Editorial Notes 325

THese works, however, could not be built at the start of the colonial period. The cost was generally beyond the capacity of the private sector, there was the fear that private ownership would lead to the development of monopolies, whose high freight rates would act against growth, and the London money market would only invest in such projects if they were assured that their capital would be safe from ‘native’ attack and provide a return sufficient to meet interest/repayment charges. The start of the railway age was thus delayed, except in prosperous South Africa, until the late nineteenth century when it was clear that the productive wealth of the continent was sufficient to support railway and harbour investment, Britain’s control of the continent had been formalized and there existed administrations that could recruit the labourers needed to construct works, manage their operation and militarily protect them. By the
First World War, the majority of the trunk lines had been laid down. Feeder and branch railways and works to eliminate trans-shipments were then built to 1931 when the world slump and the collapse of African commodity prices brought the construction phase to an end.

As regards the other forms of transport/communications that appeared in this period, the popular media (newspapers, movies and radio) was developed by the private sector. Apart from the issue of broadcasting licences and some modest attempts at film censorship, the imperial/colonial governments had little involvement in the area. This was not the case with roads, the telegraph and aviation. Of the three sectors, telegraphy was considered most important. Heavily subsidized by the imperial government, the laying of telegraphic cable allowed information to be transmitted from Africa to Britain in minutes rather than weeks and thus permitted better control and defence of the empire and promoted the expansion of trade. By the First World War, most of Africa was linked to Europe and railway telegraphs and other cabling operations ensured good communications within and between colonies/protectorates. Roads and aviation, by contrast, were given a lower priority. The fragility and small carrying capacity of vehicles and the poor quality of routes made road transportation less economically viable than railways for both the short and long distance carriage of goods. Administrations also regarded roads as unwanted competition to railroads, which would damage government receipts, and lacked the funds necessary for their construction and maintenance. Relatively few thoroughfares were therefore constructed until after the First World War when the arrival of large sturdy American lorries and tarmac made them cost-effective for the transport of goods to and from the railhead. Aviation was similarly neglected. Its high costs and small carrying capacities made it unsuitable for the transport of passengers or cargo, apart from mail, and, by the end of the period, although the continent was connected to the major European cities, the service provided was limited and there were few inter-African air routes.

This General Introduction, the thematic introductions and the collection sources examine the communications revolution experienced by British Africa over the period 1880 to 1939 and the impact it had on economic growth, urban geography and the African way of life. After a brief discussion of two traditional forms of transport, porters and animal drawn wagons (waterborne transport is discussed in the Canoes and Boats thematic introduction of Volume 5), this General Introduction explores the State construction of railways, concentrating on the use by colonial administrations of the department system, contractors and their own Public Works departments and the finance of lines. Private sector construction, the use of consulting engineers and contractors, and the methods by which building materials and rolling stock were purchased are then examined (other aspects of railway construction/operation are discussed in the Proposals,
General Introduction

Construction, Operation of Lines and Economic Impact thematic introductions in the first four volumes of the collection.

The Introduction then explores other forms of infrastructure/communications – the development of harbours, the arrival of the road and motor vehicles, the laying of telegraph cables and the popular media. The shipment of cargo to and from Africa, aviation and the postal services are discussed respectively in the Shipping, Air Transport and Postal Communication thematic introductions, all of which are in the fifth volume of the collection. I conclude with a brief examination of the impact of the communications revolution on African well-being and post-colonial growth.

Traditional Forms of Communication

Traditionally, goods were transported by human carriers, pack animals and by canoe and boat. Porters carried a great variety of goods, usually individually, but in the case of large items as wagon dragging teams, and worked for Arab, Swahili and Indian caravan owners and colonial administrations.\(^2\) The caravans were generally quite large, occasionally stretching several miles, often stopped at towns and villages en-route to buy foodstuffs and to sell their goods, and were accompanied by armed guards to protect the convoys from raids.\(^3\) It used to be thought that most caravan porters were slaves hired from their masters, who received up to 75 per cent of their income. Many, however, now believe that the majority were free labourers. Most stayed in the profession for many years travelling along the coast, and, to a lesser extent, into the interior where they developed their own unique lifestyles.\(^4\) Those employed by colonial administrations, by comparison, tended to be local Africans, though labour shortages caused some governments to obtain workers from further afield. Nyasaland, for example, recruited men, women and children from Mozambique. Often forced into providing their labour, most government porters undertook the work for only a short period of time.\(^5\)

The main drawbacks of human porterage were that it was costly, slow, unreliable and had a negative impact on local economies. Transport costs at around 3s per ton/mile were from three to thirty times that of railways.\(^6\) Facing competition from other economic sectors in need of labour, and, in some cases, restrictions from local governments, caravan owners had to pay high wages, in West Africa from 9d to 1s per day, and suffered high desertion and mortality levels. To reduce their costs, most provided their workers with inadequate food and blankets, forced them to carry excessive loads and to walk long distances without a break, and all carriers were prone to communicable diseases and animal attack.\(^7\) Many thus died en-route or became so sick that they had to be abandoned or sent home. Goods, needless to say, could only be transported as fast as a human
could walk – a great disadvantage if they were perishable – and were often delivered late or not at all, with many deserters absconding with their loads. The system also damaged local economies, contributing to labour shortages and high African wage rates, spreading disease, and, in Nyasaland, where large numbers of migrants were recruited, aggravating food shortages. Nonetheless, the mode of transport proved highly resilient and survived well into the railway age. Before the arrival of roads and motor vehicles, porters were needed to transport goods to and from the nearest railhead and to carry the wood and water required by locomotives. In 1900, there were 78,000 porters in Nyasaland alone, and, in the First World War, East Africa employed over one million.

Animal transport possessed similar drawbacks. In most of Africa, draught animals were rarely used for the movement of goods. The animals were susceptible to draught and disease, the rinderpest epidemic at the turn of the century killing large numbers of oxen, and progress was slow and unreliable. Oxen need to graze for eight hours per day and rest for eight hours, and, in the remaining eight hours, an ox wagon could only travel ten to eighteen miles, depending on the state of the roads and the country traversed. Often journeys took far longer. Axles and wheels broke and could take days to repair, during the rainy season some roads became impassable, and oxen could fall prey to lions and crocodiles and be slowed by swarms of tsetse flies. The exception was South Africa, where ox wagons were the preferred method of carrying supplies. The wagons used could be as long as 18’ by 6’, carried around a ton of goods, and were drawn by as many as fourteen paired oxen, with the strongest at the rear of the team. The drivers, known as ‘transport riders’, controlled the beasts with a whip rather than reins and were landless Boers and Africans who ‘blazed their own trails’, driving their wagons across the open veldt. Even here, however, the wagon was eventually superseded by railways, which set out to destroy their cheaper competitor by placing pressure on governments to introduce restrictive laws, and, in eastern South Africa where they owned the ports, applying surcharges on traffic arriving at or leaving harbours by road. The result was that large numbers of drivers became destitute and moved to the towns, contributing to the urban poverty that blighted the country after the turn of the century, though some continued to eke out a living serving communities located some distance from the railheads.

Railways

Railways were constructed and operated both by colonial administrations and private companies.
1. Construction and Finance of Government Lines

Colonial government lines were built by consulting engineers, in what was known as the department system, by contractors and by local Public Works departments and financed by the British government, loans, short-term advances and private capital.

**Department Construction**

*Nature and adoption.* The department system was adopted in the Crown colonies from the mid-1890s to the early 1900s. Theoretically, infrastructure was built by colonial Public Works departments. In reality, local engineers had little involvement in construction, which was organized by the Crown Agents, a quasi government organization that acted as the Crown colonies’ development agency and by consulting engineers, in the case of Africa by William Shelford and his son Frederic, who became his father’s partner in 1899, and, in 1906, on William’s death, took over the family firm. After the Colonial Office had decided that there was a need for a railway, the consulting engineers completed a reconnaissance survey to determine possible routes. Using the information collected, they then determined the mode of construction and estimated the likely costs and the economic viability of each route. Their report was sent to the Crown Agents, who added their own comments, and then passed to the Colonial Office, which decided whether the scheme would go ahead. If approval was given, from approximately 1905 the consulting engineers undertook a location survey that determined the exact direction of the chosen route and then sent a team led by a senior engineer, known as a resident engineer, to the colony, which set about building the line.

Department construction was adopted in the West African colonies of Southern Nigeria, the Gold Coast and Sierra Leone. In Southern Nigeria, the first line to be built was the Iddo to Ibadan railway, begun in 1895 and completed in March 1901. To connect Iddo with the port of Lagos, a two mile 2’ 6” gauge tramway was then constructed from the Iddo railhead, along the waterfront, to Government House and the European residential area (1902). After which, the main line was extended to Oshogbo (1907), Ilorin (1908), Jebba (1910) and Minna (1912), where it joined up with the Public Works Department-built Northern Nigerian Baro–Kano railroad. In the Gold Coast, a line was laid from the south-west coastal port of Sekondi inland to Tarkwa (1901), from where two extensions were constructed: one travelling to Broomassie (1910) and the other to the mining centre of Obuasi (1902) and then onto the Asante capital, Kumasi (1903). Proposals for a Sierra Leone railway were first made in 1872 and eventually came to fruition in 1896 when tracks were laid from the capital Freetown to Wellington (1897), Waterloo (1898) and Sogotown (1899). This line was then extended to Rotifunk (1900), Bo (1903) and
Baiima (1905), and, in 1903, Freetown was connected to the European residential area of Hill station by 5.5 miles of track, known as the mountain railway.\textsuperscript{19}

The adoption of the department system was promoted by both the Crown Agents and the Colonial Office. As discussed below, the Crown Agents disparaged both construction by contractor and local Public Works Department, though their enthusiasm for the use of consulting engineers was probably at least partly driven by self-interest. The system ensured that all the materials required for construction would be purchased by themselves and that they would thus earn large revenues from the commissions earned; gave them greater control of the building process, reducing the likelihood of poor quality lines and colonial criticism; and permitted the operation of nepotism. Frederick Shelford was the son-in-law of the senior Crown Agent, Sir Montague Ommanney, and Frederic’s uncle, Thomas Shelford, was one of the ‘greatest friends’ of Sir Maurice Cameron, the Agent in charge of engineering. For the Colonial Office, the system avoided the delays in the commencement of works that occurred when contractors were used and which led to complaints from outside interest groups; ensured the purchase of British construction materials; reduced the likelihood of clashes between constructors and local populations; and avoided the legal proceedings that usually followed a contractor’s demands for additional payments and drew attention to over-expenditure and again led to criticism.\textsuperscript{20}

\textit{High costs.} The system was the subject of much colonial, parliamentary and press complaint. Construction costs were relatively high as compared to the consulting engineers’ survey estimates and similar railways (see \textit{Tables 1} to \textit{3}), the lines were poorly built, and, once completed, were often uneconomic, revenues failing to match the engineers’ pre-construction projections. Building costs were high relative to estimates because of the harsh African environment, discussed in the Construction thematic introduction, and because both the Crown Agents and the consulting engineers encouraged Colonial Office authorization of lines by underestimating costs.\textsuperscript{21} The potential difficulties of construction were minimized and estimates often contained inadequate margins for contingencies; used approximated quantities, particularly for bridges and rolling stock; omitted expenses, such as the cost of unloading railway materials at harbour-side; underestimated land prices; and took no account of the rise in labour expenditure that would result from a project’s own demand for workers.\textsuperscript{22}

</table>

The actual cost of lines was raised by the piecemeal nature of construction and the nature of the department system. Owing to a lack of funds and a wish to minimize losses if lines failed to pay, the Colonial Office only permitted short lengths of track to be built at any one time, which reduced potential economies of scale, and, as ultimate destinations were unknown, made it difficult to plan cost-effective alignments. Expenditure was further raised by the departmental system itself. By allowing location surveys to be carried out during construction rather than before building commenced, as occurred when contractors were used, the system led to hurried surveys, particularly if construction was ‘treading on ... (the surveyor’s) ... heels’, and poor and costly alignments and gradients. The voluminous correspondence between Shelford and his resident engineers resulted in high administration expenses and delays, and, as discussed in the Operations thematic introduction, the construction materials purchased by the Crown Agents were overly expensive.26

More importantly, the system led to the building of expensive high standard lines and relatively slow construction, which again raised costs. Unlike railways built under other systems (see Construction thematic introduction), departmental railways were generally constructed to a high standard. Wide gauges were adopted, which increased material and land expenses and required more cuttings and embankments; stone rather than wooden or steel bridges were erected; and most lines had a large number of well-equipped stations. The Agents’ and Shelford’s justification for such quality was that the capital savings of low standard lines were relatively small; as discussed in the Operation of Lines thematic
introduction, any capital savings would be offset by high operating costs. Poor quality lines also had small carrying capacities and would eventually have to be upgraded causing relatively expensive disruption of traffic. The true reason was that they both benefited from high standard works. The lines required large amounts of building materials, which increased the revenue they received from its purchase (see Operations thematic introduction), were unlikely to generate reputation damaging colonial criticism as regards poor line performance, and took longer to build and thus increased Shelford’s remuneration.  

Until 1905, Shelford was paid a salary. This was higher than the remuneration consulting engineers obtained from private clients and that other consulting engineers employed by the Agency received, plus the payment of a salary encouraged Shelford to deliberately slow progress in order to maximize his income (see Table 4). The Crown Agents and Colonial Office were bombarded by minor queries and construction methods were adopted that prevented rapid progress. Little plant was used, as machinery was supposedly expensive compared to the cost of labour and its use impeded by the thickness of the forest and the perceived intellectual deficiencies of African labourers. There were no temporary diversions around heavy earthworks and viaducts to prevent their construction slowing track-laying, and, rather than using the spoil removed from cuttings to build embankments, Shelford simply dumped the material and obtained fresh embankment earth from specially dug ‘borrow’ pits. Under pressure from colonial administrations and the Colonial Office, the Agents gradually reduced Shelford’s salary and, in 1905, this was replaced by a fee and a percentage payment scale based on the estimated cost of works, which eliminated the benefits of slow construction and discouraged underestimation of costs.

Shelford, in turn, paid his resident engineers relatively high salaries and generous ‘extras’, and the payment of a salary and the fact that the engineers were employed only for the duration of the construction project, again, led to idling
and the erection of unnecessary works. On the Lagos railway, for example, one bridge that was not required was built and another constructed that was too large. The resident engineers and their teams also had little knowledge of local conditions or labour rates, were more prone to illness than local engineers, and were distrusted by Public Works Department staff, who often withheld help and information – all of which raised costs.\textsuperscript{30}

**Poor construction.** Although the Crown Agents and Shelford aimed to build quality lines, many were shoddily constructed. For example, when handed over to the colony, the Lagos–Ibadan railway was only half ballasted and had an incomplete drainage and telegraph network; while the Sekondi–Tarkwa line had an uneven track. These inadequacies were largely due to Frederic Shelford’s meagre engineering skills and the poor monitoring of the construction process. Owing to William Shelford’s poor health, much of the work before his death was undertaken by Frederic, who was just twenty-eight when he was made a partner and had been an associate member of the Institution of Civil Engineers for only two years. Shelford’s abilities were widely criticized, and, in 1910, at the age of thirty-nine he abandoned the engineering profession to become successively an East African cocoa farmer, barrister and a Nyasaland tea planter. His lack of skills was often matched by those of his resident engineers. The worldwide boom in railway construction had resulted in a shortage of engineers, few of whom wished to endanger their health by working in Africa. Shelford thus had to recruit relatively inexperienced men, many of whom on arrival in Africa were immediately poached by local mining companies.\textsuperscript{31}

Ideally, the work undertaken should have been closely monitored. Theoretically, the Colonial Office and the Crown Agents perused quarterly reports on the progress of works prepared by Shelford, and, in the case of the Agents, the resident engineers’ monthly progress summaries and their correspondence with their employer. Copies of these documents were additionally passed to the governor of the constructing colony, who also saw the works’ accounts and could inspect the construction sites. Shelford, in turn, followed progress via his resident engineers’ reports/correspondence and made site visits, and the resident engineers directly monitored their own construction staff. Finally, before a completed line was handed over to the local colonial administration, it was inspected by an engineer or the manager of the colony’s railway department.\textsuperscript{32}

In reality, these strategies proved ineffective. The Colonial Office and the Crown Agents lacked the technical expertise and time to judge the accuracy of the information provided by Shelford, which was presented in a highly technical and lengthy form; perhaps to deflect criticism.\textsuperscript{33} To minimize costs, Shelford made relatively few trips to Africa and was thus unable to determine the accuracy of the information provided by his engineering teams, and, in any case, was
unlikely to draw attention to any construction staff errors or irregularities that came to light. In the colonies, long leave periods and high turnover and invalidity/mortality levels led to constant changes of resident engineers and made the supervision of construction staff difficult. Governors, who again generally lacked engineering expertise, were at first discouraged by the Crown Agents from intervening in the construction process in order to avoid delays and to ensure that the consulting engineer could be held directly responsible for work. Later, under pressure from the Colonial Office, resident engineers were placed under an obligation to furnish governors with any information required and to follow their wishes in all matters affecting the use of the works when finished provided that they were consistent with sound engineering principles. As for the inspection of completed lines, this was again unlikely to be overly critical. Inspection engineers were recruited by the consulting engineer, and, in the case of the Ibadan–Oshogbo line, Frederic Shelford himself took on the role. Railway department managers, meanwhile, were unlikely to criticize the consulting engineer who had recruited them (see Operation of Lines thematic introduction), advised the colony on their salaries, and on whom they would depend for selection if they wished to move to another colony.34

Unprofitability. In addition to being expensively and poorly built departmental lines were uneconomic, revenues failing to match the consulting engineers’ pre-construction projections (Table 5). Inevitably, the railways were subject to the problems discussed in the Operation of Lines thematic introduction, but a further reason for their unprofitability was that the Crown Agents and Shelford overestimated their returns in order to encourage Colonial Office authorization of construction and to strengthen their case for high standard works. The majority of consulting engineers’ reports predicted that proposed lines would immediately cover both working and debt charges. Where this was not the case, it was usually stated that any loss would be temporary and that the shortfall would be offset by increased customs revenues on the trade fostered by the line. Occasionally, when it appeared that a railway they had disparaged would actually be built, they improved their forecasts of profitability, and, when a completed line failed to pay, they continued to insist that their predictions would be fulfilled or used the failure to encourage further construction, warning that the project would only become remunerative if an extension was built. The Crown Agents, not surprisingly, generally welcomed these optimistic conclusions, raising doubts only when they believed them to be overly pessimistic. The Colonial Office, lacking the expertise to judge the veracity of the economic analysis and believing that all railways promoted growth, generally accepted the advice without comment.35

To arrive at their findings, the consulting engineers used construction costs to determine loan interest/sinking fund charges and based expected working expenses on those of similar lines. Revenue calculations took account of import, export, passenger, government and future receipts. Although the methods adopted varied, export estimates were generally calculated according to the export figures of the nearest port, surveyors’ road traffic counts, information gleaned from local chiefs and merchants, or the result of the multiplication of the average per square mile yield of the main crops grown by the number of square miles to be served by the railway from which home consumption (the average population per square mile multiplied by the assumed annual per capita consumption) was subtracted. Total exports were then multiplied by the freight rate that the engineers believed the exports could bear, which was generally below that charged by competing forms of transport. Import estimates were based on import figures or the import traffic of similar railways, which was again multiplied by a given freight rate. Passenger revenues were determined using population figures, road traffic counts and the passenger rates of similar lines. While future receipts were arrived at by multiplying the expected per acre crop of the product that was expected to be grown by the expected acreage and freight rate and adding an estimate of the natural increase in traffic, usually the growth rate of a similar line.\textsuperscript{37}

The eventual forecasts, however, tended to be wide-of-the-mark. Projected debt charges were based on underestimated construction costs and working expense predictions on figures from dissimilar lines, and, in the case of extensions, it was assumed that the new railway in the first instance would be worked at a reduced cost by existing operating staff. All revenue calculations were based on a single assumed freight rate, which took no account of the different goods to
be carried. Traffic counts were limited, taking place over a week at most, took no account of seasonal variations in movement and assumed that all freight would be transferred to the railway and that head load carriers would maintain their existing rates. The information obtained from chiefs and merchants, who also wished construction to go ahead, was often exaggerated and future projections were based on slight evidence and took no account of the possible unwillingness of African farmers to grow the projected crops, the lack of feeder roads, or problems of perishability.38

Contractor Construction

By the early 1900s the Colonial Office, fearing the prospect of unbalanced budgets and perturbed by parliamentary criticism began to seek a replacement for the department system, proposing that lines should be built by contractors or local Public Works departments or that colonial administrations should abandon their transportation role to the private sector. Contractors had been used to build several government railways, including Natal’s main and Northern Coast lines. The Agents, however, strongly opposed this form of construction. Contractors were often permitted to purchase building materials, thus depriving the Agency of purchasing revenue, and it was argued that they bought poor quality materials to reduce costs and built substandard lines. To avoid criticism, the Agents had to choose the lowest and therefore usually the poorest quality tender, and, once a contract had been signed, they could not alter the route or the design for fear of subsequent heavy claims for additional payments, even if new information became available that improved alignment. There was also a danger in the case of lump sum contracts, under which contractors performed the work for one fixed fee, that companies would reduce quality to increase profits, or, if conditions proved worse than expected, minimize losses.39

The poor quality of contractor railways was supposedly matched by their high cost. Tender bids were high as the harsh local environment, the small size of projects and the informal division of regions between companies minimized competition and the bids contained large contingency margins to ensure that a profit would still be made even if conditions were more difficult than expected. Colonies had to pay preliminary expenses, for example for the drawing up of contracts, the tender process and so on, and lost the income earned from opening completed sections of unfinished lines to traffic and the contractor’s profit margin, which could be large if construction was easier than expected and the contingency margin not drawn upon. They also had to employ a consulting engineer and a resident engineer to monitor construction, could face claims by the contractor for additional payments that often had to be settled through time-consuming and costly arbitration, and, if the contractor went bankrupt, would have to complete the line themselves.40
In reality, many of the Agents’ claims were spurious. Contractors’ costs were relatively low and the quality of construction relatively high. Contractors employed highly experienced and efficient engineers, whose performance required little or no monitoring; used specialized plant, which they moved from project-to-project; and purchased construction materials at a lower price than the Agency. Demands for compensation and extras were rare and the problem of high contingency margins could be overcome through the use of schedule contracts, under which the rates for the various classes of work to be completed were set and contractors paid sums calculated at the agreed rates for the work actually performed.  

Despite the Agents’ scare tactics, the Colonial Office was keen to experiment with contractors. A proposal to use them to build the extension of the Lagos line beyond Ibadan was successfully opposed by the Agency. However, in 1906 under pressure from the colonial administration, Colonial Office officials insisted that construction of the Gold Coast Accra–Akwapim railway be undertaken by contract. The Agents’ response was to sabotage the experiment by choosing as contractor a firm operated by a Mr Murphy, who had no experience of overseas construction and whose tender was 19 per cent below Shelford’s cost estimate. Not surprisingly, the line was completed late and poorly built, lacking sufficient bridges, ballast and earthworks, and Murphy requested additional payments and was accused of opening sections of the unfinished line to traffic and ‘pocketing’ the receipts. The experiment was regarded by the Colonial Office as a failure and not repeated.

Public Works Department Construction

The majority of African government lines were built by local Public Works departments, which possessed valuable local knowledge, and, identifying with the colony and likely to maintain the completed works, had greater commitment to low cost and quality construction than consulting engineers and contractors. In the Crown colonies of West Africa, Public Works departments were only used to build lines after the failure of the department system. Needless to say, the Crown Agents strongly opposed local construction, arguing that the completed works would be both expensive and substandard, as government engineers lacked the necessary surveying and building expertise/experience and eminent consulting engineers would be reluctant to provide advice and designs, as they would be unwilling to work with colleagues professionally and socially inferior to themselves. Moreover, it would be difficult to attribute responsibility for unsatisfactory work, particularly given the high turnover of personnel; construction would divert staff from their normal duties; and there was a danger that government engineers would place greater weight on the wrongheaded
views of colonial governments on whom their future livelihoods depended than on those of the Colonial Office and Crown Agents.\textsuperscript{43}

The first locally constructed line was the 1901 Northern Nigerian 22-mile Zungeru railway required to link the new administrative headquarters of the colony to the Kaduna River. The governor, Sir Frederick Lugard, a long-time foe of the Agents, demanded that his own engineers be allowed to construct the line, and, given the urgency of the project, the Colonial Office agreed. The works were completed in six months and cost a mere £1,389 per mile.\textsuperscript{44} Encouraged by this success, Lugard then proposed a further locally built line from Baro on the north bank of the Niger to Kano, an important trading centre. Lack of funds forced the project to be abandoned until 1906 when Winston Churchill, another opponent of the Agents, became colonial parliamentary under secretary of state and green-lighted the scheme, declaring that it should be used to test the viability of local construction. In the event, the line, laid down by the Public Works Department assisted by the Royal Engineers and South African engineers, cost just £3,915 per mile, 40 per cent below Shelford’s estimate, and was completed in a relatively short time and to a high standard. Such was its success that the Colonial Office required all future Crown colony railways to be built locally.\textsuperscript{45}

Subsequent works built by the Nigerian Public Works Department included the Bauchi line (1912); the Zaria–Jos–Bukuru railway (1912–14), extended in 1929 from Zaria to the cotton producing areas of Kaura Namoda; and the line from Port Harcourt to the coalfields of Enugu, which was connected to the western line in 1926.\textsuperscript{46} Elsewhere in West Africa, local construction was used for the Sierra Leone Bauya Junction to Makeni branch line (1914), later extended to Kambai; the Gold Coast Accra–Kumasi line, started in 1914, but only completed in 1923 due to the outbreak of the First World War and a smallpox epidemic; and the Gold Coast Central Province Huni Valley to Kade railway (1923–7), built to open up cocoa and mahogany growing regions and to provide a link to the new harbour at Takoradi.\textsuperscript{47}

In South Africa, Public Works Department construction, occasionally with the help of contractors, began far earlier. The discovery of diamonds in the early 1870s prompted the construction of railways towards Kimberly from the ports of Cape Town, Port Elizabeth and East London.\textsuperscript{48} The extension of these lines into Transvaal and the Orange Free State was opposed by the local governments and a breakthrough only occurred in 1888 when the Cape proposed to extend the Port Elizabeth–Colesberg line into Orange Free State and threatened an extension of the Cape Town–Fourteen Streams railway into the Transvaal or though Bechuanaland if the government refused to grant permission. The rouse was successful and the line reached Bloemfontein, the Orange Free State capital, in 1890 and was then extended into the Transvaal, reaching Johannesberg in 1892, thus opening the three Cape ports to the Rand goldfields.\textsuperscript{49} Subsequent Cape lines included branches to Maclear/Butterworth (1906) and Umtata
(1916) and the Touws River–Ladismith railway (1923). In Natal, the hub of the railway system was Durban. From 1878 to 1880, a railroad was built from the port to Camperdown via Pinetown and Bothas Hill. A line to Elandslaagte was then opened in 1888, connecting Howick, Estcourt and Ladismith, followed by a line to Johannesburg in 1895. Other works included the 1889–91 Wesselsneck–Charlestown railway, which travelled through Biggarsberg (now Glencoe) and Newcastle and branches to Richmond (1897), Greytown (1900), Donnybrook (1906), Riverside (1909), Matatiele (1924) and Kokstad (1924).

Railways in East Africa were dominated by the Uganda line. Construction by British military engineers from India began in 1896 at the port of Mombasa and eventually reached Kisumu on the eastern shore of Lake Victoria in 1901, an extension to Kampala appearing in 1931. Other major lines in Kenya were the Nairobi–Thika tramway and the Kisumu–Mumias, Eldoret and Voi–Taveta railways. The tramway was proposed by the governors Sir F. Tryer and Sir Percy Girouard in 1906 and 1907, respectively. Both proposals were turned down by the Colonial Office, which finally permitted construction in 1911. The tramway was later extended to Muranga, Nyeri and Nanyuki, and additional branches built to Solari (1926), Nyahururu (1929) and Butere (1931). The line to Eldoret was laid in 1924 and later extended to Kitale (1926) and the Voi–Taveta railway was built from 1914–15 for strategic reasons and to provide access to the Taita–Taveta sisal growing region. By the early 1930s, apart from Sotik–Kericho, all European communities were within 40 km of a railhead.

Tanganyika was less well supplied with lines. On taking over the country, the British built extensions to the existing German railways. A branch of the Dar es Salem to Kigoma Central route (1904–14) was constructed from Tabora to Mwanza on the southern shore of Lake Victoria (1928) and the Tanga–Mombo–Moshi line (1899–1911) was connected to the Uganda railway at Voi (1924) and then extended to Arusha (1929). In 1934, a branch line was also laid from Manyoni to Kinyangiri, but this was abandoned in 1947.

Finance of Government Construction

Public sector construction was financed by the British government and by the Crown Agents. Imperial government finance was minor and took the form of a number of one-off loans and two development schemes. The largest ad-hoc loan was the £5.5m provided by the Foreign Office to finance the Uganda railway, which was eventually written off. Other significant contributions included the £60,000 provided for the 1907 Nairobi–Thika tramway, the £3.5m for extensions to the Uganda railway (1924) and the £10m for the development of transport in East Africa and Palestine (1926). The two development schemes were largely ineffective. In the late 1890s, the Treasury agreed to finance Chamberlain's railway construction programme.
through advances from a colonial development fund, which contained excessive Post Office saving account funds that could not be profitably invested in the UK. Unfortunately, the passage of the empowering legislation through Parliament was delayed and the Treasury then began to have doubts about the scheme, fearing that the funded lines would fail to generate sufficient revenue for repayment. The bill was consequently abandoned and replaced by the Colonial Loans Act, which provided advances only for a limited number of projects. Moreover, the Crown Agents were reluctant to employ the legislation. The loans carried a relatively high interest rate, were insufficient for the designated works and included a first charge on the revenues and assets of the borrowing colony i.e. if the local administration defaulted on its debts, any revenue/assets available would be used to pay these loans before any other obligations. The charge, along with the implication that the Treasury had little confidence in colonies’ abilities to repay their debts, would thus reduce private investors’ willingness to buy the securities of administrations that accepted the advances. Not surprisingly, therefore, the Agents made little use of the loans. £0.792m was obtained in 1900 for the Lagos railway and small amounts drawn upon to pay off a number of current and bank advances made in 1898/9 and to finance small projects in regions that were unlikely to require further funds.

The second development scheme appeared in 1929. A further Colonial Development Fund was established to promote the advance of agriculture and industry in the colonies and thereby foster industrial expansion in the UK through the provision of grants, loans or the payment of interest on loans raised elsewhere. For a variety of reasons, described in the General Introduction to the first collection of the Britain and Africa series, Economic Development of Africa, 1880–1939, by 1940 only £8m had been distributed, £4.307m to Africa, and only a small proportion of this amount was used to fund transport developments.

The majority of the funds used to finance construction came via the Crown Agents, which issued loans, provided short-term advances and arranged the provision of private capital. The loans were either publicly issued or sold to private institutions on the London money market (see Table 6). From 1880 to 1939, £128.3m of African government colonial stock was issued or sold on the London market, of which £83.425m was used to finance public works, railways or harbours. Each loan had a lifespan of five to sixty years, after which it had to be repaid, a price per stock, an annual interest charge of between 2.5 and 6 per cent of its value, and, after issue, was quoted on the stock market. Occasionally, if a colony failed to spend all the money raised on the project listed in the loan prospectus, the Agents allowed the unspent balance to be used for other purposes. In the case of the 1929 Nigeria issue, for example, £0.550m obtained to finance the construction of the Lagos sewerage scheme was used to build a railway and a college.

Notes: P = Public works; R = Railways; H = Harbour; I = Immigration; M = Military operations; F = Internal/External Finance; R/C = Redemption/conversion.

Initial purchasers of the loans were stockbrokers, who in the fullness of time sold their allocations to the general public at a profit; financial institutions, which retained their purchases as reserves; and ‘stags’, private investors who bought securities in the hope that the price would rise soon after issue when they would be immediately resold. Generally, stockbrokers had little difficulty offloading the stock purchased. Investors were confident that dividends and capital would be repaid; the imperial government would never allow colonial administrations to default, as non-payment would destroy the Agents’ ability to raise further funds and damage the legitimacy of the empire. They were equally assured that the market price of their securities would be free from fluctuations or shocks. Colonies were secure from internal and external aggression, largely due to the might of the British army and navy, and the high ethical standards of colonial administration made it unlikely that loan proceeds would be subject to fraud. Moreover, most investors were convinced that transport projects would generate large revenues relatively quickly and that their investment would benefit British industry. The completed infrastructure ultimately increased British exports to Africa and reduced the cost of primary imports, and, as described in the Operations thematic introduction, all the construction materials and locomotives etc. were sourced from UK firms.  

The short-term advances used to finance the early stages of a project were obtained from colonial current account surpluses, the Bank of England, the
London and Westminster Bank and the inter-colonial loan scheme, all of which are described in the General Introduction to the first collection of this series.\(^{61}\) The advances ensured that by the time a loan was floated the construction of the works was well underway and an accurate estimate of their final cost could be made. As a result, there was less likelihood that a colony would run out of money and have to return to the market and damage its financial credibility, and the fact that a project was already being built increased public demand for the loan. Also, if an issue was made before work commenced, a large proportion of the proceeds would remain idle, earning interest at a lower rate than that payable, and the colony would have to begin making Sinking Fund contributions at an earlier date.\(^{62}\)

The Agents’ attempts to arrange private finance had mixed results. In the Gold Coast in 1900, the Ashanti Goldfields Corporation agreed to cover half the interest and Sinking Fund charges on loans raised for the Tarkwa–Kumassi line, and, for twenty years, to make up the net earnings of the railway to £30,000 per annum if they fell below this figure. In return, it received an efficient means of transport to/from its mines, a guaranteed freight rate of 1\(\text{s}\) 6\(\text{d}\) per ton for imports and 1\(\text{s}\) per ton for exports, and a fifth of all profits if earnings exceeded 4.5 per cent of capital expenditure. Similar attempts to finance the Tarkwa–Prestea and Princisu lines proved more problematical. In 1903, a number of mining companies agreed to advance £0.15m at 5 per cent for the construction of the Tarkwa–Prestea railway and another mining firm, backed by the Bank of British West Africa, offered to provide £0.07m at 3 per cent interest for a branch to Princisu. Unfortunately, support for both deals collapsed. The organizer of the Tarkwa–Prestea syndicate died and the Bank of British West Africa, on discovering that the Princisu loan would be repaid in Gold Coast stock, pulled out of the project. In the case of the Tarkwa–Prestea railway, however, in 1906 Fanti Consolidated Mines Ltd, supported by the Union of London and Smiths Bank, agreed to provide up to £0.122m at 3 per cent to be repaid in cash or stock towards the construction of the line, and to make good annual receipts if they fell below 3.5 per cent of capital expenditure. On completion of the works, the company further agreed to finance the extension to Broomassie on similar terms.\(^{63}\)

2. Private Construction

Construction by private enterprise was relatively rare.\(^{64}\) Although colonial governments encouraged private sector participation through the provision of capital/interest guarantees, land/mineral concessions and operational subsidies, few companies were willing to commence construction.\(^{65}\) The high cost of the works necessitated the raising of vast amounts of capital and the likely future returns were often low and uncertain. Those entrepreneurs who did want to become involved frequently put forward proposals that were impracticable or served their own interests rather than those of the colony and were
often company promoters, who lost interest in the project after they had raised and sometimes siphoned off into their own coffers the necessary capital. Others lacked construction experience and built poor quality works, and, unable to borrow money as cheaply as colonial governments, even with guarantees, tended to set high traffic rates. There were also strong objections in official circles to the provision of incentives. These could increase the cost of lines and discourage economy in their operation, as had disastrously occurred in India, the concessions offered could prove more lucrative than expected, and land grants could lead to politically embarrassing and expensive African unrest.66

Private sector construction largely occurred in South and East Africa in the early years of colonial rule. In Rhodesia, apart from the 1928 Zambesi Saw Mills logging line, the railways were built by the British South Africa Company.67 The Fontesvilla to Umtali line began in 1892 and was completed in February 1898 and provided the colony with a lifeline to the sea.68 It was followed in 1893 by a railroad from Vryburg in the Cape to Bulawayo, finished in 1898, which was then extended to Salisbury in 1902, construction having been brought to a halt by the Boar War.69 The discovery of coal, chrome and zinc/lead then led to extensions to Wankie (1902), Umvukwes (1928) and Broken Hill, respectively, the latter line on the discovery of copper at Katanga being continued to the Congo border and onto Elizabethville and the mines in 1909.70

The railways were built and operated by a number of companies including the Bechuanaland Railway Co. (1899), renamed Rhodesia Railways Co. in 1899, the Mashonaland Railway Co. (1897), the Rhodesia–Katanga Junction Railway Co. (1908), the Shabani Railway Co. and the Beira Railway Co. (1892), which in 1895 became the Beira Junction Railway Co.71 All obtained the necessary finance for construction through the issue of debenture stock on the London Stock Exchange, and, although theoretically free-standing entities, were closely linked to the British South Africa Co., which owned significant portions of their share capital and sometimes guaranteed the payment of the interest of their debenture loans.72 Amalgamation leading to State ownership began to occur from the turn of the century. In 1900 the Mashonaland Railway took over the Beira Junction company to become the Beira & Mashonaland Railway Co. Ltd, which, in 1903, merged with the Rhodesia Railway Co. and became the Beira & Mashonaland and Rhodesia Railways Co. Ltd. Renamed Rhodesia Railways Co. Ltd in 1927, this firm then acquired the Rhodesia–Katanga Junction Railway Co., and, in 1947 was finally bought by the Rhodesian government for £30m and renamed Rhodesia Railways.73

South African private construction occurred far earlier. In the early 1860s, lines were built from Durban harbour to the centre of the City by the Natal Railway Co. and from Cape Town to Wellington to serve the grape growing districts of the Western Cape by the Cape Town Railway and Dock Co. Cape Town was
then connected to Wynberg in 1864 by the Wynberg Railway Co. Thereafter, little private construction took place in the Cape until 1907 when the South Western Railway Co. laid a 2’ gauge line to transport timber from Deepwells to Knysna for milling into sleepers. In the Transvaal, anti-railway sentiment delayed all construction until the 1890s. The first project green lighted in 1890 was a line between Johannesberg and the Boksburg coal mines, financed by George Pigot Moodie and later extended to Krugersdorp (20 miles) and Springs. A far longer railway from Delagoa Bay to Pretoria was delayed owing to lack of funds. The concession to build the line had been given to the German Nederlandsche Zuid-Afrikaansche Spoorweg Maatschappij (NZASM) in 1887. Unfortunately, by mid-1891, the firm was on the brink of bankruptcy and found it was unable to issue European debentures. Construction was therefore only completed in 1894 after the Cape prime minister Cecil Rhodes agreed to loan the Transvaal administration the necessary finance.74

Gradually, all these lines were taken over by local administrations. In 1874, the Cape government purchased the Town Railway & Dock Co. and the Wynberg Railway Co. and established Cape Government Railways (CGR). A similar organization, Natal Government Railways (NGR) was formed by the Natal administration in 1877, and, in 1900, after victory in the second Anglo-Boer War, the railroads of Orange River Colony and the Transvaal were taken over by the British government and operated as Imperial Military Railways, later renamed Central South African Railways (CSAR). On the creation of the Union of South Africa in 1910, the CGR, NGR and CSAR were incorporated into South African Railways, in 1916 renamed South African Railways and Harbours (SARH), which, in addition to operating the country’s rail infrastructure, undertook a comprehensive programme of port expansion, grain silo and cold storage construction, and acquired a merchant fleet.75

In the Crown colonies and protectorates, private sector involvement was strongly opposed by the Crown Agents, partly because private constructors bought their own railway materials and thus deprived the Agency of purchasing income.76 In 1896, however, the Foreign Office insisted that a railway from Chiromo to Port Herald in Nyasaland be built privately. The Agents, again, attempted to halt the initiative. The Foreign Office was urged to allow the protectorate to build the line itself and the decision to grant the Shire Highlands Co., the firm permitted to construct the works, 3,200 acres of land was strongly opposed. Failing to convince the Foreign Office to abandon the project, the Agents turned their attention to the company itself. Contract negotiations were delayed and the Agents insisted that construction be supervised by consulting engineers and a resident engineer, whose salaries were to be paid by the company, and that an unnecessary high technical standard be adopted. After building had commenced, they and their consulting engineers then sent the Colonial Office
a barrage of complaints that enumerated the firm’s failure to meet the standard laid down, its supposedly poor finances, its operation of the uncompleted line and its alleged dishonesty. When the company made an application to build an extension to Blantyre, the Agents redoubled their efforts to sabotage the project, raising a myriad of objections, the most important of which related to the height of the track. All were rejected and the Agents were sharply criticized by the Colonial Office for their disreputable conduct. When the company made an application to build an extension to Blantyre, the Agents redoubled their efforts to sabotage the project, raising a myriad of objections, the most important of which related to the height of the track. All were rejected and the Agents were sharply criticized by the Colonial Office for their disreputable conduct.77 Bruised, they raised few objections to the 1915 extension from Port Herald to the Zambezi at Chindo nor to the Kenyan Konza–Magadi railway. The latter line was built by the Magadi Soda Co. established in 1911 by private British capital to exploit the soda ash deposits of Lake Magadi. The company agreed to wholly finance the railroad, and, in return, was given the exclusive right to exploit the deposits, land at Kilindini harbour to build a pier, more land at Ngong for the construction of its headquarters and preferential freight rates from the Uganda railway.78

3. Consulting Engineers and Contractors

All African railways, whether publicly or privately built, employed the services of a consulting engineer, who provided valuable engineering advice, helped in the choice and procurement of rolling stock, and, in the case of the department system, constructed the lines. The sector was dominated by a handful of engineers. As discussed, in West Africa William Shelford (1834–1905) was the dominant player. Shelford was briefly in partnership with T. F. Turner, later professor of engineering at Kings College, and later with his son Frederic (1871–1943), who largely ran the business. On William’s death, Frederic entered into a ‘partnership’ with the engineer Sir Benjamin Baker (1840–1907), and, on Baker’s death, Robert Elliott Cooper (1845–1942). These, however, appear to have been marriages of convenience, entered into merely to satisfy the Colonial Office, with neither ‘partner’ having much involvement in construction. Baker was a world expert on bridge design and acted as the Cape’s consulting engineer. Cooper later became chairman of the War Office Committee of Hutted Camps and served on the British Standards Committee.79

In Egypt, the dominant force was John Fowler (1817–98), and, in South Africa and Rhodesia, Douglas Fox & Partners. Founded by Charles Fox (1810–74), the latter firm was inherited by his sons Charles Douglas Fox (1840–1921) and Francis Fox (1844–1927) and was consulting engineer to the Shire Highlands Railway Co., the Rhodesia, Mashonaland and Beira Railway Co., the Benguela Railway Co., and the Trans-Zambesia Railway Co. Its progress was greatly helped by its close relationship with Cecil Rhodes and the British South Africa Co., which largely controlled the various Rhodesian railway operations. The partner Charles Metcalfe (1853–1928) had attended Oxford University with Rhodes and played a part in negotiating the lucrative amalgamation
between the British South Africa Co. and the Exploring Co., which had been
given mineral concessions in Bechuanaland in exchange for the construction of
a line through the protectorate. The firm was later consulting engineer to the
central Argentine, south Indian, southern Sao Paulo and Dorada railways, and,
in 1938 when Sir Ralph Freedom became senior partner, was renamed Freedom
Fox & Partners.

All these engineers shared a number of characteristics. They were at the top
of their professions, had been involved in works of similar size elsewhere in
Africa and the world and were influential figures in the Institution of Civil Engi-
neers. William Shelford and Charles Metcalfe were Council members and John
Fowler, Benjamin Baker, Charles Douglas Fox and Robert Elliot Cooper were
presidents. They thus had the experience and expertise that ensured the con-
struction of quality lines and the poor performance of their duties or financial
malpractice would damage their commercially valuable professional status. It
can be argued, however, that such men were often over-qualified for the projects
for which they were retained, and, as a result, that they sometimes expended
little effort on the work. Most were simultaneously involved in dozens of works
around the globe and could only devote a small amount of their time to each of
them, leaving the bulk of the work to assistants.

Other shared characteristics were the possession of offices in Great George
Street, Westminster, and links of patronage and kin. The Westminster location,
one of the most expensive in real estate terms in London, flagged to potential
suitors the success of their operations, gave them easy access to Parliament,
government departments and the Crown Agents, whose headquarters were in
the vicinity, and reaped agglomeration economies. Closeness to each other and
to networking arenas such as the professional institutions and places of social
gathering facilitated the exchange of formal information about professional and
technical developments, potential markets for their skills, pricing strategies and
so on, and the spread of informal gossip regarding the honesty and abilities of
potential employers, employees and fellow members of the profession.

The engineers had also usually learnt their trade in Africa and were closely
interconnected by patronage and kinship. The empire was regarded as a train-
ing ground for young engineers, where they could build their characters, acquire
leadership abilities, and learn from their mistakes before moving on to more
lucrative work elsewhere. During their early years, Charles Beresford Fox (1875–
1912) worked in Rhodesia, Henry Wedgwood Rendel in Uganda and Frederic
Shelford in the Gold Coast. Patronage and kin connections, meanwhile, gener-
ated trust and ensured that the profession presented a united front to employers
both as regards fees and performance. An apprenticeship with a prominent engi-
neer was a passport to success. Places were difficult to obtain and were costly;
in the 1870s candidates were required to pay a premium of £500 and had to
absorb expenses of another £500 for the duration of their training. It is therefore perhaps not surprising that many of the railway and other engineers started their careers together. Benjamin Baker and William Shelford, for example, were trainees at the office of John Fowler and Charles Metcalfe was an assistant to Douglas Fox. The engineers also had kin links; sons following fathers into the profession, allowing them to free ride on the reputations of their paterfamilias. As already discussed, Frederic Shelford followed his father into the sector, as did the two sons of Douglas Fox and the son of Alexander Rendel.85

The contracting sector was even narrower than that of consulting engineering, largely comprising just one firm, Pauling & Co. founded in 1877 by George Craig Sanders Pauling. After constructing the 65-mile Port Alfred railway, the firm went on to build, among others, the Sterksroom–Aliwal North, Orange River–Kimberley, Springs–Krugersdorp and Johannesburg–Pretoria lines, and, the first stage of the route between Beira to Umtali.86 In all, from 1877 to 1939, it built 5,922 miles of African lines and was helped in its endeavours by its close relationship with the merchant bankers the House of d’Erlanger and the British South Africa Co. D’Erlanger was the most important investor in the British South Africa Co.’s various railroad schemes and was part-owner of Pauling & Co. In order to maximise its returns, it thus put pressure on the British South Africa Co. to use its governmental powers to give Paulings a virtual monopoly of construction.87

4. Purchase of Railway Materials

Purchase Procedure

Materials, including rolling stock, for Crown colony and protectorate railways were purchased by the Crown Agents, and, for lines in self-governing territories, by the local operating departments in conjunction with their consulting engineers. Private railway companies bought their own materials, again with help from their consulting engineers. The Crown colonies had no choice but to purchase all goods not manufactured in their own territories, and, from 1904, in adjacent regions, through the Crown Agents. The colonies produced few materials themselves and it was believed that local purchasing officers would be tempted to accept bribes from suppliers in return for orders, could turn to foreign manufacturers, and would buy expensive and poor quality goods, owing to their lack of procurement expertise and experience. Meanwhile, the main alternate source of supply, colonial merchants, charged high prices for their merchandise, being unable to buy in bulk and having high profit margins, and, again, could not be relied upon to supply good quality British-made produce.88

In reality, not all territories used the Agency (see Table 7). Colonial administrations bought materials secretly or placed orders with local ‘manufacturers’,...
which then subcontracted the work to British companies, and, in the West and South African colonies/protectorates, some local purchase was permitted. As discussed in the Shipping thematic introduction, to avoid the high rates charged by the cartel that controlled the transport of goods from the UK to West Africa, local governments were permitted to buy locally produced coal, cement, and, in the case of Southern Nigeria and Sierra Leone, Kerosene oil. In the Transvaal and Orange River colony, the purchase of public goods by the Agents on the conclusion of the Boer war led to such strong protests from the Johannesburg Chamber of Commerce and the legislative councils that the Colonial Office, fearing ‘serious political consequences’, agreed that tenders could be issued simultaneously within the colonies and in Britain, and that orders would be allocated to the company that a local tender board decided offered the best terms. During the inter-war period, as the colonial manufacturing base expanded and criticism of the Agents increased, a similar compromise was adopted elsewhere in Africa, with the result that by 1936 a good proportion of goods were sourced locally.

</tbody>
</table>

Crown Agent purchase was the subject of numerous criticisms – the most significant of which were that goods were delivered late and were overly expensive. Delays in the delivery of orders were a common gripe throughout the period. Explanations include the early decision to send requisitions by mail rather than telegraph to reduce costs; the referral of indents back to colonies because they were incorrectly prepared, requested unavailable or inappropriate articles and so on; the inspection of goods (described below); the sourcing of supplies from manufacturers rather than wholesalers; the poor monitoring of the progress of orders; and the failure of British companies to meet delivery times. The latter could have been rectified had the Agents sanctioned late deliverers, but this failed to occur. There were fears that the enforcement of contract late delivery clauses would lead to lengthy and expensive legal action and damage the Agency’s relations with their suppliers, who would refuse to supply goods or charge a premium.
Prices were excessive largely because of the Agents’ purchasing procedures. Theoretically, stores with a value over £100, and, from 1929, £150, had to be bought through open competition, and, before buying lower value goods, the Agents had to obtain tenders from three or more tradesmen. In reality, few articles under £100/150 were subject to tender, supposedly because large wholesalers were reluctant to bid for small orders. Whilst goods over that value were not tendered if the goods were required urgently; the price had recently been determined by competition; a consulting engineer had advised against the use of tenders; the Agents had a standing order for an article from a particular firm, which in return charged a discounted price; and, in the inter-war period, if the colony named a manufacturer or proprietary brand in its indent. Where tenders were requested, open competition only occurred in the case of materials for the Uganda railway, which the Foreign Office insisted should be obtained through public advertisement. In all other cases, tenders were requested only from companies on the Agents’ supplier lists, which contained relatively few firms. The existence of the lists was not advertised and companies that wished to have their names added had to furnish numerous references, and, from 1911, undergo a works inspection by the Agents’ inspectors.92

Inclusion on a list, however, did not guarantee an order. Only a small number of list companies were asked to bid for contracts, generally those that had been recommended by the consulting engineer that had drawn up the tender specification. Of these, many rarely received an order. The Agents and their consulting engineers only chose the most competitive bid if the tender was judged to fulfil all the colonies’ requirements and the tenderer was believed to possess sufficient experience and to produce high quality goods. Orders, consequently, tended to be awarded to a small coterie of suppliers. These were usually well-established British manufacturers that had long trading relationships with the Agency, often extending over decades. They were also often located in the south of England and occasionally had personal connections with Crown Agents and employed the Agency’s consulting engineers as directors.93

There is evidence that these suppliers set unacceptably high prices. Many manufacturers failed to provide the Agents with full trade and cash discounts and export allowances, and, in the inter-war period, demanded and activated contract price variation clauses, which allowed the final price to be increased if costs were higher than expected. Others belonged to cartels that agreed amongst themselves the prices they would bid. The Steel Sleeper Association and the Switches and Crossings (Export) Association, for example, in the inter-war period used the Agency as a ‘milch cow’, charging them far higher prices than any other customer and using the resultant profits to cross-subsidize more competitive foreign work.94 The Agents fought such cartels, favouring firms that operated outside rings or putting pressure on weak cartel members to break ring
agreements by threatening them with removal from their lists. But, although successful in some sectors, such tactics largely failed to break cartel influence.\textsuperscript{95}

It also seems likely that prices would have been lower had the Agents made greater use of overseas firms or purchased goods in bulk or in advance. Foreign purchase was discouraged by the higher cost of sourcing supplies from abroad and Colonial Office support of British preference, motivated by a fear of the loss of colonial markets. Foreign firms were thus only invited to tender for supplies where the Agents wished to force British firms or cartels to reduce prices, there was a clear price or delivery advantage to overseas purchase or the goods were not manufactured in the UK.\textsuperscript{96} Bulk orders, for which the Agents would have received price discounts, were not possible owing to the tendency of colonial governments to purchase only small amounts of materials at any one time and to demand non-standardized articles, though this changed over time. Advance orders were precluded by colonies’ penchant for requesting goods only when needed and the Agents’ reluctance to buy in advance, which tied up capital for no return, involved high storage and deterioration costs, and, if prices subsequently fell, could lead to criticism.\textsuperscript{97}

The cost of supplies was further raised by the inclusion in the final price of a myriad of additional fees. The Agents themselves charged a purchasing commission of 1 per cent and later 1.33 per cent of the value of all the goods bought. Although far lower than that demanded by colonial merchants, the commission was higher than the fees of private railway companies. The Office’s buying procedures were highly bureaucratic and inefficient and they used part of the commission to subsidise the cost of other services they provided to colonial governments for which they received no remuneration.\textsuperscript{98}

In addition to the Agents’ commission, there were also inspection, shipping, insurance and legal fees. A large majority of goods were inspected during production and prior to despatch to the colonies by freelance inspectors and the Agency’s consulting engineers, and, from 1904, by a salaried full-time inspectorate. The Agents argued that inspection was essential. The goods supplied were used in areas with few tools for repairs and a considerable distance from the nearest repair depot, and, if an article could not be mended, an order for a substitute would have to be made. The replacement of faulty articles therefore could involve the loss of the use of equipment for a considerable period of time. Others claimed such inspection was excessive. The use of leading firms, which possessed their own inspection departments and whose reputation and business would be damaged by the supply of poor quality goods, made the practice unnecessary. Moreover, the fees charged were relatively high and some of the examination ineffective, failing to prevent the supply of defective goods. Over time, therefore more and more governments rejected inspection of their supplies and the Agents themselves decided that the examination of particular goods should cease.\textsuperscript{99}
Shipping charges were raised by the use of a shipping agent and a refusal to charter vessels. The shipping agent, Messrs J. & R. B. Freeland received a commission double that charged by the India Office’s agent and private Indian and Egyptian railway companies. According to the Freeland, this was because Crown colony freights involved a great deal more work than those of the India Office and private firms. The Crown Agents shipped from more ports and to a larger number of destinations and the delicate nature and odd dimensions of the goods transported necessitated lengthy negotiation of rates and the employment of storage inspectors to ensure they were correctly stowed. A more likely reason was that the company was operated by the sons of the Crown Agents Sir William Sargeaunt and Sir Ernest Blake, who had little experience of shipping work, and it was these connections, along with the firm’s inefficiency, that prompted the 1908 parliamentary enquiry into the Agency to demand that the firm’s duties be taken over by the Agency, which occurred in 1911.  

Similar self-interest probably explains the high insurance and legal fees charged. Freights were insured by London Assurance, whose charges were double those paid by colonial merchants and two of whose directors were the Crown Agents Sir Ernest Blake and Sir Montague Ommanney. The drawing up of purchasing contracts, meanwhile, was undertaken by Messrs Sutton, Ommanney & Rendel, who charged high fees, performed their work poorly and were owned by Ommanney’s uncle and brother, and later son and nephew. As with the shipping agency, both relationships came to an end after the enquiry into the Agency, which required the Office to establish its own insurance scheme and employ other solicitors.  

The Freeland and the Agents were additionally strangely reluctant to charter ships through open competition, preferring to use shipping cartels (known as conferences), the activities of which are described in the Shipping thematic introduction. It was argued that the conference lines provided a superior service to tramp steamers – more favourable rates and rebates, and, more importantly, regular sailings. Independently owned ships often failed to sail during periods of poor trade or particular seasons when no return cargo was available, and it was claimed that the tendering process and the need for cargoes to accumulate until the chartering of a steamer became cost-effective would lead to delays in shipment. The company’s and the Agents’ preference for the conferences, however, may also have been related to the fact that the chartering/tendering process would have raised their workload and costs and thus reduced the profits that they made from the organisation of shipments.
Identity of Suppliers

Most African rolling stock was sourced from just six firms. The most important was perhaps the North British Locomotive Co. established in 1903 by the merger of three Glasgow rolling stock firms: Sharp Stewart & Co. (Atlas works), Neilson Reid & Co. (Hyde Park works) and Dubs & Co. (Queens Park works). On formation, this was the largest locomotive building company in Europe and sold locos to South Africa and Sierra Leone.¹⁰³ Both countries also sourced locomotives from Hawthorn Leslie & Co. and Beyer Peacock & Co. Hawthorn, was founded on Tyneside in 1886 and continued to trade in the sector until 1937 when it sold its railway arm to Robert Stephenson & Co. Beyer Peacock, established in 1854 by the German engineer Charles Frederick Beyer (1813–76) and Richard Peacock (1820–89), produced the groundbreaking Garratt articulated locomotive, which also proved popular in Rhodesia.¹⁰⁴ Other companies of note were Nasmyth, Wilson & Co. (1836), a Salford based firm that additionally produced machine tools, and two Leeds firms – the Hunslet Engine Company (1864), suppliers to Nigeria and Sierra Leone, and Kitson & Co., founded in 1835 and disappearing in 1938.¹⁰⁵

Harbour Construction

One of the main purposes of railways, and, to a lesser extent, roads, was to transport raw materials to the ocean for shipment to Europe and to move imports into the interior. Such trade was dependent on the availability of harbours able to handle the vast amounts of merchandise involved and the development of ships and a shipping sector to carry the goods to and from more developed nations. The rise of the two companies that dominated African shipping – Elder Dempster in West Africa and Union-Castle in East and South Africa – and the impact their monopolistic position had on the development of the continent is discussed in the Shipping thematic introduction.

African harbour development can be divided into five stages. At the start of the colonial era, there was a scattering of small ports strung along the coast (Phase 1). These were mostly unconnected, contained a European trading post or fort and were populated by Africans, who traded with Westerners or acted as middlemen for trade with the interior. The ports had relatively small hinterlands and were often at river mouths, facilitating movement inland. The number of coastal centres then began to decline. The expansion of trade led to the construction of railways, which allowed those harbours at termini to expand (Phase 2) and the completion of branch lines and roads to the trunk lines enlarged the hinterlands of some ports at the expense of others (Phase 3). Finally, the surviving ports were linked by rail and road (Phase 4) and the main inland centres were also interconnected (Phase 5).¹⁰⁶
As trade expanded, within ports, docks and deep water harbours were constructed. The number of natural harbours in Africa was limited and many were too small to cope with the increase in the volume of business and contained various natural hazards. Unlike the railroads, the docks/harbours were largely built by local colonial administrations with the help of British consulting engineers, who completed the necessary design work. Harbours were smaller projects than railways and required less labour, construction materials and engineering expertise/experience. Occasionally, however, colonies would employ contractors, and, in the Crown colonies and protectorates until approximately 1906, the department system of construction was adopted. Consulting engineers employed by the Crown Agents designed and then built the works, though in the case of the 1907 Lagos harbour scheme, the consulting engineer subcontracted the more mundane dock design, inspection and construction work to another far less prestigious firm. The result was that many projects were poorly built and costs often exceeded estimates. The final cost of the Old Calabar quay wall (1904) and Accra harbour (1907–9), for example, exceeded the estimates by 19 per cent and 22 per cent, respectively. From 1906, therefore harbours were increasingly constructed by local Public Works departments, with consulting engineers merely designing schemes and providing advice on construction.\(^{107}\)

The consulting engineering firm most commonly appointed both in the Crown colonies and elsewhere, was John Coode & Son, which possessed all the characteristics of the typical consulting engineer described above. The founder of the company, Sir John Coode (1816–92), had served an apprenticeship with a prestigious practitioner (James M. Rendel, the uncle of the harbour engineer J. M. Dobson); established offices in Westminster; became a president of the Institution of Civil Engineers (1889–91); and passed the business onto his son, who, in turn, gave way to his son, Arthur Trevenen Coode. The firm acted as consultants in the Cape, Natal, Sierra Leone, Nigeria, and the Gold Coast as well as in Australia, New Zealand, Ceylon and India.\(^ {108}\)

In the Gold Coast, the dominant harbour was Sekondi–Tarkwa. The construction of the railway from Kumasi to the port led to its rapid expansion and the decline of adjacent centres such as Axim, Dixcove, Adjua, Shama, Komena and Elmina. The completion of the line from Kumasi to Accra then promoted further growth, again at the expense of other coastal towns.\(^ {109}\) The main drawback of the port was that it was not a deep water harbour and cargo had to be trans-shipped to ocean going vessels in surf boats and lighters, increasing costs and resulting in salt water damage.\(^ {110}\) Two great breakwaters were thus built from 1921 to 1928 and later extended at a cost of £3.23m. The completed works covered an area of 220 acres and contained wharves, storage and loading space, but operated at a loss until after the Second World War owing to high debt charges and docking fees.\(^ {111}\)
Like the Gold Coast, Nigeria possessed two main ports. The first to develop was Lagos, which served the Yoruba–Aja hinterland slave trade, and, after the suppression of slavery, became the main outlet of palm oil and timber. Like Sekondi–Tarkwa, the harbour possessed physical drawbacks and the cost of improvements reduced the port's competitiveness. To solve the problem of littoral drift and shifting channels that made entrance to the lagoon difficult, in 1906 the bar began to be dredged and an East Mole was constructed that pushed the harbour entrance seawards. Four further deep water berths of 548.64 metres at Apapa were then built. Unfortunately, the cost of these works forced the harbour authorities to charge high fees and these and the multiplicity of agencies and interdepartmental disputes caused the port to lose out to Port Harcourt. The latter was founded in 1913 to export the coal recently discovered at Enugu. By 1920, it was the second largest seaport in the country, having been used in the First World War as the centre of military operations against German Kamerun, and, in 1927, was further extended with the construction of four 1,920' berths.

In East Africa, the main port was Mombasa, where a deep water harbour at Kilindini was constructed in 1926, and, in South Africa, harbour facilities developed at Port Natal, Cape Town, Port Elizabeth and East London. Although Port Natal (Durban) possessed a lagoon, like Lagos the entrance contained a sand bank that permitted only smaller vessels to enter and exit and forced the trans-shipment of cargo to and from ocean going ships anchored in the outer bay, where they were exposed to strong winds. Numerous consulting engineers were employed to solve this problem. After the failure of a 1840s scheme designed by J. C. Caro, the authorities in the early 1850s employed the renowned engineer John Milne, who proposed the construction of two piers to narrow the harbour entrance and thus quicken and increase the scouring power of the currents. Faced with a shortage of funds, equipment and stone, he constructed only 137 metres of a North pier, which unsurprisingly failed to relieve the situation. The mantle was then taken up by Captain James Vetch, who proposed the enclosure of the outer harbour via two further piers. Regrettably, Vetch refused to visit the site and the information he received regarding the direction of the prevailing wind direction proved inaccurate. The works constructed were thus destroyed by storms, and, when the contractor went bankrupt and the £160,000 loan issued to finance the scheme ran out, the project was abandoned. Vetch was succeeded by Sir John Coode, who proposed a resurrection of the Milne plan, and by Edward Innes, who simply suggested that silt at the entrance be removed. Dredging commenced, and, by 1904, ocean going ships were able to enter the harbour.

Port Natal’s main competitors were Port Elizabeth, East London and Cape Town. Cape Town was slow to develop. Cut off from its immediate hinterland by the Cape flats and Holland mountains, it lacked a major export commodity. It was only with the discovery of gold and diamonds that the port began
to expand, with further growth being generated by the Boar and First World Wars. Port Elizabeth, with its large wool exports, developed far earlier. Its major drawback was the lack of an enclosed harbour and Algoa Bay’s notorious breakers, which were only overcome in 1922. The final port, East London, located around a lagoon at the mouth of the Buffalo river, was founded thirty years after Port Elizabeth and possessed geographic and climatic advantages. Political circumstances, however, slowed its growth until the 1870s, as did the shallow depth of the river Buffalo. Attempts to improve depths by Woodford Pilkington were abandoned because of the high cost, and it was only in the early 1870s when the discovery of diamonds in Griqualand made a further project feasible that Sir John Coode was appointed to design and construct training walls that would guide the river current into deepening the channel. The walls and the commencement of dredging in 1886 enabled ocean going ships to use the harbour, but, by this time, the port had lost momentum to its competitors.

Roads

Until the 1920s, colonial governments gave road construction a low priority. Road transportation was relatively expensive and regarded as unwanted competition to railways, which would damage receipts and make it even more difficult to ensure that these gigantic enterprises broke even. Many administrations also lacked the funds necessary to fund road construction, particularly during the First World War; acquiesced to lobbying from river carriers; and were fearful of the possible social and political consequences of an extended road system. It was a common belief that motor transport by increasing mobility would disrupt fragile social structures and lead to the spread of crime and dissent. Colonial governments thus built few roads and those that were constructed rarely ran parallel to the local railway. The commercial viability of existing thoroughfares, meanwhile, was minimized by taxing and forbidding motor transport on routes already served by rail and by cutting freight rates where road competition emerged.

Two other problems were the poor quality of existing routes and a lack of motor vehicles. African roads possessed sharp contours, were often impassable in the rainy season or blocked by fallen trees and traversed rivers via pole bridges, prone to collapse, and pontoons, unable to bear any great weight. Constructed of earth and sand, cars and lorries had to travel in third gear, causing boilers to boil over, and their weight cut deep ruts into surfaces leading to the formation of ‘razor backs’, mounds of earth that destroyed sumps and had to be constantly lowered. Motor vehicles were conspicuous by their absence. In Rhodesia, the first car only appeared in 1902, and, by 1916, the country possessed just six vehicles. The situation was hardly much better in the Gold Coast and Kenya, which contained twenty-one (1912) and 1,000 (1919) motor vehicles, respectively.
Explanations, apart from the poor roads, include shortages of petrol, spare parts, mechanics and garages; the high price and cost of importing vehicles; and, in Rhodesia, the difficulty of following routes that often became overgrown with weeds and Tambookie grass.\textsuperscript{128} The nature of the early vehicles also contributed. Their poor quality engines were noisy and prone to overheating, often necessitating journeys to take place at night, their non-removable wooden-spoked wheels made long trips uncomfortable, and the rubber covers that surrounded these wheels often perished in the hot sun or were punctured by stones.\textsuperscript{129}

Road transportation only grew in importance during the inter-war period. The war itself played a part in this renaissance. The need to transport large amounts of goods, men and equipment to areas not served by railways led to greater use of road transport, and, in the aftermath, administrations faced a shortage of head carriers, large numbers of whom had died serving the allied cause, and lacked the materials, funds and labour necessary for railway construction.\textsuperscript{130} Other factors were a growing awareness by commercial communities and administrations of the benefits of motor transportation and a rise in vehicle ownership. Over time, both expatriate firms and administrations gradually became aware of the economic advantages of road transportation. British companies experienced the benefits of road construction in other parts of the empire, and, facing greater economic turbulence, wished to avoid the high freight rates charged by monopolistic railway companies. They thus placed increasing pressure on legislative councils to increase spending on roads.\textsuperscript{131} Colonial administrations and governors were similarly more attune to the economic and revenue possibilities of motor transport and its advantages over rail. Roads were cheaper to build than railroads, could easily be abandoned if they failed to prove their commercial worth, removed the need for costly trans-shipment of goods, and, with improvements in construction, were less subject to closure due to natural disasters.\textsuperscript{132}

Roads also possessed other benefits for colonial governors and administrations. For governors, they were easily acquired physical evidence of achievement that could boost their social status and self-confidence and help to advance their careers.\textsuperscript{133} For administrations, in towns they minimized the risk of fire, and, in the countryside, facilitated settlement, the spread of ‘civilizing’ education, and the control and administration of local Africans.\textsuperscript{134} Roads and vehicles were visible symbols of the might of colonial rule and European technological mastery and superiority, and permitted the rapid transportation of troops to quell disturbances. Colonial officers could also more easily tour their districts and thus display their physical presence, an important component of control, and collect official and unofficial information that could be used to avoid or crush dissent. Gifts of cars to chiefs, meanwhile, helped to incorporate them into the colonial project.\textsuperscript{135}

Just as important as these factors was the rapid increase in the ownership of cars, lorries and bicycles, which were cheap and easy to repair and store.\textsuperscript{136}
Kenya in 1923 possessed 2,608 motor vehicles, Rhodesia, in 1928, 10,800 cars, and Uganda, in 1930, 1,500 lorries. The expansion in car/lorry numbers was related to the appearance of American vehicles, such as Fords, Dodges and REOs. These were cheaper than European models and possessed technical advantages. Not only were they more durable, but spare parts were widely available, reducing repair and maintenance costs. More importantly, they had a high road clearance, reducing damage caused by razor backs, were equipped with Firestone pneumatic tyres that ensured a smoother ride, and were lighter and could thus more easily travel on and did not destroy unsurfaced roads, reducing road maintenance costs. The vehicles were popular throughout the continent, but particularly in the Gold Coast, where in 1927 they accounted for 78 per cent of the cars imported.

Roads were mainly constructed by colonial governments, but also by Africans and occasionally by the European private sector. Government roads were built using a variety of labour sources. In East Africa, much road construction and maintenance was undertaken by African convicts and conscripted labourers, who worked under the supervision of European overseers. The conscripted workers, largely men but also occasionally women and children, received no wages, and, in Rhodesia, were expected to supply their own food and equipment. Over time, however, forced labour was gradually replaced by paid workers. Both convict and conscripted road builders performed their roles poorly, the need to provide constant supervision and portable lock-ups increased the cost of convict labour, and conscription increased African discontent and caused some to leave their villages and establish encampments far away from roads and colonial surveillance. Additionally, there were protests against the practice from international humanitarian organizations, such as the Aborigines Protection Society, the Anti-Slavery Society, the International Labour Organisation and the League of Nations. By the 1930s, therefore, most African governments employed paid African labourers. In the early years of the decade, in an attempt to combat high unemployment, Rhodesia also recruited a small number of European and Indian workers.

The roads initially comprised sand and compacted earth. These materials were then superseded by broken stones and cinders, known as road metal or gravel. Heavier and faster moving traffic, which caused corrugations in the gravel, then prompted a number of administrations to adopt concrete strips. These were soon abandoned. The concrete was expensive, the sand and water required were often not available, the laying of the strips required large numbers of semi-skilled workers and highly skilled supervisors, and the resultant roads were constantly cracking, increasing maintenance costs, had relatively short life-spans, and, by giving off intense glare in strong sunlight, caused many traffic accidents. Many governments thus turned to asphalt. This was cheaper and easier to lay than concrete, had a longer lifespan, and, flexible, could adjust to soil
movements without cracking. Asphalt roads began to be built in the Gold Coast in 1919, in Kenya in 1922, and in Rhodesia from 1933.146

African construction largely occurred in Nigeria and the Gold Coast, where cocoa farmers built roads linking the cocoa producing areas to the coast.147 The growth in cocoa exports and high cost of porterage had prompted many farmers and traders to purchase lorries, only to discover that they could not be effectively operated on the existing road system and that the local administration was reluctant to improve routes. The roads were built with local labour, materials and funds, though farmers in the eastern province of the Gold Coast engaged Italian and Greek contractors to undertake the work, and, in Nigeria, were part-financed by government grants.148

The impact of motorized transport on the African economy was immense. Roads opened up areas some distance from railways and markets to commercial farming by permitting the easy transportation of produce to the railhead, and, from there, to the nearest urban conurbation or overseas.149 They also promoted the growth of a range of African handicraft industries, reduced mine labour costs by allowing companies to access workers from a wider area and at less expense, stimulated the rise of the East African Asian trader, and led to the development of brand new sectors such as motor repair, petrol retailing and transport.150 In West Africa, many of these new industries were dominated by African businessmen such as Dr Obasa, Chief Ndoma-Egba and W. A. Dawodu.151 The success of these and other entrepreneurs was related to their willingness and ability to import superior American vehicles and the reluctance of expatriate trading companies to operate public transport services or to establish their own fleets of lorries.152 African road hauliers were also more flexible than their European counterparts, being willing to vary their routes and loads, and had no set delivery timetable and could thus wait until they had a fully loaded vehicle before travelling.153 By contrast, in South and East Africa, the sector was monopolized by Europeans. In Northern Rhodesia, haulage was controlled at various times by J. E. Stevenson, Northern Motors and Messrs Smith Bros. and Kitchin; whilst, in Nyasaland, the African Lakes Corporation in 1924 established Mandala Motors, which eventually had a presence in eleven African countries.154

Economic losers from the road revolution included head porters, animal drawn freight operators, African traders who no longer had a monopoly in the previously difficult-to-access West African hinterlands and were superseded by Western merchants and Levantines, and some railways.155 Many railroads, however, ultimately benefited from motor transport, which by transporting produce to the railhead increased the amount of freight carried. Furthermore, in some regions, railway companies diversified into road haulage. In Rhodesia, for example, the Beira, Mashonaland and Rhodesia Railway formed Road Motor Services (1927), which by 1938 operated forty-four lorries around 1,600 route
miles, and, in South Africa from 1925, the South African Railways managed a road passenger and small freight transport service.\textsuperscript{156}

The influence of road transport on African society was as profound as that on the economy. On the plus side, roads led to the establishment of new towns, generally at major road junctions; facilitated migration to and therefore the growth of cities; permitted improvements in health care, the quality of education and the diffusion of information; and promoted the formation of inter-community networks.\textsuperscript{157} On the distaff side, they contributed to increased consumption of alcohol, with all its damaging consequences, strengthened racial segregation, reduced African living standards and arguably stiffened colonial control.\textsuperscript{158}

By further permitting the separation of place of residence from place of work, motor transport encouraged the establishment of African ghettos on the outskirts of towns and cities; segregation continuing to occur on the transport systems themselves.\textsuperscript{159} The long journeys to and from work on costly and overcrowded public transport also reduced the quality of life and free time of African workers and the proportion of their incomes available for expenditure on household necessities.\textsuperscript{160} Whether motor transport increased colonial control is more debateable. The use of forced labour on the construction of roads helped to discipline the unruly elements of the population, and, as discussed, the car enabled colonial officers to bring the colonial State to the people. Alternatively, visits to communities located away from the road network became increasingly rare and officers’ contact time with Africans lessened, as the car permitted them to return to their stations in the evening rather than stay in villages over night.\textsuperscript{161}

**Telegraphy**

Even today the nineteenth-century creation of the world telegraph network is an impressive achievement, involving the manufacture of hundreds of thousands of miles of cable, a large proportion of which was laid across deep ocean beds. The network was heavily subsidized by the imperial government, which recognized that the ability to transmit information in minutes as opposed to the months it usually took to ship a message to the other side of the world would permit better control and defence of the empire and promote the expansion of trade.\textsuperscript{162} The cabling of Africa was carried out by subsidiaries of the Eastern Telegraph Co. (ETC), founded in 1872 by John Pender through the merger of four existing firms. Links between South Africa and England were established in 1879 when ETC established the Eastern and South African Telegraph Co., which, with the help of the governments of the Cape, Natal and Portugal, laid a cable that connected Delgao on the north-east corner of the Cape with Mozambique, Zanzibar and Aden, where it joined the India–UK link.\textsuperscript{163} The outbreak of the Boer War in 1899, by creating a need for direct communications between the
UK and South Africa, then prompted the ETC, via the Telegraph Construction & Maintenance Co., to lay a line from Cape Town to St Helena, Ascension and St Vincent in the Cape Verde Islands, where it connected to a cable owned by a further ETC offshoot, the Western Telegraph Co., that stretched from St Vincent to Carcavelos, Portugal and thence to London. A further wire was then laid from Durban to Mauritius, where it joined the UK–Australia connection.164

Communications between England and West Africa were established from 1885 when ETC founded the African Direct Telegraph Co. (ADT). A cable was laid by the India Rubber, Gutta Percha & Telegraph Works Co. from Bathurst in the Gambia to St Vincent in the Cape Verde islands, where it connected with the St Vincent–Portugal–London link. This was followed by a second connection laid by the Telegraph Construction & Telegraph Co. from Bathurst to Bonny in Nigeria passing through Lagos, Sierra Leone (Freetown) and the Gold Coast (Accra), and, in 1893, extended from Bonny to Calabar and Duala in the German Cameroons. In 1902 and 1914 respectively, Lagos was then linked to Cotonou/Dahomey and Freetown to Accra.165 A third round of cabling occurred from 1929 when ADT was acquired by Imperial and International Communications Ltd, which formed the West African Telegraph Co. French and Portuguese colonies were connected to the Spanish national network via a cable that began at St Louis, Senegal and passed through Gambia (Bathurst), Boloma in Portuguese Guinea, and Konakry in French Guinea before terminating in Sierra Leone (Freetown). Further French and Portuguese networks were then laid, none of which passed through British territory.166

Within Africa, an 1878 proposal to link Khartoum and Pretoria was abandoned, but the idea was revived in 1892 by Cecil Rhodes who formed the African Transcontinental Telegraph Co. Financed by British investors, the firm laid a line from Salisbury to Bandawe, and later, with the help of the British South Africa Co., from Bandawe to Abercorn (1899), and, through German territory, to Ujiji on Lake Tanganyika (1903). The initiative was not as successful as hoped. Construction was slow and expensive, largely because of the high cost of transporting materials to the line and the outbreak in 1900 of a smallpox epidemic amongst the African workers. Maintenance was similarly costly. The line was carried on 14’ iron poles that were frequently pushed over by elephants and the growth of trees and other vegetation caused constant breakages and loss of current. The expected traffic also failed to emerge. In 1903, the company carried just 32,000 messages, and, in 1911, it was forced into bankruptcy, its operations taken over by the Nyasaland Co. and the Northern Rhodesian government.167 By this time, however, the baton for the cabling of Africa had been passed to the railway companies, which strung lines on posts alongside their tracks. Primarily intended to ensure the smooth operation of services, the wires additionally carried commercial communications.168
Popular Media

Whilst the railway and roads promoted physical communication, intellectual communication was facilitated through the rise of the media – books, newspapers, film and radio.

Books and Newspapers

Book reading was at first confined to Europeans, but, as missionary education increased literacy levels, spread to the African community, which read religious texts and imported and locally produced ‘trash’ fiction, the latter leading to calls for censorship. An educated minority also read British literature, often forming book clubs where they discussed the meaning of what they had read and other matters.169 Newspapers first appeared in South Africa, which developed thriving European and African presses. The first European paper was the Cape Town Gazette and African Advertiser, published in 1800 by the local administration. Its success attracted private investors to the sector, and, in 1824, the South African Commercial Advertiser appeared, followed by the first Dutch language publication, De Zuid Afrikaan in 1830. The dominant player in the market, the Argus Printing & Publishing Co., was founded in 1889 on its purchase of the Cape Argus, a liberal newspaper established in 1857 by the Cape politician Saul Solomon (1817–92). Over the next forty years, the company dominated the South African industry and acquired every English language newspaper in Southern Rhodesia and Nyasaland, and, in 1903, bought a substantial share holding in the Central News Agency, which eventually controlled newspaper distribution.170

Although the first African language publication, Umshumayeli Wendaba, appeared in 1837, the Black press only took off in 1861 with the establishment of Lovedale, which published a number of Mission newspapers aimed at black audiences, and, in 1876, allowed its Xosa language paper, Isigidimi Sama Xosa, to be edited by an African, John Tengo Jabavu (1859–1921). Jabavu, a political activist, then created his own newspaper, the English and Xhosa Inmvo Zabantsundu in 1884, the success of which led to the appearance by 1912 of seven other African controlled weeklies.171 The rise of a black-owned press, however, proved to be short lived. In the inter-war years, an upturn in African literacy levels caused European investors to move into the sector. The most successful was probably B. G. Paver, an ex-farmer who in 1921 founded the multilingual Bantu World, modelled on British tabloids. By 1934, this newspaper had a circulation of 6,000 and was itself taken over by the Argus Group. Other African papers were similarly bought out, and, by the start of the Second World War, though the country had eight Black newspapers, only three had African proprietors, two of which were published by the multiracial Communist Party of South Africa.172
The stranglehold of the Argus Group on the English language sector in South and Central Africa was matched in East Africa, by the Standard Group, founded in 1905 by the English–Austrian company Anderson Mayer to purchase the Mombasa *African Standard*, first published in 1902 by the Parsee A. M. Jeevanjee. In 1910, Standard moved this newspaper, renamed the *East African Standard*, to Nairobi and launched the *Mombasa Times*, and, in 1930, introduced the *Tanganyika Standard* – these three publications dominating the European sector to the end of the period. The first African edited and controlled newspapers were the *Sekanyolya*, founded by Sefanio Sentongo and written in Luganda, Harry Thuku’s *Tangazo*, and *Kwetu*, established by Erica Fiah, a Tanganyikan entrepreneur. There were also a number of publications aimed at the Indian community, and, in Tanganyika, at the German population.

West African newspapers had a far longer history, dating back to the 1801 *Royal Gazette and Sierra Leone Advertiser*, and were launched and subsequently failed with monotonous regularity; from 1880 to 1937 over fifty different newspapers were printed in Nigeria alone. Owing to the relatively small European population, the majority were directed at an African readership and published in Lagos, Freetown and Accra, which had relatively high literacy rates. Most were written in English, and, from the turn of the century, indigenous languages, and, until the 1920s, were weeklies. Notable examples were the *Accra Herald*, later renamed the *West African Standard*, published in 1857 by Charles Bannerman, and the Nigerian Missionary paper *Iwe Irohin* (1859). The first daily papers appeared in Lagos in 1923, Accra in 1927 and Freetown in 1933. In Nigeria, after a period of intense competition, the *Nigerian Daily Times*, established in 1926 by three Europeans and an African, emerged triumphant and remained the dominant newspaper until 1937 when its circulation was exceeded by the *West African Pilot*. Founded by Nnamdi Azikiwe (1904–96), who later became the first president of the country, the paper mixed the promotion of Nigerian nationalism with a populist style borrowed from the British press. Azikiwe’s company, the Zik Group, then launched a number of local city newspapers, and, in 1934, the *West African Standard*, which was aimed at a Gold Coast readership. Containing a mixture of nationalist politics and popular features, the newspaper rapidly made in-roads into the circulation of the market leader, the *Gold Coast Independent*, a more conservative product founded in 1918 by Dr Frederick Nanka-Bruce, who again later entered politics.

The impact of black newspapers on local populations was great. Virtual communities of educated Africans were created, which through newspaper advertisements and descriptions of social events often became actual communities; many readers forming societies or friendship networks with fellow subscribers. The papers gave such people an identity and a status, a way of distinguishing themselves, and made them aware of regional and international affairs and their
place in the world. More significantly, they became a mouthpiece through which the educated African could criticize government policies that adversely affected themselves and their peers and demand reform and greater involvement in the administrations of their countries. The very existence of the newspapers also clearly demonstrated to European communities that some of their pre-conceived notions of the intellectual abilities of the African were mistaken. For the less educated, who often attended public readings, they provided a guide to the vagaries of urban life and much-needed entertainment and gave them greater political insight and a reason to become literate themselves.

**Film**

Movies had a similar impact on the black population, providing escapism from the harsh realities of life, promoting social interaction, generating an identification with and empathy for Europeans, and permitting the expression of status; better-off Africans attended genteel cinemas or sat in relatively highly priced balcony seats. They also had more negative consequences. Europeans blamed them for the spread of immorality and crime and American and British culture soon began to suppress African customs and mores. On the Northern Rhodesian copper belt, for example, young men began to adopt the dress and slang expressions of Wild West cowboys.

Films were shown by cinema societies in hired recreation halls, and, increasingly, in cinemas owned by local, and, in East Africa, often Indian businessmen. At first, the movie houses were located in the cities and later in provincial towns in existing and then purpose-built buildings. Areas too small to support a permanent theatre were periodically visited by mobile cinemas, which exhibited films in large tents. To attract audiences, the auditoriums also housed variety shows and were meeting places for community groups and many owners advertised the arrival of a new movie through the use of street entertainers and parades.

The majority of the films screened were British or American, though in East Africa, where there was a large Asian population, Indian movies were popular. Most were distributed by local companies; in South and East Africa by African Films Ltd. A South African company, this acquired European movies that had been shown in South Africa and distributed them first to Nairobi, then to cinemas across Kenya, Uganda and northern Tanganyika, and, finally, to Dar es Salaam and Zanzibar. The only African film producer, apart from local colonial administrations, was the Bantu Educational Kinema Experiment (BEKE). Established by the International Missionary Society to operate a chain of cinemas showing educational films, BEKE then changed direction and began to produce its own movies. From 1935 to 1937, thirty-five films were made, none of which proved popular with African audiences.
Inevitably, there was much official concern about the possible impact of Western films on the unsophisticated and supposedly impressionable African mind. In 1929, the Colonial Office established a colonial films committee to investigate the matter, which proposed the establishment of a central film censorship body and set out censorship criteria that should be adopted throughout the empire. Its recommendations, however, were rejected by the Colonial Office and the censorship issue was thus passed to local administrations. The extent to which these tackled the problem varied between regions. Censorship was most strict in South Africa and Tanganyika, where films were graded as suitable for ‘Europeans’ or for ‘natives’ or were banned outright. Elsewhere, local censors cut scenes from films that depicted crime, interracial violence or general immorality.

Radio

The wireless probably had less of an impact on African audiences than either newspapers or films. Initially, most regions listened to programmes produced by the BBC Empire Service, renamed the Overseas Service in 1939 and beamed to Africa from a permanent short wave transmitter erected at Daventry in 1928. The broadcasts were targeted at European audiences and comprised repeats from the domestic service and specially created features. Their aim was to allow expatriates to maintain contact with events at home, to remind them of the purposes and ideals of the empire, and to prevent the development of regional loyalties.

Local broadcasting only emerged in East Africa and South Africa. In Kenya, the British East African Broadcasting Corporation began operations in 1929, and, three years later the government gave a twenty-five-year licence to the Imperial and International Communication Ltd. In South Africa, the first broadcasting licences were issued in 1923 to the Cape Peninsular Publicity Association, the Durban Corporation and the Johannesburg Association of Scientific and Technical Societies, which received most of their funding from the proceeds of the sale of radio receiving licences. All began broadcasting and rapidly found themselves in financial difficulties, as few listeners bothered to buy receiving licences, aware that the system was un-enforced. The Johannesburg service halted broadcasts in 1927 and was replaced by the American financed African Broadcasting Corporation (ABC), which took over the Cape Town and Durban services on the expiration of their licences. The government, however, became increasingly concerned at ABC’s output, and, after commissioning a highly critical report from Sir John Reith, the head of the BBC, in 1936 took over the Corporation creating its own South African Broadcasting Corporation (SABC). SABC’s English and Afrikaans programmes strongly supported government policies and were aimed at a white audience, though attempts were made to engage African listeners. In 1939, the musical Chief Above and Chief Below, adapted from an
African folk tale was transmitted, and, later, programmes in Zulu, Xhosa, Sesotho and Tswana were broadcast.\footnote{188}

**Conclusion**

Although Britain’s development of a transport infrastructure during the colonial period benefited the imperial economy, it had little impact on African well-being. The high cost of railroads precluded construction by the private sector and most were built by local administrations, whose poverty forced them to obtain the necessary finance from the City of London. They were thus saddled with large high interest sterling debts, which were met through the taxation of local populations and the increased production of cash crops, arguably at the expense of economic activities that would have proved more useful to economic development. Of the money raised, little found its way to Africa. The skilled staff and the materials required for the construction and operation of lines all came from the UK. There were therefore few backward linkages for local economies and the only involvement of Africans was usually as poorly paid and sometimes badly treated labourers.\footnote{189}

The communications ‘revolution’, similarly, failed to lay the foundations for sustainable post-colonial growth. On independence, many ex-colonies inherited relatively small railway networks; apart from South Africa, few possessed more than 500–600 miles of track. In South and East Africa, to reduce costs and speed construction, colonial engineers had avoided building tunnels, embankments, bridges and so on. Many lines thus had sharp curves, steep inclines and roundabout routes, which, along with the cheap lightweight rails used, limited train speeds and carrying capacities and increased maintenance costs.\footnote{190} West Africa, by contrast, thanks to the department system, was left with a number of overly expensive high quality railroads that had little chance of recouping their capital costs. Moreover, constructed to permit the export of raw materials, most lines headed to the coast and regions with little agricultural potential possessed few railheads. Little or no attempt had been made to link countries, especially where they were governed by different colonial powers, and each administration/power had adopted a different gauge(s).\footnote{191} A unified railway system, inter-African trade and the development of well-rounded economies based on the production of a range of goods were thus impossibilities.

Other forms of transport were equally inadequate. Because the colonial authorities believed rail possessed a comparative advantage, road systems were cheaply and poorly constructed and relatively modest, often comprising a few routes absolutely necessary for colonial governance, again making the development of local industries difficult.\footnote{192} Likewise, British Africa had few seaports, each export region requiring just one port to funnel goods overseas, hardly any
domestic air routes, international air connections to only a few European cities and a shipping sector controlled by monopolistic cartels. To misquote the title of the song by the 1980s group Talking Heads, Britain’s colonial transport policy put Africa on ‘the road to nowhere’.

Notes
3. T. Zeleza, A Modern Economic History of Africa. Volume One. The Nineteenth Century (Dakar: Codesria, 1993), p. 287. However, Asante caravans were relatively small and Maraka caravans carried their own food (ibid., p. 287).
8. In West Africa, a porter carrying the average load of 60 pounds was estimated to walk 15 miles per day (Chaves et al., ‘Reinventing the Wheel’). Some dispute that deserters stole their loads, arguing that porters were self-regulating groups and that deserters were expected not to steal their loads and to leave behind any wages received in advance (Rockel, Carriers of Culture).

61. The Gold Coast Sekondi–Tarkwa line was almost wholly financed by current account advances (Dumett, ‘British Imperial Transport Management’). Prior to the inter-colonial loans scheme, the Sekondi–Kumassi line was partly funded by the creation of £0.063m of 3 per cent Gold Coast stock, bought by various colonial Investment Funds, and the Northern Nigerian Baro–Kano line by Southern Nigerian advances borrowed at 3.75 per cent (Sunderland, Managing the British Empire, p. 215).

62. Sunderland, Managing British Colonial and Post-Colonial Development, p. 50. Each year, a borrowing colony placed a certain amount into a Sinking Fund, and, at the end of the loan’s life, the contents of the Fund were used to repay the capital.

63. Sunderland, Managing the British Empire, p. 216.

64. This was not the case in French West Africa, where many lines were constructed privately. The Dahomey and Togo railways were built and run by private firms, assisted by government loans (C. Newbury, The Western Slave Coast and its Rulers (Oxford: Clarendon Press, 1961), p. 143). In the case of the Dahomey line, the road bed was laid by the government and the permanent way by the Dahomey Railway Co. The Konakry–Niger railway was initially constructed by contractors, and, after the cancellation of their contract, by military engineers (Sunderland, Managing the British Empire, p. 101, footnote 15). Indian railways were also built by private companies until 1869, when the government took over construction. From the mid-1880s, the private sector was again used, though state construction continued (J. Kerr, Building the Railways of the Raj, 1850–1900 (Oxford: Oxford University Press, 1995)).

65. Sunderland, Managing the British Empire, p. 140. Similar incentives were offered in India, Russia and Latin America (P. Luntinen, Railway on the Gold Coast. A Meeting of Two Cultures (Helsinki: Suomalainen Tiedeakatemia, 1996), p. 21).

African railways were constructed for economic, administrative and political reasons. Economically, they permitted the exploitation of mineral resources and agricultural produce. In West Africa, they were built to allow the development of the Sierra Leone Tarkwa and Obuasi gold mines, and, in Nigeria, the tin found on the Jos Plateau and the Udi coalfields. Gold and coal were also the reason for Rhodesia’s Bulawayo–Salisbury and Bulawayo–Wankie lines, respectively; whilst lead/zinc, copper, chrome and soda ash provided the impetus for the Broken Hill section, the extension to the Congo border, the Umvukwes branch and the Kenyan Konza–Magadi line, respectively. Gold and coal, along with diamonds, were similarly the spur for much of the South African network. As for agricultural produce, in West Africa the cultivation of palm fruit was an impetus behind the Sierra Leone railway, cocoa the Gold Coast Accra–Kumasi and central Province lines and cotton the Nigerian Lagos–Kano extension. To the south and east, railways were largely built to encourage European mixed farming, though cotton was again an important motivator for the Uganda Busogara railway, sisal for the Kenyan Voi–Taveta link with Tanganyika and the Nairobi–Thika tramway, grapes the Cape Town to Wellington line, and timber the Cape Knysna–Deepwalls and Rhodesian Zambesi Saw Mills railroads.

A number of actors promoted construction. Various groups such as the British Cotton Growers’ Association and commercial firms aggressively lobbied the imperial government for the laying of lines. As discussed in the General Introduction above, they were supported in the Crown colonies by the Crown Agents and their consulting engineers, both of whom gained materially from construction and used the economic failure of lines as reasons for building extensions. In Nigeria, for example, Frederic Shelford claimed that the Lagos–Otta line, which was not expected to cover debt charges, would be successful if an extension was built to Ibadan. On the completion of the extension, which covered neither its own nor the original section’s costs, he advised that the two lines would be remunerative only if a further extension was built. Likewise, in Sierra Leone, he warned the Colonial Office that, unless the Freetown–Songotown line was extended, ‘the money spent will be more or less thrown away’, causing a Colonial Office offi-
cial to conclude that ‘we have gone so far that we cannot stop’. A similar state of mind ruled in Rhodesia, where the British Africa Co. extended the railway to the Congo border in the hope that the resultant development of the Katanga copper fields would generate sufficient traffic to allow them to meet the cost of financing the Beira railway and overcome the losses of the Broken Hill line.

Generally, the Crown Agents and consulting engineers were supported by colonial governors, who were well aware that the resultant expansion of trade and their operation of the railway would increase customs, tax, freight rate and land grant royalty revenues, and permit them to further stimulate development through the introduction of agricultural schemes and the construction of ports and harbours and to improve the lives of both European and African residents through the provision of medical and educational facilities, water and sewage works and so on. Such initiatives justified their existence and would improve their social standing, both in the colony and when they returned home, and, more importantly, would increase their chances of gaining a posting to a more important colony/protectorate. They were also aware that railways would allow them to govern effectively and efficiently, enabling administrators to travel into the interior, and, by permitting the rapid movement of troops, would help to maintain the political stability that was required by Europeans investing in the continent. Colonial administrations, in turn, were supported by their legislative councils, which largely composed of merchants, similarly had self-interested motives for the laying of lines.

Apart from economics, the British government and local colonial administrations had other reasons for constructing railways. The imperial government wished to demonstrate the might of the empire to Africans resistant to British control and to protect its interests on the continent from other European powers. The impetus behind the Uganda Railway, for example, was to secure the Nile against the Germans, who controlled neighbouring Tanganyika, and, to a lesser extent, the French and the Belgians, and the Nyasaland Port Herald to Blantyre line was constructed to counter Portuguese and American commercial threats. HMG also saw railways as a way of integrating their often disparate possessions on the continent and of providing a humanitarian cloak behind which their baser economic/political motives could be hidden. A supposed reason for the construction of the Uganda railroad, for instance, was the suppression of slavery via the removal of human porterage, and it was widely held that infrastructure would bring ‘civilization’ to the ‘heathen’ by permitting the spread of Christianity and Western education.

Notes

PART II. – GOLD COAST.

MESSRS. FITZ-GERALD and MERCER to COLONIAL OFFICE

10,083. No. 1.
22, Buckingham Street, W.C.,
June 23, 1879.

Sir,

Connected for many years past with British West Africa, and having closely watched the progress of the several territories, the impediments that restrain, and the aids that would impel it to results beneficial at the same time to the merchant and trader, the population at large, and the public revenue, we have the honour to bring the subject of railways in the Gold Coast Colony under your special notice, with the view of obtaining from Her Majesty’s Government the necessary concession for constructing these railways, in addition to such material and moral aid and assistance as the Government of the Colony could bestow without prejudice to any existing interest, and with reasonable certainty of a large increase in the public revenue.

2. A dissertation on the advantages to be derived by railway communication and transport would be impertinently superfluous at this advanced period of the nineteenth century. A comparison of the present condition of Great Britain, of Europe generally, of the United States of America, and other countries now and fifty years ago, exhibits these advantages in so powerful a light that no word of comment can be needed. But, considering the question with reference to the introduction of railways into the West African territories, it must be borne in mind that Great Britain and the other countries above alluded to were already possessed, before the introduction of railways, of elaborate and more or less perfect systems of
transport for people and goods by a network of good common roads, canals, and navigable rivers; while the Gold Coast territories of which we are now particularly treating are totally devoid of all common roads, almost equally so of river navigation, entirely so of canals, and without any mechanical facilities for the conveyance of produce exported and goods imported from and into the interior, all the traffic being on foot, and the produce and goods borne exclusively on human heads to and from the coast, in loads of 40 and 50, up to 70 lbs. each.

3. That such countries have progressed at all with such a total absence of facilities for the transport of goods and produce denotes the ardent desire of the people to acquire imported manufactures and other foreign goods, and points incontrovertibly to an enormous increase of production, and, consequently, of commerce and public revenue, when railways shall transport the produce and goods, and also passengers, and the tens of thousands of human carriers shall be continuously engaged in production instead of in transport.

4. Owing to peculiarities of the Gold Coast climate beasts of burden cannot be employed, so that any system of common roads would confer but little benefit, and be comparatively inoperative; which is fully borne out by the experience acquired by the Ashantee expedition under Sir Garnet Wolseley in 1873–74.

5. As produce for the most part can only be brought to the coast for shipment within a very limited distance, because of the difficulties and cost of transport on human heads, with the constant liability to loss by the breakage of the oil pots, and other accidents in the bush, the result of the railways we propose to make, by extending so as perhaps to double the area of profitable production, may be regarded as certain to double the exports, imports, and public revenue of the Colony.

6. In consequence of the difficulties of intercommunication, the dispersed population (remnants of once powerful tribes), who were in almost constant hostility under the provocative temptations of the now happily abolished foreign slave trade, remain in their isolated villages, comparatively ignorant of each other, and hostile to each other, each the prey of the abominable local as well as general superstitions, and of the infamous cheats exercising supposed powers of medicine and over witchcraft.

7. It ought to be, and we are certain must be, deemed equally desirable in the mind of enlightened statesmen, as it is in that of secular and Christian philanthropists, that these scattered populations, separated by some repellent influences, should be brought into easy and constant communication, and gradually, as would result from such intercommunication, be welded together, and elevated to the status and condition of a people, a condition in which individuals act and re-act upon individuals, to the destruction of ignorant and barbarous superstitions, the increase of intelligence, and the advancement of industry, civilization, and Christianity.
8. Confident that we shall have the enlightened sympathy and obtain the countenance and support of Her Majesty’s Government, which cannot fail to desire the rapid progress of material and moral development in a Crown Colony, we have for some months past resolutely devoted ourselves to the work of endowing the Gold Coast Colony with those lines of railway which appear to us to be most remunerative, as shown by the Circular herewith attached.

9. Ardent as our desire is to introduce these absolutely indispensable aids to material development and progress, to the growth of civilization, and the spread of an ennobling Christianity, we should not have entered upon this work of their construction had we not convinced ourselves that, built on the most approved modern principles for economical light railways, these projected lines will prove remunerating to the capital employed as well as beneficial to the people, as well as materially increase the trade, commerce, and revenue of the Colony. But important above all at the present time is the fact that these lines will open and afford easy access for passengers, tools, machinery, provisions, and general stores, to the rich gold districts. Only those who have acquired a knowledge of what the undeveloped gold resources of this Colony, in which scientific mining is only now commencing, really are, can properly estimate the success that these lines will attain. There can be no doubt that, aided by the facility of transport, the production of gold in this Colony will amount to many millions of pounds sterling per annum, which will help to remedy the evils that Her Majesty’s Principal Secretary of State lately described as being caused by the diminished yield of the gold-fields of Australia and California.

9a. In conclusion, we have now the honour to submit herewith, for your favourable consideration, the terms of concession which appear to us to be indispensable for the necessary introduction of the capital required for the construction of the proposed light railways.

We have, &c.,

(Signed) F. FITZ-GERALD.

The Right Hon. Her Majesty’s

Principal Secretary of State for the Colonies,

&c., &c., &c.
Enclosure 1 in No. 1.

CIRCULAR.

22, Buckingham Street, Strand, W.C.,

Light Railways – West Africa.

HAVING been connected with the Public Works Department of the Crown Colony of the Gold Coast, extending from 5° W. to 2° E. longitude, and averaging inland about 60 miles, with a population of 400,000, entirely under the jurisdiction of the Crown, I have had ample opportunities of observing what class of public works are most needed in this new Colony, which was constituted in 1874, for the development of its commerce, agricultural and mineral products, and for the employment of the large population that was only freed from the bonds of slavery five years since.

