recently, the Government had been immensely assisted in that respect by the leading Chambers of Commerce in that colony passing resolutions in unmistakable language calling on the Government to regulate motor transport, which was paralleling and short-circuiting the railway – on the ground that the railway was the national transport system, and that anything which tended to reduce its revenue by uneconomic competition might very easily produce the necessity for additional general taxation to meet the deficit. He thought the best method of co-ordinating road and rail transport in a Crown Colony, speaking broadly, would be for the main line of railway to penetrate the colony fully and for the railway to operate road-vehicles with diesel-engines in remote districts, rather than to build branch lines; except where there was mineral traffic which lorries could not handle. The country should then be divided transversely into 30-mile zones, extending a reasonable distance on each side of the railway, and public road vehicles licensed for one zone only, no motor-transport being permitted from one zone to another, either directly or by relay. By means of registration plates of different / colours and some police supervision, leakage could be controlled. Public motor-vehicles would be allowed complete freedom of action in their own zone, transversely and longitudinally. In the coastal zone, road vehicles should be operated under special licences only to perform services which were deemed to be in the public interest, in order to concentrate the export and import traffic on the authorized port and to prevent leakage across the foreshore elsewhere. Colonial Governments, moreover, should not construct any more motor roadways which closely paralleled or short-circuit the direct railway route. He thought a scheme on the lines he had indicated would probably coordinate the services as well as could be expected.
Mr. F. C. Cook thought that the Paper was particularly interesting because the Author had approached from a new angle problems which had beset many European countries, and which at present were of vital concern to England. The picture which the Author drew of the native owner-driver, with no overhead charges, the roadside his garage and the bus his home, working long hours for a bare living and uncontrolled by such factors as depreciation and renewal, was somewhat akin to the position which arose in this country immediately after the war, when ex-Service men, whose gratuity was sufficient to buy a second-hand lorry in some stage of decrepitude, endeavoured, pluckily enough, to earn a living for themselves, with results in many cases disastrous to already-established forms of transport and indeed to transport as a whole. Those who were concerned with road administration must find it difficult to credit the very low costs of which the Author gave illustrations. £3,000 to £5,000 per mile for narrow-gauge railways and £1,000 per mile for macadamized and tarred roads were figures which, presumably, could apply only where ample local material was available and where labour was almost as easy to obtain as it was for the building of the Pyramids. There was one calculation which the Author made, however, which he did not quite understand. The Author put the extra cost of macadamizing a gravel road at £850 a mile, and gave the annual charges as £51. On the basis of interest at 4 per cent., he therefore appeared to have assumed a life of something over 30 years for the road, which was surely very much in excess of its probable life, no matter what the traffic might be. In one way the conditions discussed by the Author differed very much from those with which European countries had to deal, as in all the countries referred to the railways had preceded the roads, whereas in countries of earlier civilization roads had formed the accepted means of transport centuries before the railways came into existence; but, in either case, there was evidently the same complaint of the detrimental effect of road competition upon the railway. As had already been mentioned by General Mance, it would seem that in new countries there should be no difficulty in so controlling road and railway development as to preclude uneconomic competition. It was thoroughly undesirable that such a position should be allowed to arise as that which existed in Tanganyika, where road charges were so excessive that the effect of railway competition was to reduce them by no less than one-third, namely, from 2s. to 1s. 4d. per ton-mile. The Author pointed out that in many tropical countries primitive pathways were all that was required for the convenience of the population, and that roads were unnecessary except for the purposes of motor transport. Even under such conditions as those it seemed that roads must have some value to the community, and that that factor would assume greater proportions as industrial and social development proceeded. If that were admitted, then it would be unreasonable to burden motor traffic with the whole cost of road construction, unless indeed the road were to be preserved.
solely for the use of mechanically-propelled vehicles. He agreed with the Author that it was in accordance with sound economic principles, and indeed in the interest of the road itself, from the point of view of upkeep, that commercial transport using the road should be capable of earning interest on capital expenditure, providing for depreciation, and paying adequate wages to the personnel engaged. He agreed also that regulations might be necessary for governing axle-loads, charges, and in some cases freights, and for ensuring that road vehicles paid such share of the cost of upkeep of the roads as might properly be apportioned to them. The difficulty of assessing the last-named factor was well known in England, and those who had to deal with the problem in new countries, where there was no need to make allowance for what the Salter Conference denominated ‘the legacy of the past,’ were very fortunate. Mention of rates led him to suggest that the railway method of charging what the traffic would bear had resulted inevitably in discrimination which might operate unfairly in favour of some particular article, and had led directly to the competition from road haulage which the railway companies had found reason to deplore. It was noteworthy, for instance, that in the case of Uganda in 1932 only 2 per cent. of the tonnage of goods was carried at the three top rates, whereas only a few years previously those three classes contributed the large percentage of 25 per cent. of the total revenue. The differentiation in railway rates to which the Author alluded must inevitably encourage competition by road, especially for the transport of the higher-rated goods, and competition once established tended to spread. He was inclined to agree with the Author that the nearer the approach to a uniform rate for all kinds of traffic, the more readily would the railways secure the traffic. In that connection it must be remembered that the new countries with which the Paper was concerned were particularly dependent on the export of commodities brought to the coast often after long haulage, which in the case of Kenya was upwards of 300 miles. The Author implied that the particulars he gave were applicable only to the territories specifically mentioned in the Paper. To many members, however, the main interest of the Paper must lie in their application to the conditions in England and similar countries. A most interesting report, to which General Mance had already referred, had recently been published by the International Chamber of Commerce.* The Report, in its conclusions, considered that the function of the State was not to maintain the status quo or to favour one means of transport at the expense of another, but to create the requisite conditions for securing the maximum efficiency of all means of transport, and to further their evolution in the interests of the general welfare of the community and of technical progress. Those aims could be attained only by

* ‘Introductory Report submitted by the Committee of Independent Experts on Road and Rail Transport to the International Chamber of Commerce.’ International Chamber of Commerce, Paris; Brochure No. 85; October, 1933.
Spiller, ‘The Respective Merits of Roads and Railways for Colonial Development’  383

a series of measures, the nature and scope of which would be influenced by the conditions existing in the particular country. It followed, he thought, that the maximum efficiency of one means of transport or another was not likely to be achieved without the stimulus afforded by competition, and competition could not be effectively secured if all reasonably available means of transport were in one ownership. In new countries, or in any country where both roads and railways were property developed by the State, it might be that good administration, strengthened by the force of public opinion, would meet the requisite needs, but otherwise there was no alternative to the regulation of both systems in such a manner as to ensure that neither was favoured by unfair advantages nor, on the other hand, hampered by undue restrictions. He would put forward the following considerations. The greatest hindrance in the development of an efficient system of transport lay in the suggestion, expressed or implied, that the interests of the railway and the road were mutually antagonistic. Except in those cases where produce could be railed over a long uninterrupted mileage from the fields to the port, railways must be fed by an adequate road system, and neglect of that principle had probably led to the construction of many miles of railway which could not be economically justified. Roads had the advantage of being capable of gradual improvement to meet the needs of the traffic to be served, provided that point / was borne in mind in the initial lay-out, alignment and grading, and development of the road system beyond its use as a feeder to the railway was closely related to the growth of private-car traffic. In new countries rail and road transport should be wholly complementary, although as social development increased they might tend in certain respects to become distinct; each service must be judged on its merits, and one could not be placed in a subordinate position to the other. It was therefore essential that, in new countries in particular, road and rail development should be so controlled that they proceeded with due regard to the needs for which each was best adapted.

Mr. E. L. Leeming remarked that the Author had covered his subject in a comprehensive manner, and he found it rather difficult to deduce conclusions on transport problems. He thought that there was a good case for constructing earth roads as service roads alongside railways, which were often the best routes for them to take, and he did not see the reason for the Author’s suggestion that there should be a limit on the type of vehicle using those roads; that limit would be set very largely by the type of road itself, particularly in the case of earth roads. There was a strong argument for reducing the joint costs of roads and railways by the common use of gradients, routes, bridges, viaducts, drainage and other facilities, which were advantageous to both kinds of traffic. All costly bridges, whether railway or road, should be designed to accommodate both types of traffic. For example, had the Forth Bridge been designed for road-traffic as well as rail it would have been of immense advantage to the adjacent districts. Another
example was the Britannia Bridge over the Menai Straits; even now he thought that bridge could be made to carry road-traffic on the top flange. Further, he thought that road-traffic could pass over some of the existing railway-bridges intermittently or at week-ends, and the railway companies could recover a good deal of revenue from road traffic to offset their expenditure on those bridges. It would seem that railways should lead to centres of development and industrial areas, and that perhaps greater ramifications in the way of branch-line connections should be made to improve the utility of the railways. Questions of cost often appeared to be considered too narrowly. Interest charges at the moment were low, and there was a strong argument for constructing further railways and roads by capital expenditure. Motor-car transport, in spite of heavy taxation, was in keen competition with the railways for passenger-traffic. Electric railway passenger-services were of more value when they passed through the centre of towns either on the surface, where practicable, or just beneath the surface, as in New York. Adjustment of railway-rates where road-competition over short distances existed was only similar to the policy adopted by the Post Office, which subsidized postage to the colonies or over long distances, and certainly did not carry letters at an economic rate from Land's End to John O'Groats. Where tramways existed in towns, rail-truck haulage at night-time could be instituted with advantage. One serious disadvantage of rail-traffic as compared with road-traffic was the heavy weight of rolling-stock. The Author said that road-transport charges did not cover the cost of road-upkeep; personally, he thought that depended on the particular taxation in the country concerned. At the present time in England road transport was subsidizing in many ways various State services. The Paper appeared to suggest that national planning should be carried out, that road and rail should be dealt with jointly under one control and as one interest of the type of the London Passenger Transport Board. He felt that it was on those lines that the best and most economical results would be obtained from road and rail development in the colonies.

The Author.

The Author, in reply, said that Sir Henry Fowler had referred to the question of feeders to railways and to the road vehicle which his Committee had produced. All colonial railways needed lateral feeders, and he did not think that in the future any one was likely to suggest that a branch railway should be built where it was possible to provide the necessary traffic facilities by means of road transport. Sir Henry had asked whether the costs of rail transport quoted in the Paper were operating figures only, or whether they included the overhead charges for interest, depreciation and so on. The year 1932, for which the figures were given, was an exceedingly bad year for colonial railways from the point of view of revenue. In the Federated Malay States in 1932 the railways earned less than half of what they earned in 1930, and the working results of 1932 were not a measure
of the ability of the colonial railways to earn sufficient to cover all their overhead charges; but average receipts of 2d. per ton-mile on the Nigerian Railway, 1.54d. on the Kenya & Uganda Railway, and 2.5d. on the Tanganyika Railway would have been sufficient to yield a net revenue which would have covered all interest and sinking-fund charges on those railways. The Author agreed that freedom should be given to 30-cwt. lorries to operate on colonial roads, but he believed that there were a number of lorries with a carrying capacity of 30 cwt. whose axle-load did not exceed 2 tons. Colonial bridges had been designed in recent years for two standards, namely, heavy and light. The heavy standard was suitable for axle-loads up to 8 tons and the light standard for axle-loads up to 4 tons.

Sir John Thornycroft had referred to the fact that road-haulage costs in South Africa were about 4d. per ton-mile, which was appreciably less than the figure given in the Paper. He believed, however, that in South Africa very heavy lorries were employed, also that trailers were used to a large extent, and therefore the loads could be increased and the cost per mile reduced. On the South African Railways rail costs averaged less than 1d. per ton-mile, so that the ratio of road costs to rail costs was 4 to 1, or even, larger than the ratio adopted in the Paper.

General Mance had said that the present rate-structure was inevitable and advantageous with a monopoly, but impossible without a monopoly, and that, if the present rate-structure for colonial services was to be maintained, it was necessary to create a monopoly and thus maintain their present tariff. He pointed out that colonial railways could not increase their tariffs since, presumably, they were as high as the traffic would bear. The Author thought that was undoubtedly so at the present time but, if the prices of tropical commodities were to increase appreciably within the next few years, there would be a possibility of increasing rates. It was, in fact, a question whether railway rates should not be on a sliding scale, varying with the price of the commodity. In that way profits could be made and set aside in years of prosperity to cover losses during periods of trade depression. The export rates were those which presented the greatest difficulty, because in tropical countries the wealth of the country was due chiefly to agricultural products which had to be carried at low rates if they were to reach world markets. It was only the wealth arising from the marketing of those tropical products that could pay for the imported goods which, being of greater value, enabled road transport to operate successfully.

Mr. Bulkeley’s suggestion of zoning road traffic was very interesting, and should provide a solution for some of the disadvantages arising from unrestricted competition, as it would prevent road traffic competing over the long distances for which rail transport was the more suitable.

Mr. Cook had referred to the statement that in Tanganyika road haulage charges had dropped from 2s. to 1s. 4d. per ton-mile where there was railway...
competition. He thought it should be made clear that the charge of 2s. per ton-mile was made in remote districts where traffic was very light.

It had been suggested by Mr. Leeming that costly bridges should be designed to accommodate both rail and road traffic. That was often done in the colonies, and the recently-completed Benue bridge across the river Niger was an example of a bridge constructed to carry both rail and road traffic.

[...]

Mr. H. C. M. Austen, of the Mauritius Railway, remarked that the Midland and North lines of that railway, completed in 1864, had been constructed to the English standard gauge, with chairs. Mauritius being a small island, and already provided with very good military roads (made of the excellent basalt stone abounding in island) to link up the various fortified posts round the coast, as well as sea transport, it was doubtful whether a railway, and certainly a standard-gauge railway, was ever required. The development of the Colony would, however, have been retarded if none had been built. The railway, when once constructed, did give very great impetus to the island’s sugar production. The output in 1865 was about 120,000 tons, and that in 1933 was 262,000 tons. In 1914, the output was slightly larger than that figure, and it was certain that no system of mechanical transport, other than the railway – obviously not the old mule- or ox-cart system that existed in 1860 – could then have transported so large a tonnage. The very important factors of weather and time had also to be considered. Sugar would not keep in the moist upland climate of Mauritius, where a great many of the factories were, and, as the crop was cut between August and December, the sugar had to be carried promptly to Port Louis for storage and, moreover, carried in such a way as to keep in good condition en route. It was generally conceded that the railway was essential for the sugar industry in Mauritius. Unfortunately, there were a number of factories which seemed unmindful of the original impetus given by the railway to the industry, and preferred to send their sugar by road rather than pay the very slightly higher rates demanded by the railway, thereby depriving the railway of about 18 per cent. of the total tonnage available for transport. The sugar rates and general goods rates on the Mauritius Railways averaged 3¼d. and 2d. per ton-mile respectively. Those rates could not be considered exorbitant, but the railway had to carry on a perpetual competition (which, in itself, was not an evil) with road-transport / companies, though those companies had apparently considerable difficulty in making both ends meet without dipping into their depreciation funds to pay dividends, or, alternatively, raising fresh capital when their old plant was worn out and new plant became a necessity. Heavy gradients affected the cost both of road-and rail-transport; the railway, on its Midland line, over a length of 16 miles, had long gradients of 1 in 26 to negotiate, the peak being 1,800 feet above sea-level at Curepipe, about equidistant from the terminal points 36 miles apart, i.e. Port
Louis, Mahebourg and Souillac. The North line and the other branch lines were reasonably level, and he considered that under present tax and import-duty conditions it would only be economically sound to carry goods by road within a distance of about 10 miles from Port Louis. On the other hand, the revenue derived from motor-spirit and lubricating-oil importations was large, so that all the indications pointed to the need for a unified central control which should hold the balance equitably between the various systems of transport, old and new, that the Colony possessed.

Passenger traffic receipts had fallen from Rs.1,500,000 in 1927/8 to Rs.420,000 in 1932/3, owing to the rapid development of buses and cars. The number of bus journeys made in 1928 was 61,000 carrying 850,000 passengers, as against 186,000 bus journeys in 1933 carrying 3,000,000 passengers; the buses used in Mauritius were of the ‘light’ type. The Mauritius Railway did not expect to recover all its former passenger traffic, but had cut down and speeded up its train service and reduced its fares in such a way that it had definitely and, he thought, permanently recovered sufficient passenger traffic to yield a revenue in 1934 of about Rs.500,000. Further, a revision of rates and a door-to-door rail-and-road service, the road work being effected by contract, had produced a marked improvement of revenue from general goods traffic, which should be maintained. Railway costs had, at the same time, been thoroughly overhauled. In spite of heavily increased expenditure due to gratuities and pensions, as the result of drastic reductions in personnel, the total expenditure had fallen from Rs.3,230,000 in 1927/8 to about Rs.1,700,000 in 1933/4. Replacements of rolling stock by items of more modern design were gradually being made, and a fixed sum annually would in future be set aside for the renewal of railway wasting assets. He considered that there was no reason why the railway should not continue to function to the economic advantage of the Colony, working side by side with the roadways, provided that the transport situation generally was firmly controlled by an impartial authority, with due regard to the present and future needs of the Colony and a sound technical judgment on all mechanical systems / of transport and their developments, always bearing in mind the commercial and financial issues involved in relation to the local problems which such developments might be designed to assist. Views on traffic control similar to those expressed by the Author were embodied 2 years ago in Mauritius under the Transport Control Board Ordinance, but the issue of regulations putting into effect certain of the powers so conferred has been delayed by other matters.

Mr. H. D. BINDLEY remarked that during the last 10 years the following railway extensions had been constructed in the Sudan:

- Haiya to Kassala(1923–24) 347 kilometres.
- Kassala to Sennar(1926–29) 455 “
- Khartoum to Gordon’s Tree(1930) 8 “
- Gordon’s Tree to Gebel Aulia(1933) 38 “

848 kilometres or 530 miles (of single track).
The average cost of those lines, including station buildings, quarters for staff, telegraphs, signalling, bridging, etc., was approximately £E.3,000* per mile. Motor-transport competition with the railways began about 1927 and, at first, was limited almost entirely to the cotton-growing area of the Gezira and to the carriage of passengers in that area, but later it extended to the transport of goods as well. Its development progressed rapidly until retarded by the economic depression, but there were indications of its revival. Some years ago the railways introduced motor-transport services of their own in order to obtain first-hand experience of that form of transport as feeder-services. The urgent necessity for retrenchment resulted in the abandonment of the schemes, and unfortunately the comparative results of the working of a motor-transport scheme on a sound basis as against the native-operated schemes were lost. The Author’s comparisons of the Government-owned motor-service and the native bus-service was as applicable to the Sudan as to the colonies about which he wrote. The Sudan Railways charges varied from less than 1 millième (¼d.) to nearly 21 millièmes (5d.) per ton-kilometre. The average full working costs amounted to about 2-2 millièmes and average rates to 3-6 millièmes per ton-kilometre. Privately-owned motor-transport operating in the Sudan had as yet little or no public responsibility and was practically free from control. Its method of assessment of charges was therefore bound by no prescribed principle. It would probably not be far wrong to take an average figure of 11 millièmes per ton-kilometre as the present minimum working cost of motor-transport in the Sudan. That figure was no less than five times as high as average railway working cost, but even so was far below the upper range of railway charges, wherein lay the ability of motor-transport to attract traffic from the railway. Motor-transport had not found conditions of operating in the Sudan as favourable as in many other countries. Distances were great, and proper roads practically non-existent. Also, except possibly in the Gezira, there were no areas having an appreciable density of local traffic. Throughout the greater part of the year, nevertheless, the conditions offered considerable opportunities for the resourceful private motor-transport owner to ply alongside the railway, offering to carry passengers at lower fares, and goods at rates lower than the higher ranges of railway-rates.

Mr. M. B. BUXTON observed that the development of African Colonies had been for a long time almost impossible owing to the curse of slavery; the natives would not settle down to cultivation and trade when at any moment raiders might appear and carry them off into slavery. Those who at the beginning of last century fought the slave trade recognized that the building of good roads in such countries as the Gold Coast and Nigeria would open up the country to lawful trade and stop much of the slave-raiding, and constantly advocated their con-

---

* £E1 equals 1,000 milliemes equals £1 0s. 6d. sterling.
struction. The subsequent history of Africa had proved the correctness of that
view and shown the utility of roads both in the cause of humanity and colonial
development; he was convinced that in backward countries good roads were of
more value than railways.

[...]