2. Since my retirement from the Public Service, I have been engaged, in conjunction with Mr. Fitz-Gerald (Editor of the ‘African Times’), in preparing a scheme for the introduction of light railways in the Settlements on the West Coast of Africa; and being fully Convinced that Her Majesty’s Government would recognise any project for developing the resources of the country, if strong representations are made by gentlemen of position and experience, I respectfully solicit your valuable support and co-operation in obtaining the sanction of the Secretary of State for the Colonies for the power of constructing these most useful and necessary public works. /

3. The financial and commercial prospects of the proposed undertaking are most encouraging, as the extracts from official papers fully bear out, viz.:–

<table>
<thead>
<tr>
<th></th>
<th>Tons</th>
<th>£</th>
</tr>
</thead>
<tbody>
<tr>
<td>Vessels entered</td>
<td>90,087</td>
<td>90,087</td>
</tr>
<tr>
<td>Vessels cleared</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Imports</td>
<td>364,672</td>
<td></td>
</tr>
<tr>
<td>Exports</td>
<td>327,012</td>
<td></td>
</tr>
</tbody>
</table>

The above figures are for the Gold Coast alone, and in the year when trade had only commenced to revive after the Ashantee Expedition of 1873–74.

The imports consist of cotton goods, spirits, tobacco, hardware, haberdashery, silk goods, and spice; and the imports of gold dust (bullion), ground nuts, gumer grain, gum copal, ivory, palm oil, palm kernels, monkey skins, &c. In tonnage and value the Lagos trade may be taken at double the above figures for the same year.

The revenue of the Gold Coast in 1869 was 24, 127l., and expenditure 18,836l. In 1877 the revenue was 92,347l. and expenditure 82,741l. – surplus
9,806l. sterling, showing a clear increase of nearly 25 per cent, per annum for eight years; and I learn on good authority that this prosperity has continued during the past year, 1878, the Gold Coast having realised nearly 100,000l. and Lagos nearly 60,000l.

Taking into consideration these official statements, there is every reason to hope that, by the introduction of better means of transport, instead of carrying every ounce weight of exports and imports on the heads of women, men, and even young children, a proportionate increase of production and consumption may reasonably be expected.

4. With a view of meeting the immediate requirements of the Colony, we propose to lay down four single lines of light railway:–

(1) From Chamah to the gold mines in Wassaw, where two concessions are in full work on English capital. This length is about 50 miles, and passes through the auriferous and oil districts of Secoudee, Dixcove, and Ahanta.

(2) A short line of 20 miles, from Salt Pond to Mankessim, through the centre of an oil district. This will eventually terminate at Elmina.

(3) A line of 40 miles from Acera, running through the most healthy districts of the Gold Coast and the largest palm plantations to Kpong on the Volta; with ultimate extension to Salaga, the centre where caravans meet from the Niger Towns, Timbuctoo, &c.

(4) A line from Garru on the Oguno at Lagos to Abeokuta in the interior, about 40 miles.

The total length of these lines is about 150 miles, with landing-places, warehouses, and hulks at the seaports, Chamah, Salt Pond, and Accra.

5. From personal experience of the country, I am satisfied that a narrow gauge line of 36-1b. rails will suffice for all the traffic for some years to come and the country, though hilly, is principally covered with low hills of short ranges, so that a railway line could always be selected with low and short embankments; and, there being no rivers of any size to cross, the lines could be completed for 2,500l. per mile. When the concession is secured, the shares taken, and surveys and plans approved, I am disposed to think that the prosperous state of the Colonies would induce the Government to guarantee a fair percentage on the cost of the works, which I estimate at 500,000l.; a 4 per cent. guarantee on which is equal to 20,000l., and this amount nearly represents the surplus revenue over expenditure for the past two years.

6. To assure the promoters of the success of this undertaking, it is only necessary to point out the recuperative powers of the lines in goods traffic alone; and for this purpose I select the shortest line as a test, Salt Pond, with a trade of 20,000 tons per annum, exports and imports inclusive; the transport, 20 miles
at 6d. a ton, equals 10,000l., to which, adding 2s. per ton storage in warehouses and hulks, gives 2,000l., or total receipts of 12,000l. Taking the construction and maintenance of this line, warehouses and hulks, at 70,000l., and deducting working expenses, 50 per cent, on 12,000l. (the gross earnings), leaves a balance of 6,000l., or about 8 1/2 per cent. on the outlay of 70,000l. exclusive of passenger traffic. Now, if I analyse these charges, I find there is a large margin for higher rates than 6d. per ton and 2s. per ton for storage. Thus, the weight of palm oil is about 7 1/2 lbs. per gallon of 300 per ton, and the average weight carried by an adult is 60 lbs. It therefore takes 37 adults to bring a ton of produce to the coast. The hire of these men, if only paid 3d. per day for their subsistence for two days to and fro, amounts to 18s. 6d., exclusive of any wages; and the charge of 2s. per ton for warehouse and hulk storing will compare favourably with the rate charged by Government for bonding in Government stores.

7. As the ultimate success of this undertaking depends upon what support we can obtain from the Government, I shall be glad to learn if you will allow me to add your name to the list of supporters who are willing to co-operate or recommend the project now brought to your notice.

I have, &c.,

(Signed) Wm. Mercer, Asste. Mem. Inst. C.E.,
West African Merchants.
late Colonial Surveyor, Gold Coast.

Enclosure 2 in No. 1.

Draft Memorandum of Terms and Conditions of Concession for Light Railways, Gold Coast, West Coast of Africa.

1. The concession to be in force for 21 years from date of grant.
2. Terms:–
   (1) The grant of all lands and waterways 500 yards on each side of the central line of the single line of railway.
   (2) The sole and absolute right of the Company to work any quarries, waterways, mines, forests and lands within the above lines of limitation.
   (3) Power to lease, allot, and sell any land that has been cleared, cultivated, planted or worked by the Company.
   (4) Power to build warehouses and landing-places on the sea coast, and to keep hulks at anchor in roadsteads free of harbour dues, rates, and taxes.
   (5) To land, free of duty, all materials and appliances for the construction and maintenance of the railways, stations, hulks, &c.
(6) Full power to levy rates, tolls, rent, &c., on all traffic carried by or along the lines, or deposited in the stations, &c., or taken on board the hulks, and to appropriate the same free of duty or tax.

Conditions:–

(1) That the survey plans, &c., approved by two Civil Engineers of note, shall be deposited with the Crown Agents within two years after the concession has been granted.

(2) That the several lines shall be completed within five years after the approval of the said plans by Her Majesty’s Secretary of State for the Colonies.

(3) That the Company shall deposit 4 per cent. of their capital as caution money when the Government of the Colony grants an annual subsidy from the local revenue, for the true and faithful execution of the works as shown by the plans.

(4) The local government shall have full right to purchase the lines and rolling stock, &c., at the expiration of the concession; and that, in consideration of the subsidy, the Government shall be entitled to one-half of the surplus nett revenue of the Company, after paying 6 per cent. on the capital (inclusive of the subsidy).

(5) That the Company shall pay a royalty of 1s. per ton of 20 cwt. on all minerals worked or exported; and a nominal rent on all lands cultivated within the prescribed limits.

(6) That the Government shall have power to examine the accounts of the Company after each half-yearly report has been issued.

(7) That the concession be granted jointly to William James Mercer, Civil Engineer, and Ferdinand Fitz-Gerald, Esq., and that the provisions, guarantees, &c., entirely lapse at the end of two years, provided they fail to comply with Clauses 1 and 2 of No. 3 of the Concession or Agreement.
No. 2

COLONIAL OFFICE to Messrs. FITZ-GERALD and MERCER.

Gentlemen,

Downing Street, July 11, 1879.

I am directed by the Secretary of State for the Colonies to acknowledge the receipt of your letter of 23rd June,* asking for a concession of privileges, &c., for the construction of railways on the Gold Coast.

Sir M. Hicks Beach\(^2\) desires me in reply to state that, although he would desire to see the development of the Gold Coast Colony advanced by the establishment of such improved means of communication with the interior as a railway would afford, the scheme placed before him in your letter is of too general a character to be entertained by Her Majesty Government, even if they were in a position to make the proposed concessions.

Except in the immediate neighbourhood of forts and towns the country of the Gold Coast belongs not to the Crown but to independent kings and tribes; and Her Majesty’s Government could not undertake either to make grants of land or to secure persons constructing a railway from interference and danger. Sir M. Hicks Beach does not perceive how this preliminary objection to your proposal could be overcome; but, in any case before a proposal for railway construction could be considered, it would be necessary to show that responsible persons were prepared to provide the requisite capital, and to submit the details of the particular works contemplated.

I am, &c.,

F. Fitz-Gerald, Esq. (Signed) ROBERT G. W. HERBERT.

W. Mercer, Esq.

REPORTS ON INSPECTIONS
MADE
TO ASCERTAIN THE BEST LINES
OF POSSIBLE
RAILWAY EXTENSION
IN
THE COLONY.
No. 1. – POSSIBLE EXTENSIONS OF THE WESTERN AND MIDLAND SYSTEMS.

Presented to both Houses of Parliament by command of His Excellency the Governor. JUNE, 1879.

[...]

Cape Town, 30th April, 1879.
W. G. Brounger, Esq., Railway Engineer.

Sir,—In compliance with the instructions contained in your letter No. 409 C of the 23rd October, 1878, I have examined the country with the view to possible railway extension between the Midland and Western Systems of Railways, and the Orange River, and I have now the honor to submit to you the following report of my inspection, and approximate estimates of the cost of the work:— /

[...]

Generally speaking the heights have been taken by Aneroid,¹ and the distances by Trochometer,² or by pacing, and the results are of course only approximate.³

In cases, however, where there appears to be any doubt as to the practicability of the country for a railway within the prescribed limits of gradients and curves, trial chain surveys have been made, and the levels taken.

The prices of labour and of transport, on which the estimates are based, are about the average of those prevailing on the Beaufort West Extension Railway in course of construction.

The prices of permanent-way material are those at present quoted in England, and are exceptionally low, and unless the work is proceeded with at once, there must be some addition allowed to this item.

Throughout the whole of the country which I have inspected, there is a great scarcity of a permanent supply of water, and I have allowed an extra of £100 per mile, in the estimate, on this account.

The estimates are calculated to cover work and material of every description required to complete and equip the railway, including the first cost of rolling-stock. The cost of land and fencing is not included.

I now proceed to describe generally the work on the different lines.
Route No. 1. – Beaufort West to Hope Town Direct.

Estimated distance, 224 miles; sidings, 11 miles; total, 235 miles.

The line will leave the Beaufort West Extension Railway, at a point about 228 ¼ miles from Worcester, that is, about ¼ mile from the proposed station at Beaufort, and will cross the Gamka River about 100 yards above the road drift, at the southern entrance to the town, by a bridge of 150 feet waterway, and it will then cross the main street by a level crossing, and the stream from the reservoir by a bridge of 50-feet span.

The line will then pass over perfectly easy country, with light work, and no gradient steeper than 1 in 70, and only a short length of that, to Rhenoster Kop Farm.

From here to the foot of Reim Hoogte, the work is still light, but a mile of heavy work will be required to reach the point on the summit of Reim Hoogte, about 25 ½ miles from Beaufort West, where the lines to Hope Town and Richmond diverge.

Thence the Hope Town line can be taken through Courlands Kloof, with less than 9 miles of moderately heavy earthwork. It will be necessary to cross the stream in the kloof, at least three times, but the bridges required will not be of an expensive character.

After leaving the kloof the work for 5 miles is light, and with easy gradients, and the line then crosses the Salt River, by a bridge with 150 feet waterway, near Kalk Val, about 39 miles from Beaufort West.

From Kalk Val the line follows the general direction of the road to Victoria West, as far as the ‘Old Stable,’ about 45 ½ miles from Beaufort West, and then diverges to the east, and runs up the valley to Noblesfontein.

To 55 ½ miles the work is still light, but near the homestead at Noblesfontein, there will be a mile of heavy work, chiefly in rock, with steep gradients.

After passing this point, the line reaches a summit 62 miles from Beaufort West, dividing the drainage areas of the Salt River and Ongers River, near Matjesfontein Farm, and leaving Eendvogelfontein about a mile to the left, at 64 ½ miles, then passes Beisjesfontein Farm at 76 miles from Beaufort West. From Noblesfontein to this point, the work and gradients are moderate.

If this route be adopted, a Station for Victoria West will have to be placed here; the distance from the town will be a little more than 6 miles, and over a good road.

From Biesjesfontein the line passes near Klein Bosmans Poort, and Slaghtbergs Farm, and the Ongers River is reached at 105 miles from Beaufort West, where a bridge of 160 feet waterway is required. The work to this point is of the lightest description, and with easy gradients.
At 113 miles the line passes near Lieuwkuil Farm, where a 30-feet bridge is required, and the work continues moderately light, till a rocky neck is reached at 119 ½ miles, where about a mile of heavy work will be necessary.

From Nieuw Jaars Fontein (126 miles) the work is moderate in quantity, but partly in rock.

Thence to 183 ½ miles the work is little more than forming, and nearly all in soft ground, and over a level country.

The line passes near the under-mentioned Farms: Reit Poort, 128 miles; Dreunfontein or Kalkenberg, 135 miles; Brakfontein, 147 miles.

This point (Brakfontein) is only about 4 miles to the east of Brits Town, and a station might be placed to advantage in this neighbourhood.

At 160 miles the Brak River will have to be crossed, and a bridge of 150 feet waterway will be required.

At 164 miles near Matjesfontein a bridge of 120 feet will be required over a branch of the Brak River.

At 172 miles the line passes within a short distance of Rhenosterfontein Farm, where there is a spring, which yields an abundant and constant supply of good water. Lime of good quality is also to be had in abundance.

A bridge of 120 feet waterway will be required over the Rhenoster River.

Rietfontein Farm is reached at 179 miles, and Whirlwind Poort at 183 ½ miles from Beaufort West.

Here, Whirlwind Poort 1 ½ miles of somewhat heavier work, partly rock, will be required, but after that the work as far as Hope Town is little more than forming.

The line passes Quaggas Pan at 189 miles, Biesespet Farm at 194 ½ miles. Paardepet at 200 miles, and Kaffirs Dam at 203 miles from Beaufort West.

At 221 miles I propose to place the station for Hope Town about 1/2 mile to the west of the church, where the ground is in every way suitable.

The total length of the line to the Orange River is 224 miles.

There is an excellent site for the bridge about 1 mile below the pont, and 1 ¼ miles above the road bridge at present in course of construction. The line could be brought here without heavy work, and the bed of the river is of rock, and most favourable for foundations of abutments and piers.

The approach to the bridge, on the farther side of the river, could also be formed without heavy earthwork. It would be possible to take the line to the bridge now in course of construction, but this would entail some extra distance, and a considerable increase in the earthwork. A rock-cutting 30 feet in depth would be required to get a gradient of 1 in 40 on this side of the river, and the work on the farther side would also be heavy.

Speaking generally of this route, the country is in nearly all respects most suitable for making a railway at a cheap rate. The earthworks are unusually light,
the masonry in bridges and culverts not above the average, and building material
and ballast generally accessible. The great difficulty is, as I have stated previously,
the scarcity of water.

From the approximate list of gradients which follows, it will be seen that the
traffic can be worked at a low rate:

**List of Gradients.**

<table>
<thead>
<tr>
<th>Miles</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>1 in 40</td>
<td>1 ¼</td>
</tr>
<tr>

</tbody>
</table>

The details of the Estimate are annexed.

**Route No. 2. – Beaufort West to Richmond.**

From 25 ½ miles from Beaufort West, where this line leaves the direct line to
Hope Town, to 26 ½ miles, the work is moderately heavy, and a / gradient of
about 1 in 50 will be required, and an 80-feet bridge will be necessary.
At 32 miles the line passes near the accommodation house at Salt River Drift, and at 33 ¼ miles, Mr. Devenish’s Farm, Klip Kraal.

At 35 ¼ miles the Salt River has to be crossed by a bridge of 150 feet water-way. From here to 45 ¾ miles the work is light, and in soft ground, and the gradients easy.

From 45 ¾ miles to 48 ½ miles, Waaifontein, the work is rather of a heavy description in rock and shale, except the last ½ mile which is heavy work, in rock, with a gradient of about 1 in 50.

At 49 ½ miles a 40-feet bridge will be required.

To 54 ¾ miles the work is moderate, chiefly in shale; but from this point to 57 ½ miles, the work is somewhat heavy, and there is much rock.

From here to 63 ¾ miles the ground is soft and the work moderate.

Tigerfontein Farm is passed about 59 ½ miles.

From 63 ¾ to 65 ¼ miles the work is heavy, chiefly in rock.

At 66 ½ miles, the line passes to the east of Mynhaard Klassens Fontein, and at 74 ½ miles reaches Scietkuil, which is one of the points I propose as suitable as a junction with the Midland System. There is a fair supply of water here, and the farm is on the main road from Victoria West to Murraysburg, and about 30 miles from the former place.

One 60-feet and two 30-feet bridges will be required between Mynhaard Klassens Kraal and Scietkuil, but the work is moderate and the ground chiefly soft.

From Scietkuil, the line crosses an extensive plain, to Bultfontein at 87 miles, and Rondafelsfontein at 92 miles.

With the exception of ¼ mile of tolerably heavy work in shale, this length requires little more than forming. Three 30-feet bridges are however necessary.

At 96 ½ miles the line passes near Mr. Botha’s Farm, Vogelstruisfontein, at 99 ½ miles Gegundenfontein, and at 103 miles Rooi Vald Farm, where a 70-feet bridge is required.

At 105 miles a bridge with 100 feet waterway will be necessary, and at 105 ¾ miles a 30-feet bridge. The work to this point is of the lightest description.

From here to Richmond at 109 ½ miles, the work is heavier, and some rock is met with.

One 30-feet bridge will be required at the entrance to the town.

The site of the station at Richmond cannot be fixed until the question of extension northwards is decided, and a detailed survey made. I am of opinion that if the line is extended from here in the direction of Hanover, the station should be placed to the north-east of the village. Although this will entail a considerable amount of rock-cutting, two bridges over the Ongers River will be saved.
The earthwork on this line is somewhat heavier than on the route to Hope Town, but ballast, stone, and lime, are plentiful, and there is a better supply of water than on route No. 1.

This estimate provides for stations at Salt River, 32 miles, Scietkuils, 74 ½ miles, and at Richmond, besides an allowance of £2,500 for the junction at Beaufort West.

</table>

I estimate the cost at £686,892. /

**Route No. 3. – Graaff-Reinet to Richmond.**

This is the only route which presents any engineering difficulties, and on this account, and because I understood that the inhabitants of Graaff-Reinet attached great importance to having the line extended through the town, I made a most thorough examination of the country, and after I had selected the line which on the whole I considered best, Messrs. Shaw and Sykes were employed for some weeks in making a trial survey of the more difficult parts of the country; but I am sorry to state that the result of the survey was to prove that the difficulties were greater than I had anticipated.

[...] I inspected three routes northwards from Graaff-Reinet.

First, – the one recommended by Mr. Bain, via Pienaars River Valley, Osfontein Nek, Scorpions Kral, and Hartebeeste Nek.

For about 20 miles, this route is identical with the one via Zuurpoort, which I have adopted, and although of somewhat greater length than the Zuurpoort route, should be surveyed in detail, before either route is decided upon.

To the best of my judgment, however, the line via Zuurpoort can be made for a smaller sum than the other, and this route has the advantage of providing a Station within a convenient distance of Murraysburg.

The third route which I examined, is towards Herbets Nek, a gap in the mountains, some distance beyond Mr. Rubidge’s Farm, Wellwood.
The country rises in a series of terraces from the valley of the Sundays River, and is rough and broken in the extreme.

I consider this route utterly unsuitable for a line of railway.

Route via Zuurpoort.

After leaving the present Terminus of the Midland Railway, the line will cross the Sundays River, near the end of Bourke-street, and will follow the general direction of this street through the Town. The ground is favourable, and very little house-property will be interfered with.

About 1¼ miles from the Junction, the Sundays River has again to be crossed. A bridge of 150 feet waterway will be required in each case.

After crossing the river, the line will be taken through Rynevelds Pass, where two sharp curves will be required, and there will be about ¼ mile of heavy scarping in rock.

After this, the work is moderate to 8¼ miles, where the farm Lower Buffels Hoek is reached.

A 30-feet bridge will be required for the crossing of the Pienaars River.

From 8¼ miles to 13¼ miles the line follows the slope of the hills on the east side of the valley, and reaches a neck, opposite Riet Vley Farm, with a continuous gradient for the 5 miles, of about 1 in 50. The work will be moderately heavy, scarping partly in rock, and three 20 feet bridges are required on the length.

From here to 18¾ miles, the line still follows the slope of the hills on the east side of the Pienaars River valley, but the work on a great part of this length will be of the heaviest description, on account of the numerous cross kloofs which have to be passed, and at least three heavy viaducts will be required, and several 5-chain curves will be necessary.

The gradient to this point is about 1 in 66.

At 18¾ miles the line emerges from the valley at the head of Wolve Kloof, and from here to Sneuwerberg Nek, at 31 miles, thence to Zuurplaats Dam (36¾ miles), the work is only moderately heavy.

From this point, the steep ascent (of two miles by road) to Zuurpoort Hoogte begins, and the line has to be lengthened two miles, by contouring the hillsides to the left of the road, in order to get a gradient of 1 in 40. Both earthwork and masonry on this length will be extremely heavy, and several curves of small radius cannot be avoided.

Zuurpoort Hoogte 40¾ miles, is the first summit of the Sneuwerberg mountains which the line crosses, and is about 2,500 feet above the town of Graaff-Reinet.

A point is passed at 70 miles on this route, which is about 400 feet higher than Zuurpoot, yet the great difficulty of the work is over at the last-mentioned
place, and the rest of the line to Richmond, although above the average, is not unusually heavy.

For the next 4 miles, the ground is good and the work light.

From 44 ¾ to 45 ¼ miles there is some scarping, partly in rock, on the east side of Poortjie Kloof.

The roads to Murraysburg and Richmond separate here, and this would I think, be the best site for a station.

The distance to Murraysburg is under 20 miles.

At 53 miles, the line will pass at the back of Witte Klip Farm, and the work to this point will be moderately heavy.

To 63 miles, the work is little more than forming in soft ground, and thence to Rhenosterfontein Farm at 65 miles, only a little heavier. A 40 feet bridge will be required here.

For 3 ½ miles from Rhenosterfontein, only forming is required, but from 68 ½ miles to 72 miles, the work is mostly heavy, and partly in rock.

Burghers Kraal is passed at 74 miles, and Scietkuil Kraal at 76 miles.

The whole of the work from 72 miles to Richmond (89 miles), is as light as possible, and with the exception of one mile (79 to 80) the gradients are easy.

A bridge of 120 feet waterway will be required for the Ongers River at Richmond.

With reference to the cost of this line, as it is impossible to estimate with certainty, for heavy work of this description, without detailed surveys, which I was not authorised to make, I can only say that to the best of my judgment, the line can be made for the sum named in the approximate estimate appended to the report, viz., £927,531.

The estimate provides a sum of £2,000 for extra works at the Junction Station at Graaff-Reinet, and £5,520 for the Station at Murraysburg. The station at Richmond is provided for in the estimate of No. 2 Route.

The Bridges required are as follows:

Route No. 4. — Hanover to Phillips Town.

With the exception of about 3 miles near Phillips Town, the earthworks of this line are exceptionally light, and on account of the line following generally the direction of the watershed between the Ongers and Zeekoe Rivers, only 5 bridges, 1 of 50 feet, and 4 of 30 feet span are required.

Building stone is not so plentiful as on the other routes, and I have increased item for culverts on this account.

After leaving the station at Richmond, the line runs for 11 miles over slightly undulating ground, with good gradients and light work.

At 12½ miles the line passes near Kaifontein Farm, the last 1½ miles being somewhat heavier work, and about ½ mile of steep gradient being necessary.

At 114 miles, Skuirfontein, there is a short length of moderately heavy work in rock, but from here to Bontebok Nek, at 25 miles, the work is little more than forming. A ¼ mile of rough work in rock, but only moderately heavy, is required here.

At 33½ miles the line passes near Uilefontein Farm, and reaches Hanover, 38 miles, with the very lightest work except that some extra provision for drainage is required here and there.

I propose to place the station for Hanover at the south-east of the village, near the Cemetery, where there is a most suitable site in all respects. The water-supply is ample, and of good quality.

With the exception of a short length of work in rock, about 44 miles from Richmond, the country beyond Hanover is perfectly flat, and the work is of the lightest description, to the Waterfall Farm, at 76 miles.

Two farms called Stirkfontein are passed at 54½ and 59½ miles respectively.

Beyond the Waterfall Farm, one mile of rough ground is encountered, where the work will be moderately heavy, and the ground falls rapidly to the valley of the Hondeblas River, where Phillips Town stands.

I estimate the distance from Richmond to Phillips Town at 80½ miles.
The line will pass to the west of the village, and I propose to place a station here, about ½ mile distant from the Market Square. The water-supply is not good, but can probably be improved by sinking.

At 89½ miles the line passes to the left of the hill, where the homestead of Tigerfontein stands, and then follows the valley of the valley of the stream for some miles.

From Tigerfontein stands, and then follows the valley of the stream for some miles.

From Tigerfontein to the junction with route No. 1, at 146 miles, the work is as light as possible, and in soft ground.

The following Farms are passed: Bok Kraal, 94 ½ miles; Boschberg, 102½ miles; Grass Pan, 106 ½ miles; Plessis Dam, 111 miles; Dornkuil or Aasvogel Kop, 119 miles; Biesilaagte, 138 ½ miles.

I estimate the cost at £870,401.

[...] The gradients from Richmond to junction with route No. 1, are approximately as follows:

<table>
<thead>
<tr>
<th>Miles</th>
</tr>
</thead>
<tbody>
<tr>
<td>1 in 40 . . . . . . . .</td>
</tr>
<tr>
<td>1 &quot; 41 to 1 in 50 . . . . . . . . . . . . . .</td>

</tr>
<tr>
<td>Above 1 in 100 and level . . . . . . . . . . . . . .</td>
</tr>
</tbody>
</table>

The detailed estimate is annexed.

**Route No. 5. – Hanover to Colesberg and Orange River.**

From the proposed station at Hanover to the Zeekoe River, 8 miles, the earthwork is light, but some extra work is light, but some extra provision for drainage is required.

A 40-feet bridge must be provided about 5¾ miles, and one with 150 feet waterway will be necessary to cross the Zeekoe River.

All 11 miles the line passes Andriesfontein, where there is a good spring.

The work to this point is moderate, but after passing the farm, there is a ¼ mile of pretty heavy work in rock.

As far as Beestekraal Sluit, near Mr. Bartlett’s Farm, at 19½ miles, the work is still medium, and chiefly in shale.

A 40-feet bridge is required for the Sluit, and a 30-feet bridge at 21½ miles.
The line must pass some distance to the north of Mooi Fontein, about 26 miles, and the work is not heavy until near Elandsfontein, where about 1 mile of moderately heavy work cannot be avoided.

From here, to Kuilsfontein, at 35½ miles, and to the site which I propose for the station, to the north-west of Colesberg, 46 miles, the country is easy, and the work is light.

The line will pass to the north of the Town, and, for the first 3 miles, the work is somewhat rough, and the gradients broken, but after this to about 51 miles, where the line enters Rietfontein Poort, the work is light.

There is about 1 mile of medium work, and some pitching to the slopes of the bank will be required. In the poort through which the road and river runs, a skew bridge with 70 feet waterway is necessary for crossing the river.

From Rietfontein to the Orange River, at the site of the road bridge in course of construction (63 miles), the work is not heavy, though somewhat above the average.

If the road bridge is not available for the Railway, an equally good crossing exists about ½ mile down stream, immediately above the Pont, and the quantity of the earthwork would not be increased.

Speaking generally of this route from Richmond, the earthworks are somewhat above the average, but building materials and ballast are plentiful.

The annexed estimate provides for a station at Colesberg, and 1 at the Orange River.

The Bridges required are as follows:

<table>
<thead>
<tr>
<th>Span in Feet</th>
<th>No.</th>
</tr>
</thead>
<tbody>
<tr>
<td>150</td>
<td>1</td>
</tr>
<tr>
<td>70 (Skew)</td>

<td>42</td>
</tr>
</tbody>
</table>

I estimate the cost of the line at £400,067.
Route No. 6. – From a point on No. 2 near Nels Poort, to Aberdeen Road Station on the Midland Line.

The Line leaves Route No. 2, about 32 miles from Beaufort, near the accommodation house at Salt River Drift, and crosses the river by a bridge of 150 feet waterway.

After following the slopes of the hills which extend from here to Stellenbosch Valley to a Nek about 4 ½ miles from the Junction, the line takes the general direction of the Murraysbug Road, to a point 2 miles to the west of Kruidfontein, where route No. 8 diverges to Secretaarskraal. With the exception of 1 mile of rough ground at the Nek above-mentioned, the earthwork on this length will be light.

At about 19 ½ miles the Buffalo River is crossed, near Rosebaaken Farm, by a bridge of 200 feet waterway, and thence the line passes over the extensive plains to the north of Stellenbosch Valley towards Aberdeen at 70 miles. The work is nothing more than forming, with some extra provision for drainage.

The following Bridges are, however, required:–

1 80-feet at Oudeplaats River.
1 50-feet " Zarels River.
1 70-feet " Kewna River.
1 50-feet " Branch of Camdeboo River.

In the neighbourhood of Aberdeen, the work is somewhat heavier for about 2 miles.

The site of the station will be near the crossing of the stream to the south of the village, where there is a fair supply of water.

From Aberdeen to the junction with the Midland Railway at Aberdeen Road Station, the line will follow the general direction of the new road in course of construction, and the work continues light the whole of the way.

With the exception of ½ mile of about 1 in 60, there need be no gradient steeper than 1 in 100 on this line, and the traffic can be worked most economically.

The cost of construction will also be below the average, not only on account of the lightness of the earthworks, but also from the advantage of railway communication with both ends of the work.

Ballast, however, is not so plentiful as no the other routes, and I have increased the price for that item.

I have provided in the estimate for a station at Salt River and Aberdeen, and for an intermediate one.

I estimate the cost at £522,947.
Route No. 7. – From a point near Stellenbosch Vallei on No. 6 to Scietkuil on No. 2.

This line leaves route No. 6 about 28 miles, and for the first 6 miles to Doofontein the work is light forming only.

From here to the crossing of the Murraysburg road at 13 miles, the country rises in a series of plateaus, with short steep ascents between them, and the work is consequently somewhat heavier, and partly in rock.

After crossing the road the line has to follow the base of the hills to the left, which die out opposite Toverfontein. This causes a considerable divergence from the direct route, but the work is not heavy, and the ground is chiefly soft.

At 19 miles the Buffalo River is crossed at Secretaars Kraal, by a bridge of 180 feet waterway; the section of the river bed at this point is most favourable for crossing, and the foundations for the bridge are good.

From here to Scietkuil, 38 miles, the line passes over much the same ground as that described in route No. 2, with moderate work in soft material.

I have provided in the estimate for a station at Secretaars Kraal, one at Scietkuil is provided for in the estimate for No. 2 route.

The only bridges required are one of 180 feet, and two of 30 feet, but the number of culverts is above the average.

The gradients are approximately as follows:

<table>
<thead>
<tr>
<th>Miles</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>1 in 40</td>
<td>¼</td>
</tr>
<tr>
<td>1 &quot; 41 to 1 in 50</td>
<td>¾</td>
</tr>
<tr>
<td>1 &quot; 51 &quot; 1 &quot;</td>
<td>60 1</td>
</tr>
<tr>
<td>1 &quot; 61 &quot; 1 &quot;</td>
<td>70 1</td>
</tr>
<tr>
<td>1 &quot; 71 &quot; 1 &quot;</td>
<td>80 0</td>
</tr>
<tr>
<td>1 &quot; 81 &quot; 1 &quot;</td>
<td>90 2 ½</td>
</tr>
<tr>
<td>1 &quot; 91 &quot; 1 &quot;</td>
<td>100 4</td>
</tr>
<tr>
<td>Above 1 in 100 and level</td>
<td>28</td>
</tr>
</tbody>
</table>

I estimate the cost of this line at £229,347.

Route No. 8 – From a point near Kruidfontein on No. 6 to Secjetaars Kraal on No. 7.

This is an alternative line for forming a junction between the two systems at Secretaars Kraal instead of at Nels Poort or Scietkuil. It leaves route No. 6 at 15 miles from Nels Poort, and after 2 miles of light work over the flat, crosses the stream below Kruidfontein Farm by a 50-feet bridge.

The line then turns to the left, to avoid a range of hills, and to 6 ¾ miles where a 20-feet bridge is required, the work is moderate.
From here to the Buffalo River, which is crossed at 7 ¾ miles, the work is heavier, and a gradient of 1 in 66 is required for a part of the distance.

A bridge of 200 feet waterway is required for the river.

At 13 ¼ miles the line passes between the homestead and the dam at Kraaifontein, and crosses the Murraysburg Road.

The work is not heavy, but two short lengths of 1 in 40 gradients are necessary.

From here to Secretaars Kraal, 19 miles, the line follows a valley to the north of the road, and the work is light and the gradients easy.

The bridge and station at Secretaars Kraal are provided for in the estimate for route No. 7. /

The Bridges required on this route are as follows:–

<table>
<thead>
<tr>
<th>No</th>
<th>Span in Feet</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>200</td>
</tr>
<tr>
<td>1</td>
<td>50</td>
</tr>
<tr>
<td>1</td>
<td>30</td>
</tr>
<tr>
<td>2</td>
<td>20</td>
</tr>
</tbody>
</table>

Approximate Gradients.

<table>
<thead>
<tr>
<th>1 in 40</th>
<th>1 in 41 to 1 in 70</th>
<th>1 in 71 to 1 in 90</th>
<th>1 in 91 to 1 in 100</th>
<th>Above 1 in 100 and level</th>
</tr>
</thead>
<tbody>
<tr>
<td>¾</td>
<td>¾</td>
<td>1½</td>
<td>2</td>
<td>14</td>
</tr>
</tbody>
</table>

I estimate the cost of this line £ 133,600.

With regard to the estimates appended to the Report, I should state that the total estimated length, including sidings, is taken in all cases. This will give an average increase of 5 per cent. in the prices, if the net distance only is taken.

I consider the prices ample to carry on the work under present circumstances, when a large quantity of plant and skilled labour of various kinds would be available from the railways now nearly completed.

But if there be a long delay in starting the Extension Works, and a new staff has to be organized, a considerable addition will have to be made.

J. F. STATTER.
Correspondence having Reference to Construction of Railways in Territory of Bechuanaland (Cape Town: Government Printer, 1889).

CAPE OF GOOD HOPE.

CORRESPONDENCE
HAVING REFERENCE TO
CONSTRUCTION OF RAILWAYS
IN TERRITORY OF
BECHUANALAND.

Presented by His Excellency the Officer Administering the Government and Her Majesty’s Acting High Commissioner, in reply to Address from the House of Assembly.

CAPE TOWN:

[...]

1889. /
Lord Knutsford to Sir H. Robinson.

Downing Street,
2nd July, 1888.

South Africa.
No. 77.

Sir, – I transmit to you for your information the enclosed copies of correspondence between Lord Gifford, V. C., Chairman of the Bechuanaland Exploration Company, and this Department, relative to a scheme for a Railway in British Bechuanaland, and I have to request that, after such consultation as you may deem necessary with Sir S. Shippard, you will favour me with a full and detailed expression of your views on the various points connected with the scheme which are raised in the present correspondence.

For the present, as I have informed you by telegram, I think it reasonable that you should refrain from entertaining any competing proposals for a Railway Concession which you may receive from other parties. And it will also be desirable to discontinue for the present the issue of any grants of farms or even near to the Eastern Frontier of British Bechuanaland.

I am aware that the only land already granted which the Government can hand over to the Company free of expense is land forming part of a quitrent farm ‘which has not been improved by cultivation, irrigation or otherwise.’

I have, &c.,
(Signed) KNUTSFORD,

The Right Honourable
Sir Hercules Robinson, G. C. M. G., &c., &c., &c.

Lord Gifford to the Colonial Office.

Copy.

The Bechuanaland Exploration Company, Limited,
14, George Street, Mansion House, E. C.,
London, 30th May, 1888.

Sir, – Adverting to the interview you kindly gave myself and Mr. Cawston yesterday on the subject of the Bechuanaland Concession, at which we were enabled to satisfy you of the influential position of the majority of the persons interested in the Company, I have now the honour to inform you that it is considered desirable to develop the resources of South Africa in the direction of Shoshong as rapidly as possible.
With this object in view I have been requested to ascertain whether the Secretary of State will be prepared to entertain a proposal for extending the railway system from the frontier of Bechuanaland to Vryburg, provided the Cape Government agree to extend this railway system to the border of Bechuanaland.

I need hardly point out that the Cape Government will greatly benefit by the proposed Railway, as it will secure the chief trade of the interior passing over her system, and the railway would become the main trade route to the north, passing through British territory.

Should the Government be prepared to consider this suggestion I shall, on learning the Secretary of State’s views, at once lay before his Lordship proposals, and ask for the right to construct the line and such financial assistance, either in the form of a guarantee or otherwise, which will enable the concessionaries to carry the Railway through without delay.

I have, &c.,

(Signed) GIFFORD.

To Sir Robert Herbert, K. C. B.,
Permanent Under Secretary of State for the Colonies,
Downing Street, S. W. /

LORD GIFFORD TO THE COLONIAL OFFICE.

Copy.

14, George Street, Mansion House, E. C.,
London, 12th June, 1888.

Sir, – I have the honour to acknowledge the receipt of your letter of the 9th instant.

I shall forthwith communicate with the Government of the Cape Colony as to the construction of the line from Kimberley to the Frontier of Bechuanaland, and on the receipt of a satisfactory reply the financial group I represent will make application for grants of land, and will have no difficulty in giving the guarantee you mention.

I have, &c.,

(Signed) GIFFORD,
Chairman.

To Sir Robert Herbert, K. C. B.,
Permanent Under Secretary of State for the Colonies,
Downing Street,
Lord Gifford to Colonial Office.

14, George Street, Mansion House, E. C.,
London, 18th June, 1888.

Sir, – Since my letter to you of the 12th instant I have the honour to inform you that the financial group with whom I am associated have been in communication with the Government of the Cape Colony, and learn that the Cape Government contemplate introducing into their Parliament a Bill for the extension of the line from Kimberley to nearly the boundary line between the Cape Colony and British Bechuanaland, and that, if terms are arranged for the construction of the line in Bechuanaland, the Cape Government will extend their line to the frontier.

In these circumstances I beg to request that the Secretary of State for the Colonies will grant me an interview, when I can introduce those associated with me, with a view to determine the basis upon which our arrangements for the construction of the Railway in Bechuanaland can be matured. It is apparent that, at the present nominal value of land in Bechuanaland, it would be almost impossible to make sufficiently large land grants to cover the cost of constructing the Railway. The revenue from land might, however, be supplemented by a light railway tax on land, the value of which is increased by the existence of the Railway; the right to lay out townships and the disposition of the town lots by sale on lease or freehold, as considered most desirable; the sharing upon equal proportions with the Government of the licences paid at the gold-fields which are being or may be hereafter discovered; the right to fuel on Crown lands through which the Railway passes; the right to let or use water obtained by artesian wells or any other process.

I have, &c.,
(Signed) GIFFORD,
Chairman.

To Sir Robert Herbert, K. C. B.,
Permanent Under Secretary of State for the Colonies,
Downing Street, S. W. /

The Colonial Office to Lord Gifford.

Copy.

Downing Street,
30th June, 1888.

My LORD, – I am directed by Lord Knutsford to acquaint you that he has given his careful consideration to the proposals relative to the construction of a Railway in British Bechuanaland brought before him in your letters of the dates
noted in the margin, and at the interview which took place between you and
other gentlemen and his Lordship on the 26th instant.

Lord Knutsford understood from the Deputation that they have received a
communication from the Cape Government in reply to a proposal which they
had made to construct the northward extension of the Kimberley Railway, to
the effect that the Cape Government has decided to carry that line to within a
few miles of the Cape frontier, and is favourable to its further extension by your
company into British Bechuanaland, and that your Company consider that, if
sufficient assistance can be given them, they may be able at present to construct
some 60 or 70 miles along the Transvaal frontier to some point near Vryburg.

Lord Knutsford cannot doubt that the construction of such a line would
be of great advantage to British Bechuanaland, and, subject to the opinion of
the Governor, who must of course be consulted before any definite undertaking
can be given, his Lordship thinks that it may be possible to entertain some at all
events of the suggestions which have been made for assisting the Company to
construct and work a Railway.

Lord Knutsford is not unfavourable to the principle of imposing a light grad-
uated tax on land directly benefitted and increased in value by the passage of the
Railway through or near it, and will desire Sir H. Robinson to consider what
amount of tax could be so laid upon land, and up to what distance from the line
the lower rate of land tax could properly be charged.

The request to be allowed to lay out and sell town sites along the line of
railway may also be entertained. The places selected would, of course, have to
be approved by the Government, and, if not on Crown lands or Crown Reserves,
would have to be acquired in the lawful manner for the purpose, and arrange-
ments could be made for deferring the sale of such portions as might be reserved
to the Government. Lord Knutsford does not feel able to give any assurance as
to the proportion, if any, of the money received for mining licences which might
be allotted to the Company in assistance of the railway construction, but he will
consult the Governor on the point.

As to fuel, Lord Knutsford is very doubtful whether the little timber which
exists on the line of railway to Vryburg would be of any value to the Company.

The country has, in fact, been denuded of fuel for some years, in consequence
of the demand for it at the Diamond Fields.

The Governor will have to consider whether in any districts where timber is
abundant a concession to cut it might be granted to the Company under proper
control.

The proposal to be allowed to raise a revenue from water raised by the Com-
pany from artesian wells or otherwise may be admitted for consideration.

The same remark applies to the request to be protected, for a term of years,
from the competition of any line through British Bechuanaland within a dis-
tance to be defined, and to have the sole right to construct branch lines within the Province in connection with the main line. Such a monopoly would be subject to the maintenance or an efficient service on the protected lines, according to conditions to be laid down in the definite concession, and should the Company fail within a reasonable time to construct / any branch which, in the opinion of the Government, is required and would carry a remunerative traffic, a concession may be given to other parties for such branch.

At the recent interview the Company finally asked that no offer from any other party for a Railway concession in British Bechuanaland should be entertained during the period that may be required for making a survey of the line of route and for the consideration of their proposals as above stated.

This appears reasonable to Lord Knutsford, and Sir H. Robinson will be desired by telegraph not to entertain for the present any other proposals, as the Company’s application is about to be referred to him at once for his consideration.

I am, &c.,
(Signed) J. BRAMSTON.

The Lord Gifford, V. C.

COLONIAL OFFICE TO GOVERNOR.

Copy.

No. 89.

Downing Street,
16th July, 1888.

STR. – I am directed by the Secretary of State to transmit to you for your information, with reference to Lord Knutsford’s despatch No. 77 of the 2nd instant, the documents specified in the annexed schedule.

I have, &c.,
(Signed) ROBERT G. W. HERBERT.

The Officer Administering the Government of South Africa.

Date. Description of Document.
5th July, 1888. Lord Gifford to the Colonial Office, relative to the construction of a railway to the Zambesi.
14th July, 1888. Colonial Office to Lord Gifford in reply to above. (Copies).
Construction of Railways in Territory of Bechuanaland

Lord Gifford to Colonial Office.

Copy.

14, George Street, Mansion House, E. C.,

Sir, – I have the honour to acknowledge the receipt of your letter dated Downing Street, 30th June, 1888, informing me that Lord Knutsford has given his careful consideration to the proposals relative to the construction of a Railway in British Bechuanaland brought before him by myself and other gentlemen. At the present time it appears that no further steps can be taken without reference to the authorities in Cape Town, consequently it is proposed to request Mr. Murray, a gentleman well acquainted with South African affairs, and who, it is believed, will be acceptable to the Secretary of State, to proceed to the Cape Colony, in order that the High Commissioner may be able to state to our representative his views, time and correspondence being saved by this arrangement.

It is, I venture to hope, understood that should my Company carry out the Railway to Vryburg to the satisfaction of the Government, and should my Company be desirous of extending the line in the direction of the Zambesi, the right to do so by them will be upheld by the British Government, Native Reserves being respected in every instance. / 

I desire to point out that it is trusted that from this date, and whilst the survey is being made, Government lands along the probable route of the Railway will not be disposed of.

My Company, in conclusion, desire to express to Lord Knutsford their thanks for the instructions conveyed by telegrams to Sir Hercules Robinson.

I have, &c.,

(Signed) GIFFORD,
Chairman.

John Bramston, Esq., C. B.,
Assistant Under Secretary of State for the Colonies,
Downing Street, S. W.

Colonial Office to Lord Gifford, V. C.

Copy.

Downing Street,
14th July, 1888.

My Lord, – I am directed by Lord Knutsford to acknowledge the receipt of your letter of the 5th instant on the subject of the construction of a Railway in British Bechuanaland.
With reference to the subject of the extension of the line from Vryburg to the Northern Border of British Bechuanaland and thence through the Bechuanaland Protectorate, I am to acquaint you that the grant of the right to carry the Railway through the territories of protected native chiefs will be a matter for negotiation between your Company and those chiefs whose territory would be traversed by the proposed Railway; but I am to add that Her Majesty’s Government would always be willing to induce the chiefs, as far as it should be able to do so by the fair exercise of its influence, to agree to reasonable arrangements in the matter.

I am, &c.,

(Initd.) J. B.

Sir H. Robinson to Lord Knutsford.

Government House, Cape Town, 26th September, 1888.

My Lord, – With reference to your Lordship’s dispatch No. 77, of the 2nd July last, I have the honour to enclose for your information a copy of a despatch which I have received from the Acting Administrator of British Bechuanaland covering memoranda on the proposal to grant a concession of the right to construct a Railway in British Bechuanaland.

When I receive Sir Sidney Shippard’s Report I will forward it, with my own observations on the subject.

I have, &c.,

(Signed) HERCULES ROBINSON,
Governor and High Commissioner.

The Right Honourable Lord Knutsford, G. C. M. G.,
&c., &c., &c.,
Colonial Office.

Sir S. Shippard to Sir H. Robinson.

Administrator’s Office, British Bechuanaland,
Vryburg, 5th September, 1888.

No. 205G.

Sir, – I have the honour to inform your Excellency that I transmitted your despatch No. 157b, of the 3rd instant, covering the correspondence respecting the
Construction of Railways in Territory of Bechuanaland

49

proposed Railway concession in this Colony, to the Surveyor-General, for an expression of his views on the proposals contained in Lord Gifford's letter of the 18th June last. I enclose for your Excellency's information a copy of Mr. Duncan's memorandum on the subject. In accordance, however, with your Excellency's instructions the papers will be held over until the return of the Administrator enables him to report on the matter, as desired by the Secretary of State.

I have also the honour to enclose, for your Excellency's information, copy of a memorandum, written by myself, on the correspondence forwarded in the dispatch from the Secretary of State.

I have, &c.,
(Signed) F. J. NEWTON, Acting Administrator.
His Excellency the Governor,
Cape Town.

Remarks on proposed Railway Concession by the Surveyor-General.

Copy.

Light Graduated Tax on Land.

The land which could be made subject to this tax – at least for the present – lies wholly within British Bechuanaland, and the sphere of attraction of the Railway would probably be all that portion of British Bechuanaland which lies to the eastward of a line drawn from the south-western extremity of the Taung Native Reserve towards Honing Vlei. This would embrace an area of, roughly, 15,000 square miles. Of this about 2,200 square miles is held by tribal tenure by a native population of approximately 45,000 souls, or, say, 12,000 adult males. (Blue Book, C. 4889.)

Of the remainder, viz., 12,800 square miles, about 4,900 square miles is held in severalty of 490 persons, and the balance (7,900 square miles) is available for sale. As a general rule, each farm held in severalty has an approximate area of 10 square miles.

The tax, therefore, levied upon present and prospective holders in severalty within the sphere of attraction would be borne by approximately 1,280 persons.

Of the 4,900 square miles held in severalty, about one-third is in actual occupation (vide Blue-book, C. 5363, p. 21, treating of a portion which may be fairly assumed to govern the whole).

Each farm at present unoccupied and available for sale (that is \(2/3 \times 4,900 + 7,900\) square miles, or, roughly, 1,100 farms) would require an expenditure of
about £300 before the proprietor could live upon it, and a profitable return is not looked for in this territory for two or three years.

In endeavouring to estimate the amount to be levied I assume that the Company would not be content with less than eight or ten thousand pounds per annum, or say one per cent. on the cost of construction to Mafeking, a distance of 160 miles.

Thus to levy £8,000 on 12,800 square miles would represent a tax whose average would be £6 5s. per farm, the distribution of which would vary probably from £9 on farms near the railway to £3 on farms in the outlying districts.

There can be little doubt that farms through or near which the Railway runs would derive substantial benefit and be increased in value, and £9 per annum non commutable tax on adjacent farms might be found not to be an exorbitant impost, other things being equal. But in this instance the Railway will run along the Transvaal border. The Transvaal farmers, therefore, would derive an advantage from the proximity of the Railway equal to that enjoyed by the majority* of the Bechuanaland farmers, with the additional advantage of being untaxed by the railway which serves them.

This would tend to throw Bechuanaland farms out of cultivation, with the result of diminishing traffic returns, unless a differential rate were imposed upon Transvaal produce.

But a differential rate could not be imposed, even were it practicable, unless the cost of administration were increased by the establishment of the necessary Custom-houses on the frontier.

If, then, a tax of appreciable value to the Company were imposed it is possible that the Government would require an increase of the grant-in-aid, for it is to be apprehended that the result of establishing Custom-houses on the border would result in a diversion of the Western Transvaal trade to Natal.

On the other hand, if a light railway tax were imposed, say £1 10s. per farm, as in the Transvaal, the Company would receive upon 12,800 square miles of land only £1,920 per annum.

If the estimated returns are such that a subvention of such an amount be considered of some moment to a Company contemplating the expenditure of three-quarters of a million of money, it would then devolve upon the Government to consider whether an increase of a couple of thousand pounds in the subsidy for carrying the mails would not be preferable to levying by proclamation a direct tax upon an unrepresented community.

It is not stated in the correspondence whether the tax will be levied upon Native Reserves.

* There will be left a majority when the area between the Railway and the Border and the corresponding area on the western side of the Railway are deducted.
2. The Crown land through and near which the Railway will pass is now reserved until the negotiations have been completed. Without special legislation the Government has not the power to expropriate any portion of a farm held in quitrent tenure for the purpose of laying out a township, with or without compensation. The Company will no doubt be able to purchase from owners such farms as may be required, but the owners cannot be compelled to sell. If the company acquires any such farm it can lay out a township without reference to the Government.

3. There is little if any Crown land on the probable line of rail. A tract of land to the westward, upon which there is timber, might be leased to the Company, who could appoint their own Conservator of Forests.

(Signed) A. H. F. DUNCAN,
Surveyor-General.

Vryburg,
16th August, 1888.

Administrator’s Office,
Vryburg, British Bechuanaland.

Memo. On proposed Railway Concession.

Adverse criticism of these proposals on any broader grounds than the facts and figures set forth by Mr. Duncan appears to be a task requiring some delicacy of treatment, and I trust I may be forgiven for presenting the following considerations to your Excellency’s notice:

In Lord Gifford’s letter of the 30th May it is stated, in the first paragraph, that ‘it is considered desirable to develop the resources of South Africa in the direction of Shoshong as rapidly as possible,’ and ‘with that object in view’ a proposal is submitted for extending the railway system from the frontier of Bechuanaland to Vryburg.

In the following letter of the 12th June Lord Gifford announces the intention of the ‘financial group’ which he represents to make application for grants of land; and in his next letter of the 18th June he gives a sketch of the ‘basis upon which arrangements for the construction of the railway in Bechuanaland can be matured.’ From these quotations, taken in connection with the basis of arrangement sketched out by him, it would appear that, while it is the object of the ‘financial group’ to ‘develop the resources of South Africa in the direction of Shoshong as rapidly as possible,’ yet that ‘the basis upon which the arrangements can be matured’ is that British Bechuanaland should be the chief if not the sole initial contributor to the construction of a comprehensive railway scheme.

Bechuanaland is certainly no ‘arid desert,’ as it was hastily described by a well known Cape politician a short time ago. At the same time it is a country with
no immediate resources of its own, and one in which capitalists do not appear eager to invest. How far they will be attracted by the prospect of a railway may be left for the decision of any one who will examine the figures and facts in Mr. Duncan’s memorandum.

While it is evident that a large proportion of the expenses is sought to be charged upon the land and the inhabitants of the Colony, it would be idle to contend that the chief advantages of the scheme will be correspondingly secured. The object of that scheme, as stated in Lord Gifford’s letter, is the development of South Africa as far as Shoshong, and, according to a later letter, up to the Zambesi; from which, no doubt some advantages would be gained by landowners and residents in this Colony – nothing, however, so substantial as to compensate for the severe taxation and loss which are suggested in the ‘basis for arrangements’ already alluded to.

The towns in Bechuanaland, viz., Taungs, Vryburg and Mafeking, are but places by the wayside, and are in no way either great depots for agricultural produce requiring means of transport or important centres of industry calling for expansion. No doubt the farmers in the neighbourhoods of those towns would gladly avail themselves of the advantages a railway would afford; but at the same time neither they nor the other residents in the Colony nor the Colony itself can afford to pay the price asked for them. To expect them to do so would, to compare great things with small, nearly resemble a proposal that the inhabitants of Port Said, Ismailia, and Suez should materially contribute to the construction and maintenance of the Suez Canal. British Bechuanaland is at present but a very little more than the highway between the Cape Colony and Kimberley in the south and the Gold Fields and unknown Interior in the north. The lapse of time and the investment of capital will no doubt effect much for its development, but at present it is unable to bear the burden that is sought to be put upon it. From the foregoing I do not wish it to be understood for a moment that British Bechuanaland would not in any way be benefitted by a Railway, but that it is neither reasonable nor just to expect that Colony to contribute to the extent asked for by the promoters of this scheme.

The Surveyor-General in his memorandum has only dealt with those proposed sources of revenue which are mentioned in the letter to the Colonial Office of the 18th June as possible methods of supplementing the revenue from land. Lord Gifford and those associated with him evidently rely on securing to their Company so substantial a grant of land as to render entirely subsidiary those five sources of revenue, to the granting of which the Secretary of the State is apparently not prepared to offer any serious objection. Owing to the difficulties, however, in the way of imposing a ‘light railway tax,’ as set forth by Mr. Duncan, the questionable advantages to be gained from the privilege of laying out townships in Bechuanaland, and the entire absence of timber for fuel on
Crown lands through which the railway would be likely to pass, Lord Gifford and his undisclosed principals are not likely to ask for any grant of less extent than what they had originally hoped to obtain from Lord Knutsford.

By a reference to Mr. Duncan’s memorandum it will be seen that there are only 7,900 squares miles in what he describes as the ‘sphere of attraction’ available for disposal, that is, sufficient land to let out to some 790 persons in farms.

The object of obtaining a substantial grant of land is, it may be presumed, the development of such land by means of immigration, so as to procure increased material for traffic on the railway. Any immigration scheme having so considerable an object in view must, to be successful, be conducted on a large scale, so that of these remaining 790 farms there would probably be very few left in the possession of the Government. Without wishing it to be inferred that this would be matter for regret, it may well be asked, ‘If all the available Crown lands, sources of revenue, and powers of taxation are to be absorbed in promoting this undertaking, why continue the present heavy expenditure over the internal government of the Colony merely for the benefit of this Company?’

The road to the north has been secured to the empire; the private rights of individuals are in no danger; freebooters have gone elsewhere, and law and order prevail. Why, then, should her Majesty’s Government continue at great expense to carry on the civil administration of what is never likely to be to it a remunerative Colony? It would be more reasonable to cede at once by charter to such a Company the entire management of the territory, than to continue to administer it while disposing of its most valuable assets on the lines proposed by Lord Gifford.

Other reasons, however, would interfere with the possibility even of such a cession, into which it is not necessary here to go. But it is at this point that a new factor, viz., the Cape Colony, appears. How would such a concession of land, rights, and privileges as that proposed affect the ultimate destination of the Colony of British Bechuanaland?

Were the undertakings of this association purely limited to a railway enterprise, there are, I believe, generally accepted forms of agreement, by which, when the time comes, the transfer of the Railway could be easily accomplished, and the system incorporated with that of the Government Railways of the Cape Colony. But when so large a territorial scheme is introduced as an indispensable adjunct to the Railway, it is only natural to expect that, on the one hand, in the event of its turning out a success the Company will be indisposed to sell, and, on the other hand, in the events of its failure, the Cape Colony may not care to buy.

Is it advisable, therefore, to place what may turn out to be widely extended powers over public interests in this portion of South Africa in the hands of a private association, and would it not be wiser to allow the advance of the Railway to proceed in its ordinary course and in a natural manner under the auspices of
a Government which is already responsible for the working of so much of the South African Trunk Railway as is at present in existence?

(Signed) F. J. NEWTON. /

SIR H. ROBINSON, G. C. M. G., TO LORD KNUTSFORD, G. C. M. G.

Copy.

Government House,
Cape Town, 31st October, 1888.

South Africa,
No. 503.

My LORD, – I have the honour to forward, for your Lordship’s consideration, a copy of a despatch which I have received from the Acting Administrator of British Bechuanaland, covering communications from Mr. R. W. Murray, setting forth the conditions on which the Bechuanaland Exploration Company are prepared to carry out the construction of a railway through Bechuanaland, together with the Surveyor-General’s report on the proposals.

2. It appears to me that there is little use in considering the question of a Railway through Bechuanaland until it has first been ascertained whether the Cape Colony will either itself extend its railway system to the Bechuanaland border or else allow a company to do so. The question of northern extension from Kimberley involves political considerations, in which the Orange Free State and the South African Republic are interested. The subject is now engaging the attention of the Cape constituencies, and a decision cannot be come to upon it until the new Parliament shall have assembled in May next. If that decision should be adverse to extension northwards, the idea of a Railway through Bechuanaland may be dismissed from immediate consideration.

3. If, on the other hand, the decision should be favourable, it appears to me the first step should be to frame an approximate estimate as to the length and probable cost of a Railway through British Bechuanaland, as to the cost of maintenance and working expenses, and as to the probable receipts of the line under a reasonable tariff. Without some general idea on these points it is difficult to form any opinion as to whether the concessions now asked for in aid of the undertaking are reasonable or the reverse.

4. The present proposals ask for the following concessions in the Crown Colony of British Bechuanaland:–

   (1) 860,000 acres of land,
   (2) Mineral rights,
   (3) Irrigation monopoly and water rates,
   (4) A property tax, and
   (5) The laying out of townships.
Also the following concessions in the British Protectorate upon annexation:—

1. Alternate blocks of 10 square miles along the line,
2. A property tax,
3. Forest rights,
4. Mineral rights, and
5. A monopoly of irrigation, with water rates, extending to the Zambesi.

5. I think the whole of the proposals as regards the Protectorate, as also the proposal for the laying out of European townships in the Native Reserves in British Bechuanaland, are inadmissible. If the Protectorate and the ‘sphere of influence’ should ever be annexed, it is desirable that Her Majesty’s Government should retain a free hand to deal as may then seem proper with the rights and interests of the Natives, and with the claims of any Europeans who may have obtained land grants and mineral concessions from the Chiefs and their Councillors; whilst, as regards the establishment of European townships in the Native Reserves within British Bechuanaland, such a step would not only be prejudicial to the rights and interests of the Natives, but would involve also a distinct breach of faith.

6. As regards the other concessions asked for in British Bechuanaland, I can only observe that, in the absence of any estimate as to their value and of any information such as that to which I have referred, as to the probable annual deficiency on Railway working expenses and interest, it is impossible to form any decided opinion as to their fairness. My present impression, however, is that No. 4 (the property tax) is fair, that No. 3 (the irrigation scheme) is unpracticable, and that Nos. 1 and 2 (the land grants and mineral rights) would, in the event of the country proving auriferous, be altogether excessive. The proposals, too, appear to me so crude and ill-defined that, if assented to in their present shape, they might possibly involve Her Majesty’s Government in much future trouble and perhaps in costly litigation. The embarrassments entailed on the Government of the South African Republic by the concession which it granted to the Netherlands Railway Company before the gold discoveries had changed the whole condition of the country constitute a warning against the adoption by Her Majesty’s Government of a similar course.

7. It seems to me that if rich gold-fields should be discovered in British Bechuanaland, such as those which have been found in the adjoining Transvaal territory, the concessions asked for would pay for the Railway over and over again, and a large portion of the legitimate resources of the Colony, instead of being available for the advancement of its inhabitants, would be transferred in perpetuity to the shareholders of a London Joint Stock Company. If, on the other hand, gold-fields should not be found, the concessions asked for would practically have to be paid by the British taxpayers.

8. In explanation of this last point I may observe that, as far as can be foreseen at present, the Colony cannot in the absence of gold discoveries be self-supporting for many years to come. It will with the most rigid economy
be dependent on Imperial grants-in-aid. In these circumstances any sources of revenue paid to the Company which would otherwise go in reduction of the grant-in-aid will practically be a payment to the Company by British taxpayers. In such case it seems deserving of consideration whether, if Her Majesty’s Government desire to force on the immediate construction of a railway, a direct grant-in-aid from Imperial funds or an Imperial guarantee for a minimum rate of interest, would not be a more straight-forward and economical arrangement as regards the present than the complicated concessions asked for, whilst such a course would guard against a wasteful hypothecation of the proceeds of possible future prosperity.

But my advice to Her Majesty’s Government is to allow the question of a Railway through British Bechuanaland to remain in abeyance until at all events after the meeting here of the new Parliament. The present moment is not a favourable one for pressing on construction in the lasting interests of the Colony. The history of the Graham’s Town and Port Alfred Railway Company, in which both the shareholders’ capital and the Government contribution have been lost, furnishes a lesson on this subject which it will be well for all connected in any way with the talked of British Bechuanaland Railway to take to heart. Assuredly there is nothing now to enable such a Railway to pay even working expenses, to say nothing of interest on capital. If it were made by a private company it could, under existing conditions, only be kept open by a direct or indirect subsidy from Her Majesty’s Government. If, on the other hand, gold discoveries in British Bechuanaland should once become an established fact, the Railway would soon be made either by the British Bechuanaland Government on borrowed capital, or by a private company without any concession except the land.

I have, &c.,
(Signed) HERCULES ROBINSON,
Governor and High Commissioner

The Right Honourable
Lord Knutsford; G. C. M. G., &c., &c., &c.,
Colonial Office.

SIR S. SHIPPARD TO SIR H. ROBINSON.

Copy.

No. 248G.

Administrator’s Office,
British Bechuanaland,
Vryburg, 19th October, 1888.

Sir, – I have the honour to enclose for your Excellency’s information copies of two letters which I have received from Mr. R. W. Murray, one of which contains
a proposal setting forth the conditions under which the Company he represents will carry out the construction of the Bechuanaland Railway.

I have transmitted these letters for the consideration of the Surveyor-General, and beg to enclose copy of a Report which that officer has furnished on Mr. Myrray’s proposal.

I do not propose to offer any remarks on those conditions relating to land grants, mineral rights, or irrigation, which are matters exclusively within the province of those technically qualified to advise upon them.

The conditions under those heads are stated by Mr. Murray and generally approved by Mr. Duncan, and those gentlemen are better qualified to judge of them than myself.

Nor do I think it necessary to say anything on the subject of the proposed advantages to be given to the Company in the Protectorate. Besides the fact that those advantages consist also of land grants, rights to minerals, and powers for irrigation purposes, and are therefore also matters for professional opinion, the question is so entirely dependent on the course of events leading at some uncertain date to annexation, and on the conditions subject to which annexation may be effected, that no reliable estimate of their probable value could be arrived at even by conjecture.

I propose, therefore, only to deal with the questions under paragraphs 4 and 5 of Mr. Murray’s letter relating respectively to properties taxed (1) and townships (2).

(1) It will be seen that Mr. Murray has proposed that the property tax shall be instituted in lieu of ‘the light graduated railway tax,’ which formed the chief feature of the first set of proposals laid before the Secretary of State. It has been represented to Mr. Murray, and conclusively proved by Mr. Duncan, that such a Railway tax would be undesirable and at the same time of little pecuniary value to the Company, and Mr. Murray has readily withdrawn the idea, and substituted in its place a tax on the value of property, to be periodically assessed.

The proposal seems to commend itself on the broad ground that if it is a good bargain for the Company the Government will get an equally good bargain; and that the value of the tax will be enhanced by the development of the resources of the country; moreover, the rate suggested appears to be reasonably low. A farmer holding a farm in this district, for instance, where the average value of a farm is about £400, would have to pay a tax of £5. This he should be able to afford, but I am not prepared to endorse Mr. Duncan’s apprehension that there will be no serious opposition to it.

There appears to me to be no genuine distinction between the original light graduated railway tax proposed and favoured by Lord Knutsford, and the property tax now proposed; the idea has merely been altered by allowing the Government a share of the tax, and abolishing the principle of graduation of
the rate according to distance from the railway, that principle being merely preserved to determine the destination of the contribution.

It is worth considering whether, as a distinction is made between farms lying within 15 miles of either side of the proposed railway and farms lying without that distance, it would not be desirable to make some corresponding distinction in the rate of the taxation. / 

For instance, farms or portions of farms within that distance might fairly be called on to pay a tax at the rate of 1½, and farms without it at the rate only of 1 per cent.

The greatest considerations will in any case have to be given before such a tax is definitely decided on. The whole population of South Africa, and especially the farming population, is exceedingly sensitive to direct taxation of any kind. It was quite recently pointed out with some force, by one who is well acquainted with the country, that a man who thinks nothing of paying five and twenty pounds a year in indirect taxation makes a great grievance of having to pay a sovereign, perhaps, for house duty.

If, however, the retention of this item in the list of conditions is considered desirable, there is no doubt that the population of British Bechuanaland would consent to the burden rather than lose any chance of securing Bechuanaland, the more especially as there is comparatively little or no indirect taxation in British Bechuanaland.

The payment of such a tax on Native Reserves from a Native Reserve Fund would depend, I imagine, on the successful institution of another scheme of which such a fund forms a part, but I do not think there would ever be any disposition to question the liability of Native Reserves in this respect.

(2). As regards townships, Mr. Duncan very clearly points out that where there is a demand for a town there will a town naturally arise, and that there can be no objection to the Company endeavouring to promote the growth of townships on land acquired by them along the line of railway, but he has very properly taken exception to the institution of townships on Native Reserves.

It would, I imagine, be difficult for the Company to acquire sites for townships in Native Reserves, in view of the broad rules laid down that such reserves are inalienable. Indeed it would seem impossible to confer on the Company the power of securing such sites without receding from the obligations which we have incurred towards the Bechuanas, to the protection of whose rights and interests we are so strongly committed.

I have, &c.,

(Signed) F. J. NEWTON,
Acting Administrator.

His Excellency the Governor,
Cape Town.
Enclosure 1 in Despatch No. 248g, 19/10/88.

Mr. Murray to Mr. Newton.

Copy.

Vryburg, October 16th, 1888.

Sir, – I should esteem it as a great favor if the accompanying letter, containing the proposals for the construction of the Bechuanaland Railway, could be laid before His Excellency the High Commissioner with as little delay as possible.

The survey of the first section of the Railway will be completed by about this day week, and I am desirous of seeing the surveyors proceeding at once with the survey towards Mafeking.

I have, &c.,

(Signed) R. W. MURRAY.

His Honor F. J. Newton, Esq.,
Acting Administrator,
British Bechuanaland.

Enclosure 2 in Despatch No. 248g, 19/10/88.

Mr. Murray to Mr. Newton.

Copy.

Vryburg, October 16th, 1888.

Sir, – In continuation of my letter dated the 22nd August last to His Excellency the High Commissioner, I have now the honor to propose, on behalf of the Company which I represent, that the construction of the Bechuanaland Railway shall be carried out under the following conditions:–

1. Land Grants.

(a) That for the purpose of raising revenue the available Crown lands in British Bechuanaland which, I understand, are about 150,000 acres surveyed and 70,000 acres unsurveyed in the Maritsani district, shall be placed at the disposal of the Railway Company.

(b) Also a tract of country, say 1,000 square miles in extent, in the neighbourhood of Genesa. As it will be hereafter seen that I propose that the Company shall cause the payment of a property tax which will bring revenue to the Government, I anticipate that the Government will not be disinclined to increase the area if it is considered desirable in the interests
of the Company. The land grants shall be in the form of the present quit-rent tenure of British Bechuanaland, excluding the fiscal provisions.

2. **Mineral Rights.**

That the Company shall share with the Government half the revenue derived from the discovery of precious minerals and precious stones, after deducting the costs of local administrations.

3. **Irrigation.**

That the Company shall be empowered to promote the irrigation of all lands in British Bechuanaland by the preservation and improvement by artificial and other means of the supply and storage of water. The Company shall have the right to levy rates, to be called irrigation rates, upon all property irrigated and capable of being irrigated, regard being had to the value to be derived by the owners of property from irrigation works. The assessment of rates to be regulated by a Board consisting of a nominee of the Government, a nominee of the Company, and a local representative. Such rates shall not be levied until the Company is prepared to place the water upon the land. The Government to receive one per cent. of the irrigation revenue after deducting expenditure.

4. **Property Tax.**

This tax, which will be 1 ¼ per cent. of the value of the property periodically assessed, shall be divided between the Government and the Company upon the following basis:—

(a) The tax derived from all lands lying within 15 miles on either side of such lines of railway as shall be actually working shall be paid by the Government to the Company.

(b) The tax derived from all lands situated at a distance greater than fifteen miles from existent railways shall be retained by the Government.

(c) In reference to native reserves the tax shall be levied in the form of a contribution from the income of a Native Reserve Fund brought into existence by revenue raised from mineral discoveries, the dealing with land, and other sources. /

It will be seen that the Secretary of State in his despatch to the Company which I represent is not adverse to a railway tax, but I am led to believe that the Government of Bechuanaland apprehend some difficulty in levying such a tax. I therefore take the liberty of proposing this tax as an alternative.
5. **The laying out of Townships.**

In Lord Knutsford’s despatch of the 30th of June, 1888, the fifth paragraph reads as follows:— ‘The request to be allowed to lay out and sell town sites along the line of railway may also be entertained. The places selected would, of course, have to be approved by the Government, and if not on Crown lands or Crown reserves would have to be acquired in the lawful manner for the purpose, and arrangements could be made for deferring the sale of such portion as might be reserved to the Government.’

The term Crown Reserves I interpret as Native Reserves, and it will be, of course, to the advantage to those reserves to have townships in localities which will be selected by the Government. For instance, a township somewhere in the neighbourhood of Taungs, but at a sufficient distance so as not to affect the existing native settlement, will be a necessity.

6. **Land Grants in British Protectorate upon Annexation.**

\(a\) In case of annexation of the British Protectorate to the Crown, alternative blocks of land 10 square miles in extent along the line shall be granted to the Company.

\(b\) The grants to be made and the revenue to be derived in a similar manner to that proposed in (the preceding) clause 4.

\(c\) That the Government shall either make a grant of forest land adequate to the requirements of this Company, if such land is available; or, in the event of the creation of a Forest Department, the Government shall supply to the Company assorted wood to the value of 25 per cent. of the annual revenue derived from the sale of wood.

7. **Mineral Rights in the Protectorate.**

Mineral rights in the Protectorate upon annexation shall be conferred on the Company, similar to those granted as proposed in British Bechuanaland.

8. **Irrigation Works in the Protectorate.**

That the powers vested in the Company in respect of irrigation in British Bechuanaland shall be extended to the Company in case of the annexation of the Protectorate and the region within the sphere of British Influence beyond the Protectorate to the Crown.

I have, &c.,

(Signed) R. W. MURRAY.

His Honour F.J. Newton, Esq.,
Acting Administrator, British Bechuanaland.
Enclosure 3 in Despatch No. 248g, 19/10/88.

Remarks on Railway Proposals.

Copy.

1. Land Grants.

The area applied for embraces all the Crown land in the Maritsani District, confiscated police farms, and Rooi-grond commonage and erven not granted. Mr. Murray proposes to obtain powers from Government to resume possession of the nine erven already granted, by compensating the proprietors under the clause in the Title Deed permitting such resumption. The large block of 1,000 square miles lies between Genesa and Morokwen.

All land must be at least roughly surveyed before title can be issued.

I understand that this agreement has been already made, i.e., that half the net profits accruing to Government on discovery of the precious minerals or precious stones in payable quantities shall be paid to the Company.

It would be desirable to clearly lay down that, if for any sufficient reason the Government determines upon reducing the mining licence fees, &c., no hindrance shall be offered by the Company, and that the Company shall thereupon receive the reduced amount of its half share without other compensation.

3. Irrigation.

This scheme, it is believed, will be practicable and profitable to the Company.

Upon the lands acquired by the Company agricultural families may be placed upon conditions involving payment in the form of irrigation rates, and (which, by the way, Mr. Murray has inadvertently omitted) for water supplied.

Lands now held in severalty can be brought under the operation of the necessary proclamation on petition of a proportion of resident owners of a district. A clause must be inserted in the Proclamation compelling the Company to irrigate any district on petition or to waive their rights to irrigate such district.

The one per cent. net profit is to cover what little expenditure may be entailed upon the Government.

The detail as to the composition of the Board can be safely left until the draft proclamation is under consideration.
4. Property Tax.

I recommend the Government to agree to the tax. It has the advantage that the contribution to the revenue will increase with the value of the land; it will to a certain extent indirectly control unlimited land speculation, and will not interfere with the existing form of land tenure.

I do not apprehend that any serious opposition will be made to it, as persons who have spoken to me on the subject expect that a tax of some such nature will be shortly imposed. Should any difficulty arise the concession of a Legislative Council, composed of a President and four nominees of the Crown, with four unpaid elective members, might be made, while the portion of the cost of the Bechuanaland Border Police now really devoted to patrolling and implying a defence of the Protectorate, the Assistant Commissioner’s expenses, &c., might be placed to a separate account, thus tending towards an equalization of revenue and expenditure. The amount, 1 ¼ per cent., is I think reasonable.

5. The laying out of Townships.

If the Company wish to lay out townships along the line of Railway upon such land as may be lawfully acquired, that is, by purchase from individual proprietors, the Government can offer no objection; ground, however, for Government offices, &c., should be set apart for the Government.

Native Reserves are not Crown Reserves, and I think that there would be some difficulty in acceding to Mr. Murray’s request that townships may be laid out within them. Moreover, in the instance given, namely, within the Taungs Reserve, the proposed township would be at the wrong end of the Company’s line. There would be no export northward, and all produce carried southward would immediately cross over the Border on to the Colonial lines of railway. Where local industries are developed – such, for instance, as gold mining – townships will grow up naturally, and the Company can always run branch lines, if necessary. /

(a) These land grants could be made after the native territorial boundaries and necessary reserves have been defined.

(b) The property tax appears to me a good one, and I would recommend its extension to the Protectorate.

(c) A Forest Department will, I should think, be certainly organized, and 25 per cent. in value of the wood annually prepared for sale would be a fair proportion.

I would suggest that this clause be agreed to, on the understanding that a reasonable share be paid to the Government by the Company in the event of the latter obtaining a mining concession from native chiefs or from former concessionaries.

8. Irrigation in the Protectorate.

I should recommend the Government to agree to this condition also, reserving, however, the right to allow other persons to irrigate a district, should the Company not do so when called upon, and to use all natural reservoirs, &c., for such purpose.

In the main and subject to the above remarks, I should agree with the proposals made by Mr. Murray.

(Signed) A. H. F. DUNCAN,
Surveyor-General.

Vryburg,
October 17th, 1888.

Sir H. Robinson to Lord Knutsford.

Copy.

Government House,

South Africa,
No. 34.

My Lord, – I have the honour to forward for your consideration a copy of a correspondence which I have had with Mr. R. W. Murray, representing the Bechuanaland Exploring Company, with reference to the construction of a Railway through that territory.

2. Mr. Murray’s letter of the 12th instant submits amended proposals, copies of which I have transmitted to the Administrator for his report, and to Ministers for their information.

3. As soon as I hear from Sir Sidney Shippard on the subject I will communicate to your Lordship my opinion upon the proposals as they now stand.

I have &c.,

(Signed) HERCULES ROBINSON,
Governor and High Commissioner.

The Right Honourable Lord Knutsford, G. C. M. G.,
&c., &c., &c., Colonial Office.
Mr. Murray to Captain Bower.  

Copy.  

Cape Town,  
4th January, 1889.  

Sir, – I have the honour to forward to you, in accord with our conversation, the following draft of proposals, with space left for marginal notes, so that, in case His Excellency wishes to vary them, they may be so varied as to enable me to send in a proposal in a form in harmony therewith.  

I have, &c.,  
(Signed) R. W. MURRAY.  

Capt. Graham Bower, R. N., C. M. G.,  
Imperial Secretary,  
Cape Town.

Mr. Murray to Sir H. Robinson.  

Cape Town,  
4th January, 1889.  

Sir, – In accordance with interview which Sir Charles Metcalfe and myself have lately had with your Excellency and Sir S. G. A. Shippard, I have now the honour to submit the following amendment of the preliminary proposals lodged with the Acting Administrator of British Bechuanaland at Vryburg on the 16th October last, for the creation of revenue towards the construction and maintenance of a Railway from the borders of the Cape Colony through British Bechuanaland.  

Your Excellency will remember that, while appreciating the great advantages which this Railway would confer on the Cape Colony and the localities to the north, you were doubtful whether there were Crown lands sufficient or any other inducement in Bechuanaland itself to cause English financiers to undertake so costly a work as the construction of this Railway.  

The preliminary proposals of the 16th October were framed by me after obtaining all information courteously placed under instructions at my disposal by the officials of Bechuanaland.  

They were intended merely as a basis of negotiations and were necessarily crude. They have now had the advantage of criticism by your Excellency, and I have the honour to make the following proposals:–

1. Land Grants.  

(a) That for the purpose of raising revenue the available Crown lands in British Bechuanaland, which I understand are about 150,000 acres surveyed and 70,000 acres unsurveyed in the Maritsani District, shall be placed at the disposal of the Railway Company.
(b) Also a tract of country (say 1,000 square miles in extent) in the neighbourhood of Genesa.

As it will be hereafter seen that I propose the Company shall originate a property tax which will bring revenue to the Government, I anticipate that the Government will not be disinclined to increase the area if it is at all desirable in the interests of the Company.

The land grants shall be in the form of the present quitrent tenure of British Bechuanaland, excluding the fiscal provisions.

That the Company shall share with the Government half the revenue derived from the discovery of precious minerals and precious stones after deducting the costs of local administrations, or it shall receive 33 per cent. of the gross revenue accruing to Government, which would be equivalent to one-third of the half of the gross revenue.

3. Irrigation.

That the Company shall be empowered to promote the irrigation of all lands in British Bechuanaland by artificial and other means of the supply and storage of water. The Company shall have the right to levy rates to be called irrigation rates upon all property irrigated and capable of being irrigated, regard being had to the value to be derived by the owners of property from irrigation works.

The assessment of rates to be regulated by a Board consisting of a nominee of the Government, a nominee of the Company, and a local representative. Such rates shall not be levied until the Company is prepared to place the water upon the land. The Government to receive one per cent. of the irrigation revenue after deducting expenditure. Nothing in this proposal shall be taken to interfere with the rights of private owners to irrigate their own lands.

4. Property Tax.

This tax, which will be 1 ¼ per cent. of the value of the property periodically assessed shall be divided between the Government and the Company upon the following basis:–

(a) The tax derived from all lands lying within 15 miles on either side of such lines of Railway as shall be actually working shall be paid by the Government to the Company.

(b) The tax derived from all lands situated at a distance greater than 15 miles of existent railways shall be retained by the Government.

(c) In the event of the Government deriving any revenue from the territories at present held as Native Reserves other than the hut tax now levied, it
would be fair that the Company should participate in such revenue upon the same principles as above stated.

5. Land Grants in British Protectorate upon Annexation.

(a) In case of annexation of the British Protectorate to the Crown, alternative blocks of land ten square miles in extent along the line shall be granted to the Company.

(b) Grants to be made and the revenue to be derived to be appropriated in a similar manner to that proposed in clause 4.

(c) That the Government shall either make a grant of forest land adequate to the requirements of this Company, if such land is available, or, in the event of a creation of a Forest Department, the Government shall supply to the Company assorted wood to the value of 25 per cent. of the annual revenue derived from the sale of wood.

Mineral rights in the Protectorate upon annexation shall be similar to those granted in British Bechuanaland.

7. Irrigation Works in the Protectorate.

That the powers vested in the Company in respect of irrigation in British Bechuanaland shall be extended to the Company in case of the annexation of the Protectorate and the region within the sphere of British influence beyond the Protectorate to the Crown.

These Protectorate clauses to be understood to be valid only with the consent of the Chiefs, and not to interfere with rights legally acquired previous to the date of annexation.

In consideration of the grant of the above concessions the Company is prepared to undertake the construction of the Railway through British Bechuanaland starting from its southern border and proceeding, via Mafeking, through Bechuanaland thus:

(1) That the Railway shall be of the same gauge and similarly constructed as the Cape Railways.

(2) The tariff to be based upon the present Colonial rates.

(3) In case of annexation of British Bechuanaland to the Cape Colony, the Cape Government to have the right to take over the Railway at a valuation / to be fixed by arbitration, such valuation to amount to at least the original cost with 10 per cent. added thereon.
As the Railway surveyors purpose leaving by the next mail steamer, your Excellency will confer a great favour upon us if we could receive an early reply to this communication.

I have, &c.,  
(Signed) R. W. MURRAY.

The Right Honourable Sir Hercules G. R. Robinson, P. C., K. C. M. G.,  
Governor of the Colony of the Cape of Good Hope and  
Her Majesty’s High Commissioner, &c., &c., &c.

Captain Bower to Mr. Murray.

Government House,  
Cape Town, 5th January, 1889.  
No. 1/j. s.

Sir, – I have the honour to acknowledge the receipt of your letter of the 4th instant, covering, for the consideration of the High Commissioner, a draft of amended proposals for the construction of a Railway through British Bechuanaland, upon which I am directed by His Excellency to make the following remarks.

2. The amended proposals contain no information whatever on the points specified in His Excellency’s observations to the Secretary of State upon your former proposals as of primary importance, namely, the estimated length, cost, and working expenses of the Railway proposed to be constructed, together with the probable receipts and consequent deficiency to be made good.

3. His Excellency can therefore, at present, do no more than point out the parts of your proposals which he would not be able to recommend Her Majesty’s Government to assent to. They are proposals 5, 6 and 7, as well as, so far as he can at present understand them, sub-sections (b) and (c) of proposal 4.

4. Before expressing any opinion on the remaining proposals 1, 2, 3 and 4 (a) the High Commissioner would have to transmit them to Sir Sidney Sheppard, so as to learn his views upon them.

5. A consideration of the remaining proposals would, however, be much facilitated by more precise information on the following points:—

6. As to 1, ‘Land Grants.’ What is the precise meaning of the word ‘available’? Is it meant that the whole of the Crown lands in the Maritsani District, surveyed and unsurveyed, whether they be more or less than 220,000 acres, shall be given to the Company. Are the 1,000 square miles in the neighbourhood of Genesa to be in one block? Is the ‘anticipation that the Government will not be disinclined to increase the area’ specified, if the Company desire it, intended to imply any obligation or promise on the part of the Government to comply with such a desire if it should be advanced at any future time? What is the precise
meaning of the words ‘excluding the fiscal provisions.’ Does it exclude only the usual redeemable and irredeemable quitrent of 10s. per 100 morgen, or does it include also survey charges and transfer fees?

7. As to 2, ‘Mineral Rights.’ Is the choice of the alternatives proposed, namely, half of the net revenue, or one-sixth of the gross revenue, to rest with the Government or the Company?

8. With reference to 3, ‘Irrigation.’ Are the words ‘all lands in British Bechuanaland’ intended to include Native Reserves and Crown lands? Is it intended that the irrigation rate shall be levied ‘on all property irrigated and capable of being irrigated,’ whether the owners desire water or not, or whether they have irrigated their own lands or not? Does the ‘one per cent. of the irrigation revenue after deducting expenditure,’ which the Government is to receive, mean one per cent. of the net profits only, if any, and on whom is the duty and expense of levying the irrigation rates throughout the whole of British Bechuanaland to devolve?

9. As to 4, ‘Property Tax’ (a). Is it intended that the words ‘all lands lying within 15 miles on either side’ of the Railway should include Crown lands and Native Reserves? By whom and at whose cost and risk is the property tax to be collected?

10. Without explicit information on the points I have thus specified, it seems impossible to advance a single step in the consideration of the four remaining proposals to which I have referred.

11. His Excellency observes that, in consideration of the promise of future concessions in the Protectorate and sphere of influence in the event of annexation, the Company only undertakes the construction of the Railway through British Bechuanaland, and not through the territories in respect of which promised concessions are asked for, but this point is not material, as a promise of concessions in the Protectorate and sphere of influence cannot be recommended.

I have, &c.,
(Signed) GRAHAM BOWER,
Imperial Secretary.

R. W. Murray, Esq., Cape Town.

Mr. Murray to Captain Bower.

Cape Town,
7th January, 1889.
No. 1/35.
Sir, – I have the honour to acknowledge the receipt of your letter of the 5th inst., received this morning, and in reply to lay the following information before His Excellency.
Referring to paragraph 2,

With regard to the estimated length and cost and working expenses of the Railway proposed to be constructed in British Bechuanaland, I have to state that the length is between 160 and 170 miles, the exact terminus not having been yet settled; the cost of which, taken at £7,000 per mile, will be £1,190,000 for 170 miles. The working expenses it is impossible at present to estimate, but they will average probably between £50,000 and £80,000 per annum, depending largely on the amount of traffic.

As to the amount of traffic it is impossible for any one to give an estimate.

As to Land Grants.

I may say that the proposal includes all the Crown lands in the Maritsani District, both surveyed and unsurveyed, and the figures given were furnished by the Department of the Surveyor-General of Bechuanaland as representing all the available Crown lands in that district, and it is proposed that they shall be given to the Company.

It is proposed that the 1,000 square miles in the neighbourhood of Genesa shall be in one block.

The paragraph respecting the increased area was intended to mean that if, hereafter, branch railways shall be made, and there are then available Crown lands, that the Government will not object to subsidize such branch lines with land grants, as in the case of the main trunk lines. / The words, 'excluding the fiscal provisions,' are intended to convey the following meaning, namely, that the lands shall be transferred free to the Company, and held by them free of quitrent; that there will be no survey charges, inasmuch as the lands will be surveyed by the Company at their own cost, but that the transfer fees will be paid by subsequent purchasers from the Company to the Government.

Mineral Rights.

The proposal was put in an alternative form for the choice of the Government, the second alternative being inserted with the idea of avoiding the investigation of the Government books.

Irrigation Works.

It is not intended to interfere with the rights of Crown lands or Native Reserves or private property in cases where the owners do not request the irrigation by the Company.
The 1 per cent. of the irrigation revenue means 1 per cent. of the net profits only, and the duty and expense of levying the irrigation rates will be carried out and borne by the Company.

Property Tax.

Clause (c) shows that it was intended Native Reserves should not be included. The Railway goes through no Crown lands except those which it is proposed should be given to the Company. The property tax it is expected will be collected by the Government.

Protectorate Clauses.

With regard to Clause 11, I beg to call the attention of His Excellency to the words in the clause of section 5, ‘alternative blocks of land ten square miles in extent along the line shall be granted to the Company.’

The Laying out of Townships.

I regret to find that I omitted in my letter of the 4th of January instant a reference to proposals in my letter dated at Vryburg on the 16th October last, with respect to the laying out of townships. I understand that there will be no objection to the right of our laying out townships on lands acquired by us, and in the event of stations occurring on Native Reserves a plot of land not exceeding 8 morgen shall be granted to the Company free for station purposes.

In conclusion, I anticipate that it is hardly necessary to say it is understood that the rights retained by Government under the land titles of British Bechuanaland for the construction of railways will, for the construction of this Railway, be extended to the Company which I represent.

I have, &c.,

(Signed) R. W. MURRAY.

Captain Graham Bower, R. M., C. M. G.,
Imperial Secretary.

Captain Bower to Mr. Murray.

Government House,
Cape Town, 8th January, 1889.

Sir, – I have the honour to acknowledge the receipt of your letter of the 7th instant, supplying information on the points specified in my letter of the 5th instant. Your explanations enable the High Commissioner to understand more precisely the nature of the concessions which your Company / require from the Government of British Bechuanaland for the construction of a Railway through
that territory, and upon this part of your proposal His Excellency only thinks it necessary, therefore, to make at present a few further remarks.

2. His Excellency thinks it desirable to add to the parts of your proposal, which, as already explained, he would not be able to recommend Her Majesty’s Government to assent to, the passage under the head of land grants referring to the subsidizing of possible future Branch Railways.

3. With reference to your explanation as to survey charges, the High Commissioner assumes that any expenses already incurred for the survey of the 150,000 acres, and any that may hereafter be necessarily incurred by the Government upon the 70,000 acres and the 1,000 square miles, so as to enable the Surveyor-General to assume the responsibility of issuing Crown titles or transfers for these lands, will be paid by the Company.

4. His Excellency presumes, also, that the Company will pay for any injury to improvements on lands taken for the line or for station purposes in the Native Reserves, in the same manner as they would have to pay under the land titles of British Bechuanaland for injury to improvements on private lands expropriated for the same purposes.

5. With reference to the obligations which the Company on their part are prepared to undertake, His Excellency would be glad to receive such information as you can supply on the following points:—

(a) Are the Company prepared to undertake the construction of a Railway through British Bechuanaland, whether the Cape Government extends its line to the border immediately or not?

(b) If so, in what time after the execution of a formal agreement will the work be commenced, and within what period will it be completed?

(c) What security will be given by the Company for the due fulfilment of their part of the contract?

(d) It is understood that the property tax will be leviable on lands (other than Native Reserves and Crown Lands and Crown Reserves) lying within fifteen miles on either side of the Railway, as soon as each section of the line is actually working; but is it proposed that the advantages of land grants, mineral rights, and irrigation rates are to be deferred till the completion of the Railway to Mafeking? If not, when do the Company propose that they should be allowed to avail themselves of these concessions?

(e) If the railway should be taken over by the Colonial Government at a valuation, is it intended that the minimum of such valuation shall be the original cost plus 10 per cent., exclusive of any sums which the Company may have realised from the concessions, and would what remained of such concessions be then surrendered?

(f) What minimum of train accommodation, per day or week, would the Company guarantee to supply?
6. When information has been furnished on these points the High Commissioner thinks it would be convenient if you were to submit amended proposals, embodying the explanations furnished in the correspondence, and His Excellency would then lose no time in forwarding such proposals to the Administrator for his report and to Ministers for their information, as directed by the Secretary of State.

I have, &c.,
(Signed) GRAHAM BOWER,
Imperial Secretary.

R. W. Murray, Esq., Cape Town. / 

Mr. Murray to Captain Bower.

Copy.

Cape Town, 9th January, 1889.
No. 6/J. S./M.

Sir, – I have the honour to acknowledge the receipt of your communication of the 8th instant, and in reply thereto I beg to state as follows:–

Branch Railways.
I am prepared to strike out the passage under the head of land grants (2) referring to the subsidizing of future branch railways.

Survey Expenses (3).
The Company will agree to pay the expenses which have been incurred and which may be necessary in the future for surveys by the Government.

Compensation (4)
The Company will pay for any injury to improvements on lands taken for the line or for station purposes in the Native Reserves.

Construction of the Railway.
As to clause 5 sub-section (a) of your communication, the Company is prepared to undertake the construction of a line through British Bechuanaland, whether the Cape Government extends its line to the border immediately or not.

Time in Construction (5).
As to clause (b), the success of the Railway being in the first instance dependent on the speed of its construction, there is no reason to doubt that every effort will be made to construct the Railway as quickly as possible, inasmuch as some of the
concessions will not come into operation until the line is working. This should be a sufficient guarantee that the work will be prosecuted with vigour. Provided there are no delays by shipwreck or other causes in the conveyance of material, the line will reach Mafeking within three years of the formal grant.

Security (3)

The Company has already proved to the satisfaction of the Secretary of State for the Colonies that it is composed of respectable people, and the usual guarantee will be given by these gentlemen for the due fulfilment of the contract.

This may be safely left for the decision of the Secretary of State for the Colonies, inasmuch as the final contract must be signed in London.

Property Tax.

This tax, as previously explained, is not to come into operation until the Railway is working, and this tax will only be levied on the areas through which the Railway is actually working.

Mineral Rights.

The conditions respecting mineral rights shall come into force upon the signing of the contract between the British Government and the Bechuanaland Exploring Company for the construction of the Railway, which construction will be guaranteed in the manner before stated.

Land Grants and Irrigation Rights.

These, it is proposed, shall be given to the Company on the execution of their formal agreement with the Government, in order that the Company may at once take steps to develop the country. It would perhaps be as well to define the land grants as in the Mafeking and Maritsani Districts, including all available lands near the eastern frontier, such as Rooi Grond erven and commonage.

If more detailed information is necessary, the Surveyor-General of British Bechuanaland, who is at present in Cape Town would provide His Excellency with such information.

Taking over the Railway.

It is intended that the minimum of valuation shall be the original cost, plus 10 per cent., exclusive of any sums which the Company may have realised from the concessions, and the remainder of such concessions would be surrendered to the Colonial Government, excepting such lands as may have been brought under irrigation works, subject to compensation for all monies spent in irrigation works or land improvements.
Train Traffic.

The trains, of course, would so largely depend upon the amount of traffic that it is almost impossible to fix what the number of trains would be. At the same time a guarantee may be given of a minimum of not less than six per week.

If these answers meet with the approval of His Excellency I shall immediately be prepared to formulate the amended proposals as suggested.

I have, &c.,

(Signed) R. W. MURRAY.

Imperial Secretary to Mr. Murray.

Copy.

Government House,
Cape Town, 11th January, 1889.

Sir, – I have the honour to acknowledge the receipt of your letter of the 9th instant, and in reply to observe that, taking this letter in conjunction with your previous letters of the 5th and 7th instants, His Excellency the High Commissioner understands that the proposals for the construction of a Railway through British Bechuanaland which you now submit for the consideration of the Government are as follows:—

The Bechuanaland Exploring Company undertakes, for the consideration hereinafter specified, to construct a Railway through British Bechuanaland, starting from its southern border and proceeding to the neighbourhood of Mafeking via Taungs and Vryburg.

The Railway to be of the same gauge and similarly constructed as the Cape Railways.

The length will be between 160 and 170 miles, the exact terminus not having been yet settled.

The cost, taken at £7,000 a mile, would be £1,190,000 for 170 miles.

The working expenses it is impossible at present to estimate, but they will probably average between £50,000 and £80,000 per annum, depending largely on the amount of traffic.

The tariff to be based upon the present Cape Colony rates, but it is impossible at present for any one to give an estimate as to the probable amount of receipts.

The number of trains would depend largely upon the amount of traffic, but the Company would guarantee a minimum of not less than six a week, being three each way.
The work will be prosecuted with vigour, and, provided there are no delays by shipwreck or other unavoidable causes in the conveyance of material, the Company will undertake that the line shall reach Mafeking and be open for traffic within three years of the formal signing of the agreement.

The Company is prepared to construct the line through British Bechuanaland, whether the Cape Government extends its line to the border immediately or not.

The security to be given by the Company for the due fulfillment of their contract to be left for the decision of the Secretary of State for the Colonies, as the final agreement will have to be signed in London.

The Colony of British Bechuanaland, in return for the Railway, to make to the Company the following concessions:

The land required for the line and sidings and stations to be given to the Company, the Company paying for any injury to improvements on land so taken from private proprietors and in the Native Reserves.

The Crown lands available for sale in the Maritsani and Mafeking districts, and estimated at about 150,000 acres surveyed and 70,000 acres unsurveyed, to be given to the Company; also a block of 1,000 square miles in the neighbourhood of Genesa.

The land grants to be in the form of the present quitrent tenure of British Bechuanaland, but the lands to be held by the Company free of quitrent.

The Company to pay any expenses which have been incurred and which may in the future be necessarily incurred for the survey of these lands by the Government. Transfer fees will be paid to the Government by future purchasers from the Company.

The Company shall share with the Government half the revenue derived from the discovery of precious minerals and precious stones after deducting the costs of local administration, or it shall receive 33 per cent. of the gross revenue accruing to Government, which would be equivalent to one-third of the half of the gross revenue.

The choice of the alternatives proposed, namely, half the net revenue or one-sixth of the gross revenue to rest with the Government.

The Company shall be empowered to promote the irrigation of all lands in British Bechuanaland other than Crown lands and Native Reserves by artificial and other means for the supply and storage of water.

The Company shall have the right to levy rates, to be called irrigation rates, upon all property irrigated and capable of being irrigated, regard being had to the value to be derived by the owners of property from irrigation works. The assessment of rates to be regulated by a Board, consisting of a nominee of the Government, a nominee of the Company, and a local representative. Such rates shall not be levied until the Company is prepared to place the water on the land.
Nothing in this proposal to be taken to interfere with the rights of private owners to irrigate their own lands, or with the rights of owners who do not desire the irrigation by the Company.

The Government to receive one per cent. of the irrigation revenue after deducting expenditure (that is one per cent. of the net profits), and the duty and expense of levying irrigation rates will be carried out and borne by the Company.

A property tax of 1 ¼ per cent. on the value of all lands other than Crown lands, Crown Reserves and Native Reserves, lying within 15 miles on either side of such line of Railway as shall be actually working shall be collected by the Government and paid to the Company.

The value of the lands to be periodically assessed.

The Company, having given such security for the due fulfilment of its contract as may be decided on by the Secretary of State, it is proposed that the conditions specified as regards land grants, mineral rights, and irrigation rights shall come into operation on the signing of the contract between the British Government and the Bechuanaland Exploring Company. / In case of annexation of British Bechuanaland by the Cape Colony, the Cape Government to have the right to take over the Railway at a valuation to be fixed by arbitration, such valuation to amount to at least the original cost with 10 per cent. added thereon.

No abatement to be made for any sums which the Company may, before the time of transfer, have realized from the concessions; but the remainder of the concessions would be surrendered to the Colonial Government, excepting such lands as may have been brought under irrigation works, such would be subject to compensation for all monies spent in irrigation works or land improvements.

If the foregoing correctly represents your proposals as they may stand, His Excellency will be glad if you will furnish me with three signed copies, one for this office and the others for transmission to His Honour the Administrator for his report and to Ministers for their information.

I have, &c.,

Imperial Secretary.

R. W. Murray, Esq., Cape Town.

Mr. Murray to Captain Bower.

Cape Town, 12th January, 1889.

Sir, – I have the honour to acknowledge the receipt of your letter of the 11th instant, and to forward herewith the amended proposals for the construction of the Bechuanaland Railway. You will observe that I have, in accord with an interview, made provision for the compensation to owners of town erven in case
the Railway should proceed over such, and have also provided that the local
Government of British Bechuanaland shall hold the same rights as the Cape
Government would do in case of the annexation of British Bechuanaland to the
Cape Colony, and the Colony was desirous of taking over the railway.

I forward three signed copies at your request.

I have, &c.,

(Signed) R. W. MURRAY.

Captain Graham Bower, R. N., C. M. G.,
Imperial Secretary.

Proposals for the construction of the British
Bechuanaland Railway, made by the Exploring Company,
Limited, to His Excellency the Right Honourable
Sir Hercules George Robert Robinson, P.C., G.C.M.G.,
Governor of the Colony of the Cape of Good Hope, and
Her Majesty’s High Commissioner, &c., &c., &c.

The Bechuanaland Exploring Company undertakes, for the considerations here-
inafter specified, to construct a Railway through British Bechuanaland, starting
from its Southern Border and proceeding to the neighbourhood of Mafeking via
Taungs and Vryburg.

The Railway to be of the same gauge and similarly constructed as the Cape
Railways.

The length will be between 160 and 170 miles, the exact terminus not having
been yet settled.

The cost, taken at £7,000 per mile, would be £1,190,000 for 170 miles.

The working expenses it is impossible at present to estimate, but they will
probably average between £50,000 and £80,000 per annum, depending largely
on the amount of traffic.

The tariff to be based upon the present Cape Colony rates, but it is impos-
sible at present for any one to give an estimate as to the probable amount of
receipts. /

The number of trains would depend largely upon the amount of traffic, but
the company would guarantee a minimum of not less than six a week, being
three each way.

The work was prosecuted with vigour, and, provided there are no delays by
shipwreck or other unavoidable causes in the conveyance of material, the Com-
pany will undertake that the line shall reach Mafeking and be open for traffic
within three years of the formal signing of the agreement.
The Company is prepared to construct a line through British Bechuanaland, whether the Cape Government extend its line to the border immediately or not.

The security to be given by the Company for the due fulfilment of their contract to be left for the decision of the Secretary of State for the Colonies, as the final agreement will have to be signed in London.

The Colony of British Bechuanaland, in return for the Railway, to make the Company the following concessions:—

Land. – The land required for the line and sidings and stations to be given to the Company, the Company paying for any injury to improvements on land so taken from private proprietors and in the Native Reserves.

The Crown lands available for sale in the Maritsani and Mafeking districts, and estimated at about 150,000 acres surveyed and 70,000 acres unsurveyed, to be given to the Company; also a block of 1,000 square miles in the neighbourhood of Genesa.

The land grants to be in the form of the present quitrent tenure of British Bechuanaland, but the lands to be held by the company free of quitrent.

The Company to pay any expenses which have been incurred and which may in the future be necessarily incurred for the survey of these lands by the Government.

Transfer fees will be paid to the Government by subsequent purchasers from the Company.

In case of the Railway passing over town or village erven, the owners to be compensated, and the amount of compensation to be settled by arbitration.

Minerals. – The Company shall share with the Government half the revenue derived from the discovery of precious minerals and precious stones after deducting the costs of local administration, or it shall receive 33 per cent. of the gross revenue accruing to Government, which would be equivalent to one-third of the half of the gross revenue.

The choice of the alternatives proposed, namely, half the net revenue or one-sixth of the gross revenue to rest with the Government.

Irrigation. – The Company shall be empowered to promote the irrigation of all lands in British Bechuanaland, other than Crown lands and Native Reserves, by artificial and other means for the supply and storage of water. The Company shall have the right to levy rates to be called irrigation rates upon all property irrigated and capable of being irrigated, regard being had to the value to be derived by the owners of property from irrigation works.

The assessment of rates to be regulated by a Board, consisting of a nominee of the Government, a nominee of the Company, and a local representative. Such rates shall not be levied until the Company is prepared to place the water on the
land. Nothing in this proposal to be taken to interfere with the rights of private owners to irrigate their own lands, or with the rights of owners who do not desire the irrigation by the Company.

The Government to receive one per cent. of the irrigation revenue after deducting expenditure (i.e., one per cent. of the net profits) and the duty and expense of levying the irrigation rates will be carried out and borne by the Company.

Property Tax. – A property tax of 1 ¼ per cent. on the value of all lands other than Crown lands, Crown Reserves and Native Reserves lying within fifteen miles on either side of such line of Railway as shall be actually working shall be collected by the Government and paid to the Company. / The value of the lands to be periodically assessed.

The Company having given such security for the due fulfilment of its contract as may be decided on by the Secretary of State, it is proposed that the conditions specified as regards land grants, mineral rights, and irrigation rights shall come into operation on the signing of the contract between the British Government and the Bechuanaland Exploring Company.

In case of annexation of British Bechuanaland by the Cape Colony, the Cape Government to have the right to take over the Railway at a valuation to be fixed by arbitration, such valuation to amount to at least the original cost with ten per cent. added thereon.

No abatement to be made for any sums which the Company may before the time of transfer have realized from the concessions, but the remainder of such concessions would be surrendered to the Colonial Government, excepting such lands as may have been brought under irrigation works, which would be subject to compensation for all monies spent in irrigation works or land improvements.

These conditions will equally apply to the Bechuanaland Government in the event of their wishing to take over the Railway.

Government House, Cape Town, 6th February, 1889.

South Africa, No. 103.

My Lord, — With reference to my despatch No. 34 of the 12th ultimo, I have the honour to enclose for your Lordship’s information copies of further correspondence which I have had with Mr. R. W. Murray respecting the proposed terms of a railway concession in British Bechuanaland.

I have, &c.,

(Signed) HERCULES ROBINSON,
Governor and High Commissioner.

The Right Honourable Lord Knutsford,
G. C. M. G., &c., &c., &c.,
Colonial Office.

Mr. Murray to Captain Bower.

Copy.

Cape Town, 12th January, 1889.

Sir, — I have the honour to suggest, so as to prevent any misunderstanding on the point (in continuation of my correspondence of this day’s date) with regard to the expropriation of land in connection with the Bechuanaland Railway and the rights to be granted to the Company which I represent, and I take it to be clearly understood that the Rooi Grond Commonage would come under the term ‘available land,’ that is to say, that, in the event of the acquiring of the land held by the present erfholders, the entire commonage will then become the property of the Company, subject to the same conditions on which all land will be conveyed to them under the agreement, and, in order that they should become possessed of the erven aforesaid, that the Government will cede to the Company the right which it possesses of re-acquiring the property under the quitrent titles of the erfholders.

I have, &c.,

(Signed) R. W. MURRAY.

Captain Graham Bower, R. N., C. M. G.,
Imperial Secretary.
Captain Bower to Mr. Murray.

Copy.

Government House,
Cape Town, 16th January, 1889.
J. S./12m.

Sir, — I am directed by His Excellency the High Commissioner to acknowledge the receipt of your letter of the 12th instant, enquiring whether the Rooi Groud Commonage would come under the term available land if your Company were to acquire all the rights of the existing erfholders, and whether the Government would cede to the Company the right of expropriation in order that they might become possessed of the erven.

In reply I am directed to say that the expropriation right reserved to Government could not properly be ceded to a private Company, nor could it be used in the manner suggested, but if the Company were to acquire, by purchase or otherwise, the rights of all existing erfholders, the Rooi Groud Commonage could be held to come under the term available land.

I have, &c.,
(Signed) GRAHAM BOWER,
Imperial Secretary.

R. W. Murray, Esq.,

Government House,
Cape Town, 27th February, 1889.
South Africa,
No. 148.

My Lord, — In continuation of my despatches Nos. 34 and 103 of the 12th January and 6th February, I have now the honour to forward copies of Minutes by the Administrator and Surveyor-General of British Bechuanaland upon the amended proposals submitted by Mr. R. W. Murray on behalf of the Bechuanaland Exploring Company for the construction of a Railway through that territory.

2. Mr. Murray, in return for a Railway to be made and worked by his Company, asks for the following concessions from the Government:—

(1) Land grants;
(2) A share of any future revenue from minerals and precious stones;
(3) Irrigation rights; and
(4) A property tax.

3. As regards (1) Land grants, Mr. Duncan, the Surveyor-General, points out that the capitalised value of the total extent of land asked for is only at the current prices £41,700, which is equivalent to an annual quitrent revenue of £2,085. Sir Sidney Shippard considers that this concession might be granted, and I concur with him in this view.

4. With reference to (2) a share of any future receipts from the discovery of precious minerals and precious stones in British Bechuanaland, Mr. Murray asks for one-half of the net revenue, or one-sixth of the gross revenue, which may hereafter be derived from this source. Sir Sidney Shippard observes he is so sure of the enormous value of the mineral resources of the territory that he regards this concession alone as far more than an equivalent for the construction of the proposed Railway. He thinks it would be better for the Government to make the Railway, retaining the Crown lands and mineral rights asked for by the Company; but, if this cannot be effected, he would, for the sake of securing the speedy construction of a Railway through British Bechuanaland, which he considers an object of primary importance, even go so far as to agree to what he describes the ‘exorbitant terms’ which the Company demand under this head.

5. I cannot altogether concur with Sir Sidney Shippard as to the unreasonable character of this demand. I do not think there is the least chance of a railway through British Bechuanaland paying interest on construction, or working expenses, except under one or other of two doubtful contingencies, namely, either the discovery of payable gold-fields or reefs in British Bechua-
naland or the discovery of rich alluvial gold-fields in the Protectorate or the sphere of influence beyond it, which would be approachable only through British Bechuanaland. As to the first contingency, I am not aware of any grounds whatever for the certainty expressed by Sir Sidney Shippard as to the enormous value of the mineral resources of British Bechuanaland. If this were so I should assuredly say it would be unwise to give any concessions at all for constructing a railway, as it could, in such case, before long be made without them. As to the second contingency, there is no doubt grounds for thinking that Mashonaland will prove a rich alluvial gold-field, but to what civilized power that country will eventually belong and whether it will be approached through British Bechuanaland, the Transvaal, Portuguese territory, or by the Zambesi, are still open questions.

6. The Railway, therefore, at present is purely a speculative undertaking. I concur with Sir Sidney Shippard that the cheapest course would be for the Government to make it; but, if Her Majesty’s Government are not prepared to incur such a risk, and desire the immediate prosecution of the work, it seems to me only reasonable that the Company, which is willing to undertake such a serious risk, should have also the chances of gain.

I do not object, therefore, to the mineral concession asked for.

7. As to (3) the irrigation proposals, it is not very clear what the Company require; but, if they seek for a monopoly of waterworks throughout British Bechuanaland, it would be necessary, for the protection of the public, to embody in the concession, as suggested by Mr. Duncan, the provisions of the Cape Irrigation Act, No.8 of 1877, with certain modifications.

8. As regards (4) the proposal for a property tax, Sir Sidney Shippard is entirely opposed to it, unless a Legislative Council with representation in some shape be first established. I think Sir Sidney Shippard exaggerates the magnitude of the proposal and the difficulties in the way of giving effect to it.

Mr. Duncan, in his Minute, points out that the total present value of the property within 15 miles of the Railway which would be subject to the proposed tax is £128,900, and that the annual payment on this at 1 ¼ per cent. would only amount to £1,611. I think the property tax, which should more / correctly be described as a railway rate, might be collected without additional expense with the Government quitrents, and that the assent of the whole, or at all events of the great majority, of the owners of property within 15 miles of the Railway might easily be secured beforehand to such a tax.

9. With reference to the conditions on which the Government can take over the Railway from the Company if it desires to do so, I think those proposed by Mr. Murray are preferable to those suggested by Sir Sidney Shippard. The chief objection that I see to the making of a railway at all through British
Bechuanaland by a Company in return for concessions such as those asked for, is that such a scheme would interpose many obstacles in the way of the acceptance by the Cape of the Crown Colony if, as I think likely, Her Majesty’s Government and the British public should before many years be anxious for such a transfer. Sir Sidney Shippard’s suggested conditions would render annexation by the Cape almost impracticable for 20 years.

10. On the whole, I am disposed to think it would be better not to move further in this matter at present. The South African Republic, with its extravagant and embarrassing concession to the Netherlands Company, is an example of what can be lost in a similar undertaking by impatience; whilst the Orange Free State, which can now get its railways made without cost or risk, is an example of what can be gained by waiting. If, however, Her Majesty’s Government desire the immediate construction of a railway through British Bechuanaland, and are not prepared themselves to incur the risk of such an undertaking, I should recommend the acceptance of Mr. Murray’s proposals, which, under all the Circumstances of the case at the present moment, are, I think, far from unreasonable.

11. I must, however, point out that Mr. Murray has not supplied me with any information whatever as to the personnel of the Bechuanaland Exploring Company, and has stipulated that ‘the security to be given by the Company for the due fulfilment of their contract is to be left for the decision of the Secretary of State for the Colonies.’

If your Lordship is satisfied on these points, and thinks it desirable to proceed further in the matter, the present proposals can, of course, only be looked on as a skeleton of the final agreement, which would have to be most carefully drafted by legal and railway professional experts.

I have, &c.,
(Signed) HERCULES ROBINSON,
Governor and High Commissioner.

The Right Honourable Lord Knutsford,
G. C. M. G., &c., &c., &c.,
Colonial Office.

**Minute on Proposals by the Bechuanaland Exploring Company, Limited, for the Construction of a Railway through British Bechuanaland.**

(1). The estimate of cost, viz., £7,000 per mile, appears to me exceedingly high for a 3-ft. 6-in. gauge in a country which may be fairly described as a dead level from end to end. I have been assured by persons, whom I believe to be
Communications in Africa, 1880–1939: Volume 1

competent to estimate the cost, that a railway on the Cape gauge could be constructed through British Bechuanaland for £5,000 a mile, inclusive of rolling stock, and that this rate would leave a handsome margin of profit.

(2). The estimate of working expenses appears also excessive. I have reason to believe that from the outset the traffic would be very large, as the Bechuanaland Railway would command the easiest approaches to the Transvaal Gold-fields.

(3). The question of tariff and the conditions requisite for the protection of the interests of the public and of the Government will, I presume, receive due attention before terms are finally agreed on. In view of future contingencies it would, I think, be desirable to adhere as closely as possible to the conditions imposed by the Cape Legislature when authorising the construction of railways by any Company or individual. (cf. The Cape Central Railway Act, No. 16, 1883; The Cape Central Railways Extension Act, No. 32, 188; The Graham’s Town and Port Alfred Railway Act, No. 5 1881; The Point and Sea Point Railway Company’s Act, No. 31, 1884; The Imvae and Indwe Railway and Coal Mines Act, No. 3, 1882; and The Imvae and Indwe Railway and Coal Mines Act, No. 11, 1886).

With regard to the concessions asked for,

(4). I am of opinion that the proposals of the Company with respect to land grants may be accepted.

(5). For the sake of securing the speedy construction of a railway through Bechuanaland – an object of primary importance – I would even go so far as to agree to the exorbitant terms which the Company demand with regard to the revenue hereafter to be derived from the discovery of precious minerals and precious stones in British Bechuanaland. I am so sure of the enormous value of the mineral resources of this territory that I regard this concession alone as far more than an equivalent for the construction of the proposed Railway. It would be far cheaper and more advantageous for this Government to make the Railway departmentally and retain both the Crown lands and the full mineral rights at present secured by law; unless, indeed, the territory be soon annexed to the Cape Colony.

(6). The proposals with regard to irrigation appear to me somewhat obscure. I do not clearly understand whether the Company demand a monopoly of waterworks throughout the territory or not. If they do, it might become necessary to protect the public against the evils of what might prove to be a most vexatious and oppressive monopoly.

If the Company do not seek a monopoly, the law already gives them all powers necessary to enable them to carry out irrigation works and convey water from or over any land belonging to or in the occupation of any person. The Right of Passage or Water Act, No. 26, 1882, is in force in this territory, and gives ample powers of this kind.
The Irrigation Act, No. 8, 1877 (as amended by the Irrigation Act Amendment Act, No. 7, 1880) and the Municipalities Irrigation Works Loan Act, No. 28, 1879, can hardly be considered as in all respects applicable to the present circumstances of this territory.

As I suppose that a proposal of a Government guarantee to cover the amount of revenue which the Company might reasonably expect to derive from irrigation works would not be entertained, I would somewhat reluctantly concede the demands of the Company with regard to irrigation, provided that due precautions be taken to protect the public against the evils of a monopoly, and provided further that the Company undertake to conform to the terms of the Cape Irrigation Act, No. 8, 1877, so far as applicable.

(7). To the proposal of a 'Property Tax' I am opposed on principle, because I regard any attempt to impose on Europeans direct taxation without representation as a dangerous if not fatal error. To that error England owed the irreparable loss of the American Colonies. Again, it was Sir Owen Lanyon's ill advised attempt to levy the direct railway tax, originally imposed by President Burgers, which was the immediate cause of the rising of the Transvaal Boers and of the loss to the Empire of one of the richest countries in the world. It is true that in the present case, as the Surveyor-General points out, the proposed tax would fall almost entirely on the hitherto untaxed Dutch farmers of Stellaland and their assigns, who he says ought to be taxed, but this circumstance does not affect my conclusions.

If it be decided, contrary to my advice, to impose a direct property tax in this territory for the benefit of a Company of shareholders in England, I can only express a hope that a Legislative Council, with some sort of representative element, will be established before any attempt be made to levy such a tax, which, in my opinion, ought at the very least to have the approval of a majority of the elected members. Even then a tender of payment in lead, followed by coercion, might necessitate an expenditure more than sufficient for the construction of the Bechuanaland Railway.

(8). With regard to the proposed conditions of purchase of the Railway by Government, I object to the proviso that the valuation to be fixed by arbitration must amount to at least the original cost, with ten per cent. added thereon.

I think that on this point the provisions of the Cape law should be adhered to, viz., that the Government should have a right to purchase the Railway after twenty years, upon such terms as may be mutually agreed upon between the Company and the Colonial Government, and, failing such agreement, at a price to be settled by arbitration.

(Signed) SIDNEY SHIPPARD,
Administrator.

Vryburg, 12th February, 1889.
Land Grants. – This proposal may be stated as follows:–

150,000 acres surveyed.
70,000 ” unsurveyed.
220,000 ” or 104,762 morgen.
1,000 square miles or 302,000 ”
406,762 morgen.

Or in round numbers 407,000 morgen.

At current prices the capitalized value of this farm land to the Government, when sold, would be £40,700. Add to this, say, £1,000, the value of the Rooi Grand and Mafeking erven available, and the total land grant would be worth £41,700, or, at 5 per cent., an annual revenue of £2,085.

Of the farm land applied for, that surveyed and about 130,000 acres, of the Genesa block would be taken up in the course of a few months. The remainder would, in all probability, not be sold by the Government for two years or more. The prospective immediate loss to the revenue would therefore be, assuming the erven to be immediately saleable, about £700 per annum.

The erven in the township of Mafeking already granted are held upon free-hold tenure, and it may be thought desirable to adhere to such tenure when granting to the Railway Company such Mafeking township erven as may be available for this purpose.

In the final agreement the breadth of the land ‘required for the line and sidings and stations’ must be stated.

Mineral Rights. – The money paid to the Railway Company would be derived from the following sources:–

1. Claim licences, Sections 27 and 35.
2. Certificates of hypothecation of claims, Section 29.
3. Certificates of transfer of claims, Section 30.
4. Certificates of reservation, Section 33.
5. Royalties on mining leases, Section 36 (b).
6. Certificates of liens against claims, Section 56.
7. Royalties, Section 65.

The expenditure on local administration would embrace:–

1. Salaries and allowances of mining commissioners, inspectors, registrars, and other officers, and persons appointed to perform duties at a digging or mine, and whose salaries and allowances are payable out of the public funds. These would not include civil commissioners, resident magistrates / and staff, post office officials, territorial police, and other persons to whom appointments would be given on a mere increase of population.
2. Expenses of surveys of claims, mining areas, depositing flows, stands, &c., payable by Government, and not recoverable.

3. Expenses of all proceedings under such Lands and Clauses Arbitrations Acts as may be in existence.

5. Payment of share of licences to proprietor of soil.

The revenue and expenditure brought to account under 'Posts' and 'Telegraphs,' 'Administration of Justice,' 'Education,' 'Hospitals,' 'Gaols,' &c., would not be included in the term 'local Administration.'

The impossibility of making an estimate of the revenue to be derived from the discovery of precious minerals and precious stones is of course obvious, inasmuch as the number and richness or such deposits as may be discovered are unknown.

An estimate of the gold-fields' revenue relatively to the total revenue may therefore be of some little value. On reference to the 'Argus Annual,' 1888, p. 119, and comparing the items of 'ordinary revenue' in the Transvaal in the financial years ending March 31st, 1885, before the rush to the gold-fields took place, and March 31st, 1887, when the gold-fields had been attracting people for nine months or so, it will be noticed that the receipt under 'Diggers' Licences,' rose from less than one to nearly twelve per cent. of the total revenue.

During the six months ending September 30th, 1887 the diggers' licences had fallen to ten per cent. of the total revenue.

I am not sure whether any of the receipts under the head 'licences,' and 'special receipts' would include other items of revenue to be included in Mr. Murray's term 'mineral rights.' In all probability some small proportion would be included, and I would therefore place the mineral rights under consideration at, say, fifteen per cent. of the total revenue of the Transvaal.

So far, then, as can be estimated, the mining revenue would be about fifteen per cent. of the total revenue, and, accepting this as the fund out of which, after defraying the costs of local administration, the Railway Company is to obtain a half share, we now proceed to deduct local expenditure.

I have no statistics to show what this proportion would be. A fair assumption would probably be that two-thirds of the gross mining revenue would be expended on local administration. Hence the Government would pay to the Railway Company annually for some years an amount estimated to be 2½ per cent. of the total revenue of the territory.

It must be remembered that the proposed contribution of half the net profits to the Railway Company will be paid out of the revenue derived directly from the mining of precious minerals and precious stones, and will vary with the surplus under this head.
This surplus will not maintain the proportion of five per cent. to the total revenue, for on the discovery of gold a rush takes place and a mining population springs up which demands the necessaries and luxuries of life, the arable lands in the vicinity of the mining centres will be cultivated, the pasturage will be trodden by stock, and local industries will be created. It is therefore probable that, owing to these and other causes, with the progress of the country the revenue derived from mining licences will gradually decrease relatively to the total revenue. In Hayter’s Victorian Year Book for 1884–5 it is shown (statistical summary) that the total population of Victoria in 1850 was 76,162. In 1851 gold was discovered, and the population on the 31st December of that year was 97,489. The value of gold at £4 per oz. raised in 1853 – the highest ever reached – was £12,600,084, and the population in that year was 222,436. In 1856 the amount raised was nearly twelve millions by a population of 397,560, and since that year the value of gold raised has gradually declined, while the population has as gradually increased, until in 1884 gold the value of a little over three million was raised by a population of more than nine hundred thousand. In 1884 the proportion of miners and persons engaged in pursuits subsidiary to mining to the total population was 40,019 to 946,100 (vide paragraph 111), or roughly 4 per cent. In the financial year 1883–4 the revenue from the Victorian Gold-fields was (ibid. para. 901) £20,344, excluding prospecting licences, not included in the proposed agreement, and the total revenue of the Colony for that year was £5,934,687.

It would thus appear that the proposed contribution of half the net mining revenue to the Railway Company is reasonable, and that no term need be agreed upon at the expiration of which such contribution should cease. As to the latter alternative suggested, namely, a payment of one-sixth of the gross mining revenue, I would limit its application to mining areas upon Crown land.

**Irrigation.** – Effect could be given to this proposal by applying, with certain modifications, to British Bechuanaland, Parts 1, 3, 4, 7 and 8 of the Irrigation Act (No. 8) 1887. Instead of Part 2, dealing with the constitution of irrigation boards, a few clauses could be introduced providing for the election of a local representative, and Part 5 could be dispensed with. There would be some difficulty in applying Part 6 to British Bechuanaland under present circumstances, and, on the other hand, it will probably be found that the paragraph in the proposal repudiating interference with the ‘rights of private owners to irrigate their own lands or with the rights of owners who do not desire the irrigation by the Company’ will require to be modified in the sense of the provisions of the Act, prior to insertion in the final agreement.

The paragraph appears, moreover, to be in conflict with that dealing with irrigation rates, which was evidently taken from the forty-fourth section of the Irrigation Act.

It will be observed (Act 8, 77, Section VII) that the consent two-thirds of the landowners within a district is required before such district may be proclaimed
an irrigation district. This would appear to be a sufficient proportion, while a further concession to individuals might seriously affect the working of the scheme, and thereby prevent the majority from enjoying the benefit of a public work of great utility. It will be seen, also, that the provisions of the Act secure full compensation to owners for damage done.

The taxable area under this proposal would be as follows:

<table>
<thead>
<tr>
<th>Division</th>
<th>... ...</th>
<th>130 square miles.</th>
</tr>
</thead>
<tbody>
<tr>
<td>“” Vryburg</td>
<td>... ...</td>
<td>1885 ” ”</td>
</tr>
<tr>
<td>“” Mafeking</td>
<td>... ...</td>
<td>615 ” ”</td>
</tr>
</tbody>
</table>

Total area held in severalty within 15 miles of railway ... 2,630 square miles.

At the current Government upset price for selling land the value of this area would be 2,630 × £30 = £78,900.

To this add the valuation of property in the village of Taung, Vryburg, and Mafeking, approximately £50,000.

The total valuation, therefore, of property subject to this tax at present value would be £128,900, and the annual payment as property tax to the Railway Company until the value increased would be £1,611.

A satisfactory guide for the periodical assessment would no doubt be found in the Divisional Councils Acts.

It is apparent that in the majority of cases the fifteen-mile limit will cut through and not coincide with the boundaries of private properties. As this arrangement might be attended with inconvenience, I would suggest that the local boundaries of the taxable area be subsequently defined on the basis of the fifteen-mile limit. It is obvious that the returns under this tax will steadily increase in amount, and that the term during which this concession is operative should be limited, in order that a legitimate and increasingly important source of public revenue may not be enjoyed by the Company for a longer period than may be considered reasonable in the interests alike of the Company and the State. I would therefore suggest the term of thirty years for this concession. This proposal would appear to ensure the sale of all lands now granted to the Company prior to the purchase of the Railway by the State.

It appears to me to be certain that, if such purchase of the Railway be at any time contemplated, the Company would prefer rather to transfer to private persons the land on receipt of a sum covering the value of the land in addition to the value of the improvements, than to surrender the land to the Government for the value of the improvements only.

Perhaps it would be well to deduct from the purchase price of the Railway the amount realized by the Company from the sale of land or the declared value of the land transferred by it.

(Signed) A. H. F DUNCAN,
Surveyor-General.

22nd January, 1889.
Sir H. Robinson to Lord Knutsford.

South Africa, No. 164.
Government House, Cape Town, 4th March, 1889.

My Lord, – I have the honour to enclose for your Lordship’s information a copy of a despatch which I have received from the Administrator of British Bechuanaland, covering a copy of a Minute from the Surveyor-General reporting that certain Vryburg erven have been confiscated as derelict.

These lots are clearly part of the available Crown lands, and the question of their disposal must, I think, stand over until it is known whether your Lordship accepts or rejects the offer made by Mr. Murray on behalf of the Bechuanaland Exploring Company.

I have, &c.,

(Signed) HERCULES ROBINSON,
Governor and High Commissioner.

The Right Honourable Lord Knutsford,
G.C.M.G., &c., &c., &c.,
Colonial Office.

Sir Sidney Shippard to Sir H. Robinson.

Copy.

No. 47g.

Administrator’s Office, British Bechuanaland.
Vryburg, 19th February, 1889.

Sir, – I have the honour to enclose for your Excellency’s consideration a copy of a Minute from the Surveyor-General, covering a Minute from the Acting Civil Commissioner of Vryburg, forwarding a list of erven in this township confiscated under the Derelict Lands Act, Mr. Duncan had apparently not been informed of the confiscation of these erven when the representative of the Railway Company was in Vryburg, and he consequently did not include them in the statement of vacant Crown land near the Eastern Frontier which he gave to Mr. Murray. / He now requests instructions as to what course is to be pursued with regard to these erven, which should, in terms of the arrangements with Mr. Murray, have been included in the offer of vacant Crown lands on the Eastern frontier made to the Bechuanaland Railway Company.

I have, &c.,

(Signed) SIDNEY SHIPPARD,
Administrator.

His Excellency the Governor,
Cape Town.
Enclosure in Despatch No. 47G., 19/2/89.

Mr. Duncan to the Secretary.

Copy.

Vryburg,
19th February, 1889.

No. 819. Minute.

When the representative of the Railway Company was in Vryburg I told him that the proposed land grants of the Mafeking district included the whole of the vacant Crown land near the Eastern Frontier. It now appears that these confiscated erven were at the time also Crown land, and under these circumstances I suppose that the Railway Company ought to be so informed.

I shall be glad to know what is to be done with them.

At present they cannot be disposed of until definite instructions have been received concerning the Crown land near the Eastern Frontier, of which they form a part.

I enclose a sketch showing the confiscated erven in pink.

(Signed) A. H. F. DUNCAN,
Surveyor-General.

Mr. Scholtz to Mr. Duncan.

Vryburg,
14th February, 1889.

No. 420. Minute.

Enclosed please find list of erven confiscated under the Derelict Lands Act.

(Signed) C. B. SCHOLTZ,
Acting Civil Commissioner.

Lord Knutsford to Sir H. Robinson.

South Africa.

No. 94.

Downing Street,
28th March, 1889.

Sir, – I have the honour to acknowledge the receipt of your despatch No. 164 of the 4th instant, respecting the disposal of certain derelict erven in the Vryburg township.

I agree with you that the matter must stand over pending a decision on the proposals made by the Bechuanaland Exploring Company.

I have, &c.,

(Signed) KNUTSFORD.

The Right Honourable Sir H. Robinson, G.C.M.G.,

CAPE OF GOOD HOPE.
RAILWAY EXTENSION THROUGH BRITISH BECHUANALAND.

II.

AGREEMENT, DATED 23RD JANUARY, 1890, BETWEEN THE COLONIAL GOVERNMENT AND THE HONOURABLE C. J. RHODES.

Presented to both Houses of Parliament by command of His Exce- lency the Governor.

1890.

[...]

Railway Extension through British Bechuanaland (Cape Town: Government Printer, 1890).
I.

Agreement,

By and between Her Majesty’s High Commissioner for South Africa and Governor of British Bechuanaland, of the one part, and the Honourable Cecil John Rhodes, M.L.A., representing the British South Africa Company, of the other part, made at Cape Town on the twenty-third day of January, 1890, for the construction of a Railway from the Southern to the Northern Border of British Bechuanaland on the following terms and conditions, to wit:–

1. Railway to be made under certain conditions by the Company from the Southern to the Northern Border of British Bechuanaland via Taungs, Vryburg and Mafeking.

2. Land required for the Railway, of a uniform width throughout of 100 yards, and for all junctions, sidings and stations, and all other works and approaches and for any future extensions or branches, or other lines, to be given by Her Majesty’s Government, but the Company to pay compensation for any injury to improvements actually made and existing when the land is taken, whether it is taken from private proprietors or from native reserves, and also to pay compensation in case of the line passing through town or village erven.

3. No parallel or competing line to be constructed on British Territory or Territory under the British influence; and the Company to have the exclusive right of constructing on British Territory or Territory under British influence extensions and branch or other lines, so long as they maintain a reasonably efficient service on the Railway, the subject of this Agreement. / If Her Majesty’s Government require a line or lines other than a competing line to be constructed, which, in their opinion, would carry a remunerative traffic, and the Company refuse to construct within a reasonable time, then Her Majesty’s Government may make such line, or a Concession may be granted to other parties, but not on more favourable terms than offered to the Company, and Her Majesty’s Government then to have the right of calling on the Company to permit any other line to cross the line of the Company on terms which shall be reasonable and fair to the Company.

4. Maximum charges for carriage of passengers and goods, if exceeding that in force on the railways under the control of the Cape Government, to be subject to approval of her Majesty’s Government, and tables of charges to be exhibited at places of collection.

5. Company to keep the line in good repair, and to equip it with proper plant and rolling stock for its efficient working. Company to run at least three trains each way in every week.

6. In consideration of the premises, Her Majesty’s Government to grant to the said Cecil John Rhodes, in his said capacity as representing the British South
Railway Extension through British Bechuanaland

Africa Company, six thousand square miles in British Bechuanaland in consideration of railway construction to Vryburg, and, in case the said Cecil John Rhodes in his said capacity agrees to extend the said line of railway to Mafeking, to further grant six thousand square miles in British Bechuanaland, the selection of the land to be subject to mutual agreement, the title thereto to be in fee simple and free from all mineral reservations in favour of the Crown.

7. In case any arrangement be entered into by the said British South Africa Company for the lease or sale of the said line or any portion thereof, the same shall be submitted for the approval of the High Commissioner.

8. In case the British South Africa Company, or any such purchaser as aforesaid, shall discontinue the working of the said line, the High Commissioner shall have the right to enter and take and work the portion of the line in British Bechuanaland, and also to enter upon such portion of the land or other concessions or benefits accruing therefrom given to the Company in consideration of railway construction as shall be unsold at the time when the Company or purchaser aforesaid failed to fulfil their part of the contract; Provided that the High Commissioner shall hold and work such line and realise such land or other concession for the benefit of the said Company or purchaser, as the case may be; such Company or purchaser always retaining the right to resume the working of the said line with the High Commissioner’s approval.

9. The regulations with regard to rates of transit and transport for Government officials and goods to be the same as those in force in the Cape Colony, subject to modification by mutual agreement.

10. The Company to have the right to proclaim, set out, and sell town and village sites on any land of which they may become possessed.

11. In case of any dispute arising as to the terms or construction of this Agreement, the same shall be referred to the decision of the Chief Justice of the Cape Colony; and in the event of the said Chief Justice declining to arbitrate, then the same shall be decided by arbitration in terms of the Lands and Arbitrations Clauses Act, No.6, 1882.

In witness whereof the parties hereto, have hereunto affixed their respective signatures at the place and on the date first above written—

(Signed) HENRY B. LOCH,¹
Her Majesty’s High Commissioner for South Africa, and Governor of British Bechuanaland.

(Signed) C. J. RHODES,
Representative of the British South Africa Company.

In presence of:

(Signed) SIDNEY SHIPPARD, Witnesses. /

(GRAHAM BOWER, ̋)
II.

AGREEMENT, DATED 23RD JANUARY, 1890, BETWEEN THE COLONIAL GOVERNMENT AND THE HONOURABLE C. J. RHODES.

Made at Cape Town on the twenty-third day of January, 1890, by and between the Honourable Cecil John Rhodes, M.L.A., as representing the British South Africa Company, of the one part, and Sir John Gordon Sprigg, K.C.M.G., on behalf of the Government of the Colony of the Cape of Good Hope, of the other part, with reference to Railway Extension from Kimberley through British Bechuanaland, on the following terms and conditions, to wit:–

1. The Railway to Vryburg to be built on the following terms:–
   The Cape Government to raise and advance to Mr. Rhodes the necessary money on the same terms as they raise it.

2. The Cape Government to hold as security the line of Railway in addition to the six thousand square miles of land in Bechuanaland, which shall be duly hypothecated.

3. In case the Cape Government shall take over the line on or before the 30th June, 1891, the Cape Government shall be entitled to share in the proportion of two to one with Mr. Rhodes in the proceeds of all lands that may have been realized, and to be a partner in the proportion of two to one in whatever lands may at the date of purchase remain unsold.

4. It is understood that all lands sold must be subject to a substantial quitrent of not less than One Pound Sterling per thousand acres, and any lands unsold at date of taking over railway shall be jointly dealt with in the aforementioned proportion; it being understood that for a period of twelve months after the date of purchase of railway neither party shall sell his share without first giving the refusal to the other party, and in the event of this right of pre-emption not being acted upon, any lands sold subsequently shall be subject to the same substantial quitrent.

5. If either the Government of the Cape Colony or Mr. Rhodes shall at any time object or refuse consent to any proposal of the other for the sale or other disposition of the whole or any portion of the land referred to in this Agreement, or if any question or dispute shall arise between them relative to the management, sale, or other disposition of the whole or any portion of the said land, either party may call upon the other to refer and submit such proposal, question, or dispute to the arbitration of one arbitrator jointly appointed; or if no joint appointment can be agreed upon, then to the arbitration of the Chief Justice of the Cape Colony; and the decision of such arbitrator or of the Chief
Justice, as the case may be, shall be given with due observance of the terms of this Agreement and consideration of what is fair and reasonable, and shall, when given, be binding, final, and conclusive with respect to such proposal, question, or dispute.

6. In the final liquidation of the account either party shall have the right to purchase all the quitrents accruing to the other on a basis of twenty years’ purchase.

7. It is further understood that Mr. Rhodes binds himself to proceed with the Railway Extension from Vryburg to Mafeking, provided the Cape Government purchases the Kimberley-Vryburg Section on the foregoing terms, and he receives a further grant of six thousand square miles in Bechuanaland.

In witness whereof the parties hereto have hereunto affixed their respective signatures at the time and place first above written.

(Signed) C. J. RHODES,
For the British South Africa Company.

HANDBOOK

TO THE

UGANDA QUESTION

AND PROPOSED

EAST AFRICA RAILWAY.

BY

ERNEST L. BENTLEY.

1892

[...]
expensive and difficult precaution, to pursue the evil to its home and kill it at its root, we shall not only have saved mankind from a fearful curse, but we shall have spared the Treasury of our own people and the lives of the gallant sailors.' – Lord SALISBURY at Glasgow, 20th May, 1891.

Extracts from the General Act of the Anti-Slavery Conference, July, 1890.

Chapter I.
Slave-Trade Countries. – Measures to be taken in the country of Origin.

Article I. – The Powers declare that the most effective means for counteracting the slave trade in the interior of Africa are the following:–

(1.) Progressive organization of the administrative, judicial, religious, and military services in the African territories placed under the sovereignty or protectorate of civilised nations:

(2.) The gradual establishment in the interior, by the Powers to which the territories are subject, of strongly occupied stations, in such a way as to make their protective or repressive action effectively felt in the territories devastated by slave-hunting:

(3.) The construction of roads, and, in particular, of railways, connecting the further (avancés) stations with the coast, and permitting easy access to the inland waters and on the upper courses of the rivers and streams broken by rapids and cataracts, in view of substituting economical and rapid means of transport for the present means of transport by men:

(4.) Installation of steamboats on the inland navigable waters and on the lakes, supported by fortified posts established on the banks:

(5.) Establishment of telegraphic lines, insuring the communication of the station and posts with the coast and administrative centres:

(6.) Organisation of expeditions and colonnes mobiles to keep up the communication of the stations with each other and with the coast, and to enforce the repressive action and insure the security of the routes (route de par cours):

(7.) Restriction of the importation of firearms, or at least of improved arms, and of ammunition throughout the territories infected by the slave trade.

Chapter I.

Article IV. – The States exercising sovereign powers or protectorate in Africa may in all cases delegate to companies provided with charters all or a portion of the engagements which they assume...

‘You will explain (to Prince Bismarck) that some prominent capitalists have originated a plan for a British settlement in the country between the coast and
the lakes which are the sources of the White Nile, and for its connection with
the coast by a railway.' – Lord Granville to Sir E. Malet, May 25th, 1885.

That the Brussels Act expressly refers to 'Territories placed under the sovereignty
or protectorate of civilised nations' with an evident and studied exclusion of what
are termed spheres of influence – therefore the Act has no connection with the East
Africa Railway.*

‘That without the Mombasa-Victoria Nyanza Railway, it is not only practi-
cally impossible to bring the great and populous region of Uganda into touch
with British interests, but it will assist materially in the suppression of slave tra-
ffic and in the abolition of the status of slavery Therefore, if for no other reason,
the project is deserving of all support of all who have at heart the welfare and
civilization of the great African continent.' – British Anti-Slavery Soci-
ety† to Parliamentary Candidates.

That in anglicising Central and Eastern Africa we must depend / less upon
the sword than on the influences of commerce, and the real pioneer of commerce
is the railway.

‘It costs two or three hundred times as much to bring goods by caravans as it
would cost to bring them by railway. Of course when once a railway existed cara-
vans would become a matter of antiquity, and if no caravans existed there would
be no means of carrying slaves from the interior to the coast.' – Lord Salisbury
at Glasgow, 20th May, 1891.

That if the East Africa Company cannot construct the railway out of its own
resources the work must be left undone.

That the Imperial British East Africa Company would not be any more
directly interested in the East Africa Railway than Her Majesty's Government is
benefited by the construction of the English railways.

‘The Mombasa and Victoria Nyanza Railway Survey Grant was submitted in
continuation and amplification of a policy which for many years past had actu-
ated Her Majesty's Government and the country in dealing with the suppression
of the slave trade in Eastern and Central Africa.' – Mr. J. W. Lowther.

That it would be an evil precedent for the Imperial Government to undertake
the construction of public works in territories in which it has no Government or
administrative authority.†

That it is, no doubt, of very great importance to be beforehand with Ger-
many in opening quick communication between the lake region and the coast,
as whichever nation wins this race will assuredly become the leading Power in
Eastern Africa.

* Note. – The Company's treaties covering the route include sovereign rights, and have all
been approved by Her Majesty's Secretary of State in terms of the Royal Charter.
† Note. – The Company's treaties with chiefs extend from the coast to the Victoria
Nyanza, and include sovereign and administrative rights.
That as soon as the railway advanced beyond the Zanzibar boundary it would pass through territory where England apparently has no locus standi of an official character.*

That as the construction of the railway cannot be carried out as a State work, except at a cost and responsibility which Parliament would hesitate to sanction, some agency must be employed, and the most eligible one which exists, both by reason of its administrative machinery and its cognate duties under its Charter, is the Imperial British East Africa Company.

That the Company will in time, as the commerce created by the railway flows through its ports, benefit largely by the work is certain, and so, also, to a greater extent, will the trade of Manchester and other centres of manufacturing industry. / That whilst the railway would check the slave trade, it would not be a commercial success – (see the ‘Commercial Aspect.’)

That Australian, New Zealand, and South African Colonies, to say nothing of India, have realised the urgency of investing largely in railways, and in new countries State guarantees are almost indispensable to attract the necessary capital.†

That, in fact, the salvation of Africa depends on a railway guarantee, and that, perhaps, for a limited period.

That it is an enormous undertaking to set about making and providing for the defence of a railroad some 500 or 600 miles long through a territory inhabited by warlike tribes.‡

That the bitterest opponents to the East Africa Railway are those who know least of its commercial possibilities, its political advantages, and its humanising issues.

That caravans in the British sphere are absolutely unremunerative, whilst a railway would not only effect the greatest economies in the conduct of our beneficent jurisdiction, but at the same time immensely stimulate British commerce.§

That the trade in hides alone would go a long way towards defraying the cost of railway construction.

* Note. – The Company’s treaties with chiefs extend from the coast to the Victoria Nyanza, and include sovereign and administrative rights.

† Note. – The Indian railways in the aggregate during 1891 did not draw anything from the guarantors.

‡ Note. – The Company has had caravans, some as small as 40 carriers, and has never lost an officer. The Government railway survey party did not fire a single shot in self-defence.

§ Note. – Transport is now £200 to £300 per ton to Victoria Nyanza.
That the East Africa Railway is to stretch across the belt of swamps which cuts off Uganda from the coast, in order that we may send an army along the line to seize and hold the province for a commercial Company.*

The proposed East Africa Railway is spoken of as if it were a ‘wild cat’ line of indefinite length ending in irreclaimable wildnesses, instead of reaching half-way to the lakes an elevated table land offering all the conditions for a prosperous European settlement.

That the East Africa Railway will bring our commerce into contact with 12,000,000 of people, whose wants will grow concurrently with the extension of civilization. / That the postponement of the East Africa Railway would be disastrous to humanity and injurious to the moral, religious, commercial, and political interests of the Empire.

‘That the cost of making the East Africa Railway, as compared with the vast sums we have expended in maintaining our vessels off the East Coast of Africa, is trifling’ – Mr. J. W. Lowther,\(^{5}\) Under Secretary of State.

That the locomotive in fact by means of competition would kill both the caravan and the kidnapper. Animals cannot be used owing to the prevalence in some places of the tsetse fly.

That if the East Africa Railway is not carried to the Victoria Nyanza it should be at once constructed to the Kikuyu highlands, where Europeans can settle in an exceptionally fertile and well-watered country.

That Germany, France, and the Congo State are making railways whilst we discuss evacuation.

That by substituting for this human porterage some better kind of transport the slave trade would die out.

*That the guaranteeing of a railway for the benefit of a private Company would be a dangerous precedent.\(^{†}\)

That the construction of the East Africa Railway specially recommends itself at a time when protective duties are closing so many markets to our manufacturers, whilst at the same time it would advance the cause of humanity, civilisation, and commerce.

* **Note.** – No swamp exists. The country gradually rises from the coast for the first 300 miles to an altitude of about 7,000 feet, then falls to the level of the lake, which is itself 3,850 feet above the sea. Kikuyu (half-way to the lake) is 6,000 feet, and the Mau plateau 7,000 to 9,000 feet.

† **Note.** – The only benefit to be derived by the Imperial British East Africa Company would be the Customs dues for administrative purposes. The guarantee would be for the direct benefit of the subscribers to the railway company – quite a distinct concern.
That Her Majesty’s Government proposed we should show (by the East Africa Railway) that our vaunted philanthropy was not a sham and our professions of humanitarianism were not mere hypocrisy.

That the Government must be prepared to fortify their railway, which might be done by making the stations fortresses and the signal boxes Martello towers, with guns raking the railway up and down.*

That Great Britain should recoup the Imperial British East Africa Company for its expenditure in Imperial objects, and guarantee the interest on the Victoria Nyanza Railway, in fulfillment of her obligations under the Brussels Act. / That if Uganda is to be left to anarchy, it is idle pushing forward a railway, of which the terminus will not be a British fort, but a region of unregenerate savages, with nothing except serfs to sell.

That a railway connecting Mombasa with the Victoria Nyanza would in any benefits which might thereby accrue to the coast, enable a more effective administration on the littoral to arrest the export of slaves by sea, and by its civilising effect upon the interior prevent the import of slaves from the lake region for agricultural or domestic purposes by the Arab and Swahili population of the coast area.

That the Parliamentary opponents of the grant for the East Africa Railway were justified in their action in the absence of essential information upon the merits of the case; but that they may with equal justification now reconsider the question apart from political bias in the light of the further intelligence and estimates available.

That during the debate upon the Survey Grant an extraordinary appetite was developed for information of a kind it was well known could not in the nature of things be forthcoming. The surveyors have, however, since dispelled many of the imaginary complications and gloomy apprehension then expressed.

That the greatest difficulties in the construction of the railway would be the supply of labour and food.†

That the easiest portion of the railway should be constructed, viz., to about 300 miles from the coast, leaving the mountainous part to be traversed by caravans until such time as it is desirable that the railway be extended to the lake.

That the question of holding Uganda must be decided before the railway could be constructed.

*Note. – The Company has stations along this route, but has not found such measures requisite. See note (†) at foot of previous page.
†Note. – The estimates provide for the importation of skilled Indian labour to ensure efficiency in construction. Abundance of food can be grown along the route of the line whenever required. Had any difficulty existed the railway could have carried supplies from the coast.
That to subsidise the East Africa Railway would be voting money for the benefit of a private Company,

That the entire Empire would, in the end, benefit by the preliminary expenditure of a Government Guarantee for the East Africa Railway.

That the substantial argument in regard to slavery was that in pursuance of the Brussels Act it could only be suppressed by a railway under guarantee, and, therefore, Parliament is bound to vote the Money.*

‘That when the railway is made the country can be held easily enough.’ – Lord Salisbury. /

[...]

* NOTE. – This is not quite correctly expressed. – (See the quotation from the Act.)
The Railway Extension from Charlestown to Johannesburg.  
Copy of Agreements dated 3rd and 12th February and 25th April, 1894 between the Governments of the Colony of Natal and the South African Republic (Durban: T. L. Cullingworth, 1894).

THE
RAILWAY EXTENSION
FROM
CHARLESTOWN TO JOHANNESBURG.
COPY OF AGREEMENTS,
Dated 3rd and 12th February, and 25th April, 1894.
BETWEEN THE
GOVERNMENTS
OF THE
Colony of Natal
AND THE
SOUTH AFRICAN REPUBLIC.

[...]
GOVERNMENT NOTICE NO. 67, 1894.

The following Agreement between the Governments of the South African Republic and the Colony of Natal, providing for the construction of a Line of Railway from Charlestown and Volksrust to a point of junction with the Main Line of the South African Republic, near Johannesburg, is published for general information.

JOHN ROBINSON,\(^1\)
Colonial Secretary.
Colonial Secretary’s Office, Natal,
12th February, 1894. /

Agreement dated the Third day of February, Eighteen Hundred and Ninety-four, between Jacobus Stefanus Smit, Esquire, Government Commissioner for Railways in the South African Republic; Gerrit Adriaan Arnold Middelberg, Esquire, Director of the Netherlands South African Railway Company; Maximiliaan Emile Hubert Breuning, Esquire, Chief Engineer of the Netherlands, South African Railway Company, Members of a Committee appointed by the Government of the South African Republic, and representing as such the aforesaid Government, and the Honourable Thomas Keir Murray, Minister of Lands and Works of the Colony of Natal; and David Hunter, Esquire, General Manager of the Natal Government Railways, Delegates of the Government of the Colony of Natal:

Whereas the Government of the South African Republic and the Government of the Colony of Natal, are mutually desirous of immediately extending the Railway communication now terminating at Charlestown, in the Colony of Natal, to Johannesburg and Pretoria, in the South African Republic:

And whereas an Agreement was on the 25th day of November, 1892, entered into between the Government of the South African Republic and the Government of the Colony of Natal, providing for the survey of the said Railway Extension:

And whereas the detailed survey of the said Railway Extension has been completed:

And whereas the Honourable the First Volksraad of the South African Republic did, by resolution, on the 25th day of August, 1893, approve of the building and construction of the said Railway Extension, and authorise the Government, with the advice and consent of the Executive Council, to take steps for the carrying out of such Resolution:

And whereas the Government of the South African Republic, with the advice and consent of the Executive Council as aforesaid, did, on the 4th day of January, 1894, finally decide upon the construction of the said Railway Extension:
Now therefore it is hereby agreed as follows:

Article 1. – That the Government of the Colony of Natal shall immediately extend its line of Railway from Charlestown to the boundary, between the Colony of Natal and the South African Republic.

Article 2. – That the Government of the South African Republic shall, with all possible speed, construct, equip, and work, or cause to be constructed, equipped and worked, a line of Railway from the terminus of the Natal Government Railway on the boundary via the towns of Volksrust, Standerton, and Heidelberg, to the station at Elsburg, or to such other point of the line of Railway between Vereeniging and Elandsfontein, as may be chosen by the Government of the South African Republic, provided always, that the through distance to Johannesburg and Pretoria as already surveyed, shall not be materially increased.

Article 3. – That the construction and the equipment of the lines of Railway referred to in Articles 1 and 2, shall be in all respects of equality as regards stability and efficiency with the best constructed lines of Railway in the Colony of Natal and the South African Republic, and serviceable for the conveyance of a heavy and fast traffic.

Article 4. – That the work of constructing the line of Railway referred to in Article 2 shall be commenced from the Volksrust and Johannesburg ends immediately, and that in order to accelerate the completion of the work the line of Railway from Delagoa Bay shall be utilised to convey the rails and other materials necessary for the construction from Delagoa Bay to the point of junction on the line of Railway from Vereeniging to Elandsfontein as soon as such Railway is sufficiently completed to permit of this being done, and it is hereby further agreed that the aforesaid line of Railway from Volksrust shall be completed and opened for public traffic to Johannesburg and Pretoria if possible by 31st July, 1895, but not later than 31st December, 1895, and that as soon as the line can possibly be made fit for traffic it shall be opened in sections from Volksrust to Standerton and Heidelberg respectively in anticipation of the opening of the line throughout.

Article 5. – That the Government of the Colony of Natal binds itself not to construct or work any extension of the line of Railway from Ladysmith to Harrismith which joins on any point to the north of Kroonstadt of the now existing line of Railway through the Orange Free State.

Article 6. – That near the boundary there shall be provided a joint station where the service of the Natal Government Railways Administration shall terminate and the service of the South African Republic Railway Administration shall commence, the site of this station to be in the option of the Government of the South African Republic, and the plans to be designed by one or other of the Administrations as may be arranged in conjunction with the other.
Article 7. – That the two contracting Governments bind themselves to promote in every way the practical and expeditious working of the through traffic from places in the Colony of Natal to places in the South African Republic, and from places in the South African Republic to places in the Colony of Natal, and to grant to each other all usual and useful facilities for the interchange, development, and satisfactory working of the traffic.

Article 8. – That in order to promote efficient cooperation an agreement shall be entered into between the two Railway Administrations, subject to the approval of the respective Governments, having regard to the following points: –

(a) The conditions for the use of the one Administration of the line of Railway from the boundary to the joint Station near the boundary, and for the common use of the said Station.

(b) Regulations for the interchange of rolling stock and goods in through traffic, payment for hire of rolling stock, the through traffic in passengers, goods, animals, articles, and things, the facilities for the loading, unloading, collection, and delivery of goods, the system of dividing and accounting for the proportions of fares and freights due to the respective Administrations, and all other practical details which are necessary to secure efficient and economical working.

(c) The harmonising of the Systems, whereby the rolling stock of the respective Administrations, with their continuous break and other appliances, may conveniently couple and interchange with each other.

(d) The mutual assistance to be rendered by the one Administration to the other in the matter of staff, labour, and other matters in which such mutual assistance would be possible and beneficial.

Article 9. – That the running of the trains on both lines of railway shall be so regulated as to avoid unnecessary delay, and so as to afford the best possible through service.

Article 10. – That the consignment notes for through traffic shall be drawn up by both Railway Administrations in conjunction with each other, and shall be printed in both the Dutch and English languages.

Article 11. – That the Railway Administration of each Government shall fix the rates applicable to its own line, and in the case of the route via Volksrust, the through rates for goods traffic from Port Natal to Johannesburg and Pretoria shall be the sum of the two Administration rates, provided always that the rates for ordinary goods per mile and per ton of 2,000 lbs. shall not exceed 6d. per mile and per ton, and shall not be lower than 3d. per mile and per ton, and that the rates for rough goods (that is to say coal, stone, unmanufactured wood, &c., in quantities of at least five tons) shall not exceed 3d. per mile and per ton, and shall not be lower than 1½d. per mile and per ton.
Article 12. – That if the through rates from Port Natal to Johannesburg and Pretoria upon the aforesaid basis shall become higher than the rates from Delagoa Bay to Johannesburg and Pretoria, in proportion to the mileage of the lines of both Administrations, then the through rates from Port Natal to those places shall, after consultation between the two Railway Administrations, be reduced to the proper proportions, but neither of the two Administrations shall be bound to accept lower rates than the minimum rates specified in Article II, and the rates from Port Natal to Johannesburg shall not in any case be more than 20 per cent. higher than the corresponding rates from Delagoa Bay to Johannesburg, and the rates from Port Natal to Pretoria shall not in any case be more than 40 per cent. higher than the rates from Delagoa Bay to Pretoria.

Article 13. – That should any circumstance arise which may necessitate reconsideration of the rates and other arrangements herein set forth in connection with the promotion of the traffic, either Administration may at any time call upon the other Administration for consultation, with a view to making the necessary alterations.

Article 14. – That the Government of Natal binds itself to fix the rates to be charged on its lines of Railway in the Colony of Natal, and (subject always to its existing obligations) on Railways worked by it in other States, in such manner that the sum of the rates charged by the Railway Administrations of Natal and the South African Republic shall not be lower than the rates per mile and per ton on the traffic between Delagoa Bay and Johannesburg and Pretoria.

Article 15. – That the rates for the conveyance of passengers over the lines of both Railway Administrations, shall not exceed the following:– First class 3d. per mile, lowest class 2d. per mile.

Article 16. – That the Government of the Colony of Natal binds itself not to charge on goods from Foreign ports and destined for places in the South African Republic dues which are higher than the transit duties which are now in force, or lower than the transit duties at Delagoa Bay, and the Government of the South African Republic shall afford to the Government of Natal all trade facilities which may have been or may be granted to any other Government.

Article 17. – That the two contracting Governments bind themselves to cooperate in every way to ensure the substantial and speedy construction of the line of Railway referred to in Article 2, and the Government of the Colony of Natal shall convey over its existing lines all materials, goods, or things necessary for the construction and working of the aforesaid Railway, with the least possible delay, at the rate of one penny and one halfpenny per ton and per mile, and shall pass all such materials free of all Customs and transit dues.

Article 18. – That in the event of it being found that either of the routes via Delagoa Bay or Charlestown is carrying a share of the gross goods traffic from the seaboard to Johannesburg and Pretoria which shall exceed one-half or to be less than one-third of such gross goods traffic, the two contracting Govern-
ments agree that upon the application of / either, a further Conference shall take place for the purpose of reconsidering the rates, and making such re-adjustment thereof as shall be calculated to bring about a more equitable division of the traffic carried by both routes.

Article 19. – That it shall be understood between the two contracting Governments that they shall work together in a spirit of amity and friendship for the promotion of the traffic between the South African Republic and the Ports of Delagoa Bay and Natal, and all the provisions of this Agreement shall be construed in the sense of the said understanding.

Article 20. – That any dispute or question arising out of this Agreement shall be referred to arbitration, each Government to appoint one arbitrator and the two arbitrators so appointed to appoint a third, and if the said two first arbitrators shall not agree upon the selection of a third arbitrator, then the Chief Justice of the South African Republic, upon application made by either party, shall appoint such third arbitrator, and the award of the majority shall be final.

Article 21. – This Agreement is subject to the approval of the Government of the South African Republic.

Article 22. – This Agreement is subject to the approval of the Government of the Colony of Natal, on or before the 20th February, 1894.

J. S. SMIT,
Government Commissioner for Railways in the South African Republic.

[...]
Pietermaritzburg,
12th February, 1894.

GOVERNMENT NOTICE No. 119, 1894.

The following Agreement, dated the 12th day of February, 1894, for the proper carrying out of the provisions of the Agreement entered into upon the 3rd day of February, 1894, for the extension of Railway communication from Charlestown to Johannesburg and Pretoria, is published for general information, together with a letter from the Natal Delegates to the Chairman of the Railway Commission at Pretoria, relative to the establishment of Railway communication between the Main Line of the Natal Government Railways and Vryheid.

JOHN ROBINSON,
Colonial Secretary.
Colonial Secretary’s Office, Natal,
29th March, 1894.

Agreement, dated the Twelfth day of February, 1894, between the Railway Administration of the Government of the South African Republic for the time
The Railway Extension from Charlestown to Johannesburg

being, the Netherlands South African Railway Company, represented by Maximiliaan Emile Hubert Breuning, Esquire, Engineer-in-Chief, and the Railway Administration of the Government of the Colony of Natal, represented by David Hunter, Esquire, General Manager of the Natal Government Railways.

Whereas an agreement entered into upon the Third day of February, 1894, between representatives appointed by the Government of the South African Republic and Delegates of the Government of the Colony of Natal providing for the immediate extension of Railway communication now terminating at Charlestown, in the Colony of Natal, to Johannesburg and Pretoria in the South / African Republic, has been approved by the Governments of the South African Republic and the Colony of Natal respectively: and

Whereas it is expedient that a further agreement should now be entered into between the Railway Administrations of the Government of the South African Republic and the Government of the Colony of Natal for the proper carrying out of the provisions of the aforesaid Agreement:

Now, therefore, it is hereby agreed as follows:–

Definitions.

‘Contractor’ shall mean the Railway Administration of the Government of the Colony of Natal.

‘The Engineer-in-Chief’ shall mean the Engineer-in-Chief of the Railway Administration of the Government of the South African Republic.

‘The Resident Engineer’ shall mean the Chief Engineer in charge of Construction appointed by the Railway Administration of the Government of the Colony of Natal.

‘The Engineer’ shall mean the Sectional Engineer entrusted with the execution and supervision of the work.

‘The Railway’ shall, unless otherwise specifically mentioned, mean the Line of Railway with Sidings and other accessories thereto, and works of every description, from the boundary of the South African Republic at or near Volksrust, to the point of junction with the Line of Railway from Vereeniging to Elandsfontein. /

Article 1. – That the Administration entrusts to Contractor, and Contractor hereby undertakes to carry out, the construction of the Railway from the boundary of the South African Republic, near Volksrust, to the point of junction with the Line of Railway from Vereeniging to Elandsfontein as shall be determined by the definitive plans, provided always that, in order to expedite the completion of the Railway, it shall be competent for the Administration and Contractor to
agree that the portion of the Railway between the said point of junction and Heidelberg, shall be constructed by the Administration.

Article 2. – That the Survey of the Railway carried out in terms of the Agreement, dated the 25th day of November, 1892, between the Government of the South African Republic and the Government of the Colony of Natal, shall be the basis of the construction of the Railway, subject to such modifications and improvements as may be found expedient.

Article 3. – That the Construction of the Railway shall be carried out by Contractor in terms of the Agreement, dated the 3rd February, 1894, between the Government of the South African Republic and the Government of the Colony of Natal, and that the work shall be executed in the same manner in every respect as if it were being done in the interests of Natal.

Article 4. – That the work to be undertaken by Contractor shall consist of the preparation of plans, the construction of the earthworks, masonry, stone-facings and stone-slopings, the ballasting of the Line, the laying of the Rails, the construction and erection of all Station Buildings, Railway Servants’ Cottages, and Locomotive and Goods Sheds, the erection of the superstructures of Bridges, the laying of Pipes for carrying off Water, the fixing of Signal systems and appliances for supplying Water, the erection of Telegraphs, and generally the performance of all the work / implied in Railway Construction, which definition shall be held to include the supplying of the necessary Engineering, Clerical, and Supervising Staff, skilled and unskilled labour, implements, utensils, building and all other material (excepting such as shall be furnished by the Administration according to Article 9), the transport of all building material and plant, the delivery of beacon posts, mile-posts, fittings, and everything required in surveying and setting out the earth, masonry, and iron works, and for the satisfactory completion of the works.

Article 5. – That in preparing the plans of Station Yards, Buildings, Houses, Culverts, Bridges, and such like, the adopted types of the Administration shall be followed as closely as possible.

Article 6. – That the Railway shall be constructed according to the normal transverse section to be fixed by the Administration.

Article 7. – That in case Contractor shall decide to give out to a Contractor or Contractors any part of the work, the subject of this Agreement, such work shall be put up to public tender, under conditions to be approved by the Engineer-in-Chief, and the lowest tenderer shall be entrusted with the work, unless the Resident Engineer and the Engineer-in-Chief decide that, in the best interests of the work, another tender shall be accepted.

Article 8. – That for the purpose of carrying out the work, the Engineer-in-Chief and Resident Engineer shall divide the Railway into approximate sections. Before commencing the construction of a section, Contractor shall lay out the
Article 9. – That the Administration shall deliver free of charge to Contractor at the landing wharf at Port Natal, or at the junction between Vereeniging and Elandsfontein, referred to in Article 1 (for the portion of the Line which may be constructed from that end of the Railway), all the necessary rails, sleepers, and points, with accessories, the iron work of the bridges, the material for the telegraph, pipes, signals, mile-posts, water appliances, furniture and rolling stock, and such material shall be delivered by the Administration to Contractor, so that no delay shall be caused to Contractor in carrying out the work; provided always that the actual cost of all such material shall be paid for to the Administration by Contractor, and shall be recovered by Contractor from the Administration, as provided for in Article 15.

Article 10. – That the works entrusted to Contractor shall be handed over complete to the Administration on or after the 31st July, 1895, but not later than the 31st December, 1895; provided always that if by reason of any unforeseen event beyond the control of the two contracting parties, such as unusual floods causing destruction of bridges or otherwise, wrecks of vessels containing Railway materials for the Railway, or act of God generally, Contractor shall not be able to complete the Railway within the specified time, such further time shall be granted to Contractor for the completion as may be decided upon by agreement between the two contracting parties, or in case of difference, by arbitration as provided for in Article 17; provided further, that if without the intervention of such special causes Contractor shall fail to complete the aforesaid works before the 31st July, 1896, the Administration may then, without further notice, take over the works and complete them by its own staff and means.

Article 11. – That Contractor and the Administration shall co-operate so that the use of the Railway for public traffic from the Colony of Natal to Standerton / and Heidelberg, respectively, or from the point of junction with the line of Railway from Vereeniging to Elandsfontein to Heidelberg, and vice versa, may be assured at the earliest possible date, in anticipation of the opening of the Railway throughout to Johannesburg and Pretoria.

Article 12. – That the execution of the works shall be carried out in accordance with the specification here to annexed, which, after being adjusted between Natal and the Administration, and in token thereof signed by the Engineer-in-Chief and Resident, Engineer shall be held to be a part of this Agreement.

Article 13. – That so far as may be reasonable or possible under the Law of the South African Republic, the Administration shall obtain and afford to the Engineers, Surveyors, Contractors, and other Officers, and to the other mem-
bers of the Staff employed by Contractor upon the work of Construction, every facility for entrance upon land, and shall place Contractor, without loss of time, in possession of all land required for the purpose of this Agreement, including land required for the raising and carrying of Materials, sites for Stations, Goods Sheds, Signal Stations, Platelayers’ Cottages, Residences for Railway Servants, Sidings, Watering Places for Railway purposes, and otherwise, as may be deemed requisite, convenient, and necessary for the Construction and proper equipment of the Railway and all accessories thereto, and the Administration shall further give to Contractor all other usual and useful facilities for carrying out the work of Construction.

Article 14. – That all tents and other equipments, Instruments, Horses, Mules, Oxen, Carts, Wagons, and other materials used for the purposes of Construction of the Railway shall be allowed to pass into and through the South African Republic free of all Customs Duties.

Article 15. – That Contractor shall accept as payment for the Construction of the Railway, including the salaries and wages paid, materials supplied, payments to Contractors and all other charges, the actual amount expended without adding any profit whatsoever, and such amount shall be refunded to Contractor by the Administration, at the option of the latter, either in cash or in Debenture Bonds bearing interest at the rate of Four per centum per annum, redeemable within Forty five years, the interest and redemption of which shall be directly guaranteed by the Government of the South African Republic, in manner following, that is to say:–

On the first day of each month, the Resident Engineer and the Engineer-in-Chief shall agree upon and certify a statement setting forth the value of materials provided and work done during the preceding month: such certificates shall be as closely approximate as possible and represent in globular sums the value due to Contractor, and upon receipt of such statement, duly certified as aforesaid, the Administration shall either pay to Contractor the amount in cash, or issue the aforesaid Debenture Bonds of One Hundred Pounds Sterling each for every Ninety-five Pounds Sterling of the amount payable to Natal, the interest upon such Bonds being payable half-yearly, and the interest being calculated from the fifteenth day of the month during which the expenditure by Contractor was incurred.

Article 16. – That the Administration shall within six months from the date of this Agreement notify in writing to Contractor the total amount of money which Contractor will be required to advance against the Debenture Bonds referred to in Article 15, but the amount of money to be so advanced by Contractor shall not in any case exceed One Million Two Hundred and Fifty Thousand Pounds Sterling; provided further, that in the event of the Administration desiring within six months from the date of this Agreement to redeem
any Bonds which may have been issued during that period, under the provi-
sions of Clause 15, such Bonds shall be exchanged by Contractor for the sum
advanced by Contractor thereupon, with the addition of interest at the rate of
Four per centum per annum.

Article 17. – That any dispute or question arising out of this Agreement shall
be referred to Arbitration, each Administration to appoint one Arbitrator, and
the two Arbitrators so appointed to appoint a Third, and if the said two first
Arbitrators shall not agree upon the selection of a third Arbitrator, then the
Chief Justice of the South African Republic, upon application made by either
party, shall appoint such third Arbitrator, and the award of the majority shall
be final.

Article 18. – This Agreement is subject to the approval of the Netherlands
South African Railway Company.

Article 19. – This Agreement is subject to the approval of the Government
of the South African Republic.

Article 20. – This Agreement is subject to the approval of the Government
of the Colony of Natal.

M. BREUNING,
Engineer-in-Chief of the Netherlands South African Railway Company.

DAV. HUNTER,
General Manager of the Natal Government Railways.

The Netherlands South African Railway Company hereby signifi-
cates its approval of the foregoing Agreement.

G. A. A. MIDDELBERG,
Director.

Pretoria, 13th March, 1894. /

Pietermaritzburg, March 28th, 1894.

Pretoria, February 7th, 1894.

COPY.

STR., – With reference to the desire of the Government of the South African
Republic, to establish Railway communication between the Main Line of the
Natal Government Railways and Vryheid, we have now the honour to state, on
behalf of the Government of Natal, that when the Government of the South
African Republic shall be prepared to construct the said Railway in its own Ter-
ritory, the Government of the Colony of Natal will undertake to construct at
its own expense, that portion of the said Railway within the Colony of Natal,
and to bear one half of the expense of the Bridge to carry the said Railway / over
the Buffalo River. This undertaking is subject to the approval of the Agreement,
dated 3rd February, 1894, by the Government of Natal.

WHEREAS, under the agreement dated the Third day of February, 1894, between the Government of the Colony of Natal and the Government of the South African Republic, it was provided by Article 8 as follows:–

‘Article 8. – ‘That in order to promote efficient co-operation an agreement shall be entered into between the two Railway Administrations, subject to the approval of the respective Governments, having regard to the following points:–

‘(a). The conditions for the use by the one Administration of the Line of Railway from the boundary to the joint Station near the boundary, and for the common use of the said Station.

‘(b). Regulations for the interchange of Rolling Stock and Goods in through traffic, payment for the hire of Rolling Stock, the through traffic in Passengers, Goods, Animals, Articles and Things, the facilities for the loading, unloading, collection and delivery of goods, the system of dividing and accounting for the proportions of Fares and Freights due to the respective Administrations, and all other practical details which are necessary to secure efficient and economical working. /

‘(c). The harmonising of the systems whereby the Rolling Stock of the respective Administrations, with their Continuous Break and other appliances, may conveniently couple and interchange with each other.

‘(d). The mutual assistance to be rendered by the one Administration to the other in the matter of Staff, Labour, and other matters in which such mutual assistance would be possible and beneficial’

NOW, THEREFORE, it is hereby agreed as follows:–
Definitions.

‘Natal’ shall mean the Railway Administration of the Government of the Colony of Natal.

‘Through Traffic’ shall mean Passengers, Goods, Animals, Articles, and Things passing over portions of the Lines of both Railway Administrations.

‘Local Traffic’ shall mean Passengers, Goods Animals, Articles, and Things passing over the Lines of only one Administration.

‘Up Trains’ shall mean Trains from the Colony of Natal.

‘Down Trains’ shall mean Trains from the South African Republic.

‘Mileage Charges’ shall mean the Rates per Mile to be paid to the owning Administration for the running of their Vehicles over the Lines of the other Administration.

A ‘Train’ shall mean an Engine with or without Vehicles attached. / 

Article 1. – That the boundary Station of Natal shall be at Charlestown, and the boundary Station of the Administration shall be at Volksrust, and that the Main Line of Railway between the two boundary Stations shall be used in common by both Administrations for the interchange of Traffic, subject to working regulations to be agreed upon between the two Administrations, provided always that each Administration shall maintain, repair, and keep in good working order the portion of Railway on its own side of the boundary, and shall be responsible for the Vehicles composing the Train coming from its Line, until they have been accepted by the other Administration at the boundary Station.

Article 2. – That the distance from Charlestown Station to the boundary shall be reckoned as Two Miles and Three-quarters (2¾), and the distance from Volksrust Station to the boundary shall be reckoned as Three-quarters (¾) of a Mile.

Article 3. – That all Up Trains conveying Traffic for the South African Republic shall be worked by Natal Engines and Staff (viz., Engine Drivers, Firemen, Guards, Conductors, and the like) to Volksrust, where all Traffic with the relative Waybills, Invoices and other documents shall be handed over by the Guard or Conductor to the Administration, and in like manner that all Down Trains conveying Traffic for the Colony of Natal shall be worked by the Engines and Staff of the Administration to Charlestown, and the charge to be made by the one Administration for working a Train over the Line of the other shall be at the rate of TENPENCE per Train Mile run, and the working back of the Engines and Staff from the one boundary Station to the other, after completing the journey, shall be arranged by the local officers of the two Administrations.
Article 4. – That any Shunting necessary in dealing with the Through Traffic at either boundary Station shall, if required, be performed by the Engine and Staff of either Administration without charge to the other, provided always that if it should appear after a period of trial that undue advantage is gained by one Administration over the other by this arrangement, it shall be competent for either Administration to call upon the other to further consider it, with a view to an equitable readjustment.

Article 5. – That Water, Coal, and other Stores shall be supplied, if required in emergency, by the one Administration to the Engines of the other, at the following rates, viz.: Water, Two Shillings and Sixpence per Tank; Coal One Shilling and Sixpence per Hundredweight; and Oil, Tallow, and other Stores at cost price.

Article 6. – That in case of accident or breakdown in the neighbourhood of the boundary, each Administration shall assist the other with Engine power, Rolling Stock, Staff, and appliances, and the Administration so assisting shall be repaid the actual expense incurred by the Administration assisted, it being understood that train mileage shall be paid for at the rate of Tenpence per Mile, and in case of Shunting, other than for Through Traffic, as provided for in Article 3, at the rate of Six Shillings per hour.

Article 7. – That in the event of one Administration requiring to borrow from the other Engine power, Rolling Stock, or plant for local purposes, such may be done subject to special arrangements as to terms.

Article 8. – That the arrangements for the interchange of Through Traffic shall specially include the running of Passenger Carriages of a superior type, with lavatory and sleeping accommodation, and Luggage Vans, between Durban and Johannesburg and Pretoria, and that any wagon loaded with Through Traffic to half its carrying capacity shall be run through to its destination without transhipment.

Article 9. – That each Administration shall hand over to the other in good and safe running order all Vehicles conveying Through Traffic, and any defect or damage appearing on examination at the boundary Station where the Train is handed over, shall be pointed out by the Clearing Officer at the boundary Station to, and noted by, the Guard of the Train, who will also record the same in his Train Journal for the information of his superior Officers, provided always that any vehicle which may be considered unfit to travel may be detached from the Train by either Administration.

Article 10. – That each Administration shall be responsible for damage to Rolling Stock occurring whilst in its possession, and the owning Administration shall be entitled to recover from the other the actual cost of repairing damage proved as in Article 9, plus 10 per cent. for supervision, in all cases when such cost shall exceed Five Pounds Sterling.
Article 11. – That at each of the boundary Stations there shall be appointed an independent Clearing Officer, one appointed by Natal, the other by the Administration, who shall record the numbers and description of all Vehicles, loaded or empty, passing from the line of one Administration to the other, and the hour of their arrival, with all damages or defects which may be discovered by the Carriage and Wagon examiners, the Clearing Officer at Volksrust recording the Vehicles brought by all ‘Up Trains,’ and the Clearing Officer at Charlestown recording the Vehicles brought by all ‘Down Trains.’

Such Clearing Officers shall be appointed and paid jointly, and shall forward to each Administration Monthly Returns, according to the forms supplied and joint instructions given from time to time.

Article 12. – That in the event of a Vehicle belonging to one administration being damaged on the Line of the other, such damage shall be made good by the latter, so far as to enable it to be returned without delay to the owning Administration, which shall forward free of cost upon application such parts or portions of Vehicles as may be necessary, and broken or damaged portions of Vehicles shall in like manner be returned to the owning Administration.

Article 13. – That the Rates to be charged by the one Administration against the other in respect of Vehicles of / the one passing over the lines of the other, or detained thereupon, as the case may be, shall be as under:–

Passenger Carriages and Vans, Id. per hour and per axle: all other Vehicles, 3/4d. per hour and per axle,

Note. – No charge shall be made upon spare or Reserve Vehicles of one Administration, which by mutual arrangement are kept upon the Line of the other Administration nor upon Vehicles which may have been, detained by accident, for repairs, or some unavoidable cause explained satisfactorily to the owning Administration.

Article 14. – That the Vehicles of one Administration shall not be employed upon the Lines of the other Administration for local Traffic, without the permission of the owning Administration, provided, however, that Vehicles returning to the Line of the owning Administration may be loaded to any Station on the Main Line route of return.

Article 15. – That the working of the Vehicles of the one Administration over the Lines of the other, shall be regulated as far as possible so as to avoid money payments; but should one Administration be unable to furnish its quota of Rolling Stock, the other Administration may arrange to supply the deficiency, and in such case mutual arrangements shall be made for periodical payment to the latter of the charges provided for in Article 13.

Article 16. – That the Through Rates for ordinary Goods shall include loading and unloading, and that the expense of such loading and unloading shall be borne without addition to the Through Rate by the forwarding or receiving
Administration, as the case may be; provided always that the contract price for collection or delivery (as the case may be), where such service is given, shall be matter of agreement between the two Administrations.

Article 17. – That further details having reference to Train Service, Passenger Accommodation, Fares to be / charged, Rates for Parcels and other Traffic conveyed by Passenger Trains, the classification, collection, and delivery of goods and other Traffic, shall be arranged from time to time by correspondence or conference between the Administration and Natal.

Article 18. – That through Tickets for Passengers and Through Waybills, or Invoices for Goods, Animals, Article, and Things, shall be issued between any Station of the one Administration to any Station of the other Administration, as may be arranged from time to time, and that the division of the receipts for ‘Through Traffic’ between the two Administrations shall be arranged upon a ‘Clearing’ System of Accounts, and a Through Mileage Table of Distances, to be adjusted between the two Administrations, which latter shall be based upon the distances from the boundary where the Lines of the two Administrations join; providing always that in calculating ‘Through Rates’ upon the said Mileage Table, fractions of a Mile under a quarter of a Mile shall not be reckoned, and those over a quarter of a Mile shall be reckoned as a whole Mile.

Article 19. – That monthly Accounts of Through Traffic and other matters, the subject of this Agreement, shall be rendered by each Administration to the other not later than the Twentieth of the succeeding month, and that Settlement thereof shall be made within one Calendar Month thereafter, provided always that any errors or omissions in the said Accounts detected by the Accounting Officers of the respective Administrations shall be notified each to the other, and adjusted in the next Account, to the intent that the Accounts as rendered may be paid without alteration, deduction, or addition.

Article 20. – That the arrangements for dealing with the Goods Traffic at the intended Temporary Termi at Standerton and Heidelberg shall follow the practice hitherto adopted in Natal, of providing Shed Spaces, which may be let to the Forwarding Agents, and that with a view to make the arrangements work smoothly, Natal / shall supply for temporary service to the Administration, and at the expense of the latter, an Officer acquainted with the methods of working hitherto pursued in dealing with the Through Traffic at the Natal Termi.

Article 21. – That should the Administration so desire, Natal shall work by its own Engines, Rolling Stock, Enginemen and Guards, either wholly or partially, the Traffic to and from Standerton, upon the opening for public Traffic of the first section of the Railway from Volksrust to Standerton, and in such event timeous arrangements as to terms and other details shall be made between the two Administrations.
Article 22. – That at Johannesburg and Pretoria the Administration shall provide adequate Goods Shed accommodation for Traffic from Natal, and shall include in their collection and delivery arrangements the traffic to and from Natal, and give in every respect the same facilities thereto as may have been, or may be given to the similar Traffic by other routes, and that all cranes, platforms, loading banks, and other appliances and conveniences necessary for dealing with special classes of Traffic shall, in like manner, be provided by the Administration.

Article 23. – That the responsibility for any loss or damage to life, limb, or property occurring upon the Line of one or other of the Administrations, or in the case of the Common Line between Charlestown and Volksrust, through the fault of any Employé of such Administration shall be borne by such Administration, provided always that in cases where loss, damage, or delay to Goods, Animals, Articles, or Things in Through Traffic in which it is not possible to fix the whole blame upon one Administration, after enquiry and correspondence, any compensation paid to the public shall be borne by both Administrations in the proportion of the freight received by each, provided further that the particular Administration against which such a claim for compensation may be made in respect of Through Traffic may, in its discretion, settle such claim, if not exceeding Twenty Pounds in amount, and advise the other Administration thereof.

Article 24. – That in order to facilitate the interchange of the Rolling Stock of the respective Administrations. Natal shall gradually adopt the Standard Pipe and Coupling of the Automatic Vacuum Break now in use by the Administration, and shall, until the Rolling Stock has in this respect been completely assimilated, furnish the Brass Rings necessary to enable the present arrangements to couple, a supply of which the Guards of both Administrations shall carry as part of their kit, and it is further agreed that the shorter links necessary to enable the Rolling Stock of the respective Administrations to couple together, shall be supplied by Natal to the Administration at cost price; a supply of these being also a part of the kit of the Guards of both Administrations.

Article 25. – That in case modification of any of the arrangements herein set forth may be necessary through alteration in circumstances, it shall be competent for either Administration to claim reconsideration thereof, and any alteration that may be deemed desirable shall be agreed upon mutually between the two Administrations.

Article 26. – This Agreement is subject to the approval of the Government of the Colony of Natal.

Article 27. – This Agreement is subject to the approval of the Government of the South African Republic.

(Signed) DAVID HUNTER,
General Manager of the Natal Government Railways.

[...]
MEMORANDUM ON THE QUESTION OF THE DELAGOA BAY RAILWAY.

I. – The History of the Delagoa Bay Railway.¹

IN 1875 a Treaty of Friendship and Commerce was concluded between Portugal and the South African Republic. It was ratified in 1882, and is in force for twenty years from that date.

By a Protocol annexed to it, Portugal engaged to assist in the construction of a line from Lourenco Marques to the frontier of the South African Republic, by giving to any substantial Company formed for that purpose a subvention equal to half the estimated cost, with sundry other privileges. The Company would have the exclusive right of working the railway for ninety-nine years (subject to a right of redemption), at the end of which time it would revert to the Portuguese Government without compensation. The South African Republic, in return, bound itself to continue the line from the frontier to a centre of production and consumption.
By clause 8 of the Treaty, merchandize imported through Delagoa Bay for the South African Republic might be subjected to an import duty of 3 per cent., which might be raised to 6 per cent. if necessary to meet interest and sinking fund on the subvention to the Railway Company, but as soon as the capital had been redeemed, the import duty was to be reduced to 1½ per cent.

Between 1876 and 1879 attempts were made to obtain funds for both sections of the projected line, but they proved abortive.

In 1882 Major Machado made, for the Portuguese Government, plans of the Portuguese section.

On the 14th December, 1883, the Portuguese Government gave a Concession to E. MacMurdo (a United States' citizen) for constructing a line from Delagoa Bay to the frontier of the South African Republic. He did not ask for any subvention from the Portuguese, and therefore he obtained other advantages not contemplated in the Protocol to the Treaty of 1875. The principal conditions were as follows: MacMurdo to form a Portuguese Company domiciled at Lisbon within six months of signing the contract. The Company to have the exclusive right to construct and work the line and its telegraphs, with the quays, docks, &c., necessary for development of traffic. The Concession to last for ninety-nine years, after which the line would revert to the State. No other line (‘linha ferrea’) to be constructed within 100 kilom. (62½ miles) on either side of the line which could compete with it. The Company to complete the line within three years of its plans being approved by the Government. If, after beginning the line, the Company failed to complete it or to carry out the terms of the contract, the line to be put up to public auction during six months and sold to the highest bidder, the price received, less the expenses of the Government, being paid over to the Company; but if there was no bid, the line to revert to the Government without payment. Any proved case of force majeure\(^2\) to be exempt from these conditions. There was also an arbitration clause.

The Company were further to receive a grant of 250,000 acres of land in perpetuity, with a large block, on the harbour of the bay.

As the Contract was silent on the point, it followed that the Company had the right to fix their own tariffs without Government interference. This right was on several occasions acknowledged by the Portuguese Government.

The general direction of the railway was to follow Machado's plans, which were to be submitted to the Company for consideration on points of detail. This was done, and the Company's recommendations were approved by a Royal Decree of the 30th October, 1884, which specified the length of the line to the frontier as being 81.970 kilom., at which point the word 'frontier' was marked on the plans. It followed that the line had to be completed by the 30th October, 1887.

Within five months of the signature of this Contract the Transvaal Government commenced a war of intrigue against it, which was actively pursued until
the confiscation of the line in 1889; but it is impossible within the limits of this Memorandum to do more than sketch their proceedings in the briefest outline.

In May 1884 the Deputation (Krüger, Du Toit, and Smit) who had come to London to negotiate for an amendment of the Pretoria Convention visited Lisbon. They informed the Portuguese Government that they were negotiating with a powerful Dutch Syndicate for the construction of their section of the line, and that the Syndicate were anxious to get the Concession for the Portuguese section. They threw doubt on the ability of MacMurdo to carry out his Contract, and asked the Portuguese Minister to use his influence to get the Contract transferred to the Dutch Company, or at least to grant them land at Delagoa Bay, and the right to construct a 'tramway' from the bay to the frontier. They worried the Minister to such an extent that he made them a formal promise (1) that if the Delagoa Bay line was not completed in time to assist the construction of the South African Republic line, he would allow them to construct a tramway for the sole purpose of transporting their railway material, and (2) that if MacMurdo's Concession should be annulled through failure to carry out his engagements, it should be transferred to the future Dutch Company.

Still, the Deputation were not satisfied. They affected to fear that MacMurdo's Company would abuse its right to fix the tariffs over its line, and they again demanded the immediate right to construct and work a tramway (i.e., for all purposes, and not merely for the transport of their railway material from Delagoa Bay to the frontier).

The Portuguese Government advised them to attempt to come to some understanding with the Lourenço Marques Company on the question of tariffs; and on the 16th May the Minister of Marine replied to their representations by an absolute refusal to agree to them so long as the Portuguese Company fulfilled its engagements. He said that to give a public undertaking of the kind would be 'absolutely disloyal,' as it would be 'hanging a sword of Damocles over the head of the Lourenço Marques Company,' and would give the Delegates a weapon with which they could force into bankruptcy a Company that hitherto had fulfilled all its engagements. / The very next day (17th May) the Minister for Foreign Affairs gave a Memorandum to the Deputation, by which the Portuguese Government bound itself to give the Dutch Company a tramway for the transport of railway material in case the Delagoa Bay Railway were not finished with sufficient speed to assure the commencement of the Transvaal Railway; and also to allow the tramway to be used for the transport of merchandise and passengers if the two Companies failed to arrive at a general tariff agreement.

These promises were of course in flagrant violation of the MacMurdo Contract, and the Portuguese Government used every endeavour to keep them secret. They did not communicate the Memorandum to the Portuguese Company, and they did not include it in the Portuguese White Book of 1885. Moreover, the
Memorandum was excluded from the Portuguese copy of a Convention of 1886, supplementary to the Treaty of 1875, while it was included in the copy of the South African Republic. A procès-verbal explained that this was done because the Memorandum, not requiring legislative sanction, had not been presented to the Chambers.

To the Transvaal Government, however, this engagement would have been useless for their ulterior ends had they preserved the same secrecy as the Portuguese, and they caused it to be spread about that they had received the promise of a tramway for all purposes. They thus on three occasions defeated the attempts of the Lourenço Marques Company to obtain money for their line.

The Portuguese Government, when appealed to to counteract these manoeuvres by stating the truth, declared that they were under no such engagement; and at last, under pressure from the Company, a Royal Decree was issued (25th July, 1886), which stated that the Company had the exclusive right to construct and work the railway; that no other Concession was in existence for the construction and working of any means of communication whatever across the district of Lourenço Marques; and that the Portuguese Government had made no promise of a Concession whose terms or conditions were or could be interpreted as contrary to any stipulation whatever of the MacMurdo Contract.

In 1885 the three years accorded to the Company for completing the line were by Royal Decree extended to four, on condition that the works were begun before June 1886. As this condition, thanks to the manoeuvres of the Boers, appeared to be impossible of realization, the Company, in May 1886, induced the Portuguese Government to begin the construction for them. In March 1887 the Company paid for and took over from the Government the work thus done on their behalf.

In February 1887 the Government drew up a Decree annulling the Concession, and showed it to the Transvaal Minister, assuring him that it would be executed shortly. It appears to have actually received the King’s signature in the following month, but was never promulgated. It was just at this moment that MacMurdo made his last and successful attempt to raise the necessary funds. This was done by forming an English Company – the Delagoa Bay and East African Railway (Limited) – whose legal position was that of a shareholder in the Portuguese Company, as the entire absorption of the latter would have entailed the forfeiture of the Concession.

In June 1887 work was actively begun on the line, and it was opened for traffic on the 14th December, 1888, the construction having been, according to the testimony of the Government engineer, Machado, carried out in the most satisfactory manner.

In March 1887 the Portuguese Government informed Van Blokland (the Transvaal Minister to Germany, Portugal, and Holland) that the Company was
now in a position to proceed with the construction, and that therefore they
could no longer pursue negotiations with other persons respecting the Conces-
sion. If the Transvaal had only been anxious for the completion of their own
line, this intelligence would of course have been satisfactory to them. But their
real aim being to secure possession of the Lourenço Marques line the news was
highly distasteful, and they expressed themselves in strong language, saying that,
rather than submit to English influence, they would prefer to join their line to
the Natal system.

Under this menace of cutting off Lourenço Marques from the interior, they
demanded either the immediate concession of a tramway, or a maximum tariff
for the whole ninety-nine years of the Concession. /

The Portuguese Government urged the South African Republic to submit
a tariff, which they engaged to recommend to the Lourenço Marques Com-
pany, and, after some remonstrance, they consented. The tariff, however, when
presented, proved to be a fresh move in their game. It provided for a division
of receipts on a kilometrical basis, by which, owing to the great length of the
Transvaal section as compared with the other, the latter could not have paid its
expenses, and therefore the Directors refused to entertain it.

The next device of the South African Republic to kill the railway was to pro-
pose that they should be allowed to make use of the Incomati River, and, by a
heavy expenditure, render it navigable up to the frontier. This was refused by the
Portuguese Government, as being in violation of the Concession.

In 1885, or possibly earlier, Machado discovered that he had made an error of
9 kilom. in his plans, the frontier being that distance further from Delagoa Bay
than he had imagined in 1882; but, though he informed his Government of this
at the time, and reminded them of it in 1886, no communication was made to
the Company to inform them that the plans already approved by Royal Decree
were incorrect.

Machado and the Boers, who had found means to attach him to their inter-
est by appointing him their railway surveyor, saw the advantage to be derived
from this fact, and in July 1887 he informed the Railway Company’s engineer at
Lourenço Marques that beyond the terminus of the line, as shown in the plans
already approved, a further section of 9 kilom. would be required to bring it up
to the frontier.

By the time the Contract for the completion of the line according to the
plans had been given out, and the work was in active progress. The Portuguese
Directors, on being informed of Machado’s communication, at once asked for
explanations at Lisbon, and, after careful inquiry, were informed in October that
nothing was known officially or unofficially at the Ministry of Marine on the
subject of the 9 kilom.
In November 1887 the Portuguese Government called the attention of the Company to the fact that the last section had still to be made; and the latter, while claiming that they had discharged their obligation under the Contract by constructing the line to the point marked ‘frontier’ on the approved plans, expressed their willingness to continue the line, but they pointed out that to do so, it was necessary for them to learn where the frontier was. They were informed, in reply, that the delimitation of the frontier was then the subject of negotiation with the South African Republic, whose claim in the matter was unacceptable to the Portuguese Government, and whose position was supposed to be connected with the railway tariff question; but that as soon as the frontier was settled, the Government would fix a reasonable period for completing the line.

In the negotiations that took place between Portugal and the South African Republic, the latter now showed their hand clearly. Until the Contract was annulled, or the tariff arrangement which they had propounded was forced on the Company, they refused to delimit the frontier, or to allow the Netherlands Railway Company to commence their section, and they threatened to close the Komatie poort, so as to deprive the Lourenço Marques line of any chance of traffic from the Transvaal. They also suggested to the Portuguese Government that the non-completion of the 9 kilom. gave them a lever to force the Company to submit to their terms.

On the 10th March, 1888, Bok, the Transvaal Secretary, wrote that his Government expected the Portuguese Government to do all in their power to compel the Company to come to a tariff arrangement, or to forfeit the Concession; adding ‘it is unnecessary to assure your Excellency that if your Government incurs any pecuniary sacrifice in connection with annulling the Concession, this Government is ready to bear its just share. . . . I am instructed to assure your Excellency that this Government guarantees the exact performance of the conditions of the railway Concession in case of its being withdrawn from its present holders.’

The demands of the South African Republic were pressed with increasing energy, until at last on the 23rd June, 1888, Van Blokland telegraphed to the Dutch Consul-General at Lisbon to inform the Ministry that the South African Republic ‘insisted’ on either the tariff, or / forfeiture of the Concession, or a grant of the Tramway Concession, and demanded a categorical reply. On the 26th June the Minister of Marine wrote to the Minister of Foreign Affairs, showing reasons why none of these courses would be equitable at the present time; but on the 28th June the latter informed Van Blokland that the Portuguese Government were ready to demand from the Company the immediate construction of the line to the frontier, and the acceptance of the tariff demanded by

* The gorge through which the line passes as it crosses the frontier.
the South African Republic, if the latter, on their side, would engage to fix the frontier according to a Convention already proposed.

The Company having refused to accept the tariff, a Royal Decree was issued on the 24th October, 1888, ordering the Company to complete the line to a terminus in the Incomati poort within eight months. The Company protested that this would be impossible, as the period included the rainy season from November to May, during which it would be impossible to work, but their protests were met by new and more peremptory Decrees confirming the first.

To add to their difficulties unusually severe floods occurred in January 1880, which not only proved that Machado’s plans for the last section were impracticable, but also swept away portions of the line already opened. This, of course, should have been regarded as a case of force majeure under the Contract, and, moreover, the Portuguese Directors were privately assured by the Minister of Marine that if the Company showed its desire to fulfil the Contract by commencing the work, they would undoubtedly be granted a prolongation of the time. Relying on this, the Company sent out the necessary plant and began work even before the end of May, and they used the utmost efforts to get a three months’ prolongation. In this they were supported both by the United States’ and by Her Majesty’s Government, who warned the Portuguese Government that to refuse to extend the time, or to arbitrate under the arbitration clause of the Contract, would be regarded as ‘a very serious step.’ The Portuguese Government, however, were deaf to all remonstrance, and on the 25th June, 1889, the eight months having expired on the previous day, they seized the railway with an armed force, and annulled the Concession by Royal Decree.

The British Company appealed to their Government for redress. The Law Officers (Sir R. Webster and Sir E. Clarke), as well as Sir Charles Russell, Sir H. James, Sir Horace Davey, and Mr. Underwood, were unanimous in their opinion that the conduct of the Portuguese Government was unjustifiable; and the Law Officers considered the case so clear that they advised Lord Salisbury to refuse to admit any question as to the right of Portugal to make the seizure. They also considered that the claim of the Company to receive 1,000,000£ in respect of its capital was not unreasonable.

A passing reference may be made to the composition of the Portuguese Board, who resigned in a body as soon as Her Majesty’s Government intervened in the matter. The first President was M. Serpa Pimentel, an ex-Minister. He was succeeded by M. Chagas, the Minister who had given the Concession to MacMurdo, and who, up to the date of the seizure, vigorously upheld the interests of the Company, but who, two days after he had resigned, publicly approved the policy of his Government from his place in the Chamber. Another Director was M. Ressano Garcia, who resigned to become Minister of Marine, and four
months later drew up the ‘Exposé des Motifs’ and the Royal Decree annulling the Concession.

None of the Portuguese Directors appear to have paid anything for their qualifying shares, and some of them appear to have made considerable profit by selling the shares presented to them by MacMurdo. It is interesting to observe that in May 1887 Baron de Costa-Ricci, the Financial Agent of the Portuguese Government in London, writes to MacMurdo to ask when he may expect the realization of his spontaneous and generous promise to give him 200 shares in the British Company. (Répl. Angl., p. 159.)

Demands for reparation were made to the Portuguese Government by Her Majesty’s Government on behalf of the British Company, and by the United States on behalf of the widow of MacMurdo, who had died in May 1889.

The Portuguese at first refused to treat with, or to recognize, any one save the Portuguese Company; but at length they gave way, and agreed to submit to the arbitration of three Swiss jurists the question of the amount of the indemnity for which they were liable.

On the 8th August, 1890, the Swiss Government were asked to select the Arbitrators, and on the 17th September they selected MM. Blaesi, Heussler, and Soldan. After considerable correspondence between the three Governments, the terms of reference were finally settled on the 13th June, 1891.

On the 5th March, 1892, the Rules of Procedure were promulgated.

On the 2nd April, 1892, the British Case was filed. The Portuguese Counter-Case should have been presented by the 22nd July, but they obtained extensions of time to the 31st December.

The British and United States’ replies were to be filed by the 31st March, 1893, but owing to the length of the Portuguese Case and to other causes, the British claimants were not able to send in their reply till the 10th November, 1893. The Portuguese rejoinder was presented on the 14th November, 1894. The Tribunal then required each side to file a list of the essential facts of its Case, and the points on which it considered that oral or expert evidence should be taken; and this was done in August last.

The further action of the Arbitrators has not yet been reported, but they have to decide what evidence they will receive, and after this has been taken Counsel will address them, so that it is clear that the Award will not be given for some time to come.

The British claim is for 1,138,500 l. and the American for 760,000 l., plus, in each case, interest from the 25th June, 1889, and costs. Thus, the combined claims considerably exceed 2,500,000 l. The Portuguese, on the other hand, estimate the value of the line at about 163,000 l., from which they make deductions sufficient to bring in the Company as in their debt to about 100,000 l., without
taking into account the ‘material and moral prejudice’ caused to them by the Company’s misdeeds.

The position of the British and United States’ Governments in the arbitration is not identical. The former have confined their action to bringing the English claimants in regular form before the Tribunal, so that they may state their case. The United States’ Government at first proposed to appear directly as claimants, but Lord Salisbury induced them to adopt a line more in harmony with his own.

The bonds and shares owned by MacMurdo’s widow were held (as security apparently) by creditors of MacMurdo’s estate; and the English Company asked that the whole of the sum awarded might be handed to them for due and proper distribution. Mr. Blaine absolutely refused to go on with the arbitration on such terms, and at length a compromise was arranged by which MacMurdo’s creditors deposited their bonds with the United States’ Minister in London on an assurance that the United States’ Government would set aside an equitable portion of the Award to be dealt with as part of MacMurdo’s estate, the other portion being reserved for the personal benefit of his widow.

It has already been stated that one of the conditions of the MacMurdo Contract was that if the Company failed to complete the line and the Portuguese Government stepped in, the Concession should be put up to auction on the same terms, and the sum realized, less the expenses of the Government, should be paid to the Company; and the Royal Decree of the 25th June, 1889, which rescinded the Concession, gave directions accordingly. It is evident that had this condition been fulfilled, it would have enabled the Company to recover their property; for they would have been able, under these circumstances, to outbid any other competitor. But the condition was never carried out, partly because (as is believed) of foreign pressure, and partly because the Portuguese Government speedily put it out of their power to put the Concession up to auction ‘on the same conditions.’

For in August 1889 Van Blokland* appeared once more at Lisbon, and departed in a few days after accomplishing his Mission, which was to arrange a permanent tariff over the Transvaal and Portuguese sections of the line.

On the 4th September, 1889, a Tariff Arrangement / was signed between the Minister of Marine as representing the Lourenco Marques Company and Mr. Ernest George, the Transvaal Consul at Lisbon, the terms being practically those which the Delagoa Bay Railway Company had refused, including a kilo-

* As an evidence of what reliance is to be placed on Van Blokland, it may be mentioned that on the 6th July, 1889, he assured our Minister at the Hague that since the 17th May, 1884, the date of the secret engagement, the Transvaal Government had ‘been parties to no further transaction in connection with this affair.’ For a long time, Sir Horace Rum- bold seems to have been completely deceived as to the real attitude of Van Blokland and the Dutch Government.
metrical division of receipts, by which, as shown above, the Transvaal Company can, if necessary, deprive the Portuguese section of all chance of profit. This being settled, the Transvaal, who had hitherto forbidden their concessionnaires, the Netherlands South Africa Railway Company, to commence work, caused their section to be pushed on with all speed. The Portuguese Government, on their side, finished the last section of 9 kilom. (at extravagant expense), and the whole line from Pretoria to Delagoa Bay was completed before the end of 1894, although the formal inauguration did not take place till July 1895.

Before leaving this portion of the subject, it is necessary to mention a correspondence that took place in 1888 between the South African Republic and Her Majesty’s Government with reference to the railway.

On the 26th May, 1888, President Krüger telegraphed to Sir Hercules Robinson to ask if Her Majesty’s Government were willing to declare that they had no intention to buy or acquire the Delagoa Bay Railway, or the controlling power in the railway or in MacMurdo’s Company; and that they had no intention to oppose or counteract the Transvaal Government with regard to the railway. He gave as his reason the belief that MacMurdo, strengthened by the hope of support from Her Majesty’s Government, would refuse to agree in the tariff question.

Sir Hercules Robinson advised that the President be informed that Her Majesty’s Government would give the assurance desired, if the Government of the South African Republic would state that they had no intention to impose duties on imports by colonial routes other than those imposed on imports by the Delagoa Bay route.

By clause 39 of the Netherlands South African Railway Company’s Concession, the Transvaal Government had engaged to levy no duties on goods imported by the Delagoa Bay line. The Law Officers were at this time being consulted as to whether this engagement was a breach of the XIIIth Article of the London Convention securing most-favoured-nation treatment for British imports, and they reported favourably to our view.

On the 16th June Sir H. Robinson was empowered to give the assurance asked for, as far as the words ‘in MacMurdo’s Company’ on the conditions suggested by him, and without prejudice to our position under the Convention, in case our offer was not accepted. The rest was considered too vague to be the subject of a declaration by Her Majesty’s Government.

On the 19th and 22nd June President Kruger gave the assurance that the South African Republic had no intention to impose duties on imports by colonial routes other than those imposed on imports by the Delagoa Bay line, and stated that the Railway Company had agreed to cancel Article 39 of their Concession.
He did not add that the Railway Company were compensated by receiving, instead of this, the amount of all the duties collected on goods coming in by their line.

II. – The British Rights in connection with the Province of Lourenço Marques and the Railway.

In 1875, when the MacMahon Award (respecting the southern portion of Delagoa Bay and territory to the south thereof) was about to be given, Her Majesty’s Government proposed to the Portuguese Government to make an Agreement that ‘the Power in whose favour the Award is made will not entertain any proposal for the acquisition of the said territory by any other Power until the defeated claimant shall have had an opportunity of making to the successful claimant a reasonable offer for the acquisition of that territory, either by purchase or for some other consideration.’ The Portuguese Minister gave in return ‘the fullest assurance as to the determination of the Portuguese Government of not ceding to any third Power the territory the possession of which may be secured for it in virtue of the arbitration.’ In acknowledging this assurance, Lord Lytton referred to it as one ‘not to cede or sell to any / third Power . . . without having previously given to Her Britannic Majesty’s Government the opportunity of making a reasonable offer for the purchase or acquisition by other arrangements satisfactory to Portugal of the territory thus awarded.’

In 1886 Sir Geo. Petre was instructed to obtain a renewal or confirmation of this assurance. Senhor Barros Gomes told him that, even before referring to the correspondence of 1875, he ‘could at once give the most positive and unqualified assurance that the Portuguese Government had not the remotest intention of ceding Delagoa Bay on any consideration,’ and that Portugal ‘would scrupulously and loyally abide by whatever engagement she had entered into with Great Britain on this particular question as on all others.’ Subsequently Sir G. Petre reported, in a despatch dated the 8th January, 1887, that Senhor Barros Gomes, after referring to the correspondence of 1875, had given him ‘an unqualified assurance that the Portuguese Government considered that engagement as a binding one.’

On the 11th June, 1891, a Treaty was concluded between Great Britain and Portugal for the purpose of settling the grave questions that had arisen between the two Powers in Africa.