Mr. C. L. Cox, of Nigeria, remarked that the Paper would be read with very
great interest by colonial officials. It well crystallized the road and rail situation
and gave a mass of pertinent information. The dictum in the last paragraph was,
he suggested, too stringent; and he would prefer to say that colonial prosperity
was dependent on the efficient and co-ordinated development of all transport
services. In Nigeria a considerable volume of traffic was carried by the waterways.
The cost of road-transport, including all charges, might well be less than that of
a section or branch of a railway / running at low capacity or subject to widely
varying seasonal traffic – a traffic that road-transport organizations could, if road
intercommunication were adequate, more easily adjust themselves to meet.

He suggested that roads were in any case essential to the opening-up and settle-
ment of a country, to the intercourse of its peoples and to its administration, and
– if human labour were to be spared – that they must precede the railway which
later they might feed. Moreover, the possibility of improvement, perhaps revo-
lutionary, in the mechanics and economics of self-propelled road vehicles and in
methods of road construction should not be overlooked. Road-transport rates of
less than 3d. per ton-mile had been freely quoted in Nigeria, and – whether those
rates were remunerative or not, and however uneconomic his financial arrange-
ments might appear – there as elsewhere the native owner as owner-driver had
come to stay. The annual maintenance cost of the metalled, gravelled and earth
roads maintained by the Nigerian P.W.D. now averaged £28 per mile, and recent
experimental work, on the lines of the bitumen-surftaced so-called ‘low-cost’ roads
of the United States, indicated that it should be possible, when increasing prosper-
ity warranted it, to provide roads suitable for considerable traffic at a reasonable
cost and without recourse to heavy metalled construction.

It was refreshing to read references to the savings in transport costs that
could be effected by good roads. Those savings did not accrue directly to the
responsible road authorities, and their economic influence was frequently over-
looked or disregarded

Mr. F. D. EVANS observed that a full appreciation of the subject required more
information than was given in the Paper, or was indeed available, that the relative
costs and comparisons of road – and rail – transport would be found to differ
widely in different countries, and that the relative deductions and conclusions
would differ, in principle or application, from those presented by the Author.

To the considerations (a), (b), and (c) on p. 546 he would add ‘(d) the ultimate
cost and other factors concerning transport of traffic from origin to destination.’
It seemed inappropriate to him to consider only the cost of constructing railway extensions, as on p. 584 – from £3,200 to £7,000 per mile – since those figures did not include the cost of rolling-stock and expensive facilities necessary for operation; the inclusive cost per mile of a system should be considered (for example, in Nigeria it was £11,600 at the close of the financial year 1932/33); in particular circumstances it might be reasonable to consider some lower figure than the inclusive cost per mile. / 

The average cost of rail-transport per ton-mile, to which reference was made on p. 555, might be misleading in regard to certain aspects of the subject of the Paper; the low costs per ton-mile on a heavily-trafficked section of a railway might obscure the high costs on other sections; in that connection the appropriate cost per mile of extensions might be important.

The cost of constructing and maintaining roads varied greatly with the nature of country and soil passed through, the climate, the class and weight of traffic to be carried, and the standard of construction and maintenance. The weights and types of vehicles were of importance, as well as their numbers. He believed that the American figures quoted on p. 550 related mainly to cars. In Nigeria, most motor traffic included 70 per cent. or more of lorries and buses.

The high maintenance-charge noted for Malaya was due to the high standard of maintenance, the climate, and the sub-grade difficulties, and not to traffic density on country roads. Some gravel roads in south-west Nigeria, totalling 79 miles in length and in fair to good order, carried average traffics varying from 150 to 230 vehicles per day (say 600 to 1,000 tons gross) at an average annual maintenance cost of £57 per mile in 1932/33. The carriageways only cost £35, and improvements – mainly widening – £3 10s. Those were the most heavily-trafficked gravel roads in the country.* The maintenance cost of bituminous surfacing averaged £42 per mile for carriageway only. Those costs were exclusive of engineering and establishment charges, which added approximately 25 per cent. Expenditure on other roads varied from say £5 per mile per annum upwards. While it was true that tractive resistance was less on smooth and costly pavements than on earth or gravel surfaces, he thought that much of the published work on the subject had preceded the recent advances in road maintenance. Earth and gravel roads were not necessarily bad from the point of view of driving comfort or vehicle-maintenance. In any case it was generally true that the cost of roads, when dictated by traffic considerations, was a small proportion only of ton-mile costs, which decreased with increasing traffic. Political considerations in the colonies usually prevented the allocation of funds for roads in excess of the essential minimum.

* The traffic counts were made in 12 hours’ daylight on successive days of record periods. The night traffic was not known, but had been found on some roads to be from 25 to 30 per cent, of daylight traffic during the busy season of produce movement.
Small independent transport enterprises were of the greatest value: 25 years ago, when in Malaya, he had been of the opinion that native motor-transport practice was unsound, but experience had demonstrated the contrary. The hire-purchase system, in Nigeria, required cash payment of half the cost of the vehicle, and insurance until the vehicle was paid for. Large motor-transport organizations had no particular public advantage and many disadvantages; European overhead expenses were heavy, and not ultimately necessary in the tropical colonies.

Whatever the form of ownership and organization, transport owners would charge the maximum they could recover – in other words ‘what the traffic will bear’ – which made it difficult to ascertain costs. Evidence, given to a Nigeria Committee on road and railway competition (of which Mr. Evans was a member), showed that, directly parallel to the railway, road charges per ton-mile varied from less than 2d. upwards, the variation being governed by the railway rates. Road charges in the same area, not directly competing with the railway, were less than 3d. per ton-mile. Petrol cost approximately 2. 2d. per gallon. In the case of road-transport, between Lagos and Ibadan (112 miles by road, 120 miles by rail) the charges per ton-mile then varied from 1.9d. to 2.7 d. according to season (at the time of writing they were 1.6d.). The average capacity of vehicles was less than 2 tons; all had pneumatic tires. The Committee concluded that even a modern economical (petrol) vehicle would operate at a loss at the lower rates per ton-mile, but that profit was made by charges on casual passengers and loads; that vehicles were reasonably well maintained and operated; and that overloading and overspeeding did not generally occur to a dangerous extent.

An important factor was the ability to obtain full loads on all journeys. Recently, moving some 1,500 tons of ground nuts over a distance of 15 miles in Northern Nigeria, 800 tons were transported by camels at 3.6d. per ton-mile and 700 tons by motor-lorry at 6.8d. per ton-mile. Pack animals were not available to carry the 700 tons moved by motor-lorry; little return traffic was available, and petrol cost approximately 3s. per gallon. An assessment of the average cost of motor transport, without regard to the circumstances of particular cases, was as misleading as the similar assessment of the cost of railway transport.

He suggested that the ‘common carrier’ obligation of railways to accept and provide facilities for all kinds of traffic was not material to the point at issue; in so far as railways did so it was by virtue of legal compulsion on account of their monopoly; any other carriers would quote rates for anything within their capacities, and railways did no more. Any carrier would charge ‘what the traffic will bear’ unless prevented from doing so, and he thought that complicated railway rate-structures, built up under conditions which no longer obtained, were not necessarily sound. They could only be maintained by a monopoly. The system might lead to good or evil, but in the colonies he thought the latter was likely; it would seem preferable to endeavour to establish, and charge in relation to,
the real costs, and to subsidize or penalize industries and development by direct allocation to the railway or by import and export duties. When a community exported low-rated produce and imported high-rated produce in reasonable ratio there might be no disadvantage, but when one area exporting low-rated produce on a long haul was given preference against another area exporting on a short haul, the results might be the reverse of those aimed at or desirable. It was pertinent to ask who should bear the loss on transporting nearly 200,000 tons of ground nuts from Northern Nigeria, referred to on p. 564 Traffic that would bear high rates was not everywhere a marked feature of colonial import business; it became less during periods of depression.

When comparing rail- and road-transport he would add that colonial roads and railways had been and would be built not merely for traffic purposes but with a view to easier pacification and administration, also that the need for talking into account funds invested in railways and road-transport might make the problem of existing or potential competition different from that relating to transport in new areas. While the capacity of railways to transport traffic cheaply when concentrated was often a decisive factor, it did not follow that that would be the case when concentration was wasteful or when the railway route was longer than alternative routes. The use of fuels other than petrol might lessen the cost of road-transport. Minimum road-transport costs, based on full loads on all journeys, were possible only when alternative transport was available to deal with one-way loads.

He would suggest that roads should run parallel to railways, and that they would do so when traffic was developed by roads in advance of successive railheads, for the reasons given by the Author. Mr. Evans agreed that road-transport should not be privileged; studies in Nigeria had shown that petrol duty at 8d. per gallon, licence fees, etc., were more than enough to cover inclusive road costs where traffic was moderate, but the greater mileage and expenditure was in respect of roads carrying only a few vehicles each day. He nevertheless thought that road-transport should bear their whole cost.

He suggested that so far as the reasonable operation of colonial railways had been seriously threatened by road-transport, prevention and remedy were largely matters for railway administrations; it was evident that the efforts now being made by railways in all countries to provide better service were the direct outcome of road-competition. A rate-structure based, on costs of service would solve many of the difficulties of road and rail competition in the colonies. The Government of Nigeria, with the advice of the Railway Administration, had recently introduced a flat rate of 2d. per ton-mile for all traffic in the competition zone, with a few minor exceptions. At the same time increased licence fees, and better traffic inspection and control, had been imposed on road vehicles competing with the railway. He thought that regulation should be on behalf of
each colony or suitable group as a whole, and should in no case be decided by limited vested interests, however large they might be. He had to confess to prejudice against all large corporations of a monopolistic character. Motor transport was essential to countries generally, as well as to the profitable operation of colonial railways, and its further development was of the utmost importance. The industry was largely native-owned, and was being developed by native capital and ingenuity; it had naturally developed most where traffic was greatest, and where facilities were greatest for the purchase and maintenance of motor-vehicles. Unregulated motor-transport could become its own enemy, and regulation might be imperative in its own interest. While agreeing with the Author that railways were as essential to-day as ever, he did not agree that they still remained the most effective means of extending the path of civilization however necessary they might be for consolidating such extensions.

[...]

Mr. C. T. Gardner remarked that the Author proposed to lower the railway charges on high-classification goods and to recoup the Joss of revenue by raising the rates on low-classification goods. He thought, on the contrary, that if the rates on the low-classification goods were raised the distance over which motor competition would be felt would be increased, and that some of the low-rated goods which previously passed by rail would consequently be lost by the railways to motor-transport.