Article I defined the Portuguese territories north of the Zambezi; Article II those south of the Zambezi; Article III allowed the Portuguese to extend their sphere of influence south of Delagoa Bay as far as a parallel following the confluence of the Maputa and Pongolo to the sea; and Article VII, after a reference to Articles I to VI, provided in its second paragraph that ‘the two Powers agree that in the event of one of them proposing to part with any of the territories to the
south of the Zambezi assigned by these Articles’ (*i.e.*, I to VI) ‘to their respective spheres of influence, the other shall be recognized as possessing a preferential right to the territories in question, or any portion of them, upon terms similar to those proposed.’

Our rights as against the South African Republic are defined by Article IV of the London Convention of 1884, which is as follows:–

‘The South African Republic will conclude no Treaty or engagement with any State or nation other than the Orange Free State, nor with any / native tribe to the eastward or westward of the Republic, until the same has been approved by Her Majesty the Queen. Such approval shall be considered to have been granted if Her Majesty’s Government shall not, within six months after receiving a copy of such Treaty (which shall be delivered to them immediately upon its completion), have notified that the conclusion of such Treaty is in conflict with the interests of Great Britain, or of any of Her Majesty’s possessions in South Africa.’

The interpretation placed by Her Majesty’s Government on these stipulations will be most conveniently shown in the next section; but it may be observed here that the above-quoted Article VII was not accepted by the Portuguese without demur, and that Lord Salisbury, while refusing to abandon it, gave it a reciprocal form in order to spare their susceptibilities as much as possible. The Portuguese fought hard against our demands on this and other points, and instructed their Representatives abroad to invoke the intervention of the Powers,* but without success. When matters seemed at a deadlock the German Ambassador unofficially tendered his good offices to Lord Salisbury, ‘not because Germany had any interest in the questions at issue,’ but for reasons of international policy. He obtained a copy of the draft Treaty from the Portuguese, and offered to Lord Salisbury certain comments upon it;† but he does not appear to have made any reference to Article VII. It may be important to bear this in mind hereafter.

III. – Negotiations with Portugal respecting the Railway, the Attitude of Foreign Powers, and the Action taken by Her Majesty’s Government in consequence.

In October 1891, Van Blokland was again at Lisbon endeavouring to negotiate for a sale of the railway. Great secrecy was observed by the Portuguese, but our Minister (Sir G. Petre) managed to ascertain from private sources that although they had not definitely agreed to the principle of a sale to the Transvaal, they had got so far as to discuss the price to be given in the event of such a sale. The Portuguese demanded / 2,222,000l., while the Transvaal would not go beyond 1,777,000l., and the negotiations were left at this stage, with the understanding that they were to be regarded as merely suspended.

* Vide Portuguese White Book IV of 1891.
† Vide Marquess of Salisbury to Sir E. Malet, May 1, 1891.
So long ago as 1887 the Cape Government had been anxious to approach Portugal with a view to the cession of Delagoa Bay, but the Foreign Office threw cold water on the proposal, and it was not pursued. In 1891 Mr. Rhodes took up the idea, his view being that Her Majesty’s Government should act as principal in the matter, being secured by a Cape guarantee; and between January and March 1802, Lord Rothschild was moving in concert with the Cape Government for the purchase of all the Portuguese possessions south of the Zambezi.

The Portuguese, while declining to sell, hinted at a lease, and M. de Soveral even told Lord Rothschild that, with a little patience, we should have an offer made to us.

In April 1892 Mr. Rochfort Maguire went to Lisbon on behalf of Mr. Rhodes to sound the Government as to whether they would negotiate with the Cape for an arrangement respecting the Province of Lourenco Marques; but he appears to have come back with the conviction that the Portuguese would not accept the Cape or any Government as lessees. Moreover, the number of offers then before the Portuguese Government would have led them to form an exaggerated idea of the value of their territory, and to demand an impossible price; for besides the Transvaal and Lord Rothschild there was a private Syndicate, composed of Messrs. Isaacson and Baumann (M.P’s.) and others who were also after the Concessions, and Sir John Pender was negotiating, on his account, as an unauthorized agent of the Cape.

Another consideration that must have weighed with Portugal, both then and since, was that the United States had warned them that the railway must not be disposed of pending the Award, as it was practically the only asset which could be utilised for payment.

In December 1892 Mr. Rhodes renewed his attempt, this time through Baron Merck, a German financier, in whom Sir G. Petre had full confidence. The Baron, who enjoyed the support of Lord Rothschild, was semi-officially informed in January 1893 that the Portuguese were willing to receive a firm offer, and that there was every chance of success if time were not wasted. He was nearly certain that they would accept a Company in return for payment of 600,000£ in cash, payment of the Award, and 40 per cent. of the profits. Time was, however, lost in consulting Sir J. Pender and others; and though Sir J. Sivewright, on behalf of the Cape, authorized him to offer 600,000£ in cash for the Concession, the bid, when made in the following February, proved insufficient. At this time there were no less than four competitors at Lisbon, the others being: (1) a party of Boers headed by Isaac Lewis (of the firm of Lewis, Marks, and Co.); (2) Van Laun, acting through a Belgian agent named Van Closen, who was said to have offered 80,000£ in bribes, and pretended to be acting on behalf of the Transvaal; and (3) the Transvaal Government through Van Blokland. But
the Portuguese Government told all applicants that they intended to do nothing pending the Award.

On the 10th March, 1893, Mr. Rhodes telegraphed (probably on information derived from Baron Merck) that the Transvaal, backed by Germany, were in the field as purchasers of the line; that every effort should be made to prevent this; and that his colleagues assumed all responsibility of purchase. On inquiry, it was found that the Transvaal Agents had left Lisbon, and therefore no representation was made to Portugal. Subsequently, Mr. Rhodes repeated that the Cape Government were prepared to purchase the line.

In the meanwhile, Lord Rosebery's views as to the rights of Great Britain in the matter had undergone material development. On the 11th October, 1892, he informed the Delagoa Bay Railway Company that he did not see that the pending arbitration gave Her Majesty's Government any right to object to the alienation by Portugal of her rights over the district of Delagoa Bay; and on the 21st December he wrote privately to Sir H. Loch that as long as Portugal retained her sovereignty he could not see what right of intervention we possessed.

On the 23rd March, 1893, the Law Officers (who had been consulted as to the bearing of the Agreement of 1875 on the question) reported that a Concession to the South African Republic of the right to levy customs duties in Lourenço Marques, while not a cession of the territory, is / clearly the cession of a sovereign right in relation to it, and clearly goes to lessen its value; that it was therefore against the spirit of the Agreement of 1875, and might properly be made the subject of remonstrance.

On the 29th March, Sir H. MacDonell was accordingly instructed to inform Portugal that Her Majesty's Government would not recognize or allow any alienation of a sovereign right (such as customs rights) in the Delagoa Bay territory without giving previous notice to Her Majesty's Government, and affording them an opportunity of acquiring it.

On the 5th May, 1893, the Portuguese Minister informed Lord Rosebery that he had not the slightest apprehension of any sale to the South African Republic during the arbitration, and Lord Rosebery intimated, in reply, that if this were done ‘we should be compelled to take our own measures for protecting our own position.’

Sir H. Loch having pointed out to Lord Rosebery that Article VII of the Treaty of 1891 had a more important bearing on the question than the Agreement of 1875, which only applied to a small portion of Lourenço Marques, his Lordship in July 1893 sent a Memorandum to Sir H. MacDonell, for his own information, explaining the views of Her Majesty's Government as to the applicability of that Article to the question of the concession of sovereign rights in Delagoa Bay territory. His conclusion was that, in the event of Portugal propos-
ing at any time to part with any of the territories to the south of the Zambezi assigned by Article II to be within the sphere of her influence, Portugal would be bound by Article VII to recognize Great Britain as possessing a preferential right to the territories in question, or to any portion of them; but he did not intend to claim this preferential right in respect of the territory named in Article III.

[It is not easy to imagine what induced Lord Rosebery to make this limitation, which might have had most unfortunate effects, as Article III is one of the Articles to which Article VII applies, and the territory concerned is precisely that on which the Boers have designs. The point is of less importance, as the Memorandum was sent for private information, but it might be well to warn the British Minister that Lord Salisbury does not adopt his predecessor’s view in this respect – if such be the case.]

In March 1894 the Portuguese Minister for Foreign Affairs (Senhor Arouca) informed Sir H. MacDonell confidentially that the Netherlands Minister had approached him confidentially on behalf of intending Dutch purchasers of the Delagoa Bay Railway, but that he had replied that the Portuguese Government would entertain no proposals before the Award.

In April 1894, by desire of Mr. Rhodes, Sir H. Loch (who was then in this country) was in communication with Lord Rothschild on the subject of the railway. Lord Rothschild was certain that Portugal would not sell, but thought they would lease the railway for 100 years if a firm offer were made, and he suggested that his firm should be authorized to negotiate on the basis of paying the Award (which he estimated at 1,250,000£), besides payment for the lease, say, 400,000£, or possibly more. He would not mention the Cape Government in his negotiations. Sir H. Loch telegraphed to Mr. Rhodes, suggesting that he should first offer to lease the whole province, and, if that failed, he should propose to lease the railway. On the 5th May Mr. Rhodes replied that Lord Rothschild should intimate that he was prepared to make an offer when the fitting moment arrived. On the 16th May the Cape Government sent a further telegram, intimating that they would prefer to await the Award, but that Lord Rothschild might meanwhile find out the Portuguese terms; and nothing more definite could be got from the Cape.

In connection with this suggestion to lease the province, it may be observed that before any arrangement of this kind could be concluded, it would be necessary to know exactly what Portugal still has the power to sell. She had already practically assigned to Companies (the chief of which is the Mozambique Company) the administration of all her territories between the Zambezi and Lourenço Marques, and on the 26th October, 1893, a Concession over the northern half of that province was granted by Royal Decree to Senhor Diogo Conto and Captain Vasconcellos. It assigned to them all the territory between the Limpopo, the Transvaal, and the Incomati River, for the purpose of developing the mining and agricultural resources of the district, and it included the
power to make railways. In December 1893 Sir H. MacDonell protested to the Portuguese Government against the conditions of this Concession, as impairing the value of the MacMurdo Concession, but it does not appear that his protest had any effect. It has also been stated that a Boer holds the Concession of a strip of land in the south of the province (the Catembe district), running right across from the Transvaal to Delagoa Bay, and there may be other Concessions granted to Boers or Portuguese of which we know nothing.

On the 10th May, 1894, our Minister was informed privately by the Prime Minister (Senhor Hintze Ribeiro) that he had lately had a proposal from a group of Dutch financiers, apparently acting on behalf of the Transvaal, who were evidently backed up by the Dutch Government. They offered to guarantee the whole amount of the Award whatever it might be, and to share equally with the Portuguese Government whatever profit might be derived from working the line at the present rates. They proposed to leave Portugal in nominal possession of the railway, but claimed the exclusive fiscal control of it, and the right to carry out such improvements as they might deem necessary. According to the Prime Minister, they were informed, in reply, that the Portuguese Government were determined to listen to no proposals whatever touching the acquisition of the railway or harbour.

On the 28th August, 1894, Sir H. MacDonell reported the substance of further information confidentially communicated to him by the Prime Minister. When Van Blokland last visited Lisbon, ostensibly to negotiate an Extradition Treaty, he made several attempts, in concert with the Netherlands Minister, to induce Portugal to come to a tacit understanding with regard to the railway and a port improvement scheme, but the Portuguese categorically refused pending the Berne Award. Shortly after the Netherlands Minister introduced two Dutch financiers, who proposed to assist Portugal in her financial troubles, but in all the plans which they put forward the railway and a port improvement scheme were among the guarantees to be provided, and the Portuguese refused to negotiate on this basis. The German Minister then stepped in, and, by desire of his Government, urged Portugal not to break with these financiers, as they alone could extricate her from her difficulties. The Portuguese Government, however, held firm, and secret inquiries showed that one of the ‘Dutch’ negotiators was a Director of the Bank of Darmstadt (an institution enjoying influential support in Germany), which would thus have financed the scheme.

On the 15th September, 1894, Sir H. MacDonell informed Senhor Hintze Ribeiro that Her Majesty’s Government felt confident that the Government of Portugal accepted the clear understanding that no action will be taken by them without previous reference to Her Majesty’s Government in regard to granting any Concession or privileges connected with Delagoa Bay, even after the delivery of the Berne Award. To this he at once demurred, saying that if he continued
at the head of the present Administration, he would make it a point not to act in the matter without their cognizance after the Award had been given, but he could not pledge the Portuguese Government to a line of action which his successors and the Chambers might not approve. Germany, Holland, and the Transvaal had been urging him incessantly, claiming the right that they should be consulted in shaping their course, if the Award should be in favour of Portugal, and holding out every inducement in the shape of material assistance should the verdict be unfavourable. He had invariably replied in the same sense – no decision at present, and no engagement for the future.

Sir H. MacDonell reminded him of the Portuguese engagements with Great Britain, and said that if Portugal regarded England as being on the same footing in the matter as Germany, Holland, and the Transvaal, he begged him to take note of his declaration that Her Majesty’s Government expected that the King’s Government would take no action in the matter, even after the Award had been delivered.

Senhor Lobo d’Avila, the Minister for Foreign Affairs, took the same line as the Prime Minister, but was more unequivocal in his assurances that the Portuguese Government would eventually act in concert with Her Majesty’s Government in the railway question.

On the 19th September the British Minister delivered a note to Senhor Lobo d’Avila, stating that, in accordance with the Agreement of 1875, Her Majesty’s Government had the right to claim that previous notice should be given them, and an opportunity afforded them of acquiring such rights as the King’s Government may have it in contemplation to dispose of in Lourenco Marques.

On the 2nd October, Lord Kimberley pointed out to Sir H. MacDonell that the Agreement of 1875 only referred to the territory in respect of which the MacMahon Award was given, and would, therefore, not include the railway and port of Lourenco Marques; but under Article VII of the Treaty of 1891, ‘it is not open to Portugal to alienate territory south of the Zambezi to a third Power, and Her Majesty’s Government holds that the Article also precludes her from parting with rights now existing in that territory which would in any way diminish the value of the preferential claim of this country.’

During the native rising at Lourenco Marques in the autumn of 1894, 400 Transvaal Volunteers offered to proceed to Delagoa Bay to restore order. We know from Sir J. de Wet that this offer was approved, if not inspired, by President Kruger, and it was accepted by the Minister of Marine, but the Portuguese Government cancelled the acceptance in consequence of a private, but energetic, protest by our Minister. Van Blokland had previously made an official tender of assistance on the part of the Transvaal Government, but this was declined.
On the 18th October, 1894, Senhor Hintze Ribeiro made a statement in the House of Peers that the Government were firmly resolved not on any account to surrender the administration of the railway.

On the 19th October, Mr. Gosselin was confidentially informed that the Political and Colonial Directors in the German Foreign Office had stated that their Government could never agree to Delagoa Bay, or any other of the Portuguese possessions on the East African Coast, falling under the control of Great Britain; that German East Africa was already hemmed in on the north by the British sphere, and that it was of vital importance that a similar bar should not be placed to a possible future extension of the German sphere of interest on the south.

On the 27th October, Sir H. MacDonell reported that the German Minister had lately communicated a confidential Memorandum to Portugal on the Delagoa Bay Railway, which dwelt in emphatic terms on the concern which Germany / claims to feel in this question, and expressed the urgent desire that immediately on the Declaration of the Berne Award the German Government should be the first to be taken into the confidence of Portugal, with a view to combined action. According to the Portuguese, no reply was given to this communication.

On the 31st October, Count Hatzfeldt told Lord Kimberley that he had informed Lord Salisbury (in 1890 or 1891?) that in the event of a break-up of the Portuguese dominions in East Africa, Germany could not consent that they should become British possessions, as the result would be that the German Colony would be almost completely shut in by British territory. Lord Kimberley declined to discuss what might happen in such a case, but pointed out that we should, under our Treaty of 1891, have a preferential right to Portuguese territories south of the Zambezi.

In November 1894, Sir H. MacDonell was informed by Senhor Lobo d’Avila that the Netherlands Minister had pressed him on behalf of his own Government and of the Transvaal to come to some distinct understanding, in anticipation of the future, with regard to the railway, adding that Van Blokland was prepared to come to Lisbon with carte blanche to arrange any conditions in the shape of men or money, to enable Portugal to counteract the designs of the British Government on Delagoa Bay. Senhor Lobo d’Avila had replied that Portugal was determined to maintain the status quo in Lourenço Marques, and required no financial or other aid from the Transvaal or elsewhere to accomplish that object.

On the 17th November, 1894, Baron von Marschall informed Mr. Gosselin that Germany desired a maintenance of the status quo, both politically and commercially, so that the railway, pier, and harbour should remain in Portuguese hands; for the Germans had great commercial interests in the South African Republic, and could not allow foreigners to absorb those undertakings, He especially alluded to the possibility that the Cape might seek to bar the access of the Transvaal to Delagoa Bay.
In the previous month Sir H. Loch had returned to South Africa, bearing with him Lord Ripon’s instructions as to certain alterations in the London Convention, which President Krüger was understood to desire. He was permitted to assent to a modification of Article IV, but, in view of the position taken up by Germany, a telegram was sent to him on the 29th November, directing him not to initiate any discussion on the subject, and to refer the matter home if the President raised it. At this time, the German Colonial Society and newspapers of all shades of political opinion were urging their Government to take steps to counteract British designs on Delagoa Bay, and to uphold the independence of the Transvaal; and Baron von Marschall was repeatedly alluding to the bay in his conversations with our Charge d’Affaires, in a manner which indicated an intention on the part of the German Government to make their influence felt in South-East Africa.

On the 21st November, the Portuguese Prime Minister observed to Sir H. MacDonell that in any arrangement with regard to the railway, it would be necessary, in view of the attitude recently assumed by Germany, to be very careful to avoid anything which would involve even the appearance of any change in the political status quo; and our Minister expressed his concurrence in this view.

It may here be explained that under their arrangement with Portugal, the Transvaal Government have built a pier at Delagoa Bay for the exclusive purpose of landing railway material for their own lines. When no longer required for this purpose, the pier is (I believe) to revert to the Portuguese Government on payment of its cost; but the Transvaal have acquired land all round it, and evidently wish to establish a vested right in it. The Portuguese are at the present moment negotiating for its purchase for shipping purposes; but they are not prepared to pay the price asked for it, and the negotiations, which seem to have given rise to some friction, are not yet concluded.

In December 1893, the Transvaal had been pressing Portugal to give them permission to erect a jetty for landing and shipping, but the Portuguese had stoutly refused. A Concession had been given to one Cohen (apparently the former Portuguese Consul at Pretoria) for a landing pier, and in December 1894 Mr. Sawyer (who had executed work on the railway for the Portuguese Government) applied to Sir H. MacDonell for an introduction to Senhor Hintze Ribeiro in connection with this pier Concession, which Cohen was transferring to Mr. Lewis. Mr. Sawyer represented it as a genuine Anglo-Portuguese undertaking, and in opposition to the Netherlands Railway Company; but knowing the intimate relations of Messrs. Lewis and Marks with President Krüger, Sir H. MacDonell was suspicious. He, however, took Sawyer to the Prime Minister, who, after hearing what he had to say, replied that the Portuguese Government were quite aware of the plans and intentions of the Transvaal Government and those who side with the Netherlands Company, but were prepared to stand by
their rights, and would not interfere with the status quo, whatever the neig-
bouring State might say or do as regards the railway and port. On this Sawyer
said that he would advise Mr. Lewis to abandon the scheme altogether; but it
was ascertained that he afterwards interviewed the Minister of the Colonies,
and telegraphed to Lewis to legalize his contract with Cohen. I understand that
Cohen is still working at Lisbon to get approval of his plans for putting his Con-
cession into force, but that so far he has not succeeded.

At this time, the Portuguese Government seem to have been convinced that
the Transvaal had endeavoured to use the native rising at Lourenco Marques for
the furtherance of their political designs; and they removed their Consul from
Pretoria on suspicion that he was connected with the false reports sent from
the province to England and Germany by agents acting in connivance with the
Transvaal authorities.

On the 24th January, 1895, Sir H. MacDonell observed that there could be
no manner of doubt that both in Portugal and in the South African Republic the
conviction universally prevailed that Germany, Holland, and the Transvaal were
acting in concert with a view to secure a footing in Delagoa Bay.

On the 26th January Sir E. Malet,13 in conversation with Baron von Mar-
shall, remarked that he could not understand why Germany should show a
tendency to coquet with the Transvaal, when they must be aware of our extreme
dislike to it. Baron von Marschall replied that they were bound to protect Ger-
man interests, that the railway from Delagoa Bay to the Transvaal was made with
German and Dutch capital,* and that it was the only outlet [sic] for the com-
merce of the Transvaal with which German trade was increasing. Sir E. Malet
answered that the railway was in no way menaced, and that Her Majesty’s Gov-
ernment were determined to maintain the status quo. Baron von Marschall said
that he was well aware of the Treaties between Great Britain and the Transvaal,
and that there was no thought of doing anything which could have any political
significance, or to exercise in any way political influence in the Transvaal. Finally,
Sir E. Malet begged Baron von Marschall to remember that the whole question
was one on which we were peculiarly sensitive.

The celebration of the German Emperor’s birthday at Pretoria was marked by
some very effusive utterances on the part of President Krüger; and in connection
with this, Lord Kimberley wrote privately on the 30th January to Sir E. Malet,
suggesting a friendly reminder to the German Government that Article IV of the
London Convention prevented any Treaty of Alliance between the South African
Republic and any other Power without our consent, and that it was a stipulation
which we should enforce. He was also to point out that as we are agreed to main-

* Probably Sir E. Malet misunderstood him. This is, of course, only true of the Transvaal
section of the line.
tain the status quo in those parts of Africa, it was most important that nothing should be done or said which could awaken suspicion as to German action in the Transvaal. Public opinion both here and in South Africa was extremely sensitive on the point, and nothing would more prejudice a good understanding with Germany than any belief that she was attempting to lay the ground for interference in the affairs of the Transvaal. Lord Kimberley by no means credited the various rumours which reached him on the subject, but he would not be frank if he did not say that they had caused us some anxiety. This letter was read by Sir E. Malet to Baron von Marschall during an animated interview, in which the latter used strong language about Mr. Rhodes, whose recent utterances about Germany and the Transvaal, as reported by a ‘Kreuz Zeitung’ interviewer, had given violent offence in the former country. At a subsequent interview Baron von Marschall was more conciliatory, and authorized our Ambassador to assure Lord Kimberley that there was no sort of alliance between Germany and the Transvaal, that their relations were purely commercial, and not political.

On the 19th February, Lord Kimberley wrote to Sir E. Malet that as he had read to Baron von Marschall this private note, he might explain that in speaking of the status quo he referred to the friendly understanding which exists between Great Britain and Germany to do nothing to impair the authority of Portugal over her possessions in South-East Africa, and that he had no intention of referring to the South African Republic, as Her Majesty’s Government could not enter into any engagements which would interfere with the development of commercial relations between the Transvaal and the British possessions in South Africa.

In May last, a report appeared in the public press that 500,000l. had disappeared from the Treasury at Pretoria, and had been remitted to Lisbon in connection with the purchase of the Delagoa Bay Railway, and it was insinuated that part of the money was intended to bribe the press and public men in Portugal. The Portuguese Government instructed M. Soveral to publish an indignant protest against these imputations, but they received at least partial confirmation from Sir J. de Wet, the British Agent at Pretoria. The Treasurer-General of the South African Republic informed him confidentially that this 500,000l. had been remitted to Lisbon, where a Transvaal Deputation then was, and plainly intimated that part or the whole of the money must be intended to be spent in bribery to gain the support of powerful influence with the Portuguese Government. At a later date (29th July), Sir J. de Wet reported that a portion of the money had already been spent, and that the Government refused, even in secret session of the Volksraad, to say what had been done with it, on the ground that to do so would be prejudicial to the negotiations.

On the 9th July, in connection with these rumours, Lord Salisbury instructed Sir H. MacDonell to refer the Portuguese Government to the assurances given by them in 1893 and 1894, that no engagement would be entered into pending
the Award, and to say that it would be quite satisfactory / to Her Majesty's Gov-
ernment that Portugal should retain the railway in her own hands, but that they
would regard any steps in respect to an arrangement which would give to any
other Power direct or indirect control over the railway as inconsistent with the
understanding that the status quo should be maintained. Any engagement which
would transfer to a third Power rights in the Province of Lourenço Marques
which now belong to Portugal, including rights over the ports, railways, or cus-
toms, would amount to a cession of sovereign rights, and would be inconsistent
with the spirit of the Agreement of 1875 and of Article VII of the Treaty of
1891, and would, therefore, not be recognized by Her Majesty's Government.

On the 22nd July, Senhor Lobo d'Avila replied that the Portuguese Govern-
ment neither have, nor have ever had, any intention of alienating any part of
their colonial territory; that while the arbitration is pending they consider it
their duty to abstain from any act that may alter the state of the question as it
was submitted to the Tribunal; and that, with respect to the future, they had not
entered into any engagement.

On the 12th August, Lord Salisbury pointed out, in reply, that this note did
not cover the future of the railway after the Award. He instructed Sir H. Mac-
Donell to insist on the fact that Her Majesty's Government hold that Portugal
has no right to diminish, in favour of any other Power, the value of the territ-
ory in regard to which Great Britain has the right of preemption, and that they
maintain the view that – while the cession of land on which the railway stands,
or which is connected with it, or of any Government land, however limited in
extent, would be unquestionably an alienation of territory inconsistent with the
right of pre-emption – a Concession giving powers over the railway or over such
land would equally be an infringement of the preferential right of Great Brit-
ain. He was to make it clear that the time has arrived when it is essential that it
should be understood that the two Governments are agreed in this interpreta-
tion of the Convention of 1891.

On the 21st August, the Portuguese Minister verbally informed Lord Salis-
bury that Portugal had not the slightest intention of ceding their rights over the
railway to the Transvaal or any / one else, and would not allow it to be bought
by any one.

On the 30th August, Sir H. MacDonell delivered a note to the Foreign Min-
ister, in accordance with Lord Salisbury's instructions, but Senhor Lobo d'Avila
made it clear in conversation that he did not interpret the agreements in that
sense. He said that the agreements clearly lay down that Portugal cannot alienate
any portion of territory, however small, nor part with any of her sovereign rights,
or alter the territorial status quo without consulting Great Britain, who has a
right of pre-emption, and therefore a written declaration to this effect would
be superfluous. On the other hand, he maintained that, as soon as the Award is
given, the Portuguese Government necessarily comes into absolute and undis-
puted possession of the railway, and of all the privileges attached to the original Concession, and he considered that the payment of the Award would give Portugal the incontestable right, should she deem it necessary, to intrust others with its control and administration, which would carry with it no alienation whatever of sovereign rights. He was willing to give verbally the most positive assurance that the Government had neither entered into, nor intended to take any steps or enter into, any sort of engagement which would in any way commit them with respect to the eventual fate of the railway; but he declined to bind the present Administration or any future Government by a written declaration which would in itself constitute a renunciation of their sovereignty over the railway and territory in question in favour of Great Britain after the publication of the Award. He gave the usual civil assurances, and said that the Government were determined to keep the line in their own hands, adding that the money for the Award, which he estimated at 500,000l. or 600,000l., was already set apart, and this Sir H. MacDonell believes to be the case.

In his written reply (of the 7th September) he reiterated the statement that the Portuguese have no intention of alienating their sovereignty over Lourenço Marques or 'any other district of their colonial possessions;' and he added that they not only considered the development of their legitimate national interests in Lourenço Marques to be compatible with the most friendly relations with England, but they deemed it / useful and expedient that these relations should be drawn still closer and confirmed.

On the 17th September, Lord Salisbury telegraphed to Sir H. MacDonell a Report from Sir J. de Wet that Dr. Leyds (the Transvaal State Secretary) was at Lourenço Marques negotiating for running powers over the line, with a view of eventually securing a lease of it; and he instructed the Minister to inform the Portuguese Government that Her Majesty’s Government cannot admit either that Portugal has any right to lease the line without first offering it to Great Britain, or that the South African Republic have any right to have dealings with Portugal or any other foreign State except through Her Majesty’s Government. The last words are noticeable as being a distinct advance on any contention put forward by us since the London Convention of 1884.

In connection with the Portuguese claim, that a lease of the railway would not be a cession of sovereign rights, it may be useful to remember that they have put forward the opposite contention, in the strongest possible form, before the Berne Tribunal. In their Counter-Case they say:–

‘Le droit de controller l’exploitation technique et commerciale du chemin de fer est un droit souverain et inaliénable de l’État auquel aucun Ministre ne peut renoncer, parce qu’il est indispensable à la réalisation du but de l’État.’

* Quoted in the ‘Réplique Anglaise,’ p. 71. I have not verified it by a reference to the Portuguese Case.
IV. – The Railway Question in South Africa.

With the growth of the Transvaal this question has rapidly been coming to the front, and is now the most important one in South African politics. As between the Cape and Natal, the competition for the lucrative traffic of the Transvaal has accentuated and somewhat embittered the oldstanding rivalry between them; and as between the Cape and the South African Republic, the policy of the Transvaal Government, or of the Netherlands South Africa Railway (for in this matter it is hard to say if the railway is the Government or the Government the railway), has contributed to the notable weakening of the sympathetic ties which long connected Afrikanders in the two countries.

On the retrocession of the Transvaal in 1884, the policy of its Government was to discourage in every way trade with Great Britain or her Colonies, and especially to prevent any extension of British railways by which troops might be thrown into the country.

In 1887 they subscribed to the funds of the Netherlands South Africa Railway for the purpose of extending the Portuguese railway to Pretoria, and President Krüger endeavoured to induce the Orange Free State to forbid the extension through that State of any Cape line for a period of ten years. In this he failed; and in 1889 and 1890 Agreements were made between the Cape and the Orange Free State by which the Cape, at its own cost, has constructed, maintained, and worked the line from its border to the border of the South African Republic. The Orange Free State have power to take over the line at cost price; they receive half the profits, while losses, if any, are to be borne wholly by the Cape.

The Netherlands South Africa Railway Company is the outcome of a Concession given in 1884, and was first effectively constituted in 1887. It is nominally a Dutch Company domiciled at Amsterdam, but the greater part of its funds have been obtained from German sources. It has the monopoly of constructing all lines running to the borders of the South African Republic, except such as the Government may wish to construct itself – a reservation of which, I believe, no use has yet been made. The Transvaal Government is said to own from 80 to 90 per cent. of its share capital, and the total of its share capital and loans (all guaranteed by the Government) amounts to about 6,750,000l.

In 1892, the Government procured a loan of 2,000,000l. from Lord Rothschild, which they transferred to the Company for the completion of the Transvaal section of the Delagoa Bay line, and the Company is repaying it in instalments.

In 1890, the pressure of the mining population became too great for the President’s policy of shutting out the British lines; and, after a kind of émeute had occurred at Johannesburg, he determined to make use of the Cape until his own line, which by then was well advanced, should be completed. In December
1891 an agreement was made by which the Cape lent the Netherlands South Africa Railway Company 300,000l. towards extending the line from the Orange Free State to Johannesburg and Pretoria. This line was opened in 1892. In return the Cape obtained running powers and the right to fix tariff rates over the Transvaal line till December 1894, when, the Delagoa Bay line being finished and the Cape loan repaid, the South African Republic terminated the agreement, and opened hostilities against the Cape.

The ambition of Natal to get a share of the Transvaal traffic (in anticipation of which the Colony had incurred a very heavy expenditure on railway construction) was gratified in February 1894, when an agreement was concluded for the extension of their line from Charlestown to the Transvaal railway system. The extension, which is now completed, was undertaken for the Netherlands South Africa Railway by the Natal Government, who received the price in debentures of the Company which they disposed of in Holland. Elaborate tariff provisions are made in the agreement for insuring that the Natal route shall not operate to the disadvantage of the Delagoa Bay line, and there is every reason to believe that President Krüger only sanctioned the line in order to use it as a weapon against the Cape. Quite recently he is said to have formulated his policy thus: ‘His’ line to have all it can carry, Natal to have the rest, and the Cape to get the crumbs that fall from the table.

There are now five lines of communication by which traffic from the South African Republic can reach the coast, three of them being through the Cape. They are:

1. Cape Town to Johannesburg (Cape Western system.) 1,015 miles.
2. Port Elizabeth to Johannesburg (Cape Midland system.) 715 miles.
3. East London to Johannesburg (Cape Western system.) 666 miles.
4. Durban to Johannesburg (Natal line.) 480 miles.
5. Delagoa Bay to Johannesburg (Portuguese line.) 396 miles.

The first of these lines is not really a competitor on account of its excessive length. The second is cheaper to work than the third, in spite of its greater length, and has hitherto been preferred by importers, but the East London route is rapidly overhauling it. What the value of the prize is for which the several lines are contending may be seen from the fact that in 1893 these two lines alone carried over 137,000 tons of traffic to the Transvaal, for which they received 388,000l., at a cost of 122,000l. — thus earning a profit of 266,000l. And for the first seven months of this year, over 5,000,000l. worth of goods have been imported into the South African Republic, of which nearly 3,500,000l. were brought over the Cape lines, while less than 500,000l. came through Delagoa Bay.

The latter railway should have a formidable advantage over its rivals. Besides being much shorter, the Transvaal Government favour it by allowing it to retain
the customs duties on goods imported by it; and as their duties range from 7½ per cent. upwards, the benefit thus gained is very considerable.

The policy of railway extension recently followed by the South African Republic seems at first sight a reversal of its previous policy of discouraging communication with the British Colonies, but this reversal is more apparent than real. The power of directing traffic through other channels is a weapon which the President can use against the Portuguese to enable him to secure their line on cheaper terms than they would otherwise accept; but, besides this, he will now be able to play off the two English Colonies against each other, and though, for the moment, he is favouring Natal against the Cape, he will doubtless leave the former in the lurch when it suits him.

A Conference of the various Administrations was held at Cape Town in November last to devise some modus vivendi, and the Cape, which had hitherto claimed to receive one-half of the gross traffic in any such arrangement, now lowered its claim to two-fifths; but as Natal claimed one-third, and the Transvaal would listen to no proposal which did not favour Natal as against the Cape, and Delagoa Bay as against both, the Conference led to no result.

Since then there has been open warfare between the Cape and the South African Republic. The latter led off by raising the tariff on their section of the line, from the border to Johannesburg (52 miles), on goods coming from the Cape / through the Orange Free State.* The Cape met this by arranging to off-load goods on the Orange Free State side of the frontier, and forward them by ox-waggon to the Rand, and this service has attained large proportions – to the benefit of the Orange Free State transport-riders. But now that the Natal line is finished, the Transvaal have issued a Proclamation closing to over-sea traffic the drifts by which these wagons entered their territory; and the Cape have protested against this action as a breach of the XIIIth Article of the London Convention, and ask the intervention of the Imperial Government.

Meanwhile, the Delagoa Bay line has proved unequal to the demands upon it. The Portuguese section is so badly kept up that heavy engines dare not run over it; the locomotives are insufficient in number, and break down from overwork; the landing facilities are hopelessly inadequate; the Customs staff is ridiculously undermanned; goods are strewn on the beach, damaged, lost, or only found after days of delay; and every impediment that official incompetence can devise is placed in the way of speedy transit. Consequently, the block is so great, and the

* According to a despatch from Sir Hercules Robinson, dated the 7th October, 1895, and received since this Memorandum was written, up to the close of the Agreement the through traffic rates from the coast to Johannesburg had been fixed by the Cape at the average rate of about 2.4d. per ton per mile. After the close of the Agreement the Netherlands Railway Company raised the rates on its 52 miles of railway, from the Vaal River to Johannesburg, to an average of nearly 8d. per ton per mile.
Bay has got such a bad name, that shippers are diverting their cargoes elsewhere. In Johannesburg, at the other end of the line, importers have almost equal difficulties to contend with, though these are, of course, experienced whatever route is adopted. By order of the Government, the Netherlands South Africa Railway use nothing but Dutch in their business communications with their English customers, and import Dutch officials unused to and unfit for their work. The congestion of traffic is such that mines have to burn wood to keep their batteries going for want of the coal they have ordered, drapery people find their stocks out of fashion before they receive them, and so on through every branch of trade.

V. – The Policy of Her Majesty’s Government after the Award.

The foregoing pages have shown the position as between ourselves and the Portuguese. We claim that they are not free to give a Concession of the railway to any but ourselves; they refuse to recognize the claim, while privately assuring us that they will not dispose of the line. What are they likely to do?

Germany, Holland, and the South African Republic are united in urging them to give, at least, a lease of the line to the Netherlands Company, *i.e.*, to the Transvaal. We know that the Portuguese long ago promised the Concession to the Transvaal; that the Transvaal undertook to bear any share of the Award; that Portugal has the greatest difficulty in finding money for the service of her debt, and that she must have incurred heavy expense in her operations against the natives; that, in May, 500,000l. were mysteriously transferred from Pretoria to Lisbon; and that, in August, the Portuguese Government acknowledge to having 500,000l. or 600,000l. set aside for the Award. On the other hand, the Portuguese say that they have entered into no engagement respecting the future of the railway. The balance of probability is against the hypothesis that they are speaking the truth.

How are we to enforce our claim? Certainly not by arbitration. It would be sufficient for the Portuguese to reply that they have granted similar Concessions south of the Zambezi without protest from us; and that, moreover, Article VII is a reciprocal engagement, and that they are doing in their territories even less than we have done in ours to diminish the value of the reversion to one or the other Power. And even if the Portuguese Government were willing to accept our view, could they get the approval of the Chambers and of public opinion, which apparently would rather see the line in any hands than ours?

Assuming that the amount of the Berne Award makes it indispensable for Portugal to seek help from outside, that Her Majesty’s Government can find means of overcoming the difficulties mentioned above, and that the Portuguese can be induced to lease the line (a sale seems out of the question), the possible courses are:–

Purchase by an English Company.
Purchase by the Cape, direct or through Lord Rothschild.
Purchase by Natal.
Purchase by Her Majesty’s Government.

Secrecy and rapidity of action before agitation could be set on foot in Portugal by other parties seem essential, and this alone would negative the idea of an English Company, though other objections, noticed later on, would also apply.

Purchase by the Cape or by Natal would be objectionable. The two Colonies are rivals in the matter, and whichever obtained the Concession would use it as a weapon against the other. In fact, either, with its own line, *plus* Delagoa Bay, could practically ruin the other (unless the latter obtained the active assistance of the Transvaal, which it could probably get – at a price), and we have every reason to think that either would push its advantage with very little consideration for the other. It would not be just for Her Majesty’s Government to lend themselves to this, and if they did, they would be brought into a dangerous position, owing to the feeling that would be aroused against them.

It may be argued that by acquiring the Delagoa Bay line the Cape could force Natal into confederation, but how if Natal refused to be forced, as she doubtless would, and sought safety in a closer alliance with the Transvaal? The idea may be fantastic, but it has more than once occurred to me that among President Krüger’s day-dreams may be that of the possibility of detaching Natal from the British Crown.

There remains the proposal of direct purchase by Her Majesty’s Government, which has all the advantage of prompt and secret action. But if we purchase on our own account we stand to lose, for there can be little doubt that the President would be so enraged at finding his plans frustrated, that he would prefer to send his traffic through Natal and the Cape; and if, on the other hand, this did not happen, Her Majesty’s Government would be in a most difficult position as a trade competitor with the Colonies.

(The same difficulty would be experienced in a lesser degree if Her Majesty’s Government enabled an English Company to get possession of the line.)

In these circumstances, I suggest the following plan as a solution: – /

Her Majesty’s Government should lease or purchase the line; the Cape and Natal should guarantee the interest and sinking fund; and then the line should be administered by the two Colonies for their joint benefit, the profits being divided between them in proportion to their guarantees. Thus, if the line is a loss through being boycotted by the Transvaal (which is unlikely, as there would no longer be an object in doing so), what the Colonies lost in this way they would gain in the extra traffic carried over their own lines, and if their own lines suffer through the competition of the Bay, they would be recouped by the profits from the latter.
It would be necessary that the purchase should in some way include exemp-
tion from the fiscal or administrative interference of the Portuguese, for 
otherwise the Concession would be so hampered as to be unworkable; and it 
would, I consider, also be necessary to stipulate with the Colonies that Her Maj-
esty’s Government could at any time take back the railway on equitable terms. 
The reason for this I give presently.

It is clear that we should have to face a violent protest from Germany, but it 
may be assumed that Her Majesty’s Government are prepared to disregard this, 
as there would otherwise not be much point in their recent diplomatic action.

There would be no good ground for such a protest, as, on their own showing, 
German interests are pecuniary and commercial, and these would be advanced 
rather than hindered by a business-like administration of the line. But, none the 
less, the protest would be made, and doubtless political motives would under-
lie it. It is contrary to reason to suppose that Portugal can for long continue to 
maintain this narrow barrier between the Transvaal and the sea, and it must be 
well known in Berlin that the Boers, or, rather, the more ignorant section of 
them, known as the Doppers, look forward to a Republic owning Delagoa Bay, 
and under a German Protectorate. The idea of such a Protectorate is of long 
standing, and so far back as 1876 negotiations are said to have been opened at 
Berlin on the subject.

It is evident that if we are to acquire the line, we must be prepared to pay 
a fancy price for it. Our utmost right is one of pre-emption, and the / Portu-
guese have been sufficiently apprised of its value by the active competition for 
its possession. The British claimants before the Berne Tribunal have estimated 
the value of the whole MacMurdo Concession (lands, docks, and railway) at 
anything up to 5,000,000l.; the Portuguese have appraised the line, for the pur-
poses of the Award, at 163,000l., and their selling price would probably be not 
less than 2,000,000l. But having regard to the low rate at which we can raise the 
money, and to the traffic prospects of the line under good management, there is 
no reason why it should not prove remunerative even at such a price. The meas-
ure of the value of the line to the Colonies is not so much what it would yield in 
their hands as the injury it would be capable of doing them if controlled by oth-
ers. From an imperial point of view, it seems absolutely necessary that we should 
acquire the railway (and hereafter the Bay) at any cost. Here, again, the measure 
of its value to us is not only the use which we should make of the Bay, but the 
effect on British interests of a German occupation of the territory, which seems 
to be the necessary alternative. Further than this, it is inevitable that within a 
few years English influence will prevail in the Transvaal, and it is idle to expect 
that, if we have neither assistance to give nor advantage to offer, its present form 
of government will undergo any change. The existence of a rich and powerful 
English-speaking Republic on the borders of our South African Colonies would
have an influence on the latter, and possibly on our whole Colonial Empire, which it would not be easy to exaggerate. But if we have it in our power to offer them, when the time comes, the immediate control of the line, and the eventual possession of a port and seaboard, there is no reason why they should not again come under the British flag as a self-governing Colony. It is for this reason that I have suggested the advisability of leaving ourselves free to resume the line from the Colonial Governments, so that, in a political rearrangement of the kind fore-shadowed, we may be able to secure fair play all round.

G.V.F.

October 11, 1895.
F. Cardew, *Railway Schemes for the Colony of Sierra Leone. An Address before the African Trade Section of the Liverpool Chamber of Commerce, 2 August 1895* (Liverpool: Chamber of Commerce, 1895).

THE AFRICAN TRADE SECTION

OF THE

Incorporated Chamber of Commerce of Liverpool,

AUGUST, 1895.

Railway Schemes

for the

Colony Of Sierra Leone.

Address given by

His Excellency Governor Cardew, 1 C.M.G., at a Meeting

of the Members, held at the Rooms of the Liverpool

Chamber of Commerce, August 1st, 1895.

[Extracted from the 'Liverpool Journal of Commerce,' August 2nd, 1895.]

Yesterday, at the rooms of the Liverpool Chamber of Commerce, an address was given by his Excellency Col. F. Cardew, C.M.G., Governor of Sierra Leone, before the members of the African section of that chamber, and others. The title of the address was 'Railway Schemes for the Colony of Sierra Leone.' Mr. Ellis Edwards, chairman of the section, presided [...]

The Chairman said:– Gentlemen, I have pleasure in introducing to you his Excellency Colonel Cardew, Governor of Sierra Leone, who has very kindly come here to give you some information on the subject of railway schemes for
the Colony of Sierra Leone. (Applause.) You have doubtless all received a pamphlet lately circulated from this chamber, containing a most interesting and instructive address given by his Excellency to the Legislative Council of Sierra Leone. This will have given you a great deal of information about the Sierra Leone hinterlands, or what is left of them, and the capabilities and wants of the colony. Col. Cardew has travelled much in the interior, and has acquired an extensive knowledge of the country and people. His journeys by land in the colony and its hinterland have extended over 1,500 miles. He will doubtless tell you he is convinced that railways into the interior are urgently required, and that there are good prospects of their ultimate success as investments. We must not, however, forget that few railways, even in this country, or in India, pay directly in the first instance, but they do so indirectly, by promoting trade, and by increasing revenue, to say nothing about their civilising power in a country like Africa. A missionary from Lagos lately expressed the opinion that a railway in the hinterland of Lagos would do more to civilise the nations and bring them under Christian influences than a large number of missionaries. Railways in West Africa are a necessity of the times, and we must have them. They would add immensely to our political influence and put an end to many petty wars that occur in the interior. They would further benefit our trade with Africa, and through that trade many industries and manufactures in this country; and in a few years, having revolutionised commerce with the West Coast, everyone would ask why they were not made years ago. This country is the last in the field in their construction. France has 150 miles of paying railways at the Senegal, Portugal by this time has over 200 miles at Loanda, with satisfactory and increasing receipts, and Germany is undertaking a line at Waldfish Bay. Personally I am in favour of railways being made in all our West African Colonies, but especially at the Gold Coast, Lagos, and Sierra Leone. We here cannot pretend to say exactly which route should be chosen at any of these places. This is a matter for the Government and the African merchants on the spot. What we ask is that there should be no further delay in their construction. The African trade section of this chamber has for some years been agitating for railways in West Africa, and I believe we shall soon be rewarded for our trouble, as our members of Parliament have promised to vote for railways, and have referred to the need for them in their speeches and addresses, and the Colonial Government are now fully alive to the importance of them. In conclusion, I think it is of the utmost importance for the success of the coming railways that natives should be brought from the different places in West Africa where railways are likely to be made to this country, to learn railway work, in order to enable them, when railways are made, to act as porters, guards, station masters, &c. I now call on Col. Cardew to give his address.
Colonel Cardew, who was heartily received, said: I will ask your permission to allow me to read my paper, because the subject is somewhat full of details, and because I think I shall be more correctly reported, for I understand that one of the objects of my coming here is the wider dissemination of the information I gave before the Sierra Leone Legislative Council, and which is already published in the pamphlet from, which I see some of you gentlemen have in your hands. I will now proceed to read what I have to say on the colony. and the railway scheme in connection with it:–

[...] With respect to any scheme for a railway, whether such railway were constructed in the direction reported on by Mr. Shelford, whose report I daresay has been in the hands of many gentlemen present, or due eastward, or to the south-east, the question of traversing the broken and hilly country, which forms the eastern portion of the protectorate, must be faced if the railway is to be extended so as to tap the resources of that country, an object which should, I think, be the final purpose of any projected line. The hilly country is so broken up and rugged that it does not need an expert to show that unless some river valleys offering easy gradients exist, along which a railway line could thread its way, the cost of overcoming the engineering difficulties entailed by penetrating such a country would be quite prohibitive of the scheme. The only suitable valleys, as far as I know, are those of the Sehli or Rokelle river in the north, and of the Moa or Sulima river in the south. and which of these valleys the line should follow should be determined, I think, by the following considerations, which I propose to refer to seriatim:– (1) Characteristics of the natives and density of population; (2) nature and fertility of the country and existing products and trade routes; (3) capability of country for development; (4) prospects of trade from countries outside the protectorate. With regard to the characteristics of the natives I need not trouble you with a detailed statement concerning each tribe; it will be sufficient to say that generally speaking the tribes in the northern half of the protectorate are more intelligent and industries than those of the southern half, which mainly consist of Mendis, who was are not at all industrious, and are very superstitious. Besides, those in the northern half, if not Mahommedans or Mushrikin, or professing Mahommedans, are more or less under Mahommedan influence, so more temperate in their habits and reliable, but the population in the southern half is more dense than in the northern. With respect to the nature and fertility of the country and existing products and trade routes the main trade routes through the protectorate are as follows:– (1) From Falaba by Bafodeya or Bumban thence to Port Lokko; (2) from Matatoka, tapping the Kuniki and the Sanda Kono countries (the latter in the region of Karriyemma), thence by road to Benkia, on the Rokelle, where the produce is loaded in small canoes and transported to Magbilleh, and thence transshipped in larger ones to Freetown;
(3) from Mongheri, through Senahu, to Freetown; (4) from the Upper Mendi districts to Mafweh, Pujebun, and Bandasuma respectively, thence by waterways to Bonthe, Lavana, Sulima, and Mano Salija. As to the produce conveyed along these routes; by the first route small quantities of ivory and gold from the interior, rubber from the interior, and also from Kuranko; cattle in considerable numbers, kola nuts, small quantities of palm kernels and oil, and rice chiefly from the districts around Port Lokko; by the second route plam kernels, rubber, benni seed, kola nuts, rice, &c.; by the third route rubber and kola nuts, a little ivory, and a small quantity of palm kernels; by the fourth route rubber, small quantities of kola nuts and ivory, and large amounts of palm kernels and oil.

Turning to the nature and fertility of the country, I think there is no doubt that the southern portion of the protectorate, which may be divided, roughly speaking, from the northern by an east and west line drawn through Port Lokko, is by far the most fertile and productive. In the northern portion the country lying to the west of the range of the Warra Warra Limba mountains, which extend from Bafodeya to Bumban, is, generally speaking, open grass land, with ‘scrub’ well adapted for grazing cattle, but the soil is either light and sandy or mixed with gravelly laterite, and in some parts so little productive as not to be able to raise sufficient rice, which is their staple food, for the inhabitants. To the east of the range as far as our frontier the country is richer, especially between Sininkoro and Karriyemma, where it is under forests for the most part, in which the rubber vine abounds, but the valley of the upper waters of the Bagweh, Bafin, and Sehli rivers, which comprehend the Iraiya district, are not productive. There are no palm trees to the east of the Warra Warra Limba range, and these trees are very scarce to the west of it, and the only district where they grow in any productive quantity is about Massumbu, where they were noticed by Mr. Bradford during his survey of the line to Bumban. On the other hand the southern portion may be said to be throughout rich and productive, especially in oil-bearing palms; the districts about Sherbro and all along the coast are famous for the amounts of oil and kernels which they yield. In some parts of the Bargru district, along the coast, the natives even complain that they are so numerous as to impoverish the land, and that they cannot in consequence grow rice; but these rich products are not alone confined to the lower districts, the Upper Mendi districts as far north as a line drawn from Mongheri to Kanre Lahun, and the Saua Konno district, to the north of that line, abound in palm trees, but only a small portion of the harvest they yield is gathered in consequence of the distance from a market and difficulty of transport, and, as one chief informed me during my recent tour, because there are not enough people to pick the nuts, meaning there were so many nuts. Besides, the forests yield rubber and many valuable woods, such as konta and kamwood, which of course cannot be utilised, owing to the difficulty of transport. In the district lying immediately north of the route from Senahu to...
Tninahu there are no palms, but at Senahu there is a rich belt which follows the valley of the Bumpe river.

Though I believe that there is little or no mineral wealth in the protectorate, and that we are never expect a rise by leaps and bounds in the prosperity of the country, still I am of opinion that by judicious administration, a well-ordered and disciplined police force, particularly instructed to foster trade, the prompt suppression of any slave raiding or intertribal disturbances, and the encouragement of the natives by every means to reoccupy wasted and deserted districts, giving them where necessary seed rice to sow their farms, there will be a steady development of the resources of the country and a marked increases in the volume of trade. One means to these ends is obviously to encourage and instruct the natives in the cultivation of such products as are now left to nature to develop, but perhaps the foremost is to increase their wants. As long as these are few it is obvious the natives will only produce just sufficient to supply them, but as they increase so will the products be forthcoming to obtain them.

It often occurs to me when I come across factories in the interior that a greater variety of articles and more tempting ones might be on sale in them. The inside of a store, with its piles of Manchester woven goods, huge iron cooking pots, demijohns of rum and green cases of gin, has a somewhat somber appearance. There seem to be no articles bright and attractive for the natives, such as one would see in a Kafir store in Zululand or Natal, and such as the itinerant Syrian traders and hawkers, who are coming in such increasing numbers to Freetown and penetrating the interior, have amongst their wares. I make these remarks with much diffidence in the face of so many experienced merchants as I believe are before me. Further, it appears to me, apart from the moral point of view, that it would be so much better for trade if other wants and desires were created in the native mind besides those for the noxious beverages which are presented to him in the form of so-called gin and run. I noticed again and again in my travels in the interior that, wherever there was a drinking chief, his people and their towns and villages had an untidy, dirty, and poverty-stricken air, and there were few if any signs of trade going on or produce being gathered in.

The missionaries in the interior, particularly those of two or three American societies, are doing very good work (but, alas! at a great cost of life) in creating new wants amongst the natives by means of industrial training and other civilizing agencies, but still more can be done by the traders themselves by pushing their trade further afield and carefully studying the requirements and tastes of the natives. The Upper Mendi, Konno, and Kuranko districts furnish a wide field for commercial enterprise; the people are almost in their primitive condition. Manchester woven goods and cottons have scarcely found their way there, and it is most unusual to see in a crowd anyone dressed otherwise than in native-made fabrics. On the other hand, where an article is offered which meets a felt want,
it is surprising how quickly the natives acquire it. I found women using patent cotton carders of English or American manufacture in the remotest towns of the interior where no other article of European commerce could be discovered, and observed large numbers of these articles being conveyed in the caravans passing from Freetown to the districts along the Niger, hundreds of miles beyond our territory. The eastern portions of the protectorate, which consist of highlands, with on the whole a bracing and salubrious climate, relatively speaking, are well adapted for the cultivation of coffee, ginger, and other valuable products. Another means for the development of trade and the resources of the country would be the settlement in these parts of natives with capital from Sierra Leone, the West Indies, and the United States, who would be able to carry on such kinds of agriculture. The aborigines live only for the present; they cannot see the force of cultivating plants such as the coffee, for the fruits of which they must wait for a long period of four or more years. They are anxious for 'quick returns.' This may arise in a certain measure from selfishness and want of foresight on their part; but I think it is principally due to the conditions under which they have lived, for instance, to the slave-raiding habits of the people, and to the envy and distrust with which chiefs regard any of their subjects who may be possessed of more than ordinary means. Though slave raiding has practically ceased, the chiefs still exercise despotic powers, hence there is no security of tenure, from the fear of having their property confiscated at the will of the chief, the people are discouraged from making provision for the future; but I hope a closer control of native affairs by the Government will gradually do away with this feeling of insecurity. Already I have observed in the Sanda Lokko and other districts the cultivation of young kola trees along the approaches to the villages and towns, but this industry might be very much enlarged but for the influences I have referred to; and in the hands of enlightened natives with capital it might be made remunerative, for the demand for it is an increasing one, as I have endeavoured to show. The principal trade routes which exist from beyond the Protectorate are those which enter it across our northern frontier through the French posts at Herimakunu and Wossu. On the eastern frontier between Herimakunu and Kanre Lahun, though certain routes cross into our territory, as by Kombili, which is east of Koinadugu, and by Sehamma and thence between the Tinki range and Mount Binsing, practically no trade passes along them, owing to the deserted condition of the country bordering both sides of this frontier. From Kanre Lahun a certain amount of trade is done with the interior at the markets in the country, but owing to the chronic state of warfare which exists between chief Kailundu and the Kissi, Bandeh, and other chiefs, the trade is very languishing and intermittent. Along the frontier on the Liberian side from Kanre Lahun to the coast at Manoh Salija there is, as I have already pointed out, a constant state of warfare, and the border districts are a desert. During my recent tour there appeared
to be a great revival of trade with the interior across our northern frontier, and the number of caravans that have come down are unprecedented; but the future prospects of this trade are very uncertain, and its continuance cannot be counted on, nor have the products which have come down had such an effect as I anticipated in relieving the depressed condition of the market. Considering how very sparsely inhabited the regions of the Upper Niger appear to be, it is possible that the interior trade from that direction is over-rated.

Turning to the consideration of Mr. Shelford’s report, my recent tour has more than convinced me of the desirability of projecting the railway through the Upper Mendi districts rather than towards Bumban: that is to say, through the southern portion of the Protectorate rather than the northern. It must be admitted that the northern portion is on the whole inhabited by a more sober, industrious, and intelligent people, and a people a large number of whom are born traders; but on the other hand, the soil is less productive, and the trade is more or less dependent on the produce which comes from the interior rather than from the soil itself, and the former is, as I have endeavoured to show, an uncertain quantity. Again, such produce as does come down, and which, with the exception of the cattle, consists principally of rubber, gold, and ivory, is not of such a bulky nature as the products of the southern portion, which include palm kernels and oil and timber, and therefore its transport would not be so remunerative to a railway. With regard to the cattle, it is doubtful whether it would be an advantage to transport them by rail; again, the northern portion is not so capable, I think, of development by means of settlers as the southern, for though it possesses higher land towards the east, and possibly a more salubrious climate than relatively similar parts of the southern portion, the soil is not so productive. On the other hand, there is no doubt, as I have already said, that the southern portion is extremely rich in palm oil and kernels, and that its forests contain large quantities of useful and valuable timber and rubber vine.

For these reasons I would prefer the railway passing through the southern portion rather than the northern. Turning to the consideration of the exact route which the line would follow, this could only be determined after a survey by a competent engineer; but during my recent tour I carefully observed the country through which I passed, and am of opinion it should follow the route which leads from Songo Town through Manjehun and Mano to Baoma or Koranko. With the exception of the bridging of the larger rivers, such as the Ribbi and Taia, there appear to be no serious engineering difficulties as regards the configuration of the country. From Koranko my route passed over the range of the Kambui Hills to Segbewema, a very hilly and difficult country; but I am informed that this range can be turned by a road which passed from Baoma through Wendeb into the valley of the Moa or Sulima river. This valley once gained there would, I think, be no great difficulty in carrying the railway as far
as Kanre Lahun. The Ribbi River, which is navigable for steamers of from 6 to 8 feet draft some miles higher up than the point at which it would be crossed by the proposed line, would prove of great service for the transport of materials. This route, while it would not interfere with the cheap and easy means of transport by the waterways through the Lower Mendi and Sherbro districts, would tap the resources of the Upper Mendi districts, at present quits undeveloped owing to their distance from a market and the expense of transport. I don’t think it is necessary for me here to advert to the financial aspect of a railway for Sierra Leone as regards its initial cost and that of its maintenance and working expenses. There matters were fully discussed in Mr. Shelford’s report, and also in the Sierra Leone Legislative Council.

But as to the advantages or disadvantages to the colony that would result from the introduction of a railway, it is possible that at first it might be a failure financially, but there is no doubt in my mind that it would develop the resources of the country through which it passes, and that in the absence of waterways this appears to be the only effectual mode of doing so. So that the question to be determined is whether the prospective advantages from the development of the country outweigh the possible financial losses that may accrue through the railway proving unremunerative.

Palm kernels and oil are the chief products of the interior, and as long as the demand for them continues their transport, owing to their bulk, must be remunerative to a railway. It is to be hoped that this demand will continue, but sometimes the fear arises that this may not be so. In the early part of this year there was a very heavy fall in the price of these commodities, and though the prices, as I understand, have since recovered, they may fall again; but in this matter of the future prospects of the trade in these commodities you, gentlemen, are far better able to give an opinion than I am, but in this connection I venture to think, apart from any railway scheme, that more might be done to increase the supply of palm kernels for the market by the use of labour-saving machines for cracking the nuts. Machines of this kind, I believe, are in use in some of the colonies further south than Sierra Leone on the coast, and that at Old Oalabar there is steam machinery for the purpose; but in Sierra Leone there are no such appliances for expediting the work of cracking the nuts. In the interior the nuts are cracked one by one on a flat stone with another in the hand; the process is very laborious and tedious, and it takes a woman the whole day to fill with kernels an empty gin box, whereas the machine I refer to would do the same work in one-tenth of the time. These machines, I dare say, are known to many gentlemen present; they cost about 8s down the coast, and if they were introduced into the interior I think their advantages would be appreciated by the natives, and that in the course of a short time their use would result in an increased supply of kernels.
As regards passenger traffic, from inquiries I have made, it appears that the aborigines in Senegal largely avail themselves of the railway from Dakka to St. Louis, and it is reasonable to suppose that those in the interior of Sierra Leone would also do the same. For purposes of administration and military control of the country, a railway would of course be very valuable. This has been the experience of French officers in Senegal.

I have endeavoured to demonstrate that, in my opinion, a railway passing through the Upper Mendi country would be preferable to the line proposed to be carried in the direction of Bumban; there remains, therefore, only to consider the desirability of what I may call the Sulima line, from Mina to Sembahun. It already stands condemned in Mr. Shelford’s report, where it is conclusively shown that the prospects of any remunerative returns from it are most remote. I may mention that the estimate of the cost per mile for this line, which would be about 64 miles in length, is over one-third more than that of the main line to Bumban, the length of which would be about 140 miles, i.e., for a light line, as £4,483 to £3,223. The Sulima line would have to compete with the water carriage along the rivers, a far cheaper means of transport, and there would be the cost of transshipment at Mina. The proposed extension to Bendu, shown by the dotted line in the map, would, I should say, be very costly, and would present considerable engineering difficulties in the passage of such large rivers as the Kittam and Great Bum, and the rivalry of the water carriage would not be done away with.

I should like here to revert to a point I have already alluded to, and that is the liquor traffic in connection with the native races. It is a question that is intimately connected with the welfare of the hinterland of Sierra Leone, and must therefore command the attention of anyone, officially connected as I am, with that colony, but furthers, I think it is one that materially affects also the commercial interests of those concerned with it.

I think there is no doubt that the importation of spirits into the interior does the natives great harm. Putting aside the testimony of missionaries, who some may think are unduly biased on the question, owing to their zeal for the spread of the Gospel, which they assert it hinders, there is against it the testimony of many officials who have served on the coast, and amongst others of one of the most enterprising and famous of our explorers. Who is intimately acquainted with the Central African races. I refer to Captain Lugard, who, in an article recently published in the ‘Nineteenth Century,’ speaks in strong condemnation of the traffic, and likens the importation of it to a ‘flood of poisonous liquor.’ Admitting, therefore, that the importation of spirits on the West Coast does harm to the natives, the further question is whether the traffic does not also affect more or less injuriously our mercantile interests.
Its entire prohibition on the West Coast is, in my opinion, quite impracticable. The direct loss of revenue that would result from the cessation of the importation would be ruinous to the colonies concerned, but I think if, by concerted action with the other powers possessing colonies on the West Coast, a much higher duty were placed on spirits, that gradually the demand would cease, and in the meantime other wants by the natives would be created; thus, though the volume of trade in spirits would diminish, it would increase probably in an almost direct ratio with respect to other commodities.

In conclusion, it should be borne in mind whilst considering any scheme or the development of Sierra Leone, that she is not so rich as her sister colonies on the coast. The Gold Coast has her gold fields, Lagos a wealth of palm trees, with a teeming population in her hinterland to produce the oil and receive English merchandise in return; the Niger Company has the magnificent waterways of the Niger and Benue navigable by steamers for hundreds of miles inland, by which the produce is brought down from the remote interior; and the Niger Coast Protectorate, which occupies the delta of the Niger, is intersected with countless creeks and rivers, all of which are highways for commerce. These colonies can get, as it is somewhere remarked, what revenue they like almost for the trouble of collecting it; whereas a very different state of things prevails in the Protectorate of Sierra Leone. On one side it is enclosed by the colonies of France with a barrier of protective tariffs, and on the other by the Republic of Liberia, the hinterland of which, right up to our borders, is in a chronic state of disturbance.

The Sierra Leone Protectorate has no mineral wealth, its population is on the whole sparse, and a large area on the eastern confine is uninhabited; the soil of the northern portion is poor, the rivers, excepting those of the Sulima district, owing to the high lands from which they fall, are obstructed by barriers of rocks often to within a few miles from their mouths, and, even these excepted, have no great commercial importance as waterways, as they are barely navigable beyond 50 miles in a straight line from the coast. On the other hand, Sierra Leone possesses advantages for the development of the interior which are not shared by her sister colonies. She has a large population of Christianised and civilised negroes, many of whom are extremely intelligent, some of whom are men of first-rate ability, and amongst whom are to be found represented all the learned professions. From such a community it should not be difficult to find settlers for the interior, who by their knowledge and industry would be able to develop the products of the land to its fullest capacity, and teach the aborigines the arts of a better system of husbandry than they now possess, introducing amongst them the culture of the coffee, cocoa, ginger, and other plants.

With civilisation would come an increased demand for the useful commodities of life, and thus Sierra Leone, though she does not possess the inherent natural wealth and resources of her sister colonies, or access to the markets of the
interior of Africa, may yet, by the increased impulse given to trade by her greater
development, become a thriving and prosperous colony, and to this end nothing
can more surely contribute than a railway.

I think I have now said all that has occurred to me on the subject of a railway
scheme for Sierra Leone, and I beg to thank you for the very patient hearing you
have given to a subject which I feel might have been laid before you in a far more
attractive and interesting manner than I have done.

The President of the Chamber of Commerce, Mr. Chas. McArthur, said he
had much pleasure in moving that the very hearty thanks of the African Trade
Section and also of the chamber be given to his Excellency Col. Cardew for the
very interesting, weighty, and practical observations he had addressed to them.
He was quite sure they felt it was a matter of great gratification that the affairs
of so important a colony as Sierra Leone should be administered by a gentle-
man who did not perform his duties in a perfunctory manner, but who took the
deepest interest in all that concerned the moral and material well being of the
inhabitants. (Hear, hear.) He was sure they could not have listened to his address
without feeling that they had in that colony the right man in the right place.
(Hear, hear.) He was quite sure that the observations which his Excellency had
made on the subject of their trade with Sierra Leone would receive the earnest
and respectful consideration of all who were engaged in commerce with that
part of the world. They could not but feel the great weight of his observations
on the liquor traffic. They felt it was most important and most desirable that
that traffic should be so regulated that the evils which flowed from it should be
removed, and the result would not only be conducive to the well-being of the
inhabitants themselves, but would in the end promote the growth of legitimate
trade. With regard to the observations his Excellency had made on the subject
of railways, he was quite sure they would command the attention of those who
had to decide which was the best route in which railways should be laid in that
colony. He thought he might say that, as far as the Chamber of Commerce was
concerned, they were not very particular about the route as they were to see
a railway established. They were content to leave the question of route in the
hands of those best qualified to judge. They had, in season and out of season,
been pressing the Government to take up this matter of railway construction,
and they believed now that the work of conversion was accomplished, and that it
might speedily find an outcome in the work of construction. That was a consum-
mation they all desired to see realised. He was sure the observations of Governor
Cardew on the subject would find their way to a very large auditory, and would
have weight in deciding the minds of those who had to deal with this question.
He had pleasure in moving the vote of thanks.

Mr. A.L. Jones said that after the very able address of the president of the
chamber, he would merely emphasise his remarks about their visitor, to express
as strongly as possible the sincere thanks of the West African Section to Governor Cardew for his able address. It was a great advantage for commercial men to be in touch with Government officials, and it was a great pleasure to find that Liverpool and Manchester had been the cause of having these routes named surveyed, and that the results had been so highly satisfactory. The Governor had referred to the duties on spirits. The Liverpool merchants and those interested had no hesitation in recommending those duties to be increased where those duties were properly applied, and where the colonies had got a very large surplus revenue they thought they should ask them to spend that revenue before they increased taxation to the disadvantage of the trader, for it would be dangerous for Sierra Leone to increase her taxation unless their neighbours did the same. (Hear, hear.) Any increase in the duties of spirits would be supported in Liverpool, but it was necessary they should act with their neighbours. If France would be willing to increase the duties on spirits England would be the first to recommend it – (applause) – but not unless the increase was also applied by other nations. (Hear, hear.) The amount Col. Cardew had said was necessary to make this railway was so small that it seemed ridiculous to hesitate. In the pamphlet it was stated that it would cost £6,000 a year. This to a colony like Sierra Leone, where there was such valuable land, should be absolutely nothing, and they should not hesitate. Liverpool men had agitated for a great many years to get such a railway made, and they must really let officials in London know that they were getting impatient. They thought they were wasting their time. (Hear, hear.) They had a right to be considered and a right to attention. He was grateful to Col. Cardew for giving them such an able address. It was one that was of great value to commercial men. (Applause.) Mr. J. Holt supported Mr. Jones’s remarks in regard to the railway and the liquor traffic. These questions had been before the section on various occasions, and they had spoken their minds on the subject. Mr. Jones had correctly stated that they had no objection to the Government taking the liquor traffic into their own hands. It was so unprofitable to the merchants engaged in it that if they lost it altogether they would not lose much. Personally, he should like to see the Government taking a monopoly of the liquor traffic, and doing away with the disgrace that in some people’s minds attached to the selling or liquor to these poor Africans. The thing was greatly overstated – (hear, hear) – not purposely, perhaps, but much that was said was erroneous. He had been in Africa, and had mixed amongst the men who paid for and took liquor, and he had never seen anything of what he had heard went on. – (Hear, hear. & e., a voice, ’Perfectly true.’) They got such reports of the fearful state of the natives, who were said to be debased by the liquor traffic, but he did not believe a word of it. (Hear, hear). He did not care who made these statements – he challenged him to prove it, as applying to the whole of the population, and that was the impression that was left on the minds of the people of this country. (Hear, hear.) They had the right to
call in question such statements, and to ask that such people as the governors of
their colonies, like Governor Carter, the Governors of the Gold Coast and Sierra
Leone, should have their evidence taken before the statements that had been
made should be accepted by those who heard them. (Applause.) This was mat-
ter that he wished to refer to, especially as it was agitating people’s minds at the
present moment, and he wanted to call public attention to it, and to put a stop to
such reports. Governor Cardew thought that possibly the increase of duties on
liquor would have some effect in stopping the liquor traffic. It would be a source
of revenue to the colony if they could increase the duty, but they must always bear
in mind one thing—a thing that was sometimes forgotten—and that was not to
put a premium on the native production of spirits. High duties would be a greater
inducement to the natives to produce their own spirits. There was no reason why
they should not distil their own liquor if they got to know how. It might be done,
and the more they increased the duties the greater would be the inducement to
the native to produce his own liquor, and perhaps stronger than it was made now.
With regard to the question of the railway they took credit for having brought
this matter before the governors of the coast. They wanted them to make the
railway—to spend the money they got in revenue judiciously in the making of
these railways. He did not think they would like to see railways constructed that
would not be remunerative. If they were not remunerative, the money spent on
them would be wasted. He was pleased to hear the Governor criticise the route
to Bumban. He was not convinced that this was the best route, and was of opin-
ion that the lower route through the southern part of the colony to the Upper
Mendi would be most likely to be the successful route. He wondered how it was
that the route to Bumban had been surveyed when the governor in going across
the country came to the conclusion that the most desirable route was in a dif-
ferent direction altogether. How was it that the officials did not find this out
before they made the survey? It was a serious waste of time, because it meant that
another survey would have to be made, and it might necessitate years of labour to
get this lower route surveyed as the upper one was. It was a pity they did not dis-
cover this until the governor went there and found the lower route the better one.
He had much pleasure in supporting the motion. / Mr. Zochonis (Manches-
ter) said he never felt his inability to express his gratification at the interesting
address of Col. Cardew more than at present. The colony of Sierra Leone was
to be congratulated on possessing such an able administrator. They had had able
men before him, but none more able than he. (Hear, hear). He had been deputed,
with another gentleman, to report to the Manchester Chamber of Commerce on
the report of Mr. Shelford. and he had come to the same conclusion as Governor
Cardew, that the route proposed by Mr. Shelford was not exactly the right one,
and they had already recommended the Chamber of Commerce of Manchester
to disapprove of it. The Chamber had communicated with the Colonial Office,
recommending the route to the Upper Mendi. He did not think it was necessary that there should be the delay spoken of by Mr. Holt, for the first portion of the railway could be proceeded with. It would be a waste of money to construct the other, because there was a waterway there which was quite sufficient for the trade. He had resided for a good many years in Sierra Leone and he believed that the traders connected with the colony would be grateful to Col. Cardew for all he had done for the trade there. (Hear, hear).

Governor Cardew said he was extremely obliged for the kind expressions used in reference to this work. As regarded the liquor traffic, what he had said—though perhaps he was not quite clear—was that prohibition was impracticable, and that any marked increase in the duties on spirits must be arranged in concert with all the nations possessing colonies on the West Coast. It would be a suicidal policy to raise the duties in one colony, and then find that Germany, France, or Liberia would take instant advantage of it to pour their liquor across the borders at a lower rate than it was sold for in their own colony. What they should strive to do was to get that concert amongst the nations concerned, which they had in the case of the introduction of arms of precision into the interior. He thought the demand for spirits would decrease with a higher duty, but that trade generally would increase and make up for the loss on spirits. With regard to the remarks of Mr. A. L. Jones about the cost of the railway, he might say that £6,000 a year would be the cost of only one portion—that to Songo Town, only 30 miles of railway. If this line were extended every extension would necessitate a greater demand on the resources of the colony. Mr. Jones also referred to the reserve fund of the colony, which he said, could be used for this purpose. Unfortunately they did not possess a reserve fund of any great amount; it was not more than £35,000, if so much. With regard to the remark that the natives might make distilleries unless alcohol was introduced into the country in sufficient quantity, he did not think this would be so. The natives he thought, would content themselves with the palm wine of the country, which was very good, and answered their purpose. He was glad that his opinion had been confirmed by Mr. Zochonis with regard to the construction of a railway in the southern part of the colony. The railway to the north was projected before he had any voice in the matter. He thought the gentlemen present would bear him out when he said that by far the richer part of the colony was the southern porting, up to the district of the Upper Mendi, and it was here he proposed that the railway should go rather than that surveyed to the north. (Hear, hear.)

[...]

THE BEIRA RAILWAY.

REPORT OF PROCEEDINGS.

BEING A REPRINT FROM THE ‘RHODESIA HERALD’ OF THE VARIOUS MEETINGS HELD IN SALISBURY, RHODESIA, ON THE ABOVE QUESTION.

Printed in London on behalf of the Beira Railway Extension Committee, Salisbury, Rhodesia.

Salisbury, Rhodesia,
13th December, 1895.

For a long time past the inhabitants of Mashonaland have been labouring under serious disadvantages, occasioned chiefly by the lack of efficient transport, and in consequence – instead of going steadily ahead, as it should have done – the country is practically at a standstill.

A reference to the map of South Africa will show that the natural highway into the country is plainly via Beira and the East Coast, and repeated applications have been made to the British South Africa Company to extend the Beira Railway right up to Salisbury, without attaining the desired result, notwithstanding that it has been conclusively proved that it is absolutely impossible to develop the mines profitably, or even to bring up the required machinery for that purpose, with the present inadequate system of ox-wagon transport.

It is not intended in this letter, nor, indeed, would it be possible, to give full particulars of a scheme which involves such enormous interests, but we beg to
enclose / you a pamphlet reprint from the *Rhodesia Herald* of the reports of the various public meetings recently held in Salisbury, containing all necessary details. The result of these meetings was to elicit a reply from Mr. Rhodes to the effect that the railway would be extended to Umtali, or about half way to Salisbury. This reply, however, not being considered as one adequately meeting the case, it was unanimously decided at a further public meeting to petition her Majesty the Queen on the subject, and a petition will in due course, it is trusted, come before the House of Commons during the next Parliamentary Session.

The object of this petition is one which appeals to the heart of every Englishman, viz., a desire to obtain justice, and our Committee feel sure they can rely upon the support of their brethren at home.

In giving publicity to this just claim, and according it your support and influence, you will be rendering a service to the entire population of Eastern Rhodesia which can only be calculated by the overwhelming importance this question possesses for them and their future.

On behalf of the Beira Railway Extension Committee,

I am, dear Sir,

Faithfully yours,

W. E. FAIRBRIDGE,¹

*Hon. Sec.*

---

**NOTE.**

So large an amount of English capital having been invested in Rhodesia, and especially in mining companies, it is felt by the Beira Railway Extension Committee that a question of the first importance to the Colonists themselves will be of no little interest in the Home Country, and particularly to Members of Parliament and the English Press.

It was considered that no more faithful and useful account of the Rhodesian railway question could be given than by reprinting, *in extenso*, the local newspaper accounts of the various public meetings held in Salisbury on the subject, and this course has, therefore, been adopted by the Committee.

In publishing the whole of the newspaper reports, the Committee do not, of course, necessarily endorse every individual expression of opinion therein contained, but they wish to point out that the resolutions themselves were, without exception, carried unanimously, and have met with the full approval of all classes in Rhodesia.

J. H. DEARY, *Chairman.*²

W. E. FAIRBRIDGE, *Hon. Sec.*

**Salisbury, Rhodesia,**

*December 12th, 1895.*
BEIRA RAILWAY EXTENSION COMMITTEE.

Chairman:
H. J. Deary, Esq., J.P. (Deary and Co., Salisbury), and Elective Member of Town Board.
G. D. Bates, Esq., Elective Member of Town Board.
Stamford Brown, Esq., Manager, Bechuanaland Trading Association, Salisbury.
M. A. Freeman, Esq. (Tennant and Freeman), Salisbury.
E. E. Homan, Esq., J.P.
Captain Hoste, Managing Director, Holton Estate Gold Mining Co., Ltd.
J. Boyd King, Esq. (King, Williams and Co.), Salisbury.
F. G. Lowe Esq., Managing Director, Scottish African Corporation, Ltd., &c.
Frank Mack, Esq. (am Ende and Mack), Managing Director, French South African Development Co., Ltd., Salisbury.
A. J. McLaurin, Esq., Government Member of Town Board.
E. W. Meyer, Esq., Mining Engineer, Salisbury.
M. Muirhead, Esq., Salisbury.
Wm. Smith, Esq., Commissioner, Mazoe Development Co., Ltd., Salisbury.
W. Steele, Esq., Salisbury.
R. G. Snodgrass, Esq. (Snodgrass and Mitchell), Salisbury.
L. Susman, Esq., Managing Director, Salisbury Reef Gold Mining Co., Ltd.

Hon. Secretary:
W. E. Fairbridge, Esq., J.P. (Resident Director, Argus Printing and Publishing Co., Ltd.), Elective Member of Town Board, &c. /
A PUBLIC MEETING was held at the Masonic Hotel, on Friday night, to discuss the attitude of the British South Africa Company with regard to the extension of the Beira Railway. The hall was filled almost to overflowing, the meeting being fully representative, and embracing every class of industry in the country. The meeting was called for the purpose of passing certain resolutions, and as these resolutions are of considerable length, they are inserted here as being more convenient for reference, together with the names of their respective proposers and seconders.

Resolution 1. – Proposed by Mr. W. E. Fairbridge, seconded by Mr. Brown:–

That this meeting desires to emphatically impress upon the British South Africa Company the absolute necessity for immediately extending the Beira Railway to Salisbury, the utter inadequacy of waggon transport from Chimoio proving an effective bar to the development of all industry in the country.

Resolution 2. – Proposed by Mr. W. Smith, seconded by Mr. E. Meyer:–

That in the opinion of this meeting, representing all interests in Eastern Rhodesia, the immediate construction of a railway is of paramount importance, for the following reasons:–

(a) Notwithstanding the extension of the line to Chimoio, it has been abundantly proved that waggon transport, even under the most favourable circumstances, between Chimoio and Salisbury, and especially in the low-lying country east of Umtali, has been wholly unsatisfactory, while now, owing to various causes, all traffic has ceased, and no relief promises in the immediate future.

(b) Owing to the above causes it will be utterly impossible to / convey to the various mining centres the enormous quantity of heavy mining machinery and material which must be sent in before an output from the mines
can be expected; and it is a well-known fact that the shipments of a very considerable amount of mining machinery have been countermanded.

(c) In the absence of railway communication, and under existing circumstances, the farming industry is seriously hampered, and it has been found unremunerative to import blood-stock and agricultural machinery.

(d) At the present rates from Beira to Salisbury, viz., £50 per ton, the cost of living presses heavily upon all wage-earning classes.

(e) While the cost of bringing goods to Salisbury remains at this figure, transport being even then extremely uncertain, the projected developments in building operations in Salisbury, which are very considerable, have been entirely stopped.

Resolution 3. – Proposed by Mr. Bates, seconded by Mr. Grimmer:

That this meeting does not consider it necessary to do more than mention the very obvious fact that a railway from Beira is the proper and natural highway into this country, and, moreover, presents no engineering difficulties in construction. This meeting, therefore, desires to ask the British South Africa Company whether they intend to proceed at once with the building of the Beira Railway to Salisbury; and if not, whether they are prepared to sanction its construction by private enterprise, as it is well known that in the latter event adequate capital would at once be forthcoming.

Resolution 4. – Proposed by Mr. Snodgrass, seconded by Mr. F. G. Lowe:

That a committee be now appointed to lay before Mr. Rhodes the foregoing resolutions, and that this meeting stand adjourned until this day week to receive the report of the committee and its answer from Mr. Rhodes.

At the commencement of the meeting Captain Hoste proposed that Mr. H. J. Deary be chairman, which proposition was hailed with acclamation. On the platform with Mr. Deary were the following gentlemen:– Messrs. Stamford Brown, W. Smith, E. Meyer, G.D. Bates, W. Grimmer, R.S. Snodgrass, F.G. Lowe, J. Edmonds, Steele, Muirhead, and W.E. Fairbridge.

The Chairman, on rising, said: Gentlemen, – It is now about eighteen months ago since we had a meeting here in connection with the extension of the Beira Railway. At that meeting we gave a very emphatic utterance as to what our views were with regard to this extension, and as a result of that meeting we obtained the present railway to Chimoio. I hope, however, that the result of tonight’s meeting will be that we get the railway, not merely extended to Umtali, but right up to Salisbury. (Cheers.) As, perhaps, you are aware, the Chamber of Commerce has taken this matter in hand, and for some time past has been in correspondence with the Government, but the response we received from the / Government has been anything but satisfactory. In reply to our last request
on this subject we received the following reply from the Administrator at Buluwayo:

Frank Mack, Esq., Salisbury.
Beira Railway, Extension.

Sir, – In further reference to your letter of the 31st July last, covering petition signed by the inhabitants and ratepayers of Salisbury praying for the extension of the Beira Railway to Salisbury, and to my reply thereto of 11th August, I have the honour to state that this petition was duly laid before Mr. Rhodes, who now desires me to inform you that it having been considered desirable, from a railway point of view, to first provide a better base from which to work the railway, and to establish direct communication with the port, arrangements were entered into some time since for a line of railway to be built from Beira to Fontesvilla; and Mr. Rhodes feels sure that the signatories to the petition will recognise the primary importance of thus establishing direct railway communication with the Coast Port.

I have the honour to be, Sir,
Your obedient servant,
Percy S. Inskipp,
Secretary to the Administrator.

Salisbury, 17th October, 1895.

Gentlemen, this reply can only be considered as distinctly unsatisfactory. (Hear, hear.) It simply means putting the thing off for a further period, and I don’t think we can submit to that any longer. (Cheers.) We thought it would be only courteous on our part to advise the Council of our intention to hold this meeting, and the secretary of our Committee wrote them accordingly requesting the honour of their attendance. In reply thereto we received a letter from the Acting Administrator regretting that the members of the Council were unable to accept this invitation; that, although they could not be present, the meeting had their entire sympathy, and they would do all in their power to help on the Beira Railway.

We have taken considerable trouble in drawing up resolutions which we will submit to the meeting in due course, and gentlemen present will be asked for any views they may hold upon the subject. Our object is to give the most decided utterance that is in our power, and I would here take the opportunity of thanking the local papers for the support they have given us on this question. I have to thank the Nugget especially for the various paragraphs which appear in their issue of to-day calling public attention to this meeting. (Hear, hear.) There are speakers before you this evening representing the professional, commercial, mining, and farming interests of this country, and I have no doubt they will be able to throw additional light on the subject. We all know that the country
between Chimoio and Umtali, under the most favourable conditions, can never be fit for transport, and we must keep that important fact before us. With these introductory remarks I will call upon Mr. Fairbridge to move the first resolution. (Cheers.)

Mr. Fairbridge: Mr. Chairman and Gentlemen,—In moving the first resolution, I will not attempt to deal with points which will be treated very fully in the second resolution, but will confine myself entirely to the resolution entrusted to me. This resolution, which is a very brief one, puts the whole thing in a nutshell, and gives the why and the wherefore of our demand for the railway. The plan of the campaign we may have to enter upon before securing the railway is a very difficult one, but I think we can do something if we all pull together and show a determined front. (Hear, hear.) It must be gratifying to all of us to see so many here to-night, and I, for one, am very glad to see this hall so full. The people of Salisbury have ever been a patient and long-suffering community, but when their cup is full to overflowing they can speak, and speak to the point; that is one reason why the Administrator generally has to give in to us. (Hear, hear, and laughter.) Well, if it is necessary to hit at somebody in order to get our railway, I suppose we must hit at Mr. Cecil Rhodes, and here I will point out a difficulty with which we, as the party of opposition in this railway matter, are confronted. There is no doubt the real circumstances directing the policy of the Chartered Company are withheld from us; we are always more or less kept in the dark. Unlike the opposition in a self-governing colony who have in their turn of power been permitted to look behind the scenes, we have had all sources of information closed to us; consequently, when we hit out in self-defence, as we are bound to do, we may hit the wrong man. Nevertheless, Mr. Rhodes is the accepted head of the Chartered Company, so that I do not care very much, nor see that it matters very much, if in hitting out at Mr. Rhodes we should hit the wrong man, or hit at him the wrong way. It is the generally accepted belief here that in Mr. Rhodes' opinion the most important thing is the extension of the Cape Government Railway northwards, and that the value of that railway would be greatly depreciated if the Beira Railway was completed first. Well, Mr. Rhodes may have had a hand in delaying the railway for various reasons, but we must not forget that he is tied to a great extent. (‘No, no.’) Well, gentlemen, I think I am right in saying that the Mozambique Company have helped to tie Mr. Rhodes' hands. I believe I am correct, if not I hope Mr. Mack will put me right, in saying that a large number of shares in the Beira Railway are held by the Mozambique Railway Company, most of the remaining shares being held by the Chartered Company. When we held our last meeting on this subject the directors of the Mozambique Company created a difficulty, and it is well-known that Mr. Rhodes had to lend the money for that extension out of his own pocket. Whether Mr. Rhodes' hands are tied or not there are other persons connected with the Chartered Company to whom
we can apply pressure in case of need. I refer to the Home Directors of the Chartered Company. (Hear, hear.) Mr. Rhodes cannot do everything for everybody, although he can do great things: he has to keep in touch with the people of Cape Colony as well as the people of Great Britain, and between these two we seem to get left out in the cold. The Home Directors, however, are not tied in any way, and, if they please, can command the money and power to extend the railway at once. As we know, this country is one in which certain groups of home speculators have very great interests, and if everything else fails we can make things so unpleasant for them that they will be compelled to yield, if only for the sake of peace; and in hopes of getting money out of the country in which they are so largely interested they will naturally wish to give the country a fair name. It will not do for them, nor the Chartered Company, to fight this question to the bitter end; and I feel confident that we shall get this railway, though possibly not without the Chartered Company being given to understand that we are prepared to go to any length in order to achieve that object. The urgency of our situation gives us no choice; but I don’t think that Mr. Rhodes or the financial groups at home are prepared to see us go to extremes, and therefore I venture to prognosticate that the battle will result in victory for ourselves. (Cheers.)

Mr. S. Brown: Mr. Chairman and Gentlemen, – I think our case that we are bringing forward to-night is a very strong case, and one founded upon facts from which the Chartered Company cannot escape, and I feel sure when those facts are laid before the Company that we shall get what we want. It has been proved during the last few months that waggon transport is quite unable to cope with the requirements of this country. (Hear, hear.) In a few months’ time the wet season will be upon us, and we shall have no traffic at all. We have always had a grievance in this country, but this present grievance is the greatest of all. If the Chartered Company cannot, or will not, build this railway themselves, we can get it done ourselves by private enterprise. The present rate of £50 per ton for transport entirely prevents the introduction of mining machinery into the country. (Hear, hear.) At the present moment our local merchants are without stocks, our mines without machinery, our builders without material, and, in fact, everything is at a standstill on account of the delay in extending this railway. It is absolutely necessary, if the country is to go ahead at all, that we should have this extension without any further delay. I have very great pleasure in seconding the resolution. (Cheers.)

Mr. Chadwick instanced the effect this lack of transport had had in connection with his firm. On their arrival here some four months ago they expected to find their machinery here before them, but that machinery is still lying at Chimoio, and as far as he could see would be there another four months. Although they had done a certain amount of development work, he had no hesitation in saying they could have done at least five times as much if their machinery had only come to hand as it should have done. (Hear, hear.)
The resolution was then put to the meeting and carried unanimously amidst tremendous applause.

Mr. W. Smith, in moving the second resolution, said: Mr. Chairman and Gentlemen, – In laying these very important resolutions before the meeting I think our task is very much lightened by the fact that no argument is needed to support them. We are all agreed, I believe, that without a railway this country runs a very great danger of having its brightest prospects blighted, and the development of its resources indefinitely delayed. I will refer very briefly to the various sub-sections of the second resolution, a cursory reading of which may not have impressed them sufficiently on your memories. Section A emphasises the fact that even in so-called good times, when oxen are fresh and well fed, and grass and water abundant, the roads in good condition and rates at their normal figure of 15s., waggon transport is wholly unsatisfactory. I hardly need to dwell upon this before a Salisbury audience. We have all had our little experiences, which have clinched that fact in our minds, but this section goes on to show that transport has now utterly broken down, just when our needs are greatest, and we have no assurance of any improvement in the future. Section B of the resolution deals with the effect which the present state of affairs is having on what must be considered our staple industry, i.e., the mining industry, in the prosperity and success of which the whole country is bound up. It is hardly necessary to detail to a mining audience the difficulties which the absence of effective transport has entailed upon us in the past. I would rather look forward and ask you how you conceive it possible for the development of our mining properties to be carried on under the existing circumstances? How is it possible for heavy machinery to be moved along our roads from Chimoio to the surrounding mining centres when it is next to impossible to provide transport for a box of matches? (Cheers.) I will not touch upon Section C, as this will be dealt with by a gentleman more capable than myself. Section D appeals to the purses of almost the entire community. I have just been informed that the hotel proprietors intend to seriously increase their charges, and who can blame them? (Sensation.) The question we shall have to face very shortly will not be so much what we shall pay, but what we shall eat! (Hear, hear.) In a similar way Section E refers to a matter which must have struck every inhabitant of Salisbury. You have only to take a walk anywhere about the township to see the numerous fine buildings standing unfinished for want of material, and if work is stopped there inevitably follows a stoppage of wages, with all its consequent hardship and misery. (Cheers.)

Mr. Meyer, who seconded the resolution, said: Mr. Chairman and / Gentlemen, – After the able manner in which the previous speakers have dealt with this question, I don’t think I can enlarge to any great extent upon what they have said. We all seem to be agreed that the prosperity of the country depends entirely upon the arrival of the Beira Railway, and Mr. Brown stated that we were
at present paying for transport at the rate of £50 per ton. Does anybody realise what this means? It means that to distribute machinery, &c., to the various mining districts this cost of £50 per ton becomes trebled! It means that instead of there being labour in this country for thousands of miners, the only men who are engaged in that occupation are a few prospectors preying on the gullibility of the British public! (Cheers and laughter.) We all know, or at least we all believe, that the mines in this country promise very great returns in the future, and I don’t think many of us would be here unless we did think so. (Hear, hear.) As a mining man for over sixteen years in all parts of the world, I can say that I have never been in a country which promised so well as this country, with one exception – I refer to the want of a railway. (Cheers.) In conclusion, I heartily second Mr. Smith’s motion that not only the mining industry, but other industries and the success of the whole country, depend entirely upon the speedy arrival of the railway. (Cheers.)

Mr. Edmonds, who spoke in support of the resolution, said: I would like to make a few remarks from a farmer’s point of view. There is no doubt we have a grand farming country here, but unfortunately we have to labour under very great disadvantages. There are many enterprising men who have spent a lot of money in importing blood-stock and cattle into this country, but only in one instance has the experiment met with the least success. Not only is the difficulty of introducing live stock into the country very great, but it applies equally to agricultural machinery. Speaking from my own experience as a farmer, I affirm that under the existing circumstances it is hopeless to attempt to bring any machinery up here. We have other difficulties to contend with, such as the locust plague, and last, but by no means least, we have the very serious difficulty which exists in obtaining native labour. There are few men, unless they have been in the country a long time, who really know how much this question of native labour affects us. The natives in many districts are starving – in fact, in some cases are already receiving Government assistance – and unless some scheme is devised without much delay whereby food can be brought up, matters will soon reach a climax. The Government accept the responsibility of feeding these natives, and, taking a very moderate estimate, it would require at least fifty bags of meal a day to do this. How are they going to meet this responsibility? It is in their own interests that this railway should be extended at once. Half a loaf is better than no bread; and if they will not give us the railway up to Salisbury, they might at least extend it to Umtali. (Cheers.)

Mr. Boyd King said: We have heard the weighty remarks of the gentlemen who have proposed and seconded this resolution, and I think most of us agree with those remarks. I do not, however, at all agree with Mr. Fairbridge and other speakers that this meeting will bring about the desired result. We must fight it out to the bitter end, and, if necessary, appeal to the Imperial Parliament, not merely
to extend the line to Umtali, but to Salisbury itself. (Hear, hear, and cheers.) One of the speakers has just said that half a loaf is better than no bread, but if the loaf itself is no larger than this – (here, amidst tremendous applause and laughter, Mr. King produced a most diminutive loaf) – I think we shall fare very badly on the half-loaf. (Cheers.) Gentlemen, I would propose that this loaf be sent to the Chartered Company – (cheers) – or even to the Imperial Parliament, as showing what the people of Mashonaland have to put up with, and what little value we get for our money when we have to pay a shilling for an article like this. (The cheering here was so vociferous that the speaker was obliged to pause.) In supporting this resolution I would conclude with the remark that we must not be content with mere prognostications. (Loud and continued applause.)

Mr. Richardson was in favour of a petition being drawn up. The local papers were very good, especially the *Nugget* with its pictures – (laughter) – but he contended that the people at home would never believe they had had such a meeting as was being held that night.

The Chairman pointed out that a petition had already been sent in, and a most unsatisfactory reply, which he had referred to in his opening remarks, had been received.

The resolution was then put to the meeting and carried unanimously.

Mr. Bates said: Before attempting to deal with the third resolution, I will refer to a trip I have just had down to Chimoio. The road from Umtali to Chimoio is simply lined with dead cattle, the stench being something awful in some places. It has been computed by reliable transport riders that close on one thousand head of cattle have been lost on that portion of the road alone during the last two or three months. We all know what that means: that the money to replace these cattle has to come out of this country. Amongst other heavy losers in this direction I may mention Messrs. Symington and Co., coach proprietors, who in this period have lost no less than 150 cattle. It has been stated that this year has been an exceptional one, but this is not the case. In 1893 I, personally, lost over 80 per cent. of my cattle, and there were others besides myself who suffered in an equal degree. I know of two men who were transport riding down there at that time – they may even be present here to-night – who can corroborate this statement.

It has been clearly demonstrated that the country between Chimoio and Umtali, under any circumstances, is totally unfit for transport. I don’t think anyone will deny that the welfare of Mashonaland is entirely bound up in the efficiency of the eastern route to Salisbury, and that efficiency can only be gained by the railway from Beira being extended. (Hear, hear.)

Dr. Harris, speaking in Cape Town on July 10th, 1894, in support of a railway between Kimberley and Bloemfontein, said ‘that such a railway would make food stuff cheaper in Kimberley, and that both Kimberley and Bloemfontein
would mutually benefit thereby. If the Cape Government and the Free State Government were both unwilling to build it, why not give out the construction to some reliable, responsible, and trustworthy contractors, who would only be too ready to take the matter up.' Well, gentlemen, as Mr. King has just said, we want to get food cheaper, and with food cheaper other things will become cheaper also. It has been said that the Beira Railway would not pay, but this is argued by those who are opposed to its construction. There is, however, a railway about to be constructed, from Mafeking to Buluwayo, which these same people assert is going to pay: but if this latter railway is going to pay, with its length of 1,400 miles (from Cape Town), surely the shorter one, from Beira to Salisbury (400 miles), should also pay, (Hear, hear.)

As regards the proposed railway from Beira not being able to pay, and the difficulties of construction, &c., the following is rather interesting: Not so very long since an expedition was sent out from England under the charge of an eminent engineer, who has constructed railways in different parts of the world, with instructions to survey the country from Beira towards Salisbury, and to advise as to the feasibility of building this railway. His opinion was an exceedingly favourable one, although (presumably on this account) his reception from Mr. Rhodes was anything but a cordial one. Nothing daunted, however, this gentleman returned to England, and later on his people submitted a scheme to the Chartered Company, with reference to the construction of a railway, the railway we are now agitating for, but the scheme was utterly rejected by the Company. There is a gentleman at present in Salisbury whose friends, since then, have offered £300,000 towards the construction of this railway, but this offer also the Chartered Company declined to accept. I do not hold with Mr. Fairbridge’s opinion that Mr. Rhodes is not entirely responsible for the delay in the extension of the line. Mr. Rhodes is the one man who looms out head and shoulders above everyone else in connection with the Chartered Company, and he is the one man we have to fight against. (Cheers.) As regards the Home Directors of the Company, these gentlemen have both a political and social position to maintain, and they would not, I think, sanction a scheme to keep back the welfare of Mashonaland. Had Mr. Rhodes ever had the slightest idea of obtaining a railway from Beira he could have accomplished it long ago, and I contend that Mr. Rhodes is, first and last, the one man responsible for the present state of affairs in this country. (Cheers, and a voice ‘He’s making the oof all the same.’)

The manner in which the people in this country have been fooled and humbugged by the Chartered Company from the very beginning is, to say the least, decidedly unscrupulous. We all know how, three or four days before the recent sale of stands at Umtali and Salisbury, the report was spread about that we should have the railway, and then immediately the sale was over the Company informed us that we should not have the railway. The result of this undoubtedly was that stands at
these sales realised far higher prices than they would otherwise have fetched, and although the Government may consider this was only diplomacy on their part it is, in my opinion, very bad diplomacy on the part of a Government when they have to stoop so low as to trick their own people. (Hear, hear, and cheers.)

Speaking at the last annual meeting of the Company, Mr. Rhodes said that if the country needed railways the money could easily be found outside the Chartered Company. We all know that, and so far as the demand for a railway is concerned we have been demanding it for the last three years; therefore Mr. Rhodes with his own words condemns himself. What is the cause – what is the obstruction that prevents this railway being constructed? If it should be, as Mr. Fairbridge states, that the Mozambique Company are causing the obstruction, the best thing Mr. Rhodes can do is to tell us they are in the way, and we might assist him to remove that obstruction. But whatever the reason may be, the people of Mashonaland, who are so much interested in the matter, have a right to know the nature of that reason. Mr. Rhodes has more than once admitted the power of the British people, and it may be as well to remind him that if the British public gave him the charter they can also take it away. (Loud cheers.) We have met with the firm determination of getting what we ask for, and if the Chartered Company still oppose the extension of this railway, and retard the progress of the country, we, the people of Mashonaland, will be prepared to fight the matter out to the finish. I don't think we need have any fear about the result – history will again repeat itself; and if the Chartered Company still oppress the people they will awake one morning – and at no very distant date – to find Mashonaland in the possession of other masters. (Loud and prolonged cheering.)

Mr. Grimmer said: We are trying to put a case to the Chartered Company which is as plain as the fact that a man has a nose on his face. (Applause.) As far as the usefulness of this railway is concerned we have the words of Dr. Jameson, who, of all men, knows what is best for this country. In support of it he, in no uncertain terms, said that the Beira Railway is the natural highway into the country. For any man to contend that this railway should have to wait until the one to Buluwayo is done, whoever that man may be, he must be a born idiot to talk such nonsense. (Cheers.) We don't insist upon the Chartered Company building the railway themselves, all we want is for them to give the necessary permission for it to be built by private enterprise. But if they refuse either to build it themselves or to allow of it being done by private enterprise, then I say we have a right to know the reason. (Loud cheers.)

Mr. Steele, in supporting the resolution, said: I believe the time has gone by when we should beg of the Chartered Company to give us a railway. (Hear, hear.) We are here to stay, and for us to stay it is absolutely necessary for us to have a railway. The time has now arrived when we must demand it, and we must be prepared to do something more than just come to a meeting and pass reso-
lutions. (Hear, hear.) Mr. Chamberlain is compelled to do his utmost for the Colonies as regards the building of railways, &c., and there is one to Uganda now being built. If a railway is going such a distance as this, where it is more than doubtful if it will ever pay, why can we not have one here to Salisbury where it will pay? (Cheers.) It rests with us to give Mr. Rhodes and the Chartered Company clearly to understand that, come what will, we must have this railway. (Applause.)

The resolution was then put to the meeting and carried unanimously.

Mr. Snodgrass: After the eloquent speeches we have heard to-night there is very little left for me to say. I have a resolution to propose which, if carried, will bring things to an issue; and I quite agree with the last speaker that the time has come when we can no longer ask, but must demand. (Hear, hear.) The Chairman informed us at the commencement of the meeting that the Committee had thought it only courteous to send an invitation to the Government members of the Council, and I am very much disappointed to see that the Government is not represented to-night. It would have been only courteous on their part to have had at any rate one representative at this meeting. It would have looked better. (Hear, hear.)

Mr. F. G. Lowe: I have very great pleasure in seconding this resolution. At the commencement of the meeting the Chairman read out a letter from the Council saying that they recognised the importance of our having this railway, and that the meeting had their entire sympathy. I am only sorry they were not present, as I feel sure that, after hearing what has been said to-night, they would have gone home feeling still more how urgent a matter the question of this railway really is. (Hear, hear.) I would express a wish that Dr. Jameson, and even Mr. Rhodes himself, had been present. (Cheers.)

One of the speakers had said that the sooner these difficulties were looked into the better, but have not these difficulties been ‘looked into’ for the last two years, and we are just as far from attaining our object as ever? In that little village London – (laughter) – there is a place called Exeter Hall, and if Khama can go there and pour out his grievances, so can we. (Cheers.) If we cannot get what we want here we must go home to the British public and tell them that the money subscribed for the Chartered Company has been absolutely thrown away. (Hear, hear.) It has been suggested that this loaf be sent to the Chartered Company, or even to the Imperial Government, as showing the difficulties under which the people of this country have to labour. Gentlemen, I would go a step further and suggest that it be embalmed and sent to the British Museum – (cheers) – where it would remain for generations to come as a standing disgrace to the Chartered Company. (Renewed cheers.) The Chartered Company are putting difficulties in our way which effectually prevent our doing any work, and if they continue doing so we must let the British public know that we can no longer continue,
but must shut down all our works. If we take up the matter in this spirit I don’t think either Mr. Rhodes or the Chartered Company will be strong enough to stand against us. (Cheers.)

Mr. Muirhead, in seconding this resolution, said: I took up my residence in Beira just when the railway was started. The papers at the time, I remember, said this was going to be a record railway, and at first I thought they were right for once, but they turned out to be wrong, as they generally are. (Laughter.) At least they were right in one respect – the line did turn out to be a record one, but in a very different way. The reason for the delay in extending this railway cannot be want of capital, for, as we all know, if liberty is only given the capital is ready waiting at a moment’s notice. We are all deeply concerned in this railway – commercial, mining, and farming interests alike are involved – and when we plainly see the volume of trade so greatly reduced, work on the mines being brought to a standstill, and building operations in the township almost entirely suspended for lack of material, we can only realise that in the completion of this railway is bound up the very existence of the country. (Cheers.) I don’t think at this stage we should be justified in going to the British public, but in the first instance should approach the Chartered Company in a respectful manner – (hear, hear) – and if that has not the desired effect, then we can take more extreme steps.

This resolution, on being put, was also declared carried without a single dissentient, and a committee was appointed in accordance with the resolution, consisting of the gentlemen on the platform, Mr. Boyd King’s name being added thereto.

The Chairman: Before closing this meeting, gentlemen, I have to thank you all for the very orderly and serious manner in which you have taken up this subject to-night. I have never yet been present at a meeting in Salisbury where so much determination has been shown, and I think this will have its effect in the right direction. (Hear, hear.) It is a very great pleasure to me – and I am sure it must be a matter of no little pride for the inhabitants of Salisbury – to reflect upon the manner in which this meeting has been conducted. The meeting will now stand adjourned until next Friday night at 8.30 p.m.

A hearty vote of thanks to the Chairman concluded the proceedings, and the meeting broke up shortly after ten o’clock.
BEIRA RAILWAY.
ANOTHER ADJOURNMENT.

November 8th, 1895.

The adjourned meeting with reference to the above question was held at the Masonic Hotel last Friday, before a numerous audience. Mr. H.J. Deary was in the chair, supported by the following gentlemen:– Messrs. G. Pauling (Commissioner of Mines), Captain Hoste, W. Smith, W.E. Fairbridge, Grimes, Snodgrass, Meyer, Bates, Steele, S. Brown, Muirhead, and Edmonds.

The Chairman: Gentlemen, – As you are all aware this is an adjourned meeting from the one we held last Friday, and we have met to-night to consider the reply of the Chartered Company, and to discuss as to what further steps should be taken in the matter. I regret to say that the information I have to lay before you to-night is not as satisfactory as it should be. The Committee received the following letter yesterday from the Secretary to the Administrator:–

Salisbury, 7th November, 1895,

Sir – His Honour the Acting Administrator has much pleasure in forwarding for the information of your Chamber the following telegram which he received from His Honour Dr. Jameson in reference to the extension of the Beira Railway:–

‘Please tell Chamber of Commerce that I have seen Mr. Rhodes and he promises that immediately the Beira Fontesvilla / extension is finished the railway will be proceeded with from Chimoio to Umtali. They will understand that, considering the extension will be finished in three months, it would be absurd to carry rails up now with the defective river transport. It has been arranged that the engineers for the Chimoio-Umtali section shall be sent in February.’

I have the honour to be, Sir,

Your obedient servant,
Percy S. Inskipp,
Secretary to the Administrator.
The Secretary, Chamber of Commerce, Salisbury.

The Committee consider that this letter can in no way be considered a reply to their message, more especially as it is addressed to the Chamber of Commerce. It was not the Chamber of Commerce who forwarded the resolution, but the public of Salisbury, and the Salisbury public have a right to expect a reply. (Hear, hear.) For my own part I don’t think this telegram was meant for this meeting at all. I am under the impression that it is a cross-telegram sent by Dr. Jameson as a ‘sop’ to our last meeting, but arrived too late. The Railway Committee met yesterday afternoon, and as this telegram was not considered to be a reply we
thought it better to wire again to Cape Town. This was accordingly done, and in connection therewith we received the following letter later this afternoon:

Salisbury, 8th November.
W.E. Fairbridge, Esq.,
Hon. Secretary,
Railway Mining Committee.

Sir, – I am desired by His Honour the Acting Administrator to inform you that, in consequence of telegraphic communication with the Colony being interrupted between Mochudi’s and Palla, he fears that it will not be possible for us to receive Dr. Jameson’s reply to the further telegram which was addressed to him at your request in time for your meeting to-night.

I have the honour to be, Sir,
Your obedient servant,
Percy S. Inskipp,
Secretary to the Administrator.

Well, gentlemen, I believe it is a fact that telegraphic communication has again broken down – (laughter) – which might account for the delay in replying to our wire of yesterday, but it does not in any way account for the delay of six days in replying to the resolutions of last week’s meeting. (Cheers.) I will now read the following telegram received from the Advertiser, Umtali, which may be interesting to you as showing the feeling of the people in that district with regard to the Beira Railway extension:

‘Enthusiastic meeting held Umtali Saturday night, when following resolution unanimously passed: That this meeting, representing Manica and Eastern Rhodesia, although recognising the necessity of a comprehensive railway policy for Rhodesia, nevertheless points out, in strongest terms, the absolute necessity for the immediate extension of / the Beira Railway for the following reasons – (1) Total inadequacy of present transport supply for even common necessaries. (2) Exorbitant rates, which have risen from six pounds to twenty-three pounds per ton for seventy miles. (3) The length of time occupied in transit reaching even to two months. (4) The impossibility, even at existing high rates, of obtaining transport on account of the high mortality amongst oxen. The present block of goods at Chimoio amounts to almost one thousand tons, and is increasing every day; some heavy goods, including a large amount of machinery, having been lying there for months. This meeting expresses its extreme dissatisfaction at the apparent indifference of the Chartered Company to the welfare of Eastern Rhodesia, and asks for a definite statement from Mr. Rhodes as to the actual time to be fixed for the commencement of the extension, and would especially
point out that a large number of stands were recently sold in Umtali on the tacit understanding that the extension was to be commenced at once.'

That is Umtali's opinion, and I think we can heartily endorse every statement contained in the foregoing telegrams. I don't think there is any good to be gained by going over old ground, and will bring my remarks to a conclusion. I am sure you will all agree with me when I say how glad we are to see Mr. Pauling here to-night. (Hear, hear.) We have his sympathy in this matter I know, and I will call upon him to tell us what he knows of the Company's real intentions in the matter. (Cheers.)

Mr. Pauling, who met with a most cordial reception, said: Mr. Chairman and Gentlemen, – I did not come here to-night with the intention of making a speech, but I came more because regret had been expressed at last week's meeting that no member of the Council had accepted the invitation of the Committee to be present. Before dealing with the question before this meeting I would like to refer to the telegram received from Cape Town. I think, with Mr. Deary, that this telegram was not intended for this meeting at all, but was sent for last week's meeting, unfortunately arriving too late; and further that Dr. Jameson sent it without having time to consider the real state of affairs, and the proper remedy. (Hear, hear.) I can assure you, gentlemen, that this meeting has the full sympathy of the Council, and so far as I personally have been able to do any-thing to further this railway it has been most willingly done. At the time your resolutions were sent down to Cape Town I pointed out to Mr. Rhodes that if a survey is not commenced until next February, the tall grass and other difficulties would delay the matter six or seven months, and as the engineer, Mr. Mansergh, is practically on the spot, I asked for permission to put him on the work at once. (Cheers.) I think we should have had a reply assenting to this, but the telegraph has broken down. (Laughter.) I will tell you what, in my opinion, is the best course to pursue. The past has gone, and we have not got the railway, so there can be no use talking about what might have been. What we have to think about is how to get the railway up in the shortest time. (Hear, hear.) It would take at least two months to survey sufficient ground to enable them to commence the line. What the telegram says about the Beira-Fontesvilla extension is perfectly true, but that does not, or should not, prove any hindrance. Even supposing the rails required for this Beira Railway extension were ordered now it would be four months before they could arrive from England. This railway, gentlemen, is, as most of you are aware, a peculiar one; there is, perhaps, not another like it in the world. (Hear, hear, and laughter.) It is a very difficult country, and the line will take a considerable time to build. As to the actual length of time that would be required for its construction, this is entirely a question of money, and will accordingly have to be taken into consideration. Until the survey has been taken it is absolutely impossible for the Chartered Company to arrive at an estimate of
what the cost will be. In my opinion the best plan the Company can adopt would be to first complete the survey, and when that is done enter into a contract for the entire line right through to Salisbury. (Loud cheers.) Unless something of this kind is done the Company would get into difficulties and find themselves short of funds. Some people have an idea that the Beira Railway belongs to the Chartered Company, but this is not the case. Some of the money has certainly been found by members of the Company, Mr. Rhodes particularly, and so far these gentlemen have not seen a penny in return; there has consequently been some difficulty in persuading them to put their hands in their pockets a second time. That argument, however, does not apply any longer, and I have no doubt in my own mind that Mr. Rhodes will agree to what I have proposed. As far as the Council is concerned, we are just as anxious to see the railway pushed forward as any of you, so that you may be satisfied that anything you say or wish to forward to Cape Town will not be ‘burked.’ If we can do anything to help you in any way you can depend upon us doing it. (Hear, hear, and cheers.) I don’t think there is anything else I can say, but if any gentlemen present would like to ask any questions I will do my best to answer them. (Cheers.)

The Chairman: Gentlemen, – Mr. Pauling has told us something that we already know – that we have the sympathy of the Council; but he has not told us that we have the sympathy of the Chartered Company. (Cheers.) We must first know whether the railway is to be started at once as, from what Mr. Pauling says, there are no difficulties in the way and there are already competent engineers on the spot. Mr. Pauling has kindly offered to answer any questions put to him, and as it is so very seldom we experience the pleasure of extracting information from a member of the Government I think we should be somewhat remiss if we failed to take full advantage of his offer. (Hear, hear and laughter.) If any gentleman present would like to ask Mr. Pauling any question will he kindly do so?

Mr. Meyer asked how long it would take for the line to be built between Chimoio and Umtali, supposing work was to commence at the beginning of the year.

Mr. Pauling: As I said before, this is purely a matter of money. If the Company choose to pay for it I believe you could have a running line into Umtali within twelve to fifteen months after commencing the work, (‘Oh.’)

Mr. Snodgrass asked, with reference to the wire from Dr. Jameson respecting the Beira-Fontesvilla extension, if Mr. Pauling thought it possible this would be completed in the time mentioned. He understood considerable trouble had occurred between the natives and the Portuguese, and that native labour, already scarce, threatened even greater difficulties.

Mr. Pauling: The permanent way for half this extension is already landed at Beira. There certainly have been difficulties with the natives, owing to their wars with the Portuguese, and I think I am right in saying that the only thing to
prevent this extension being completed within the time mentioned will be the scarcity of native labour. However, as Mr. Lawley, the gentleman in charge of the line, is here to-night I will ask him to explain how matters stand.

Mr. Lawley, who met with a very flattering reception, said: Mr. Chairman and Gentlemen, – When I commenced the Beira-Fontesvilla extension my intention was to get it finished by January, but owing to unforeseen troubles among the Portuguese and the natives which has caused the supply of native labour to become exceedingly scarce, progress has been considerably retarded. I have done everything that was in my power to secure additional labour, but, although I have had men out to a radius of 300 miles, up to now I have only managed to secure 500 natives. However, I still hope to get it done by February. I have no wish to spend another wet season down there, and if for that reason alone, you can depend upon my doing my very best – if it is possible to get it done by February I promise you it shall be done. (Hear, hear and cheers.)

Mr. Fairbridge asked Mr. Pauling if, in his opinion, it would be possible to get the money guaranteed in London now necessary for the extension of the railway to Salisbury.

Mr. Pauling: I don’t think there would be any difficulty at all in doing this, providing no big ‘slump’ takes place in the mean-time. Gentlemen. I would prefer that this reply was not taken down – (loud laughter and cheers) – but my opinion is that if the Chartered Company say they will extend this railway the money could be at once obtained. (Cheers.) The present is about the most favourable opportunity that has yet occurred, or is likely to occur. You have many large mining properties up here which can do nothing until they have a railway, and they, in their own / interest, would also be inclined to help. I don’t think there is the slightest doubt that the money could be got as soon as it is wanted for the railway right through to Salisbury itself. (Loud cheers.)

Mr. Meyer asked if it would not be possible to have the line into Salisbury itself in twelve to fifteen months, or at any rate considerably reduce the time Mr. Pauling had estimated it would occupy to construct the line as far as Umtali. There were railways in America longer than this, and far more difficult to construct, which had been built in a much less time, and he thought that by ‘grading’ they could save a lot of time.

Mr. Pauling: They always come from America – (great laughter) – and tell us what they do there. Whilst admitting that they do things there which are not done in any other part of the world – (laughter) – I would point out to Mr. Meyer that the circumstances in America are very different to what they are here; there is no comparison. In America they have white labour; here we have to depend on native labour, and you all know well enough what the difference is. (Hear, hear.) The great difficulty is in laying the rails. I have had twenty year’s experience in building railways in this country, and my chief difficulty has been
with the platelayers. You can only get a very limited amount done in a day. If you manage a mile or a mile and a quarter a day you are doing very well. In America it is far different, and they can easily get three miles done in a day; but then each man knows his work, and everything proceeds like a piece of machinery. I don’t think there would be any object in ‘grading’ the line to Umtali, but I do think it can be done with advantage from that point; and I would further propose that the section from Umtali to Salisbury be started eight or nine months after the line from Chimoio to Umtali has been commenced, and thus work on both sections at once. (Cheers.)

Mr. King asked if Mr. Pauling could give them an estimate of the time it would take to bring the line right up to Salisbury.

Mr. Pauling: If, as I have just suggested, we commence the work from Umtali nine months after work has been started at Chimoio, I think we might have the line up to Salisbury in two years and three months. To do as I have suggested would, undoubtedly, cost more money, but that should be no object, seeing how important a result would be attained. (Cheers.)

The Chairman: We have just heard that delays are frequently occasioned by the fact of the rails for a two-foot gauge being a special article, and I think that is all the more reason why they should be ordered at once. (Hear, hear.) Then, too, unless we know for certain that the money is forthcoming the question becomes quite an indefinite one, and I would ask Mr. Pauling whether, supposing the money be forthcoming, the whole of the rails of the line, right up to Salisbury, could be ordered at once. /

Mr. Pauling: I have every reason to believe that the money required for the extension to Umtali is forthcoming, but for the extension up to Salisbury I cannot say. I think that the only reason that has prevented the railway being started before now is that a misconception has taken place as regards having the railway to Beira first. With regard to the Chairman’s suggestion that the whole of the rails should be at once ordered, I hardly see that this would serve any useful purpose, as four months after being ordered is quite sufficient to see them landed in Beira, and we should only have too much on our hands at once.

Mr. King asked Mr. Pauling if he considered a two-foot gauge would meet the requirements of the country, where so much mining machinery would be wanted; also whether it would not be practicable to have the line up in less than two years and three months, seeing that Dr. Jameson has given a pledge that the Mafeking line, 600 miles in length, should be completed within three years. (Cheers.)

Mr. Pauling: The two-foot gauge is quite sufficient for the requirements of this country. We have at present on the Beira Railway trucks capable of carrying fifteen tons, and I don’t know of any pieces of machinery that weigh more than that. I think the railway will be quite capable of bringing up all the articles for this country – at any rate for some years to come. With regard to the Mafeking
line, which is between 400 and 450 miles, and not 600 as stated by Mr. King, the country there is much better and far easier for railway purposes than that we are at present discussing. As to Dr. Jameson’s pledge – well, he may have said it would be completed in three years – (laughter) – but that is not my opinion. I think it will take four years to construct. (Cheers.)

The Chairman: I think we ought to thank Mr. Pauling for the kind and courteous manner in which he has met us to-night, and, so far as he personally is concerned, we can only regard his answers as being in every way satisfactory. (Hear, hear.) I am not speaking of him now as a member of the Government, but as a man of experience in constructing railways giving us information. We propose to submit two resolutions, and I will now call upon Mr. Fairbridge to move the first one.

Mr. Fairbridge said they would remember at the last meeting they had given the authorities at the Cape a week to consider as to their reply, when they were to meet again and discuss what steps should be taken. It might seem as if they were departing somewhat from their programme in postponing the meeting, but he thought they would all see how desirable it was that they should do so. If they desired to thrash the matter out in a constitutional manner, – and he did not imagine for a moment they wished to proceed otherwise – they were bound to give the Government the benefit of any doubt there might be, and in this case there was a doubt owing to / the telegraph line having broken down. At the same time he thought it only right that the gentlemen on the platform should ascertain the feeling of the meeting on the subject and, moreover, should not lose sight of their object, which was to obtain the extension of the line to Salisbury. (Hear, hear.) They did not know as yet whether there would be a refusal or not, and although it was proposed to adjourn that meeting their minds were already made up that nothing should stop them obtaining what they wanted in a legitimate way. He begged, therefore, to propose the following resolution:– That this meeting expresses its regret that a week has elapsed without a reply from the Chartered Company, but before taking further action is prepared to adjourn until next Thursday in order to enable the Chartered Company to reply firstly to the categorical questions sent them at last meeting.

Captain Hoste in a brief but vigorous speech seconded the resolution. He thought they were all of one mind on this question, and that if the Chartered Company did not like to build the railway themselves they must get someone else to do it. (Cheers.)

Mr. Grimmer said he had been called upon to support the resolution, which he did very gladly. He thought, however, after what Mr. Pauling had told them that the thing supported itself – that his remarks had in themselves supported all the statements contained in the resolutions passed at the previous meeting. (Hear, hear.) It had been pointed out, on more than one occasion, that
the railway would not only be in their interests, but would also benefit the Chartered Company, and he could only repeat what he had said before that if the Company refuse to give them, or allow them to build, the railway they must give their reason for refusing. (Cheers.)

The resolution was then put to the meeting and carried unanimously.

Mr. Bates said that the resolution he had to propose was one that affected their pockets. If they were to be in a position to fight for the railway they would require money to defray the necessary expenses that would be incurred. With regard to Mr. Pauling’s remarks it was gratifying to learn that the line to Umtali would not take longer than fifteen months, although he urged that as being all the stronger argument that it should be pushed on at once. What they wanted from the Chartered Company was a distinct understanding, and that, he contended, they must have. (Hear, hear.) Seeing that it was well known that the part of the country which proved so fatal to cattle was that between Chimoio and the Border, he would like to ask Mr. Pauling how long it would take for the line to be carried to that point. He thought it of the greatest importance that that part of the line should be pushed forward with the greatest possible speed. (Cheers.)

Referring to the resolution he was about to propose, he informed them that £105 had been already subscribed by the gentlemen on the platform – (cheers) – and he concluded by asking for their liberal support. He had great pleasure in proposing the following resolution:

That the Committee be empowered to open a fund to be called the ‘Railway Extension Fund,’ to collect subscriptions and expend the moneys as they may consider proper towards the attainment of this object.

Mr. Pauling: I quite agree with Mr. Bates that it is of the utmost importance we should reach the Border as speedily as possible; and once there our chief difficulties would be at an end. It would take six or seven months to do this.

Mr. W. Smith thought that, under the circumstances, they could not have done any different to what was proposed that night. The second resolution would prove how sincere they were in the matter. Money was absolutely necessary if they were to do anything at all, and he hoped the good example shown by the gentlemen on the platform would be well supported by the meeting. (Hear, hear.)

Mr. Meyer said they were called upon to subscribe to what might be called a fighting fund. Everybody had come to that meeting to say they wanted a railway; now it would be seen how much they wanted it. (Laughter.) He had been to many similar meetings before where men spoke bravely enough, but when it came to producing the ‘collateral’ – (laughter) – they buttoned up their pockets; but he hoped it would not be the case on that occasion. If any of them had a sovereign to spare and would not give it towards this fund he thought that man ought to be kicked out of the country. (‘Oh!’ and laughter.) Well, at any rate, he had no right to be present at that meeting. (Cheers.)
Mr. Lamb asked what the Committee proposed to do with all this money, and why such haste had been shown in asking for subscriptions.

Mr. Chairman: Without calling upon the Committee I think I can answer Mr. Lamb. It must be plain to everyone that before prosecuting anything of this kind we must have money. I take it that Mr. Lamb allows the gentlemen on the platform to be men of common sense, and that being the case they are not likely to subscribe £105 unless there is some necessity for it. (Hear, hear.) If there is any body here who does not care to subscribe he need not do so. We do not press anyone to subscribe, the act of their doing so being purely a voluntary one.

The resolution was then put to the meeting and carried unanimously.

The Chairman, before closing the meeting, proposed a vote of thanks to Mr. Pauling for his attendance that evening. They had, he said, received from him some valuable hints, which had been given in a most straightforward way. After drawing attention to the fact that the subscription list was lying on the table, if any gentlemen cared to come forward after the meeting was over, the Chairman declared the meeting adjourned to Thursday, November 14th.

A vote of thanks to the Chairman was passed, and the meeting broke up at 9.30.

[We may mention that many of the audience added their names to the subscription list after the meeting was over, the total amount raised being close on £300.]

THE BEIRA RAILWAY.

ADJOURNED MEETING.

November 14th, 1895.

Held on Thursday evening last at the Masonic Hotel. The following gentlemen were on the platform:– Messrs. H. J. Deary (in the chair), G. D. Bates, Grimmer, W. E. Fairbridge, W. Smith, W. Meyer, Boyd King, Muirhead, Steele and Captain Hoste.

The Chairman: Gentlemen, – Since meeting last Friday evening the resolutions passed at that meeting have been forwarded to Cape Town, and the following reply was received by your Committee yesterday:–
Secretary’s Office, Salisbury, Nov. 13, 1895.
W. E. Fairbridge, Esq.
Hon. Sec.,
Railway Meeting Committee.

Str,—I am desired by His Honour the Acting Administrator to inform you that a telegram has been received from His Honour Dr. Jameson stating that arrangements have been concluded for the immediate survey of the railway extension from Chimoio, and that upon the completion of the survey the earthworks will at once be proceeded with. The necessary instructions have already been issued for the employment of surveyors now on the spot.

I have the honour to be, Sir,
Your obedient servant,
Percy Inskipp,
Secretary to the Administrator.

A meeting of the Committee was at once called, when it was felt that this letter hardly constituted a reply to the resolutions passed at our first meeting. (Hear, hear.) An appointment was made with the Acting Administrator for this morning, when we had a / long interview with him, Mr. Pauling being also present. We explained at this interview that what we wanted — what the public of Salisbury wanted — was a definite reply as to whether the railway right up to Salisbury would be proceeded with at once. (Cheers.) The result of our interview was that His Honour consented to send a very strong telegram to Dr. Jameson, pointing out that the reply was not what the people of Salisbury wanted, and stating that the Railway Committee would not be satisfied unless they had a reply from the Company at Cape Town to the effect that they would proceed with the line from Chimoio at once, and keep on continuously until Salisbury is reached! (Loud cheers.) This the Committee thought was the least they could do, and although we have had all these troubles and delays I really think we should have had a reply in time for this meeting but for the unfortunate break-down of the telegraph wires. Well, gentlemen, this is the present position of matters, and as you will see, it places the Committee in a very awkward position. The question now arises whether, in the face of this telegram received by the Acting Administrator, we had not better delay taking the action we are fully determined upon until we receive the Company’s further reply. Should that reply be unsatisfactory, there would then be only one course open to us, and I need hardly say that we are all of us fully resolved upon taking that course. (Hear, hear.) We cannot hold the Chartered Company blameless in the matter, because the least they could have done would have been to study these resolutions and give us some definite idea of what their intentions really are. (Cheers.) I think the public have behaved in
a very just manner on the subject, and this must be the very last postponement we can possibly make; and whatever reply we receive from Cape Town, whether satisfactory or not, we shall then decide upon our future action. I think our agitation has already had the effect of awakening the Chartered Company to the fact that the public of Salisbury are really in earnest, and that when they ask for a reply they expect to have one. (Cheers.) It now remains for this meeting to decide whether we shall take immediate action or wait for the reply of the Chartered Company – yes or no – when we shall know exactly what to do.

Major Brown said they had had heaps of promises made to them, which had been broken time after time. Mere promises would not bring the desired reduction in the cost of food, clothing, &c., and he thought they had a right to expect something more definite and satisfactory than promises (Cheers.) What guarantee had they to induce them to rely upon this last promise of Dr. Jameson? They were one and all heartily sick of these promises; they wanted something doing, and he contended that a guarantee to this effect should be forthcoming. (Hear, hear, and cheers.)

The Chairman: I am sure, gentlemen, it must be very pleasant to you all to hear Major Brown speak as he has done. I wish Mr. Strachan had been here to-night; he might have given us his views on the other side of the question. (Laughter, and a voice: ‘Where is he?’) As we are having a free discussion on this question I would have liked Mr. Strachan to have been here and tell us something more than he has done in yesterday’s Herald. I do not think it right for a man who holds opinions on a public question to shelter himself behind newspapers – (hear, hear) – and if he is present I shall be very glad if he will come forward, when, if we agree with him, we shall be ready to say so. (A pause ensued, during which it was ascertained that Mr. Strachan was not present.) There is one important point which occurred when discussing the question this morning with the Government, which I omitted to mention before. Mr. Pauling assured us that if the railway was commenced at once as stated in Dr. Jameson’s telegram the line could be laid through the very bad country – i.e., forty miles from Chimoio – by the 1st of July next year. If we had the railway up to that point on that date it would help us a great deal; and if we got a definite promise from the Government for the continuous extension of the line to Salisbury we should in the meantime, I think, have a far better chance of getting our goods up from Beira and Chimoio than at present. This, however, should only make us the more anxious for the work to be carried on without intermission until we have the railway to Salisbury an accomplished fact. (Cheers).

Mr. King: I think, gentlemen, this question is much more serious than we apprehend. It is now a fortnight since we first met and passed certain resolutions, and the reply has not been forth-coming as yet, thereby placing us in a most awkward position, when we consider the threats held out in these resolutions.
(Hear, hear.) Seeing that that meeting was so unanimous in its decisions, it was all the more difficult to understand why the Chartered Company have ignored it so long; and as it is not the first time such appeals have been entirely ignored by the Company, some explanation, I think, is due to us. (Cheers.) However, we shall in a few days have received a definite reply one way or the other, no doubt containing further promises from the Company. Notwithstanding this, I think we should still keep up the agitation. We cannot get away from the fact that our resolutions of November 1st have so far been entirely ignored, although there has been ample time given for a reply. It may be, of course, that the Company consider they have some good reason for not extending the railway, which has accounted for the delay, but if this is so the least they could have done would have been to state that reason. (Hear, hear.) I think, therefore, in giving the Chartered Company another chance of definitely answering these resolutions, we ought to understand that it is the very last one. (Loud cheers.)

THE CHAIRMAN: I am sorry to say that Mr. King is rather out of order, as he has somewhat anticipated the resolution we have to bring forward, although I did not like to interrupt him, as we know he generally speaks to the purpose. I will now call upon Mr. Bates to move the resolution.

MR BATES: To a certain extent I agree with Mr. King that delay is dangerous inasmuch as we have nothing to gain by it and have everything to lose. Still, in asking you to adjourn this meeting until a definite reply is received, I think the Committee are perfectly right, as it would be most unwise for us to rush ahead until we know where we are. (Hear, hear.) It is very probable that the telegram sent down to Cape Town this morning will not only show the Company there that we are determined to go on with this matter if necessary, but will also bring a definite reply one way or the other. With regard to the interview the Committee had this morning with the Government, it was a great pleasure to us to be treated so courteously as we were by the two gentlemen who at present represent them in Salisbury. (Hear, hear.) Quite different to the old time attitude of indifference that was assumed by members of the Council. We all remember the off-hand manner of that Administration, such as cigarette smoking, the use of slangy expressions, and so forth. (Laughter.) The local Government deserve well of us, but for that ‘absentee’ Government, I ask how it is possible for us to respect them? (Cheers.) It is very essential that we should have the extension from Chimoio commenced at once, seeing that Mr. Pauling has informed us it will take six or seven months to get beyond the ‘deadly’ strip of country. We are all expecting, and with some reason, a considerable influx of people into the country next year, and I think you will have a very great difficulty in finding transport riders who will attempt that part of the road, notwithstanding the high rates of transport. The question already staring us in the face is, can we afford to pay those high rates for another year? I don’t think we can. (Hear, hear, and cheers.)
The Committee are strongly determined to carry the matter forward if need be. Unfortunately there are men on the Committee who are 'laggards,' and I think they ought to retire in favour of better men – (hear, hear.) – they keep very much in the background while the real work is being carried on, although they do not object to reap whatever benefits may be gained. We have to pull the chestnuts out of the fire for them to eat. I would not have made these remarks, gentlemen, but for the fact that we must have the Railway Committee in existence until we have the railway into Salisbury, and it is therefore of the utmost importance that our Committee should be composed entirely of men who are willing to take their fair share of the work. (Cheers.) Most of us have been in the country several years and have spent a considerable amount of money in it. What have the Chartered Company given us in return for our money? (A unanimous cry from the audience: 'Nothing!') Nothing, as you / all say. The motto of the Company is 'Justice, Freedom and Commerce.' Up to the present we have had very little of any of these. (Hear, hear, and a voice: 'They ain't got no justice'.) Justice is what we are here to-night to obtain. With regard to Freedom, there are several members of the Government who are quite willing to allow us full freedom, but the Cape Town section – the 'absentee' Government – are not willing and, in fact, not only refuse us freedom, but do their utmost to retard our Commerce! (Cheers.) We have now met three times, and up to the present have done nothing more than endeavour to persuade the Chartered Company to extend this railway, and this persuasion is still going on; but whether it will be continued any longer depends entirely upon the answer we receive. (Cheers.) I have very great pleasure in proposing that this meeting stand adjourned until such time as a definite reply has been received.

Mr. Muirhead: At the beginning of this agitation we made a request for the railway to Salisbury itself, and the Chartered Company have met us half-way in promising to make the survey, and push the line on to Umtali, but the Committee are determined not to relax their efforts until it is brought up here. For my own part I think the reply we are waiting for will be a favourable one, as I cannot conceive how they can possibly delay the matter any longer. (Hear, hear.) The capital of the Company is enormous, and it has assumed a position of almost international importance; that being the case, I don't see how, in their own interest, they can hold out much longer. Now that we have brought pressure to bear upon the Company I think they will give way, and as a few days do not matter very much I don't see how we can do better than wait for the last time, for a definite reply. Should this reply be unfavourable we can then take decisive action. (Cheers.)

Mr W. E. Fairbridge: Things have gone in rather a contrary direction to that anticipated by your Committee, and consequently they have been prevented from taking the steps they had at first contemplated. The position your Committee are in is a somewhat delicate one. When interviewing the Gov-
The Beira Railway

Government this morning we were accorded details concerning the Beira Railway Company which it would not be proper to divulge on this platform. You will quite understand, I am sure, why this should be. We need only remember that even in England, which is practically ruled by the people who are masters of even the Cabinet, information at times comes to those charged with carrying on the business of government that would perhaps be very interesting to their constituents, but which it is improper to use for publicity. So it is in a smaller degree with your Committee as regards the interview they had with the Government, but, although I am not at liberty to state the exact nature of that information, I may tell you that it was not of a very remarkable or private nature. It was quite sufficient, however, to show us the practical difficulties in connection with this railway under which the Chartered Company are labouring, and the position Mr. Rhodes is consequently placed in. Still, gentlemen, I am of opinion that these difficulties are more or less of the Company’s own creation in the earlier days – (hear, hear, and cheers), – and are of such a nature that if the Chartered Company cannot remove them by themselves now that they know the railway must come, I say that the public of Salisbury would be doing them a very good turn in appealing to the British Government to lend the Chartered Company a hand, and showing our rulers generally that these difficulties must be removed at any cost. (Loud cheers.) With regard to what Mr. Bates has said in respect of the lack of courtesy and indifference, &c., he alleges on the part of previous members of the Government resident in Salisbury – special reference being made to Dr. Jameson – I must, in this one matter, disagree with Mr. Bates, and I think his remarks might have been left unsaid. While allowing, for the sake of a contrast between the present and past members of the Government of Salisbury, that Dr. Jameson certainly seemed to take things easily, I contend that he was always courteous and well disposed to the public. What we had chiefly to complain about him was that he would never say what was in his mind, and I think this was owing more than anything else, to the fact of his being essentially a ‘Rhodesian Imperialist’; that is, he takes questions outside of strictly Rhodesian ones into consideration before our own local wants, although his views on this question were not perhaps so pronounced in former days as we have every reason to believe they are now. (Hear, hear.) Well, gentlemen, no doubt a far-sighted Imperialism is a very fine thing, but we do not look upon it quite so kindly when it begins to affect our bread and butter. (Cheers.) We know now that the mines cannot be worked at a profit under present conditions, and we have arrived at a stage where we must persuade the powers that be to give us, or extract from Mr. Rhodes by some means or other, at a very early date, a guarantee to the effect that this railway shall be carried forward continuously to Salisbury. (Hear, hear, and cheers.) It is not only that the cost of living and working is too high within this country, but the absence of the railway is ruining the name
of Mashonaland among the home investors. One of the things that has been depressing this community and its friends at home, of late, more than any other is a general feeling – whether right or wrong – that Matabeleland is being preferred by politicians at the Cape to the detriment of Eastern Rhodesia. We are, of course, glad Matabeleland is getting a railway, and that it has such good friends, but we object to be left out in the cold and submit to a process of starvation.

If we can obtain a satisfactory assurance from Mr. Rhodes that such is not the policy being adopted – that the Matabeleland line is not being pushed forward with the intention of retarding the Mashonaland line, and that this latter will be pushed on equally fast, then I think we should have won a very important point. (Cheers.) We hope to get a satisfactory assurance, but, gentlemen, I don’t think it unwise to hide from you the course we propose to adopt, in case the reply we receive from the Company is not a satisfactory one. (Hear, hear.) We are in a certain position, and having gone so far we do not desire to draw back now. If the necessity arises, we must, acting in a purely constitutional manner, send or take your grievances home to the Colonial Secretary, and seek the sympathy of the English public. We have a grievance in this:– the Beira line to Salisbury is the one essential to our industry, but instead of that being pushed on, we see a political line being pushed on to suit the Cape Colony more than any one else. As Mr. Muirhead said, the Chartered Company has grown to such an extent, and acquired such influence that its interests have become almost international interests. But my opinion is that no government, however strong and certainly not a government which in form is a commercial company, can afford to let the cry of a deeply discontented people go forth to the world. All said and done, the Chartered Company can exist and flourish only if a white community exists and flourishes. Well, our existence is far from a flourishing one, and the Company will be forced to give us the Beira line sooner than it perhaps intended. I wish to endorse what has been said with regard to the attitude of the two members of the Council who are left in Salisbury, and we, the Committee, were very pleased with the reception they accorded us this morning. These two gentlemen, who, as we know, fully recognise the importance of at once extending the Beira line, have not the powers the Council should have, and consequently are frequently placed in a somewhat helpless position. After five years’ residence, I don’t see how it is possible for this country ever to become prosperous so long as we are governed partly from Cape Town, partly from England, but never from here. (Cheers.) Until we can get real Local Government, or at any rate, have members of the Council vested with sufficient authority, so that it would not be necessary for them to appeal to Cape Town or London on any and every question that could be decided here just as well, or, in other words, feel ourselves free from being made to play ‘second fiddle’; I say that until then we can never really go ahead. (Cheers.) Let us look back and examine the working of the existing régime. Since
1891 we have had no less than four agitations; first, there was the Pioneer Agitation in 1891 – that was of little political moment. Then came the agitation against the 50 per cent clause, and other matters connected with the Chartered Company’s policy. Eighteen months ago an agitation succeeded in extending the Beira line a few miles, and now we are at it again; this time with our eyes open. Tomorrow, I suppose, we shall have to inaugurate an agitation to remove some other equally serious grievance. I think these agitations, which have been found necessary in order to obtain our just demands and keep residents from throwing up the country, constitute a very bad method for getting what we require. (Hear, hear.) We certainly obtain some redress and give people here new hopes, but the agitations do not do the country any other good; in fact, they only tend to alarm investors and frighten away the very people that are wanted in the country; and the sooner the Chartered Company go in for a real system of Local Government the better it will be, not only for Rhodesia, but for the Chartered Company itself. (Loud cheers.)

The Chairman: I would like to say a word with regard to Mr. Fairbridge’s remark about the course the Committee propose to take in the event of the reply being unsatisfactory. I think I need scarcely say that in omitting all reference to this I had no intention of concealing anything from you. I purposely omitted all mention of this particular point, because I do not believe in referring to such unpleasant questions until it is absolutely necessary to do so. (Hear, hear.) As regards the action of our local members of the Government, I must certainly support the previous speakers with reference to those gentlemen, who, so far as they were able, have done everything to help us. (Cheers.) Whatever our opinion may be of what Mr. Bates calls the ‘absentee’ Government, our own local members deserve our heartiest thanks. (Hear, hear.) For my own part I don’t think the time has yet arrived when we can properly discuss the question of Local Government. There is no doubt that the present one is a very ‘fly-about’ kind of Government – in fact, sometimes we hardly know whether we have a Government at all! (Laughter and cheers.) I do think, however, that the time is coming – perhaps not so far distant as it may seem – when we shall have another agitation, not merely as to what kind of Government, but as to what kind of Government we shall have! (Loud cheers.) One more point I would like to mention is the secrecy observed by the Government in dealing with us. I do seriously think that if the Government would only take the people of the country into their confidence a little more, and let them see, if only occasionally, what they are doing, we should not be placed in such a position as we are to-night. (Hear, hear, and cheers)

Mr. Fairbridge pointed out that he did not mean to imply that the Chairman had the slightest intention of concealing anything from them. In saying what he had his sole idea was to let the meeting know that the Committee really meant business. (Hear, hear.)
Mr. Meyer: Several speakers have said that we mean business, and that when we say we want the railway we mean to have it. There is no good in slang-ing the Government. We have had enough / criticisms, and what we want now is the railroad. (Hear, hear.)

We are all paying big prices for everything we eat and for everything we wear, and especially for everything we drink. (Cheers and laughter.) I don’t know the depths of the pockets of gentlemen here, but I do know that my own is limited, and will not wait five or ten years for a railway to come up here and reduce those prices. (Cheers.) With all due deference to Mr. Pauling, I still maintain that there are no engineering difficulties to be surmounted – it is only a tram line after all has been said – (laughter) – and it ought to be done in six months. I am of opinion that an addition should be made to this resolution to the effect that no answer should be accepted as satisfactory unless a specified promise is given by the Company for the railway to be carried forward continuously, to arrive at Salisbury within two years and six months. (Loud cheers.)

The Chairman suggested that Mr. Meyer should bring this forward as a separate resolution to follow the one then under discussion.

Mr. Steele: I am hardly surprised that we have received such a shabby reply from Dr. Jameson, as we are getting used by now to these evasive answers. We all know Dr. Jameson, and are not to be bribed by his drinks any longer. (Cheers and laughter.) That’s all right, gentlemen, but in days gone by you know that when discussing any question with him he would say, ‘This is rather dry talking, let’s have a drink.’ (Loud laughter.) To be quite serious, it is high time we let them know clearly that this reply must be a definite one. There is one point I would like to mention which seems to have been overlooked by other speakers. The Company have promised an immediate survey, and on the completion of the same to erect earthworks at once. We have the authority of Mr. Pauling that a survey will take twelve months, – that is, if it comes right through, but I think after they had surveyed a few miles they might build the line up to that point, by which time there would be another section surveyed ready for construction. (Hear, hear.) If an arrangement such as this could be adopted, it would save a considerable amount of time. (Cheers.)

The Chairman then put the resolution of adjournment to the meeting, which was carried.

Mr. Meyer then proposed a second resolution (as suggested by the Chairman) as follows:—

That the Chartered Company shall state a definite time, not to exceed two years and six months, in which the railway shall be carried right into Salisbury.

This was seconded by Mr. Broadbent, and supported by Major Brown. On being put to the meeting the resolution was carried unanimously amidst tremendous applause.
The Chairman having declared the meeting adjourned until such time as the Committee could call another meeting to finally discuss the matter, the proceedings terminated with a vote of thanks to the Chairman.

**BEIRA RAILWAY EXTENSION.**

**SPEECH BY MR. BYRON REED, M.P.**

*November 29th, 1895.*

**THE QUEEN TO BE PETITIONED.**

A further meeting with reference to the above question was held on Friday last, in order that some decisive action should be decided upon without any further delay, the hall of the Masonic Hotel being again crowded. A pleasant feature of the evening was the presence of Mr. H. Byron Reed, M.P., at present on a visit to this country, who heartily supported the movement in the course of a brilliant speech. The Chairman of the Committee, Mr. H. J. Deary, again presided, supported by the following gentlemen:– Messrs. F. Mack, Captain Hoste, W. Smith, F. G. Lowe, G. D. Bates, Grimmer, McLaurin, E. E. Homan, M. Muirhead, S. Brown, King, Snodgrass, Steele, and W. E. Fairbridge.

The Chairman stated that a fortnight had elapsed since their last meeting, during which time the Committee had hoped to receive a satisfactory reply from Cape Town. That very day they had received a letter from the Secretary to the Administrator on the subject, and just before the meeting started the Committee had received a wire from Mr. Rhodes himself; these would both be read out to them and the meeting would have to decide whether they were satisfactory or not. A very kind wire had been received from Buluwayo, to which the Committee had replied thanking them for their sympathy and had taken that opportunity of pointing out to them that the people in Salisbury had no intention whatever of preventing them having their railway. (Hear, hear.) He thought they were all of opinion that there was plenty of room in the country for two lines of railway. The Committee had also received a letter from the Salisbury Chamber of Mines sympathising with the movement, and he thought they ought to thank them for the same, as in a case like theirs they could not have too much sympathy. It was a very great pleasure to him to welcome on the platform Mr. H. Byron Reed, M.P. for Bradford, who had kindly consented to be present and see what they were doing in this matter, and he (the Chairman) thought that Mr. Reed’s presence would be of great assistance to them. (Cheers) That afternoon the Committee had received the following letter from the Secretary to the Administrator:–
Sir, – With reference to the resolutions on the subject of Railway Extension which were communicated to Mr. Rhodes, I am directed by His Honour the Acting Administrator to inform you that the Beira-Fontesvilla and Chimoio-Umtali Sections are in hand, and that due consideration will be given to the further extension as soon as circumstances will permit. In connection with this subject I am directed to call your attention to the fact that in the case of the railway from Mafeking towards Buluwayo, the contract has only been given out for the first section, namely, as far as Gaberones.

I am, &c.,
Percy S. Inskipp,
Sec. to the Administrator.
The Hon. Secretary to the Railway Committee,
Salisbury.

Later on that day – in fact only about half-an-hour before the meeting commenced – the Committee had received a wire from Mr. Rhodes at Cape Town as follows:–

Re the position as to railway communication, Beira and Salisbury, is as follows: I understand the railway from Fontesvilla to Beira will be completed about February. We have meantime authorised the survey from Chimoio to Umtali, which will be commenced at once, and upon its completion the railway will be extended from Chimoio to Umtali. If the traffic for Victoria, Salisbury, and the country connected with that area warrants its extension we shall then proceed to Salisbury.

He did not think it necessary for him to comment on this correspondence. As the wire from Mr. Rhodes had been received so late the Committee had not had time to deliberate upon it, and had decided to take the opinion of the meeting on the matter. (Hear, hear.)

On being put to the meeting it was unanimously decided that the wire from Mr. Rhodes could not be considered a satisfactory reply. The Chairman stated that the Committee had anticipated their decision and had drafted a resolution accordingly, which he would call upon Mr. Lowe to propose.

Mr. F. G. Lowe said the first thing that occurred to him on reading the telegram from Mr. Rhodes was the remark ‘if the traffic warrants a railway.’ The railway would not make the traffic, but the traffic would make the railway! As they knew only too well, there was plenty of traffic, and if they had a railway there would be quite sufficient traffic to make that railway pay. (Hear, hear.) He had been at considerable trouble to ascertain what goods at the present moment were waiting at Beira and Chimoio for transport, and although it was next to
impossible to get the exact amount he thought his figures were very near the mark. He was informed that at least 600 tons of goods for Salisbury were lying at Chimoio, and an additional 2,000 tons at Beira, all waiting for transport! The people at home, who were so interested in this country, and who had found so much capital for it, were asking them to push ahead and, by making an output, prove to them that this was a good country and that there was gold in it. How were they to do that? It was simply impossible for them to have an output whilst they had to contend with the present difficulties. They had approached the Chartered Company in a respectful and dignified manner as business men and he thought they would do so again that night. (Hear, hear.) They had not come to these meetings to ventilate their own private and individual wrongs, but they had come to assist a patriotic movement, and he appealed to them all to lose sight entirely of their own private interests and think of those people at home who had put their money into the country. What prospect had they of paying to those people at home dividends upon the money they had advanced to enable mining work to be carried on? They knew well enough that mining work had been almost entirely stopped simply owing to lack of transport. They had a very nice book of mining laws – (laughter) – in which they were all more or less interested, and under those laws they were compelled to work under very severe regulations, but unless they could make the mining work pay there was no use in going on with it, and it was impossible for them to make the work pay unless they had the available means at their command. (Hear, hear and cheers.)

The Right Hon. James Boyce, late President of the Board of Trade, who had recently made an extended tour in South Africa, had expressed the following opinion with regard to the Beira Railway:– ‘At present, what was most wanted was quicker and cheaper transport. Desirable as it was to carry forward the line from Mafeking to Buluwayo – and he was glad to hear a beginning had already been made with the first section from Mafeking to Gaberones – the completion of the Beira line was no less called for. When at Fontesvilla he was told that in four months the line from that place to Beira would probably be complete. This ought evidently to be followed up by carrying the railway from Chimoio right to Umtali. Three weeks ago, when he was there, there was practically no transport beyond Chimoio, for the locusts had destroyed the grass, and waggons could not proceed. The loss of oxen had been very heavy.’ It was very nice (Mr. Lowe continued) to have the support of a gentleman of the experience of Mr. Bryce, and who occupied such a high position in England, When Mr. Bryce was here a few weeks ago he had been very greatly impressed with the prospects of the country, and had been strongly of opinion that if only proper means of transport were at hand the country would go ahead at once. This opinion Mr. Bryce had said he was prepared to take home with him. (Cheers.) In the letter from the Secretary to the Administrator there was a clause which he was very sorry to see,
reading as follows:— 'In connection with this subject I am directed to call your attention to the fact that in the case of the railway from Mafeking towards Bulawayo, the contract has only been given out for the first section, namely, as far as Gaberones,' He thought it was very unfortunate that this should be dragged into the discussion at all, and for his own part he failed to see in what way it had any reference to the question they had under consideration. (Hear, hear.) Their meetings had been held with the sole intention of obtaining the extension of the Beira Railway to Salisbury, and had no reference whatever to the Mafeking line. They never had the slightest intention of preventing the extension of the Mafeking line, and he thought, therefore, that this clause might very well have been omitted. (Cheers.) When he was in Buluwayo a few days ago he found there was a very strong opinion prevalent there that Salisbury was trying to prevent the extension of the Mafeking line to Buluwayo. (Loud cries of 'No.') Well, as he had said before, it was a very mistaken impression, and most unfortunate that it should have been raked up at all — (hear, hear) — but he had explained to the people in Buluwayo as fully as possible that there had never been any such intention on the part of Salisbury — that so far from wishing to prevent the Mafeking extension being carried into Buluwayo, the people of Salisbury were very glad to hear of it, and had wished it every success. He thought that the people of Buluwayo understood now the real feelings of Salisbury on this particular subject, and, now that they did understand those feelings, had expressed their sympathy with the object of that meeting. (Loud cheers.) It had been a very great pleasure to him to read the very strong and able remarks in Messrs. am Ende and Mack’s circular with reference to the Beira Railway extension, and he thanked them most heartily for those remarks. (Hear, hear.) For his own part he wrote home to his friends very fully on the subject, and had repeatedly pointed out to them that there was a prosperous future before the country, but not until such time as they had the railway they were asking for. (Cheers.) The course suggested by the Committee was, he felt sure, the only one they could act upon. They had gone to the Chartered Company and told them that it was absolutely necessary for the welfare of the country that they should have this railway, and as the Chartered Company had not taken any real notice of their request, they had no alternative but to go to the fountain head and ask for the assistance of the Colonial Secretary and the British public in order to obtain their just demand. (Cheers.) He had very great pleasure in proposing the following resolution:—

That, as the Chartered Company have made no satisfactory reply / to the resolutions passed by the public of this province a month ago requesting a definite statement of its intentions with reference to extending the Beira Railway, this meeting, representing all sections of the community, considers public opinion is being ignored by the Government, and is resolved to petition Her Majesty the Queen upon the subject of its grievance, and hereby authorises the Railway
Extension Committee to draw up and to have signed and forwarded such petition through the proper channels.

Mr. McLaurin, in seconding the resolution, said he would like to make one remark with regard to the paragraph in the telegram from Mr. Rhodes, which stated ‘if the traffic warranted the extension, &c.’ He thought that when it was a matter of such great difficulty – at times almost an impossibility – to obtain sufficient transport for food-stuff alone, there could be no doubt whatever as to the traffic warranting a railway. (Cheers.) That was the first meeting on this question he had attended, and he had been greatly struck with the very serious manner in which they had come forward to support the efforts of the Committee.

Mr. H. Byron Reed, M.P., who was accorded a most enthusiastic welcome, said: Mr. Chairman and Gentlemen, – It is with very great diffidence that I address this gathering. I am here a stranger and a visitor, an impartial witness of the proceedings, and I should have preferred to take no part in this discussion. However, as I have been in South Africa nearly two months, and have seen and heard a great deal whilst in the country, I feel impelled to speak when asked to do so. I have no right to speak on behalf of the House of Commons or Her Majesty’s Ministers. I am only a humble member of the House of Commons, representing some thousands of working men in the North of England, and have neither the position nor influence of my colleague, the Right Hon. James Bryce. At any rate, I am an Englishman – (cheers) – and I may be permitted to lay aside my political character for a brief space, and say a few words on this subject. I must say that I am very greatly impressed with the strength of feeling which prevails in this city with regard to the extension of the Beira Railway, and I am quite prepared to convey that feeling to the proper authorities at home so far as it is in my power. (Loud cheers.) In my opinion railways are absolutely necessary for the extension of commerce and prosperity in every country, but especially in new countries, and I am certainly at one with the gentleman who proposed the resolution, when he said that the traffic would make the railway. In my somewhat limited capacity, I have found, whilst in this country, that it is a very difficult matter to obtain even the simple necessaries of life, and that difficulty is owing entirely to one things, the lack of efficient transport. (Hear, hear and cheers.) I have heard the same reply given time after time with overwhelming emphasis, ‘Give us transport and we will give you trade.’ I am reminded very forcibly of the time when Mr. Arthur J. Balfour – (cheers) – successfully carried out a system of light railways in the Western parts of Ireland. There the people had no industries, the seas were swarming with fish, and agricultural and dairy produce in any quantity was ready to hand; but they had no facilities for getting them to the markets, as they had no means of communication. Then Mr. Balfour, like the great statesman that he is, saw that the one way to promote Irish industry was to make them railways, so as to bring the industries and products of the working people into communication
with the markets from which they had hitherto been shut out. I want to apply that illustration to this vast country – the same principle to be adopted – and to see that means of communication with the outside world are afforded you. It is from my knowledge of what Mr. Balfour did in Ireland that I stand on this platform and say that I am heart and soul with you in this matter. (Loud cheers.) For over twenty years I have taken an active part in home politics, and have always found myself on the side of constituted authority. I am a Conservative – (hear, hear) – and have sometimes had to fight some very hard battles for that Constitution. My only qualm in appearing on this platform to-night is that I may be accused of turning round and fighting against it; still, although I support constituted authority when it is in the right, I shall never hesitate to speak on the other side, or withhold my vote, when I find it to be in the wrong. (Cheers.) In dealing with constituted authority, you have first to make up your own minds, and, having done that, you must express yourselves firmly, and persevere, and in the long run constituted authority will recognise that you are on its side. I hold that in adopting the methods you have, and in making your representations and passing resolutions, you are carrying out the very essence of constitutional government, and so long as you continue to do this you will find a very warm supporter in the man who has the honour of addressing you. (Cheers.) Your resolution speaks of making representations to the Colonial Secretary of Her Majesty’s Government. In speaking on this particular subject I am treading on somewhat delicate ground, as I am not aware of your exact position and your relations with regard to the Imperial Government, and therefore I speak with even more diffidence than before. I should say that every possible means that honourable men can employ should be exhausted in addressing your properly constituted authorities before taking such steps as those you now propose, which can only be regarded as a last resource, and I take it that you have exhausted every means in your power before deciding upon this course. (Hear, hear.) Imperial authority, to be exercised at all, must be done more from the view of a mediator than of a dictator. I may say also that this petition should be addressed to Her Majesty in person, rather than to one of Her Majesty’s Ministers. Of course, the petition would have to be dealt with by Her Majesty’s Ministers, who are responsible to the House of Commons, and who would have to account to that House for any action they may take in the matter. I can only add to what I have already said, that if, in the course of the next Session of Parliament, a petition from this country should be presented to Her Majesty, by her referred to the Secretary of State, and by him laid before the House of Commons, I shall be only too happy to take counsel with Mr. Bryce (who is my senior, and sits on the opposite side of the House) as to the best means we can jointly take towards securing what you desire. (Loud cheers.) Perhaps before I resume my seat the meeting will permit me to take this opportunity, – probably the only one I may have – of expressing my great admi-
ration for all that I have seen in this marvellous country, I have come here for the first time, but have determined it will not be the last – (hear, hear) – and from all that I have seen and heard, I am every day more and more impressed with the mighty future that lies before it. (Cheers.) When you have overcome such small difficulties as locusts, and managed that your rivers shall not flow too rapidly in one season and not enough in another – (laughter) – when you have overcome such difficulties as these, and secured more British blood and British capital in the country, you will have one of the vastest and most prosperous territories over which the British flag has ever flown. (Loud cheers.) Gentlemen, I am no ‘Little Englisher,’ I am a ‘Big Englisher,’ and I believe that in these great possessions of ours beyond the seas will be found the homes and happiness of generations yet to come; and when I say this I mean English, Scotch, and Irish alike, for thanks to the defeat of the Home Rule Bill, Englishmen, Scotchmen, and Irishmen are still Britons in the truest sense of the word – (cheers) – and when we are all dead and gone, the name of Englishmen will be handed down to posterity as men who feared God, honoured the King, and kept the Constitution. (Loud and continued applause.)

The Chairman said that when that meeting was called the Committee had no idea that they were going to receive the strong support of Mr. Byron Reed. That gentleman had assured them that they had done everything in a constitutional manner, and it would be a great pleasure to them all to receive that information. (Hear, hear.) After Mr. Reed’s very eloquent speech he thought the best thing he could do would be to put the resolution to the meeting without further delay. The resolution, after being altered in accordance with Mr. Reed’s suggestion so as to read ‘Her Majesty’ instead of ‘Her Majesty’s Secretary of State for the Colonies,’ was then put to the meeting and carried unanimously.

The Chairman then asked the audience what their intention was with regard to the reply the Committee were to send to Mr. Rhodes, whether they would themselves decide upon the reply or leave it in the hands of the Committee. /  

Mr. Main said that at the last meeting a vote of confidence in the Committee had been passed, and he thought they could not do better than let that vote stand and leave the matter of a reply entirely to the Committee. (Hear, hear.)

Mr. Lamb briefly seconded the resolution, which was carried accordingly.

The Chairman said that before the meeting dissolved he would like to say a few words with regard to finance. He had been somewhat misunderstood at a recent meeting, and he wished to remove any misunderstanding that might exist. In the first place the work of the Committee had increased to such an extent that the hon. secretary, Mr. W. E. Fairbridge, could not continue it any longer, and the Committee had decided that the Board of Executors should act for them in the matter. He wished, therefore, to inform them that all subscriptions would be received by Mr. Eustace, and when the proper time arrived a balance-sheet
would be issued showing exactly how the money entrusted to them had been spent. Naturally, at that stage the Committee could not say how the money would be spent, but he thought they could trust the Committee to expend the money in such a manner as would be best calculated to further the interests of the movement they had at heart. (Hear, hear.)

The meeting then dissolved. / 

THE REPLY TO MR. RHODES.

The following is an exact copy of the reply forwarded to Mr. Rhodes by the Railway Extension Committee:—

Secretary Railway Committee. Rhodes, Cape Town.

Your telegram arrived here a few minutes before the time arranged for a public meeting last night, which was very largely attended. It was duly submitted to the meeting, and a resolution was unanimously carried as follows:—

‘That as the Chartered Company have made no satisfactory reply to the resolutions passed by the public of this province a month ago, requesting a definite statement of its intentions with reference to extending the Beira Railway, this meeting, representing all sections of the community, considers public opinion is being ignored by the Government and is resolved to petition Her Majesty the Queen upon the subject of its grievance and hereby authorises the Railway Extension Committee to draw up and to have signed and forwarded such petition through the proper channels.’

[...]
Wassau (Gold Coast) Mining Company, Limited, to Colonial Office (19 August 1897); held at the National Archives, CO 879/49/2, No. 185a.

18359. No. 185a

WASSAU (GOLD COAST) MINING COMPANY, LIMITED, to COLONIAL OFFICE.

(Received August 20, 1897.)

[Answered by No. 191a.]

The Wassau (Gold Coast) Mining Company, Limited,
147, Cannon Street, London, E.C.,
August 19, 1897.

SIR

I am instructed to inform you that a resolution, as under, was passed at a meeting of shareholders of this Company, held on the 12th instant:—

‘That this meeting strongly urges on the Government the importance of constructing the railway to the mines with as little delay as possible, in accordance with their promise.’

My Directors have also asked me to give you the following as reasons which make it of the utmost importance for this line to be constructed if the mining district which this Company has now proved to be of such wealth is to be opened up, their reef in Wassau being of the same character as that of the Witwatersrand, and so far as is at present ascertained, likely to exceed it in richness.

In my letter of the 3rd May last,* I pointed out that there is little hope for the mining industry without railway facilities being provided. At the present time transport by the River Ankobra is most uncertain, and owing to the frequent want of water in this river, and the absence of roads, it has frequently taken a year to get our machinery up to the mine. It is found that the Natives are unwilling to transport heavy pieces of machinery, such work being undoubtedly much harder than the transport of ordinary goods.
Further, the Company finds that it has to go farther afield for fuel, and undoubtedly the opportunity of obtaining coal provided by the proposed railway will be of the greatest advantage.

Again, my Directors feel very strongly that with regard to health the railway is of the utmost importance. At the present time Europeans are apt to catch fever through the exposure they have to put up with in reaching the mines from the coast. Then again, when attacked with fever it is a vital necessity for them to get away quickly for a change.

At the present time the Company contemplated spending a considerable sum of money on fresh machinery for further development of their properties, but so great are the difficulties of transport they hesitate about doing so, and are particularly desirous, therefore, of knowing how soon the railway will be put in hand, and at what time there is a probability of its being completed.

I enclose a short report of the shareholders’ meeting above-mentioned, and shall await with pleasure to hear from you at your earliest convenience.

I have, &c.
C. S. BARNETT,
Secretary.

Enclosure in No. 185A.
(Short Report of Meeting.)

THE WASSAU (GOLD COAST) MINING COMPANY, LIMITED.

An extraordinary general meeting of the Wassau (Gold Coast) Mining Company, Limited, was held at the registered office of the Company, No. 147, Cannon Street, London, E.C., on Thursday, August 12th, 1897 [...] 

Mr. STRUBEN: [...] 
With regard to the railway, the surveyor sent out by the Government has returned, and is now preparing his report to submit to the Crown Agents.

Mr. E. H. BAYLDON suggested that in order to strengthen the hands of the Directors a resolution should be passed urging the Government to expedite the construction of the railway to the mines

The following resolution was then carried: ‘That this meeting strongly urges on the Government the importance of constructing the railway to the mines with as little delay as possible, in accordance with their promise.’

Mr. STRUBEN: If the Government do not soon complete the railway, I think it will be advisable to get a traction engine.

[...]
14th August, 1897.

PROSPECTIVE RAILWAY DEVELOPMENT IN BRITISH EQUATORIAL AFRICA

By C. Steuart Betton.

From the Mediterranean Sea, southward through Egypt and the Sudan, a regular service of railways and steamboats is now available for some 2,470 miles inland* to Gondokoro, the northern frontier post of the Uganda Protectorate; whilst 735 odd miles by the Uganda Railway and steamboats on the Victoria Nyanza, brings Entebbe, the administrative capital of Uganda, within a four days journey from the Indian Ocean.

Now Entebbe, 55 miles due east of Gondokoro, is 275 miles in a direct line S.S.E. by S. of it, and a project to connect this comparatively inconsiderable distance between the two places need no longer be considered chimerical.

A recently constructed cart road leads from Entebbe, via Kampala and Hoima, to Butiaba, a Government post on the Albert Nyanza, and from thence it is possible to descend the Nile (Bahr el Jebel) by boat, as far as Nimule, a post a few miles north of the junction of the Unyama with the former river.

The one steel boat at present on the lake is quite in adequate for existing requirements, and a light-draught steamer might at once be advantageously employed, as it will be needed for future development of lake commerce.

* Alexandria – Luxor, 547 miles, 4 ft. 8 1/2 in. gauge; Luxor – Shellal, 141 miles, 3 ft. 6 in. gauge (Egyptian Railways). Shellal – Tewfikiah (Wady Halfa), 125 miles, Cook’s or Sudan Government Steamboats; Wady Halfa – Khartum, 576 miles, 3 ft. 6 in. gauge, Sudan Military Railway; Khartum – Gondokoro, 1,081 miles, Sudan Government Steamboats and Gunboats.
Beyond Nimule, further progress by water is barred by a series of rapids, which extend for over 100 miles to Rejaf, and the sole available means of transport is by porters.*

Between the Belgian stations of Rejaf, Lado, Kero (or Kiru), on the west bank of the Nile, a small paddle steamboat, the *Van Kerckhoven*, plies; but at present there is no object in the Sudan Government steamers proceeding further south than Gondokoro, on the east bank,† which is the last place touched at. Moreover, the short distance, some eight miles, that might be saved at all seasons by water-carriage south of Gondokoro need not here be considered, as a more suitable site for a station in British territory is not likely to be found in that distance.

Sir Harry Johnstone, in his report on Uganda, [Africa No. 7 (1901), page 19] suggests that a good cart road be constructed from Dufi to Gondokoro, ultimately to be followed by a light railway.

Apparently Dufi is a lapsus calami for Nimule, as the former was a station of Emin Pasha’s on the west bank of the Nile, and is now abandoned, and furthermore, it is in Belgian territory.

It may be doubted whether, even if the cart road were constructed, transport animals would succeed in this climate. At an elevation of only 1,500 feet above sea level, in the Nile Valley the heat is intense, and the few horses and donkeys that have been introduced apparently lived but a short time.

Previous experience of the appalling mortality of transport animals, in some what similar country in British East Africa (where the deaths caused by tsetse fly formed but a small proportion of those from various kinds of cattle diseases), warrant one in assuming that such mode of transport could be but a costly and temporary makeshift. The Bari natives possess some cattle, but these are remarkably small, and unsuited to draught purposes.

The question then arises as to the possibility of a railway to connect up the 100-mile link in the chain of communications to Gondokoro.

* Porters are rarely available either at Nimule or Gondokoro, and a traveller reaching either place is likely to find himself stranded, until negotiations (through the administrative officer at the stations) can be concluded with the Bari chiefs for a supply of carriers from village to village. The incessant delays, endless ‘shauri’ (palavers), and general discomfort resulting, can be but faintly imagined by those unacquainted with the Nilotic tribes. It is preferable to engage Baganda porters at Kampala, and to march the entire distance between that place and Gondokoro. Travellers by the reverse route would have to advise their arrival two or three months beforehand, and arrange for carriers to be ready to meet them at the latter place.

† The ‘post-boat’ stern-wheeler *Amkeh* monthly plies between Khartum and Kanisa (6° 46’ North Lat.), a post for the sudd-cutting party; and thence a light draught gunboat carries the mails to Gondokoro. The accommodation on either boat is limited, but suffices for present needs.
From Nimule the present caravan track skirts the east bank of the Nile, crossing the formidable Assua River,* and, for 40 miles nearly to Mugi, porterage by native carriers, / even of the lightest loads, is extremely difficult. † The river (Nile) here runs through a deep one-sided gorge, said to be 135 feet in the narrowest part, where a high mountain range, rising 2,000 feet above it, comes close down to the west bank; forming a barrier of escarped hills of Gneiss and Mica Schist, which gradually diminish, and finally break out into cones as they recede to the north-west.

On the east side, very broken ground is encountered, and a range of hills, 1,000 feet or more above the river, is noticeable; but, unfortunately, I had no opportunity of ascertaining how far inland this extends.

Apparently this range forms the water parting between the Nile and River Gomoro (or Khor kit). This latter river runs north-west, and after 50 miles enters the Nile opposite Rejaf, being there 500 yards across, between low banks, with a sandy bed of decomposed granite, partly covered with water a few inches deep, and liable to heavy floods.

Beyond Mugi the country may be described as undulating, in places covered with bush jungle or grass, with patches of fine timber, and dotted with low ranges of hog-backed hills and granite outcrops, presenting, however, few engineering difficulties.

But it is certain that in the neighbourhood of Nimule heavy work will be unavoidable; for, in a radius of 10 miles, the Assua, and its large tributary, the Atappi, the Unyama, and the Jeifi rivers (vide p. 13) discharge enormous floods (after heavy rains) into the >-shaped elbow of the Bahr el Jebel at this point, and much broken ground may be reckoned on.

Assuming that a reconnaissance of the country between Nimule and Gondokoro will prove that a line is practicable (i.e., the cost be not excessive), it is obvious that railway plant and material, for however light a line, could not be brought up through the Sudan. ‡ Furthermore, neither labour nor food is obtainable in the portion of the Bari country under consideration. The natives, fairly

* After its main tributary, the Atappi, has joined it, and 1/2-mile above its junction with the Nile, it is 60 feet wide, a series of deep pools with ridges of granite rock running across it, strata uptilted nearly vertical. In flood said to be 80 feet wide, 14 feet deep, with swift current; liable to very sudden flushes, High ground on either bank.
† The track apparently has been unimproved since the Bari fishermen first utilized the Hippopotamus, and other game paths to convey their catches of fish to neighbouring villages. For a caravan route to an European settlement it is execrable.
‡ Even after the completion of the Suakim-Berber line, the distance from the Red Sea would entail transport of 470 miles by railway and 1,081 by boat. The exigencies of the Sudan, for many years to come, will require expenditure on improvements of its waterways rather than on construction of railways south of Khartuni.
numerous, are none too friendly, and generally have been on the verge of starvation during recent years.

Considered by itself, the idea of a short detached piece of line here is not practical. Should, however, the light line westward from Entebbe, as suggested by Sir Harry Johnstone, to open up the Ruwenzori district, be considered, we may examine the possibility of branching off from the latter at some convenient point, and, striking northward, of crossing the Somerset Nile near Fajoa, of continuing east of the Bahr el Jebel toward Nimule, and ultimately to Gondokoro.

Such a line might be feasible. The gauge of the railway need not be considered here, but, looking forward to possible distant-future developments, it may be questioned whether a 3 ft. 6 in. gauge would not be advisable at the onset.

As regards the engineering difficulties likely to be encountered, it may first be observed that the Victoria Nyanza is 3,775 feet above sea level, the Albert Nyanza 2,170 feet, and the Nile at Gondokoro approximately 1,550 feet. Heavy gradients, therefore, are not to be expected.

It is noticeable that, as one leaves the Victoria Nyanza for the Somerset Nile the valleys widen out, and the hills of red marl, shale, or metamorphic rock lessen, till, with a few exceptions, they gradually disappear and the country presents the appearance of a huge plain gently sloping to the north and intersected by wide swamps and numerous small streams. Long waterless tracts are nowhere met with.

Generally speaking, it would be an easy country to survey but for the intensely long rank grass which covers much of it. In the dry season this grass is red and an extended view then only is obtained.

Through Uganda and Unyoro most of the swamps are choked up with rushes, papyrus,5 and grass, and it is only occasionally that a current is noticeable. The time of year (October) at which I traversed the country is generally considered to be the middle of the second period of maximum rainfall, but in no case did it appear that any of the swamps would present much difficulty, and the treacherous and bottomless quagmires, mentioned by some travellers as occurring in Uganda, were not encountered by this route.

The native roadbuilders’ attempts at bridging these swamps consist of carrying across a foot or 18-inch bank, leaving a small opening at the lowest part of the valley, where a few / logs are thrown transversely to the road, and then covered with brushwood and earth. So long as these are kept in repair they admirably effect their purpose; but, except near the capital, these roads are often in a rotten condition.

I can recall no instance where a 5-feet bank would not have been amply sufficient for any contingency; and, as regards the opening, 10-feet girders on screw-piles, with the toe of the bank protected by rubble stone, would probably
be found better than culverts; for the difficulty of excavating foundations, during most months of the year, would be considerable.

Presupposing the railway to be started in the vicinity of Entebbe (which is situated on the south end of a peninsula that is practically an island), it is possible that a suitable harbour may be found on the western side of the Murchison Bay. Kampala is six miles due north of this bay, and the native road thither, as is customary in Uganda, runs straight over the low-lying hills, all of which might easily have been avoided by slight détours.

Striking north-west of Kampala, and following the native road which leads through Kunguni, Kalasa, and Kisibika, over low undulating country, a range of low hills (through which the River Maanja runs) is conspicuous on the south-west. Many of the valleys passed are swampy, in which cases corduroy bridges are employed.

At Kisibika an extended view is first obtainable, and one is surprised at the general aspect of the country, which is strongly suggestive of the Taru Desert (East Africa) at certain seasons.

Crossing the Maanja River where it is flowing swiftly, 20 feet wide and 6 inches deep (Nov., 1901), a mile of marsh land is met with. The track then keeps about 10 miles west of the latter river, and, except for a few swamps, no obstacle is met with up to the Kafu River, in Unyoro; crossed at a point due south of Masindi. The papyrus choked stream, 15 feet wide, has no perceptible flow, and for miles to the north of it there is low lying ground.

However, this river would probably be crossed near the abandoned station of Fort Lugard, and, by following the water parting between the Kafu River and the Albert Nyanza, the granitic hill country round Massindi would also be avoided. With the exception of the major bridges required for the Maanja and Kafu Rivers, the country traversed strikes one as being extremely easy for road or railway projects.

It is probable that the Kesokwa, Waja, and other rivers flowing into the Albert Nyanza would require major bridges; but the Waja only I crossed north of Masindi, where its branches were 5, 30, and 6 feet wide, at intervals of two miles apart, where it has a rapid fall, is evidently subject to heavy floods, and the main stream is between high banks.

On nearing Fajao the caravan track leads over very broken ground, and, a mile from the river, follows a spur, with deep ravines on either side, leading sharply to the Somerset Nile. The former European post, consisting of a few grass huts, is perched on an isolated rock hill, which commands the ferry.

Westward of Fajao the hills rapidly widen out and disappear, and a broad expanse of low lying ground borders the river, which is a mile in width, gradually increasing to five miles or more as it nears the lake. On the east side of the station
several more isolated rock masses are conspicuous, and three-quarters of a mile further are the Murchison Falls.

It is evident that the river has cut its way back, leaving these masses of gneiss as ‘witnesses.’ The cliffs, 200–300 feet high, are composed of rocks belonging to the Archæan series, and the specimens I brought home have been identified by Mr. George Prior, of the Natural History Section of the British Museum, as biotite gneiss, mica schist quartz, and garnetiferous mica schist.

At the site of the falls, which are probably over 100 feet in height (reputed 120 feet), the river, 1/4 mile wide, after several rapids, takes a sharp bend to the north-west, and then again west, and, rapidly narrowing, tumbles over a rock ridge 10 feet high, then over another 5 feet ridge, and finally enters a cleft through one side of a mica-schist-rock witness, similar to those previously mentioned.

The sides of the cleft, which varies in width from 20 to 30 feet (on meeting Major Delmé Radcliffe two days later he informed me the minimum width measured by him was only 18 feet), are absolutely sheer. Down this shoot the river rushes, an unbroken mass, for 150 feet, apparently then meets with some obstacle, probably a harder class of rock, through which it is endeavouring to force its way, and, hitting this with tremendous force, a ‘back wave’ is created. Meanwhile, ere this can break, the mass of water following on has forced its way over the obstruction with considerable turmoil, and often in a mass of spray.

Another 250 feet is traversed through the / continuous cleft ere the water tumbles into a huge basin below, followed hard after by the back wave, thus causing the peculiar irregular sound of the falls so noticeable even at Fajao.

On the south side the ledge above the cleft is of considerable extent and evidently marks the site of the river bed in former times. Hollowed out in the ledge are some large ‘pot-holes,’ one of which is 15 feet in diameter and 10 feet deep (another 6 feet in diameter) now filled with clear water. Behind this ledge (quarter mile wide including both sides of the cleft) the hills rise in tiers, but lack of time alone prevented a further examination of the river, more than half mile above the falls.

This spot, however, struck me as admirably adapted for a crossing, and the American type of trestle viaducts would be especially adaptable. Probably trestles of 100 feet height would be sufficient at the actual crossing, but as I was unable to examine the north side of the river at this point I know nothing as to the possibilities of the approach there.

Apparently there exists a plateau extending some distance northward, along which the line would run, avoiding the branches of the Tengi River, and crossing the Achwa near its sources. The latter river, a few miles ere it enters the Bahr el Jebel, was 50 feet wide and waist deep, between banks a few feet high.

From the Somerset Nile onwards the aspect of the country rapidly changes. We are crossing the Eastern watershed of the Bahr el Jebel, and usually are within
ten miles of it. The drainage runs from east to west – wide swamps are rarer, streams and rivulets more common. Long rolling downs of grass (still dense rank grass as before encountered, and often six to twelve feet high, but the natives are now, in November, already firing it)* are succeeded by patches of bush jungle. Probably the entire country was so covered; then, destroyed by fires, the bush jungle was replaced by cultivation; intertribal wars, &c., followed by famines, have reduced the numbers of natives, and huge areas of once cultivated land are now the haunts of antelope and other game.

The heat is much greater, but not so depressing, for the atmosphere is intensely dry. The natives also have changed. From the well-clothed natives of the ancient Kitara kingdom, we pass to the stark-naked Nilotic races: Acholi (closely resembling and probably allied to the Kavirondo), Lur, Madi, and, finally, Bari; amongst all of whom, the bastard form of Arabic spoken by the Nubians (i.e., the Sudanese) takes the place of Kiswahili, the lingua franca of East Africa.

No river of any importance (for the two crossed by the caravan track north of Wadelai,† would be probably avoided by the railway, and others crossed are only 2 to 4 feet wide), need not be mentioned, till the Zukar River is reached; 30 feet wide, 3 feet deep, it flows swiftly between low banks to the North-West, passing close to a bank of magnificent primæval timber.

A few miles north of the Zukar, the track crosses the water parting between the Bahr el Jebel and the River Jeifi, and distant views of wide rolling plains are obtained. The track crosses another river (? Dirikwa), three channels three to four feet wide and three feet deep, between banks 15 feet high, and then keeps along the west side of the watershed of the River Jeifi, crossed where it is 30 feet wide, 2 feet deep, with a branch 6 feet wide and 2 feet deep, between low banks.

Ten miles further the River Unyama is met, 30 feet wide, 2 feet deep, also with low banks, after the abandoned station of Affuddu is passed. The track then turns sharply north-west, and on a granite hill overlooking the Nile, and commanded by hog-backed hills on the east, the existing Government station of

* Apparently a road cleared 10 feet wide is, in less than a year, entirely overgrown except for the 10-inch track hardly kept open by passing traffic. This track is often completely obscured, especially after heavy rain, by the overhanging grass; and after a few miles march in the early morn, ere the dew has been dispersed, the entire caravan is wet through to the skin. The difficulty of constructing the road originally is so considerable (the only implement used by natives for grass clearing being a pointed heart-shaped hoe with a short handle – Uganda pattern), that it seems remarkable some European machinery has not been attempted. A light reaping machine, drawn by a couple of oxen or mules, to cut 5 feet swathes, would keep open the main roads throughout the country, and reduce the difficulties of transport, which are always sufficiently onerous during the greater portion of he year.

† The present station of Wadelai is on the east bank of the Bahr el Jebel, close to its junction with the River Omee. The original station of Emin Pasha’s was on the west bank.
Nimule is reached. The feasibility of a railway beyond this point to Gondokoro, has already been discussed.

In conclusion, it may be expected that the line will be one of easy curves (except possibly part of the last section) and gradients; water supply everywhere ample, and fuel, except in a few localities, generally plentiful.

It having been previously mentioned that the suggested railway could not be built from the Gondokoro end, there remains the question of its construction from Entebbe.

Now, the first portion of the line would pass through the densely populated part of Uganda proper, where a large supply of cheap labour can be obtained locally.

The hut-tax, introduced two years ago, of Rs. 3 per annum, is payable in coin, kind, or by one month’s labour on Government work. The Baganda largely avail themselves of the latter method, and as they provide their own food, public works are being cheaply constructed.

Allowing that, on starting the railway, increased demand for labour will tend to raise prices, and that food will have to be provided for the workmen when beyond the confines of their own districts, it will still be evident that, in comparison with the imported labour necessarily employed on the Uganda Railway, the cost would be slight: probably only one-quarter of the latter.

The present Government rate in Uganda may be taken as the minimum for unskilled labour; but, as an example of extremely low wage, I may instance when an Indian merchant at Kampala agreed to supply me with 33 porters for the six weeks journey to Gondokoro at Rs. 11 per capitum. (This included cost of registration, beads of various kinds for food barter en route, and commission. The porters, on their return, would be free to carry loads for the contractor, who would thus make a handsome profit. The actual wage for which the porters hired themselves out to the contractor was Rs. 4 for the three months – or 1s. 8d. per mensem; yet large numbers of porters are being hired at this small wage.)

It must be borne in mind that the administrative officers in the various districts, are already, through the native chiefs, directing the construction of roads, &c. All that would further be required would be the formation of a central labour bureau, under some officers well known to both Baganda and Banyoro,

\* e.g. on the East coast, where labour of any kind has always been scarce and high prices for even unskilled labour prevailed. Increased demand of recent years has forced up prices to absurd rates, which are (or were in 1901) still maintained. A repetition of this, in Uganda, it is to be hoped, will be carefully avoided.

\+ Punjabi coolies, on three year agreements, had to be provided with Indian rations, also imported. Their passage to and fro, housing, and incidental expenses which would not be incurred with Baganda labour, raised the cost of construction to a very high figure.
who would deal solely with the chiefs. His picked staff would deal with the
organisation, on which everything would depend.

Commencing with a few hundreds of labourers, it would be necessary as the
work proceeded, to insure continual drafts being forwarded to maintain the ultimate standard, say 10,000, required. The question of food supply would also fall
on this bureau; entailing high organisation and a complete mastery of detail;
and the strain on the Uganda administration would undoubtedly be great.

The difficulty of providing food beyond the confines of Uganda and Unyoro
would also be very considerable.

One important point may be noted – the labourers would be, advisedly,
working directly under their chiefs, in their own country or in adjoining ter-
ritories, with the natives of whom they are on friendly terms. Constant friction
between imported foreign labour and natives would be altogether avoided, and
a police force, except for the purpose of guarding stores, &c., unnecessary.

Moreover, the contact of the comparatively civilised and intelligent Baganda
with the savages of the Upper Nile Province (Acholi, Lur, Madi, Bari) would
have a far-reaching beneficial effect. Trading caravans of Baganda and Banyoro
are already constantly proceeding to and fro between Entebbe and Gondokoro,
and it is by no means uncommon to meet en route isolated unarmed parties of
two or three men. Not only would there be no disturbance (among the Bari
especially the advent of earthwork parties would be beneficial), but these latter
would soon join in the construction of the earthworks. They are keen traders,
but at present their chief desire is for brass, &c., wire, and beads, and such like
commodities. Large numbers at first might be attracted by the prospect of food
alone; for, generally speaking, from the Somerset Nile onwards, the tribes have
usually been famine-stricken during recent years. (It is, however, probable that as
the country becomes more settled, and a cycle of ‘wet’ succeeds one of ‘dry’ years,
there will be ample food for passing caravans; but no more can be expected.)

Another point in the employment of natives of this portion of the country
is that the difficulties of housing (also transport) are reduced to a minimum.
Even when on the march, they daily construct grass huts, at which work they are
adepts; and when a lengthened stay in one place is intended, wattle houses, with
rain-proof thatch, are quickly constructed.

In the case of the Baganda, personal belongings, on a three months’ trip, are
reduced to a change of bark-cloth clothing (mbugu) and a cooking-pot. Nor do
they possess much more when at home.

It is unfortunate that the natives of (former) Kitara have in recent years been
decimated by wars, famines, and disease (at this moment ‘sleeping sickness’ is rampant),
and that from various causes the birth-rate is decreasing. The peas-
antry (bakopi) of Uganda is undoubtedly the finest material we possess in British
East Equatorial Africa for the future development of the country.
The questions of the advantage of the railway, its cost, probable commerce, &c., have not been touched on. They are beyond the purport of the present paper, which is to comment on the feasibility, from a railway engineer’s point of view, of a line through that portion of the country (440 miles) traversed in a five weeks’ march between Entebbe and the Sudan frontier, in October and November last.

[Unless otherwise stated, by the ‘width’ of rivers is implied the width of the water or flooded area at the point at which the caravan track crossed it. Naturally, the fords selected by the natives are usually at points where the river is broad and shallow, and the banks low. Notes of every stream, river, and swamp were taken for the information of later travellers by this route, but further examination of most rivers was impossible in the limited time available on the daily march.

Informal Conference with Mr. F. Bedford Glasier, on the Subject of the Lagos Railway, held at the Exchange Station Hotel, on Monday, April 27th, 1903, African Trade Section of the Incorporated Chamber of Commerce (Liverpool: C. Tinling & Co. printers, 1903).

AFRICAN TRADE SECTION

OF THE

INCORPORATED CHAMBER of COMMERCE of LIVERPOOL.

INFORMAL CONFERENCE

WITH

Mr. F. BEDFORD GLASIER

(GENERAL MANAGER, LAGOS RAILWAY),

ON THE SUBJECT OF

THE LAGOS RAILWAY,

HELD AT THE

Exchange Station Hotel, on Monday, April 27th, 1903.

LIVERPOOL:

[...]

– 223 –
Sir Alfred Jones, K.C.M.G. Gentlemen – I take it that you do not want to waste time, and that you would like to hear what our friend, Mr. F. Bedford Glasier, has to say about the Lagos Railway. First of all, I must say that this meeting is purely an informal one, as our friend is a Government officer appointed by Mr. Chamberlain to look after the Lagos Railway. Liverpool has been the pioneer in the movement for railways in West Africa, and we can safely say that we induced the Government to construct the railways. I don’t think we are sorry for what has been done – they might have been made cheaper, but this is generally the cry after one has made a bargain. For developing the country, the thing is to get railways as cheap as you can, and as quick as you can – the quicker the better. The French are showing us a great example in the matter of constructing railways. They say the French are going in for railways on a tremendous big scale. We dare not be left behind, and at the present time there does not appear to be any doubt as to who will reach the Niger first by rail. We have gentlemen here from Manchester, and I have no doubt they see the desirability of extending the railway to Jebba. I am also very glad to see Mr. Ellis Edwards present to-day, as he has always taken a great interest in inducing the Government to construct railways in West Africa, and, as a result of Liverpool’s work, we have now got railways in West Africa, at the principal ports, running up-country for about 100 to 150 miles. To show what a convenience the railway is – my company took out a party to Sekondi for the Ashantee Goldfields, and after landing they were at their destination within twenty-four hours, whereas on their first trip, before the construction of the railway, it took them nearly one year. Besides, you can travel by the railways with health and comfort. There is no country in the world where railways will be of more value than in West Africa, and there is no more valuable country, as we are learning every day. Our last boat arrived and landed £21,000 specie from the Gold Mines. The railway is a necessity, and it is also a great means to civilisation. It is a poor thing, as my friend Mr. Irvine knows, to send a missionary empty-handed into Africa. We are going ahead now, and it is a great kindness of Mr. Glasier to come here and give us information about the Lagos Railway; he is not a man appointed by Contractors, but a Government officer, and salary-paid official. To people who are paid a salary, it is more to their credit to make the railway for the smallest cost, and to get everything for the lowest possible price. I am perfectly certain that the railways in / West Africa will pay cent. per cent. when
in proper working order. With regard to railways, we want the railways at once. Mr. Glasier is purely a man representing the Colonial Office, and I am perfectly certain, when we have heard his statement, we will be glad to help him to extend the line at Lagos. I think it is only a question of time before we have thousands of miles of railways, and you will then have a great deal of your labour released. What we want at present is railways about 150 miles long from every shipping port in West Africa, in order to develop the country. Now, Mr. Glasier, I am exceedingly glad to see you here to-day, and congratulate you upon the success of your railway. We would certainly like to have the railways made cheaper, but rather at the present price than not at all. I now ask Mr. Glasier to state his arguments in favour of the extension of the railway, and to press upon all present the extreme necessity of these proceedings being quite private.

I have much pleasure in proposing the health of Mr. F. Bedford Glasier.

Mr. F. Bedford Glasier: Sir Alfred Jones and Gentlemen – I thank you for the kind way in which my health has been proposed and received, and also for the honour you have accorded me in inviting me to meet you here to-day. Sir Alfred Jones has mentioned that this meeting must necessarily be private, and in accepting your invitation I made it quite clear that this must be so. I am here to-day in a private capacity, and cannot, therefore, speak for the Government of Lagos, or any body or persons connected with the construction or administration of West African Railways. Of course, as General Manager of the Lagos Railway, I am much interested in its ultimate success, and I am indeed glad to meet here to-day so many gentlemen, not only interested in the Lagos Railway, but in other undertakings, such as the Sierra Leone and Gold Coast Railways, for I have been for the last six years employed on the railways of British West Africa. I have for a long time felt that some misconception is prevalent concerning the construction and administration of West African Railways, and if I can give you any information which will elucidate any points which are obscure, or have been misinterpreted, I shall only be too glad to do so, and my visit to Liverpool will have served a useful purpose. I have gentlemen before me of great experience on the West Coast, who know the difficulties that have to be overcome, and the climatic conditions which render it impossible for Europeans to reside there for a long period without change; this is very detrimental to the desired continuity of administration, and is much felt in the construction and the inception of the working of railways, but when the systems are in full working order it will be less appreciable.

Up to the present we have not had time to educate the natives in railway matters; the native, as you know, is not fond of work – far from it, he resents work. I am speaking now of the educated native, and he is not blessed with those qualities of smartness, punctuality, and business aptitude which railway working requires. However, we are making some progress, and have reason to hope that in time some of them will become satisfactory native railway servants.
Sir Alfred Jones has alluded to the cost of West African Railways. The expenditure on the Lagos Railway will be under £7,000 a mile. I have been concerned with the construction of railways in three different continents, and am glad to be able to inform you that a comparison of the cost of the Lagos Railway with similar railways in other countries is favourable to the former. We hear a good deal about the alleged cheapness of the French West African Railways, but I am extremely sceptical that they have cost less than our own. I must remind you, gentlemen, that you cannot compare the initial cost of railways constructed by indirect compulsion and by granting land and monopolies with the British undertakings; time can only prove the actual cost of the former.

The working of the Lagos Railway has at times been adversely criticised. I should like to point out that when the present line was opened for traffic it had been decided to extend the railway. A policy of low rate was, therefore, deliberately adopted, which it was known would not pay much more than working expenses, but which would become remunerative when the railway was extended, and the length of haul thereby increased; for the present the Government was satisfied that the indirect benefits accruing to the Colony would fully compensate for the developmental rates. Gentlemen, the Lagos Railway has achieved its present purpose, the trade of the Colony and the General Revenue has greatly increased. During the six months ending September, 1902, the increased value of palm kernels and oil exported, compared with the similar period of 1901 amounted to over a quarter of a million; the railway has paid working expenses, and this year there will be a surplus of some £6,000. You cannot make a short line of railway dependent on forest products pay full interest charges unless heavy rates are imposed, as is the case on the Congo Railway, where, for instance, the rate for palm kernels is £4 per ton; such policy will make the railway a paying concern, but will not develop the Colony. As regards the extension of the Lagos Railway, as I have explained, I am interested in its ultimate success, and my view is to extend it immediately, for until it has reached its natural objective it cannot be fully remunerative. In regard to the administration of the construction works, I understand that it is generally believed in Liverpool that the consulting engineers are paid a commission on the amount expended on the construction; this is not so – Messrs. Shelford & Son receive a fixed salary.

Mr. Morel in his very interesting notes has clearly demonstrated the necessity of our reaching the Niger before the Dahomey Railway, and some of you, gentlemen, may have read two interesting articles which appeared in the Morning Post of last week. The French have deliberately adopted an extensive railway policy, and are carrying it into effect with expedition. A loan of 2 1/2 million pounds sterling, which is only a forerunner of more to come, chiefly for railway purposes and harbour works, has lately been placed on the market, and the interest guaranteed by the French Government. This is of serious concern to British
West Africa, the guaranteeing of interest by the Home Government, and unless, gentlemen, we counteract the French Policy, which menaces our present trade and future prospects, by vigorous enterprise, our trade in West Africa will be irretrievably damaged. Gentlemen, I must now crave your indulgence; as a Railway Manager and Civil Engineer my life’s work lies rather in deeds than words, and the present occasion is strange to me. I can only add that if I can, in return for your kindness, give any information in my power it will be a pleasure to do so. I beg again to thank Sir Alfred Jones, Mr. Holt, and other members from whom I have received hospitality during my visit to Liverpool.

Sir Alfred Jones: I shall be glad to hear a free discussion of the railway. There can be no question that if British trade is to be pushed we must not lose any time in Liverpool. If the Government cannot do it, then we must get to work in the same manner and on the same lines as the Canadian Pacific Railway was constructed. If the English people had any kind of sense of responsibility for the future we should not have had the French in Africa at all, and no nation was ever less entitled to get the Cameroons than the Germans, but it was all owing to British apathy. We have a great deal to undo; the world has changed with regard to Colonies; we must be up and doing. The object of this discussion is to get information from Mr. Glasier re the Lagos Railway. We were glad to hear that he was a Government man and not a contractor’s, and we were certainly under the impression that Messrs. Shelford were paid a commission, but are glad to hear that they receive a salary. I should like to see the line made quickly rather than let the French get to the Niger first. We also want the railway from Old Calabar to Lake Tchad. I will now ask Mr. Holt if he has anything to say on this subject. He would like to have the railways built cheaper. It is the greatest work you can do for the native of West Africa to construct the railway, and also for the Lancashire spinner, and it is also important to have cheap rates of freight – you have got them by the steamers.

Mr. John Holt: I regret I was unable to be present to hear all of Mr. Glasier’s remarks. It rather amused me to hear Sir Alfred allude to me as being economic, but I sometimes think that I spend a great deal of money. I see that Mr. Glasier has now raised the rates on the Lagos Railway, which I think would not have been necessary if the railway had been cheaper. I maintain that if the railway cost £10,000 per mile to build, and it could be done for half the cost, the railway would go twice as far for the same money. We all agree that we want railways on the West Coast, and we advocated the same many years ago, and we want as many as possible. If there is one place in West Africa where a railway ought to pay it is in Lagos. Personally, I feel disappointed that up to the present time they have not been able to produce a dividend, and that they have not got anything to pay the interest on the capital the Government lent them. If they cannot do this, then there must be something wrong in the working of the railway, and
when such is the case, some of us here have an idea that there has been too much money spent on them. However, Mr. Glasier assures me that the railway has been an economical one, and, as he is an expert, I cannot attempt to go against his opinion, but I must say that the reports we hear of other railways being built at cheap rates must be very misleading. In Dahomey the French Government are making the railway, and the contractors only find the railway material and engines, and I hear that the French Government are going to make the railway for half the amount it cost to build the Lagos Railway. The contractors appear to have the privilege of taking so much land each side of the railway as a recompense for their work. I should like our Government to go into the thing in a business-like manner – I want them to put out tenders for the material, including the freight. We should go to our friend Sir Alfred Jones to get cheap railway material. I think there can be very little harm in urging the Government to work as business men, and I therefore say let us urge the Government to go on with the railways, and ask them to consider whether it would not be advisable to ask for tenders, and compare the estimates with what the Government expects it to cost. With regard to the cash question, Sir William MacGregor, in his very able message to the Legislative Council (it is a pattern for the other Colonies), has asked whether the Government would be disposed to stop a proportion of the sinking fund for some years in order to have sufficient funds to go on with the railway, but I do not know how the Treasury will view a matter of this sort. There must be a sinking fund to give them more security, and I fancy that there will be some difficulty on this point, and I don’t think Lagos will be able to provide the necessary funds for the extension of the railway, if carried on with care and economy. In the arguments brought before me with regard to the proposed extension of the railway, there is a mention of the expansion of the trade in Lagos for one year, but we must not judge by the results of one year. The last year has been a good one for produce in Lagos and Dahomey, also in the Cameroons and elsewhere, so we cannot give credit to the railway for the expansion of trade. You will notice that the principal increase has been palm kernels, but, on comparing the figures with those of Dahomey, you will see that there has been a similar increase in Dahomey without the assistance of any railway. Mr. Glasier can only calculate and take credit for a little over 10 per cent, of the kernels brought down.

I must say that I don’t share the feeling of the Chairman and others with regard to the French railways reaching the Niger first, as I don’t think it will have an important feeling upon the trade. I don’t mind which railway reaches the Niger first, but I am rather inclined to back the French, as they have managed their business first-class. I should be very glad if Mr. Chamberlain could see his way to extend the railway, even to Kano, and we may find practical results of the employment of any capital necessary in the railway undertaking. I can only urge the Government to make the extension on sound business lines, and to get
the best value for their money. If you could get the Government to guarantee the
shares, it would place the matter on sound lines.

Sir Alfred Jones: I think it is much to our credit if we allow the native to
keep his land, and make the railway through it, which the French do not appear
to do. I also think it is a great point that we should reach the Niger before the
French. The following are the costs of some of the principal railways, viz.:–

<table>
<thead>
<tr>
<th>Location</th>
<th>Cost (£ per mile)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Sierra Leone</td>
<td>£ 4,000</td>

</table>

I should be quite willing to press the making of the railway on the Canadian
Pacific system, or on the same lines as the French, but I don't think the latter
system would be quite fair to the natives. If you can make this railway in a bet-
ter way and cheaper, it is our duty to ourselves and also to the interests of the
Colony. I look forward to having thousands of miles of railway within the next
ten years. We cannot expect the new railway to pay all at once. I am working
up the West Indies, but do not expect to make money at once. When you hear
of 30,000 people per week coming down with produce, I think the railway is
bound to pay if low rates are started. I would like to hear Mr. Bradley’s opinion
on the matter, as he is very often in Lagos.

Mr. J. Bradley: When I was last in Lagos I went up to the terminus of the
railway at Ibadan, and spoke to several of the principal natives on the subject of
sending their produce / by rail. The natives ask which is going to cost them more
– to send their produce by rail or by canoes; so it appears to me to be merely a
question of rates. I would strongly advocate pushing the railway on to reach the
Niger before the French, as if the French once take the trade, it would be very
hard work to get it back again.

Mr. Ellis Edwards: I am very pleased to see Mr. F. Bedford Glasier here
to-day, and I am certain that you cannot do anything in Africa without the
railways. It has been a great pleasure to listen to Mr. Holt to-day, and I think
Mr. Glasier has converted him. Mr. Holt generally says that railways won't pay
in West Africa. If you read carefully Mr. Glasier’s report on the railway, which
is a most interesting one, you will see that the revenue in six months has been
increased by £47,000, and this is entirely due to the railway. Without the railway
you can do nothing, and I have always persisted in this Mr. Glasier tells us that
the railway pays expenses, and indirectly it does pay expenses. If you had had the
railway on the Gold Coast years ago you would not have had a war which cost
millions, in fact, a railway is worth more than 100 mines. I think it is a great thing to have Mr. Holt converted – Sir Alfred Jones has always been for the making of railways, but Mr. Holt has always been against it.

Sir Alfred Jones: I don’t think Mr. Holt is against the building of railways, but he wants to make the railways cheaper. I hope Mr. Glasier does not think that we do not appreciate his work.

Mr. John Holt: I have never been against Sir Alfred’s opinion re making of railways, but we should spend other people’s money as if it were our own, and get the best value for it.

Mr. J. C. Atkins (Oldham): With reference to Northern Nigeria, everything points to the fact that good cotton can be grown there, but the difficulty is to get the cotton down to the port. If the British Cotton Growing Association is to be successful in its endeavours, we must have railways in West Africa, otherwise we cannot get the cotton.

Mr. E. D. Morel: I should like to know something about the contractor’s system, and if Mr. Glasier could tell us the disadvantages of the contractor’s system. We all want railways in West Africa, and the financial question is what the Colonial Office is considering. There is one point, however, that should not be overlooked, and that is that Lagos has a debt of £1,300,000, whereas Dahomey has not a single debt. I should like to know, however, if there is any objection to the Colonial Office making enquires about contractors.

Sir Alfred Jones: Conakry had two contractors to build the railway there. The first one failed in business, also the second, so the French Government had to take the matter in hand. Another thing, the French are exceedingly liberal in Imperial grants, which the English are not. We want the railway quickly, and the Government has a certain policy. The Colonial Office let the railway in Jamaica be constructed by contractors, with a very unsatisfactory result. Then as regards the water carriage competition, the railways must be extended in order to compete with this.

Mr. John Holt: In going to Oshogbo, what are we going to get from there that we are not getting at present. I think the Lagos Railway has cost something like £10,000 per mile.

Sir Alfred Jones: With regard to the three bridges mentioned in the report, Mr. Glasier pointed out to me that these bridges were built before the railway was constructed.

Mr. F. Bedford Glasier: The Carter and Denton Road Bridges are not part of the railway undertaking, but merely attached to the management for administrative purposes; their use is to connect the town of Lagos with the mainland, and this purpose they fully serve. The cost of their maintenance could be easily obtained by levying a small toll on / people and animals crossing – a much larger sum had to be paid for ferry charges before the bridges were built.
This is now being considered, but I believe that the Government at present are of the opinion that the general revenue of the Colony can well bear the cost of this up-keep. It would be absurd to include the expenditure on these bridges in the cost of the railway, one of them – the Denton Bridge – is actually a competitor, as it is an alternative route.

Mr. Morel has pointed out that Lagos has a large debt of £1,300,000, and Dahomey has nothing. That is quite correct, but Lagos has the railway and Dahomey has nothing – the railway there belongs to the contractor, who will doubtless work it for his own benefit.