He felt that the Author had failed to arrive at any very definite conclusions, and he would like to try to extend the Paper, and to wring more out of the very useful data given.

Often it was impossible to say definitely how or why a road was developed. It might start with a bush path, which gradually became wider; some road metal might be put down; the road might then be extended out to a suburb, then macadamized, and a bitumen coat might be applied: in a short time the continuous clamour for good roads would have been yielded to, and a fine metalled road paralleling the railway would have been made. Further, roads were necessary for military purposes and the progress of civilization, and were of a value which could not be expressed in terms of pence per ton-mile. / Mr. Gardner.

The following sentence in the Paper was of outstanding importance: ‘If railways are to continue to carry export traffic at uneconomic rates while higher-rated traffic uses the road, it is doubtful whether they will earn sufficient net revenue to maintain their efficiency’. That was the key-note of the situation, and the indicator of future action.

The Paper showed clearly that the diminution in the railway revenue, setting aside the loss of traffic due to the economic depression, was due to loss of passenger-traffic and of the higher-rated goods traffic owing to motor competition. It was certainly hurtful to any country that that skimming of the ‘cream’
by road-transport should either have the effect of raising rates on bulk traffic, or imperil the economic stability of the railways. It was imperative that the consequent problem should be solved without delay, so as to avoid the hostility and greater difficulties which would arise if various interests became established, which might at a later date, when being brought under inevitable control, feel that they were badly used.

It would appear that more co-operation between the Government departments concerned was desirable. It had been thought that conflicting claims between overlapping departments, such as the railways and the public works, and possibly, in some colonies, the marine and harbour authorities, might be avoided if an engineer skilled in economics occupied a permanent place in the administration; but he did not feel that that solution would be effective, nor did he think that the Author’s proposals were sufficiently precise and definite.

Mr. Gardner would agree to restriction, but he thought it must be constructive restriction, and therefore he would propose the acquisition, of all major motor transport by a transport board. That board would permit only light vehicles to run on the roads, or heavier vehicles under special licence: producers would be permitted to own their own transport under licence, but any transport companies would be taken over at a valuation by the board: the economic structures of the roads department and of the railways should be absorbed into the economic structure of the transport board.

He did not think the railways had yet explored every avenue of recovering or retaining passenger-traffic; the possibility of the high-speed motor-coach operating at frequent intervals on railway-lines, which under present conditions were not at all crowded, had not been adequately investigated. Such vehicles should be designed on the lines of the motor-car, should afford the same standard of comfort, must essentially run at regular and reasonably close intervals so that the passenger should not be bothered with time-tables, and should stop on demand anywhere. They could run at the same cost per mile as road vehicles, carry a larger number of passengers, and offer greater comfort and greater speed. They were being developed on the Continent and in America, but in the colonies they had been put to little, and rather ineffective, use.

Colonel G A. P. Maxwell, of the Tanganyika Railway, remarked that on pp. 547 and 548, new railway construction and its cost in various Colonies, Protectorates and Mandated Territories was dealt with. The following Table* gave particulars of railway construction carried out in Tanganyika in the last 10 years, and some notes on the cost thereof.

* Compiled by Mr. C. Gillman, Chief Engineer, Tanganyika Railway.
Spiller, ‘The Respective Merits of Roads and Railways for Colonial Development’ 395

**Note.** – Parts of the lines tabulated above utilized second-hand permanent-way material, or included short sections of existing track. The figures of coat have therefore been corrected as for construction with new material throughout.

Regarding the cost of road construction, his impression was that in Tanganyika road-making was rather more expensive than any figure mentioned in the Paper, owing to the almost complete lack of suitable road-making material. For the construction of metalled roads he had found it necessary to allow approximately £2,000 per mile. / 

A great deal of the competition arising in Tanganyika between road and rail was due to privately-owned vehicles being run on uneconomic lines without regard to interest on capital, depreciation, etc. A. vehicle obtained on the hire-purchase system was often run to death before it was paid for, and final payment might never be made. In the course of dealing with many problems of marketing native produce, he had gone most carefully into the figures of the cost of road transport, and he was convinced that even near the coast the actual operating expenditure of motor transport, allowing for all charges, was in the neighbourhood of 5-4d. per ton-mile, and that up-country on rather poorer roads it increased to between 6-5d. and 7d. per ton-mile. Those figures took no account of direct payment towards the upkeep of roads. At the present time, owing to the fact that lorries were actually in existence and their owners trying to make a living by keeping them going, rates as low as 6d. per ton-mile were being quoted in the interior of the Territory, but he was quite convinced that those rates could not be maintained for any lengthy period if capital cost and depreciation were taken into account.

The cost of rail transport was of major importance. Tanganyika Territory was rather over 365,000 square miles in area, and had a population of about 4½ millions. The railway was about 1,458 miles in length, and the main line from
Dar-es-Salaam to Kigoma, which might be said to have followed the engineering line of least resistance, was 772 miles in length. The population was centred in well-defined parts of the Territory, and many of the centres were some distance from rail. Also, about five-eighths of the total area of the territory was infested with tsetse fly and was practically uninhabited. The present annual tonnage on the railway was about 220,000 tons, and the receipts 1.75d per ton-mile, which did not cover the total expenses of the railway, so that it was actually run at a loss. He calculated that 2.5d per ton-mile on the present very small tonnage would cover all expenses, and that if the tonnage could be worked up to 600,000 tons, an average receipt of 1.5d per ton-mile would cover all expenses.

The rating employed was almost exactly similar to that in force on the Kenya and Uganda Railways. The export rates differed very considerably from those quoted as in force in Nigeria. The main centre of ground-nut production in Tanganyika was 700 miles from the coast, and 35s. per ton was the maximum rate which it was considered that industry could afford, so that the railway was faced with carrying some 10,000 tons of ground-nuts 700 miles for 35s. per ton, the average rate being 0.6d. per ton-mile, which was actually below the cost of working. Obviously no form of road-transport could possibly cope with such bulk traffic at that price, and so in 1931 a Bill was introduced placing a heavy licence fee on road-transport along roads running parallel to the railways. Those licences were not sufficient to stop competition altogether, but did a great deal to return import traffic to the railways, and a Bill was introduced in the Council April, 1934, to prohibit competition by road-transport along roads parallel to the railway. No licence or penalty of any kind was imposed on motor-transport using feeder-roads to the railway.

He had considered very closely the question of abolishing the highest rate on the railways, but he had concluded that revenue would be actually lost by that proceeding, even though some of the traffic which had gone to the road might be recovered, and those final figures had induced the Government to bring in the new Bill. On a long system of rail such as that of Tanganyika, it was almost impossible to retain the short-distance passenger for the railway, as the service could not be made sufficiently frequent and sufficiently fast to attract him from the road. He considered it equally certain that to raise the low-class rates would only result in stifling the development of the country, so that, as long as the tonnage remained small, the country must face a deficit on its railways.

The following was an extract from a report he had written some little time ago:

‘Taking past history, it may be stated generally that all Colonial Government Railways have actually, in the beginning, been run for the benefit of the country, and not with the view of placing them in a sound financial position, although I agree that the degree of soundness varies largely. Practically none of
them, however, have built up a sufficiently large Reserve fund to carry them over any extended period of general depression or over a period of continued failure of the staple crop of the country. I do not say that the object should not be to put Colonial Railways on a sound financial basis, and in periods of reasonable trade activity once the Colony has become properly established, it should be the desire of all concerned to have a sound and separate Railway Budget, but, in the early days of a Colony or in a period of extreme depression, I maintain that the Railway should be used for the general welfare of the Colony for quoting low export rates in order to enable the Colony to establish a favourable balance of trade, out of which a subsidy to the Railway can easily be forthcoming. I also consider that any grants so given should not be repayable until the Railway has been put on a sound financial basis during the boom period following the depression.

‘Looking at Colonial Railways another way, the Railway Budget is ordinarily charged with the whole of the interest on Railway Construction, whereas development benefits the Government by Customs Returns and by general taxation probably far more than it ever benefits the Railway, so that, as long as the Government is satisfied that their Railway is well and economically managed, they should assume that the period of depression is not a permanency and should, during this period of depression, be prepared to shoulder the interest charges on the original capital expended on Railway construction for development purposes. It must be borne in mind that a Government Railway is given no grants of land, or no control over mineral rights in the country over which it is built such as would be demanded by a private Company undertaking railway construction.’

Mr. H. C. Platts remarked that, although conditions in many colonies were similar, it was often difficult in one colony to reap the benefit of experience in another, and the pooling of information carried out by the Author was of great benefit. It seemed a pity that, in spite of the interchangeability of technical personnel between colonies, there was no centralized co-ordination of colonial engineering services, and it was well that The Institution provided a means of exchange of information that was not always readily obtainable through official channels. Could the Author give any figures relating to the ton-mileage cost on railways with a short average haul, such as in Trinidad and Mauritius? Mr. Platts had spent rather more than five years in the East African islands of Zanzibar and Pemba, mostly on the construction of new roads and road-bridges, as after the war a vigorous policy of road construction was pursued as the best means of developing internal communications, and he did not think that a railway was ever seriously considered as an alternative. An economic reason for favouring road rather than railway development in those islands was that the principal product, cloves, was comparatively high-priced in relation to its bulk; also Pemba was topographically unsuited to easy railway construction. The calculable facts of economics were not, however, the only points to be taken into consideration,
because a road system offered social and administrative advantages of a value that it was almost impossible to assess. In a small island like Zanzibar with an average population density of about 200 per square mile, those advantages were so important that a road system was indispensable. A railway could / not be regarded as an alternative, but only as a supplement to be added if potential traffic should justify its construction.

Mr. Platts was subsequently, from 1927 to 1929, responsible for over 600 miles of main roads in the Tanga and Northern Provinces of Tanganyika Territory (Fig. 9). That district was served by a metre-gauge railway running about 220 miles inland to Moshi on the slopes of Mount Kilimanjaro, with an extension, recently constructed, to Arusha, 50 miles west of Moshi. The greater part of the railway existed before the roads, and he had soon come into contact with the road-rail problem, and with ‘parallelism’ in particular. The area served by the railway was developing rapidly during that period, but in 1927 through road communication parallel to the railway was only possible from the port of Tanga to Mkomasi, about 117 miles along the railway. That route was rather hazardous because the Lwengera bridge near Korogwe was very primitive, and liable to submersion during the rains.