With regard to the desirability, or otherwise, of constructing railways in West Africa at the present stage by contractors, I can speak from experience, as for six years I was employed, in positions of responsibility, by one of our largest firms of contractors. If you bring a contractor into West Africa you constitute a monopoly. English contractors will not fight for West Africa, they will not trespass on one another’s preserves, and if any contractor took the work it would only be with a very large contingency item, for the conditions of railway construction are so little known, and the disabilities occasioned by the climate so obvious. During the construction of the present three West African Railways a rebellion has occurred in each colony, greatly hindering operations. Consider if these railways had been built by contractors what a large sum, as compensation to the contractor, would have been awarded by any arbitrator. In West Africa, with its terrible climate, we cannot expect to build railways at less capital expenditure than in other countries more favoured by nature; Sir Alfred Jones has quoted the cost of similar railways in other countries, and the comparison is favourable to Lagos. I would mention that the Cape Government Railways, which are of a similar gauge to the Lagos Railway, but of much greater length, average a capital cost of £10,400 a mile. It has been alleged, gentlemen, that a contractor offered to build the Gold Coast Railway for £4,000 a mile. I have also heard that a firm wished to be allowed to construct the Uganda Railway for some £3,500 a mile, which finally cost more than £10,000 a mile. Now, gentlemen, you cannot waste hundreds of thousands of pounds in railway construction unless some extraordinary and untoward circumstances arise, which did not in this case, and, as the actual cost in comparison with the contractor’s estimate was so divergent, it may be presumed that the terms proposed by the latter were sufficiently elastic to cover the discrepancy. When West Africa is sufficiently developed to require competing railways it will be time to call in the contractor – till then your interests are better served in the construction of railways by a salaried staff.

As regards the operation of a short length of railway in a new country, you cannot with forest and agricultural products both meet the interest on capital outlay and develop the country; the latter requires cheap rates, and these only pay a railway that has a long length of haul. In India, it was many years before
the railways paid, but they developed the country and increased the general revenue; now that they have been extended, and reached their natural limits, they form the most valuable asset of that Empire. When the Lagos tariff was fixed, I told the Governor and others that the charges with the existing length of line would barely meet the cost of haulage, but the Government decided that the railways must be extended, and that if working expenses were met the indirect benefits would fully compensate the General Revenue for the interest paid on capital charges. The railway has more than paid its working expenses, and there will approximately be a surplus of some £6,000 for last year, and the excess of the General Revenue of the Colony over expenditure – for three years prior to the opening of the railway there was a deficit – culminated for the last financial year in the very satisfactory figure of over £80,000. /

In reply to a question, Mr. Glasier said that the quantity of palm kernels carried for the half-year ending June, 1902, amounted to 7,000 tons, with general merchandise 10,800 tons, earning £11,384.

In reply to a further question regarding the departmental system of building railways Mr. Glasier said, when it has been decided to construct a railway or other big undertaking, the Crown agents obtain the services of a consulting engineer to advise in all technical matters, and who closely supervises the work – for this he is paid a fixed salary and actual office expenses; he receives no other remuneration whatever. All the material is bought by the Crown agents, who invite tenders in the open market for all purchases exceeding £100. It is usual in young and undeveloped colonies to build railways departmentally. It is not considered desirable to place the work in the hands of a contractor, who is only concerned with his immediate profit and who is not interested in its stability or its ultimate success. To safeguard the work being adequately performed by a contractor, in accordance with drawings and specifications, would necessitate a considerable staff of Government engineers, and this would be an additional expense.

Replying to another question relative to the railways being constructed by the Colony without extraneous help, Mr. Glasier said the limited number of European officials in West African Colonies have already duties fully engaging their time, but even if this were not so, it is most desirable, in undertakings involving large expenditure, that the best men obtainable should administer the work, and that the highest technical advice should be taken advantage of. In Lagos, for instance, officials had never been concerned in anything more extensive than public buildings, road-making, and such municipal work – the only concern anyone had probably had with a railway was as a passenger. It would be an expensive policy to pay for the experience necessary in endeavouring to make local officials expert railway constructors / and administrators. Until such time as the West African Colonies could be amalgamated, and an Agent-General appointed, the Crown agents were a necessity – they performed their
duties most satisfactorily, and could not be replaced by any more efficient body. It would be suicidal to allow parochial councils to still further prevail by each little colony having its own agent. In the extension of the railway existing institutions would be taken advantage of, the ‘Open Line’ staff comprised officers highly trained in administration and engineering, and they would be utilised as far as possible for extension purposes.

Mr. John Holt: There are some of the best officials in Lagos.

Sir Alfred Jones: The Congo Railway is a magnificent undertaking, but not so good for the country as that of Lagos. There is no doubt that the Congo Railway carries more valuable produce than at Lagos, viz., rubber and ivory. The French have given the concessions to contractors, and they charge 2s. per ton per mile.

I think the discussion has been very useful, and I am extremely gratified to Mr. Glasier who has been able to make such statements, and to know that we have got the railways at a fair price is very satisfactory. I believe the consulting engineer for the Coast gets something like £2,000 per year, so we have the best advice, and will go as quickly as possible. We want now to come to some practical result for this meeting – would it be wise to change the method of making the railways? – I think it would be a great mistake to change the method of construction. The question then is, should we support Sir William MacGregor in the extension of the Lagos Railway? Then I don’t think you want a sinking fund for a railway, as the railway is good security, as it becomes more valuable day by day. I don’t think we ought to try to block it when we see the 15,000 tons of kernels brought down in a year, which is certainly a good thing for the natives, merchants, and shipowners. I now put the following Resolution to the meeting, viz.: –

‘That the Committee recommend the immediate extension of the Lagos Railway from Ibadan to Oshogbo, 71 miles, at a cost of £429,000, the interest on which can be paid by the suspension of existing Sinking Fund.’

Mr. John Holt: I would rather support a Motion in general terms, viz.: –

‘That we support the proposal of Sir William MacGregor to extend the Lagos Railway, and for that purpose to take such steps as the Government may deem necessary to gain the end.’

The following Resolution was then proposed by the Chairman, seconded by Mr. John Holt, and passed unanimously, viz.: –

Resolved –

‘To recommend the prompt extension of the Lagos Railway to Oshogbo, and, if needful, the suspension of the Lagos Railway Sinking Fund.’

[...]

Mr. J. Newton: I think that the extension of the railway to Oshogbo would mean that a great deal more produce would come down for the merchants to buy, and the result would be that Manchester people would have an increased
sale of their cotton goods, &c. A great deal is being done in Africa for the construction of railways, and I think we have been rather fortunate in having such a splendid Colonial Secretary, who has placed such confidence in Manchester and Liverpool, and it will be a great pleasure when I hear that the extension has been carried out. Some people think it has been a most extravagant way of making the railway, but it has been the most efficient. I quite agree with Sir Alfred and Mr. Glasier that we should employ the best men we possibly can, and then we shall have nothing to regret afterwards. I have much pleasure in supporting the vote of thanks to Mr. Glasier.

THE RIGHT RAILWAY SYSTEM
AND THE
BEST OUTLETS FOR NIGERIA
(Reprinted from the ‘West African Mail,’ January 19 and 26, 1906.)

[...]

A subject of such vast and vital import as this in its bearing to our West African Empire is bound to prove of the deepest and most essential interest to all our readers. To grasp and digest the printed matter contained in this Blue Book of 203 pages (Cd. 2,787), which is divided and sub-divided into a great number and variety of despatches, reports, minutes, maps, estimates, tables and plans – documents, in fact, representative of varying interests, views and opinions – is in itself no easy matter. But when all these multitudinous differences and opinions have to be reduced and condensed into a readable and intelligible article, the difficulties before us can only be estimated at their due worth by those who have either waded through the mass of matter itself, or who possess an intimate and appreciable knowledge of the mental intricacies of official literature.

Yet there is a fascination about these pages which is only explicable to the philosopher who is interested in the psychological study of human motives. What we have attempted to arrive at on behalf of those who have neither time nor patience to read this Blue Book for themselves, is a clear and concise summary with regard to the most practical system of railways and sea bases, that will meet the full requirements of the case from every side: / from the more or less equal standpoints of commerce and administration, in their respective relation to the interests of the natives, equally with that of ourselves as protectors, initiators, and bankers.
Regarding this vast mass of correspondence solely from the estimate of time (the accumulation of six years), and its aggregate in words, amounting as this does to over 150,000, it is, indeed, a stupendous monument of official labour and methods – those laborious and roundabout methods that the sympathetically observant Dickens belaboured under the designation of ‘circumlocution’ – in popular parlance, the ‘red tape and sealing wax of official routine.’

But even making allowances for this congestion of official system, and putting it to one side, it is quite impossible to wade through so formidable an array of words and figures without being inspired with amazement; not so much as to the expression of individual opinions, as that so great a quantity of energy and so much valuable time has been allowed to pass – we will not say wasted or frittered away – by so many eminently practical individualities. And all for what? In arriving at a conclusion, the definiteness of which was, to a great extent at least, distinctly evident, if not a foregone conclusion, from the very outset.

Regarding the question at issue from a purely practical standpoint, it seems to us that the only conclusion which it was possible to arrive at was (a) to select the right system necessary for the development of Nigeria; (b) equally so, to fix on the best – i.e., the most suitable – harbours or outlets, in connection with this.

Yet simple as was the problem (we do not in any sense refer to the issue, and fully recognize the difficulties that had to be contended with), it has taken the various units concerned – the Colonial Office, the Crown Agents, the Consulting Engineers, and the local Governors or Administrators – six years merely to decide, not as to its solution, but as to the validity and soundness of the question before them.

Even now this conclusion had been only partially arrived at by Lord Elgin, the new Colonial Secretary, on 16th ult. Not a single step has as yet been adopted with regard to the initiation of any railway or harbour scheme; so that we are in reality as far off a practical realisation of it as we were in 1900, when the question was first actively mooted.

This is all the more extraordinary and incomprehensible, when we take into consideration the fact that it has occurred in a country such as England, whose commercial interests are the greatest in the world, and whose people have at least the reputation of being the soul and personification of business. This in itself is astonishing; but after having carefully and diligently studied the contents of this correspondence, it strikes us as almost impossible to reconcile the extremely glaring inconsistencies of theory and practice which are to be discovered therein.

But human nature, as thinkers of old have pointed out, is fearfully and wonderfully constructed: it is so intricately variable in fact, as to defy analysis. And if ever we have rightly gauged the depth and meaning of the phrase ‘human document,’ this Parliamentary Blue Book has brought it home to us more forcibly and luminously than almost any other that we have ever read. For there is a strong
The Right Railway System and the Best Outlets for Nigeria

and undiluted flavour of humanity in every page and line of it – the humanity of personal egoism and of conflicting interests, opinions and reputations – which in a very great measure explains the existence and *raison d’être* of official routine and red-tapeism.

But with this interesting aspect of the case we are not at present concerned. We will therefore endeavour to place before our readers as pithy a *resumé* of the entire matter as it is possible, within the confined space of a few of our columns, to give.

Before doing so, however, it will be advisable first of all, as a preliminary measure, to make a study of the map of Nigeria, so as to comprehend the entire situation from every standpoint – geographical, commercial and political. Although the country / alluded to in this correspondence as Nigeria, drained as it is by the River Niger and its principal confluent, the Binue, is, so to speak, from an Imperial standard one, it is in reality, and from a human sense, divided up into numerous petty and insignificant states and communities.

Putting these to one side, however, as outside the scope of the present larger issue, there are three political divisions of this huge territory with which we have to deal, viz.: (1) Lagos; (2) Southern Nigeria; (3) Northern Nigeria; and it is with the first of these that the history of this voluminous correspondence commences.

For some four or five years prior to the beginning of this correspondence in 1900, a railway from Lagos into the interior had been started, the terminus of which at the time had arrived at Ibadan. Passing over the first twenty-two pages, which mainly concerns certain schemes proposed for the improvement of Lagos harbour, in which Messrs. Coode, Son and Matthews¹ had been taken into consultation – dating back to April, 1892 – the first portion of the Blue Book which merits our serious attention is that of two letters written between May and July, 1900: (1) from the Crown Agents to the Colonial Office; (2) from the Crown Agents to Messrs. Shelford and Son. In these communications, with regard to the Imperial unit now spoken of as Nigeria, the question of railway construction is only considered ‘as having at present hardly reached beyond the stage of discussion.’ So that it evidently does not appear necessary or desirable to the Crown Agents to incur the expense of ‘*even* flying surveys’ at present.

A few months later – on 9th August – Sir W. MacGregor, then Governor of Lagos, comes upon the scene with a strong recommendation to the Colonial Office for the extension of the Lagos Railway into Northern Nigeria, partly on commercial grounds, but also in a great measure on strategic and political premises, concluding his despatch at the same time by the remark that ‘in the present state of railway development, the harbour / works could not be undertaken at the expense of the colony’ – an argument, we think, that to some extent invalidates the financial basis of his previous recommendation for its extension, because, as we shall see later on, there are already in existence in Southern Nigeria, which is
contiguous to Lagos, the two splendid harbours of Forcados and Old Calabar, besides several of lesser importance, which, apart from any financial consideration, such as affects Lagos, are the natural outlets of a richer hinterland than is possessed by Lagos.

Almost simultaneously with Sir W. MacGregor, Brigadier-General Lugard, High Commissioner of Northern Nigeria, as he was then, had sent in a report – also, of course, to the Colonial Office – with regard to the results of his researches into the nature and accessibility or otherwise of the country to the north of the Niger, but more especially with reference to the selection of a site suitable for the Government Headquarters of the recently-formed Protectorate of Northern Nigeria: a fact that in an administrative sense, of course, was closely and directly connected with the main issue, for it was with this before his mind that the High Commissioner was guided in his selection of a site.

The year 1900, however, passed away without any strenuous effort being made in the required direction, but early in 1901, Sir Ralph Moor, High Commissioner of Southern Nigeria, entered the arena of discussion by inditing a despatch on the subject of railway development in connection with navigable harbours, to that able Colonial Secretary, Mr. Chamberlain. And here, for the first time in this history of official correspondence, we are confronted with views which, as engaging our immediate and close attention by the lucidity and business-like tenor of their expression, are distinctly worth reading. Apart from all such weighty considerations, they are without doubt the views of a personality with local experience of Lagos and Southern Nigeria, who has regarded the question at issue from a broad and comprehensive aspect. Indeed, the few headings – as given / below – under which he submits his views, demonstrate this to a great extent. These are:–

(a) In developing the territories of Nigeria by railroad, the scheme should be comprehensive from its initiation, and determine as nearly as possible what railways will be required in future to properly open up and develop the territories.

(b) The most suitable harbours for the establishment of depots for the trade of the interior.

(c) The advisability of running railways in such manner that by short branch lines they may supplement the existing water transport during those periods of the dry season when the rivers are unnavigable even by the smallest steamers.

(d) The question of the extension of the existing Lagos railway.

It is most unfortunate that space conditions prevent us from quoting this document in full, for it seems to us to have approached the main issue in the one and only way in which it was possible to approach it, viz.: to look ahead and
The Right Railway System and the Best Outlets for Nigeria

determine the railways, and the natural sea outlets connected with them, which were required, and in doing so, to start with a scheme sufficiently comprehensive to embrace the most essential interests at stake, namely, those of commerce, administration, and strategy. What is more, it occurs to us that had all those who were interested in and associated with the issue, dealt with it in the same practical and business-like manner, not only would a definite decision have long since been made, but the work of development would also have been in full swing. Unfortunately, however, for development, the inevitable BUT and official circumlocution have intervened.

Having divided his subject into four principal issues, Sir Ralph Moor then proceeded to discuss each of them in detail:—

‘With regard to (a), I must submit that having regard to the extent of the territories, and looking somewhat to the future, it seems to me quite impossible that the enormous area of Nigeria can be developed by one railway. I would submit that at least two main railways are required to open up these territories with any degree of success, which, with / the water-carriage supplied by the Niger and its main tributary, the Binue, would ensure quick development through the entire area. I would suggest that one line be run into the interior to the west of the Lower Niger, crossing that river in its upper waters, and taking the direction of Sokoto, for the development of the western area. The other railway should, I submit, be run to the east of the Niger, across the Binue, in the direction of Yakoba, and thence to Kano; from the former place a branch line being thrown out in the direction of Lake Chad, and similar lines in other directions if necessary. The depot ports for these railways I shall suggest later on.’

Whether the places here mentioned, either as termini for the railways, or crossings over the Niger and Binue, are suitable or otherwise, they are questions of detail, to be settled subsequent to the final decision with regard to the settlement of the main factor. But in looking somewhat to the future, and insisting that at least two main railways are requisite to open up the territories in question, Sir Ralph Moor has undoubtedly taken the bull of this business by the horns; for if development is necessary – further, if it is to be commercially payable, by all means let it be undertaken in downright earnest, and on a scale that is commensurate with the issues which are at stake.

Referring next to (b), the High Commissioner of Southern Nigeria was of opinion that:—

‘The question of harbours is apparently the most difficult one to deal with, for there are considerations, not only of the natural fitness of the existing ports, but others of vested interests which have to be considered. This question concerns the port of Lagos vitally, and in giving my views with regard to that port I should wish first to premise that I am not in any way prejudiced against Lagos, and that the views I put forward are those which I consider to be for the best
interests of the territories; nor do I claim that my views are of any special value, though I am personally acquainted with Lagos and all the ports of Nigeria probably better than anyone who has written on the subject. In fact, I am not aware that anyone who has advised in this matter is acquainted with any of the ports beyond Lagos, and such representations as I make are put forward with a view to a thorough consideration / being given to the subject before extensive railway enterprise is embarked on. In my despatch of 26th June, 1897, to the Foreign Office, I called attention to this question of ports, and requested that before railway enterprise was embarked on due consideration might be given to it, and I understood at the time that the despatch was forwarded to the Colonial Office.

‘Counting Lagos as a port, there are, in all, nine on the coast line of Nigeria, viz.: Lagos, Sapele, Warri, Forcados, Akassa, Brass, Bonny, Opobo, and Calabar, of which Lagos is distinctly the worst, for the main line steamers cannot enter it, and into all the others the main line steamers are able to enter. At Forcados and Warri steamers can enter drawing twenty feet, at Sapele eighteen feet, Akassa fourteen feet, Brass fourteen feet, Bonny twenty-one feet, Opobo fourteen feet, Old Calabar twenty feet; and in all these ports the steamers lie in still water.

‘The primary difficulty in Lagos is the bar, and I understand that it is estimated that from eight hundred thousand to one and a half million pounds will be required to make this bar practicable to main line steamers.

‘Admitting that the bar can be dealt with, the next question is as to the suitability of Lagos itself for a depot, and I understand it is regarded as having claims to be such, based on the vested interest in the property on the island of Lagos. It seems to me that this claim is to an extent a fictitious one, for if Lagos is to be made a depot I understand that it is admitted by all who have a good knowledge of the locality, that the depot will have to be not on the island of Lagos, but on the mainland. Thus the vested interest in the property of Lagos island itself must be disturbed. Considering next Lagos and the mainland, we have the fact that the population – permanent and floating – of Lagos itself is seriously congested, and that the European and native habitations are far too contiguous from a tropical health point of view. I believe it is the opinion of experts that were an epidemic to break out in Lagos the results in mortality would be too terrible to contemplate. The island of Lagos itself is low lying and insanitary, and does not lend itself to drainage in any way. Further, there is no water supply whatever, except such as can be obtained from rain-water collected in tanks.

‘Dealing now with the mainland, to which, no doubt, a considerable portion of the present population would transfer if a depot be established, there is, I believe, a good area of / land suitable for the establishment of a large town, but again the difficulty of water supply presents itself. For I understand there is no water obtainable nearer than the Ogun river, and from that source I am told that the water supply available would not be for more than 100,000 persons, and
The Right Railway System and the Best Outlets for Nigeria

it would take at least £100,000 to obtain it. It seems to me that the depôt for the trade of the interior will, some years hence, be a town of considerably over 100,000 inhabitants – indeed, several hundred thousands and it is well that this fact should be considered in any action that is taken. Having regard, therefore, to the enormous expenditure that would be required to make Lagos a port, and to the foregoing disadvantages, I submit it is a matter for serious consideration as to whether Lagos is not better fitted for the depôt of a purely local trade than for the depôt of the vast trade which may be expected to result from the opening up of the interior in future years.’

The absolutely fair and unbiassed manner in which the suitability and respective merits of Lagos and Southern ports and depôts are discussed, is undeniable. Indeed, speaking from a wide experience of these localities, we cannot but concur in the sound and commonsense conclusions here arrived at. For although we fully acknowledge the importance to the people of local and vested interests, this is a question which must be Imperially handled. But by Imperial, we mean that higher and broader factor which in its integrity enhances and consults the interests of all its component parts.

Passing over the details with regard to the capabilities of the principal ports of Southern Nigeria, Sir Ralph Moor continues:

‘Referring next to (c), at the commencement of my despatch, I certainly consider it advisable that the railways should be run in such a way that short branch lines can be thrown out to tap waterways at suitable points during periods of the dry season when such waterways become in part unnavigable. If the trade is to be developed so that it may be progressive, there must be better facilities for transport afforded in the dry season throughout the territories than the existing waterways, and I need hardly point out that peace and good order would be quickly ensured by the establishment of such a system.’

The absence of all data, or, in fact, of any information whatsoever in support of this contention is, of course, obvious. But we must recollect that up to then, reliable information with regard to the physical features, population and traffic of the country were not forthcoming. And apart from this the larger issue, and not details, was under discussion.

Proceeding next to (d) the question of the extension of the existing Lagos railway, ‘this must depend,’ Sir Ralph Moor argues, ‘on the settlement arrived at as regards the port of Lagos, and the fitness of Lagos itself as a central depôt for the trade of the interior. It is, of course, essential that the Lagos line should be extended to tap a sufficiently large area to render it a paying concern, if it be decided that it is to be relegated to the position of a local line. The area necessary for this is at the moment, I presume, rather a matter of opinion, as there is

* More than this, existing waterways ought to be utilised. /
no definite information as to traffic.’ But deferring to the professional opinion of Mr. Shelford, that an extension to Oshogbo would meet the case, he frankly admits that he has no knowledge of the Niger crossings, but fully concurs with Sir Frederick Lugard’s opinion that it is of the utmost importance, indeed essential, that the question with regard to railways and ports should be decided at the earliest possible moment, to enable the local Administrations to proceed with the development of the territories in such a manner as to facilitate the construction of the lines when they are undertaken, for much might be done in this direction by road-making and developing the trend of the trade in the directions of the railway.

Then after dealing with a few smaller issues, the despatch is concluded in the following well-weighed and rational words:—

‘In dealing with this subject I would venture to suggest that the Imperial Government should render assistance in the expenditure necessary for the construction of railways throughout Nigeria. The French and Germans are both contemplating the construction of railways through areas bordering on the territories, and it is possible that difficulties may arise in maintaining the frontiers. To provide the capital moneys necessary from local funds is absolutely impossible, and to charge such funds with the interest on the capital which it is necessary to expend must seriously delay the construction of railways, and I fear practically stop their extension, for the maximum amount with which the revenues could be charged in this manner would be reached long before the necessary lines were constructed. If a grant could be made for railway construction in the same manner as in East Africa for Uganda, the enormous expansion of trade in these territories which would follow on the opening up by railway would soon compensate for the Imperial grant, in the trade done with British manufacturers and merchants. I submit that it is for the best interest of the territories, that now, before the enormous expenditure contemplated is undertaken, the best and most efficacious way of dealing with the question should be arrived at, and further, that hitherto no consideration has been given to the facilities that exist in directions other than Lagos. It does not appear that it was contemplated carrying the Lagos line into territories which were then under the administration of the Royal Niger Company at the time it was commenced, and no provision was then made for making Lagos an ocean steamer port. I conclude, therefore, that a local line was contemplated, which would not have been undertaken had there not been reasonable grounds for calculating that it would pay its way. There are undoubted facilities in other directions for providing railway transport to the interior, which should receive consideration, together with those at Lagos, that the best means for arriving at the desired object may be determined with due regard to economy.’

The next step of any importance in the development of this great question was the meeting of the three Governors, Sir William MacGregor, Sir Ralph
Moor, and Sir Frederick Lugard, of Lagos, Southern Nigeria, and Northern Nigeria respectively, which took place at Lagos on 5th April of that year (1901): a meeting, by the way, which included a flying visit by railway to Ibadan, the then and present terminus of the local line. Unfortunately, the practical result of this conference was a negative quantity. For theoretically, there was a divergence of opinion between these selected representatives of the three units into which the area under discussion was then divided. /

Thus, the High Commissioner of Southern Nigeria, looking at the matter as a whole, was, as we have already seen, an advocate, and a strong yet unbiased advocate, for (1) the conversion of the Lagos railway into a local line, the cost of construction of Lagos harbour being altogether too great; (2) the construction of two railways: a Western, with its outlet at Sapele or Warri, and an Eastern, having Old Calabar as its sea base – admittedly the best harbour next to Freetown on the whole coast of West Africa. The Governor of Lagos, regarding it in our view from too local a standpoint, very strongly advocated the extension of the existing railway from Ibadan to Kano, or other objective in the north. And finally, the Governor of Northern Nigeria, with his own very decided opinion on the subject, favoured Sir William MacGregor’s scheme with regard to the latter, and was in accord with Sir Ralph Moor in respect to the Eastern line, and the connection of Sapele with the Lagos-Kano extension.

It is, however, impossible to arrive at any definite conclusion, without in some measure examining the general and specific arguments advanced by the different Governors in support of their own views; for a more comprehensive grasp of the various capabilities of the question is in this way attained. Condensing those of Sir William MacGregor, they may briefly be placed under the following heads:– (1) The potential argument that in a few months 120 miles of the Lagos line would be open to traffic; (2) the fact that its geographical position naturally placed on it the duty of protection from invasion; (3) the further fact that to the Empire at large, it was a matter of indifference whether Nigerian produce was carried via Lagos or Forcados; (4) that the question of the best means of defending these provinces was a broad one of great importance, which presented itself in considering the extension of the Lagos railway; (5) that this line seemed to be the natural route for commerce.

These views were further expressed and emphasised in a speech made by Sir William MacGregor a few months later on / the opening for traffic of the railway to Ibadan, an extract from which reveals his concept even more plainly:–

‘This far-reaching extension of the railway leads to consider, for a moment, the question of Lagos harbour. The probabilities are that a million sterling would make an excellent harbour there. The estimates prepared by experts are less than that.
'Now the interest on a million sterling at 4 per cent. would be £40,000 a year – I daresay more than that is now expended on maintaining branch boats. Do not forget that; and do not forget that there is also some chance that ocean-going steamers may be built that may be able to pass the bar without any great harbour works. Remember that the increase to the commerce of Lagos by the extension of this railway to the heart of Hausaland would be enormous. The £40,000 required annually as interest on the cost of the harbour would never be felt were that trade secured. Think for a moment what would be the geographical position of the Lagos harbour were it once made. It would be at the ocean end of the direct route to Kano. It would be a day or two nearer to England than any harbour that exists, or that could be made; it could not be rivalled on either side. I may say emphatically that the harbour question may be left alone at present. Existing arrangements will suffice till this railway arrives at Kano, and then you can tackle the harbour with a light heart.'

Similarly, in analysing the governing ideas which actuated Sir Frederick Lugard, it is at once evident that certain prominent local views had also guided him in his conception of the question at issue. Thus he never loses sight of the ultimate destination and course of the railway, and especially of the point at which it should cross the Niger, with regard particularly to the selection of an Administration centre in Northern Nigeria. But although alive to the commercial possibilities of the situation, he in reality, like Sir William MacGregor, primarily bases his concept on strategic grounds. In his own words, ‘the extraordinary efforts made by France in the matter of railway extension in West Africa would appear to force upon the British possession of Nigeria some corresponding effort as a measure of defence, even though it might have been considered premature from the point of view of development only. It is, therefore, chiefly from the former standpoint that the urgency of railway construction should, in my view, be considered.’

Passing over the many salient features which are only too open to criticism, we are now confronted with the opinion of Sir Ralph Moor. And again it appears to us that he goes into the heart of the matter in a much more systematic and comprehensive manner, dealing with it as thoroughly and exhaustively as it is possible to do under the circumstances, and considering as he does the strategic importance of the question at the same time that he subordinates it to the commercial. In his estimation, the finance question is the one of all others which must be dealt with first. Prior to this, however, he had stated in concise and definite language, which does not admit even the possibility of misconception, his entire disagreement with Sir William MacGregor, with regard to the question that the harbour can be left alone. ‘I submit,’ he says, ‘that the extension of the railway and the construction of the harbour practically form but one question. For if it be determined to extend the railway, I submit it is essential for dealing
with the traffic that may be expected to result, that steps be at once taken to provide a suitable port and harbour.’ These words, quite irrespective of the practical arguments with which he supports them, speak for themselves; and so, we think, do those in which he discusses, in a broad and general manner, the primary and all-important question of finance.

Space limitations prevent us from quoting in extenso his views on finance, the consideration of which is based on an investigation of the existing revenues, the present development, and the future prospects of the three units concerned, with a view to estimating what, if any, portion of the cost of construction of this railway could be borne by them. Taking the three revenues of Lagos, Northern Nigeria, and Southern Nigeria at £210,000, £25,000, and £364,593 respectively, Sir Ralph Moor goes on to show that while the two latter units are yet in an absolutely undeveloped state, with every prospect of a great increase in the revenue, especially in Southern Nigeria, the revenue of Lagos has of recent years diminished very considerably, a fact that, taken into consideration with other matters, demonstrates to a great extent the full development of the territories in question. But even mitting that this is not altogether the case, having regard to the figures and details which he has given, Sir Ralph Moor is still of opinion that none of the Administrations are in a position to bear the initial cost of the railway. And in this – from a strictly economic standpoint – he was perfectly right.

Then follows a recommendation as to the soundest method of incurring this expenditure, which is best given in his own words:

‘The Lagos railway will, I should anticipate, certainly not pay its maintenance, upkeep, and working expenses from the traffic derived in Lagos territories proper, and the extension to Northern Nigeria is not likely to pay such expenses until some considerable time after its completion. It may, therefore, I am of opinion, be anticipated that for some years to come there must be considerable charge on the revenues for maintenance, upkeep, and working of this system. It seems to me hardly likely that the revenue derivable from Lagos and Northern Nigeria for some years to come would be able to meet this expenditure, and also to pay interest on the cost of construction; and the revenue derived from Southern Nigeria could hardly be called upon to assist in meeting such expenses, considering the contribution it is now called upon to make for the administration of Northern Nigeria, which is about £20,000 in excess of the amount of revenue collected for that Administration. Taking the eastern railway system proposed, practically the first use of the railway in this area would be to conquer, open up, and control the territories, during which period the traffic would be comparatively small; and this argument applies also to some extent to the western railway system, so that the maintenance and upkeep of railways in these territories will, in my opinion, in the first few years of development, tax the resources of the Administrations to the utmost, without attempting to pay any interest on the cost of construction.
‘It follows from the foregoing paragraph that my view is that the cost of the construction of the railways throughout Nigeria should be borne by the Imperial Government, and on looking into the circumstances of the territories, it does not appear to me that this is in any way unreasonable. The estate of Nigeria has been acquired by his Majesty’s Government at little or no cost beyond the monies paid to the Royal Niger Company, amounting to about £865,000, and the additional cost borne by the Imperial Treasury, exclusive of grants-in-aid of Northern Nigeria, since the territories were first acquired would not, in all probability, increase this sum to beyond £1,000,000. The entire cost of the local Governments, and the cost of opening up and developing of the territories of Lagos and Southern Nigeria, is provided from local funds, and contribution is made towards the Administration of Northern Nigeria from Southern Nigeria funds, amounting to £34,000, which is, as before mentioned, some £20,000 in excess of the revenue collected for that Administration. The remaining cost of the administration of Northern Nigeria is paid from Imperial funds, and for the current year a sum of £283,269 is provided. I take it that the first thing to be aimed at is to make the Administrations self-supporting, and the entire revenues of the territories should, I submit, in first instance, be devoted to this purpose rather than to paying interest on loans for railway construction. It seems to me probable that for the next ten years there will require to be an Imperial contribution to the Administration of Northern Nigeria, which should, however, be an annually decreasing one, particularly so if the local funds of the other Administrations in Nigeria are not saddled with interests on railway construction loans. At the end of that period the contributions from the Imperial Treasury for the Northern Nigerian Government will probably have amounted to about two millions, which, with the million previously referred to, will amount to three millions in all. I would submit that the estate of Nigeria is worth an infinitely larger sum than this to his Majesty’s Government, having regard to the benefits derived in England from its possession, in profits made by manufacturers, merchants, and shipping companies, and in wages provided for mechanics, artisans, and labourers. The increase in these profits and wages depends almost entirely on the opening up and development of the territories, which can only be effectually done by railways, and I would venture the opinion that a further expenditure from Imperial funds of £10,000,000 to £15,000,000 of money for railway construction, admitting, as I think may be done, that the local revenues would maintain and upkeep the railways when completed, would eventually be justified by a proportionate increase of these profits and wages accruing to British merchants, manufacturers, shipping companies, mechanics, artisans, and labourers. The figures showing the trade done with Great Britain and Ireland by the whole of Nigeria are not available for demonstrating this, as no records of shipping and trade are available for the past years, owing to no returns having
been published by the Royal Niger Company; but when the returns for the past year are completed some figures showing such trade will be available. I estimate that the value of the trade of Nigeria with the United Kingdom is about four millions per annum, which in the course of the next ten years should increase enormously, probably to more than twice that amount if development anticipated in the territories occurs.

‘I submit that some definite scheme for the development of the territories should be determined on, in order that the work of the Administrations may be conducted on systematic lines, and also that there should be some definite understanding with regard to the method in which local revenues are to be applied, and provision made for such development and opening up of the territories.’

These, it seems to us, were far-reaching words, based on sound and practical premises, which in principle at all events, although not in detail, were in entire agreement with the policy of development advocated by Sir Frederick Lugard, that ought at least to have produced some good and practical effect. Yet the immediate effect resulted in a mere shuffling of the cards in the old official game of ‘circumbendibus.’ In other words, the Colonial Office referred the matter to the Crown Agents, who in their turn passed it on to the Consulting Engineers.

This was the initial stage. A scheme was then drawn up, or rather a professional opinion was drafted out by Messrs. Shelford and Son, which was forwarded to the Crown Agents, and submitted by them to the Colonial Office. This, again, was the R.S.V.P. stage, leading up to the reconsideration of its own proposition by the Colonial Office, and the sanction, not in any sense of the scheme or even any considerable portion of it, but of a Flying Survey regarding the most suitable route beyond Ibadan, and known as the Egbon-Jebba-Ilorin Survey.

It would, from our point of view, be a sheer waste of valuable time to enter into any details or otherwise over the belated and long-winded correspondence that extended over the next two years / or so. In Messrs. Shelford’s own words, ‘that these points’ (those under discussion) ‘will no doubt settle themselves by discussion in due course, the question at the present moment being rather the extension of the Lagos railway,’ the entire position is most picturesquely yet forcibly illuminated. ‘Discussion’ in fact is the corner stone and centre of the position; while the impression left with regard to that specific portion of it which is confined to the Colonial Office, the Crown Agents, and the Consulting Engineers, is one that is productive of reflection, but more so in the direction of those principles which are commonly defined as reflexion and reverberation.

It is not in the least surprising, therefore, that of the three Flying Surveys suggested by the Consulting Engineers early in 1902 – one and all of which were most essential, as an initial stage of the proceedings – the first-mentioned alone was sanctioned ... and did not commence its operations until October, 1903.
A few points, however, in this maze and tangle of words stand out with some prominence, and these are:— (1) That the extension of the Lagos railway was to be carried out as far as Oshogbo as soon as funds permitted. (2) That its objective was to be Kano and not Sokoto. (3) That in tropical and wooded countries, it was impossible to obtain the best line by any means other than that of approximation. This had been found to be the case with the other West African railways. Surveys had been begun by a reconnaissance or flying survey, and each successive survey, more elaborate than the last, had shown that further improvements were still possible before the best line through the country could be determined on. (4) That in Messrs. Shelfords' opinion a definite scheme of development must be deferred until decisive information had been obtained.

So that the conclusions they arrive at as a result of the report of Mr. Gee – the Chief Engineer who had been in charge of the Egbom-Jebba-Ilorin Survey, are as follow:—

'(1) Jebba is by far the best site for crossing the Niger by a bridge, from the point of view of economy in construction, but it is rather too far west of the straight line from Lagos to Kano, which would be the shortest route, giving the best result.

(2) The route from Ilorin to Jebba is practicable for a railway, put passes through barren country.

(3) If for these reasons Jebba is considered unsuitable Shonga appears to be the best place east of Jebba.

(4) Kaduna Mouth is believed to be an impossible site for a bridge.

(5) The route from Ilorin to Shonga is a 'trade route,' and is considered an easier road than that from Ilorin to Jebba. It has not been surveyed.

(6) A ferry could probably be worked across the Niger at almost any point, although in some cases it would be necessary to steam round islands in the river. A wire ropeway could be worked at Jebba with advantage during the construction of the line and until traffic developed.

(7) Considerable light has been thrown upon the problem of determining the route by which the Lagos railway should be extended beyond Oshogbo, and the best crossing of the Niger, but definite decision upon the matter is rendered impossible by the almost complete absence of reliable information with regard to the country north of the Niger.'

And added to this were these recommendations:—

'(1) From Wushishi as a centre to Zaria, or still better to Kano, by one or more alternative routes.

(2) From Wushishi as a centre to the Niger at:—

(a) Jebba.

(b) Shonga and thence to Ilorin.
(c) Kaduna Mouth, or any other point considered desirable.

‘By making Wushishi the centre and base of operations the routes to be surveyed are diminished in number and the difficulties of the survey parties would be greatly decreased.’

From this onward, as far as the Administrators are concerned with the correspondence, Sir Frederick Lugard has it all to himself. But many and valiant as are the efforts he made in endeavouring to impress upon the Colonial Office the urgency and expediency of building the railway, there is no visible turning in the official fane – no end in view; for, like a West African bush / path, it is too tortuous. So in sheer desperation he recommends the temporary construction of a line from Kano to the Niger, and not to the sea.

‘I submit,’ he says, ‘that on administrative, military, and commercial grounds, the necessity of this line is most urgent [the italics are his own] and that its construction should be undertaken quite independent of the Lagos railway’ – and then he proceeds to explain his reasons for such urgency on the four following substantial grounds of (a) commerce; (b) policy; (c) strategy; (d) finance: with a greater knowledge of the situation, and a modification of his earlier views, but laying, it seems to us, greater stress on the danger of French competition, consequently on the advantage of being in front of them by the construction of a light surface railway, than on the financial and commercial side.

One thing, however, that is most obvious all through his effusions, is the thorough earnestness and sincerity of the man as a unit of a great Empire; also of the Ego, as one of the administrative units who is helping to shape the destinies of one of its many portions. And this is a spirit, whether we be in accord with his views or not, that we cannot but be in sympathy with. No matter how much sounder and more substantial are the calm and studied methods of mathematical calculation and accuracy, sincerity is a quality so rare in these days of over-haste and rapidity, that apart from the exhilaration of its infection, we hail it as a most essential factor in the policy of all true development and extension.

Yet, ably backed up as Sir Frederick Lugard was by Mr. Eaglesome, his own Director of Public Works, an engineer of considerable Indian experience; the Consulting Engineers – now supplemented by the accession to their firm of Sir Benjamin Baker – were altogether opposed to the construction of a light surface railway. This, too, is all the more significant, because the conclusions reached by Mr. J. D. Weir – the Engineer who / had charge of the Baro-Kano survey, 1903–4 – were in some measure in accord with the alternative scheme put forward by Sir F.I.ard, and different to those of Messrs. Baker and Shelford, which of course were not only based on this report, but also on the experience of some of the greatest railway experts in other parts of the world.
It will be as well, however, to first of all study the objects of this survey, as described in the instructions issued to Mr. Weir by the Consulting Engineers. These were:—

‘(a) To determine whether Baro is suitable for adoption as a port and terminus of a railway to Bida, Zungeru, and the northern portion of Northern Nigeria.

‘(b) To ascertain whether it would be possible to construct a bridge across the Niger at that place, and to obtain information from which an approximate estimate of the cost could be made.

‘(c) To survey the route of a light railway between Baro and Wushishi via Bida.

‘(d) To determine by flying surveys the best route to be followed by a railway from Wushishi to Zaria, and to make a more detailed survey of the route so selected.

‘(e) To ascertain the routes by which trade is at present carried on, and which might become feeders to the railway or maintain competition with it.

‘(f) To report on the navigability and seasonal rise and fall of the Niger.

‘(g) To make enquiries with regard to the possibility and comparative advantages of a route between Jebba and, say, Gwari, through the Kontagora country.

‘(h) If time permitted, to make a flying survey to Kano.’

Having completed his survey, and after careful consideration of the data which he obtained by personal observation and from various sources, Mr. Weir was led to the following conclusions:—

‘(1) A light narrow gauge railway, such as advocated by the High Commissioner, would meet the immediate requirements of the Administration, and be sufficient for the existing traffic. /

‘(2) Baro would be a good starting point from the Niger for such a line, if no suitable terminus can be found between the mouth of the Bako and that of the Kaduna.

‘(3) The limitations imposed by a railway of so light a type, and by the difficulties of navigation above Lokoja during two months of the year, would not permit of the development of the country to the full extent of which it is capable.

‘(4) A bridge over the Niger to connect Baro with the Lagos railway system would be practicable but costly.

‘(5) No great development of industry and trade need be looked for unless transport facilities are provided by the construction of a railway.

‘(6) Such development is likely to become more difficult the longer the construction of the railway is postponed.’
The Right Railway System and the Best Outlets for Nigeria

It is needless once more for us to investigate the details of the report submitted by the Consulting Engineers to the Crown Agents on 28th February, 1905, a summary of which is quite sufficient for our purpose.

‘(1) The immediate construction of a railway from the Niger to Kano is essential to the agricultural and commercial development of Northern Nigeria, and would enable the Government to reduce the cost of administration while increasing its efficiency.

‘(2) The conditions of navigation of the Niger at and above Baro, although inadequate for the traffic which is ultimately to be expected, are sufficient to justify the selection of a port in that neighbourhood as the present starting point of the railway, and a material saving in first cost will be effected if a suitable site for this port can be found north of the confluence of the Bako with the Niger.

‘(3) In view of the probable rapid development of traffic from the large area to be served by the railway, and the necessity for its ultimate extension to the sea, either by linking up with the Lagos railway system or independently, the line should be constructed upon the 3 ft. 6 in. gauge.

‘(4) A line on the 3 ft. 6 in. gauge, to the Lagos standard, with rolling stock and provision for working stores and capital would cost £2,300,000; and there is every prospect that within a very short period of its completion, the net earnings would be sufficient to meet the capital charges on this amount. /

‘(5) A temporary light line on the 2 ft. 6 in. gauge, although effecting a saving in first cost, cannot be recommended.

‘(6) A line on the 3 ft. 6 in. gauge, of a lighter type than the Lagos standard, would effect a saving of £300,000 in first cost, but we do not recommend it unless the saving of this amount is considered to be of extreme importance.’

This, as usual, was followed up by the Crown Agents forwarding this report on 19th April, with some remarks thereon of their own, to the Colonial Office. Some of these, pertinent as they are with respect to the solid and immovable principles of circumlocution, therefore indicative at least of the present fate of the great issue, are worth reading. One extract will suffice:–

‘Much, therefore, as we should like to see a railway in Northern Nigeria started at the earliest possible moment, we cannot arrive at any other opinion than that under existing conditions, and with the small amount of information at present in the possession of the Government, it would be disastrous to fetter the future by taking any precipitate action. It appears to us that the proper course would be the despatch of further reconnaissance survey parties to collect all the possible information, and so enable the Secretary of State to decide on the
route to be adopted, before any construction work is taken in hand. If this course of action should approve itself to the Secretary of State we would suggest that the further examination of the country should be systematically taken in hand, bearing in mind that what is really required is information sufficient to enable a broad and general policy to be laid down for future railway construction in Nigeria. A general scheme of this kind, it will be remembered, was tentatively laid down in 1900 in regard to the existing West African railways.’

Comment on our part is futile, for words such as these speak for themselves, as words of a mere connecting link in a system the various units of which dovetail one into the other.

But, as if taking them at their word, the great and important issue at stake has, until just the other day – 16th December – been allowed to have a well-earned rest. On that day, however, the question was once more reopened by Lord Elgin – the new Secretary of State for the Colonies – who addressed a despatch / to Sir Frederick Lugard, which, while pronouncing Messrs. Baker and Sheldford’s scheme of the broader gauge as definitely conclusive, also agreeing with it in principle, leaves the matter where it has so long been – in the pigeon-hole of consideration. And there we fear – much as we hope not – it will remain for another considerable period.

But under circumstances such as these, the only thing to do is to philosophise. Reflection and soliloquy are useless. According to the poet and philosopher – ‘everything comes to him who waits’ – even costly railway systems. But unfortunately for those who are really interested in Nigerian development, there is just the possibility that the wait may be a trifle too long and too late in this instance. And this is just where the rub of the whole question comes in.

We cannot, however, close this great volume of correspondence without a sigh and a pang – a sigh of vain regrets, and a pang of disappointment. Indeed, the futility and pathos of it all is too pathetic for words. For if it is true, according to the Aryan philosophy, that man was born to action, it is equally true, from the standpoint of Western practice, that action at times must be muzzled and reserved until it is required, or can make its own way. Which of these principles is right we will not pretend to argue. All we do say is that it is unfortunate so much valuable time has been spent, and, what is worse, to so little purpose beyond the accumulation of a large number of words. For important questions relative to political and commercial economy, we are told that time is, without doubt, the most valuable factor in existence and operation. More than this, that it is an irrecoverable quantity.

If this is the case – as from experience we believe it is – then we can say no more; we can but marvel at the utter incomprehensibility of it all.
Programme of Tour.

1. The principal objects of the tour were to ascertain the sections of the Niger navigable for steam-propelled vessels of any size, as compared with canoes controlled by paddles or poles. For this purpose, on the outward journey, visits were made to Bajibo, Wuru, and to Sekachi, where the northernmost of the series of
rapids is situated. The river was subsequently traversed from Sekachi to Gaya, the first French post over the frontier, situated on the left bank opposite the future terminus of the Dahomey Railway, and recently connected by telegraph with Northern Nigeria via Birnin Kebbi. On the return journey, Sokoto River was ascended as far as Kiende and Kurgu. In order to save time and acquire some knowledge of the country, the outward journey to Yelwa was made by land. There was no time to examine the country between Jebba and Yelwa from a railway point of view; so, as the existing maps are most unreliable, a carefully contoured reconnaissance at a scale of one inch to one mile was carried along the route followed. On the return journey a different road was followed for the greater part of the distance, the remainder of the return journey being made by canoe in order to save time, and seize this opportunity of traversing all the principal rapids, except Wuru, which was not yet passable. Four days were spent in studying the approaches to the Niger at and near Sekachi above the rapids. Every opportunity was taken of studying the existing and possible trade of the country, prices of commodities, and roads followed by the present trade, and I am indebted to Messrs. Clarke and Newton, Residents, Yelwa and Bussa, for valuable information in this respect. Special attention was paid to the question of possible competition by the French Dahomey Railway.

**IMPORTANT POINTS NOTED.**

2. The following points become evident as the result of my tour:—
   
   (a) The River Niger is unnavigable for steam vessels of any kind between Jebba and Sekachi.

   (b) The River Niger is navigable for steam vessels from Sekachi to the frontier, and certainly up to Gaya. Native canoeemen are unanimous in stating that vessels of at least 18 inches draught could work on this section at dead low water, and that vessels of 4 feet draught could run for a considerable portion of the year, and all my supplementary enquiries tended to indicate that this estimate was on the safe side. A few rocks, the approximate positions of which have been noted, would have to be buoyed, and in one or two instances it would be advisable to remove small rocks.

   (c) The distances by road or water from the Sokoto markets to a British Railway terminus at Sekachi, and the proposed French one at Gaya are for all practical purposes the same.

   (d) The principal existing export trade is in live stock, after which comes potash, after that again skins. The principal imports are kolas, cloth, and salt. Although a large number of traders use the Jebba route, the greater part of the Sokoto trade goes to Lagos by a road which closely follows the Dahomey frontier. At present all this trade goes to Lagos, but the
French are beginning to draw the local trade over the border near Okuta by establishing markets and taxing salt from Lagos, and they will doubtless make a bid for the through traffic when their railway reaches Paraku. At present our Western frontier can only be visited at rare intervals by the Resident, Bussa.

The whole of the South of Kontagora, and I am informed the whole of Borgu, is swarming with shea trees, though this year has been an exceptionally bad season, and there are believed to be a large number of trees in the South of Sokoto Province away from the swamps.

Cotton is freely grown in Kontagora, Borgu, and South Sokoto. It is sold in Yelwa market from 1.25d. to 625d. per lb., according to the season; the price on the 6th August, 1911, was 8d. Serikin Gomba sent a man to Kaoge to buy cotton in the open market, and he returned with rather more than 5 lbs. for 6d., and informed me that the price was unusually high. Samples of cotton from Yelwa, Kaoge, and Kiende have been brought done for examination. It is presumably possible to improve the quality of the cotton by selection of seed, but the figures are significant in view of the difficulty experienced by the British Cotton Growing Association in buying seed-cotton at 1d. per lb. in Kano and Zaria Provinces.

The Dahomey Railway is working to Savé, 160 miles from their port of Cotonou. The new 150-million franc French West African loan now under consideration provides for the extension of the line to Paraku, mile 274, and a branch thence to Djougou (Zugu). This place, which is situated on the West of Dahomey, must not be confused with the place of the same name between Nikki and Kandi on the East of Dahomey. The distance from Cotonou to Koki (opposite Gaya), the proposed terminus of the Dahomey Railway on the Niger, will be about 465 miles.

Recommendations.

3. The general scheme recommended divides itself into two stages. Firstly, the construction with the least possible delay of a 3 foot 6 inches line on the Baro-Kano Railway standard from Jebba, or near Jebba, to Sekachi, on the left bank of the Niger. The direct distance is about 125 miles, and a railway would probably be about 140 miles long. Without this link the commercial development of Sokoto and North Borgu is impossible, except by the French Railway when it is completed to the Niger. The opening of 140 miles of railway would also at once render available over 100 miles of navigable Niger, and also the Sokoto River, which is already regularly used by trade canoes to a comparatively small extent as far as Jega. It would also be a great stimulus to trade, owing to the reduced cost of transport, and we would at once be on practically even terms with the facilities
which could eventually be offered by the Dahomey Railway, and should have secured the bulk of the trade before the latter railway reaches the Niger.

The reasons for starting the line from Jebba are overwhelming, and will be submitted in the final report. It is possible that the question of diverting Kano and Zaria traffic from its natural route, via Baro, may be met by giving the Lagos Railway a legitimate sphere of development in Northern Nigeria.

It is recommended that a marine officer should visit the river between Sekachi and the frontier at dead low water, when he could ascertain definitely the minimum depth of channel on this section, and carry out the necessary removal of snags and rocks with a small party in one season. A small service of tugs and barges should be started as soon as the railway reaches Sekachi, and could be extended as trade develops. If this is not done, and native canoe transport is relied upon to feed the railway, not only will the development of trade be retarded, but the French Railway on arrival at Gaya might secure the trade by establishing a Marine Service.

As regards the chance of such a line paying, there is no doubt in my mind that it would pay its way within five years of the completion of construction, probably within three or four years, and should there be any chance of one of the large meat firms exploiting the cattle and sheep trade on a large scale, the prospects of the line would be correspondingly improved.

As a preliminary measure, it will be advisable to use the influence of Residents to divert the Sokoto traffic from following the road along the French frontier to the Yelwa-Jebba road, which it used to follow in the old days. It is also recommended, as suggested in the previous correspondence, that a steel canoe be allotted to the Resident, Sokoto, to facilitate the survey, clearing, and improvement of the navigation of the Sokoto River, to Jega and Sokoto. There is a large number of snags in the Sokoto River between Kiende and Gomba, and also probably above Kiende, which would have to be removed before the river could safely be used by steam vessels.

The second part of the scheme recommended is the eventual extension of the railway to Sokoto, via Jega. The Sokoto River is quite insufficient as the sole alternative to road transport for the commercial development of the most densely-populated portion of Sokoto Province, though it would be a useful feeder to a railway.

The engineering difficulties of the above proposals are not great, and will be dealt with in a final report [...]

H. O. MANCE,  
Captain, R.E.  
30th August, 1911.
Report.

General Remarks on Tour.

1. Previous correspondence on this subject will be found in M.P.s. 540/1902 and 5307/1907, the principal communications being the report by Lieutenant Gordon on a voyage by the French flotilla with Captain Lenfant from Fort Goldie to Ilo, October to November, 1901; a report by Mr. Gowers, Resident, Sokoto, on the development of water transport in the Sokoto Province; and a report by Mr. Dwyer, Resident, Baro, on the Niger from Bajibo to Ilo, with particulars of Sokoto trade.

2. In view of the altered complexion which a question involving so many factors might easily take at any moment of the investigation, an absolutely free hand was given to me during my recent tour.

3. The information contained in this report is compiled from the reports in the above-mentioned M.P.s, from information obtained during my tour, and from French Colonial papers. In cases where the information given below is at variance with previous reports every care was taken to verify the alteration. It is quite possible that some of the information of secondary importance obtained by hearsay may be inaccurate, as the time available did not admit in every case of the examination of independent witnesses, with a view to corroboration. The information is given in detail, with a view to facilitating any further enquiries which may be undertaken.

The River Niger and its Navigable Tributaries.

4. Jebba to Sekachi. – (a) The first rapids met with going north from Jebba are at the north end of the Island of Djekede, not far from Bajibo. They are classified as ‘lesser rapids’ by Lieutenant Gordon, and by Mr. Dwyer as being dangerous for heavily laden canoes in the low season. Mr. Watts, of the Niger Company, on two occasions several years ago took up a twin screw steamer drawing five feet to Leaba at the highest water. He considers it a risky procedure and states he was nearly wrecked at the Juju rock at Jebba near the existing wreck and that navigation for steam vessels is not safe above this latter point. At Bajibo a number of rocks are visible in the bed of the river at low water, and there would be considerable risk at Leaba from the rocks bordering the river and submerged during high water. Captain Lenfant,⁴ in his book ‘Le Niger,’ published 1903 (Hachette), reports difficulties all the way between Bajibo and Leaba and still greater ones between Leaba and Wuru.

(b) The next important rapids are those at Wuru. The many mishaps at this place are reflected in the local superstitions. At the worst part of the main rapid the river is about 60 yards broad, and the current at low water (July 12th) must
have been from 15 to 20 miles an hour between the rocks visible at intervals across this narrow waterway. The branch following the right bank was high and dry on the 12th July, 1911, and not deep enough for the passage of canoes on the 15th August. On the former date it had the appearance of a steep path about 20 feet wide bounded by rocks some 15 or 20 feet high with jagged tops. In the centre of this narrow channel are some sharp pointed rocks. The whole passage is covered at highest flood, when the river becomes nearly 600 yards broad, with thousands of sharp rocks at varying distances under the surface. It is not to be wondered at that in a falling river canoes are broken every year. Such few canoes as pass at low water are dismantled into their two component parts, carried round the rapids, and reassembled at the other end. On the 15th August two large trading canoes from Yelwa had arrived above the rapids, and the owners proposed to transfer the loads to other canoes below the rapids.

(c) From the above it was evident that the Niger must be regarded as absolutely unnavigable, except for canoes, between Jebba and some point above the rapids. It remained to be seen whether this point is at Bussa or Warra, or whether the two lesser rapids at Sulu and Sekachi, and a short length just below Yelwa, reported to be bad at low water, extend the unnavigable section. For this purpose, Sekachi rapids were traversed at low and medium water. For about six miles from Sekachi towards Yelwa all the river channels are crossed at intervals of from 100 to 400 yards by lines of rocks appearing at close intervals above the surface at low water. At this period there is only one safe channel for large canoes, which have to pass between the rocks of some of these bars in a skew-wise channel only 20 feet wide. There is plenty of depth of water, the shallowest sounding in the channel being over two feet, and large canoes can safely pass all the year round with ordinary care, though the current is swift in places. Under these circumstances, no steam-propelled boat, uncontrolled by poles or paddles, would survive more than a few weeks. The day before I arrived, three canoes with strangers attempted the wrong passage which they had previously traversed at another season of the year, and they were broken up.

It is significant that canoemen, when asked whether they considered the journey Gomba to Sekachi and back easier than Gomba to Karimama, all asked if I meant Yelwa or Sekachi, and stated if I meant Sekachi the former would be the preferable journey.

(d) Between Yelwa and Bussa there is an awkward place at the Sulu rapid where there was a clear drop of about 18 inches on August 12th, and the canoemen insisted on lightening the canoes. The river is crowded with rocks between Warra and Bussa, resulting, I am informed, in occasional accidents.

(e) The Malali and Patashi Rapids between Bussa and Wuru are both difficult for canoes to navigate, and on August 14th necessitated long portages to
lighten the canoes. Between these rapids the river abounds with rocks. It is not necessary to enter into a further description of this part of the river.

(f) It would be possible at high water to send up a steel canoe right past the rapids – one has already been employed in the past at Yelwa. With expert supervision it might be possible to transfer a sternwheeler canoe of the ‘Swan’ type past the rapids if desired.

(g) It is hopeless to think of improving the navigation of the river on this section, and a fundamental necessity in any scheme for the economic development of Sokoto and the north of Kontagora and Borgu is a branch line from the existing railway system to a point above the Sekachi Rapids.

5. Sekachi to Gaya. – (a) From Sekachi to Ilo, about 90 miles, the channel is from 300 to 800 yards broad, but the river floods its left bank for a considerable distance at high water, when, I am informed, it is, in places, over 3 miles broad. A low range of hills from 60 to 100 feet in height follows the right bank, now defining the river by a precipitous slope, now retreating a few miles behind a tract of swamp. Along the right bank the water was frequently beyond the depth of the longest canoe pole and, as a general rule, the main difficulty of the canoemen was to get a satisfactory purchase for their poles. Native observation of depths beyond that necessary for the largest canoes (up to 18 inches) is unreliable, but the canoemen were unanimous in stating that a draught of 18 inches was available from Sekachi to Karimama at the lowest water and that the ‘Empire’ (drawing about four feet) could get to Ilo easily at high water. Surugu was mentioned as the shallowest place up to Gomba, and possible bars were noticed between Lafagu and Kawachi, between the River Kwa and Garawassu, and a few miles south of Gaya. All my supplementary enquiries tended to indicate that this estimate was on the safe side, and that at a time when the water had not risen 25 per cent. (24th to 31st July) there was a draught of at least four feet right up to Ilo, if not to Gaya. There exist obstacles, however, in the shape of occasional rocks between Jebe and Baterratere, between Kwunje and Maie, at Gendenni and Giri, and between Garu and Gaya ( [...] ). Most of these rocks can easily be avoided if buoyed, but in a few cases a line of rocks extends across, or nearly across, the river, and the best channel is a narrow one at low water. I am of the opinion that all these rocks could be made safe for stern wheelers in the course of a single season by one buoying and blasting party. There is plenty of depth between the rocks, but the removal of a few small rocks would afford a straighter channel. There are a few dangerous snags on this section [...] . These would not take long to remove. Canoemen assert the river is as deep above Gomba as below. An ordinary canoe can go from Sekachi to Giri (Ilo) in six or seven days. By having / extra canoemen it is possible to do this journey comfortably in five days,
halting at Gunugu, Ganti n Fadama, Tungan Gomba, and Yantilla, and to reach Gaya in two days more, halting at or opposite Madekali.

6. **Gaya to Ansongo.**—Canoe men assert that the largest canoe fully laden can always reach Karimama, but the Commandant, Gaya, states that there is a sand bar at Tara, a few miles above Gaya, which is only about nine inches deep at the lowest water. There appear to be other bars, but no dangerous rocks below Kompa. Above Kompa to Ansongo the river is navigable for poling canoes and barges drawing from 14 to 16 inches for the whole year, excepting a period of one month to six weeks at dead low water, when the rocks are dangerous. Lenfant was held up in this way during June and July. During ordinary low water there is always a chance of a puncture of the steel canoes and barges employed, but no personal risk. The principal rocky sections are Kompa to Kirtashi, Jirafi-eri to Fort Achinar, Bobo, Farka to Ayoru; and the worst rapids are Labezenga, where they become falls at low water and are difficult to negotiate. At Ansongo the last of the rapids is passed and this place is accessible from above by boats drawing three feet from September to early April, by boats carrying 20 tons and capable of towing 40 tons of cargo up to the end of April, and by boats drawing 16 inches and capable of carrying 3,000 lbs. of cargo in addition to coal and two passengers up to the end of May. It is not proposed, however, to use the first type of boat between Kabara (Port of Timbuctoo) and Ansongo. From Ansongo to the next rocky section of the Niger, namely, Koulikoro, the terminus of the railway from Kayes on the Senegal River, there is a navigable section of 1,400 kilometres (about 900 miles).

7. **Rise of Niger.**—At Gaya there are two floods. The first, reaching its highest at the end of August (though late this year), is due to comparatively local rains. The second, arriving at the end of November and lasting till the end of February, is due to the tardy arrival of rains from French Guinea. I was informed at Gaya that the latter rise is the highest and amounts to just under 4 metres (13 feet), being about one metre higher than the first flood. Captain Lenfant, however, reports that in 1901 the peak of the first flood at Gaya touched 4 1/3 metres, while the second flood was highest at only 3 1/3 metres at the end of February. At Gomba I was informed that the high water usually lasted from the end of August to December and January. By this time the river has flooded its banks, and a three-feet rise at Gaya would probably produce an imperceptible increase in depth over so large a breadth.

Repeated enquiries were made regarding the total rise of the Niger between low and high water, and the results set forth below are fairly consistent:

<table>
<thead>
<tr>
<th>Place</th>
<th>Rise</th>
</tr>
</thead>
<tbody>
<tr>
<td>Gaya</td>
<td>13 feet.</td>
</tr>
<tr>
<td>Lafagu</td>
<td>14 feet.</td>
</tr>
<tr>
<td>Ganti</td>
<td>9 feet.</td>
</tr>
<tr>
<td>Sekachi</td>
<td>9 feet.</td>
</tr>
</tbody>
</table>
Tillo 10 feet.
Yelwa 12 to 13 feet.
Wuru 40 to 45 feet.
Leaba 45 feet.
Bajibo 20 to 28 feet (Captain Lenfant reports 23 feet).

The small rise at Sekachi may be due to the comparatively rapid descent just below. This is an important fact in any scheme for approaching the river above the rapids.

8. Sokoto River. — The Sokoto River is open for about 60 miles to Bunza, whence the Gulbin Gindi is open for some 30 miles to Jega for small canoes all the year round and for large canoes July to February. The Sokoto River, which was ascended by me as far as Kurig, is plentifully sprinkled with snags, many of them big ones. They are, presumably, the accumulation of a large number of years, and though they do not interfere with the passage of canoes, the fact that they were sometimes unexpectedly encountered below the surface emphasises the necessity for clearing the snags before risking a steam vessel on the river. This operation would take some time and trouble, but once done it seems probable that the number of snags to be removed annually would be insignificant. The Sokoto River is about 60 yards wide between its banks, which are in many places flooded at high water. Up to Kiende there appeared to be a four-feet channel the first week in August. The frequent turns in the river and its swift current make it probably unsuitable for our present tugs towing barges or for larger vessels than the ‘Kampala.’

From Bunza the Sokoto River is blocked by swamps to Argungu, whence there is a clear channel to Sokoto. After clearing operations carried out by natives a trading canoe reached Sokoto at the end of February, 1904. The section, Ambrusa to Argungu, appears to be better than the section below Ambrusa, where the depth of channel was stated in July, 1905, to be insufficient for a Nupe canoe (the largest size used) although the grass had been cleared throughout Gando and Argungu. It was thought, however, that during September and October, the height of the flood season, the work done would allow canoes up to Sokoto. I am informed that at the height of the dry season the Sokoto River can be crossed dry shod near Birnin Kebbi. It seems evident that the best that could be hoped for as a result of a moderate expenditure is a channel to Sokoto suitable for steam vessels of the ‘Swan’ type for not exceeding six months in the year. Clearing the snags would apparently afford a channel for steam canoes up to Jega for at least six months in the year, but this point has not been verified. It has also been suggested by Major Burdon that clearing the channel would restore to the land its natural drainage system, and help to counteract the advance of the desert.

9. Shada River. — As it was understood that the Shada River is navigable for a considerable distance, enquiries were made, from which it appears that canoes can proceed up this river for about six hours, when they arrive at a ‘kurimi’ (for-
est swamp) blocked with snags, which prevent further progress even at high water. The river is not used at all by traders.

The rivers Sota and Alibori, in Dahomey, are navigable for several miles at high water, but, I am given to understand, not to any useful extent.

Notes on the Trade of Sokoto, Borgu, and Kontagora Provinces.

10. From old caravan toll receipts at Ilesha and Ilo Mr. Dwyer estimates that the trade then passing through from Sokoto to the coast amounted to £52,800 per annum, excluding salt, sylvan produce, and food-stuffs.

The ‘down’ trade taxed consisted chiefly of live-stock, leather work, native hats, and mats. The ‘up’ trade was chiefly kolas, cloth, with a few sundries, such as perfumes, looking glasses, beads, &c. Salt was an important item of the ‘up’ trade. Mr. Dwyer considers that greater transport facilities would enormously develop this trade, and in addition that sylvan5 products, more particularly shea nuts and shea butter, would be exported, and that large quantities of cotton would be obtained from the Kontagora Province. Mr. Gowers, Resident, Sokoto, states that the population which would benefit by improved transport facilities between Sokoto and the Lower Niger would be not less than 1,000,000. Mr. Birtwistle, Commercial Intelligence Officer, Southern Nigeria, reported in April, 1907, that he considered a large increase in trade would soon be seen from Borgu and Kontagora with cheap transport. He stated that the main wealth of Sokoto lies in the raising of cattle, which helps to supply the Lagos and Southern Nigerian markets.

11. Present External Trade. – From the above and from my own enquiries the existing external trade of these provinces appears to be as follows:–

(a) Riverain Kontagora.

Down. – Cattle to Ilorin and Lagos. Not in very large quantities.

Shea butter. This is prepared by the women for sale to the Niger Company from villages up to about Momaji. It used to be sent down to Jebba, but in future a good deal of it will go to the new Niger Company’s station at Leaba, where the nearer villages already bring in quantities of shea nuts as well as butter.

Up. – Cloth, salt, kolas, and the usual sundries.

(b) Sokoto, with Lagos and Southern Nigerian markets.

Down. – Cattle, sheep and goats, potash, skins and leather work, hats, onions and onion leaves.

Up. – Cloth, kolas, salt, cigarettes, sugar, matches, beads, and other sundries, and certain native food-stuffs which appear to grow only near the coast (kimber, yaji, &c.).
With the Gold Coast (Salaga).
Down. – Potash, skins, onions and onion leaves, and a little native salt.
Up. – Kolas.
Down. – Potash, skins, and a few cattle.
Up. – Kolas and a little salt. I was informed that imported salt was practically all obtained at Lagos.

(c) Territoire Militaire.
Down. – Cattle to Lagos and Ilorin.
Up. – Cloth and kolas. It appears that the road to Cotonou is much infested with tsetse, a disadvantage which will be overcome by the extension of the Dahomey Railway.
In all the above cases cattle are taken down from starting point to destination by the same man, and do not change hands at intermediate markets.

As regards development under improved conditions of transport.

12. Cattle. – The stimulus of trade and increased prosperity of the country is bound to increase the local demand as well as the demand on the coast. It is not likely that the cattle trade as now organised will be carried on by a mixed system of road and rail transport, or road, water, and rail transport, unless the road journey involves heavy fatalities (about which I could obtain no reliable information), or unless the rail transport brings the animals into the market in such an improved condition as to realise a higher price towards covering the freight. These conditions might easily operate during the rainy season and, possibly, throughout the year. It is possible, however, that native, or even European traders from the coast, with capital, may endeavour to carry on a trade in cattle on a larger scale, and to such a quicker turnover would be of importance, while the fact of handling large consignments in full truckloads, and eventually trainloads, would justify low railway rates. In this case the cattle trade might afford a valuable contribution to the revenue of any transport undertaking. It is worth going a step further and enquiring into the possibility of developing an export trade in cattle to other west coast markets or to England. Any such development would probably be best effected by one of the large firms dealing with the cattle and meat trade in other parts of the world, as, in their case, it would not be necessary to irretrievably embark so much capital in a new venture. As a preliminary measure the Administration would be asked to furnish fairly reliable figures as to the number of cattle in the country, with the annual output of saleable oxen likely to be available. From information in past official reports there would appear to be at least 600,000 to 800,000 cattle in Northern Nigeria, more probably from 1 to 1 1/2 millions, with an annual recorded export to the coast of some 15,000
head; according to a French official estimate the number of cattle in the Territoire Militaire du Niger is 250,000. Enquiries would also doubtless be made as to whether the country has been subjected to ravages, like the rinderpest in South Africa, which might diminish the supply and prospective increase. Steps would also have to be taken to improve the quality of the cattle, and, in view of the great importance of this question, it would appear advisable, if not already done, to obtain and act on expert advice as to the best method of carrying this out. Even now it is possible that the low price of cattle – 35s. for the largest size animal at Kano, and about £3 between Yelwa and Ilo – and the large existing and prospective markets may disclose a margin of profit sufficient to encourage an endeavour to start and develop this trade on a large scale. For the frozen meat trade, it is understood that the usual practice is to slaughter the cattle as near as possible to the point of shipment, but the possibility of establishing refrigerators up-country and sending the meat down in cold storage vehicles should be borne in mind. It is not impossible that a start would be made with tinned instead of frozen meat in view of the smaller capital outlay. In any case, however, a proportion of live cattle will always be required to supply the Mohammedan market. I regret I have not sufficient data on this point to hazard a guess as to whether there is any chance of competing with the other existing sources of supply. Among these may be mentioned the extensive trade in jerked beef between Argentine and Lagos and other west coast markets. The above suggestions, which apply to Kano as well as to Sokoto, are submitted as a basis for enquiry. Large herds of cattle were passed on nearly every sand-bank between Yelwa and Gaya. It appears that they are herded on these banks during the dry season and driven daily to the dried-up swamps to feed. Every sand-bank is covered with cow dung, which would afford valuable manure and could easily be collected by canoe, but which is allowed to be washed away every year by the river, at high water. / 

13. Sheep and Goats. – It is doubtful whether the sheep of Northern Nigeria are large enough for export, but there is a heavy demand for them on the coast, and if carried in bulk the traffic is likely to be more remunerative to a railway than the carriage of cattle.

14. Skins. The increased local consumption of meat, already noticeable in the Kano Province, and the extinction of the desert trade will doubtless effect an appreciable increase in the quantity of skins available for export, and it should be possible, with improved transport facilities, to divert the trade with the Gold Coast via Lagos and Sekondi. There is an unlimited demand in the European and American markets for hides and skins, on the general question of which it is hoped to shortly submit a separate report. The construction of the Baro-Kano Railway has already resulted in an ever-increasing trade in raw hides.

15. Potash. – This will doubtless be sent down by the improved communications, and the trade, which is a local one with Southern Nigeria, is likely to
increase. The overland potash trade with the Gold Coast will follow the route to which the kolas are attracted.

16. **Shea.** – Shea trees are very plentiful between Jebba and Yelwa. Mr. Dwyer states they abound all over Kontagora. Beyond Yelwa I was informed everywhere that there were many shea trees, except close along the banks of the river, and that this rich belt extended into French territory. Shea butter is made everywhere for local requirements, and I frequently saw the nuts laid out to dry prior to decortication. There was, however, absolute unanimity in reporting a very bad season this year in riverain Kontagora, Borgu, and Sokoto. Near Ibo I was informed that this was the third bad year in succession. In Kontagora and Sokoto last year was a good season. It may be mentioned that last year was a bad season for shea along the Baro-Kano Railway, whereas this year is believed to be a particularly good one. Enquiries in Borgu and Sokoto provinces elicited the unanimous information that the shea flowers were destroyed by a large fly, called ‘Kurungu’ at Ilo, or ‘Besunu’ at Kiende, and which is about as large as a locust, black in colour, and feeds by night. At Kiende I was informed that these insects arrived in large numbers from the direction of Yelwa, and appeared to be migrating. The visitation lasts about one month, and presumably takes place about January, when the shea is in flower. It was expressly stated that the fly is not the same as the white fly – presumably the locust – which sometimes arrives in clouds, and eats the corn, but which they had not seen for several years. At Kiende I was informed that this year was the first time for six years that the shea had been attacked by fly, but at Ilo and Sabongari it was stated that the fly was the cause of the three bad seasons. Anything which affects the output of shea is of the highest importance to Northern Nigeria, and it is suggested that specimens of the insect referred to above should be collected next season for submission to experts. In a good or average year the quantity of shea available for exportation will constitute an important source of revenue to any scheme for improving communications. The price of shea butter in Yelwa market varies from 1d. to 1 1/2d. per lb., and of shea nuts from 1/5th to 2/5ths of 1d. per lb. Shea butter fetches about the same price as palm oil on the European markets (£28 to £32 at the present time). The shea nuts now exported are mostly disposed of privately on the Continent, and the present low official price of £10 to £11 10s. per ton will improve when a regular supply comes on the open market.

17. **Cotton.** – Mr. Dwyer described in his report how an attempt to develop the cotton trade by establishing markets at Yelwa and Warra failed solely through lack of cheap transport. Resident, Yelwa, states that with improved transport he considers that cotton would be the staple export from the north of Kontagora. The price in Yelwa market varies from .625 to 1.25 pence per lb., the price on the 5th August being .8 pence per lb. At Gomba 5 1/2 lbs. of Borgu cotton from Kaoge market was bought for 6d., and I was told the price was unusually high.
This cotton is grown round Kalli and Bani, and the whole of the quantity now produced is sold in the local markets. I was unable to obtain particulars during my brief visit regarding the area likely to be available for the cultivation of cotton in Borgu and Sokoto. Small samples of Kontagora, Sokoto, and Borgu cotton were brought down and submitted to the British Cotton Growing Association, copies of whose reports are attached (Annexure 2). It therefore appears that cotton is already profitably grown at a price of less than the 1d. per lb. which the British Cotton Growing Association offer at their buying stations, and this is a more favourable state of affairs than in Kano and Zaria, where the British Cotton Growing Association were faced by a far higher ruling price. / 

_Ground-nuts_ are not largely grown in the neighbourhood of the river, but would probably flourish wherever the shea tree is found.

18. _Gum and beeswax_—Gum is reported in large quantities all over Borgu. It is not known whether the trees are plentiful in Sokoto, though this appears probable in view of the expected importance of the commodity along the Baro-Kano Railway in Kano and Zaria Provinces. The constant demand in European markets and the high prices obtainable are bound to develop the trade in beeswax in any part of Northern Nigeria where transport facilities are available.

19. _Capsicums and peppers_ would doubtless find an outlet on a smaller scale. They are to be seen in every local market.

As regards imports:—

20. _Kolas_.—Apart from the increase in this trade, which is bound to result from cheaper transport, it seems highly probable that the large caravans proceeding direct from Ilo to Salaga, in the Gold Coast, a journey of at least 50 days each way, will be diverted either via Lagos or via Cotonou.

21. _Salt_.—Native salt is produced all along the Dallum Mauri, bordering the western frontier of Northern Nigeria, north of the Niger. It is turned out in double-ended cones about two feet long and four inches diameter, or else sold in small baskets varying in size down to one foot long and 1 1/2 inches diameter. This salt was met with as far south as Yelwa, though imported salt is chiefly sold at the latter place. It is found in all the markets along the river nearer the frontier, but is not taken south in large quantities. A statement of the market price of this salt at the principal centres in the Sokoto Province will be necessary before estimating its possible displacement by imported salt. The latter could be delivered at Jega by rail from Lagos at approximately the following cost per ton:—

<table>
<thead>
<tr>
<th>Description</th>
<th>Cost (in English)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cost in England</td>
<td>£2 0 0</td>
</tr>
<tr>
<td>Freight</td>
<td>1 0 0</td>
</tr>
<tr>
<td>Duty</td>
<td>2 0 0</td>
</tr>
<tr>
<td>Railway</td>
<td>4 0 0</td>
</tr>
<tr>
<td><strong>Total</strong></td>
<td><strong>£9 0 0</strong></td>
</tr>
</tbody>
</table>

At equal prices the European salt is preferred.
22. **Imported cotton goods.** – This, in the absence of gin, will always remain the most important item. Its extent will be governed primarily by the development of the export trade, and to a far lesser extent by the ability of imported cotton goods to compete with the native product. European firms have not yet been able to produce an article of equal quality and durability as the native cloth at the same price, consequently the native cloth industry is in no immediate danger, and may even receive an impetus with increased prosperity. It is not impossible that there may be a demand in Europe for certain lines.

23. **Miscellaneous.** – Sugar, and articles such as cigarettes, matches, beads, looking glasses, &c., would doubtless share the general advance. Corrugated iron and kerosene already find a ready sale in Southern Nigeria, and doubtless with improved communications the market would be extended to Northern Nigeria.

Attached is a copy of a list prepared by Resident, Yelwa, showing the prices prevailing in Yelwa market. (Annexure 3.)

24. **Coinage.** – At Giri, and also at other places visited by me along the river, the subsidiary coinage, and especially the tenths, has not yet attained the same popularity as in the Nupe, Zaria, and Kano Provinces, but no difficulty was met with. The rate of exchange appears to be 2,000 cowries to the shilling.

**Trade routes.**

25. The routes followed by the existing trade are of importance. It is sufficient to consider the more important routes from Sokoto Province to Lagos, Salaga (Gold Coast) and Cotonou (Dahomey). They all appear to converge at Jega, five days by road from Sokoto [...].

26. **Routes to and from Lagos.** – (a) Via Kaura Aliwanta, Giro, Kwaiifa, across the River Gulbin Ka, Cherubi Kongwai, *Kiende*, Marati, Besse, across the River Gia, Zuguntenne, Shanga, Gangwo, across the River Dan Zaki, Sowashi, Funfundeji, across the River Kundu, Tandi, Yelwa, Likofe, N’Gashki, and so towards Jebba. During the dry season the road followed varies as below:–

Besse, Boma, across Gulbin Gia, Gonangwanda, Dugaraha, across the River Dan Zaki, Tsafonderu (Dugutufo), Funundeji. /

In the height of the rains the road sometimes followed goes via Sowashi, Bakin Toro, across River Kundu, Gulungu, Tungan Bawa, Tandi.

The road from Kwaiita to Kiende is said to be swampy in the height of the rains, but is passable all the year round, – cattle being swum across where necessary.

(b) A comparatively small number of traders, mostly dealing in imported salt, which practically all comes via Jebba, use the river all or part of the way from Jebba to Jega during high water. It takes three days to go by road from Kiende to Jega, and thirteen days by canoe. The river above Sekachi is used for local trade in native salt, calabashes, and fish.
(c) Jega, via Kaura Alikanta, Kiende, Lela, Tuga, across the Niger to Gendenni, Kaoge, Konkwesso, Yangbassa (also called Yerima Gwazo), Masaka, Dekala (also called Karofi), across the River Gulbin Darina (called Oli in 1909 [...]), Giddan Doruma, Bote, Yashikira, Guri, Sua, Borai, Okuta (also called Duchì), Ilesha, Dan Sani Meja (Mojo?), Shaki, Iseyin, Abeokuta, Lagos. Time taken Gendenni to Lagos about 35 days.

There is an alternative less important road via Kaiama. Traders by these roads do not use the Sokoto River. The cattle are swum across the River Niger at Gendenni. The trade by this route is chiefly cattle and sheep, the return loads containing cloth and kolas. Further particulars were not available, as the Sokoto traders do not undo their loads at Gendenni.

From Kiende to Tuga is very swampy in the rains, but the road is used all the year round. Traders state that from Tuga to Tungan Gado the swamps are up to one foot in depth in the dry season, and up to five feet deep in the rains; that there are frequent swamps between Tungan Gado and Lela; that between Lela and Ruan Duchi there is one large swamp accessible by canoes in the rains, and between Ruan Duchi and Kiende there is a swamp impassable during high flood, and traders have to go a long way round via Marati. [...]

(d) A small number of traders branch off from Giro via Dakingari, Algernia, Sabongari to Ilo, or via Bunza, Kangakoe and Giri to Ilo. The Ilo market (Mondays and Fridays) is chiefly for Salaga trade and for the small Cotonou trade. Traders for Lagos proceeding via Ilo follow the road Kalli, Samia, then into French territory to Daku, Segbana, Kankali, Kiouré, Naganzi (also called Giddan Lalli) then back again into Nigeria to Yangbassa (also called Yerima Gwazo) and thence as per '(c).' It takes about 37 days from Ilo to Lagos.

27. At Giri, the river port of Ilo (which is four miles from the river) for traffic from the Kangakoe District and for Salaga, there is a swamp between the river and the village. For some fifty yards it is about three feet deep at low water. No effort is made to provide a canoe, and everybody seems to take it as a matter of course to walk through the water, which, on August 1st, was up to the chins of the women who went to sell food to the canoemen. A bank two feet high and about 100 yards long through the shallow part of the swamp, and a canoe at the deep place would seem worth while arranging for in view of the inevitable growing competition of Gaya as a market. At high water canoes can go up the Iloguru River and over the swamp to firm ground at Giri. Ilo is a Customs station in charge of a native clerk, who, however, had gone away with the Resident a few days before my arrival.

28. Mr. Dwyer reports ‘the original trade route between Lagos and Jega markets was Bahindi, Yelwa, N’Gashki and Warra. At Warra the caravans would split up and some go south via Auna, while others crossed the river and went to Lagos territory via Bussa, Wawa, Kaiama, and Ilesha. The road, Bahindi to
Yelwa, was made impracticable by the attacks which Serikin Faiki and Serikin Keli made on caravans, and also to a small extent by the attacks of Kontagora and Legau. If the traders escaped one they usually fell into the hands of the other. By degrees the traders began to cross the river to Sabongari, and go to Lagos via Kaoge, Yangbassa, Kaiama, and Ilesha. This road was changed by the action of the Officer Commanding Troops, Yashikira, before the Government of Northern Nigeria was formed. The Officer Commanding diverted the traders to the road Yangbassa, Yashikira, Boria, Okuta, Ilesha.'

There seems no doubt from all enquiries that large as the present trade via Yelwa is, a greater quantity still goes down along the Dahomey frontier by route c, i.e., via Tuga, Gendenni, Kaoge, Yashikira.

29. Trade Road to Cotonou and also to Salaga. – Owing to tsetse very little trade from Sokoto appears to go to Cotonou, and most of the cattle and sheep from the north of Dahomey and from the Territoire Militaire appear to go at present to the Southern Nigerian markets. Owing to there being two important places called Zugu (French, Zougou), and also Kandi (French, Kouande), and also because the local names differ from the names given to places by traders (see Route (c) above), it is not easy to follow the routes described by traders. With the assistance of the latest French map, it is evident that the road to Salaga goes through the eastern Kandi and on via the western Zugu. The following is the wet season road to Kandi from Ilo:— Ilo, Madekali, Garu, Monkassa, Kuberi (Goubéri), Faiki (Férékire), Guéné, Gungun (Goungoun), Chefu, Tioka, Touy, Peredi, Gala, Kandi. In the dry season there is a direct road from Ilo via Bani, Gulubi, Janrua, Koncheraga, to Kandi. This road is said to be rendered impassable in the rains by continuous swamps and one big river.

After passing Kandi traders for the Gold Coast proceed as follows:— Giddan Magigia, Bagou, Irira Gandu(?), Sinendé, Baku, Makuru, Kua, Zougou, Dan Zougou, Yendi (Togoland), Kobia, Salaga (also called Gonda or Gwonga(?)), and also to markets at Yagi and Parre, both in the Gold Coast. It takes fifty days from Ilo to Salaga, and seven days on to Chibabo (?) (untraceable on maps) where the kolas are said to grow. Some of the traders go on to Coomassie. There is evidently a large trade done by this route, and it is an important question whether it can be diverted to British channels of communication.

There is a more direct road [...] from Jega to Salaga via Bunza, Fingila, Dolé, or Gaya. It is understood that in the dry season there is a shortage of water along this route, the importance of which will be again referred to.

Information bearing on possible French trade competition.

30. The Dahomey Railway is open for traffic to Savé, 260 kilometres (162 miles) from the port of Cotonou, and from this point there has recently been constructed a good motor road to Guéné and thence to Karimama with a branch to Gaya. Two important bridges over the Sota and Alibori rivers and several
minor bridges and culverts are said to be solely constructed out of local material. The distance from Savé to Karimama is 510 kilometres – 320 miles. The distance from Savé to Gaya is about 300 miles, making about 465 miles Cotonou to Gaya. At present it takes twenty days to trek from Savé to Gaya. Carriers on this section cost one franc per day’s march on the outward journey and twenty centimes per day for the return journey light.

31. Since his recent tour through French Guinea, Haut-Sénégal-et-Niger, Dahomey, and the Ivory Coast, M. Ponty, Governor-General of French West Africa, has foreshadowed a comprehensive scheme for linking up the Colonies of French West Africa by a system of railways, the completion of which is estimated to cost 480,000,000 francs in addition to expenditure already authorised. [...] A loan of 150,000,000 francs is to be raised forthwith and will be devoted to completing the sections shown in red. From the above it will be seen: Firstly, that there will eventually be a line from Cotonou to Koki, or rather to the right bank of the River Niger at a point two miles north of Gaya and which will be referred to as Gaya in this report. Secondly, that the extension of the Dahomey Railway from Savé to Paraku, mile 274, is to be undertaken shortly, leaving about 190 miles of comparatively easy country to complete to Gaya. It is proposed to provide for diverting funds from one railway to another at the discretion of the Governor-General, in which case there is nothing to prevent the Dahomey Railway being completed to the Niger out of the forthcoming loan.

32. [...] Other things being equal, a railway to Paraku might tap the whole of the trade going down the western road, possibly diverting it from Dekala via Nikki and Pérééré to Paraku, and may quite likely capture the trade of the portion of Borgu between Ilesha and Yashikira. Already an effort seems to have been made in this latter respect. The principal external trade of this district consists of shea butter, exported, and salt, imported. This trade used to be centred at the markets of Gbassero [...] and, secondly, Boria. A market has now been started at Agua in Dahomey just over the border, and it is reported that traders from Ilorin and Lagos instead of exchanging their salt for shea butter at Gbassero and Boria are now doing so at Agua, from which place there is said to be a good road to Paraku. It is reported that about a year ago the French started to enforce an import duty on salt arriving from Lagos or Ilorin. It is stated that this duty is not collected from Borgu traders, natives saying ‘Because the Borgu people and the Nikki people are of the same / blood.’ It may, however, be that Borgu traders deal more particularly in local salt from the vicinity of Tunuga in French territory. The French duty on salt imported from Cotonou is 15 francs per ton, as compared with £1 per ton into Southern Nigeria with a further £1 on entering Northern Nigeria, and any extra duty on the frontier will tend to divert the trade via the Dahomey railway to Cotonou firms. Natives report the amount of the duty collected on the frontier to be one shilling per cwt., but, in view of the
Convention of June, 1898, it is not likely that the amount exceeds 15 francs per ton unless the import duty at Cotonou has been recently raised.

The French have Customs stations under European supervision at Paraku, Nikki, and Zugu, of which Nikki is the principal one. They have also a European Customs officer, assisted by police, to look after the frontier. As the salt referred to above is caught while in bulk, it is not difficult for the duty to be collected. On the other hand, we have only had a native Customs clerk at Ilesha, who can only be inspected at rate intervals by the Resident from Bussa, and a new Customs post is being started at Yashikira (vide the ‘Northern Nigeria Government Gazette,’ of May 31st). If the markets are transferred to Dahomey the salt will be brought back in small quantities to the villages direct, and it will be almost impossible to collect duty on it. Apart from the question of duty, it is now as cheap to send salt to the above markets via Cotonou and Savé as via Lagos, and when the Dahomey Railway reaches Paraku it is difficult to see how Lagos can compete unless a branch line is built from Abeokuta to Ilesha. It should be mentioned, however, that the import of salt into Dahomey fell from 4,000 tons in 1909 to 3,300 tons in 1910, figures which point to the strong position hitherto held by Lagos merchants in this trade. The imports of salt into Lagos were 6,969 tons in 1909 and 7,841 tons in 1910.

33. As regards the through trade from Sokoto, a remedy appears to exist, namely, to use all the influence possible to divert this trade to the Jedba route. The latter road is already a good one and largely used. Facilities for traders could, doubtless, easily be expanded to meet the increased traffic. A few additional markets for food and slight improvements to drifts and arrangements for crossing the principal rivers would assist in popularising this route. It would, doubtless, take time to effect a substantial change, and it is therefore important that the necessary steps should be taken without delay. It is observed that the success of this policy would lessen the importance of the strip of Borgu along the western frontier, which at present subsists largely on the through caravan trade.

34. The present French policy is to utilise the Dahomey Railway for officials and stores proceeding to Zinder instead of the route via Dakar and Timbuctoo, which had hitherto been chiefly employed. So long as the headquarters of the Territoire Militaire was at Niamey, traffic via Dahomey used to proceed to that place en route, but now the headquarters have been transferred to Zinder the Territoire Militaire will take over the transport at Gaya, thus effecting a substantial reduction of the distance. The Resident at Karimama is being withdrawn and transferred to Guéné, situated on the motor road to Gaya. Rest-houses have recently been built at Gaya, which is the headquarters of a lieutenant commanding a Secteur of the Niamey Cercle of the Territoire Militaire. Captain Lenfant mentions in his book that there is insufficient water along the road from Gaya to
Chad, but from the above information it appears evident that this difficulty has since been overcome.

35. In the report of the 20th June, 1911, on my mission to Zinder, the relative cost of transport to Zinder by the different routes was gone into and a copy of the tabulated results is attached to this report (Annexure 4). It will be seen that there is at present a large saving in the cost of transporting goods and in the time taken by officials if they go via the Kano route. After the Dahomey Railway reaches the Niger, the saving, though still large, is much reduced, and the Administration of French West Africa may be tempted to face the extra expense in order to keep the traffic in French territory. Should they decide on this, they will doubtless use every means to make the railway pay by tapping every possible source of traffic; and though, by the Convention of June, 1898, the French cannot differentiate against foreign goods in their Dahomey Customs tariff, there is believed to be no such restriction in the case of the Territoire Militaire or the Northern part of Dahomey [...], and in either Colony it might be advanced that Article IX. of the Convention admits of a surtax on indirect importations, i.e., other than through a French Colony, similar to the surtax applying to French Guinea, so long as foreign goods are not discriminated against (see Zinder report).

36. A vigorous policy now, on our part, to the end of retaining the Sokoto and Borgu traffic, may tend to damp anticipations of capturing a large proportion of it for the Dahomey Railway and indirectly influence the French Administration in favour of the Kano route of access to the Territoire Militaire du Niger and also the northern part of the Territoire Militaire du Chad. The latter policy has many advocates among French officials, and it is hardly necessary to refer to the advantage which would accrue to the British Administration. When the Dahomey Railway reaches the Niger at Gaya, there is nothing to prevent the French Government starting a river marine to work between Kompa and Sekachi, and unless steps are taken to anticipate this development the Lagos merchants will find it hard to retain a share in the export and import trade of the north-west Provinces of Northern Nigeria, which will find their economic outlet through Dahomey.

Summary of Important Data.

37. From the preceding details, it is submitted that the salient points affecting our transport policy to develop the north-west provinces of Northern Nigeria are as follows:

38. The River Niger is unnavigable for steam vessels of any kind between Jebba and Sekachi.

39. The River Niger is navigable for steam vessels from Sekachi to Kompa. A minimum draft of 18 inches is available from Sekachi to Gaya at dead low
water, and vessels of four feet draft could run for the greater part of the year. That is to say, a railway terminus at Sekachi or Gaya would be served by at least 120 miles of excellent waterway which practically intersects every trade route from the Sokoto province to the coast and to the Ashanti (Gold Coast) markets.

40. The Sokoto River is open to Bunza and thence the Gulbin Gindi is practicable to Jega for small canoes all the year round and for large canoes from July to February. Navigation on this river could probably be improved.

41. The principal existing export trade is live stock, after which comes potash, after which, again, skins. The principal imports are kolas, cloth, and salt. Improved communications would not only develop this trade but open up a large shea-bearing area to exploitation and also a trade in gum and possibly ground-nuts and beeswax. Cotton is freely grown in Kontagora, Borgu, and Sokoto. It is sold in Yelwa market at prices ranging from .625 pence to 1.25 pence per lb., according to season. Samples purchased during my tour have been not unfavourably reported on. These figures compare very favourably with the prices ruling in Zaria and Kano. With improved communications a large production from Kontagora province is anticipated.

42. Although a large number of traders use the Jebba route, the greater part of the Sokoto trade goes to Lagos by a road which closely follows the Dahomey frontier. The French are beginning to draw the local trade over the border near Okuta by establishing markets and taxing salt from Lagos, and they will doubtless make a bid for the through traffic when the railway reaches Paraku (mile 274 from Cotonou), to which place it is proposed to extend it at an early date from Savé, mile 162. Eventually the Dahomey Railway will be extended to Gaya, 465 miles from Cotonou and 25 miles from our western frontier, and the French can then start a river service on the Niger, extending from Kompa to Sekachi. Unless countervailing action is taken by the Administration of Northern Nigeria the above service will be the easiest outlet to the coast from Sokoto, Borgu, and the north of Kontagora, and not only would a large quantity of trade be lost by British firms and traffic by Nigerian railways, including possibly traffic now going overland to the Gold Coast, but, indirectly, the chances of the French Government using the Kano route to their Territoires Militaires will be greatly lessened.

Recommendations.

43. In view of the above facts, the following recommendations are submitted. The general scheme proposed divides itself into two stages. Firstly, the construction with the least possible delay of a 3 feet 6 inch line on the Baro Kano Railway standard from Jebba, or a point near Jebba, to Sekachi on the left bank of the Niger. The direct distance is about 125 miles, and a railway would probably be about 140 miles long. Without this link the commercial development of
Sokoto is impossible except via the French Railway, when it is completed to the Niger. With the additional advantage of being served by extensive waterways, it would be a great stimulus to trade, and we would at once be on practically even terms with the facilities which could eventually be offered by the Dahomey Railway, and if action is taken without delay British firms should have secured the bulk of the trade before the Dahomey Railway reaches the Niger.

44. An alternative line of approximately equal length could be constructed to Sokoto, starting from the vicinity of Akerri. This line might be somewhat less expensive to construct, and at first sight offers attractions, in that it would pass Kontagora town, that it would be more convenient for internal movements in Northern Nigeria, and that it would enable part of the traffic to be worked via Baro, but the paramount consideration is that the proposed railway is a competitive route to the coast. Akerri is equidistant from Lagos and Burutu from a transport point of view, i.e., it would cost about the same to work the traffic either way. By making Jebba the starting point, a saving of about 110 miles of railway journey is effected. Even then the distance by rail from Lagos to Sekachi will be about 450 miles, as compared with 465 miles, Cotonou to Gaya, and the latter place is nearer the Sokoto markets, so that any extra mileage by the Jebba route would seriously affect the prospects of the line. Moreover, Jebba is a good port, open to steamers drawing 5 feet during about six months in the year, and offering an alternative route to the coast during this period which it might pay firms owning river steamers to use.

45. It is possible that the question of diverting Kano and Zaria traffic from its natural route, via Baro, may be met by giving the Lagos Railway an independent sphere of development in Northern Nigeria.

46. As regards the chances of the proposed line paying, there is no doubt in my mind that it would pay its way within five years of the completion of construction, probably within three or four years, and should there be any chance of one of the large meat firms exploiting the cattle and sheep trade, the prospects of the line would be correspondingly improved.

47. A service of tugs and barges should be started as soon as the railway reaches Sekachi. If this is not done, and native canoe traffic is relied on to feed the railway, not only will the development of trade be retarded, but the French Railway, on arrival at Gaya, might secure the trade by establishing a river service. It is worth noting that, under the Convention of 1898, the French may apparently claim the right to discriminate against British shipping on the Niger above our western frontier. It is presumed, however, that the Act of Berlin, 26 February, 1885, Articles 26 to 33, will safeguard us in this respect.

48. It will be seen [...] that the distance by road or water from the Sokoto markets to a British railway terminus at Sekachi and the proposed French one at Gaya are for all purposes practically the same, except in the case of the short
Transport Policy to Develop the Northern Provinces of Northern Nigeria

road from Jega via Bunza and Fingila to Gaya. This difference is not regarded as a serious one in the face of official encouragement of the other route and the position already enjoyed by British trade, but it will be worthwhile going into the question of water service up the Sokoto River as far as Bunza, in case it is found advantageous to try and intercept traffic at this point.

49. The second part of the scheme recommended is the eventual extension of the railway to Sokoto via Jega. The Sokoto River is quite insufficient as the sole alternative to road transport for the commercial development of the most densely populated portion of Sokoto Province, though it will be a useful feeder to the railway.

50. Quite apart from the French competition, it is considered that the scheme proposed is best calculated to develop the resources of the north-west provinces of Northern Nigeria, and that the country is ripe for it.

51. As a preliminary measure, it is most important to use the influence of Residents to divert the Sokoto traffic from following the road along the Dahomey frontier to the Yelwa-Jebba road, which it used to follow in the old days.

52. It is also recommended that a marine officer should visit the Niger between Sekachi and the frontier at dead low water, when he could ascertain definitely the minimum depth of channel on this section and carry out any necessary removal of snags and rocks with a small party in one season. He could, at the same time, report on the Sokoto River to Bunza and the Gulbin Gindi to Jega, and possibly make a start in removing snags on these rivers. A steel canoe might with advantage be allotted to Residents of Sokoto to facilitate the survey, clearing, and improvement of the navigation of the Sokoto River. /

[...] Engineering considerations affecting the First Section of the proposed Railway from Jebba to Sekachi. [...]

63. The obstacles to be surmounted or avoided are as follows:–

The hills between Jebba and Biaggi, known as the Washington Mountains.
The River Kudda at Biaggi.
The hills between the Niger and the trade road from Karoji to Mykera.
The River Mainyaro, an important tributary of the Kontagora River, running past Shaffini.
The hill between Shaffini and Momaji separating the basins of the Mainyaro and Kontagora Rivers.
The River Kontagora.
The high country in the vicinity of N’Gashki.
The River Wata (comparatively small).
The River Molendo.
The River Bambirri, north of Tandi (comparatively small).
The River Kundu and the swamps on the left bank of the Niger at Sekachi.

64. [...] With the possible exception of the River Kundu all the founds are likely to be on rock or in firm sand, and do not appear to offer any difficulties. There were outcrops of rock in several places along the road followed by me, but I consider there would be no difficulty in locating a railway to avoid heavy rock cutting.

65. Time did not permit of anything like a proper railway reconnaissance being attempted, but from what I saw of the country the most likely lines for further investigation would appear to be as follows:–

(a) Starting from Tatabu, on the Lagos extension, strike the Kudda River somewhere near Karo, and follow the valley of the Kia River to its source. Then it would possibly be best to strike west of Shaffini, skirt the western slopes of the high ground between Shaffini and Momaji, crossing the Kontagora River near the latter place so as to take advantage of the valley followed by the road to Makwari.

(b) As regards the N’Gashki hills, the small river at Mafungi proceeds for some distance in a northerly direction along an open flat valley, and there may be an easy summit between this stream and the valley of the Wata. This part of the route would require little or no bridging. On the other hand, it would be preferable from a commercial point of view for the railway to pass west of N’Gashki, and thus better serve this place and the important market of Warra.

(c) After crossing the Wata, a river hardly as big as the Bakogi River on the Baro-Kano Railway, it would be necessary to choose the best crossing over the Molendo, from which river the line should deflect towards the River Niger and follow it to Yelwa. An easy crossing with rock founds over the Bambirri River can be found a few hundred yards from its mouth. The approaches to the river at Sekachi will be dealt with below.

66. As alternatives to this route the line might start from Jebba and follow the stream up to the col at Kylema, thence west of Giddan Salu to Biaggi. From Biaggi, instead of following the valleys of the Kudda and Kia, the line might skirt the southern and western slopes of the high ground north-west of Biaggi till it reaches Leaba, and then skirting the Niger from Leaba to Wuru rejoin the first line north of Mykera.

67. It may be thought worth while investigating a line closely following the Niger for the greater part of the distance. Such a line might be possible, but it is feared the bridging would be heavy, and though from the reports received a fairly easy way round the Washington Mountains and hills south of Leaba seems not unlikely, there might be difficulties at Kijonji [...] and the rocky hill
between Bussa and Libata, and the line would have to skirt the swampy ground north of Warra.

68. A disadvantage of the first route suggested would be that part of it passes through uninhabited bush, but if this should be the shortest and easiest route it is not worth building the line further west in view of the fact that the country up to Leaba can send its produce down to Jebba by river. It is far more important to serve N’Gashki, and, if possible Auna, Warra, and Bussa, as these are all fairly important places. Bin Yauri, which, in times gone by, must have been a large town, now consists of a group of unimportant villages. On the other hand, Yelwa is already an important and flourishing market.

69. [...] 

70. This proposal has taken into consideration the eventual extension of the railway towards Sokoto, which would probably skirt the rising ground which limits the swamps on the left bank of the Niger as far as the Sokoto River. In view of the importance of the proposed railway as a competing line with the Dahomey Railway it is submitted that the estimates for the construction of the first section should be based on a cost of £4,000 a mile.