During his term of office, a number of war-demolished bridges on the pre-war road connecting Mkomasi and Same were rebuilt, and although technically that road was a railway feeder because it served the side of the South Pare Mountains remote from the railway, the work had the effect also of extending ‘parallelism’ as far as Same. In the area of the Middle and North Pare development had not advanced to the same extent as farther south-east, nor to the same extent as in the European-settled areas of Moshi and Arusha, but it was making progress and motor tracks were opened between Same and Lembeni, ‘parallelism’ being thus extended still farther north.

The nearest centre of any consequence for the North and Middle / Pare area was Moshi, but access by road was at that time blocked by the River Ruvu. It was suggested that the existing railway bridge over the Ruvu near Kahe should be decked to allow the passage of road-traffic, and that a toll-system should be operated by and on behalf of the railway. That suggestion was made, not only with the intention of advancing essential road communication, but because it occurred to him that it would place a strong weapon in the hands of the railway for defeating unfair parallel competition by lorries. Such a precedent of policy required time for consideration, and the proposal was not developed during his period of office. Meanwhile, however, the necessity for some sort of communication by motor with Moshi became urgent, and some of the local planters, with the assistance of the District Officer in charge of the recently established Pare District, constructed a primitive timber bridge over the Ruvu. Approach tracks were cleared, and thus parallel communication, possible for light lorries and private cars, was established

Mr. Platts.
between Tanga and Moshi. Incidentally, the building of that rather shaky structure opened the Tanga, Usambara and Pare areas for road-communication with the main roads leading to Kenya and Uganda in the north, and the Rhodesias and the Union in the south. The bridge was much too frail to withstand heavily laden lorries, but it was inevitable that public opinion would in the future press for and ultimately obtain a superior structure, and the danger of lorry competition with the railway goods traffic would arise. The Lwengera Bridge near Korogwe previously mentioned was an example of that process; it had a similar and equally humble beginning, but in 1929 the money was found by the Government, and a steel girder-bridge clear of flood level was completed in 1930.

Those examples confirmed the opinion expressed by the Author on p. 571, that it was impossible in practice to confine a road-system to feeders radiating from a railway. Not including the 62 miles from Mkomasi to Same along which the bridges were reconstructed by the Government, about 60 miles of parallel track, passable for private cars and light lorries, came into use in a period of less than 2 years without either direct initiative or expenditure on the part of the Government. That could only be the result of the pressure of necessity, and it was certain that the tracks would ultimately acquire the status of recognized roads, and that the Government would find itself compelled in the interests of the community to undertake their maintenance and improvement. That process of development by roads and motors was inevitable if progress was not to be retarded, and if, indirectly, the welfare of the railway itself was not to be prejudiced. Freedom of movement for people was essential for social, administrative and business purposes, and railway passenger services could never be adequate to fulfil the requirements.

Regarding lorry competition in goods-traffic, no reasonable person could disagree that control of some sort was necessary. The difficulty was to decide what form that control should take, and the method must vary with the conditions peculiar to different localities. Restriction of lorry-size and axle-loads might be suitable in some countries, but it might affect adversely the efficiency and economy of feeder-services. Restriction from the use of roads parallel to railways by licensing or other means might also be possible, but difficulties would arise in practice, because most parallel roads were feeder-roads as well. It had to be borne in mind also that the temporary transfer of lorries to other districts, or to the larger centres for repairs, was not unusual, and it would be unreasonable to restrict such movement. He had concluded that a toll-system operated at key points, such as major bridges, had much to commend it. Control would be concentrated at a few points, and the details of administration should thus present no great difficulty. The tariff could be adjusted according to lorry-size and to the nature of the goods transported, so that adequate protection to railway freight-traffic would be afforded. The revenue would provide funds for maintenance and
interest charges, and any surplus might well be applied to stimulating services of which the legitimate road-user stood so much in need. The combined road-rail bridge was no new conception, and if such bridges were built at important river-crossings where railway construction or reconstruction was undertaken, the control of ‘parallelism’ by tolls could be conveniently exercised should it become necessary. There was a natural reluctance on the part of railway-engineers to contemplate such action, which suggested facilitating road-transport, but a concession to the class of road traffic for which the railway could never cater adequately could be the means of affording effective control of traffic that was truly competitive.

Railways had played, and continued to play, a magnificent and indispensable part in colonial development, but it was well to remember that the monopoly which they once enjoyed for all kinds of land-transport no longer existed. The road and the motor-car had provided a new sphere of convenience and utility to mankind for which, under colonial conditions, the railway could offer no adequate substitute. Both roads and railways had their own place, and it was misleading to think of them in the general sense as alternatives. The question of alternatives arose in a different way when a certain stage of development or potential development was reached in any locality; the choice then lay not between roads and railways / in the general sense, but between roads of a higher standard of construction on the one hand, and a railway and roads of relatively low standard on the other.

[...]
Editorial Notes

Opening of the Lagos–Ibadan Railway for Traffic

1. Sir William MacGregor: Sir William MacGregor (1846–1919), Lieutenant-Governor of British New Guinea, Governor of Newfoundland, Governor of Queensland, and Governor of Lagos Colony (1899–1904).

2. Hausa: The Hausa are a Sahelian people chiefly located in Northern Nigeria and southeastern Niger.

3. Egba: The Egba are a subgroup of the Yoruba people who live in Western Nigeria.

4. Lord Ripon: George Frederick Samuel Robinson (1827–1909), Secretary of State for the Colonies (1892–5) and Viceroy of India (1880–4).

5. Sir Gilbert Carter: Sir Gilbert Thomas Carter (1848–1927), an administrative officer in the Royal Navy, Collector of Customs for the Gold Coast (1879–82), Treasurer of the Gold Coast (1879–82) and the Gambia (1882–6), acting and later Administrator of the Gambia (1886–91), and Governor of Lagos Colony (1891–7), the Bahamas, Barbados and Trinidad and Tobago.

6. Carter Bridge: The Carter Bridge was built in 1901 and connected the mainland to Lagos Island. The bridge starts from Iddo and ends in the Idumota area of Lagos Island.

7. pennons: A pennon is a pennant, banner or flag.

8. eclat: a demonstration of admiration and approbation, such as an applause.

Hoy, State Ownership and Operation of Railways

Governor Sir W. MacGregor to Mr. Lyttelton

1. Governor Sir W. MacGregor: Sir William MacGregor (1846–1919), Governor of Lagos Colony from 1899 to 1904. His main achievements were his success in reducing the incidence of malaria and the construction of roads and a railway.

2. Mr. Lyttelton: Alfred Lyttelton (1857–1913), Liberal Unionist MP, and, from 1903 to 1905, Secretary of State for the Colonies.
3. **Ilesha**: The Ijesha are a subgroup of the Yoruba tribe. Their territory is adjoined by the Ekiti on the east, the Igbomina to the north, the Ife to the south, and the Oyo and Ibolo to the west.

4. **demijohns**: A demijohn is a large, narrow-necked bottle made of glass or earthenware and usually encased in wickerwork.

5. **Oyo**: The oyo belong to the Yoruba ethnic group.

**Railway Retrenchment Committee Report and Recommendations**

1. **cacao harvest**: Cacao is another name for cocoa.

3. **Sinking Fund**: A sinking fund is a fund into which the government annually paid a certain sum, which is then invested in securities. At the end of the loan’s life, the sinking fund is sold and the receipts used to repay the loan.

4. **African Manganese Company**: The African Manganese Company Limited was a subsidiary of Union Carbide Corporation and was established in 1923 to operate the Nsuta manganese mine.

5. **the Gold Coast Chamber of Mines**: The Chamber was established with the goal of advancing and protecting the mining interests of the shareholders of the mining companies that operated in the region. On 6 June 1928, it was incorporated as a private company.

**The Birmingham Chamber of Commerce to Colonial Office**

2. **BIRMINGHAM CHAMBER OF COMMERCE (INCORPORATED)**: The Chamber was established in 1813 to represent the interests of local businesses.

**The Governor of Uganda to the Secretary of State**

1. **Sir Hesketh Bell**: Sir Henry Hesketh Joudou Bell (1864–1952), British colonial administrator and author. Governor of Mauritius from 1916 to 1924.

3. **Kampala-Port Bell Railway**: Kampala–Port Bell Railway was part of the Uganda Railway. It ran for just seven miles (11 km).
4. **H. R. WALLIS**: Henry Richard Wallis was Acting Governor of Nyasaland from 1910 to 1911.

5. **His Excellency Sir Frederick Jackson**: Frederick John Jackson (1859–1929), administrator, explorer and ornithologist. Governor of Uganda from 1911 to 1918.

6. **Thika Branch**: The branch line to Thika was constructed in 1913.

**Gurney, Report of the Road-Rail Transport Committee**

1. **H. L. G. GURNEY**: Sir Henry Lovell Goldsworthy Gurney (1898–1951), Chief Secretary to the Conference of East Africa Governors (1938–44) and Colonial Secretary of the Gold Coast (1944–6). Assassinated by communist insurgents during the Malayan Emergency.

**Mance, Report on the Co-ordination of Transport in Kenya, Uganda and the Tanganyika Territory**

1. **Sir Felix Pole**: Sir Felix John Clewett Pole (1877–1956), General Manager of the Great Western Railway (1921–9) and Executive Chairman of Associated Electrical Industries (1929–45).

2. **primage**: Primage is a tax added to customs duty.

3. **inter se**: between or among themselves.

4. **Dhows**: A dhow is a lateen-rigged sailing vessel, usually with a raised poop, a raked stern and one or two masts.

**Mance, The Railway Systems of West Africa**

1. **Sir Clement Hill**: Sir Clement Lloyd Hill (1845–1913), colonial administrator, MP for Shrewsbury (1906–13).

**Anon., ‘The Railways of Africa’, Railway Gazette, 21 November 1927**

1. **gangers**: A ganger is the foreman of a gang of labourers.

2. **Garratt locomotives**: A Garratt locomotive is articulated in three parts. Its boiler is mounted on the centre frame, and two steam engines are on separate frames, one at each end of the boiler. It was designed by Herbert William Garratt in 1907.

3. **brake vans**: A brake van is the coach or vehicle from which the guard applies the brakes.

4. **bogie**: A bogie is a railway car or locomotive undercarriage having pairs of wheels that swivel so that curves can be negotiated.

5. **buffers**: Buffers are often spring-loaded steel pads attached at both ends of railway vehicles and at the end of a railway track to reduce shock due to contact.

6. **Tyer’s electric key token system**: a form of railway signalling for single line railways. It was first devised by the engineer Edward Tyer after the Thorpe rail accident of 1874. The system used a token, called a tablet, as a physical guarantee to a train crew that their train had exclusive right of way on the single line section. Without this they could not proceed beyond the section signal that protected entry to the single line. With advances in electrical locking of the lever frame within the signal box, the tablet instrument also electrically locked the section signal lever.

8. Strophanthus: Strophanthus is any small tree or shrub of the apocynaceous genus. It has strap-shaped twisted petals and the seeds yield the drug strophanthin.

9. Bantu race: Bantu is a general label for 300–600 ethnic groups in Africa who speak the Bantu languages. They are distributed from Cameroon East across Central Africa and Eastern Africa to Southern Africa.

10. rack locomotives: A rack locomotive is one designed for operation on a rack railway, a line with a toothed rack rail, usually between the running rails.

Anon., ‘The Railways of Africa’, Railway Gazette, 5 December 1927

1. lattice girder: A lattice girder is a girder where the flanges are connected by a lattice web.

2. crib work: Cribwork is a temporary framework that supports a structure.

3. Mallet class: The Mallet Locomotive articulated engine, invented by the Swiss engineer Anatole Mallet (1837–1919). It has two pairs of cylinders, each pair rod-connected to a group of driving wheels.

4. Mikado engines: A Mikado engine, 2–8–2, has a wheel arrangement of two leading wheels on one axle, eight powered and coupled driving wheels on four axles, and two trailing wheels on one axle (usually in a trailing truck).

5. out-turn: the total amount produced during a given period.

6. Churchill Machine Tool Co. Ltd.: founded in 1906 as the manufacturing subsidiary of the machine tool importers Charles Churchill & Company Ltd, established in the early 1900s by the American born Charles Churchill (1837–1916). Initially it adapted tools imported by Charles Churchill & Co Ltd. It then began to produce American tools under licence and finally manufactured equipment of its own design.

7. Kendall & Gent Limited: Kendall & Gent (Manchester) was famous for its plano-mills. In 1917, it became part of Associated British Machine Tool Makers Ltd.

9. Armstrong, Whitworth & Co. Ltd.: Sir W. G. Armstrong Whitworth & Co. Ltd was founded in 1847 by the engineer William George Armstrong (1810–1900). Based in Elswick, Newcastle upon Tyne, it produced armaments, ships, locomotives, automobiles, aircraft and a range of engineering equipment.

10. Dean, Smith & Grace: founded in 1865 by Joseph Dean. Following Dean’s retirement, it traded as Smith & Grace of Thrapston, and, in 1908, became Dean Smith & Grace Ltd. It produced machine tools.

11. Greenwood & Batley: Greenwood & Batley was founded in 1856 by Thomas Greenwood and John Batley. From 1859, the company was based at the Albion Works in Armley Road, Leeds. It manufactured a wide range of goods, including armaments, electrical engineering, and printing and milling machinery.

12. New Alldays & Onions Limited: The Alldays & Onions Pneumatic Engineering Co. of Birmingham was founded in 1889 as a result of the merger of the long established Onions (dating from 1650) and Alldays (dating from 1720) engineering companies. The firm manufactured automobiles.

13. W. & T. Avery Limited: founded in 1730 when James Ford established the business in Digbeth. In 1813, the company was taken over by William and Thomas Avery, who, in 1818, renamed it W. & T. Avery. By 1885, it operated three factories: the Atlas Works in
West Bromwich, the Mill Lane Works in Birmingham and the Moat Lane Works in Digbeth. It became a Public Limited Company in 1891, and, in 1895, it bought the Soho Foundry in Smethwick. From 1897, its steam engine business gradually gave way to the manufacture of weighing machines.

14. bandsaw: A bandsaw uses a blade consisting of a continuous band of metal with teeth along one edge to cut various work pieces.

15. twinscrew: A twin screw steamer is a steam-powered vessel propelled by two screws, one on either side of the keel.

16. a system of banking: A bank engine is a railway locomotive that temporarily assists a train that requires additional power or traction to climb a grade (or bank).

17. treadle lathe: A treadle lathe is a lathe powered by the operator pressing his foot on a treadle.

18. Sir William Arrol & Co. Ltd.: founded by William Arrol (1839–1913) at Dunn Street in Dalmarnock, Glasgow, in 1873. It later expanded to incorporate the Parkhead Crane Works in Nuneaton Street. It was famous for its bridges, which included the Forth Bridge and Tower Bridge, London.

20. Waybilling: A waybill is a document issued by a carrier giving details and instructions relating to the shipment of a consignment of goods.

21. Smith & Coventry Limited: Smith & Coventry Ltd (Salford) produced plain and universal millers, high speed planers and gear-cutting machines. In 1917, it became part of Associated British Machine Tool Makers Ltd.

22. Alley & Maclellan Limited: founded in 1875 and based in Polmadie, Glasgow. It moved from Polmadie Road to the nearby Jessie Street where it continued to trade until the 1950s.

23. Alfred Herbert Limited: founded by Alfred Herbert and William Hubbard in 1888 in Coventry as Herbert & Hubbard, initially making boilers and steam engines. The firm later moved into the manufacture of machine tools, and, in 1890, became Alfred Herbert Ltd.

24. Cincinnati Milling Machine Company: founded in 1889 by Frederick V. Geier and Fred Holz. It was one of the first manufacturers of machine tools.

25. Thwaites & Sons: Thwaites & Sons was founded by Robinson Thwaites (1807–84) in 1848 as Robinson Thwaites & Co., later becoming Thwaites & Carbutt (1862), and Thwaites Brothers (1880).

Anon., ‘Some Typical Modern Locomotives and Rolling Stock for African Railways’

1. *Vulcan Foundry Ltd*: a locomotive builder located at Newton-le-Willows, Lancashire. The firm was originally established in 1832 as Charles Tayleur and Company to produce girders, bridges, switches and crossings and other ironwork for the Liverpool and Manchester Railway. It changed its name to the Vulcan Foundry Company in 1847 and obtained limited liability status in 1864.

2. *tender*: A tender is a railroad carriage attached to the rear of a locomotive that carries fuel and water.

4. *The outside cylinders ... by Walschaerts' motion*: A valve gear invented by Egide Walschaerts in 1844.

5. *These engines ... Newcastle-on-Tyne*: see General Introduction, Volume 1.

6. *The boiler ... smoke-box*: A smoke box is part of a steam locomotive exhaust system. Smoke and hot gases move from the firebox through tubes where they pass heat to the surrounding water in the boiler. The smoke then enters the smoke box and is released to the atmosphere through the chimney.

7. *drawgear*: Draw gear is an apparatus for coupling railway cars.

9. *Two 4-8-0 locomotives ... (Southern Nigeria Line)*: see General Introduction, Volume 1.

10. *A.B.C. couplers*: A.B.C. couplers are a device for automatically coupling railway rolling stock and for transmitting and cushioning the effect of longitudinal stresses generated as a train moves and stops.

13. *Birmingham Railway Carriage & Wagon Company, Ltd.*: The Birmingham Railway Carriage and Wagon Company was a railway locomotive and carriage builder located at Smethwick. It was established in 1854 and its markets included Egypt, India, Iraq, Malaya, Mandate Palestine, South Africa and Nigeria.

14. *Gloucester Railway Carriage & Wagon Company, Ltd.*: a railway rolling stock manufacturer based at Gloucester. It was established in 1860.

15. *Moulmein teak*: teak exported from the Burmese port of Moulmein.

16. *millboard*: Millboard is hard and strong paperboard.

17. *Metropolitan ... Wagon Co., Ltd.*: The Metropolitan Amalgamated Railway Carriage and Wagon Company Ltd was formed in 1863 as the Metropolitan Railway Carriage and Wagon Company Ltd (successors to Messrs Joseph Wright & Sons) of London. In 1845, the carriage works were moved from London to Birmingham, and, in 1902, the company merged with four other carriage and wagon builders to become Metropolitan Amalgamated Railway Carriage and Wagon Company Ltd. By 1926, it had changed its name to Metropolitan Carriage, Wagon & Finance Company Ltd.

18. *Bristol Wagon & Carriage Works, Ltd.*: founded in 1851 as Fowler & Fry by Albert Fry, a member Quaker chocolate manufacturing family, and John Fowler. Fowler left the company in 1855 and was replaced as partner by Albert’s brother Theodore (until 1866). The company, based in Temple Gate and later Lawrence Hill, produced carts, wagons, agricultural machinery and railway locomotives and carriages.

20. **vacuum and hand brakes**: A vacuum brake is a braking system employed on trains introduced in the mid-1860s. Its limitations caused it to be progressively superseded by compressed air systems.

21. **T.R.H. the Duke and Duchess ... to South Africa**: Prince Arthur, Duke of Connaught and Strathearn (1850–1942), seventh child and third son of Queen Victoria, served as the Governor General of Canada. His wife was Princess Louise Margaret of Prussia (1860–1917), a German princess. Princess Patricia of Connaught (1886–1974), a granddaughter of Queen Victoria. She relinquished her title upon her marriage to the commoner Alexander Ramsay.

**Williams, The Cape to Cairo Railway from the Point of View of African Development**

1. **THE CENTRAL ASIAN SOCIETY**: The Royal Society for Asian Affairs was founded in 1901 to 'promote greater knowledge and understanding of Central Asia and surrounding countries'. Its journal, *Asian Affairs*, was first published in 1914.

2. **LORD CARNOCK**: Arthur Nicolson, first Baron Carnock (1849–1928), a British diplomat and politician. From 1910 to 1916, he was Permanent Under Secretary for Foreign Affairs.

3. **George Grey**: Sir George Grey (1812–98), soldier, explorer and writer. Governor of south Australia, Governor of New Zealand, Governor of Cape Colony (1854–61), and the eleventh Premier of New Zealand.

4. **King Leopold**: Leopold II (1835–1909). Born in Brussels the second (but eldest surviving) son of Leopold I and Louise-Marie of Orléans, he attained the throne on 17 December 1865. He was the founder and sole owner of the Congo Free State from which he extracted a personal fortune initially by the collection of ivory, and, from the 1890s, via the collection of rubber. His harsh regime was directly or indirectly responsible for the death of an estimated six million Africans and the maiming of millions more. For more on the King and the forgotten Congo 'holocaust,' see A. Hochschild, *King Leopold's Ghost: A Story of Greed, Terror, and Heroism in Colonial Africa* (London: Marion Books, 1998).