H. O. Mance, Captain,
Royal Engineers.
30 November, 1911.

Annexure 2.

Dear Sir,

Lokoja, 7th September, 1911.

Your letter of date and samples cotton from the Kontagora, Borgu, and Sokoto Districts to hand.

Information as regards prices in the several localities mentioned is of interest.

The samples (3) are of one class of cotton, and judging from the small size of each particular ‘lock’ the writer considers it to be a ratooned or tree cotton, that is, the plant is allowed to grow for several years instead of the usual annual.

The sample from Kaoge is the best for colour. In all three cases the length is good, fibre silky, but rather weak.

I have referred them home with a copy of your letter, and asked our people to let you have an expert (broker’s) report.

Yours faithfully,

H. Worsley,
Manager.

Captain Mance, Royal Engineers,
Lokoja.
Dear Captain Mance, 15, Cross Street, Manchester, 4th October, 1911.

We recently received from Mr. Worsley several samples of cotton which you had handed to him for valuation purposes. We have submitted these to one of our expert brokers, and send you herewith his valuation and report upon the same.

The sample from Kiende, Sokoto, is valued at about 40 points on Middling American. The samples from Yelwa and Kontagora do not compare at all favourably with American, but go better against Indian cotton, known as broach, and would be worth to-day 5 3/4d. to 5 7/8d.

The price of American cotton being 5.31d., the Sokoto sample would be worth about 5.70d., and the other two would be worth 5.75d. to 5.87d. per lb., although, of course, owing to shortness and roughness of these two latter types, they would be of more use to the Yorkshire trade* for mixing with wool.

The valuations, however, are merely nominal, as the samples were exceedingly small, and it is almost impossible to say what would be the proper values unless one had commercial quantities to judge from.

Yours faithfully,

W. H. Himbury,
Manager.

Captain H. Mance, R.E.,
Old Woodbury,
Sandy,
Beds.

Dear Sirs,

Liverpool, 3rd October, 1911.

We have your three small samples of Northern Nigeria cotton before us.

‘Sokoto’ we make fine and a fair length, and is worth at the present moment about 40 on; the other ‘Borgu’ and ‘Kontagora’ are very short, and would have to be compared with broach, perhaps more valuable, say, about 5 3/4d. to 5 7/8d., and would be very acceptable in the Royton District. They are short in staple, but firm, and the slight stain would not matter much. It is, of course, difficult from the small size of these samples to give exact values, but these are the best we can do.

Yours faithfully,

Buchanan, Wignall & Co.

Messrs. The British Cotton Growing Association, Manchester.

* Limited demand.
Annexure 3.

**Yelwa Price List.**

Compiled by Mr. J. C. O. Clarke, Assistant Resident, Yelwa.

- Rani, Funturu = Dry season, Harmattan.
- Basara = Just before rains.
- Damana = Rains.
- Ferkon Damana = Beginning of rains.
- Agagere = Just after rains.
- Kakka = Harvest season.

Transport in Africa.
EAST AFRICA COMMISSION’S RECOMMENDATIONS.
£10,000,000 LOAN.
NEWSPAPER ARTICLES & CORRESPONDENCE. /
(Incorporated by Royal Charter.)
[...]

A PATRIOTIC LOAN.
NOT TO BENEFIT LANCASHIRE EXCLUSIVELY.

Reprinted from the 'Daily Dispatch,' Tuesday, October 20th, 1925.

Having visited the cotton fields of the world, and realising the paramount importance of transport to the almost limitless extension of our own Empire fields, I sincerely wish that on my coming tour I could with confidence tell the native growers, merchants, and all interested in cotton, that the 10 millions sterling so long spoken of was forthcoming, and that the construction of railways, the handmaiden of active development, would immediately be proceeded with.

We should then witness such a remarkable broadening of Empire cotton growing as would reassure Lancashire against the recurring fears of short American crops, and, in the process, send a thrill of activity through the engineering trades in this country and provide before the Christmas season a welcome message of hope to many thousands of our best British workmen now reduced to drawing State 'dole.'

Can it be done? Why should it not be done, and what would be the effect of doing it? Let me deal with these very pertinent questions.

Personally, I see nothing in the nation's finances which justifies a negative attitude. I am confident if the Chancellor of the Exchequer, whose great patriotism and commanding business vision are a great national asset, would devote his own personal attention to the issue nothing could stand in the way.

He will see in this scheme means – a cheap means – not only of lengthening but also of strengthening our Empire stakes. He will also launch one of the finest programmes for assisting our heavy industries at home whilst relieving unemployment. East African cotton planters are ahead of available cotton transport, and there is a grave danger that increased efforts of putting further land under cultivation may be delayed. / 

Lancashire’s cotton requirements to-day represent in hard cash 130 million pounds, but the problem goes much further than the limits of any one county. What if this money could be spent within the Empire? Lancashire would be enriched, the Empire would be enriched, and the world would benefit.

Speaking at the annual meeting of the British Cotton-Growing Association last June, Lord Derby (the President) put the issue very squarely; he pointed
out that the East Africa Commission, appointed by Mr. J. H. Thomas when Secretary of State for the Colonies, which comprised Major the Hon. W.G.A. Ormsby-Gore (Conservative) (Chairman), Major A. G. Church (Labour), and Mr. F. C. Linfield (Liberal), in a most able report laid special stress on the need for railway extensions in East Africa, and recommended a loan of £10,000,000, the first few years’ interest being guaranteed by the Government until the railways were established. He (Lord Derby) went further and urged that the loan should be made 20 millions of money, the extra 10 millions being utilised for providing similar facilities in West Africa, and that part of the money might be usefully spent in providing additional medical services to deal with disease and more technical education, which is badly wanted.

What Empire cotton-growing meant in the scheme of national economy he emphasised by reference to Uganda, where we are now threatened with a restriction policy on account of inadequate transport. Cotton there heads the list of exports, totalling 80 per cent. It has led to some £3,500,000 being distributed amongst the cotton growers, and this money has been largely spent in the purchase of European goods, upon which the local Government has received an import duty. The Excise duty on cotton collected by the Uganda Government last year amounted to over £158,614.

Cotton interests by themselves are big enough to justify such a loan, but there are considerations much more immense. Because of their great natural wealth, our Empire Colonies can with irrigation, harbours, railways, waterworks, roads, and lighting be made more valuable to the Empire than India. All these works must be provided by the Government. Of course the great departments of State – the Colonial Office and Foreign Office – are quite alive to the importance of the subject, and it is only the policy of economy which has been brought about since the war that has prevented greater official support. / It may be suggested that this is not the time to spend money, but any time is the right time if the expenditure can be justified, for no matter from what angle a business man approaches this question, the nation cannot embark on an outlay which will so surely repay itself.

We do not ask the Government to spend ten millions sterling, but even this could be supported if serious heed is paid to the Empire’s needs, and to the great new markets available in East and West Africa as soon as transport is provided. What is desired, and what has been promised, is that the Government should issue a loan of that amount, guaranteeing the interest for the first few years until the railways have been constructed, when they will pay for themselves. Is this proposition extravagant?

The Government responsibility would be something less than half-a-million sterling in interest for the first few years, but, on the other side of the national balance-sheet, there would be the saving effected in dole expenditure, since at
least 60 per cent. of the money would be expended in the workshops of Great Britain and returned in the form of wages in place of doles. That does not finish the matter. New markets which are badly required would open before the manufacturers of Great Britain, markets affording such enormous possibilities that one cannot believe the new loan would not be subscribed within 24 hours.

W. H. Himbury.

Reprinted from the 'Daily Dispatch,' Tuesday, October 20th, 1925.

TEN MILLIONS TO FINANCE COTTON.
WHY EAST AFRICA IS WAITING.
PLEA FOR ACTION.
GOVERNMENT OUGHT TO GRANT LOAN.

Uganda, with its great possibilities to Lancashire as a cotton-growing area, is well ahead of transport, and some authorities advise the Government to go slowly and not push development until more transport is available. /

Reports from the other centres where cotton cultivation has been encouraged – the Sudan, Tanganyika Territory, Kenya and Nyasaland – indicate that the position is also becoming increasingly serious for a great enterprise which has been carried by the highest patriotism to a point where Empire Cotton Growing should speedily place the Lancashire Textile industry in a position of independence as regards the raw material essential to the healthy life of her manufactures.

Mr. W. H. Himbury, the general manager of the British Cotton Growing Association, who, along with Mr. James M. Thomas, a member of the Council of the Association, is about to leave Manchester on a tour of the cotton fields of India and East Africa, favours us with an article in which he deals with the pressing need for action, and expresses the opinion that it would be secured if Mr. Churchill would deal with it himself instead of leaving it to the mercies of the permanent officials, who, acting under instructions of economists, are inclined to use the axe on the wrong tree.

Reprint of the correspondence supporting Mr. Himbury's article.

Mr. J. ARTHUR HUTTON, a founder and now Vice-President of the British Cotton Growing Association, writes:

In their mutual interests, capital and labour ought to join together in doing everything possible to increase our cotton supplies in new fields, and more especially within the British Empire.
Of all the fields developed under the auspices of the B.C.G.A., so far, Uganda has given the largest results, and this season’s crop will probably reach 200,000 bales of a quality eminently suitable for Lancashire’s requirements.

Unfortunately, as pointed out by Mr. Himbury, we have run up against a most serious difficulty. Unless further transport facilities are provided, it will be almost impossible to have any further development. More railways are required immediately, otherwise we shall have to stop the natives increasing their production.

It will be nothing less than a calamity if we have to tell the natives that they must not grow any more cotton because it is impossible to convey it to the market. / Here, on the one hand, we have Lancashire clamouring out for more cotton, and, on the other hand, the native farmer anxious and willing to grow it. All that is required is the connecting link – the necessary transport facilities.

WHY HESITATE?

I cannot understand how the Government can possibly hesitate for one moment in taking the steps which are necessary for the development of one of our most productive tropical possessions. They are not asked to find any capital whatever. All they are asked to do is to guarantee the interest on £10,000,000 for a few years.

Major Ormsby-Gore’s Commission was most emphatic in pressing forward the urgent need of providing these additional transport facilities in Uganda. The native farmer, if he was able to express his views, would be equally emphatic. The risk is almost infinitesimal, for it is almost impossible to construct a railway in tropical Africa which will not pay its way if properly managed.

There is also another aspect of the question. All trade means barter in the long run. Every £100 worth of cotton grown means an export of, say, £80 worth of cotton and the importation of manufactured goods in exchange. Therefore, the more we develop cotton growing the more we increase the demand for our home manufactures, and, as Mr. Himbury pointed out, the better chance there is of doing away with these dreadful ‘doles.’ Also, the duty levied on these imports will largely increase the revenue of the colony, so that the railway must pay indirectly even if the receipts only barely covered working expenses.

FOR STEEL TRADE’S SAKE.

There is also a very strong reason why there should not be one moment’s delay. The steel trade of this country is in a very bad way. The orders for the necessary rails, girders, bridges, locomotives, and rolling stock would be invaluable to the trade at the present time.

I think, therefore, that the British Cotton Growing Association, the Empire Cotton Growing Corporation, and, indeed, the whole trade of Lancashire
should not lose a single moment in pressing the Government to waste no further time and to proceed with the construction of these railways at once. / If they are not prepared to do this, will the Government please stand on one side and let somebody else do it for them? In my opinion, it is intolerable that there should be any further delay. Too much time has already been wasted. The Rt. Hon. J. R. CLYNES, M.P. states:

I have read the article by Mr. Himbury. Everything possible should be done to make the great cotton industry less dependent upon supplies grown outside the Empire.

The way in which a Government can best help is in the development of transport services. If Grants cannot be provided, Guarantees for Loans easily can, and either form of support would be a very helpful outlay indeed, more in the nature of investment than expenditure.

The construction of railways and the provision of transport facilities in a remote Dominion or Colony would mean orders for British workshops and ultimately cheaper supplies of the raw material for Lancashire factories.

Mr. R. H. JACKSON, Chairman of the Empire Cotton Growing Corporation, states:

Having been Chairman of the Executive Committee of the Empire Cotton Growing Corporation for the past three years, and a member of the Executive of the British Cotton Growing Association for a much longer period, I think I may claim to know something about what is required to increase the production of cotton in the various Crown Colonies in Africa.

In every area the question of transport comes up, and until this is settled, the problem is hopeless. What is the use of growing cotton or any other article if the cost of getting it to the consumer is so great that the market price, after paying for transport and other charges, leaves little or nothing for the grower? Carrying products by manual labour in head loads is most expensive, and also by taking labour from where it could be more profitably used is most wasteful. /

Last winter the Empire Cotton Growing Corporation sent Colonel C. N. French, C.M.G., C.B.E., to East Africa to find out on the spot what was required to help on Cotton Growing and the general development of the country.

The Government sent out the East Africa Commission for the same purpose, and where the two reports touched on the same problem, the conclusions arrived at quite independently agreed. The definite conclusions of the East Africa Commission were that the further economic development of these East African territories is dependent on the early provision of increased transport facilities; that little or nothing can be done without liberal financial assistance from the Imperial Government; and that an East Africa Loan Guarantee Bill authorising the issue of a loan for £10,000,000, guaranteed as to principal and interest by the Imperial Government, should be introduced, the money so obtained to be
used for railway extensions (in particular the 800 miles of new railway in Tanganyika and 200 miles in Uganda described in the Commission’s report), harbour developments and the provision of other transport facilities, and, further, that if the surveys for the new railways which they suggest in Tanganyika are not commenced this autumn, or those in Uganda next year, the expert staffs may have to be disbanded, with the consequence that, should a decision in favour of railway development in those territories be postponed too long, difficulty, expense and delay will be experienced in reassembling a constructional staff.

The report was considered by the Committee on Industry and Trade, who were so impressed by it that on July 2nd, 1925, they sent a memorandum to the Prime Minister strongly supporting the proposals on the ground amongst others that ‘British Industry, and in particular British export trade, would derive very considerable benefit from the development.’

The Empire Cotton Growing Corporation carefully considered the reports, and, with the British Cotton Growing Association and representatives of the employers and work-people in the cotton spinning and manufacturing areas, organised a deputation to Mr. Amery, Secretary of the Colonies, on July 30th, to recommend that immediate steps be taken to give effect to the recommendations of the East Africa Commission Report.

Mr. Amery gave the deputation a very courteous reception and, after listening carefully to the case put forward, replied that he was entirely in sympathy with the request made, and promised to do all possible to get a Bill put through to provide the money required. Since then we have been hoping to hear that the Government will take the matter up early in the next session, but, if we do not hear anything shortly, we shall have to consider what further steps to take to push the matter.

Until the transport can be provided in East Africa, the increase in the production of cotton is held up, and until a larger supply of cotton is obtained, I think the price will be too high for the Eastern Markets, and Lancashire may have to continue on Short Time.

Mr. FRED HOLROYD, J.P., President of the International Committee and President of the Federation of Master Cotton Spinners’ Associations, Ltd., states:

With reference to the article that has been written by Mr. W. H. Himbury, the General Manager of the British Cotton Growing Association, I am in absolute agreement with what he says. It is of vital importance that means of communication should be opened up as quickly as possible in the Cotton-Growing areas in the British Empire.

From my own personal knowledge, I can confirm what Mr. Himbury says with regard to the danger of retarding cotton-growing propositions in our
African Colonies and Protectorates because of this lack of adequate transport facilities.

I am fully convinced of the absolute necessity for this country to obtain adequate supplies of raw cotton which will make us less dependent on the United States. In our African Colonies and Protectorates we have the land and, in most cases, the labour; what is urgently needed is additional means of communication and transport.

In emphasising my statement that we should be made less dependent on America, having been in the States I can add that from what I ascertained when in that country that the American mill-owners are not going to be satisfied until they can consume their own crop by their own spindles. This being the case, no one can say how necessary it is – not only for the Cotton trade itself – but even the Government – to use every means at its disposal to encourage in every possible direction the production of cotton within the Empire.

Mr. WILLIAM HOWARTH, the Chairman of the Executive Committee of the Fine Cotton Spinners’ and Doublers’ Association, states:

I am in full agreement with the views expressed by Mr. Himbury in his article. The provision of transport facilities, whether in East or West Africa, is a profitable investment, and if we are to justify our control, the facilities cannot be withheld. It is not very long since that West Africa was described as the ‘white man’s grave.’ It is now one of the best markets for our goods. The standard of life has risen beyond our powers of measurement, and I have no hesitation in saying that further progress will be proportionate to transport development on proper lines.

Mr. J. CRINION, President of the Card Room Amalgamation, states:

Had the Government done years ago what we pressed, and what Mr. Himbury is now seeking, this country and the Colonies would have benefited immeasurably. There is no answering the arguments in favour of a large loan for the development of the Colonies. From a financial point of view it is surely better to spend money on a scheme which must eventually increase the wealth of the nation and provide employment at home and in our Colonies than spend money keeping workers who cannot find employment. I certainly hope the Government will see its way to do what those in the cotton trade have so long desired and which would so clearly redound to the good of the nation, particularly Lancashire.

Mr. A. A. PATON, C.B., President of the Liverpool Cotton Association, states:

The Liverpool Cotton Association has always taken a keen interest in Colonial and Dominion Cotton growing.

Those of us who have had extensive experience of Cotton fields and Cotton Growing, know that the most important thing is transport. I am heartily in accord with the British Cotton Growing Association that every possible Government support should be given for the transport of the Cotton in the seed.
to the gins, and from the gins to the seaboard for shipment to Liverpool. In my opinion, no Government expenditure would be as profitable as that expended on roads and railways in Africa, as it encourages agriculture and brings much-needed raw material to our ports and mills.

My Association has only recently adopted an Empire Futures Contract. This is of great importance to Empire growers, inasmuch as it affords them protection against any violent fluctuation in price after the commodity has once been marketed. The Liverpool Cotton Association is, and always has been, most anxious to help in every possible way, and to encourage the growth of Cotton in our widely-distributed Empire.

Mr. RICHARD BROOKS, Chairman of the Manchester Cotton Association, says:

Mr. Himbury's article on the necessity of increased transport in the duly developed parts of the Empire should arouse public interest in this important question. It is now some months since Mr. Ormsby-Gore returned from his tour in East Africa, and drew particular attention to the urgent need for increased railway development. Since this, various deputations have waited upon Government departments, and, so far as one knows, no steps have been taken, either by the Treasury or the Colonial Office, to raise the necessary loan. Until adequate railway transport is provided, Lancashire will continue to be under the dominance of the United States as regards her supplies of raw cotton, and, in my opinion, this county should continue to press the Government to provide as quickly as possible all facilities for the raising of the loan.

Mr. E. B. FIELDEN, Member of Parliament for the Exchange Division of Manchester, states:

The development of Cotton Growing within the Empire is a matter of supreme importance to Lancashire as we can no longer look to the United States of America continuing to export the bulk of her crop, as in the past. / It is therefore a matter for congratulation to those interested in the cotton trade that the Government are taking steps to develop Cotton Growing in East Africa and any wise expenditure on improving transportation in that part of the Empire will yield a rich return in a comparatively short time.

Mr. S. S. HAMMERSLEY, Member of Parliament for Stockport, states:

There is no doubt that improved transport facilities are essential in both East Africa and West Africa if Lancashire is in the future to obtain the considerable supplies of raw cotton which are so necessary if our position of dependence on America is to be mitigated.

Stimulating as is the knowledge that Uganda produced close upon 200,000 bales of cotton last year, this is only the fringe of a possible production, given the whole-hearted cooperation of Lancashire users, and the backing of the Government.
The urgent necessity for national economy will render abortive any direct subsidy to the transport needs of Uganda by the Government, but the Government can quite legitimately be urged to guarantee the interest on a loan which, on the closest examination, has every evidence of a sound business proposition.

Mr. W. M. WIGGINS, Member of Parliament for Oldham, states:

I hold the opinion that the safest and cheapest way for this or any Government to assist in extending the production of Empire-grown cotton is by financing the building of railways and roads.

I believe one of the first necessities of to-day is strict economy in administration, a reduction of the burden of Taxation on Industry.

But with this idea at the forefront of my mind, I am definitely in favour of the proposals which have been made from time to time, viz., that the Nation should guarantee the interest – for a short term of years, say 5 or 7 – on a Loan to be raised for the purpose of laying down Railways in Cotton-growing areas in Africa. No doubt the taxpayer of this country would have to meet the charge for interest during construction and for a short time after; but I am assured that very soon a railway of reasonable proportion would pay its way. The provision of railroads would not only assist employment here in manufacturing the material – it would be bound to assist our coal, iron and steel trades and thus reduce unemployment in those harassed quarters; would not only assist the cheaper marketing of cotton, but, in addition, would have a big civilising influence; must encourage other branches of agriculture in the areas railed.

And, as this developed, those lands would become potential and actual customers for home-manufactured goods.

It therefore seems to me that for the Government to guarantee, within limits, the interest which might cost for five years half-a-million a year, would be good business and true economy.

Sir S. H. H. HENN, K.B.E., M.P., Chairman Joint East African Board, and Member of Parliament for Blackburn, writing to the ‘Manchester Guardian,’ states:

DEVELOPMENT OF TROPICAL AFRICA.

To the Editor of the ‘Manchester Guardian.’

House of Commons, October 24th, 1925.

Sir,

As the mover in the House of Commons last year of the resolution which was accepted by Mr. J. H. Thomas, the Secretary of State for the Colonies, and led directly to the dispatch of the Parliamentary Commission under Major Ormsby-Gore to East Africa, I have read with profound satisfaction in this morning’s papers of the Cabinet decision to approve in principle the recommendation of
East African Commission’s Recommendations

that Commission for an Imperial guarantee for loans raised for transport developments in East Africa up to an amount not exceeding £10,000,000. / 

When the various works proposed to be constructed under this guarantee come to be considered, it is certain that pleas will be put forward in favour of those railways that offer prospect of an immediate or an early return on the capital, as against lines that may not pay their way and provide for interest and sinking fund for some time to come. I would, however, urge the Government to give preference over all other projects to the construction of a main trunk line to connect Dar-es-Salaam with the north end of Lake Nyasa, and I appeal to public opinion throughout the country to support this recommendation. I am not wedded either to the particular scheme suggested in the report of the East Africa Commission or to any other route, but I do most definitely assert my belief that from both an Imperial and an International point of view the early construction of this trunk line is of supreme importance: Imperial, because it would open up for development fertile areas in South-west Tanganyika, and eventually provide an outlet to the sea at a British port for North-eastern Rhodesia and Northern Nyasaland (consider in this regard the Conference of White Settlers from Kenya, Tanganyika, Nyasaland, and Northeastern Rhodesia held under Lord Delamere a few days ago at Tukuyo, near the boundaries of the three last-named territories); international, because our failure to date to show any serious intention of developing Tanganyika territory as it should be developed under the mandate is the main reason why the claim of Germany to have this particular colony returned to it is listened to with sympathy in many quarters abroad. Finally, this line would bring all the East African territories into direct transport communication and greatly advance the cause of good government.

Col. J. J. SHUTE, C.M.G., D.S.O., a member of the Council and of the Executive of the Empire Cotton Growing Corporation and an Ex-President of the Liverpool Cotton Association, states:

I should express the most profound disappointment if the Government in the very earliest session of Parliament did not immediately make arrangements for the issue of this loan, which would be of incalculable benefit to our home industries. We know by definite practical experience, which was only confirmed in our business mail to-day, from correspondents, / how badly this transport is tying up the development of moving to our Lancashire mills all the cotton which is badly wanted here.

I start on a personal tour of Uganda, Tanganyika, Rhodesia and South Africa, and shall doubtless see at first hand what I have already learned from others. Really my tour is a business one, but I shall not dissociate my mind from the fact that I am a member of the Council and of the Executive of the Empire Cotton Growing Corporation. The whole question now of the development of these Colonies depends on transport. The lack of transport is like a bogey over-
shadowing every other question. The climate, the soil and the labour are there. I cannot believe they will delay any longer in dealing with this question, in view of the very strong recommendation of the Commission which was sent out by the last Government. It should be understood that if finances do not allow of the absolute issuance of the money in the shape of a loan by the Government, surely there ought to be no difficulty in the Government giving assistance in the matter of guaranteeing the loan, for which the financial responsibility would certainly be limited only to the first few years whilst the railway was developing.

Sir WILLIAM BARTON, Wybersleigh Hall, Stockport, states:

The British Cotton Growing Association has recently entered a new period – it is no longer a pioneer only, but the master of a vital problem. We are getting British-grown cotton in bulk, and are in sight of a quantity sufficient to shift the balance of cotton control and ultimately to make us master of our own destiny in cotton. We can only fail now by lack of courage in the last lap. Transport is needed. East and West, transport and still more transport, and the men who should and could provide it are standing idle in the market place.

Our manager, Mr. Himbury, is the prince of managers, big enough for anything and meticulously careful in everything. He maintains contact with the work on the spot, and is starting on a further mission of help and oversight. The value of his visit is determined by his power to supply what he advises to be necessary, and he tells us that transport or paralysis confronts us, and transport means money, and big money. / A small man at the Treasury might shrink from giving the necessary guarantee, but Mr. Winston Churchill is no small man, and amongst his bewildering catalogue of requirements he knows cotton and all about cotton growing – his political birthplace was Oldham.

Sir HUMPHREY LEGGETT, Chairman of the British East Africa Corporation Ltd., and Chairman of the East African Section of the London Chamber of Commerce, said:

I have read Mr. Himbury’s article with deep interest and appreciation. He possesses a unique personal knowledge of the cotton fields, actual and potential, of the whole world, and his opinions and forecasts of what can be done within the British Empire itself are supported (although he is too modest to say so) by a remarkable record of success already achieved by the efforts of the British Cotton Growing Association under his inspiration and driving power.

The case of Uganda, to which his article chiefly refers, is specially striking. Less than 20 years ago, cotton production there was practically unknown. This year that country produced close upon 200,000 bales of the quality exactly needed by Lancashire, and the planting down for 1926 harvest indicates that the next crop will show a further marked increase.
Even in 1924–1925 very great transport difficulty and delay, accompanied by some serious damage and loss, was experienced in getting the Uganda crop to tide water and the world’s markets.

Despite all that can be done in the existing resources, those difficulties are bound to recur next season. The fear of such difficulties is in itself a discouragement to further planting.

It is probably true that had a comprehensive scheme of transport development been set on foot fifteen years ago, Uganda would now be producing not 200,000, but probably half-a-million bales per annum. Lancashire needs it all badly. And, as Mr. Himbury truly says, the greater part of the money spent in buying the crop comes back in the form of purchases of British-made goods by the cotton cultivators. /

Thus, the plea for ten millions of money to be guaranteed without delay to enable this stream to flow in both directions is a plea for the creation of permanent employment year in and year out in the Mother country, besides being the means of immediate employment by the expenditure of the loan itself upon the manufacture of the rails, rolling stock, bridges, etc., etc., to be all made in British workshops.

Immediate employment now, and the certainty of increasing the annual supplies of raw materials – reciprocal trade in manufactured goods – that is the prospect and, indeed, the certainty, if Mr. Himbury’s plea for prompt action be accepted without delay. But, if delays occur, the future of cotton development may be serious indeed, and that would increase unemployment. It is not a matter that can stand still.

Mr. J. T. BROWNLIE, a member of the Special Committee on Industry and Trade of the Board of Trade, states:

What are my views in regard to the Government granting financial assistance in regard to the development of cotton-growing in Uganda? Well, I am strongly in favour of the Government rendering all possible assistance that will further development of cotton-growing in East Africa and other cotton-growing districts of the Empire.

The Committee on Industry and Trade, of which I am a member, submitted a memorandum to the Prime Minister in the early part of July of this year, in which they made a recommendation that British industry would derive very great benefit from the development of the East Africa cotton-growing industry, for the encouragement of which the primary need is transport.

This recommendation was arrived at after being very carefully considered by various Associations connected with cotton-growing, iron and steel manufacture and the Trade Unions concerned.
Were the Government to give effect to the recommendation of the Committee, it would undoubtedly give a great impetus to export trade, inasmuch as the major portion of the money expended would be spent in this country. / Of course, it is not to be expected that the development of cotton-growing in East Africa would be an instant financial success in a commercial sense, but the benefits that would accrue cannot be over-estimated, inasmuch that it would mean the permanent development of that part of the Empire.

I sincerely hope that the Government will, at the earliest possible date, take action and thus stimulate industry and find employment for many who are at present unemployed.

Mr. C. PONSONBY, Managing Director of the British Central Africa Company, Limited, states:

I have recently returned from a tour of East Africa, Kenya, Uganda, Tanganyika and Nyasaland. It is perhaps a platitude to state that a consideration of these countries requires imagination and breadth of vision. Few people in 1890 could have visualised the Uganda of to-day, and this progress which has come almost suddenly in the last few years must be attributed to the breadth of vision of those who built the Uganda railway. Without it, there could have been no development. Uganda is a standing example of what can be done by a wide outlook. There is no doubt that similar enterprise in the other countries of East Africa will have even greater results, and owing to the more rapid civilisation of the native, the results will be obvious far more quickly than formerly. Each country of East Africa has enormous possibilities, given improved transport facilities, and the proposed expenditure of ten million pounds on railways – a considerable proportion of which would be spent on material in England – will help these possibilities to materialise. The Belgian Congo is moving quickly in this direction. Why should Great Britain lag behind in the race of civilisation?

Dr. ALFRED REE, President of the Manchester Chamber of Commerce, states:

Lancashire’s future depends largely upon the amount of cotton which can be produced within the Empire. What could be more disastrous than that the development of the industry in one of our most promising Colonies should be prevented through the lack of transport facilities. /

To my mind, it is not economy to refrain from using money in a manner which would ultimately increase the prosperity of Uganda, and, by doing so, help to provide Lancashire with her greatest need.

Mr. Himbury’s proposal is a practical solution of the difficulties barring the way to the Colony’s potential wealth as a cotton-growing country, and as a market for British industrial products. In my opinion, His Majesty’s Government should provide the financial assistance as advocated by the British Cotton Growing Association and so render it possible to secure the efficient transport
facilities which Mr. Ormsby-Gore’s Commission consider to be so urgently needed.

The time has gone when Great Britain can afford to dally with questions affecting the development of its Empire, and I sincerely hope that the representations being made by the British Cotton Growing Association will have the desired effect.

Sir ALFRED SHARPE, K.C.M.G., Ex-Governor of Nyasaland, and Chairman of the Mozambique Industrial and Commercial Co., Ltd., states:

I have read with very great interest the article by Mr. W. H. Himbury, of the British Cotton Growing Association, dealing with the question of a loan of ten million pounds (or more) for the purpose of stimulating the growth of cotton within the Empire.

Mr. Himbury points out most clearly the pressing need for giving realisation to the financial proposals made by the East Africa Commission appointed by the late Secretary for the Colonies, consisting of Major W. G. A. Ormsby-Gore, Major A. G. Church, and Mr. F. C. Linfield.

There could not be a more opportune moment for carrying out those proposals than the present. All political parties are unanimous in their approval of the proposals made in the East Africa Commission’s Report.

There is no object on our holding the vast territories we have in tropical Africa, with their enormous possibilities, unless we take steps to develop them. The first thing necessary for such development is the provision of cheap transport, which means the construction of railways and the provision of shipping facilities, and this cannot be too often reiterated.

Apart from the needs of Kenya, Uganda, and Tanganyika Territory, Nyasaland and Northern Rhodesia cannot possibly proceed with the development of their vast resources without the provision of cheap transport.

Everybody concerned or interested in the development of these territories has long since agreed that it is of vital interest that the bridge across the Zambezi River to connect the Trans-Zambesi Line with the Nyasaland Railway System should be at once constructed.

The Nyasaland cotton industry is suffering at the present moment from the fact that a rotation of crops is practically impossible, because comparatively cheap products such as maize, ground nuts, beans, etc., cannot at present be exported at a profit on account of the want of railway transport. When once these territories are connected by a through line of transport with the sea, Planters, both European and Native, will be able to institute a proper rotation of crops which will largely cut out the present loss from various cotton diseases such as Boll Worm, etc., which are due to continuing the cultivation of cotton year after year on the same ground.
I am well acquainted with these territories, and I have no hesitation in saying that the provision of a through line of rail transport will result in an enormous development both of the cotton industry and other planting interests.

Lord Derby, as Mr. Himbury states in his article, desires that the loan should be at least twenty million pounds instead of ten million pounds. As Mr. Himbury further points out, it is not necessary for the Treasury to find the money. If a Government guarantee of interest is given, all the money will be available in a day, and it appears to me that this guarantee should not be for a few years only, but as a permanency. Experience has shown that it takes a comparatively short time for any railway in tropical Africa to be in a position to pay its way and interest on capital.

Mr. H.T. POOLEY, General Secretary of the British Empire Producers’ Organisation, states:

Mr. Himbury has pointed out the all-important distinction between true economy and the mistaken withholding of productive expenditure. The Eastern and Central African Colonies would respond to a reasonable expenditure on transport facilities by tremendous development of foodstuffs and raw materials urgently needed in this country. Cotton is a particularly pertinent example of this; it is an essential raw material and we are mainly dependent on foreign production for our supplies. A precarious situation, especially in view of the growth of the spinning industry in America.

Another important point is that the greater part of the money spent for railway, harbour and transport developments in East Africa, would come to this country.

One example of very many may be taken in the Zambesi Bridge, if constructed, would provide work for the iron, steel and engineering trades in this country which is badly needed and would open up in Nyasaland and important districts of Rhodesia for the production of supplies essential to the well-being of this country, cotton looming large among them.

Producers generally will strongly endorse Mr. Himbury’s plea, and it should be remembered also that Empire producers are the best customers for British-manufactured goods.

Mr. G. H. LEPPER, London, who has taken a keen interest as regards Railways in Mozambique and the construction of the Zambesi Bridge, states:

Having devoted a great deal of time during the past three years to the task of endeavouring to arouse public interest to the national importance of accelerating the development of our great tropical estate in Africa, I wish to endorse to the full Mr. Himbury’s eloquent appeal for early action to give effect to the recommendations of the East Africa Commission regarding increased transport facilities. The new railways proposed, together with the Zambesi Bridge, will have an immense effect in stimulating the production not only of cotton, but of many other crops
for which we now pay in dollar currencies. The fabrication of the necessary material will give much-needed employment to some of our most depressed industries, thereby diminishing the amount spent on unemployment relief. Intensive development of tropical Africa will also enlarge the market for British exports and particularly those classes of exports which are most adversely affected by the trend of events in Asia. There are, therefore, three motives, each of which is sufficiently good in itself to justify prompt action in the direction of sanctioning the proposed £10,000,000 loan for new East African railways and roads, and the necessary guarantees to enable the bridging of the Zambesi to be put in hand.

THE RACE FOR COTTON.

HOW TO MEET FOREIGN COMPETITION.

It is very significant and somewhat perturbing that while Lancashire is discussing short time and depreciating markets, the Japanese cotton industry is bounding ahead. Half-a-million new spindles added last year; the number of mills doubled since 1907; the cotton consumption risen from 881,673 bales to 2,238,376, and the mills working two 11-hour shifts daily. These are figures to make one think.

At the same time we are told that while our cotton piece goods imported into Egypt during last July show a decrease of £69,000 compared with the previous July, Japan’s imports have gone up £14,000 and Italy’s £42,000. Nor are these isolated examples. Sir Arthur Balfour’s committee has placed it on record that the total imports of yarn into India from the United Kingdom in 1923–4 were 21,790,000lbs., compared with 37,836,000lbs. in 1913–14, whereas the Japanese imports jumped from 1,000,000lbs. in 1913–14 to 20,430,000lbs. last year. This will not do. Once again we would urge all concerned to go seriously into the whole matter.

Mr. J. A. Hutton has appealed to capital and labour to co-operate in increasing our supplies in new fields, and has stressed the need for transport facilities in our African cotton fields. If this is not done production by the natives may have to be stopped, simply because it is impossible to convey crops to the market. This deplorable and crippling lack of a bridge between the fields and the markets is only another factor which supports the argument we have repeatedly advanced – that the industry from raw material to finished article must be considered in its entirety. Sectional views, sectional interests sectional preoccupations must be subordinated to a clear vision of the whole. To ‘compartmentalise’ the cotton industry is to handicap its progress.

Industries are interdependent. If it is not only fallacious but paralysis not to look beyond the immediate industry in which one is engaged, how much more...
unbusinesslike and short-sighted it is not to see beyond the confines of a particular department of a specialised section. The greatest business need to-day is vision. When old methods fail new ones must be adopted. Trade depression is not a justification for despair but a challenge to enterprise. We do not say that much of the trouble which has afflicted the cotton trade was not inevitable, but we do not think it will be denied that some of it would have been readily overcome if there had been a stronger sense of common partnership and less internal disagreement.

Other countries do not intend to leave the future to Lancashire. The struggle for cotton supremacy has begun. If we lose in this, every other industry will suffer also. If we hold our own – better still, if we blaze new trails and win fresh markets – every other trade in the country will draw new energy and add to the prosperity of a recovering nation. /

DEVELOPMENT IN EAST AFRICA.

£10,000,000 LOANS GUARANTEE.

An important pronouncement on Empire Development was made by Mr. Amery, Secretary of State for Dominion Affairs and for the Colonies, at Bristol last night. He was responding to the toast of ‘United Empire’ at the annual dinner of the Bristol Branch of the Royal Colonial Institute, at which he was the chief guest.

Dealing with the development of tropical Africa, Mr. Amery said:– The Cabinet have decided to approve in principle the recommendation of the East Africa Commission for an Imperial guarantee for loans raised in connexion with transport development in East Africa up to an amount not exceeding £10,000,000 sterling. A Bill will be required to give the necessary guarantee. Surveys, etc., will be set on foot at once, and the precise works to be undertaken will be settled after thorough scrutiny of the financial and economic prospects of each individual project. It is anticipated that the work, in the main, will consist of new railways in Tanganyika Territory and Uganda, but provision for improvements in harbour and port facilities and for certain permanent, bridges and main roads is also contemplated. A small percentage of the loans will be specially earmarked for capital works and equipment in connexion with the further development of scientific research.

Mr. Amery pointed out that the West African colony which the House of Commons Committee wished to give up altogether 50 years ago was now one of the wealthiest and most progressive markets for British trade. In East Africa we had now, since the addition of Tanganyika Territory, an Empire within an
Empire of something like a million square miles and 12,000,000 inhabitants. That was a great responsibility. We could not afford, whether as mandatories or as a colonizing Power, to fail to develop these countries in such a manner that no one could say we had not fully done our / duty to them. The need for a progressive policy of development had been realized ever since the war, but the most important step forward taken was due to the initiative of Mr. Thomas, when, as Colonial Secretary, he sent out a Commission of three members, one from each party, under the chairmanship of Mr. Ormsby-Gore, to report on the whole situation. That Committee recommended a loan for harbour development. The Committee made a most valuable report on every aspect of the problem, on land, labour, health, education, and so on.

There was one point on which the Commission fastened as the crux of the whole problem – the development of the transport system, without which there could be no real progress, either for British trade in the area or for the development of the land and the welfare of the natives themselves. As the result of their investigations they had recommended that the Imperial Government should guarantee the raising of a loan on the lines he had indicated, and he was glad to say that he had persuaded the Government to adopt the same point of view. A thousand miles of new railways were contemplated in the scheme. The scheme of development in tropical Africa would in an indirect way help appreciably to reduce unemployment in this country. Orders would come in for the plant and material required for the railway schemes and road schemes, and later work would be required in connexion with maintenance. The iron and engineering industries should benefit. The areas would increase markets for British goods and the extension of cotton growing in Uganda would ensure adequate supplies of raw materials in Lancashire.

NEW RAILWAY IN EAST AFRICA.
IMPERIAL GUARANTEE FOR LOANS.
CABINET DECISION.

(By our Parliamentary Correspondent.)

In his speech at Bristol last night, Mr. Amery, the Secretary of State for Dominion Affairs, announced that the Cabinet had decided to approve in principle the recommendation of the East Africa Commission for an Imperial guarantee for loans raised for the purposes of transport developments in East Africa up to an amount not exceeding £10,000,000.
A Bill will have to be passed through Parliament to give the necessary guarantee, but surveys will be begun at once and the precise works to be undertaken will be settled after a thorough scrutiny of the financial and economic prospects of each individual project. It is expected that the work will consist in the main of new railways in Tanganyika Territory and Uganda, but provision is also contemplated for improvements in harbour and port facilities and for certain permanent bridges on main roads. A small percentage of the loans will be specially earmarked for capital works and equipment connected with the further development of scientific research.

In their report, which was published in May, Mr. Ormsby-Gore and his two colleagues expressed the view that the further economic development of both native and non-native production in East Africa is dependent on the early provision of increased transport facilities, and in particular on new railway construction. Because little or nothing could be done unless the Government were prepared to assist liberally, they recommended the passing of an East African Transport / Loan Guarantee Bill which would authorize the issue of a loan for £10,000,000, guaranteed as to principal and interest by the Government and ranking as a trustee security. It was estimated that the construction period would be five years.

One reason that influenced the Cabinet in its decision was the stimulus which the development of East Africa is expected to give to trade and employment in this country. The Commissioners expressed the view that approximately half the capital sum would be spent in this country on rails, bridging materials, and rolling stock. Work would thus be found for the engineering industries of Great Britain, and the unemployment charges would be lessened accordingly.

EAST AFRICAN LOAN APPROVED.
DEVELOPMENT AID TO COTTON-GROWING.
NEW RAILWAYS.

(From our Political Correspondent.)

There will be considerable satisfaction in Lancashire with the news that the Cabinet has now approved in principle of the loan scheme for East African development.

A Bill will be introduced during the Autumn session and probably carried before Christmas, authorising an Imperial guarantee for a series of loans up to a total of £10,000,000 for transport development in East Africa.

The loans will be floated as and when the various constructional schemes have been approved.
Now that the Cabinet have sanctioned the scheme, immediate steps will be taken to put some of the work in hand, and the first thing to be done will be to start surveys for the new railways in Tanganyika and Uganda.

**ORDERS FOR ENGLAND.**

Development work is also to be undertaken in regard to harbour and port facilities at Mombasa and Kilindini and permanent bridges on some of the main roads are contemplated.

There will be a thorough scrutiny of the financial and economic prospects of each stage of development, and when the Government have approved them the loan will be sanctioned in each case. /  

A small percentage of the loans will be specially earmarked for capital works and equipment in connection with the further development of scientific research. The loans will be placed on the market in the ordinary way, and a large proportion of the money will be spent on material which will bring substantial orders to this country, thus benefiting particularly the iron and steel industry, as well as extending the facilities for cotton production in East Africa.

Mr. Amery, Colonial Secretary, speaking at Bristol last night, mentioned the approval of the loan, and said that the most important step towards development of the African Colonies was due to the initiative of Mr. Thomas, who, as Colonial Secretary, appointed the Commission. /

Reprinted from the ‘Manchester Guardian,’ Saturday, October 24th, 1925.

£10,000,000 FOR COTTON  
NEW RAILWAYS AND PORT FACILITIES.  
GOVERNMENT GUARANTEE OF LOAN.

**BRISTOL, FRIDAY.**

An important policy announcement in regard to Empire development was made by Mr. Amery, Secretary for Dominion Affairs and for the Colonies, at Bristol to-night. He was speaking in reply to the toast of ‘A united Empire,’ at the annual dinner of the Bristol branch of the Royal Colonial Institute, at which he was the guest of honour. Dealing with Empire trade development, and particularly with the development of tropical Africa, he said: The Cabinet have decided to approve in principle the recommendation of the East African Commission for an Imperial guarantee for loans raised in connection with transport development in East Africa up to an amount not exceeding £10,000,000 sterling. A bill will be required to give the necessary guarantee. Surveys, etc., will be set on foot
at once, and the precise works to be undertaken will be settled after a thorough scrutiny of the financial and economic prospects of each individual project.

It is anticipated (Mr. Amery continued) that the work in the main will consist of new railways in Tanganyika Territory and Uganda, but provision for improvements in harbour and port facilities, and for certain permanent bridges and main roads, is also contemplated. A small percentage of the loans will be specially earmarked for capital works, and equipment in connection with the further development of scientific research.

Mr. Amery pointed out that the West African colony which the House of Commons Committee wished to give up altogether fifty years ago was now one of the wealthiest and most progressive markets for British trade. In East Africa we had now, since the addition of Tanganyika, Territory an empire within an Empire of something like a million square miles, and twelve million inhabitants. That was a great responsibility. We could not afford, whether as mandatories or as a colonising Power, to fail to develop these countries in such a manner that no one could say we had not fully done our duty to them.

The need for a progressive policy of development had been realised ever since the war, but the most important step forward taken was due to the initiative of Mr. Thomas, when, as Colonial Secretary, he sent out a Commission of three members – one from each party – under the chairmanship of Mr. Ormsby-Gore, to report on the whole situation. That Commission recommended a loan for harbour development. The Commission made a most valuable report on every aspect of the problem, on land, labour, health and education, etc.

The report was presented to himself, and not, as might have been anticipated, to his predecessor. There was one point on which the Commission fastened, and it was the crux of the whole problem – the development of the transport system, without which there could be no real progress either for British trade in the area or for the development of the land and the welfare of the natives themselves. As the result of their investigations they had recommended that the Imperial Government should guarantee the raising of a loan on the lines he had indicated, and he was glad to say that he had persuaded His Majesty’s Government to adopt the same point of view.

He pointed out that a thousand miles of new railways were contemplated in the scheme. The scheme of development in tropical Africa, he emphasised, would, in an indirect way, help appreciably to reduce unemployment in this country. Orders would come in for the plant and material required in connection with the railway schemes and road schemes, and, later, work would be required in connection with maintenance. The iron and engineering industries should benefit. The areas would increase markets for British goods, and the extension of cotton growing in Uganda would ensure adequate supplies of raw materials in Lancashire.
LETTER FROM MR. W. H. HIMBURY.

To the Editor of the ‘Daily Dispatch’:

Sir,

Allow me to say with what extreme pleasure I read this morning the clear statement made by Mr. Amery, the Colonial Secretary, at Bristol the previous night.

My colleague and myself start on a tour of our Empire cotton fields on Tuesday. Nothing could be better calculated to make our mission pleasant or more memorable than the decision now given. It has come just as I am packing up, but I cannot leave without saying how deeply indebted I am to you for the space devoted to staging an appeal. Without the service so freely rendered by the ‘Daily Dispatch’, I feel satisfied that action so essential in this issue might have been indefinitely delayed.

The guarantee of this loan is, I feel satisfied, one of the biggest things done by a Government for Lancashire trade, and in the years before us will be so recognised.

Not a few besides myself, knowing the great patriotism of the Chancellor, felt he would allow no other consideration to stand in the way of applying the recommendations of the Committee appointed by the Right Hon. J. H. Thomas during the regime of the Labour Government. Time prevents me more than mentioning assistance extended by Mr. Amery, Major Ormsby-Gore, and many others who have been active in our joint movement during the past fortnight. Other means will be adopted for fulfilling this uncompleted task.

The real purpose of this hurried note is to recognise the important lead given by Mr. Thomas’s Committee and thank the ‘Daily Dispatch’ for all it has done.

(Signed)

W.H. Himbury.

[...]

CONFIDENTIAL.

COLONY AND PROTECTORATE OF KENYA

MEMORANDUM

ON

RAILWAY DEVELOPMENT

By LT.-COL. SIR EDWARD GRIGG, K.C.V.O., C.M.G., D.S.O., M.C.,

Governor and Commander-in-Chief of the Colony and Protectorate of Kenya, and High Commissioner for the Kenya-Uganda Railway.

NAIROBI:

[...]

1926. /

RAILWAYS.

1. Close attention is now being given in England to the commercial development of the basin of Lake Victoria, with particular regard to the growth and export of cotton, and an influential body of opinion is urging that Mwanza, at the south end of the Lake, should be connected by rail with the Central Tanganyika Railway for the special purpose of affording cotton and the other products of the Lake basin an alternative outlet to the sea in competition with the Uganda Railway. This memorandum is written as a broad presentment of the views of Kenya Colony and Protectorate upon that subject.
2. Kenya's main contention is a simple one. German rivalry in Tanganyika has been eliminated by the war. East Africa as a whole is now under British administration. Economic development is no longer limited by the old artificial international frontier nor need it be retarded by inter-colonial rivalry in trade and transport. Kenya therefore submits that the railway development of the East African territories should now be pushed forward on co-operative and complementary, not on competitive lines, and that railway questions affecting more than one of the East African territories should be judged by geographical and economic convenience without too strict a regard for existing inter-colonial boundaries.

3. It is true that the adoption of this principle must give all the territories a voice proportionate to their interest in railway questions outside their own boundaries; but the conquest of German East Africa and the placing of a continuous series of territories under British administration would seem to have little value if all questions of railway development which necessarily affect more than one territory are still to be considered and decided in watertight compartments. Kenya, at any rate, claims some right to be heard on common questions such as railway development even outside her own frontiers, because in the campaign which freed Tanganyika from German rule she bore a burden and made a sacrifice larger in proportion to her means than any other British colony of her size and settled population. It is no more than just that the effort which she then made for the Empire in East Africa should not be overlooked now that developments only made possible by the war are being discussed.

4. But she has no desire to use her share in the war as a form of special pleading for a policy or a principle the merits of which would otherwise be weak. On the contrary, she is firmly convinced that the policy which she advocates presents, on purely economic grounds, the soundest line of investment for British capital in East Africa at the Present time; and she desires it to be judged solely on its merits from the economic point of view. It is indeed her whole case that when the British taxpayer is about to invest ten millions sterling in East Africa free of interest for ten years, all narrow political considerations based on boundaries fixed in totally different conditions forty years ago should be firmly set aside, and attention given only to the best form of investment / regardless of inter-colonial boundaries, which the economic conditions permit. Kenya reverted to the history of the war only to prove her right to urge that case with what might otherwise seem an improper disregard for existing political landmarks.

5. Before the war Kenya marched on both her northern and southern frontiers with foreign territories, two of which were held by first-class European Powers. When war broke out, the total European population in Kenya was estimated at 3,500. The total number of adult males, of fighting age and over, including civil servants, missionaries and aliens, was 2,321. Of these 1,987
Grigg, Memorandum on Railway Development

volunteered for military service and rendered it. The war was at first mainly defensive; Kenya was threatened by German raiders all along her southern frontier, and largely by her own efforts staved them off. With the arrival a few months later of reinforcements from Europe, South Africa, and India the war was carried into German territory and resulted after very heavy losses in the complete conquest of the German Colony. The total lives lost in the East African campaign were 52,764. Of these, 2,365 were Indian, 3,781 European, and 46,618 (including porters and followers) African. The African troops, porters and followers engaged came from South as well as East Africa, but Kenya and Uganda suffered much the heavier share of the loss. The Indians came entirely from India. The great majority of the European troops came from the South African Union, Rhodesia, Kenya and Nyasaland. In addition to a heavy toll of lives, Kenya has actually paid in war expenditure nearly £700,000 out of revenue and has in addition to meet interest and sinking fund charges which will amount to three-quarters of a million on this account.

6. The campaign completely changed the political map of East Africa. For the first time British control was established over a continuous belt of tropical territories stretching from Rhodesia to the frontiers of Egypt, Abyssinia and Italian Somaliland. To Kenya this transformation brought one supreme advantage and with it a promise for the future such as had no existence before the war. She not only remained British herself, but she ceased to be an isolated British post, bounded north and south by foreign Powers. That was the accomplished fact. Its promise was that with the disappearance of German rivalry in trade and transport, from which both in the Lake Victoria and in the Tanga areas she had much to fear, co-operative instead of competitive development might be provided for in East Africa as a whole.

7. From Kenya’s standpoint, however, the results of the war are up to the present even less satisfactory than they seem to be elsewhere. The European population, estimated at a total of 3,500 in 1914, has indeed risen to well over 10,000, and amongst these are over 1,500 soldier-settlers who received land on special terms by instruction of the Imperial Government. Much capital has gone into the Railway and the Port, and since 1921 production has made amazing strides. But the picture has another and a less smiling side. Alone in the British Empire Kenya by the cession of Jubaland to Italy actually lost territory as a result of the war. The transfer was made without her knowledge, and she was comforted with the assurance that her expenditure would be considerably reduced. The promise has not been fulfilled. She retains an equally long and far less convenient frontier which threatens much future trouble and expense. Owing to its character, she has had to face an immediate increase of smuggling, which entails for 1926 alone an estimated loss of £25,000 in ivory revenue, and seems likely in a few years to destroy that branch of revenue altogether. In Kismayu and the Juba
River, moreover, she has lost an asset capable of great future development both as a stock- and crop-producing area. Nor is that all. In 1921, at a moment when the trade of the whole world had suddenly collapsed and Kenya herself was suffering from the results of a bad year, her currency was suddenly converted from rupee to sterling by Imperial instructions, with the result that overdrafts at the banks, which were then large and numerous, were increased overnight by over 50 per cent. The Colony was severely hit by the change, and the heavy interest and sinking fund charges referred to above were added to her recurrent expenditure from that period. Kenya's recovery since that date has been amazing, but it has not been due to any consideration given her for the services she has rendered or the sacrifices she has made.

8. The future, however, is still an open book; and for Kenya it will turn to a very great extent on whether she has to look for co-operation or for competition in the organisation of what was once German East Africa. Her own boundaries have been treated with small respect; and she considers herself entitled to a voice in matters which affect her closely to the south of the old international boundary proportionate to her share in wiping that boundary out. She submits that, since East Africa is now wholly British, the geographical facts, the racial configuration and the economic convenience of the country as a whole should no longer be subordinated to artificial boundaries established blindly in another age.

9. That is the foundation of the argument on the railway question set out in this memorandum. The old frontier between British and German East Africa, on which the most pressing railway and tribal questions turns, was ignorantly drawn forty years ago in Europe by diplomats who knew practically nothing about the country they were dividing and could not possibly have forecasted the lines of its development. Nothing could be more artificial than that frontier, whether from the tribal, or the geographical, or the economic point of view. Now that the British Empire administers both sides of it, the time has surely come to remedy its anomalies, in the interests of native, settler and trader alike. Why, Kenya asks, should an old and artificial frontier, which has lost its raison d’être, continue to dominate British minds as though it were an ineradicable feature of the soil, not a mere line upon the map?

10. These considerations evidently shaped both the instructions received and the conclusions reached by Lieutenant-Colonel F. D. Hammond, who was sent out by the Secretary of State for the Colonies in 1921 to report on the railway systems of Kenya, Uganda and Tanganyika, including marine and terminal facilities. His findings coincide exactly with the points which Kenya now desires to urge in regard to future railway development.
Colonel Hammond’s Railway Report, 1921.

11. In addition to making certain specific investigations, Colonel Hammond was asked in the Secretary of State’s instructions ‘to advise on railway extension generally – regarding Kenya, Uganda and Tanganyika as a single whole from the point of view of railway and harbour / development.’ In the last section of his report, entitled ‘Future Development of the Railway Systems of Kenya, Uganda and Tanganyika,’ he addressed himself to this question, arguing ‘the necessity to concentrate on one or two big ports, and to direct the policy of railway development accordingly.’ On these grounds, he recommended:–

(1) That the Voi-Kahe Railway should be reconstructed and made permanent, and that the area round Moshi and Arusha and their hinterland should evacuate its products via Kilindini instead of Tanga.

(2) That the aim of policy should be to develop the two principal ports, Kilindini and Dar-es-Salaam, and to direct as much of the traffic through them as possible.

(3) That a clear line of demarcation should be laid down between the areas to be served by these two ports and the railway systems based on them.

Colonel Hammond’s recommendations on the latter point were perfectly clear. He wrote (Report, Part III, p. 56, para. 290):–

‘The two main systems centring on Kilindini and Dar-es-Salaam are best described by the analogy of a large river system. The basin served by the former would include the Moshi and Arusha areas and any subsequent extension towards the south-east corner of Victoria Nyanza: the whole of Uganda and Victoria Nyanza is also included in this ‘basin’; and the ‘traffic watershed’ between it and the Dar-es-Salaam ‘basin’ would be along a line passing midway between Mwanza and Tabora and to the north of Kondoa Irangi until it finally meets the boundaries of the small Tanga ‘basin.’ The southern boundary of the Dar-es-Salaam ‘basin’ would correspond very closely with the eastern watershed of the Rufiji River down as far as the Pangani Rapids.’

It is precisely these recommendations for the demarcation of the ‘basin’ of the Kenya-Uganda railway system that Kenya now desires to see realised. The proposed railway ‘watershed’ between the Kenya-Uganda and Tanganyika systems corresponds exactly with the physical watershed, which is shown by the brown line in the map attached to this memorandum. The line runs just north of Shinyanga, so that Shinyanga belongs naturally to the Tanganyika basin, while the whole of the area south-east and east of Mwanza through which it is sug-

gested that the Shinyanga-Mwanza line should run falls equally naturally into the Kenya-Uganda basin. A dotted brown line shows the small Tanga basin.

12. The advisability of a demarcation of railway basins is raised in a pressing form by the fact that a railway is now under actual construction from Tabora to Shinyanga, and that the continuation of this line to Lake Victoria at Mwanza is being vigorously urged in many quarters. This branch was originally started by the Germans. Its object, / as Colonel Hammond pointed out,* was ‘to tap the rich districts of Ruanda and Urundi, and to divert both this and the traffic of the Mwanza district from the Uganda Railway Marine.’ Colonel Hammond added that, ‘with the absence of any motive for competition, the raison d’être of this line has disappeared.’ To Kenya and Uganda it is of the utmost importance that, before this branch line, condemned as unnecessarily competitive by Colonel Hammond, is completed, full consideration should be given to the following questions:–

(a) Whether, when the Tabora-Mwanza line is completed, competition between the Tanganyika and Kenya-Uganda railways can be avoided or minimised by agreement as to uniform import and export rates.

(b) Whether, even if agreement as to rates be possible, the construction of this line will not necessarily reduce returns on capital already invested in the railway systems and thereby delay fresh capital development to the detriment of new construction of a complementary and non-competitive character.

(c) Whether, pending the time when amalgamation of the two railway systems may become possible, the true line of economic development for East Africa, regarded as a whole from the standpoint of transport facilities, is not to accept the demarcation of railway basins proposed by Colonel Hammond and thus to avoid the dangers indicated in the two preceding paragraphs until they can be dealt with by a single authority with unified control of railway rates and finance.

The questions posed in these three paragraphs follow each other in logical sequence.

(a) The Question of Rates.

13. It is difficult to see how a uniform system of export and import rates over the two railway systems from Lake Victoria to the sea can in practice be applied. At present the two railway systems are financed by almost diametrically opposite systems of rates.

The Uganda Railway has aimed at the encouragement of production throughout the area which it serves. For this reason it has adopted a system of

* Report, p. 60, para. 296.
cheap long distance export rates and comparatively high import rates. Some of the import rates are very high; all the export rates are exceptionally low. Examples of the latter are the rate for groundnuts from Mwanza to the Coast, and the flat rate for maize from any part of the country.

The Tanganyika Railway has evidently had quite different conditions to face. It carries a large tonnage of copper ore from the Belgian Congo to the Coast. These minerals pay a comparatively high rate. But the trucks which carry them to Dar-es-Salaam would return empty to the Lake if the import rates were not low enough to persuade importers into the Belgian Congo to send their goods by the Tanganyika route. On the Tanganyika railway system therefore the established principle, exactly converse to that of the Uganda system, is to have fairly high export rates and comparatively low import rates.

14. The results of this divergence between the two systems can already be studied both in the Mwanza and the Moshi areas. In the case of Moshi, for instance, the Uganda Railway seems to be receiving only the low-rated export traffic, while the Tanga Railway takes the lion’s share of the more profitable import trade. In the Mwanza area also, the Uganda Railway is carrying the bulk of the export trade at very low rates, while certain far more profitable classes of import traffic reach Mwanza through Tabora, because the cost by rail and road from Dar-es-Salaam to the Lake is less for such classes of goods than the cost from Kilindini by rail and ship.

15. If the rates are not assimilated when the Mwanza-Tabora line is built, there must inevitably be a further diversion of the profitable import trade from the Uganda system – a loss which that system can only meet by raising its export rates proportionately, and thereby penalising production. On the other hand, the Tanganyika system could hardly raise its import rates to the same level as those on the Uganda system without sacrificing import traffic to the Belgian Congo. The only practicable course would therefore be to arrange a compromise under which the import and export rates on both systems would be as closely assimilated as possible. But any such compromise must so gravely affect the financial system of both railways, and also the fundamental conditions of trade and production in all three territories, that it would inevitably become the subject of continuous controversy between them.

16. The difficulty of adjustment, so far as the Uganda Railway system is concerned, is clearly shown by the following table of the import rates charged to the Lake area by the two railway systems on three important commodities:
Comparative Rates on Tanganyika and Kenya-Uganda Railways.

<table>

</tbody>
</table>

The importance of these high rates to the Uganda Railway is considerable. They make possible a low export rate on raw cotton and cotton-seed, and therefore give a stimulus to native production. The spirit and tobacco rates, on the other hand, are rates on luxuries, and they are almost entirely paid by the European population, which benefits in return by low export rates on its own produce. Kenya also maintains very high customs duties on spirits and tobacco, without apparently affecting consumption.

What any loss of revenue on the import of these commodities would mean to the Uganda Railway may be judged by the fact that the total receipts on these three commodities alone for the first nine months of 1925 amounted to no less than £242,419, or about one-sixth of the total revenue of the railway for that period, which amounted altogether to £1,490,219. The total advertised traffic receipts from all sources on the Tanganyika Railway amounted over the same period to £193,202.

17. Other examples might easily be given to show the profoundly disturbing effect upon the railway systems of rate competition or even of rate assimilation. The complexity and unpopularity of any such development would, moreover, be aggravated by the necessity of referring disputes to a distant authority in London, which would never be regarded as a satisfactory final arbiter on intimate local conditions. The delicacy of such questions, and the difficulty of reaching agreement on them, can be illustrated from chapter after chapter of the history of the railways in South Africa before the Union. Such controversies hamper trade and hinder development to an extent which can hardly be overdrawn. They make stable conditions of trade and production impossible, for every new compromise produces some unexpected result, or inflicts on some branch of traders or producers a change of conditions which they regard as intolerable, and so controversy and uncertainty are renewed perpetually. The only final solution of the problem is amalgamation of the railway systems. Until that becomes practicable in East Africa as in the South African Union, it is surely wise to avoid in East Africa, as foresight can, the controversies between Colonial railway systems which distracted South Africa for half a generation.

18. The difficult would, moreover, not be confined to the railways. It would extend to the organisation and direction of shipping on Lake Victoria, and even
to the port systems at Kilindini and Dares-es-Salaam. On the Lake it would presumably be agreed that the Tanganyika Railway should not start a marine service in competition with that into which Kenya and Uganda have already put much capital. Railway development now proceeding in Uganda will during the present year and more particularly during 1927 deprive the existing fleet of a considerable proportion of its existing traffic. Unless therefore the whole of the Lake Victoria basin remains available for exploitation by the Uganda Marine Services, it will be necessary to lay by ships and lighters on which heavy loan expenditure has already been incurred. Even, however, if competition on the waters of the Lake were avoided, controversy would be hard to avoid, for the Uganda Marine Services would be called upon to serve two railway systems with efficiency and impartiality and could never escape from criticism on one or other of these grounds or on both together. The same difficulty would extend to harbour dues at the coast; and opinion would ultimately be driven to conclude that the only alternative to free competition between the two systems was complete amalgamation.

(b) The Division of Traffic.

19. Whether, moreover, competition were free or limited by compromise agreements, it is surely undeniable that the completion of the Tabora-Mwanza line must lead to competition. Two railway systems will then be tapping the Lake Victoria basin instead of one, and whether they agree on rates or not, the trade of the basin, instead of going wholly to one railway, must be divided in some proportion or other between the two. For the Tanganyika system this is not an immediate objection since it carries at present very little of the trade of that basin, But from the point of view of the Uganda Railway, and also from that of the British taxpayer, it is a very serious one. Loss of traffic from the Lake must mean for Kenya and Uganda a slower return upon the capital invested in their railways and harbours, a longer period before rates can be reduced, a proportionately weakened stimulus to increased production, and some serious retardation of new railway construction. It would also compel immediate revision of the present policy of renewals and betterment on the main line. The British taxpayer, for his part, must look for all-round development, and the demand for goods which development produces; but if the capital which he devotes to developing one railway system is so used as to retard the development of another in which he is equally interested, he loses on the swings what he gains on the roundabouts, and is none the better off for his expenditure.

20. Not even for the Tanganyika system would competition for the Lake Victoria trade be an unmixed blessing. The capital invested in the Tabora-Mwanza line, where competition in some form is inevitable, is capital withdrawn from the construction of other feeder-lines, such as the greatly needed branch to Nyasaland and Northern Rhodesia, where the whole trade, import and export,
and every mile of new development would bring an undivided increment to the Tanganyika revenues. Not the least of Kenya’s objections to the Tabora-Mwanza line is that its construction must inevitably postpone the completion of essential arterial lines in both the northern and southern East African basins. Ten millions sterling are only ten millions; but they will go further if invested in complementary rather than competitive railway development.

This consideration is fortified by the fact that some part of the ten millions must of necessity be spent on bridging the Zambesi and thereby enriching Beira and the foreign or privately owned railways connected with it. Unless therefore another considerable part of the ten-million loan is available to press on the construction of a railway from the Tanganyika line to Northern Rhodesia through Nyasaland, the British taxpayer will merely be assisting to divert trade from a British port to a Portuguese one. To spend the British taxpayer’s money on enriching Dar-es-Salaam by impoverishing Kilindini is bad enough; but it seems even worse to spend it on fattening Beira and starving Dar-es-salaam, more particularly since the completion of an essential British railway connexion along the highlands south of the Tanganyika line must thereby be greatly prejudiced and perhaps long postponed.

On this question the views of Sir Sydney Henn, the Chairman of the Joint East Africa Board, who looks at East African affairs from an impartial stand-point and has studied them intimately, deserve respectful attention. Writing to the Manchester Guardian of October 24th on the allocation of the ten-million loan, he said:

‘I would urge the Government to give preference over all other projects to the construction of a main trunk line to connect Dar-es-salaam with the north end of Lake Nyasa, and I appeal to public opinion throughout the country to support this recommendation. I am not wedded either to the particular scheme suggested in the report of the East Africa Commission or to any other route, but / I do most definitely assert my belief that from both an Imperial and an International point of view the early construction of this trunk line is of supreme importance; Imperial, because it would open up for development fertile areas in south-west Tanganyika, and eventually provide an outlet to the sea at a British port for north-eastern Rhodesia and northern Nyasaland (consider in this regard the Conference of White Settlers from Kenya, Tanganyika, Nyasaland, and north-eastern Rhodesia held under Lord Delamere a few days ago at Tukuyu, near the boundaries of the three last-named territories); International because our failure to date to show any serious intention of developing Tanganyika Territory as it should be developed under the mandate is the main reason why the claim of Germany to have this particular Colony returned to it is listened to with sympathy in many quarters abroad. Finally, this line would bring
all the East African territories into direct transport communication and greatly advance the cause of good government.

It is interesting to note that while actually writing this paragraph, I received a telegram saying the Governor of Northern Rhodesia, having to travel to the Governors’ Conference by Beira, had been stopped by floods and had consequently missed his steamer. The episode lends force to Sir Sydney Henn’s concluding observation.

21. The arguments of the preceding seven paragraphs apply with equal force to the Moshi-Arusha district. No one has suggested that it would be wise or even practicable to develop the port of Tanga in competition with Dar-es-Salaam and Kilindini. Tanga, with its present facilities, will continue to serve a small coastal hinterland, but the main trade of the Moshi-Arusha district must go either to Kilindini or Dar-es-Salaam. Moshi is already connected by rail through Voi with Kilindini. A new line already surveyed by the Tanganyika Government will extend that connexion to Arusha. No railway engineer or business man, looking at the geographical configuration of the country, could well dispute Colonel Hammond’s verdict that the natural outlet of the Moshi-Arusha area to the sea is through Kilindini.

To build a competing connexion from Arusha to the main Tanganyika line, which must go through harder and less profitable country unless a long detour be undertaken and the mileage to the sea proportionately increased, can never be an economic proposition until both trade and policy require a continuous north and south arterial connexion. There is no such prospect yet in view, and in the meanwhile division of the trade of the Moshi-Arusha district between two railway systems could lead to nothing but an accentuated form of the rate problem already dealt with in regard to the Mwanza area. In other words, it would lead only to retarded development and waste of capital.

(c) Demarcation of Railway Basins.

22. It seems therefore clear that there are great advantages to be gained, and equally great disadvantages to be avoided, by the demarcation of railway basins proposed by Colonel Hammond four years ago. The practical value of his suggestions stands out plainly now that it is actually proposed that the two railway systems should enter the same basin, whether in the Mwanza or the Arusha areas, and divide the trade between them. For Kenya and Uganda that prospect is particularly threatening at a moment when they are reorganizing their seaport at Kilindini and putting further capital into it. The penetration of a second railway system into the basin which that port is designed to serve must necessarily put a very different complexion upon the project of fresh capital expenditure on harbour facilities and upon the prospect of reducing harbour dues. For a sec-
ond railway tapping the same area must mean competition, and the preceding paragraphs have shown that even assimilation of rates cannot in practice so neutralize competition as to prevent it from affecting most gravely the whole basis on which both railway and port are at present financed.

23. Serious, however, as this question is for Kenya, Uganda, and other parts of East Africa, which must all suffer if the present policy is not revised, it does not affect East Africa alone. It is also a serious question for the British taxpayer, who can hardly wish to see ten millions sterling of his money devoted to mutually damaging forms of enterprise. Yet if part of that sum is spent on Kilindini Harbour, and part of it on branch lines from the Tanganyika line to the Mwanza or Arusha areas, the former investment suffers directly from the latter. It is a policy, or a lack of policy, which defeats itself. The demarcation of railway basins seems indeed to be the only means of saving the British national capital already invested or soon to be invested in East Africa from this unprofitable competition with itself. Are there, any objections to the policy of demarcation so serious as to outweigh its evident advantages?

24. Colonel Hammond’s proposed demarcation has been so completely lost to sight during the last five years that there has been no recent consideration given to it; but the following possible objections emerge by inference from the discussions of railway development which have recently taken place:–

(a) That the Uganda trade urgently needs an alternative outlet to the sea, and that production in Uganda will be stimulated thereby.

(b) That the port of Kisumu can never be adequately developed to take the whole of the Lake Victoria trade.

(c) That a local railway is necessary to develop the Mwanza area.

(d) That the Tanganyika Railway is entitled to all the trade of Tanganyika Territory, including the Mwanza and Moshi-Arusha areas, and that the Mandate forms a serious obstacle to any other line of development.

It will be convenient to take these objections in turn.

(a) Uganda’s Need of another Outlet to the Sea.

25. The question whether production in Uganda would be stimulated by the establishment of another transport route to the sea has already been explored in paragraph 13–19 of this memorandum. The present state of the railways in Canada is perhaps a sufficient additional illustration of the fallacy that two competing railway systems are better for a developing country than one. /
railway purposes before 1923, the Uganda Railway has suffered from serious congestion during the past two years; but impatient remedies of such trouble often produce even worse, though different, results. The capital necessary to increase the carrying capacity of the Kenya-Uganda main line is far less than the capital necessary to build the Tabora-Mwanza line. A great deal of the necessary capital, and further large sums allocated to renewals and betterment from revenue, have indeed already been devoted to that object, and the hard work done, in the face of unceasing criticism, by the present General Manager of the Railway is just beginning to bear fruit. But a great deal of the expenditure incurred for catching up arrears in maintenance and expanding the carrying capacity of the line to meet a rapid development of trade will be thrown away, if part of that expected trade is diverted to another line; and while Kenya and Uganda’s expenditure is thus being wasted, Tanganyika must incur new expenditure for similar improvements on its own line. For investors, traders and producers alike, this would be an expensive procedure to pursue.

27. If any doubt exists regarding the future capacity of the line, it should be removed by comparison with the traffic carried by the Natal main line. The following statement by the General Manager of the Uganda Railway points this comparison:–

‘The Natal single main line, when I left South Africa, was carrying 21,000 tons per day. I believe it has since carried up to 25,000 tons per day.

‘We have never yet been asked to carry more than approximately 1,500 tons per day on the section between Nakuru and Kilindini, and there is no reason whatever why that section should not be developed to make it capable of carrying certainly 12,000 tons per day, and probably much more, without doubling, provided the Port is developed and worked so as to fit in with the railway system. It is most unlikely that for the next fifty years the line will be asked to carry anything like 12,000 tons per day, unless there is a big mineral development in the interior, of which no signs are apparent to-day. The Natal heavy traffic includes, of course, coal for export and bunkering. In Kenya and Uganda we are still entirely dependent on agricultural traffic and precedent or consequential imports.

‘We are relaying the main line between the Coast and Nairobi with 80lb. rails. That will treble, and may quadruple, the capacity in the matter of engine loads. Further increases in capacity will depend, as they do on all railways, on the number of crossing stations, and numerous crossing stations can be put in without difficulty.

‘The section between Nairobi and Nakuru presents the only difficulty. For that section I am ordering ‘Garrett’ engines, which will take, I hope, up to double the present loads. If that is not enough we should relay the line with 80lb. rails; and if that does / not increase the capacity sufficiently, or even before relaying
with 80lb. rails is resorted to, we could relieve the whole position by the simple process of running a loop line from Nairobi through Ngong to Kijabe (a section which has been reconnoitred since my appointment here), thereby not only providing a double line but avoiding the bad grades on the existing line between Nairobi and Longonot.

‘In my opinion, relaying with heavier rails, strengthening bridges, increasing the number of crossing stations, building larger engine depôts and depot yards, etc., would increase the capacity of the main line from Nakuru to the Coast sufficiently to meet any demand likely to be made upon the Uganda Railway for the next fifty years, but if I should prove to be wrong, doubling could always be resorted to.’

The General Manager adds, with reference to the suggested need of another outlet for Uganda to the sea, that, ‘Surely, unless competition is a deliberate object, developing one line to its full capacity is the sound business method.’ It may also be observed that doubling the whole main line, when necessary, would involve a smaller tax on capital and development than the competition of two main lines, whether regulated by rate agreements or not. The example of Canada is the gravest possible warning against the increase of capital burdens without return which results from over-hasty development of competitive main lines.

28. A word is called for by the General Manager’s reference to port management, which is of the highest concern. The task of the railway has undoubtedly been aggravated in the past three years by congestion at Kilindini. The two new deep-water berths, with their modern equipment of cranes and sheds, are now coming into operation; two new berths are to be built with as small delay as possible; and the whole business of harbour management has been reorganized on lines which will greatly facilitate the railway’s task. It would at least be well to give this new organization, with all the expenditure entailed, a year or two’s trial before committing the railway and the port to competition with another transport system so short a distance, as African distances go, to the south.

29. It should also be remembered that the traffic on both the Tanganyika and the Uganda Railways is at present swelled by the carriage of construction material for new lines. That fact bears closely upon any estimate that may be made of the ultimate carrying capacity of the railways and of the revenues which they will earn. The Uganda Railway is endeavouring to keep its debt charges as low as possible against the time when construction slows down and revenues in consequence fall by allocating a large proportion of its earnings to renewals and betterment and by other means. This aspect of the railway question should not be lost to mind by those who urge that the immediate prospects of trade justify and even necessitate the establishment of competition between the Tanganyika and Uganda lines.
(b) The Port of Kisumu and Lake Traffic.

30. The argument that Kisumu, owing to its shallow approaches and other natural disadvantages, must ultimately prove incapable of evacuating all the developing traffic of the Lake may be conceded without reserve. But that time is far ahead, since the pressure of traffic on Kisumu will be considerably relieved in the near future when the main line through Uganda north of the Lake is completed. Through railway connexion with Jinja will be established by the middle of 1927, unless unforeseen reasons prevent. A shorter connexion from the neighbourhood of Tororo to Jinja is now being surveyed. It is expected that the traffic down the Mbale-Tororo road to Mjanji will be diverted to the new railway by the end of the present year. Kisumu will therefore more and more depend upon trade from the southern half of Lake Victoria, and an increased flotilla of tugs and lighters is already being provided to carry traffic from the smaller ports and piers. Kisumu can thus fully serve the Lake for many years to come; and when it begins to prove inadequate, Jinja with its excellent harbour will be available for Lake trade. Ultimately, the traffic of the southern end of the Lake may justify a separate railway outlet to the sea; but the shortest route for such an outlet, to which reference is made in the next two paragraphs, would be by junction with the Kenya line to Kilindini, not by junction with the Tanganyika line to Dar-es-Salaam. The prospects of Lake traffic and the Lake ports for many years to come give no ground for the establishment of competing railways from the Lake to the sea, whether regulated by agreements or not.

(c) The Need of a Railway for the Mwanza Area.

31. The objection that the Mwanza area cannot be left without a railway is also sound so far as it goes; but it is not an argument against the proposed demarcation of railway basins. It is generally agreed that the best alignment for a railway intended to develop the Mwanza hinter-land is east of the direct line to Tabora. Such a line, pushed eastwards as conditions required, could for some time evacuate its traffic through Mwanza and the Lake, and it would eventually be linked with the Uganda Railway either through Arusha and Moshi, or, if that alignment were attended with too serious difficulty, through Magadi or South Kavirondo. Like many other coastal regions round the Lake, Mwanza may also be profitably and cheaply developed by feeder-roads running either to Mwanza itself or to small subsidiary ports where piers for tugs and lighters may be built at small expense. The need of these has already been urged by the Kenya and Uganda Governments.

32. It is in any case highly desirable, before the alignment of the Mwanza railway is finally determined, to have the country between Mwanza and Arusha freshly surveyed. All that is known about it at present is through a German survey,
and the Germans had special reasons for wishing to deflect traffic to the Central Tanganyika Railway and Dar-es-Salaam. It is the fact, moreover, that other German surveys have been found unsatisfactory. The Governor of Tanganyika has noted this in regard to the German railway survey of the Ngerengere-Kilombero area and the German railway survey reports of the country between the Igali Pass and Ilongo. It will also be remembered that our own first estimates of the cost of reconditioning the Voi-Moshi railway were extremely inaccurate. It was announced in Parliament, presumably on local advice, that the work would cost half a million. After much hesitation, due to this estimate, the line was ultimately put in working order by the Uganda Railway for £30,000. It is therefore not unreasonable to ask that old surveys and estimates for the construction of a line between Mwanza and Arusha should be checked by fresh reconnaissance. /

(d) The Inter-Colonial Frontier and the Mandate.

33. There remains the argument that Tanganyika Territory is naturally and properly entitled to build what railways it considers advisable within its own boundaries. The claim which Kenya advances to be heard on this question has been stated earlier in this memorandum and need not be repeated. Her view may be summarised in a sentence, already used – that ‘the conquest of German East Africa and the placing of a continuous series of Territories under British administration would seem to have little value if all questions of railway development which necessarily affect more than one Territory are still to be considered and decided in watertight compartments.’ The whole of this memorandum is an argument against the competition and waste which that method must inevitably produce.

34. As to the Mandate, there is no reason why its terms should create any difficulty in the proposed demarcation of railway basins. There is, in fact, a clause in the Tanganyika Mandate which provides for necessary administrative reorganization. There are also precedents for linking Mandated Territory with a British Colony for one purpose or another in West Africa and elsewhere. To the League of Nations it cannot matter what British administration undertakes this or that responsibility in Mandated Territory, provided the terms of the Mandate be respected and the responsibility duly discharged.

Conclusions.

35. To Kenya, then, the objections that may be urged against the demarcation of railway basins proposed by Colonel Hammond do not seem insuperable. All that is required for the moment to give that policy effect is that the principle of demarcation by the natural watershed should be accepted as the basis of future development, and that the proposed extension of the Tanganyika line from Tabora to Shinyanga which lies south of the natural watershed, should
not be continued over the watershed into the Lake basin. The possible effect of demarcation of railway basins upon existing administrative boundaries may indeed require the closest consideration; but such questions are not relevant to a memorandum on the economic problem of railway development, nor do they call for any urgent solution. All that is urgent is, by acceptance of the principle of demarcation of basins, to save East Africa from an era of competitive instead of co-operative development, and from all the retardation, controversy and waste which railway competition, however regulated, must inevitably produce.

36. It would in truth be better for trade and production in Kenya and Uganda that there should be no ten-million loan at all than that a part of that loan should be applied to financing competition against their railway and their port. They can raise on their own credit sufficient capital to complete all the railway and harbour development necessary to serve the Lake Victoria basin as whole. Competition against them, on the other hand, would not be possible without the British taxpayer’s aid. How gravely such competition affected both Colonies would naturally depend on circumstances, such as good and bad years, which cannot be foreseen; but whatever their prospects, they would in any event be altered for the worse. Even the privilege, if granted, of paying no interest for a period on such part of the ten-million loan as might be allocated to them would not compensate them for any considerable loss of traffic to another line; and they would have to begin paying interest on the loan at a period when the results of competition would probably not yet have been made good by increase of trade and new development.

37. It is, of course, not only certain but also desirable that the railways of British East Africa should ultimately be linked up. But the whole trend of East African traffic is from the coast to the interior and from the interior to the coast, or roughly east and west. The railway system based on Kilindini is the natural inlet and outlet for the trade of Lake Victoria. The system based on Dar-es-Salaam is, on the other hand, the natural inlet and outlet for the valuable trade of Lake Tanganyika and the Southern Congo, and of the two British Colonies, Nyasaland and Northern Rhodesia, lying immediately to the south. To carry the southern system into the basin of the northern system, until the trade of that basin is really beyond the single capacity of the railway already serving it, can only be to squander capital on competition in the north which should be spent on new construction in the south. It is therefore surely wise, as Colonel Hammond proposed, first to develop both railway systems from east to west and to delay the north and south connexions until the necessary main lines from east to west are complete.

38. To summarize, the policy of demarcation of basins follows the natural physical and economic configuration of the country, the main channels of which run east and west. To recognize this principle in the investment of capital makes
certain that all the capital invested will pull its full weight. It is the only means, moreover, of avoiding competition in the period of development. How disabling such competition may be in growing Colonies South African history is there to illustrate. Lord Selborne, in the famous memorandum which first raised the question of union, described it as ‘a monstrous state of affairs ... the direct result of frontiers arbitrarily ruled across the map of South Africa between sections of one community which corresponded to no real political or physical lines of division’; and in another passage he pointed to union as the only final remedy for a system in which the railways were ‘cut up by political accidents of the past utterly at variance with the natural conditions of railway administration.’ Closely as this description fits the present situation in the northern East African basin, Lord Selborne’s remedy is not practicable in East Africa as yet; but it is possible to apply a temporary remedy here until conditions are ripe for the closer union which ultimately made an end of inter-colonial competition in South Africa. That temporary remedy is demarcation.

39. I trust, in conclusion, that the Governors of other East African Territories will condone the liberty which I have taken of speaking at large on East African affairs. They will, I think, endorse the claim that Kenya’s service in the war entitles her to be heard on questions so closely affecting her, even beyond her own boundaries; and I apologize to them if in any argument that I have used I have unwittingly transgressed the limits to which that claim may properly be pressed. No question, outside the vast range of questions raised by native welfare and government, is of greater importance to Kenya than the co-operative organization of railway development. In the Lake Victoria and Tanganyka areas that question is now urgent and acute; and being responsible for the interests both of Kenya and of the Kenya-Uganda Railway, could not conscientiously have abstained from explaining how seriously both interests may be affected by the policy of inter-colonial railway competition now being advocated in influential quarters at home. Nor could I properly have failed to call attention to the practical alternative advocated by the only great railway authority who has been invited to study East African railway development as a whole since the map of East Africa was transformed by the Treaty of Versailles.

EDWARD GRIGG.

Nairobi,

January 18th, 1926.
EDITORIAL NOTES

Part 2, Nos 1 and 2. Messrs Fitzgerald and Mercer to Colonial Office and Colonial Office to Messrs Fitzgerald and Mercer

1. Sir Garnet Wolseley: Field Marshal Garnet Joseph Wolseley, first Viscount Wolseley (1833–1913), an Anglo-Irish officer, who served in Burma, the Crimean War, the Indian Mutiny, China, Canada, and in Africa – commanding the Ashanti campaign (1873–4) and the Nile Expedition against Mahdist Sudan (1884–5). The Ashanti campaign lasted just two months. After the battles of Amoaful and Orhahsue, his forces entered Kumasi, which they burnt to the ground (see H. Kochanski, Sir Garnet Wolseley: Victorian Hero (London: Hambledon Press, 1999)).

2. Sir M. Hicks Beach: Michael Edward Hicks Beach (1837–1916), a Conservative politician, who served as Chancellor of the Exchequer (1885–6, 1895–1902) and led the Conservative Party in the House of Commons (1885–6).

Reports on Inspections Made to Ascertain the Best Lines of Possible Railway Extension in the Colony

1. Aneroid: An aneroid is an instrument that measures the height above ground.

2. Trochometer: A trochometer is an instrument that measures distance via the revolutions of a wheel.

Correspondence having Reference to Construction of Railways in Territory of Bechuanaland

1. Lord Knutsford to Sir H. Robinson: Henry Thurstan Holland, first Viscount Knutsford (1825–1914), Conservative politician and Secretary of State for the Colonies from 1887 to 1892.

2. Lord Gifford: Major Edric Frederick Gifford, third Baron Gifford (1849–1911). From 1889, a director of the British South Africa Company.

6. *Mr. Murray to Captain Bower*: Sir Graham John Bower (1848–1933), Imperial Secretary to the High Commissioner for Southern Africa.

**Railway Extension through British Bechuanaland**

2. *J. GORDON SPRIGG*: Sir John Gordon Sprigg (1830–1913), administrator, politician and four-time Prime Minister of the Cape Colony (1878–81, 1886–90, 1896–8 and 1900–4).

**Bentley, Handbook to the Uganda Question**

4. *British anti-Slavery Society*: The British and Foreign Anti-Slavery Society was founded in 1839 with the goal of abolishing worldwide slavery.

**The Railway Extension from Charlestown to Johannesburg**

1. *JOHN ROBINSON*: John Robinson (1839–1903), the first Prime Minister of Natal.

**Memorandum on the Question of the Delagoa Bay Railway**

2. *force majeure*: a superior or overpowering force.

7. **President Krüger**: Stephanus Johannes Paulus Kruger (1825–1904), State President of the Transvaal (1883–1900).

8. **Sir Hercules Robinson**: Hercules George Robert Robinson, first Baron Rosmead (1824–1897), colonial administrator.

9. **Senhor Barros Gomes**: Henrique de Barros Gomes (1843–98), Portuguese politician, member of the Progressive Party. Minister of Foreign Affairs (1886–90), Minister of the Navy and Overseas Territories (May–September 1887), Minister of Finance and Public Administration (February–November 1889). As Minister of Foreign Affairs, he played an important role in the 1890 British Ultimatum, an ultimatum by the British government delivered on 11 January 1890 to Portugal, which required the removal of Portuguese military forces from the lands between the Portuguese colonies of Mozambique and Angola that had been claimed by Portugal.

11. **Lord Rosebery’s**: Archibald Philip Primrose, fifth Earl of Rosebery (1847–1929), Liberal statesman and British Prime Minister (1894–5).

12. **Lord Kimberley**: John Wodehouse, first Earl of Kimberley (1826–1902), Liberal politician. Secretary of State for the Colonies (1870–4) and Foreign Secretary (1894–5).

---

**Cardew, Railway Schemes for the Colony of Sierra Leone**

1. **His Excellency GOVERNOR CARDEW**: Sir Frederic Cardew was Governor of Sierra Leone from 1894 to 1900.

2. **Mr. Shelford**: Frederic Shelford, consulting engineer to the Crown Agents. See General Introduction, above.

3. **Mendis**: The Mende are one of the two largest and most dominant ethnic groups in Sierra Leone. They were largely farmers and hunters.

4. **benni seed**: the small oval seeds of the sesame plant.

5. **kola**: Kola (or cola) nuts are the seeds of the cola tree, which contain caffeine and theobromine and were used medicinally and, more recently, in the manufacture of soft drinks.

6. **kamwood**: or cam wood comes from the West African leguminous tree, *Baphia nitida*, whose hard wood was used in making a red dye.

8. **Mr. J. Holt**: John Holt (1841–1915), merchant and founder of a shipping line operating between Liverpool and West Africa.

9. **Mr. Zockonis**: George Zochnis (d. 1929). Founder (1879), with George Paterson, of Paterson Zochnis, a large West African trading house.
The Beira Railway

1. **W. E. FAIRBRIDGE**: William Ernest Fairbridge, founder of the Mashonaland Herald (1891), the first Mayor of Salisbury (1897–8), and general manager of the Argus Company of newspapers (1904–15).

3. **the Mozambique Company**: The Mozambique Company (Companhia de Moçambique), founded in 1891, was a royal company in the Portuguese colony of Mozambique, that had the concession of the lands that include the provinces of Manica and Sofala.

4. **Mr. Mansergh**: James Mansergh (1834–1905), a civil engineer.

5. **MR. BYRON REED, M.P**: Henry Byron Reed (1855–96), a Conservative politician.

Betton, ‘Prospective Railway Development in British Equatorial Africa’

1. (*palavers*): A palaver was a negotiation between Europeans and representatives of local populations.

2. **Nilotic tribes**: The Nilotic resided in the Nile Valley.

4. **Emin Pasha**: Mehmed Emin Pasha, born Isaak Eduard Schnitzer and baptized (1847) Eduard Carl Oscar Theodor Schnitzer (1840–92), physician, naturalist and governor of the Egyptian province of Equatoria on the upper Nile.

5. **papyrus**: A papyrus is a tall, aquatic, Mediterranean sedge (Cyperus papyrus) that has numerous drooping rays grouped in umbels. Also called the paper plant.

6. **corduroy bridges**: A corduroy bridge is a bridge made of logs laid transversely. Used to cross swamps.

Informal Conference with Mr. F. Bedford Glasier

1. **Mr Morel**: Edmund Dene Morel, originally Georges Eduard Pierre Achille Morel de Ville (1873–1924) was a journalist, author, socialist politician and former employee of Sir Alfred Jones, whom he despised. He campaigned against the Belgium atrocities in the Congo and the First World War (For more see A. Hochschild, *King Leopold's Ghost* (London: Pan, 1998).

2. **Dahomy Railway**: Dahomey was a French colony in West Africa in what is now Benin.

3. **Morning Post**: The *Morning Post* was a conservative daily newspaper published in London from 1772 to 1937.

4. **Canadian Pacific Railway**: The Canadian Pacific Railway was built between eastern Canada and British Columbia from 1881 to 1885.

5. **Conakry had two contractors to build the railway there**: Presumably Jones is referring to French Guinea.

6. **‘Open Line’ staff**: Open line staff operated completed railways.
**The Right Railway System and the Best Outlets for Nigeria**

**Report on Transport Policy to Develop the Northern Provinces of Northern Nigeria**

2. *Borgu*: Borgu was a state in West Africa in what is now Nigeria and the Republic of Benin.

3. *shea tree*: A shea tree is a tropical African sapotaceous tree, *Butyrospermum parkii*, which has oily seeds.

5. *sylvan*: relating to woods or forests.

6. *Imported cotton goods*: Cotton gins are machines that separate the seeds, hulls and other small objects from the fibres of cotton.

**Transport in Africa. East African Commission’s Recommendations**

1. *Daily Dispatch*: The *Daily Dispatch* is a South African newspaper published in East London and founded in 1872 as the *East London Dispatch*.

4. *the Fine Cotton Spinners’ and Doublers’ Association*: The Fine Cotton Spinners and Doublers Association Limited promoted the interests of cotton spinners in the north-west of England. It was founded in 1897 by Herbert Dixon and Scott Lings.

8. **London Chamber of Commerce**: The London Chamber of Commerce and Industry was founded on 25 July 1881 at the Mansion House in the City of London to represent business in the London Metropolis.

### Grigg, Memorandum on Railway Development

1. **Lt.-Col. Sir Edward Grigg**: Edward William Macleay Grigg (1879–1955) was a British colonial administrator and politician. After serving in the Grenadier Guards during the First World War, he became private secretary to Prime Minister David Lloyd George (1920), and, in 1922, entered Parliament himself as the Liberal MP for Oldham. Three years later, he resigned his seat to take up the post of Governor of Kenya, where he worked to improve the agriculture, education provision and the infrastructure of the territory. On leaving Kenya in 1930, he re-entered Parliament, this time as a Conservative representing Altrincham, and, on the outbreak of the Second World War, became first the financial secretary and then the Joint Parliamentary Under-Secretary of State for War. (K. Rose, ‘Grigg, Edward William Macleay, first Baron Altrincham’, in H. C. G. Matthew and B. Harrison (eds), *The Oxford Dictionary of National Biography* (Oxford: Oxford University Press, 2004), vol. 24, p. 1).

2. **Jubaland**: Jubaland, also known as Azania or the Juba Valley, is now in southern Somalia. It was ceded to Italy, supposedly as a reward for the Italians having joined the Allies in the First World War. In 1926, it was incorporated into neighbouring Italian Somaliland.

3. **Tabora-Mwanza line**: The line was completed in 1928.

5. **the League of Nations**: The League of Nations, the precursor of the United Nations, was an intergovernmental organization founded in 1919 as a result of the Paris Peace Conference.

6. **Lord Selborne**: William Waldegrave Palmer, second Earl of Selborne (1859–1942), British politician and colonial administrator. In 1905, he became High Commissioner for South Africa and Governor of the Transvaal and Orange River colonies. The memorandum, dated 7 January 1907, supported the creation of a union. The document, in fact, was largely written by Lionel Curtis.

CONSTRUCTION

As discussed in the General Introduction in Volume 1, railways in West Africa were constructed by the department system and Public Works departments (PWDs) (see Crown Agents to Colonial Office (1897); Sierra Leone (Kwalu) Railway Survey (1899); High Commissioner Sir F. Lugard to Mr. Chamberlain (1903); Papers [August 10, 1893 to August 12, 1904] relating to Construction of Foreign Railways in West Africa (1905); Mr. Lyttelton to Governor Egerton (on the Oshogbo Lagos Railway Extension, 1905); Memorandum by Mr. Churchill on Railway Construction in Nigeria (1906); Shelford, Some Features of West African Railways (1912); The Nigerian Railway [1925]; and De Frece, The Failure of Officialdom (1923), all below), in Uganda by the PWD and by Royal Engineers (see O’Callaghan, Uganda Railway; Emett, ‘Some Curiosities of the Uganda Railway’ (1901), and Memorandum for the Private Enterprise Committee by the Honourable Gideon Murray, Master of Elibank, all below), in Rhodesia and Nyasaland by private companies (see Smith Wright, Railways in Rhodesia; ‘Contract for the Construction of a Railway and Works in the British Central Africa Protectorate, dated 1897’ (1925); and Central Africa Railway Company Limited and Shire Highlands Railway Nyasaland Limited and the Crown Agents for the Colonies on behalf of the Nyasaland Government: Conditional Agreement (1930), all below), and, in South Africa, by both the private sector and the local government (see Dalton, A Report and Estimate Concerning the Construction and Equipment of a Railway between Oudtshoorn and Klipplaat (1894); Owen, Report and Estimate in Connection with Caledon Surveys (1897); and Railway Construction: Zoutpansberg District (1909), all below). Public sector construction was financed by the British government and by the Crown Agents via loans, short-term advances and private capital (see Tanganyika Territory. Proposed Loan for Railway and Harbour Development (1923–4), and Natal Government Railways. Draft Law ... To Raise a Loan for the Construction and Equipment of Certain Railways, below).

Builders of railways in Africa faced many problems, the most formidable of which was the environment. The lack of wharfage facilities made the landing of construction materials difficult and the absence of roads and paths necessitated
the use of just one base and precluded the transport of materials in advance of the railhead. Mountainous regions and those riven by rivers and streams forced the construction of expensive cuttings, earthworks, viaducts and bridges, which often collapsed as engineers were unaware of local geologies. Dense tropical forest had to be cleared at great cost and made surveying difficult, leading to poorly aligned lines. Heavy rainfall caused washouts and slips, corroded machinery, and, when combined with high temperatures, resulted in high European invalidity and mortality rates and high turnover of personnel. From 1898 to 1904, each engineering post on the Sierra Leone, Gold Coast and Lagos railways was filled by 5.45, 4.31 and 3.84 employees, respectively.¹ There was also often a shortage of ballast and water, both of which had to be transported to the rail head, and construction was occasionally interrupted by native revolt.²

A further problem was the shortage of labour (see Report of the Select Committee on Railway Labourers (1863), and Seymour, ‘Tropical Railways’ (c. 1925), below). Many areas had low population densities, and, where this was not the case, railways had to compete for workers with agriculture and mines, and, in the rainy season, often saw large numbers of labourers desert their work to cultivate family plots of land.³ Most lines also had high African mortality/invalidity rates. 2,293 labourers died in the construction of the Uganda railway, four for each mile of track laid, and 6,454 were invalided.⁴ Labourers were over-worked, provided with inadequate and poor quality food and accommodation, and were prone to mosquito and water spread diseases and accidents, there being few cost increasing safety features. Small numbers were also killed by lions and in attacks on camps by local tribesmen.⁵

In Nigeria and Kenya, labour shortages were overcome through the use of conscripted labour, largely convicts and tax defaulters. The practice, however, was not widely adopted. Forced labourers performed their roles poorly, required a great deal of costly supervision, and the policy generated African discontent and was disparaged by international humanitarian organizations, such as the Aborigines Protection Society and the Anti-Slavery Society.⁶ A more common and sustainable solution was the use of paid local and imported workers. Africans were recruited locally by colonial administrators or contractors, either individually, or, in the case of earthworks, through native subcontractors, who agreed to complete a certain amount of work for a given fee. The advantages of the system were that colonial officials, through their close relationships with chiefs, could usually source a good supply of workers, and the subcontractors, employing members of their own tribe/family, could deliver higher levels of productivity and a better quality of work than European foremen, and unlike foremen, could be easily dismissed if ineffective. The major drawback was that the practice increased labour costs (see Table 1). The subcontractors fee included
a profit margin and administrators, eager to maintain their trust relationships with the local community, ensured that the wages/fees paid were ‘fair’. Colonial officials also occasionally allowed agreements to continue even when the conditions had been broken, and, in Nigeria, stipulated that workers be paid by the day, thus increasing administration costs, and, to avoid the disruption of agriculture, be employed for only two months, which resulted in high training expenses and reduced productivity.7

Where insufficient local labour was available, workers were imported from neighbouring regions/countries. To build the Gold Coast line, 13,000 labourers were brought into the colony, mostly from Lagos.9 In Uganda and Natal, Indian workers were employed. The Uganda railway recruited on contract 38,000 Sikhs, largely from Gujarat and the Punjab; while from 1876 to 1895 Natal first employed workers from Mauritius and then indentured Indian labourers. Indians were relatively cheap, believed to be more reliable and easier to control than indigenous labour and possessed some experience and skills, often having worked on the construction of Indian lines. On the completion of their contracts, many remained in Africa, earning their living as market gardeners, railway workers, traders and dukawallahs (petty-shopkeepers).10 European labour was only used for the construction of the 1923–5 South African Touws River–Lady-smith line; economic recession forcing the workers to take any job available. Generally, white labour was too expensive for construction and such hard physical work was regarded as the preserve of the ‘lesser’ races.

Inevitably, the harsh African environment, high labour costs and need to import railway materials and construction equipment from Britain caused construction costs to be relatively high, though they tended to decline over time. Engineers gradually learnt how to overcome many of the environmental problems faced, coastal facilities were established, labour became more skilled and the country became more open and the climate healthier as lines extended inland. Costs varied between regions. As discussed in the General Introduction (Volume 1), prior to the First World War, West African railways were relatively expensive and built to a high standard. Elsewhere, very basic low cost lines
were constructed (see Calthrop, ‘Light Railways in the Colonies’ below). Most regions had low/difficult to estimate traffic levels, lines could easily be upgraded if traffic increased, and, by keeping costs low, builders could increase the length of tracks laid expanding trade catchment areas. Low standard lines could also be constructed relatively rapidly, allowing the potential economic returns to be reaped almost immediately.11

Costs were minimized in a number of ways. Gauges, the distance between track rails, were narrow. Rather than adopt the standard or Stephenson gauge of 4’ 8.5”, most builders used a 3’ 6” gauge, known as the Cape gauge. This was relatively cheap to lay, reduced land excavation, required smaller bridges and could more easily navigate mountainous terrain.12 Others used even narrower gauges. The Uganda railway adopted a 3’ 3.5” gauge; the Sierra Leone lines and the Lagos Steam tramway one of 2’ 6”; and the South African Knysna–Deepwalls, Uganda Mombassa and Rhodesia Fontesvilla–Umtali lines a 2’ gauge, though the latter was later upgraded to 3’ 6”.13 To further reduce costs, tracks traversed the easiest terrain, often following watersheds, and, instead of avoiding hills via detours, tunnels or heavy earthworks and natural features though long radius curves, track ascended inclinations and possessed small radius curves.14 Other aspects of construction were also minimized. There were few, widely spaced and rudimentarily built stations, most of which lacked a platform, little fencing and, to avoid delays in track laying whilst rivers were traversed, river courses carrying little water in the dry season were filled with earth embankments and the water allowed to flow through iron pipes or temporary wooden trestles were constructed, both later being replaced by permanent cheap steel rather than stone bridges.15

Notes

CROWN AGENTS to COLONIAL OFFICE.
(Received August 24, 1897.)