5. **King Albert**: Albert I (1875–1934), King of the Belgians from 1909 until 1934.

6. **Major Christy**: Major Cuthbert Christy (1863–1932), medical officer, traveller and member of the first Royal Society Africa Sleeping Sickness Commission (1902). Between 1911 and 1914, Christy worked for the Belgian government, investigating sleeping sickness and rubber cultivation in the Congo, and collecting zoological specimens. During 1915–16, he mapped the Nile–Congo boundary for the Sudanese government, and then served in East Africa and Mesopotamia as an army medical officer.

12. Sir Lee Stack: Sir Lee Oliver Fitzmaurice Stack (1868–1924), army officer and Governor-General of the Anglo-Egyptian Sudan. Assassinated while driving through Cairo.

1. JOHN WYATT SPILLER: John Wyatt Spiller was also the author of *The Deflections of Suspension Bridges* (London, 1923).

Spiller, ‘The Respective Merits of Roads and Railways for Colonial Development’

2. The Oversea Mechanical Transport Committee: founded in 1929 to study every aspect of mechanical transport likely to further the economic development of the empire.

4. The Salter Commission: held in 1932 and recommended that UK rail and road should be dealt with on a competitive basis.

7. Brig.-General Sir H. Osborne Mance: Sir Henry Osborne Mance (1875–1966). Served as a subaltern in the Royal Engineers in the Boer War, as Director of Railways, Light Railways and Roads in the 1914–18 War and as a communication expert in the British Delegation to the 1919–20 Peace Conference. His papers are in the National Archive (PRO30).

8. International Chamber of Commerce: founded in 1919 to serve world business by promoting trade and investment, open markets and the free flow of capital. Its international secretariat was established in Paris and its International Court of Arbitration founded in 1923.

Editorial Notes 419
Index 427
The progress of road construction varied greatly between countries (see Table 1). Early routes included the Stevenson, MacKinnon-Sclater, and a number of Rhodesian roads. The Stevenson roadway ran between Lake Nyassa in Nyasaland and Lake Tanganyika in Central Africa and was constructed in the early 1880s to counter German claims to the hinterland and to extend British commercial and missionary interests, and, in so-doing, to end the slave trade.\(^1\) By the late 1920s, this highway had been joined by three more Nyasaland routes – Chikwawa on the Tchiri River to Blantyre, the country’s commercial centre (25 miles); Blantyre to Zomba (40 miles); and Blantyre to Matope on the Tchiri river (30 miles).\(^2\) The 600-mile MacKinnon-Sclater road, built in the early 1890s, comprised two sections. The Mackinnon route, so-called because it was funded by Sir William Mackinon, the founder of the British East Africa Company, linked Mombassa in Kenya to Kibwezi, and was constructed by the Australian George Wilson to increase trade with Uganda. This road was then extended by Captain B. Sclater of the Royal Engineers to Busia at the Uganda border.\(^3\) Subsequent road construction in Kenya was impressive. From 1902 to 1940, feeder routes were built to link the main agricultural areas with Nairobi, the Uganda Railway and the usable sections of the MacKinnon-Sclater road (much of which fell into disuse after the arrival of the railway), and, by 1947, the country possessed 27,162 km of highway.\(^4\)

Progress in Uganda was less dramatic. By 1932, there were just 1,800 miles of roadway, including the 55-mile Kampala to Toro route.\(^5\) Early Rhodesian roads included Salisbury to Chimoio, Bulawayo–Tati (120 miles), Bulawayo–Charter–Salisbury and the Moodie Trek, running from Fort Victoria Eastward, all of which were built from 1891 to 1895. By 1923, the country possessed over 8,000 miles of highway, though the quality varied considerably (see Cripps, *How Roads were Made in the Native Reserves of Charter District, Mashonaland* (1936) and *Southern Rhodesia. Committee to Enquire into the Costs of Distribution of Imported Goods and Local Products in Southern Rhodesia* (1936), below).\(^6\) As regards South and West Africa, at the end of the First World War, South Africa had 47,000 miles of ‘provincial’ roads and even more miles of ‘farm’ roads (see
Campbell, *Kenya’s Road Policy: Repercussions of South African Practice: Report on a Tour of South African Roads* (1945); Van Reenan, *The Free State Roads* (1914); and *Report of the Commission on Roads* (1921), all below), and, by the early 1920s and late 1920s, Nigeria and the Gold Coast possessed 6,000- and 4,588-mile road systems, respectively (see *Notes on Road Construction* (1933) and *Replies to Questions of the Private Enterprise Committee by the Governor of Sierra Leone* (1923), below).\(^7\)

Notes

Early in the year 1935 reliable news had reached me of how a big burden of unpaid forced labour was being laid upon Africans in Charter District, Mashonaland. Complaints reached me concerning road-making as well as the multiplication of work at dip-tank centres. An outspoken denunciation of the way in which Africans were being oppressed under the authority of a dip-tank supervisor reached me from a European resident in a somewhat remote part of the District.

Not long after receiving this indictment, I wrote a letter, and followed it up by paying a visit, to a Native Department official at The Range, the headquarters of that Department in Charter District. I appealed to this official to stand up for the Africans concerned, but he gave me to understand that the dip-tank supervisor was working under his own supervision and authority, and that the
Africans of our District, who, he alleged to have been idle for years, must do the road-making required of them.

I had come to this District of Mashonaland first in the year 1901, and I had put in some twenty-eight years there of bona-fide residence since my arrival, so I could certainly claim to know it fairly well. In March, 1935, I proceeded to make a personal investigation into that allegation of Unpaid Forced Labour in the area, whence such a stirring protest had reached me, an area that I had frequently visited in years past, in the neighbourhood of the Sabi River. A local Methodist Missionary-in-charge, the Reverend Walter Howarth, proved of great service to me in helping me to carry out my investigation.

After I had obtained much evidence myself by foot-travel, he took me on his light lorry over a great stretch of country, and showed me what an astonishing extension of road-making had been achieved in the course of a few months by Africans (already miserably overtaxed) called out under our Native Department’s authority. The amount of work accomplished must have been a stupendous burden upon those who were called out from their own employments to do it – with their own cattle, their own sledges, their own ploughs, their own hoes, and their own axes, without any regular rationing,* and without any wages whatsoever. I want to submit that it was a public disgrace that this vast multiplication of road-making on the Sabi Reserve, Charter District, and on an isolated adjacent Mission farm, which had been pushed / forward in a few months, should not have been paid for. It was disgraceful that no wages were given, no regular rations supplied, and no remission of poll-tax promised or conceded to the road makers employed. My comrade the Methodist missionary assured me that the new banking-up and ditching of roads policy,* which I saw exemplified,, compared very unfavourably with the old system of scuffling and stubbing of tracks – from a motorist’s point of view. The increased burden of forced unpaid labour, entailed already by the making, and threatened by future upkeep of this new ambitious, if ineffective, roads scheme, is appalling to contemplate.

All needful roads in the Southern Rhodesian Native Reserves ought to be made and maintained by voluntary labour, paid at least fifteen shillings a month, regularly and sufficiently rationed, and efficiently directed by our Public Works Department.

The Southern Rhodesian settler (so lavishly subsidised out of Africans’ poll-tax revenue, as well as out of the Beit Trust) ought surely to find the wherewithal for this reform, which is long overdue now. The African of Southern Rhodesia, harassed by heavy taxation,† juggled out of a fair return for what he grows by Maize Control legislation, impoverished by a Cattle Levy devised to help to pay

for the Europeans' cattle-export trade, ought not in these days to be left at the mercy of a huge undefined policy of forced labour, a vast additional impost. Will the interests of African Development be pleaded as an excuse for an extortion of forced unpaid labour in Africans' own Reserve land?

I want to ask two plain questions of those people who may plead any such excuse.

(i.) How many African-owned wagons, Scotch carts, or sledges will be allowed to travel freely over (and to impair) these motor-roads made and maintained by Africans for European motorists?

(ii.) How much of the Southern Rhodesian African's miserly allowance of Native Reserves is being whittled away by the abandonment of old tracks, which are left to erosion, and by the multiplication of new motor roads – the unrestricted use of which is grudged, or debarred, to the old-fashioned vehicles of those Africans, who have been sweating unpaid to make them?

In the Preface to the third edition of his book 'Kenya,' Dr. Norman Leys has told us that even the most conservative of his informants 'agree that the payment of labourers on communal work is of prime importance. In a country where most of the workers are paid sixpence a day or less, the requiring of unpaid labour from a single section of the population, and that section the poorest, amounts to slavery.'

In a leading article, dated April 20th, 1935, based upon those revelations as to Unpaid Forced Labour, which "The Manchester Guardian" had printed for me on April 12th, 1935, 'West Africa' (published in England) spoke out strongly to the following effect as to the shameful character of the allegations I had made against Southern Rhodesia, inasmuch as Southern Rhodesia formed part of our British Commonwealth of Nations. – 'It is scarcely necessary to remind people interested, in African matters that one of the strongest counts in the indictment of the Liberian Government by the Christy Commission was the use of forced, unpaid labour. Many comments passed in this country upon the Liberian authorities then responsible have gone so far as to suggest that Liberia, owing to the charges made by the Christy Commission and others, should be deprived of membership of and reliance upon the League of Nations. It is therefore incumbent upon countries which form part of the British Empire to show that they neither impose nor tolerate practices of the nature of those which came to light in Liberia several years ago.

'On general grounds it is to be hoped the Southern Rhodesia Government will make strict and prompt inquiry into the truth of Mr. Cripps' charges. It is a high political interest and a high commercial interest of Great Britain that Afri-

* See Appendix I.
cans under European Administrations in British Africa should be left in peaceful possession of their natural human rights and should be contented and prosperous. But in the case of Southern Rhodesia there are certain special reasons why public inquiry should be made. The country’s Prime Minister frequently speaks as if his Government had hit upon some new and better way of dealing with its African population than other Governments have been able to evolve. Then, the country has just reported a Budget* claimed to be the most favourable in its history, which fact suggests that it could afford to pay the standard wage for Government-directed labour. Further, it is a country which professes great pride in its foundation by Mr. Rhodes and its devotion to his principles. If the case stated by Mr. Cripps is not disproved, it will be no matter for surprise if impartial critics say either that the principles of the founder of Rhodesia were unjust to Africans or that those who to-day govern the country he founded are departing entirely from his principles.

CHAPTER II.

‘An Inquiry Necessary’

THAT leading article from ‘West Africa’, which I have quoted, is headed ‘An Inquiry Necessary’. ‘West Africa’ says of me, the compiler of this pamphlet: ‘When therefore he makes in the ‘Manchester Guardian’ a serious charge against the Government of Southern Rhodesia, that Government will no doubt feel that it cannot with due regard to its own fair fame leave it uninvestigated.’

On May 14th, 1935, the following question was put in the British House of Commons to the Secretary of State for Dominion Affairs, the Right Hon. J. H. Thomas, M.P., by Mr. Mallalieu, M.P.:–

‘Whether his attention has been drawn to the fact that the natives of Mashonaland, Southern Rhodesia, are now being subjected to compulsory labour for the making of roads without receiving any payment of wages or rations whilst at work and without any remission of poll-tax; and whether he will say under what legislation this labour is being exacted?’

To this question Mr. Thomas is recorded to have replied as follows:–

‘I have made inquiries and understand that certain roads, of about twenty-four miles in extent, are being constructed in one of the reserves of Mashonaland in order to give better access to dipping tanks and so attract purchasers to whom the natives may sell their cattle. These roads have been made by native cattle owners at the suggestion of the dip-tank supervisor. No compulsion has been used and no complaints have been received from the natives.’

* See Appendix III (not included). /
Did this answer refer to recent happenings in my own District of Charter, Mashonaland? If so, it contained two bare-faced terminological inexactitudes.

I allege that wide-spread compulsion has been used here, and that complaints have most certainly been received from our local Africans.

Moreover, I allege that our dip-tank supervisor, who acted as the compelling European agent, received his compulsive power from the local Native Department Office of our Government.

In the ‘Manchester Guardian’ of June 26th, 1935, I wrote: ‘Southern Rhodesia is a large country containing many native districts. I profess to know only one native district comparatively well, the Charter District of Mashonaland, and I allege that / the information given by Mr. Thomas does not fit the facts as to that district. If the Government of Southern Rhodesia does not see its way to grant an impartial inquiry into the allegations I made as to unpaid forced labour in this district, I hope to publish and to circulate a pamphlet entitled ’How Roads were made in the Native Reserves of Charter District, S. Rhodesia, 1934–5’.”

Such a Government Inquiry as I suggested has not been afforded to me. About the end of August, 1935, I was told by a Chief Native Commissioner, who has recently come into office, that he could not well afford me such an inquiry, since his doing so might seem to reflect on his predecessor in office (who was supposed to have made some sort of an inquiry into the matter concerned on a brief visit that he paid to Charter District about April, 1935).

If the information referred to in the British House of Commons emanated from that predecessor, who is now out of office, and was meant to refer to this district of Charter, wherein I am now residing, I repeat that it does not fit the facts, as I know them. I repeat that wide-spread compulsion has been used in Charter District, and that complaints have most certainly been received from local Africans, domiciled in Charter District. In my next two chapters precise information may be found as to compulsion having been used, and as to complaints having been made.

CHAPTER III.

How Compulsion was Used in the Charter District

SINCE the information, which I have quoted, was given in the British House of Commons, on May 14th, 1935, I have made personal researches far and wide in Charter District, supplementary to that research which I had made in the Sabi Reserve neighbourhood, and reported in my letter of April 12th to ‘The Manchester Guardian’. I have found evidence as to an imposing amount of Unpaid Forced Labour having been exacted in the period 1934–5. The extent of the new road-making in that Sabi area, which I investigated in March, 1935, may have
been about 24 miles in extent, but I have found that that road-making is but a portion of a far-flung scheme of Unpaid Forced Labour superimposed upon our Charter District’s Native Reserves by a certain dip-tank supervisor under the authority of the Native Department’s Office at The Range in the Charter District.

I found that this dip-tank supervisor did indeed come about last June, some time after that misleading (not to call it utterly disingenuous) explanation had been given in Parliament as to unpaid road-making in Mashonaland, to one particular centre of Africans, and remark that the roads which he had set them to make were for the purpose of getting cattle-buyers to buy their cattle. Elsewhere I have found no trace of this explanation having been given by him to Africans, however tardily. I suggest that this explanation may have been an after-thought, as far as he was concerned. In June, 1934, some time before the pressure of Unpaid Forced Labour, so far as I can estimate, reached its height in our District, the whole District without exception, was, I believe, closed to the movement of cattle – a local outbreak of African Coast Fever having been discovered. I remember putting the question in March, 1935, to an African dip attendant as to when he had last seen cattle-buyers at the dip which I found him to be serving, and being told that it was at a time earlier than that when our Coast Fever quarantine came into force. I have heard from a European source that quite another explanation has been given by the dip supervisor of his road-making activities – that he has alleged his desire to free Africans from the extortionate tyrannies of local traders. But I do not think that either the one explanation or the other is of very much importance, or to be taken very seriously. The fact remains that the dip-tank supervisor, backed by the local Native Department, forced an astounding amount of labour from Africans, who had cattle to dip, in that region of Charter District and Buhera Sub-District which was under his control, using African dip attendants as his agents or overseers. I feel no reasonable doubt, after making extensive and intensive researches into the history of his proceedings, that in his policy of bluff he used threats of gaol. I believe in the general accuracy of the report given to me in the Manyene Reserve of Charter District as to this dip-tank supervisor having proclaimed: ‘Ndini ishe doktera we mombe: yitayi basa re road: kana musingayite basa ndinokuyisayi mu torongo.’ This proclamation, being interpreted, means: ‘I am the Chief, the Cattle Doctor: do the road-work: if you do not do the work, I will put you in gaol.’

Mr. Thomas told the British House of Commons that, according to his information, no compulsion was used. At a Paramount Chief’s centre (in the Mondoro Reserve of Charter District), when I was investigating our Unpaid Forced Labour scandal, an African used an argument that appeared to me to go straight to the root of the matter. He asked a question of this kind: ‘If we were not forced, should we be punished?’ Here is an instance of the sort of punishment inflicted.
I allege (and I offer evidence in support of my allegation) that a brother of this same Paramount Chief was punished for absenting himself from work on the road, when other people went to that work, by being sentenced to work in a dip-garden.

I allege that another man of the same Chief’s people, who had been looking about for lost cattle, and so had absented himself from road-work, was punished by being given a week’s roadwork. I submit that a woman in the same neighbourhood, whose husband was alleged to be looking for Tax, was penalised for a day. And so on, and so on.

I offer evidence that in this particular Reserve (from which I have been drawing these particular instances, that I have given of the penalising of defaulters) the rule was that, if a man were sick, his wife must be sent; if she were not sent, he must work when he got better. In the Manyene Reserve, not very far from where I live, I submit that I have evidence taken in the presence of a Paramount Chief that the rule there was apparently that, were a man away, his wife or child must take his place at road-making. An African, whom I know intimately, who lives and owns cattle upon a Native Purchase area – dipping his cattle at a tank on the Manyene Native Reserve – has told me that at one time his daughter acted as his substitute in his absence from home.

One of the most sinister features of the whole had business appears to have been the use of women’s labour, while their husbands were away at work, or seeking their tax-money.

The dip-tank supervisor worked his Unpaid Forced Labour scheme by means of African dip-attendants, through whose hands those dipping cards passed, on which the numbers of the various African owners’ cattle were entered. Each card-owner might be warned to complete a strip of road, about fifty yards in length. One dip attendant assured me that he only allowed a woman to help her husband on a strip, but not to take over a strip, when the husband was not available, but I am offering evidence to prove that all our Charter District dip attendants were not so scrupulous. (In both a Reserve to the west of Charter District, and in another to the east of the same District, I have gathered this evidence of mine.) I assert that, through the custody of their cattle-tickets, leverage of a bluffing kind has been brought to bear upon our Africans in Charter District to bring them out in wholesale fashion for Forced Unpaid Labour, both labour for road-making, and also labour at dip-tank centres.*

By the machinery of the Adult Male Africans’ Registration Certificates, native labour for wages is regulated, and coerced from / desertion before the periods of labourers’ contracts may have expired. By the machinery of the African cattle-owner’s dipping ticket (used with a liberal amount of bluff by some

* See Appendix IV (not included).
dip-tank official – acting as the Native Department’s go-between) a vast amount of labour has been secured by the Native Department of our Charter District in Mashonaland, without money and without price.

The son of a Paramount Chief pointed out his view in my presence that the dipping ticket was a second Registration Certificate. I think that I understand what had prompted that view, to which he gave such significant expression. Surely the vague menace of being refused back one’s dipping list of cattle by a dip attendant, who represented a dip-tank supervisor with some reputation for rough dealings* at dips, who in his turn represented the Southern Rhodesia Native Department, may have proved wondrously successful in extracting Unpaid Forced Labour among the very submissive African cattle-owners inhabiting Mashonaland.

Assuredly it may have been found an easy task to bluff them thereby into surrendering their services on a gigantic scale to further an organised scheme of unpaid navvying. In certain places a great amount of raised roadway was substituted for old tracks. Not only the African people, already taxed almost out of existence as individuals, but the people’s cattle,† axes, hoes, sledges, ploughs were commandeered for communal work on roads, or on dip tanks’ embellishments. One African gave testimony that he had used twelve cattle for a day’s work with an iron road-smoothing apparatus. I maintain that such use of man’s and cattle’s labour without wage reflects little credit on that Native Department, under whose authority he was employed. In Kenya, so we have been told, communal work was required by law from Africans, who preferred their own free village life to plantation life as wage-earners for Europeans.‡ Here in our Charter District of Southern Rhodesia I submit that I have found evidence of the communal labour of road-making having been exacted from women while their husbands have been busied with the business of wage-earning or Tax-seeking. It is an outstanding disgrace, I maintain, to that district of Mashonaland wherein I have made my home for so many years now, that Unpaid Forced Labour should have taken the repulsive shape that it did in the period. 1934–5.

CHAPTER IV.

How Complaints were Made in Charter District

THE Right Hon. the Dominions Secretary told the House of Commons that, according to his information, no complaints had been received from the Natives about that road-making in Mashonaland of which he spoke. I allege that in