Downing Street, London,
August 23, 1897.

Sir,

With reference to your letter of the 24th ultimo,* I have the honour to forward two copies of Mr. Shelford's report on the proposed railway to Tarquah in the Western Districts of the Gold Coast, and of a letter which we addressed to him on the 11th instant, calling his attention to certain points connected with this report, upon which it appeared to us that additional information was required. As soon as we receive Mr. Shelford's reply to this letter, we will report further on this scheme, but in the meantime it appears to us desirable that Mr. Shelford's report, which, in accordance with your desire for early information, has been prepared in anticipation of the completion of the plans and detailed estimates, and of the decision which may be arrived at in regard to the exact position of the terminus on the sea coast, should be sent to the Governor for his consideration and report.

The line recommended by Mr. Shelford, for reasons which appear to us to be sound, is one running from a point hereafter to be decided, between Sekondi and Takoradi, via Mansu to Tarquah, following very closely the existing trade route. This line is undoubtedly the shortest, cheapest and most easily maintained route for reaching Tarquah, and possesses the material advantage of being much less exposed to floods than any of the alternative routes which have been suggested. The gauge recommended by Mr. Shelford's is 3’ 6”, and having regard to the fact

* No. 172.
that this gauge has been adopted in Lagos, and that it will probably be that of the Eastern section of the Gold Coast railways, Mr. Shelford’s recommendation seems to be justified. The line is to be as nearly as possible a surface line, but in all other respects of a fairly substantial character. Its cost is estimated at 240,000l., or at about 6,000l. per mile, and it will be seen that we have requested Mr. Shelford to report whether some reductions cannot be made in this estimate without interposing difficulties in the way of subsequent development to meet increases of traffic. It must, however, be borne in mind that the ordinary tests cannot be applied to estimates of railway construction in West Africa.

As regards Mr. Shelford’s estimate of traffic, there is no doubt that the rate of 5 per cent. which he has assumed for the interest and sinking fund on the borrowed capital, may safely be reduced by 1/2 per cent., and the charges may be put at 10,800l. instead of 12,000l. This would have the effect of somewhat reducing the rate per ton per mile required to pay the working expenses and capital charges on the assumed annual load of 12,180 tons. It is, however, very desirable, as we have pointed out to Mr. Shelford, to be able to form some idea as to the prospects of this minimum traffic being obtained within a reasonable period. Much interesting information of the district will be found in Mr. Rogerson’s report, which forms an appendix to Mr. Shelford’s.

I have, &c.

M. F. OMMANNEY.

Enclosure 1 in No. 190.

Gentlemen,

35A, Great George Street, Westminster, S.W.,

August 6, 1897.

Acting upon your letter of the 31st December last, and your subsequent instructions, I advised you on the 5th of January that I had engaged the services of two engineers to make a reconnaissance survey from the coast at Takoradi Bay to the gold mining district at Tarqua. These gentlemen arrived in the Colony on the 5th of February and at Takoradi Bay on the 17th. It was recognised in my instructions that the time to make such a survey was limited by the current dry season, which was already considerably advanced, and to provide for emergencies every precaution was taken and an European doctor sent from England to accompany the expedition; nevertheless I regret to say that it was overtaken by the rains, with the result that the assistant engineer, Mr. Lines, succumbed to malarial fever, and the chief engineer, Mr. Rogerson, was attacked, as also the doctor himself, without whose watchfulness and aid the expedition would have ended in disaster.
Mr. Rogerson returned to this country on the 2nd of July, but in a condition which rendered him unfit for work up till the 26th, since which time he has furnished me with the necessary information for the following report.

It was arranged that the engineer acting for Messrs. Coode, Son & Matthews on the Gold Coast should visit Takoradi Bay, and determine upon the most favourable site for the sea termination of the proposed railway, for which three points had been selected, namely, Sekondi, Apoassi, and Takoradi Fort; and before Mr. Rogerson left Africa, he saw Mr. Coventry, and left with him the information shewn upon his survey of Sekondi, accompanied by the assurance that whatever point he might select on Takoradi Bay as most suitable for a port or harbour could be easily approached by the proposed railway.

In the meantime I received from you in April last the report and survey which had been prepared by Mr. Thomas Barham, under the direction of Sir Douglas Fox, in the year 1882, showing a proposed railway from Tarqua to Dixcove, and an alternative, recommended by him, from Tarqua to Axim. I have studied this report and survey with care, and have had an opportunity also of consulting with Mr. Barham, to whom I was introduced by Sir Douglas Fox.

Subsequently, namely, on the 10th of June, I received from you certain correspondence, accompanied by a map, forwarded by the Castle Gold Exploration Syndicate, Limited, in which was enclosed an extract from a letter from Mr. Hutchison, dated 25th of March, 1897, to which I shall have occasion to refer.

As a consequence of the above suggestions, and with a view to obtain further knowledge of the country referred to, telegraphic instructions were sent to the engineers to survey a branch line from Mansu to Kyniankor, which were carried out.

[...]

Report.

A glance at the map will show that there exists a considerable difference of opinion as to the best route for a railway to Tarqua, and as to the most suitable port out of several which may be selected; it being, of course, understood and well known that none of the places upon the coast can be considered ‘ports’ in the proper sense of the term, as they are only capable of being approached by surf boats, until some money has been expended in the construction of landing stages or breakwaters at such points as may prove suitable on investigation.

Mr. Barham’s Line.

Mr. Barham’s line from Dixcove was considered by him capable of being constructed with little difficulty for the first 17 or 18 miles beyond Tarqua, but the general contour of the ground showed that a great deal of time and labour would
have to be expended in locating it. Beyond the 17th mile very rough ground occurred and continued up to the remarkable hill known to Englishmen as the Kyniankor hill, from the town of / Kyniankor (present population only 150), which is built upon its summit. This hill presented more difficulty than any other part of the ground which was examined, consisting of a table land and ridges, with an altitude of 300 feet above the streams, and of a shape on plan said to resemble that of an octopus. This hill had a reputation among the natives of that part of the country of being richer in gold than any other on the coast, but the native workings were practically almost abandoned, as also were those at the adjoining mine of Apankan. Mr. Barham found it essential that the line should cross this country by tunnelling through one of the ridges, with a tunnel about 200 yards in length. At its northern end it would open up into a rough ravine where some comparatively heavy work would be required for about half a mile beyond the tunnel. Beyond this point and up to the River Bonsa, a distance of about nine miles along the railway, low-living places would be met with requiring banks of sufficient height to protect the railway from floods. The River Bonsa would require a bridge 150 feet span with flood waterways on each of its banks, which were found to be very low, and the floods attained a height of eight or nine feet above them.

Mr. Barham had no instructions to make a section or to take levels along this line, but it is evident from his excellent plan and report that it cannot be regarded as an easy route for the construction of a railway in an uncivilised country, where the construction of a tunnel would be exceedingly difficult, if not altogether impossible, partly owing to the want of skilled labour and the difficulty of importing it, and partly, perhaps chiefly, on account of the religious prejudices of the people.

The alternative route recommended by Mr. Barham to Axim appears to have been selected by him chiefly on account of the superior facilities and trade at that place. For 24 miles from Tarqua he found there would be no difficulties to contend with, except those due to the low level of the ground, but the bridge over the Bonsa would have to be considerably larger than the one already mentioned, and for about four miles on the northern side of the river the ground was at times very deeply flooded, and a bank at least 10 feet high would be required for almost the whole of that distance.

Leaving the Bonsa, the line would necessarily reach Axim by the valley of the Ancobra river, which in such a country would apparently involve considerable expenditure on account of the floods.

Mr. Barham very carefully inspected the country without surveying it, and concluded his report of this line by saying that he considered it quite 'certain that a good line could be constructed from Tarqua to Axim without going to the River Ancobra, and that no heavier works would be required on it than
those made necessary by the floods. It would require, in my opinion, a complete survey and section and ample information before a cheap line could be recommended under such conditions as are likely to be found where tropical floods of a large river have to be encountered.

**Castle Gold Exploration.**

*Mr. Hutchison's Route.*

The remaining alternative shown upon the plan appears to have been suggested by Mr. Hutchison, who enclosed with his letter of the 25th of March last a sketch map showing the route under survey by Mr. Rogerson, to which he objects on the ground that the chosen harbour is too small to admit a ship, the route selected is very hilly, and will be much prolonged by following the sinuous course round the bases of the hills. In reply to this it may be said that the choice of a harbour has been left with your consulting engineers for harbours to determine, and that I am not aware of any harbour on that coast which will admit a ship, and that the route selected is proved by surveys to be shorter than that of the existing road, after allowing for sinuosities. On the other hand, the line sketched on Mr. Hutchison's tracing [...] increases the distance between Takoradi Bay and Tarqua by at least 10 miles.

Mr. Hutchison continues by saying that he has marked upon his map the eastern limit of the gold-fields, and that the proposed line runs outside such limit. He admits, however, that there are ‘sporadic reefs’ in that country, and it will be seen that the Ebenezer Gold Mines (which are working) are amongst such reefs, whilst the mines marked on the map within his limit are believed to be practically abandoned. / *Proposed Railway as surveyed by Mr. Rogerson.*

Mr. Rogerson's report on this line is appended hereto (see Appendix A.), [...]. His survey, which was carefully made to a scale of 12” to a mile, and the levels, which he has taken instrumentally, show that the country is adapted to the construction of a railway. It is comparatively free from water and is of such a character that a line can be carried through the hills without recourse to steeper gradients or sharper curves than can be effectively worked with the rolling stock of the type which is already in use upon the Lagos Government Railway.

Having carefully studied the questions of railways both in Sierra Leone and Lagos, as well as between Appam and Insuiam, I am of opinion that in this case the gauge should be 3’ 6”, the steepest gradient 1 in 50, and the sharpest curve should have a radius of five chains (only to be used where absolutely necessary). This curve will admit of a speed of 15 miles per hour. I would suggest that the rails should have a weight of 50 lbs. per yard, and that steel sleepers should be employed, except where the soil may be impregnated with salt, in which case
Communications in Africa, 1880–1939: Volume 2

hard wood timber sleepers may be used. The length of the railway will be 39 miles 3 furlongs, which compares with 40 miles by road.

I estimate that the cost of such a line will be covered by the capital expenditure of 240,000l., exclusive of the port.

I have no hesitation in saying that the line surveyed will be less exposed to risk from floods, both in construction and maintenance, and will be less costly than any other of the routes suggested, and to which I have already referred. It appears to me also to be the most likely one to accommodate the trade of the district, for the following reasons:–

(1.) Because it follows the line of the main road from Chama to Tarqua.

(2.) It does not appear to come into competition with the water navigations of the country by which the port of Axim is supplied with timber and other exports.

(3.) It passes through the centre of the concessions of the Abanta Company, Limited, which are now being worked, and extend over an area of 162 square miles.

(4.) The present course of trade seems to indicate that the natural products of the country, such as palm-oil and kernels, find their outlet at Chama, which is close to Sekondi, and not at Axim, and that general supplies which go to the gold mines of Tarqua find their entrance at the same place, and along the route of the proposed railway.

(5.) Lastly, all the information which has been obtained points to the conclusion that the great development of gold-mining, both at present and in the near future, is at Tarqua and beyond, and that it is important, therefore, to reach that point by the shortest, cheapest, and most easily maintained route, which the one selected proves to be.

Mr. Rogerson’s survey of the branch line from Mansu to Kyniankor is not yet completely plotted. It does not appear to afford the best route to the latter, but to be favourable for the accommodation of the Ebenezer gold field, which is working, and lies upon the route. He is of opinion, however, that a sufficiently good light railway may be made, when required, to Kyniankor.

Working.

It is estimated that the passenger traffic will be sufficiently accommodated by attaching passenger cars to the freight trains, by which the revenue will be chiefly earned. The cost of working a railway in a Colony where there is no experience of railways is very difficult to estimate with accuracy, but experience now seems to show that the Natives will be competent under some European supervision, and on this basis the cost of working the whole length of 40 miles with two trains per day (one each way), for six days per week, should be covered by an annual expenditure of 10,798l., and the cost of working with four trains per day (two each way) should be covered by 13,758l., whilst the maximum net tonnage
estimated to be carried will be 26,666 tons, and 53,332 tons, respectively, which, if the average distance hauled be taken at 30 miles, will be equal to a cost of 8s. 7d. per train mile and 3.24d. per ton mile, or 5s. 6d. per train mile, and 2.06d. per ton mile respectively. / 

_Passengers._

In the above figures the passenger traffic has been disregarded, but the figures will apply if five passengers are substituted for one ton of goods.

_Traffic required._

The annual charges for interest and sinking fund upon the capital expended upon the railway, if estimated at 5 per cent. on 240,000l., will be 12,000l. per annum, and the total annual charges to be covered as soon as the railway is completed will thus be:–

<table>
<thead>
<tr>
<th>Description</th>
<th>Amount</th>
</tr>
</thead>
<tbody>
<tr>
<td>Working expenses, two trains per day (one each way)</td>
<td>10,798</td>
</tr>
<tr>
<td>Interest on capital and sinking fund</td>
<td>12,000</td>
</tr>
<tr>
<td>Total</td>
<td>22,798</td>
</tr>
</tbody>
</table>

And the gross earnings from the traffic should equal this amount. If it is found that two trains per day will not carry the traffic, which may happen soon after the opening of the railway, the working expenses, and therefore, the gross earnings, must be increased by the cost of the additional trains, as follows:–

<table>
<thead>
<tr>
<th>Description</th>
<th>Amount</th>
</tr>
</thead>
<tbody>
<tr>
<td>Working expenses, four trains</td>
<td>13,758</td>
</tr>
<tr>
<td>Interest on capital and sinking fund</td>
<td>12,000</td>
</tr>
<tr>
<td>Total</td>
<td>25,758</td>
</tr>
</tbody>
</table>

It may be assumed that the railway will be earning its working expenses from the first, inasmuch as there is already a good nucleus for traffic at Tarqua, and no train need be run except at rates sufficiently remunerative to cover the working expenses at least.

Mr. Rogerson points out in his report (Appendix A.) that the cost of delivery of the goods at Tarqua is increased by the transport from the sea coast by as much as 33 per cent, as a minimum, and even reaches 100 per cent., and the actual cost to the mining companies of transport between the coast and Tarqua is equal to 11l. per ton, or 5s. per ton per mile. Assuming then that the present rate is reduced to one-fourth by the construction of the railway, equal to 1s. 3d. per ton per mile, the railway will pay its working expenses and interest on capital charges with an annual load of 12,180 tons with an average haul of 30 miles in two trains per day.

This exceptional rate will only apply at the outset, for when the traffic requires four trains per day, which will carry 53,332 ton per annum, the working expenses and capital charges will be covered by an average rate of 4d. per ton per mile.
Traffic available.

Mr. Rogerson’s report shows that the country is ripe for the development which the construction of a railway will bring about, and the experience now gained of the West Coast encourages the belief that where there are natural products available for export, as in this case, they can be profitably carried by railway at a great reduction upon the present cost, and where gold mines exist in an active condition, as at Tarkwa and beyond, the export trade will certainly be supplemented by a valuable traffic in imports.

The tables appended to Mr. Rogerson’s report indicate that while the value of the exports from Chama (the present outlet from Tarkwa) had been much less in 1896 than in the previous years (which he satisfactorily accounts for), the value of the imports at the same place had steadily increased during the corresponding period, which is a very hopeful sign and supports the view that the country is ready for a railway.

The value of the exports and imports from the shipping places of Axim, Dixcove, and Chama which dispose of the produce from the districts to be served by the railway amounted in 1896 to:–

<table>
<thead>
<tr>
<th></th>
<th>£</th>
</tr>
</thead>
<tbody>
<tr>
<td>Imports</td>
<td>115,546</td>
</tr>
<tr>
<td>Exports</td>
<td>111,525</td>
</tr>
<tr>
<td>Total</td>
<td>227,071 /</td>
</tr>
</tbody>
</table>

which represents the value at the coast after the exports have been charged with the cost of transport, but before the imports have been so charged.

Having regard to the rapid rise in the value of imports at Chama, it is not too much to assume that when the railway is constructed they will reach such proportions as will justify the expenditure.

The plans and detailed estimates of the proposed railway are not yet completed and wait the report of Messrs. Coode, Son, and Matthews on its termination.

I have, &c.

W. Shelford.

To the Crown Agents for the Colonies,
Downing Street.
APPENDIX A.

Report of Mr. R.G. Rogerson, who made the Survey.
35A, Great George Street, Westminster, S.W.,
August 6, 1897.

The proposed railway would commence at the Bay of Sekondi, where there is an excellent site for the construction of either a pier or breakwater, on a small projecting reef of rocks running out north easterly, offering a protection to the bay, which is always exceptionally free from surf; and where no difficulty is ever experienced in landing from canoes. The foreshore is sandy, the anchorage good, and the officers of the British and African Steam Navigation Company, Limited, state that they would not hesitate to bring their ships to the end of the pier if constructed.

If a breakwater was constructed instead of a pier, a harbour would be made in which steamers and small vessels could lie in smooth water, but a landing stage under its protection would still be necessary to receive cargo from barges or lighters.

Sekondi is situate in the Province of Chama, and is the most important town between Chama and Axim. It contains a population of 2,500. There is a large fort (Fort Orange), in an excellent state of repair; the town contains a chapel, school, and about 260 houses. The occupation of the inhabitants is chiefly fishing; but large quantities of palm oil and kernels are brought down from the interior and exported from here.

From Sekondi, the line runs in a north-westerly direction, passing through the following villages, viz.:–

Approximate Population.
Kudjoe Kroome 31
Darkoo Kroome 26
Ando or Annoe 228
Ashieme 230
Mansu 200
Ponasi 20
Cheche Kroome 20
Bensu 100
Essuasu 151
Abuadji Kroome 22
Essekuma 110
Bansu 216
Ando, Ashieme, Mansu, Bensu, Essekuma, and Bansu are the most important agricultural villages on the route.

The soil of the country is remarkably fertile, and food, plants, fruits, and trees of various kinds grow luxuriantly on it. Among the food plants are yams, corn, plantain, cassava, cocoa-yam or eddoes, pepper, ground nuts, okros, garden eggs, and other garden vegetables. Maize and plantain is the principal food of the natives. Cassava, like yam, is a universal food.

Rice is not grown in this district but is largely imported.

In the district traversed by the railway are to be found oranges, limes, pineapples, bananas, 'papaws,' mangoes, tiger nuts, &c. None are properly cultivated, but grow wild, and all are of poor quality, with the exception of the orange, Chama and Sekondi being noted on the Gold Coast for the quality of their oranges.

Timber.

With regard to the timber on the route of the proposed railway, it is not only abundant, but practically inexhaustible, and the major portion of it is most valuable.

The Ahanta Company, Limited, hold concessions of over 160 square miles to cut timber, &c.; they have a staff of officials and Krumen at present felling timber on their concessions, which is waterborne to the sea for shipment.*

The following are the names and the descriptions of the principal timbers growing in the Ahanta and Wassaw districts:–

- Barkoe: Various trees of the mahogany class, 1 foot to 3 feet in diameter; rot and insect proof.
- Dubini
- Paenkwa
- Kusaba
- Cedar: Scented mahogany.
- Kwabohol: Beautiful wood, suitable for wainscotting, &c.; grows to 6 feet diameter.
- Danta: Hard wood, deep red in colour; grows 1 foot to 4 feet in diameter.

* The Ahanta Company are now, and have been for the last four or five years, exporting large quantities of mahogany and other valuable timbers to Great Britain; they have laid down on their concessions a portable light railway to expedite the transport of heavy timbers. As will be seen on the map, the proposed railway passes nearly through the centre of their immense concessions.
Embil Good for building purposes; largely used for beams; rot and insect proof and grows to 3 feet diameter.

Effram
Oprun
Kanwin Boxwood.
Achin Grows to 18 inches diameter; rot and insect proof.
War-War Grows to 6 feet diameter; canoes are made from the trunks of these trees.
Dubimah Grows to 1 feet diameter; rot proof.
Odoom Grows to 6 feet diameter; rot and insect proof.
Subahah Grows to 2 feet diameter; rot and insect proof.
Cacho (ironwood) Grows to 5 feet diameter; raw beef colour when full grown; rot and insect proof.

N.B. – This information as to timber was supplied by Mr. R. J. Nicholas, general manager of the Ahanta Company, Limited.

From Chama, mahogany was exported to England as per the following table, viz.:–

<table>
<thead>
<tr>
<th>Year</th>
<th>Cubic Fed.</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>1894</td>
<td>1,416,852</td>
<td>34,976 4 2</td>
</tr>
<tr>
<td>1895</td>
<td>630,573</td>
<td>5,495 17 0</td>
</tr>
<tr>
<td>1896</td>
<td>465,106</td>
<td>3,871 12 0</td>
</tr>
</tbody>
</table>

It will be seen that the export of mahogany shows an extraordinary falling off, and this is attributed to the exceptionally dry seasons of 1895 and 1896, there not being sufficient water in the rivers to float the timber down to the sea. The construction of a railway would remedy this, as transport could be carried on continuously.

The oil palm is not cultivated to any great extent, and on several occasions I noticed the fruit had fallen from the trees and was allowed to rot, as the difficulty and cost of transport to the coast was too great, and this also interfered with its successful and general cultivation.

The cocoa-nut tree abounds on the coast, and almost all villages on the route are partially surrounded and sheltered by these trees.

Rubber:

The rubber industry has recently developed, and a company has already been formed for the collection and gathering of rubber in the districts through which the proposed railway will pass.

The Colonial Rubbers Estates Company, Limited, in their prospectus state: ‘The territories are in the Gold Coast Colony and are thickly covered with rubber trees and vines. The shipping ports of Axim, Chama, Sekondi and Butri, are
available for export.’ [...] the whole of this traffic to these ports will be intercepted by the construction of this railway and it may be assumed that this rubber to some extent will pass over it as traffic. The Company estimate that it is possible to gather between 200 and 300 tons of rubber per annum.

Manufactures, Mines, &c.

No manufactures of any importance are carried on by the Natives.

At Sekondi, fish curing in ovens and by sun drying is carried on for export into the interior, and daily large numbers of carriers are to be met transporting dried fish into the interior.

Earthenware pots of various sizes for carrying and storing water for household purposes may be seen in process of manufacture in different villages by the Natives for their own use.

Mines.

At Tarqua are the first mines met on the route where machinery is employed, belonging to the Tarqua and Abosso Gold Mining Company, Limited, who hold concessions for 4,000 acres of land with full rights to all mineral, timber and water. This Company, originally the African Gold Coast Company, was taken over by the Société Fermière des Mines d’or de Taquah and d’Abosso (capital 1,600,000 francs), incorporated 1876.

The mines and properties belonging to the Company are situate at Tarqua, Abosso, River Ankobra, Mankooma, Tamso, Sanhoman, Makata, Akasenoe, Usupranto, Insimankaw, Assoma-Assi, Afcfama-Appim, Mirekety Kita.

The mines and properties belonging to the Company are situate at Tarqua, Abosso, River Ankobra, Mankooma, Tamso, Sanhoman, Makata, Akasenoe, Usupranto, Insimankaw, Assoma-Assi, Afcfama-Appim, Mirekety Kita.

Prolongation of River Mankooma and allkuvials, Eweaboo, Tuappim, Peta-boo, Tintinaah.

The Taquah and Abosso Gold Mining Company, Limited, was incorporated on May 26th, 1888, with an authorised capital of 100,000l. was offered for subscription. This Company which took over the French Company, have now batteries at work at Tarqua and Abosso containing 43 stamps, the majority being 750 lbs. in weight. The present crushing is 1,600 tons per month and when the new machinery which is in course of transit is erected, this quantity will be doubled.

The mine has five shafts of various depths, the deepest being 115 feet vertically or 240 feet on incline. Levels 407 feet long on one side and 170 feet on the other are driven and opened out on each side of the shaft.

The reef of gold veins, called fissure veins, dip at an angle of about 32 degrees and vary in thickness from 2 feet to 6 feet and in value from 10 dwt. to 3 oz. per ton. Rock drills worked with compressed air are used.
The ore after being raised is pulverised in the batteries and the gold extracted by amalgamation on copper plates.

The machinery in use consists of nine steam boilers, six engines and eight steam pumps. The boiler capacity equals 200 horse-poers, they work night and day, Sunday included.

Five hundred to six hundred cords of firewood at a cost of 10s. per cord are consumed monthly (1 cord = 128 cubic feet). The working of the mines since 1879 has exhausted the timber in the immediate vicinity of the mines and the cost of transport yearly becomes greater, some thousands of cubic feet of timber being consumed annually in propping.

The average number of men working at the mines and in connexion therewith is 1,500.

During the year 1896 there was transported from these mines to Axim 6,087 ounces of gold bullion, value 23,373l. 4s. 4d., and from Axim to the mines, 38 cases of silver / specie, value 8,200ll., and 12,044 packages of stores, &c. weighing 341 tons. The latter cost:–

<table>
<thead>
<tr>
<th>Description</th>
<th>Cost</th>
</tr>
</thead>
<tbody>
<tr>
<td>Landing at Axim</td>
<td>153 0 0</td>
</tr>
<tr>
<td>From Axim to Bonsa Station (nearest river point to Tarqua)</td>
<td>2,615 0 0</td>
</tr>
<tr>
<td>From Bonsa Station to Tarqua</td>
<td>1,200 0 0</td>
</tr>
<tr>
<td>Total cost of transport in 1896 equals</td>
<td>3,968 0 0</td>
</tr>
</tbody>
</table>

This equals 11. 3s. 9d. per ton for transport from Axim to Tarqua. (Exclusive of landing charges at Axim) Twenty tons of mining stores and one ton of dynamite are used monthly.

During the quarter ending 31st March 1897, 4, 156 packages of mining stores, machinery, provisions, implements, &c. were landed at Axim, weighing 99 tons, but owing to the River Ancobra being very low, the greater part of the stores are yet on the river (April 1897).

Five cases containing 1,636 oz. bar gold have been sent to Axim, and 14 cases containing 3,200l. of silver coin have been received.

The average time occupied in transport from the ship at Axim to Tarqua, is three weeks to one month, and the quickest time 10 days.

A surf boat will carry up the river between Axim and Bonsa station in the wet season two tons, and in the dry season half-a-ton a part of the way, when the cargo is transferred to canoes, which can only get two-thirds of the way up.

For three months in the year transport on the Ancobra is practically at a standstill, the water being too low.

The manager of these mines informed me that if this railway was constructed, he would double his machinery and plant, and substitute for the present small Roots boilers burning wood, large Lancashire or Cornish boilers burning coal, the transport of the coal from the coast adding to the traffic of the line.
Adjah Bippo is situated 7 miles N.N.E. of Tarqua, and is approached the whole way by a valley along which the construction of a railway would be very simple, light, and cheap.

Here, at Adjah Bippo, are the gold mines of the Wassau (Gold Coast) Mining Company, Limited, covering an area of 930 acres, and 1 1/2 miles northwards is the Cinnamon Bippo mine, area 820 acres, owned by the same company.

At Adjah Bippo the mine is worked by three shafts, called the Swanzy, Cleaver, and Bishop shafts.

The Swanzy shaft is now 184 feet deep, and it is proposed to sink until 250 feet is reached, which will render 20,000 tons of ore accessible, estimated to contain fully 160,000l. worth of gold.

The Cleaver shaft, which is the winding shaft of the mine, is now 150 feet deep, and is being sunk to open up another level at 200 feet.

The Bishop shaft is at present 212 feet deep, and it is proposed to lower this to 263 feet.

The milling machinery consists of 22 head of stamps, made up of a 10-head battery of 750 lbs. weight per stamp, and a 12-head battery of 550 lbs. per stamp, driven by a 76 h.-p. engine. Preparations are in progress for the addition of another 10-head battery of 750 lbs. stamps.

This company has 5,000 acres of property covered with timber, consisting of mahogany, cedar, African oak, ironwood, &c., in great quantities.

Cinnamon Bippo mine is a new property with about 600 fathoms of proved reef. Five adits were started in August last, and within the boundary of these adits, the estimated quantity of ore available for extraction is 34,000 tons, containing about 70,000l. worth of gold.

At this mine there are 16 stamps erected with all the other machinery nearly erected, but the company have abandoned the works, and they remain idle and incomplete, as the company found the cost of transport of machinery so enormous.

A light line of railway 20 inches gauge (16 lbs. rail), and 1 miles long, has been constructed from this mine to Adjah Bippo, for ore, fuel, and timber transport.

I believe it was the intention of this company to have continued this line through to the Ancobra river for the transport of material, but the manager received instructions to suspend operations in view of this proposed Tarqua railway being constructed.

At Adjah Bippo mine, 600 cords of wood are used monthly at a cost of 12s. per cord, and great difficulty is experienced in even obtaining this quantity, and the distance of transport daily becomes greater.
The total power of the boilers here in 186 1/2 h. p., and at present 105 h.p. boilers are laying at Axim waiting for floods to be floated up to Bonsa Station, which is situated about 21 miles from these mines.

Small articles up to 56 lbs. in weight cost 4l. per ton to transport this distance, but heavy pieces of machinery, say of 5 cwt., cost 16l. per ton.

Transport from Chama to Tarqua costs this company 15s. per 100 lbs. weight, and they add 33 per cent. on to the cost of provisions at the coast, at which price they supply their own men only.

Traders and 50 per cent. to 100 per cent. on to all articles for sale.

Six hundred native men are employed in the mines here at present, there being only six imported labourers, of which two are Europeans.

No difficulty is experienced in obtaining native labour, except occasionally in the rainy season, when the men go to their farms. Imported labour is then employed.

The health of the natives is generally good, and that of Europeans good.

Water is plentiful.

The amount paid by this company for transport in 1896 for stores, &c. from Bonsa Station to Adjah Bippo = 962l. 13s. 1d., and the weight under 90 tons.

Gold remitted to England, 1895 13,438 7 10
Gold remitted to England, 1896 23,606 11 8

*Engineering Notes on proposed Railway.*

The total length of the line is 39 miles 3 furlongs from Sekondi to Tarqua, and by the existing path 40 miles.

No heavy initial outlay will be necessary at Sekondi before this line would be commenced.

There is abundance of land available for goods’ yard, the erection of warehouses and custom house, &c.

The line as laid out is practically a surface one, no rock is met with, the curves are generally easy, and in the worst cases are within the prescribed limit; the gradients are also light and within the limit assigned to them.

No viaducts are necessary, and only four rivers, viz., the Annangkon, 40 feet wide, Ben, 45 feet wide, Bonsa, 69 feet wide, Bonsawia, 42 feet wide, are crossed. There are, however, several other waterways in which water flows during the rainy season only.
**Seaward Terminus.**

It having been suggested that Takoradi or Apoassi might form a suitable point for the commencement of the railway, I examined and surveyed the whole of the foreshore between Sekondi and Takoradi, and also the intervening country, for some distance inland.

Mr. Coventry, the representative of Messrs. Coode, Son, and Matthews, arrived in the Colony in June last with a view of examining Sekondi and Takoradi Bays, and reporting upon the best position for a pier or breakwater. At his request, and upon instructions received from Mr. Shelford, I supplied him with a plan of Sekondi showing the bay and the position and direction of the railway as surveyed, together with all the information he required respecting the district generally.

I also informed him that, if any point between the two bays above-mentioned was selected for a pier, there would be no difficulty in approaching the same with a railway.

Mr. Coventry has not yet returned to this country, so that his report is not available.

**General.**

The introduction of a railway into this part of the Colony, viz., Wassaw, would be hailed with great satisfaction by the traders at Sekondi, the King and various Chiefs of Wassaw, who have been consulted, and who are anxious to find native labour for constructional work, the gold mining companies at Tarqua, Abosso, and Adjah Bippo, which are labouring under great transport difficulties, and the various English and native companies who hold concessions all along the line for the cutting down and export of timber and the extraction of minerals. / Several companies are waiting for the construction of this railway before ordering and erecting stamps, mills, &c. Gold has been proved, and is known to exist from Tarkwa to within 4 miles of Sekondi.

It is impossible to estimate with any amount of accuracy the probable amount of traffic likely to be developed by a new railway in a Colony like this, but the valuable timber forests that exist for hundreds of square miles are sufficient in themselves, if developed, to keep the railway employed for some years.

The conveyance of machinery, stores, and coal from the coast to the Tarqua gold fields should give a considerable revenue, and also the conveyance of food and manufactured articles from the coast to the interior, which are at present carried by Natives.

N.B. – The average number of carriers met daily on the road between Chama and Tarqua numbered 90.

The population of Eastern and Western Wassaw is 73,683.
Exports.

The principal exports from Wassaw, and which this railway would transport, are:-

- Kola nuts
- Gold dust
- Gold copal
- Timber
- Monkey skins
- Palm kernels
- Palm oil, and
- Rubber

From Axim, Chama, and Dixcove, in 1896 these articles were exported to the value of 111, 525; 11s. 10d.

Imports.

In 1896 there was imported at the same ports goods to the value of 115, 546l. for transmission to the immediate interior, and it may be assumed that if a railway was constructed and a port formed at Sekondi, such imports would be conveyed by railway instead of native carriers as at present.

Statement showing the total value of Imports and Exports of the under-mentioned Ports on the Gold Coast Colony for the years 1894 to 1896, from information supplied by the Comptroller of Customs, Accra.

R.G. Rogerson. /
Enclosure 2 in No. 190.
Crown Agents to Mr. Shelfobd.
Downing Street, S.W.,
August 11, 1897.

I have acknowledge the receipt of your letter of the 6th instant, enclosing your report upon the Tarquah Railway Survey, and shall be obliged if you can furnish us with further information on the following points:

1. On the 6th page of your report you give the estimated cost of the line at 240,000\(\text{\pounds}\), exclusive of works at the harbour or port. This is equal to 6,000\(\text{\pounds}\) per mile, which appears to us to be very high for a line which is practically a surface line, constructed through a country presenting no engineering difficulties and no considerable waterways. You state in your covering letter that a cheaper line could be worked out from the present plans and sections, and as 6,000\(\text{\pounds}\) per mile is undoubtedly far in excess of any expenditure hitherto contemplated by the Colonial Government on this line, I should be glad if you would state in what direction you would propose to effect reductions, and what would be the cost of the cheapest line you could recommend in this instance.

2. As regards the proposed route, we concur with you in thinking that if it is clear that the development of gold mining is to be looked for at Tarquah and beyond, the route selected by Mr. Rogerson best satisfies the conditions of the problem. It is, however, not equally clear to us how Mr. Rogerson proposes to serve the Kyniankor District by means of what is described as a sufficiently good light railway. If he has in view a branch from the main line to Tarquah it is, in our opinion, imperative that however light that branch may be in construction, it should be of the same gauge as the main line.

3. In regard to the estimate of traffic required on page 8, we observe that the conclusion at which you arrive is that with an annual load of 12,180 tons, with an average haul of 30 miles, and two trains a day, at a rate of 1s. 3d. per ton per mile, the railway will pay its working expenses and the interest on the capital charges, and we agree with you in thinking that, having regard to the existing cost of transport, it might be possible to impose this rate until the growth of traffic justifies its reduction. But the point which is not clear to us, and which we have not been able to find explained in your report, is how far we should be justified in expecting this annual traffic of 12,180 tons. While giving full weight to your arguments as to the prospects of future development, it would be satisfactory to know that the existing traffic in the district bears some reasonable proportion to this minimum traffic of 12,180 tons.

[...]

I am, &c.

M. F. Ommanney.
Sierra Leone (Kwalu) Railway Survey. Report of Messrs Shelford and Son (15 November 1899); held at the National Archives, CO 879/61/612.

SIERRA LEONE.

SIERRA LEONE (KWALU) RAILWAY SURVEY.

REPORT OF MESSRS. SHELFORD AND SON, DATED 15th NOVEMBER 1899.

35A, Great George Street,
Westminster,
15th November 1899.

SIERRA LEONE (KWALU) SURVEY.

Extension beyond Rotofunk.

Gentlemen,

In accordance with the instructions contained in your letter of the 18th November 1898 to Mr. Shelford, and subsequently, we have the honour to report that after considerable delay from various causes we have now completed the investigation of the above extension, the principal loss of time being due to the necessity for postponing our conclusions as to the traffic prospects of the line until further statistics had been obtained from the Colony, which arrived on the 17th October last.

2. It is necessary to explain, in the first place, that after the expedition had started it was desired to make an alteration in the direction of the survey near Rotofunk, and at the request of His Excellency the Governor, Sir F. Cardew, 1 contained in his despatch of the 15th February last, it was arranged that Kwalu should be avoided, and that the line should be diverted so as to run direct to
Mano via Moyamba, to which latter place the head-quarters or seat of Government of the Ronietta district, which had been hitherto at Kwalu, were about to be removed. The alteration was duly authorized by Mr. Chamberlain, and signified to us in your letter of the 10th March last, and the survey was carried out on the lines suggested as far as Mano and Bo.

3. We beg to refer here to the despatch of His Excellency, dated Freetown, 4th October 1898, in which he expresses his reasons for the survey. He there stated, in paragraph 3, that the preliminary surveys beyond Rotofunk should be made during the then ensuing dry season in order that the location and final survey might be twelve months ahead of construction, which would mean a great saving in time and cost. In paragraph 4, he considered that he need hardly dwell on the necessity for the extension of the railway if it was to be a remunerative undertaking, or the advantages which must result from the development of the Protectorate by means of the railway, which would run through districts that were fertile and prolific in the extreme, in such products as palm oil, palm kernels, rubber, gum, and kola nuts, a large portion of which was going to waste through the want of a ready market. In paragraph 5, he deduced from the traffic returns of the line already opened that there was little doubt that the railway would pay its working expenses, and that as it is extended and the traffic increases from the development of the country, the interest and sinking fund on the capital invested would also be paid.

To the CROWN AGENTS for the COLONIES, Downing Street, S.W. /

In paragraph 6, he pointed to the great advantage which this line possesses over that of any of the other colonies on the West Coast, in that it has for its terminus a large city and a port which is believed to be a greater emporium of trade than any other single port on the coast, and, further, that it has a hinterland through which to pass, which, though limited in extent, was rich in products and capable of great development, and was not dependent on trade from the interior, as was shewn by the increase in the value of the imports and exports of the colony in recent years, notwithstanding that the trade of vast territories on the Niger had been cut off by the French. He then drew attention to his experience of the usefulness of the railway for military purposes during the crisis of the disturbances in April 1898 – i.e., twelve months before it was completed – and concluded by urging its continued extension on military and political grounds.

4. Having had the honour of an interview with His Excellency on the 18th September last, just before his departure for the Colony, we are well aware of the opinions which he holds, and which we may say are even stronger now than when he wrote the above despatch. They may be summed up in his own words, that ‘the further the line goes, the better it will pay.’
5. In consequence of His Excellency’s despatch, we received through you, on the 27th December last, the approval of the Secretary of State, and a special survey party, consisting of Mr. F. S. B. Gaffney, as Senior Engineer, Mr. A. Summerscale, as Junior Engineer, and Doctor W. B. Mercer, as Medical Officer, was engaged and sent out on the 7th of January of the present year. These gentlemen made a reconnaissance survey from Rotofunk to Pehwahun (31 1/4 miles), a point suitable for a station, and estimated to be the same distance from Rotofunk as the town of Kwalu, the limit to which, as already explained, had been abandoned. They also made a flying survey, or exploration of the country, towards Mano, and thence to Tikonko, which was the southernmost objective mentioned in their instructions. Returning northwards by way of the very important towns of Mattru and Bo, and thence to the westward via Mano and Kwalu, they completed the exploration of the country, which resulted in fixing the general direction of the line [...].

6. Mr. Gaffney, who was on leave from the Straits Settlements, where he holds a Government appointment, has supplied us with a report (see Appendix A) in which he has given a full description of the country and his general views as to its population and traffic prospects; and Mr. Summerscale, who is a gentleman of considerable practical experience in surveying for and constructing railways, both at home and abroad, confirms the opinion of Mr. Gaffney as to the practicability of making an easy line and the absence of engineering difficulties.

7. It may be said generally that from Rotofunk, the starting point of the proposed extension, to Moyamba, a distance of 22 miles by railway, the country is not more difficult than that between Songo town and Rotofunk, but that beyond Moyamba the prospects are more favourable for an easy line on account of the absence of hills and greater freedom from bush and other obstacles.

[...]

9. It is believed by the resident engineer that the latter section (to Rotofunk) will be ready for opening or at least for the working of construction-trains by the middle of 1900, which is earlier than had been anticipated.

If this is realised it will be due to the circumstance that advance parties of surveyors were early in the field, who were allowed time to locate the railway in the most advantageous position, thereby saving the cost of some earthwork and of two expensive viaducts, which had previously been thought unavoidable, and it is very desirable that the remainder of the railway should be treated with similar forethought, in order to secure by a good location the great advantage of economy in the construction of works.
MR. GAFENY’S REPORT (APPENDIX A).

10. This report describes the work done by the surveyors, the routes traversed, the country passed through, and the works required. Mr. Gaffney has drawn attention to the abundant evidence of population which he met with throughout the country, notwithstanding that it was temporarily very much reduced by the disturbances following upon the ‘Hut Tax Revolt.’ He has also commented upon the traffic prospects of the line when extended, and has given his views upon the desirability of pushing forward such extension by laying the rails and sleepers rapidly as a temporary road before finishing the works intended to carry the permanent way.

11. The ‘reconnaissance survey,’ which extended for a length of 31 1/4 miles to Pehwahun, proved to the surveyors that some care would be necessary in order to locate a surface line through a country so undulating and varied. Accordingly cross sections were taken from which levels and contour lines were drawn upon the plan, and thus a favourable route was obtained.

12. The remainder of the route, the choice of which resulted from the ‘flying surveys’ fully described in his report and already referred to – i.e., from Pehwahun to Mattru and Bo – is much easier, and the only works of importance are the crossings of three or four rivers for which iron or steel bridges will be required, but of moderate dimensions, and in no case equal to that now being constructed over the River Ribbi on the extension to Rotofunk.

13. The names of the principal places along the line finally selected, and their distances from each other and from Freetown, are shewn in the following table:

<table>
<thead>
<tr>

</tr>
<tr>
<td>Rotofunk – Pehwahun</td>
</tr>
<tr>
<td>Pehwahun – Mattru</td>
</tr>
<tr>
<td>Mattru – BO</td>
</tr>
</tbody>
</table>

14. The above are the most natural divisions into which the line falls for construction purposes, excepting Mattru to Bo, but as the really prolific country does not occur until Mano is reached, it will be convenient in this Report to consider the whole of the extension to Bo as being alternatively – from Rotofunk to Mano (50 1/4 miles) and Rotofunk to Bo (80 1/2 miles).
15. The following is an estimate of the cost of the line from Rotofunk to Pehwhahun (31 1/4 miles), based upon the standard works of the constructed line, and calculated at prices in accordance with the present market rates. The net result is a cost of £4,429 per mile exclusive of rolling stock, and £4,733 per mile including rolling stock. The data for the remainder of the extension supplied by the ‘flying survey’ are not sufficient to make an estimate upon, but they have established the fact that the above mileage estimate will be more than sufficient to continue the standard line to the most distant point – Bo, the total cost of which from Rotofunk to Mano (50 1/4 miles) will be £237,833, and from Rotofunk to BO (83 1/2 miles) £381,006.

* This item is not included in the estimate of work to be done because it has been already expended.
Details of Estimate.

Reconnaissance Survey.
This is the approximate cost of the portion of Mr. Gaffney’s Survey in 1899 which included the line from Rotofunk to Pehwahun.

Final Survey and Clearing.
This estimate is framed from the experience gained during the last three years, modified by the density of the bush between Rotofunk and Pehwahun.

The Earthwork.
has been estimated in detail as far as the information afforded by the preliminary survey would suffice, and is equal to 14,700 cubic yards per mile.

Bridges, Culverts, and Viaducts.
The cost of transporting the materials for the construction of these viaducts over the 56 miles of line, from Freetown to Rotofunk, has been taken into account in the estimate for these works.

Permanent Way and Ballast.
This very heavy item has been estimated by taking into account the very considerable rise in the prices of railway materials during the last twelve months, rails being £7 per ton f.o.b. The amount is also intended to include the cost of transport over the line to Rotofunk, as well as over part of the section under construction.

Administration and Engineering.
This item, which is considerable, is based upon the present expenditure upon the Sierra Leone Railway, on the assumption that the section from Rotofunk to Pehwahun, with its viaducts, would occupy a period of two years in construction.

Rolling Stock.
A small quantity of additional rolling stock has been estimated for working the additional length of line.

N.B. – The above estimate of the cost of the railway from Rotofunk to Pehwahun (31 1/4 miles) has been prepared because Mr. Gaffney’s reconnais-
sance survey located the line over that length, and to afford a mileage rate for the construction of a railway upon the Sierra Leone standard in country such as that found between Rotofunk and Bo. By this means the total cost of any portion, or the whole, can be calculated.

16. We have considered, as an alternative to a railway constructed upon the Sierra Leone standard, the cost of a light line somewhat similar to that which would be laid in this country by a contractor over the surface of the ground and commonly known as an ‘overland route.’ This light line would, however, be superior to a contractor’s line, as we have estimated for steel rails and sleepers identical in all respects with those of the standard line. Moreover, the light line would require surveying and clearing the same as the standard line, but it is considered that a substantial saving would be effected in earthworks, buildings, and administration by pushing forward the permanent way. Our estimate for the light line, made from such information as is afforded by Mr. Gaffney’s flying survey, amounts to £3,043 per mile exclusive of rolling stock, and £3,214 per mile inclusive of rolling stock, making a total of £161,500 for the 50 1/4 miles from Rotofunk to Mano and £258,700 for the 80 1/2 miles from Rotofunk to Bo. /

* This item is not included in the estimate of work to be done because it has been already expended.
Estimate for Light Railway:— Details.

Survey.

The flying survey by Mr. Gaffney in 1899 is estimated to have cost £450.

The final survey for the light line must be estimated to cost the same as the survey for a more permanent railway, for the best route for a light surface line will require to be as carefully picked out in the dense bush as a heavier line. Moreover, this survey, when made, will probably give the route for the heavier line when desired, excepting at a few difficult points where it may be advisable to construct at first an inexpensive line by making a detour from the best route for a more permanent railway. Such a survey, from past experience, may be estimated to cost £100 per mile.

Land.

All land beyond Pehwahun, being in such a remote part of the country, varying from 86 to 136 miles from Freetown, may be assumed to be freely given to the railway, the benefit to the native chiefs or other landowners by the construction of the line being more than ample compensation for a few acres of ground. £500 is allowed for land as far as Pehwahun. /

Clearing.

The width of clearing for a light line must be the same as for the heavier one. The width of 66 feet allowed on the Freetown-Songo Town section is by no means too much, as the neighbouring bush rapidly encroaches upon the open space.

According to the description given by the surveyors, £40 per mile will suffice for clearing and for the necessary grubbing up of stumps, as the country beyond Pehwahun is more open than that nearer Freetown.

Earthwork.

With no data but that supplied by a flying survey it is impossible to estimate with accuracy the quantity of earthwork required. From the description of the country it seems as if a surface line will be possible for most of the distance, and it is therefore safe to assume that the earthworks required will not exceed the equivalent of a 2 foot 6 inch bank throughout, or 7,100 cubic yards per mile.
Bridges and Culverts.

Under this head no less than 41 swamps or swampy rivers have to be dealt with. After carefully considering the matter, Mr. Gaffney stated that most of these swamps may either be avoided altogether or drained into streams inexpensively by the digging of the side ditches of the railway.

All bridges and culverts for this light railway will be of a temporary nature, probably of timber, of which there is a plentiful supply throughout. It is anticipated that detours from the most direct route will have to be made in the case of the crossings of the larger streams.

Permanent Way and Ballast.

This has been estimated for as similar in all respects to the permanent way already laid to Songo Town. It would be unwise to make the rails lighter, and if the sleepers are of steel, the railway will be in all respects equal to the line now open to Songo Town where it traverses easy country. The estimate for this heavy item is based on the present abnormally high prices, taking rails at £7 per ton f.o.b.

Stations and Buildings.

The station buildings will be of a less permanent character than constructed on the line already made. Probably buildings with a good timber framing, covered with corrugated iron sheeting will be found sufficient, such as are now being used on the Rotofunk extension. The cost of these can hardly be reduced as they will be required for the use of the Staff.

17. The comparative costs of the standard and light lines to Mano and Bo are shown in the following table:–

<table>
<thead>
<tr>
<th></th>
<th>Rotofunk to Mano</th>
<th>Rotofunk to Bo</th>
</tr>
</thead>
<tbody>
<tr>
<td>Sierra Leone Standard Line</td>
<td>£237,833</td>
<td>£381,006</td>
</tr>
<tr>
<td>Light Line</td>
<td>£161,500</td>
<td>£258,700</td>
</tr>
<tr>
<td>Saving</td>
<td>£76,333</td>
<td>£122,306</td>
</tr>
</tbody>
</table>

N.B. – Before the works of the light line can be regarded as permanent, it is possible that the bridges will have to be renewed at a cost of about £400 per mile, thus reducing the saving to £56,233, and to £90,106 for the Mano and Bo lines respectively.

18. The expediency of such a light line depends upon local circumstances, and is now under the consideration of the Chief Resident Engineer, who has been instructed by / His Excellency the Governor to examine the country with this view. Its object would be to facilitate the construction of the heavier works, and especially to arrive at a productive point by hurrying the development of the
district. This can only be accomplished by pushing forward the permanent way over temporary bridges, and in a temporary manner, with a view to carrying traffic in construction trains before completing the permanent works.

19. Subject to the question of expediency now under consideration, we are of opinion that the time has arrived for carrying out such a light railway. It is in accordance with the views of Sir Frederic Cardew, as expressed from time to time and more particularly set forth in the following abstracts from his able ‘Observations on the Report of the Royal Commissioner on the Insurrection in the Sierra Leone Protectorate, 1898 (“Hut Tax Revolt”):’–

‘So long as trade is hampered by the present expensive system of transport, I mean the carriage on men’s heads of all kinds of merchandise and produce, and by the extreme difficulty experienced by travellers and traders in getting carriers at almost any price, no great increase in trade or revenue can be looked for in a colony like Sierra Leone with its very limited hinterland. Light railways appear to me the best practical solution of this most important question of inland transport. The difficulties attending the use of oxen or mules for draught purposes seem insuperable.’

‘But given that such animals could live and work, they cannot pull vehicles over soft roads through mud and dirt and swamps, and across streams and rivers, so metalled roads would have to be constructed on scientific principles, gradients eased, causeways constructed over swamps and morasses, culverts erected, streams bridged, and ferries established across the large rivers. The construction and keeping open such roads would entail, as regards first cost and maintenance, an expenditure perhaps little short of the construction and maintenance of light railways.’

Moreover, it is in accordance with the view expressed in Mr. Shelford’s Report of August 1894, page 2, 3rd paragraph, which was to the effect ‘that the country may not be able to support the cost of the standard railway, and that it may consequently be desirable to adopt a special construction of lighter type, which, though not equal to the standard, will still be a great advance in a country destitute of beasts of burden, and depending entirely upon human labour for transport wherever water-carriage is not available.’ Again on page 4 of the same report (paragraph 7) the maximum gradient proposed for the light line then under discussion was 1 in 30, and it was suggested that ‘the undulations of the country lend themselves to the convenient working of such gradients with ordinary engines, and to the eventual improvement of the gradients by lowering their summits when the increase of the traffic demands it and justifies the expense.’ We think it right, however, to say that we do not recommend the adoption of a steep gradient in great lengths, except under exceptional circumstances, such as we gather from the surveyors’ information are not likely to arise in this case, and our experience in Sierra Leone leads us to prefer a maximum of 1 in 35. As
bearing upon the development of the country which we desire to expedite, we
would also call attention to page 8 of the same report (3rd paragraph), wherein
it is shewn how ‘carriers, where now employed in transport, will be unable to
continue this occupation, and will be set free (by the construction of a railway)
to bring the same produce to the railway close at hand, and to go farther afield
into the palm belt to fetch it,’ and we may add that it is reported from Sierra
Leone that the effect of the railway is to carry the merchants and traders into
the districts which are further afield, thus leading to an increase of business in
imports and exports.

Traffic Prospects.

20. The traffic prospects of the extension of the railway beyond Rotofunk have
been the subject of much anxious consideration on our part. At the time that Mr.
Gaffney carried out his survey the country was suffering acutely from the shock
of the recent disturbances, and in fact the punitive expedition had not yet left it.
The time was, therefore, most unfavourable for making any estimates of traffic.
Mr. Gaffney nevertheless endeavoured to get at the possible results obtainable
from a railway under the conditions prevalent in West Africa, including domes-
tic slavery, which under another name appears to exist to a large extent in the
interior of the country, where many of the people are at the disposal of their
chiefs, and are available for carrying produce out and imports inward at a cost lit-
tle above their daily subsistence. Mr. Gaffney appeared to think that the railway
could compete with this labour, even under such conditions, inasmuch as the
natives would prefer to stop at home and to carry the goods to the railway, and
that, in any event, slavery would be of short duration, as the idea of freedom and
liberty was rapidly growing amongst them and would continue to do so. He fur-
ther expressed the opinion, which he had derived from the natives themselves,
that the quantity of produce to be sent to market from the interior depended
only upon the number of people available for carrying it out, and which would
be largely increased by the making of the railway.

Population.

21. Mr. Gaffney appears to have been greatly impressed with the evidence of
population in that part of the Protectorate which would be traversed, and from
the figures which he has given of the villages actually passed through, it would
seem that the number of people between Mano and Bo is 406 per mile run, and
that the average for the whole length from Rotofunk to Bo is 232 per mile run.
Comparing this with the population met with on the line from Songo Town to
Bumban, as given in Mr. Shelford’s Report of 1895, the average was 214 per mile
run, but the extremes were greater, the minimum being 112 and the maximum 568 per mile run.

Mr. Gaffney forms the opinion from his observations and calculations, supported by his experience of similar districts in Sumatra, and in two counties of Ireland, that the average population of the country may be taken at not less than 100 per square mile.

22. The Governor, Sir F. Cardew, who has seen personally more of the district, and particularly of this route, than anyone else who has had to consider the subject, does not put the number so high, but he is also of opinion that the population is abundant, and, as evidence, he quotes an estimate of the number of huts in the Protectorate in which they were returned at 80,000, and 35,000 were actually counted in the southern district, through which the line passes. This number of huts would represent at least 300,000 people, of which it may be considered that 250,000 would fall [...] within the influence of the extension.

From these statistics and the mileage population recorded along the surveyed routes, it seems reasonable to assume that the district served by the railway is inhabited by 250,000 persons or say 50 per square mile of area served by the railway.

Existing Trade.

23. We have obtained from the Colonial Government the statistics for recent years of the imports and exports of the Colony, and of each of the ports on the coast south of Freetown, copies of which last are appended (Appendix B). They shew some remarkable results.

24. In the first place, the financial position of the Colony of Sierra Leone in relation to the other West African Colonies – Gold Coast and Lagos – may be noted.

Their respective Revenues in 1897 and 1898 were:–

<table>
<thead>
<tr>
<th></th>
<th>1897</th>
<th>1898</th>
</tr>
</thead>
<tbody>
<tr>
<td>Gold Coast</td>
<td>233,179</td>
<td>258,822</td>
</tr>
<tr>
<td>Lagos</td>
<td>177,420</td>
<td>Not ascertained.</td>
</tr>
<tr>
<td>Sierra Leone</td>
<td>106,009</td>
<td>117,681</td>
</tr>
</tbody>
</table>

shewing an increase of 11 per cent. for the Gold Coast and the same amount for Sierra Leone, which is satisfactory, the more so because in the latter case the revenue is the highest ever received. /

Again, the value of the Imports in the years 1896, 1897, and 1898, which may, however, have been in some cases affected by exceptional causes, was:–
in which the excessive return for Sierra Leone in 1898 was probably due to the military operations.

The value of the *Exports* in the same years was:–

<table>
<thead>
<tr>
<th></th>
<th>1896</th>
<th>1897</th>
<th>1898</th>
</tr>
</thead>
<tbody>
<tr>
<td>Gold Coast</td>
<td>£778,001</td>
<td>£784,188</td>
<td>£960,336</td>
</tr>
<tr>
<td>Lagos</td>
<td>£901,474</td>
<td>£770,510</td>
<td>£908,351</td>
</tr>
<tr>
<td>Sierra Leone</td>
<td>£494,688</td>
<td>£457,389</td>
<td>£606,348</td>
</tr>
</tbody>
</table>

As the last two years at Sierra Leone were crippled by the ‘native revolt’ too much importance should not be attached to them.

The general conclusion to be derived from these figures is that the total trade of Sierra Leone is in value about one-half of that either at Lagos or the Gold Coast.

25. Secondly, it will be useful to note the relative proportions of the staple articles of export, from the same ports, such as palm oil, palm kernels, and rubber. For example, in 1897 there was exported:–

Palm oil from –

<table>
<thead>
<tr>
<th></th>
<th>Gallons.</th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Gold Coast</td>
<td>2,021,716</td>
<td>Lagos</td>
<td>1,858,968</td>
</tr>
<tr>
<td>Sierra Leone</td>
<td>181,647.</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

or less than one-tenth of the oil from the other two. But taking palm kernels for the same year we find:–

<table>
<thead>
<tr>
<th></th>
<th>Tons.</th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Gold Coast</td>
<td>10,836</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Lagos</td>
<td>not ascertained.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Sierra Leone</td>
<td>17,671,</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

or about 70 per cent. more than the product of the larger colony. / Again, in 1897 rubber was exported from –

<table>
<thead>
<tr>
<th></th>
<th>Lbs.</th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Gold Coast</td>
<td>4,957,016</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Lagos</td>
<td>4,458,327</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Sierra Leone</td>
<td>1,305,696,</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

or about one-third the product of each of the larger colonies.
The conclusion appears to be justified that the exports of Sierra Leone are remarkably deficient in palm oil as compared with the other colonies, whilst in palm kernels they are excessive, and in rubber nearly normal, i. e., one-third as against one-half which would be the due proportion.

26. Thirdly, the figures obtained from the Colonial Government since the survey was made indicate the volume of trade at each of the ports south of Freetown and to seaward of the railway; thus in 1897 the total quantity of palm oil exported from Sierra Leone was 181,647 gallons, of which –

<table>
<thead>
<tr>
<th>Gallons.</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Sherbro’ contributed</td>
<td>142,964</td>
</tr>
<tr>
<td>Sulima</td>
<td>8,805</td>
</tr>
<tr>
<td>*Mano Salija</td>
<td>13,645</td>
</tr>
<tr>
<td><strong>Total</strong></td>
<td>165,414</td>
</tr>
</tbody>
</table>

**Weight.**

<table>
<thead>
<tr>
<th>Tons.</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Freetown, balance</td>
<td>16,233 = 690 tons.</td>
</tr>
<tr>
<td><strong>Total</strong></td>
<td>181,647 = 770 tons.</td>
</tr>
</tbody>
</table>

showing that 90 per cent. comes from the southern ports.

In the same year, 1897, the total weight of palm kernels was 17,671 tons, of which –

<table>
<thead>
<tr>
<th>Tons.</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Sherbro’ sent</td>
<td>9,982</td>
</tr>
<tr>
<td>Sulima</td>
<td>477</td>
</tr>
<tr>
<td>*Mano Salija sent</td>
<td>1,214</td>
</tr>
<tr>
<td><strong>Total</strong></td>
<td>11,673 tons.</td>
</tr>
</tbody>
</table>

of which about 60 per cent. was from the southern ports.

Again, in the same year, 1897, the total weight of rubber exported was 11,658 cwt., of which –

<table>
<thead>
<tr>
<th>Cwt.</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Sherbro’ sent</td>
<td>4 ¼</td>
</tr>
<tr>
<td>Sulima</td>
<td>1 ¼</td>
</tr>
<tr>
<td>*Mano Salija sent</td>
<td>64 1/2 Cwt.</td>
</tr>
<tr>
<td><strong>Total</strong></td>
<td>70</td>
</tr>
</tbody>
</table>

**Total** 11,588 = 579 tons.

shewing that practically the whole goes from Freetown.

* This is far distant from ‘Mano’ on the railway. /
27. For the same year, 1897, the aggregate tonnage of African produce exported from Freetown was given by the Collector of Customs as 11,381 tons, including, as above –

<table>
<thead>
<tr>
<th></th>
<th>Tons.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Palm oil</td>
<td>690</td>
</tr>
<tr>
<td>Palm kernels</td>
<td>5,998</td>
</tr>
<tr>
<td>Rubber</td>
<td>579</td>
</tr>
<tr>
<td>Total</td>
<td>7,267</td>
</tr>
</tbody>
</table>

equal to about two-thirds of the whole, and leaving one-third to be made up of various products.

28. The inferences which may be drawn from these figures appear to be:–

(1.) Freetown is not yet a shipping port for palm oil, the nearest palm forest being at Rotofunk (55 miles).

(2.) The greatest weight of palm produce exported is in kernels, of which the larger part (60 per cent.) comes from Sherbro’ and other southern ports, Freetown exporting about 40 per cent. only.

(3.) Palm oil does not form a large trade, probably because of the difficulty of transport; palm kernels are worth less, weight for weight, but are perhaps more easily carried through bush and swamp.

(4.) Freetown almost monopolizes rubber because it is valuable as compared with its weight, and will bear the cost of transport by native carriers.

(5.) The extension of the railway should revolutionize Nos. 1, 2, and 3, while No. 4 should further improve greatly.

*Proposed Extension by Sections.*

29. The first section of the extended line from Songo Town to Rotofunk being well in hand, it is time to determine the objective points of the proposed extension. Of these three have been suggested – Moyamba, Mano, and Bo. Moyamba (22 miles), being the new headquarters of the district, and the centre also of the gum copal cultivation of industry, has been considered, but in the absence of palms and rubber a line built to Moyamba cannot be regarded as likely to be a very productive length. Mano (50 1/4 miles) is the nearest centre upon which traffic of all kinds may be expected to converge, and where the area influenced by the railway free from competition becomes more important. It is, however, at Bo (80 1/2 miles) where the full benefit of the line will be felt, and where the area which the railway will materially affect reaches large dimensions. The map (not included) shows three coloured areas, each of which has its apex at Songo Town. The first is based upon Rotofunk as a centre, and is the smallest because it is circumscribed by competing navigations and roads; but this section, like the main line to Freetown, does not depend upon the area from which traffic may be
produced so much as on the quality of the traffic, which here is enhanced by a valuable palm forest, reported to cover only a few square miles. The next section has Mano for its centre, and a traffic area of 2,215 square miles, in the southern part of which it may be expected that competition with the navigations will be felt for certain classes of goods. The third section, with Bo as its centre, opens up an extensive traffic area of 5,276 square miles, which will be affected doubtless on its southern side by water competition, but on the whole rich in natural products, and inhabited near its centre, according to Mr. Gaffney, by a better-class and an industrious people.

30. These traffic areas go far to justify the opinion of Sir Frederick Cardew already referred to, but before such a conclusion can be accepted it will be necessary to examine the effect of other factors, such as the capital to be expended upon construction, the annual charges for interest and sinking fund, the cost of working, and the rates obtainable from passengers and freight. The following table is intended to give this information for each section of the extension in a convenient form, and on the assumption (1st) that the works will be carried out on the Sierra Leone Government railway standard; and (2nd) that an alternative and cheaper line will be adopted to expedite the opening up of the country and to save capital expenditure in the first instance.

31. It will be observed that the ninth column shows the amount in £ per square mile (of the traffic areas) which must be contributed in order that all charges, including interest and sinking fund, may be met, and that this figure is lowest (£11) in the case of the greater extension to Bo and by the adoption of the lighter line.

This amount may be made up in passengers and goods thus:

<table>
<thead>
<tr>
<th></th>
<th>£</th>
<th>s.</th>
<th>d.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Passengers, 50 per square mile, 1 journey per annum at 1s. for average price of a ticket</td>
<td>2</td>
<td>10</td>
<td>0</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Goods.</strong></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>2 tons – Exports hauled 125 miles at 4d. per ton per mile</td>
<td>4</td>
<td>5</td>
<td>0</td>
</tr>
<tr>
<td>Imports in smaller quantities at higher rates</td>
<td>4</td>
<td>5</td>
<td>0</td>
</tr>
<tr>
<td></td>
<td>11</td>
<td>0</td>
<td>0</td>
</tr>
</tbody>
</table>

32. The traffic area is 5,276 square miles, and if the whole produce carried by the railway were palm oil, the annual tonnage of exports would be 5,276 square miles x 2 tons = 10,552 tons, in addition to the 11,381 tons of produce shipped at Freetown in 1897, which would still be a reasonable quantity for Freetown to ship, and which could be drawn by the train mileage provided in the estimate.

33. Applying the figures in the table to the Mano traffic area we have to account for £21 per annum per square mile.

</thead>
</table>

This district being so far up country people may be assumed to travel 12 miles at 1d., or at a total fare of 1s.

Freetown to two-thirds distance along the section of extended line referred to.

Note. – 2 tons of palm oil produced per annum per square mile (= per 50 people) is very small. One man can produce about 400 lbs. of palm oil and kernels in one week, or 2 tons in 11 weeks.
Allowing one man out of five people the above is about 1/50 of what might be done by the population, thus proving that the labour will be sufficient.

\[
\begin{array}{ccc}
\text{Passengers as before} & 2 & 10 \ 0 \\
\end{array}
\]

\[
\begin{array}{ccc}
\text{Goods.} & \\
6 \ 1/4 \ Tons. – Exports hauled 88 miles at 4d. per ton per mile & 9 \ 5 \ 0 \\
Imports in smaller quantities at higher rates & 9 \ 5 \ 0 \\
£21 \ 0 \ 0 \\
\end{array}
\]

from which it appears that the weight of the exports from the smaller Mano area, will have to be more than three times greater per square mile than that from the larger area – Bo, which may involve a greater development of the country before it is accomplished.

\section*{Working Expenses.}

34. Working expenses are difficult to estimate. We have calculated the amounts shewn in the table at the mileage rates estimated by Mr. Hill for the Freetown and Rotofunk line revised to date, and have assumed that the same figures will apply also to the working of the light line.

35. In conclusion, the above investigation of the conditions applying to the proposed extension confirms the opinion of Sir Frederick Cardew when he said that 'the further the line goes the better it will pay.'

There remains only the local question of the expediency or otherwise of pushing the work forward as a cheaper line than the standard hitherto constructed, the advantages of which (if its expediency is confirmed) are:

\[
\begin{array}{ccc}
\text{Mano Section} & \text{Bo Section} \\
£76,333 & £122,306 \\
\text{Or allowing for the reconstruction of bridges} & £56,233 & £90,106 \\
\end{array}
\]

(2.) A reduction in the value of gross receipts required, and therefore in the time necessary for developing the country.

36. The moral effect of more rapid construction will be advantageous to the Colony, and any economy of capital expenditure which can be obtained from the construction of a cheaper line of railway will form a
reserve available for the widening of the Wharf at Freetown, a matter which is not considered in this Report, and for which the information is not yet forthcoming, but is nevertheless absolutely necessary for the conduct of the traffic expected at the port.

37. It is, in our opinion, necessary for the development of the Colony that the line should be constructed to Bo if possible, and in no case to a less distance than Mano, but in such sections as may be convenient; and as the staff arrangements are now being made for the ensuring dry season, we shall be glad to be favoured with your early instructions.

We have, &c.,

SHELFORD AND SON. /
APPENDIX A.

SIERRA LEONE (KWALU) SURVEY, 1899.

Report of Mr. F.S.B. GAFFNEY, Assoc. M. Inst., C.E.

To Messrs. SHELFORD & SON,

35a, Great George street,
Westminster.

Sirs.

In accordance with your instructions, I left Liverpool upon January 7th for Sierra Leone accompanied by Mr. Mercer as Medical Officer to the expedition, while my colleague, Mr. Summerscale, not being able to accompany as, left by the following mail, January 14th. We arrived at Freetown on Sunday the 22nd.

On January 25th I started alone for the interior, leaving the doctor behind for urgent duty in connection with the railway construction party, caused by the illness of one of the railway medical officers.

I travelled by rail as far as Songo Town, where I expected to find 50 carriers provided by the Resident Engineer, but those who had been provided had deserted and I was supplied with 50 labourers from the railway. All preparations being made, I started at 7 a.m. on January 26th and proceeded towards Roafunk.

The first right was spent at Bandasuma with a survey party who were locating the extension of the railway from Songo Town to Rotofunk.

Preliminary Examination.

The next day I passed through Rotofunk, at which place my survey was to begin, and reached Mongire, six miles on the road towards Kwain. Here most of my carriers ran away, and I was obliged to remain for a whole day.

I then started with 10 carriers and reached Moyamba, 21 miles from Rotofunk, and spent the night there. The following morning, the 30th, I went into Kwalu, 31 miles altogether Rotofunk, I had hoped to see the District Commissioner, but he was unfortunately away. The officer acting for him informed me that Kwalu would soon cease to be the headquarters of the district, and he believed that Moyamba had been selected for the new site, and it was probable
that the villagers would follow soon after the officials. I communicated this fact to you, with the result that I received orders to alter my original instructions, which will be described later in my report. I returned that afternoon to Moyamba, and on the next day to Rotofunk, which I reached at 4 p.m. and where I met my colleague, Mr. Summerscale, who had arrived in Freetown on the 28th.

**Reconnaissance Survey.**

I resolved to camp at Rotofunk for some time, so we fixed our camp and began our survey the next day, the 1st February. We remained in Rotofunk till the 11th February, on which date we changed camp to Mongire. We worked from that place until March 2nd when we removed our camp to Makora, 7 miles further on, and on the 18th we removed to Moyamba, 21 miles from Rotofunk.

**Flying Survey.**

On the 31st we left most of our heavy equipment here and started on the ‘Flying Survey’ to Tikonko via Mano, having now completed the reconnaissance survey as far as Moyamba. On the 15th April we returned via Kwain to Moyamba, having completed 120 miles of Flying Survey.

**Reconnaissance.**

We then continued to carry on the reconnaissance on the direct road to Mano on Monday, 17th April, and completed it as far as Pehwahun, 31 miles, on the 29th April. On May 2nd we started for home and reached Songo Town on Thursday, 4th May, and handed in our instruments and equipment to the railway extension stores. 

  The next day we went by train to Freetown, the whole line having been opened on May 1st by His Excellency the acting Governor.

  On Wednesday, the 10th, we sailed for home on board the S.S. ‘Jebba’ and reached Liverpool on May 23rd. [...]

**THE RECONNAISSANCE SURVEY.**

**Description of the Country from Rotofunk to Moyamba.**

*Rotofunk* is a very suitable site for a prosperous town. It is prettily situated on the banks of the Lower Bumpe River, and bears many traces of recent cultivation of a kind superior to that of the neighbouring country.
This was the headquarters of the American mission where they did good work for over a quarter of a century in educating and civilizing the natives, but in May 1898 they were suddenly attacked by the hostile tribes, who came from the interior during the ‘Hut Tax Revolt,’ and four ladies and the Superintendent were brutally massacred, all their property looted, and their houses and schools burned to the ground. Most of the rising little town was at the same time burned, and those inhabitants who did not escape were for the most part killed.

The town has now begun to revive, and the natives, who during the scare hid in temporary huts in the thick bush, are gradually returning and rebuilding their houses. The rained foundations indicate what an extensive village Rotofunk once was, and it is reported that it contained about 1,200 inhabitants. There is every reason to hope that in the near future it will resume its former dimensions.

From here proceeding towards Kwalu on the ‘High road,’ as it is called, one passes over the Bumpe by a native-made bridge composed of large mahogany baulks (moored by tough stems of creepers) and arrives at the village of Geremah within half a mile. Up to this point the country is quite open, and, though there are no spaces now actually under cultivation, one can easily perceive that there was much of it a short time ago growing rice and piassava.

After this the road enters dense forest and continues for about 6 miles with the exception of a few valleys, where one is able to see a little of the surrounding country. The timber is composed mostly of cotton and gum trees.

This forest so near the road is misleading as to the general characteristics of the country. In some places, where long cuttings had to be made for the purpose of fixing a trace for the line, it was discovered that the larger bush was merely left as a screen to conceal the cultivation, and open cultivated ground lay beyond. This arose from the frequent raids that were formerly made by the more warlike races of the interior, who repeatedly swooped down during the harvest and carried away all the produce they could find. The effect is that even now when the villagers of the country east of the Yambutu wish to plant their rice and piassava they invariably do so in as remote a spot as possible. This condition of things applies to the whole of the track surveyed to Moyamba, and were one to traverse the country without exploring or enquiry, the impression left would be that it was quite desolate and devoid of cultivation.

Mongire. – The next village, Mongire, is six miles from Botofunk, and formerly consisted of about 80 native houses. It is situated on the top of a high apex between two streams which here meet.

During the war the inhabitants of Mongire took part with the hostile natives, so that when our forces arrived they burned every house in the village. The natives are now returning, and when last I passed through, fully half of the former town was rebuilt. When encamped here I had an opportunity of explor-
ing the neighbourhood, and was much surprised to find in nearly every direction where I penetrated the bush the traces of a large population.

Numerous groups of small huts are to be found in small villages or ‘fakus,’ and according to the system described above, their extensive cultivation is carried on far away from the main thoroughfare.

As far as Mongire the rough formation of the country is fairly uniform, consisting of steep hills composed of laterite gravel, rising abruptly from swampy valleys or marshes, which in the wet season are covered with water.

There are three such marshes up to this point, but the widest, at 5 1/2 miles, only measures some 100 yards across.

Taking these valleys as a base the rise to this point is only 50 feet in 5 1/2 miles.

Boia. – At 7 3/4 miles is the next village, and is situated on a spot almost exactly similar to Mongire, that is upon an apex of an acute triangle of high ground projecting into a swamp. Here the natives had been in sympathy with the hostile forces, with the ultimate result that their village was utterly destroyed. They have now begun to rebuild, and though little has been yet done, no doubt in time the whole place will be restored.

At 9 3/4 miles a steep valley is encountered, and the road descends abruptly some 60 feet into a marsh and stream, after which it rises equally abruptly to the village of Tungie, which from Mongire to this place passes through thick bush, and though it could hardly be recent history is similar to the others, and the inhabitants are only now beginning to rebuild their houses there.

The road from Mongire to this place passes through thick bush, and though it could hardly be described as forest, the trees run to about 30 feet high. By this village, like the others, flows a river on each side, and they meet at some distance on the south side, that on the east is of considerable size and subject to floods, as evinced by the native bridge some seven feet higher than the existing summer flow. After crossing the east river, one ascends another hill of laterite, and at 10 1/2 miles another river is met with which was found to join the last two mentioned.

A narrow marsh occurs at 11 1/2 miles, which was found not to extend far on the south side, so the railway can be carried round it without coming down to its level.

Makora is a village at 12 3/4 miles, built on a site the physical features of which are remarkably similar to the others. The natives of this village acted differently to those of the former villages during the war, at the outbreak of which they built a strong double barricade round their town, and stoutly resisted the attacks of the unfriendly tribes. The result is that they now possess a compact little village of some seventy houses closely built together, and with a population
of four or five hundred natives living in comfort. On account of the precautions of the natives in hiding their harvest, there is no sign of any cultivation, though that it exists and in a large quantity I learned on enquiry.

The road now rises and keeps fairly level up to 14 3/4 miles. The soil is like most of the rest, composed largely of red clay mixed with boulders and laterite gravel, and as far as one can see the country is all covered with thick bush from 15 to 30 feet high.

The next swamp is at the edge of the village of Yoyema where the road drops 50 feet, and a swamp of 4 chains and a small stream have to be crossed.

Yoyema is 15 miles from Rotofunk, and like Makora, it held out against the unfriendlies with strong barricades, and now contains about 65 houses and about 450 inhabitants. Unlike the other places the road continues from this village at the same level. The country is more open for two miles and a deep valley runs parallel on the north about a quarter of mile distant, at the edge of which a level for the railway was found.

At 15 3/4 miles the road suddenly drops into a swamp about 3 chains wide, and at a few hundred yards further another swamp 4 chains wide has to be crossed, but both swamps meet further down where the railway will cross and only one bridge will be required. The soil here for a few miles contains less laterite, but at 17 miles it gradually changes and many boulders of laterite shew on the surface, and from 17 1/2 to 19 miles it appears to be practically a solid rock, though the forest on either side indicates that there must be plenty of soil in the interstices. From 17 1/2 miles the country rises, but the deep valley on the north continues parallel to the road. Here an unusual feature is observed, the road suddenly emerges from the thick bush and an open undulating plain about half a mile long and from 500 to 800 feet wide is passed. It is called the ‘grass field’ by the natives, and in the rainy season a coarse grass grows upon it about 3 feet high, though in the midst of the dry season it appears to be laterite rock with gravel strewn upon it.

At 18 1/4 miles the highest point in the survey is reached, viz., 377 feet above mean sea level, but the ground drops abruptly towards the valley, which here approaches nearer to the road, so that a level for the railway is easily found.

Moyamba – The road passes through high forest till 20 miles is reached, and here one enters the large clearing made by Government for the new Administrative headquarters. It is a fairly level space nearly half a mile long and 1/4 mile wide, and is fully 70 feet higher than the river Yambutu. A deep gully surrounds this plain, running along the south and sweeping in a curve to the north, where it joins the big river Yambutu which flows to the south.

In the triangle thus formed by the gully meeting the river is the thriving village of Moyamba, containing about 700 inhabitants. It was one of our friendly towns in the war, but got burned and sacked by the hostile natives. With great
promptitude it was rebuilt, and is now as prosperous as ever. On the east side of this town a very fine river – the Yambutu – flows to the south, it is 120 feet wide and deep enough for the main traffic to be carried by a canoe ferry. Higher up stream, on the north of Moyamba, a natural ford exists in the dry season, where a road to Ronietta crosses the river and the width is less, and here it is proposed to erect a bridge for the railway.

Near this point Madame Roko – the Queen of the Ronietta district – has begun to establish her headquarters, and for this purpose made a large clearing, and intends to move her whole village from Kwain.

Moyamba is in the centre of a very fine country, and a wide view of the densely covered mountains on all sides may be obtained. In the town a good deal of European produce is disposed of by native traders. Some of the shops contain English clothes, stationery, ornamental belts, men’s hats, pipes, cheap musical instruments, &c. This is 75 miles from Freetown, and all these commodities would have to be carried on the heads of natives, and hence it is that it is only since the railway was opened to Waterloo that these European articles appeared in the distant villages. / The following is a list of the villages from Rotofunk to Moyamba, with their approximate populations and their distances by the proposed railway from Rotofunk:–

**DESCRIPTION OF ENGINEERING WORKS REQUIRED.**

**Rotofunk to Moyamba.**

A girder bridge, 30 feet span, will be required across the Bumpe River, with masonry abutments 14 feet high, on solid rock foundations.

2 1/2 to 8 chs.5

* Or 200 people per mile of railway
Sierra Leone (Kwale) Railway Survey

A bank on a curve of 5 chs. radius, 8 feet high, rising 1 in 132 for 5 chs, where it will meet rising ground.

A surface line on straight and level for 4 1/2 chs.

Surface line containing a curve of 7 chs. radius and 7 chs. long, rising 1 in 60.

One 2 ft 6 in. culvert.

Surface line for 4 chs. and a bank of 10 chs. beginning at 0 and rising to 4 ft. high. One 2 ft. 6 in. culvert.

A girder bridge on 9 ft. high masonry abutments, and 18 ft. span is required. The stream, which, joins the Bumpe lower down, is in a rocky bed, and is rapid; good granite can be procured on the site for building.

Surface line rising 1 in 60 containing two short curves 7 1/2 and 8 1/2 chs. radius. One 2 ft. 6 in. culvert.

Surface lien dropping at grade of in 105, with a short curve of 10 chs. radius. This is a surface line 37 chs. long with a 3 grades, the steepest being 1 in 87 rising

A rising grade of 1 in 63, It first crosses a swamp with a 6 ft. bank on soft mud; here a bridge of 15 ft. span with concrete abutments and probably piling will be required. The bank is continued 20 chs., where it disappears, and a shallow cutting averaging 2 ft 6 in, will be required for 17 chs. The soil is of loamy sand, so cuttings or embankments will be easy. In this section two short curves of 7 chs. will be required.

All surface lien of easy grades, I in 112 being the steepest, and of which there is 1/2 a mile and 3 chains rising. In this length two 2 ft. 6 in. culverts and one 4 ft. will be required. One short curve of 3 chs. radius will be necessary at 3 miles.

A cutting 13 chs. long averaging 1 ft. 9 in. deep will be required on an incline of 1 in 81 23 chs. long, and 7 chs. will be a bank of 1 ft. 9 in average filling. / Of this length 20 chs. will be on an embankment averaging 2 ft. high. 5 chs. are on a curve of 6 chs. radius, and 4 chs. of 7 chs. radius, and a 2 ft. cutting will be required for about 4 chs.

This is nearly a mile drop of 1 in 60, having 3 curves of 6, 10, and 12 chs. radius. A cutting of 10 chs. long of 3 ft. depth, and an embankment of 7 ft. and length 15 chs. Two openings of 15 ft. ought to be left in the swamp with concrete abutments, and, as the swamp is soft, piles (which can be procured in the adjacent bush) will probably be necessary, and in this mile two 2 ft. 6 in. and one of 4 ft. culverts will be required.

This is a surface line contouring round the hill rising 1 in 111 for 20 chs. and dropping at 1 in 76 on a curve of 17 chs. radius for 20 chs.

Here there is surface line on the level, suggested as a site for a station. For many reasons it is not a desirable site, as it is on low ground with an incline rising each side, and it contains a curve 7 chs. long of 7 1/2 chs. radius. The buildings could be placed on the higher ground adjoining. A better site is to be seen at 4 8 to 12 1/2 chs.

12 1/2 to 30 1/2 chs.

30 1/2 to 45 chs.

45 to 49 chs.

49 to 70 chs.

70 chs. to 1 m.

1 m. to 1 m. 37 chs.

1 m. to 37 chs. to 2 m. 4 chs.

2 m. 4 chs. to 3 m. 60 chs.

3 m. 60 chs. to 4 m. 10 chs.

4 m. 10 chs. to 4 m. 44 chs.

4 m. 44 chs. to 5 m. 40 chs.

5 m. 40 chs. to 6 m. 0 chs.

6 m. 0 chs. to 6 m. 51 chs.
1/2 miles, but there is no water of be found near there. A 4 ft. culvert would be required through the place suggested for the station. A 40 ft. span bridge will be required over the river on masonry abutments with rock foundations, the abutments should be 10 ft. high.

The last 17 chs. of this section will be a rising grade of 1 in 103, and will be all in cutting, averaging 2 ft. depth, and on curves of 5 chs. radius.

This is practically a surface line 19 chs. rising and 19 chs. falling at 1 in 60, with a 5 chs. curve on the summit.

Here a swamp has to be crossed on a 5 ft. bank, 13 chs. long, and a bridge 15 ft. span with concrete abutments, and probably piles will be required. Half of this level bank will be on a curve of 5 1/2 chs. radius.

The line here rises 1 in 50 (compensated) for 35 chs. and crosses the ridge with a 5 ft. cutting at deepest part, the total length of cutting being 20 chs.

This is a drop from the summit of 1 in 63. A cutting similar to that on the east side of the ridge will be required, viz., 20 chs. averaging 2 ft. 6 ins. deep; two 4 ft. culverts will be required. In this incline are two curves, each 14 chs. long, one of 8 1/2 and the other 7 chs. radius.

The first 6 chs. are on a 5 ft. embankment over a marsh. Here a 20 ft. upon bridge will be required. There is rock for a foundation, and granite boulders with which the abutments can be built. They ought to be 8 ft. high. From here the line ascends as a surface lien for nearly a mile, with two grades I in 60 and 1 in 97, and one 4 ft. culvert.

This length, of 27 chs. of straight and level, I propose as a site for a station. From a working point of view the site is almost perfect, being on a summit where the train will be impeded on arrival and assisted when starting on either side.

This is a surface lien contouring down from the end of the proposed site for the station in tow grades of 1 in 260 and 1 in 90. One 4 ft. culvert is provided for this incline.

This section begins with a level and crosses over a deep ravine and river. At Tungie on each side are rivers, and another is met at 10 1/2 miles, but they all come together, and it is proposed to cross them lower down with one viaduct, 125 ft. long, but the spans may be of the most convenient dimensions, for the whole foundation is of granite rock. The piers, abutments, and wing walls can be of granite, which is to be found in large quantities on the site.

For the next two miles the line contours round the valley of the west river with easy curves, it is all a surface line, and rises with easy grade, with the exception of one quarter mile of 1 in 64. In these two miles five culverts of 4 ft. and one of 8 ft. will be required.

Here from the summit of a ridge the line has to drop 86 ft. to cross the deep valley of Makora. The grade is nearly all 1 in 50 (compensated), but allowance is
made for as many 5 chs. curves as are necessary. Some 4 ft. cuttings and embankments will be required.

The river will require a 30 ft. span bridge, with abutments 8 ft. high of concrete, the foundations will be found to be of stiff clay. A short distance further a swamp is crossed, but as there is no definite river, three openings of 4 ft. will be sufficient to take off floods.

This mile is a surface line rising at 1 in 50 (compensated) and two 4 ft. culverts will be required.

This 18 chs. of line is a level and on a summit, and except for the difficulty of water, would make a fine site for a railway station. It is about half way between Makora and Yoyema, both places of some importance.

This mile is a surface line dropping from the proposed station site with a 1 in 71 grade, and presents no difficulty. Two 4 ft. culverts will be wanted.

The first quarter of a mile will be a bank averaging 5 ft. through swamp, and here will be required a 15 ft. bridge with concrete abutments 5 ft. high. The next half mile will be a surface line, contouring the slope on the side of the valley. A deep valley has now to be crossed, which will require 10 chs. of 7 ft. embankment and two 15 ft. span bridges with concrete abutments on soft mud foundations.

One 4 ft. and one 8 ft. culvert will be required.

This section is a surface line rising in easy grades to 18 miles, and from there to 19 1/4 miles at 1 in 62 and 1 in 56. Seven culverts of 4 ft. will be required, and one of 8 ft.

At 19 1/4 m. the summit of the line is reached, being 292 ft. higher than at Rotofunk, and from there it descends to Moyamba 3/4 of a mile, being 1 in 55.

It is all a surface line except for short portions requiring 2 or 3 ft. cutting and embankments: four 4 ft. and one 2 ft. 6 in. culverts will be required in this length.

Throughout the line where there are cuttings they are through clay.

In some places a good deal of ballast could be found by washing the clay, which is largely mixed with laterite gravel. In any case there is laterite rock everywhere, and this can be broken up and used for ballest.

**Rtofnk to Moyamba.**

**Summary of Bridges and Culverts from Rotofunk to Moyamba.**

River Tungie at 10 1/2 miles. Allow three 40 ft. spans on masonry piers.

**Bridges.**

THE FLYING SURVEY.

Moyaba to Mattru and Bo.

My instructions at first were that I should carry the reconnaissance survey as far as Kwalu and start from there on the flying survey to Mano and Tikonko. However, on March 29th, just as I had surveyed as far as Moyamba, which is 10 miles from Kwalu, I received your letter ordering me to start on the flying survey at once towards Mano and Tikouko and to return via Kwain. I was told that whichever route appeared to be the more advantageous was to be followed for the remaining ten miles still to be surveyed in connection with the reconnaissance part of the survey.

We accordingly started on March 31st in an easterly direction and reached Mano on the evening of April 3rd. The country, excepting only the first eight miles, is very easy and is more level than any we had surveyed between Rotofunk and Moyamba. Unlike the country we were accustomed to, the natives here cultivate boldly up to the edge of the road, so that a traveler has an opportunity of judgment whether the place be thickly inhabited or not, and in this case the indications of population were very satisfactory.

DESCRIPTION OF THE COUNTRY.

Moyamba to Bo.

After Moyamba the road runs nearly due south, the shortest road towards Mano. No change occurs in the physical features until 2 3/4 miles, where the river Bangue flows to join the Yambatu already crossed. This river at the road is 150 ft. wide, but lower down the railway can be made to cross at a narrower point. / Lunge. – On the south side is, or rather was, the village of Lunge. It contained about 300 inhabitants, but had to be burned by Government as a punishment for their action during the war. They too are beginning to rebuild, and in time will be as before. The temporary huts used by natives, after their villages are destroyed, last for about two dry and one wet season, say for eighteen months, and after they are past repair they usually return to the old sites to rebuild.

From this village the road rises 100 feet in about a mile, when it continues comparatively level until it drops to a swamp, at 5 miles, which is about 7 chs. wide, and is very deep. Another narrow swamp occurs at 6 1/2 miles. The road
for the last three miles contains a good deal of sandy loam, and the bush was not so high as the rest of the road, but here the laterite becomes more pronounced, and continues to show for the whole of the way to the end of our location survey. From 6 1/2 to 7 the bush becomes forest.

**Befu (7 miles).** – Here is the village of Befu, which was never a large place, but was almost obliterated by Government after the late war. It contained about 100 inhabitants, and probably will soon resume its former position.

After this village the road passes across a swamp about 10 chs. wide and rises abruptly, from 7 1/2 miles it is fairly level, till another wide swamp has to be crossed three-quarters of a mile further on and the village of Pehwahun is reached.

**Pehwahun.** – This village contains about 300 inhabitants, and as they remained friendly during the war, the place is now intact. Our reconnaissance survey extended beyond this place only with the object of finding a suitable site for a terminus for this section of the line, which we found about five furlongs to the east, after rising gradually at 29 1/4 miles by road from Rotofunk, where there is a junction with a road to Kwalu.

The road to this point is 29 1/4 miles long and the proposed railway 31 1/4 miles from Rotofunk.

**Mano** is 29 miles from Moyamba, and to get there we had to pass through 14 villages, a list of which is given further on.

Near the town of Mano is the large river of Taia, which is 480 feet wide, but contains a little lower down a natural rock causeway on which a bridge could be constructed. The piers could be made of granite of which there is a large quantity on site. This river and the Bangue at three miles from Moyamba are the only ones of great importance on the route recommended up to this point – Mano.

The town of Mano was burned during the late war, but it is rapidly rebuilding. It was said to contain about 2,000 inhabitants at one time, and I have no doubt will soon do so again, for the old occupiers are returning as their temporary huts become dilapidated.

It is not surprising that the natives should wish to return to their beautiful home, as Mano is a lovely spot, picturesquely situated on the magnificent river, of which long reaches are visible here and there from the town, framed, as it were, with brilliant foliage. The river itself is different to most found in the tropics for it runs bright and clear over its bed of rock.

From Mano we kept on still in an eastern direction till we arrived at

**Jama,** which was once a big place, but as it and the five other villages we met on this part of the road were burned, traffic had been diverted to other routes.

Jama may in time be rebuilt, but since the traffic has taken another and a shorter route it is doubtful whether the place will regain its former dimensions.
The country is very level by comparison, but there are some difficulties in connection with rivers and swamps.

This village is 42 miles from Moyamba, but as I suggest a better track for the railway we may pass on to a more prosperous neighbourhood.

*Mattru*, 17 1/4 miles from Jama and 58 1/2 miles from Moyamba by the road, is a place which remained friendly during the war, with the result that it was not destroyed and is now full of life and prosperity. It contains about 2,000 inhabitants apparently of considerable industry. There are many Mahommedans who make the collection of rubber and gum their principal occupation. They keep cattle, and I was struck with the excellent condition they were in. In fact all over this country where there are cattle the same feature is noticeable, and I think were there any facilities offered for disposing of them it would become a large and profitable business in West Africa. With the exception of numerous bridges the country to Mattru is very easy for a railway.

To carry out my instruction I went on to Tikonko, 5 1/4 miles further. This road also, like most of the country I inspected, is very easy.

*Tikonko* is 64 miles from Moyamba, and was at one time an important place, but as the natives rose up against us during the war and murdered the American missionaries, all their houses were burned, and Tikonko has since been completely deserted.

In former times the road from the important neighbourhood of Bandajuma passed through Tikonko, but since its destruction all the trade now goes via Gerihun through Bo, so that the abandonment of Tikonko appears to be permanent.

*Bo.* – On learning this I resolved to visit Bo, which is four miles north-east of Mattru, and I found it quite a city as compared with other places I saw. It is an immense place, and, like Mattru, remained friendly during the ‘War,’ and now contains 6,000 inhabitants.

The natives here are very primitive, and have not the least conception of the use of money; rice tobacco, and coloured European cloths being the only articles exchanged there.

The people appeared delighted at the prospect of the railway. It is about 14 miles from Freetown, and, of course, thousands here have never seen any signs of civilisation. Some traders told me the distance was so great that unless they could get carriers for no pay except their food, as the chiefs do, it does not pay them to carry produce to Freetown. /

Leaving Bo, we returned via Mattru, and then I resolved to take the shortest line to Mano. I returned in the way I came as far as Kendems, which is 49 miles from Moyamba, and 13 3/4 miles from Bo. This road to Mano (*via* Jagbama) is 3 1/2 miles shorter than the way we went (*via* Jama), and, moreover, we encountered fourteen villages on this route against only seven in the other. Soon after
leaving Kendama we found a curious plain, or ‘grass field,’ about 2 1/2 miles across and quite level, and, therefore, a most easy place for a railway. It is all a laterite formation, and during the rainy season the grass grows 6 or 7 feet high.

For the rest of the distance (13 miles) to Mano, it is a very thickly populated district, there being thirteen villages, and this is the main trade road [...]. We then proceeded to Kwalu.

Leaving Mano and following the road by which we came for seven miles, we reached Mabassiki, and thence turned north in the direction of Kwalu. This proved to be very desolate country as far as Kwalu. In this distance of 17 1/2 miles, four villages only were found, and they had all been destroyed. Makora was once a fairly good place, but the other three villages were so insignificant I could not even ascertain their names.

The road is level, but in this length there are 12 swamps.

Kwalu is a large place composed of three villages and said to contain about 750 people, but it is believed that when the district headquarters are moved from here to Moyamba the size of the village will be diminished.

From here to Moyamba – ten miles – the country is extremely rough, there is no village between the two places, though there are five swamps and some rivers. The first river met is the Bangue, 90 ft. span and 25 ft. banks, all in loose sand.

At 64 1/2 miles from Bo we reached the point at which we started the flying survey. Being quite convinced that the road by which I had travelled up country was greatly superior to the route by which I returned, we started at once to carry on the reconnaissance survey towards Mano until we found a suitable site for a temporary terminus at Pehwahun, nine miles from Moyamba.

The result of considering the two routes is that I suggest the shorter, more cultivated, and easier one, traversing the following villages:

Add for various swamps 41 bridges, 15 ft. span, with concrete abutments 5 ft. high, and piling.

Add also minor culverts, 2 1/2 ft. span, two per mile.

### DESCRIPTION OF ENGINEERING WORKS REQUIRED

**Moyamba to Pehwahun.**

(Reconnaissance Survey.)

The River Yambutu, a quarter of a mile from Moyamba, which is 80 ft. wide here, could be bridged with steel spans on masonry piers founded on solid rock. Plenty of granite is procurable for building.

A 5 ft. bank will be required for about 6 chs. length here, as the place is subject to floods.

It was found necessary to curve the line round the village to suit the contour of the country. Good sand for concrete and mortar may be got in this river bed. / Half a mile from Moyamba there is a level of nearly three-quarters of a mile, and it is proposed for a station, as no other site could be found near Moyamba. Though it is upon the wrong side of the river, as far as the new Government station and the village are concerned, I fear there is no alternative. If passengers were allowed to pass over the railway bridge, the station would be only a half mile distant.
At Lunge (3 miles) the River Rangue requires a viaduct. The wide and deep sandy-bedded river contracts in width lower down, where there is a rocky ford. The viaduct would be on granite rock, and all the material for building, except cement, is on the ground.

After this a high ridge has to be over, and unless another trace be discovered, it will be necessary to make a 16 ft. cutting on the admit of a grade of 1 in 50 (compensated). This would mean about 15,000 c. yds. of excavation, so I think it would be well to develop the line between the river and here.

Any place in the following mile could be selected for a station, for it is practically level and nearly all straight. I would suggest near 46 miles as being the most central of the possible sites available.

From 26 miles a surface line rises at 1 in 50 for about three-quarters of a mile, then continuing as a surface line drops at a grade of 1 in 103.

At the Befu swamp at 7 miles, three 10 ft. openings with concrete abutments and piers and a bank of 5 ft. for about a quarter of a mile will be necessary. The swamp is quite hard in the dry season, but during the rains it sometimes is under water to the depth of 3 1/2 ft.

From the edge of the Pehwahun swamp, a surface line ascends with a grade of 1 in 60 to 9 miles, and here upon a level is the proposed temporary terminus of this section. This is located upon a large plain where a good deal of clearing has taken place, and there is room for a triangle if it be desired.

GEOLOGICAL FEATURES OF THE COUNTRY.

The geological formation of the whole of the country is quite similar to that between Rotofunk and Moyamba.

All the hills are of laterite, and they form about two-thirds of the whole, the rest being composed of swamps and a loamy sand formation.

The swamps, of which there are 25, amount in the aggregate to two miles, varying from 2 to 15 chs. in width, and in calculating the bridges enumerated above, I dealt with each swamp separately, and allowed a 15 ft. opening for each 4 chs. of distance.

The whole of the bush, where not cut down for this year’s cultivation, is young, and indicates recent planting.

The population as seen in the villages must form but a small proportion of the whole, for the amount of cultivation visible everywhere indicates a great number of inhabitants.

I found it difficult to gather much information from the villages far up country, as they usually hide when they see Europeans coming, and as we approached several of the smaller villages a gong was sounded, and all the men of the place rushed to the bush and hid, until we were well past their village. I sometimes
heard the gong again after we got on our journey, which was probably meant as a signal that the men might now return without danger.

I was told that they fly from Europeans, and from the police for fear of being pressed into their service, and forced to become carriers against their will.

‘Overland Route.’ – I would suggest that both on the part I surveyed to Moyamba and over the district through which we made the flying survey, should construction to sanctioned, a temporary track with new rails be constructed at once. There is plenty of timber everywhere to make rough temporary bridges, and it would thus save the enormous cost of transport. On the 30 miles of country surveyed by our reconnaissance I see no reason why a temporary line could not be laid, and then the finishing work could be done much cheaper and faster.

Every means will have to be adopted to do so as much as possible with a minimum amount of labour, and this becomes more necessary in proportion as we penetrate further into the remote interior.

**TRAFFIC PROSPECTS.**

**General Remarks.**

The immediate development of traffic in passengers or goods, in my opinion, cannot be hoped for on account of the great disturbance caused by the hut tax revolt; but the ultimate result, when the natives become more settled down and enlightened, I believe will be satisfactory.

There is a very large population in the country, much more so than is generally imagined. The approximate populations were hitherto calculated by counting the inhabitants of all the known villages, but no allowance appears to have been made for the numerous dwellers in small clusters of huts and those isolated natives living deep in the bush remote from all towns or thoroughfares.

On every occasion when I penetrated the bush to any distance I discovered more people. The general impression is that those people really belong to the villages, and take up, as it were, a country residence for a time, for the purpose of cultivation. This is right, to some extent, for natives found near the larger villages, but most of those I questioned had never lived in any other than the place where I found them.

Again, the large amount of cultivation one sees in the interior indicates a population quite out of all proportion to the visible inhabitants, and it is for this reason I believe in the ultimate success of the railway. At present there is very little money amongst the natives, and, unfortunately, they appear to entirely disregard it. The reason appears to be that now, in the interior, there is practically nothing to be procured for money; but it is reasonable to believe that after the country is opened up by a railway, they will soon perceive that certain necessaries and luxuries can be obtained for the exchange of coin. As far as the line goes, the stations will be
surrounded by native traders who will form depôts where money will be given for produce, and the native will find he can select amongst the European commodities that which suits him, when in time money will be more appreciated.

As an example of how the people in the interior deal, I relate what happened in one village and which indicates generally what occurs in all the remoter places. One of our party being convalescent after fever, it was considered by our doctor desirable that a change in his diet should be made, so our head man was sent out to purchase a fowl at any price. There were several houses where he saw chickens, and though he offered prices twice as high as would be paid in London, they would hardly listen to him, and if he offered unlimited money I believe the result would be the same. Having returned to the camp unsuccessful, he went out again with tobacco, and for an amount worth a tenth of what he offered in silver he got the bird.

With such a feeling throughout the population, it would be unreasonable to expect passenger traffic at first, as there is practically no ready money in the interior to pay for it. But the education of races into the appreciation of money has always been found to be a short process, and in the near future, with such a vast population, passenger traffic is bound to grow.

The prospect of goods traffic, however, appears to be much more satisfactory, because produce will continue to come down country, and it is impossible that it could, for any length of time, be carried on the heads of natives parallel to the railway. No doubt there is still remaining a large element of slavery, so that chiefs in the interior procure their carriers in exchange only for their nourishment, but even the chiefs will probably soon perceive that it will pay them better to dispose of their produce to the traders who will be established at the end of the railway. A part from the fact that this system of slavery is rapidly disappearing, the value of rice and palm oil consumed by the natives, going and returning, would pay for the carriage of the produce on the railway. Take as an example Moyamba, which is 75 miles from Freetown. Between these two places a man’s journey there and back occupies 10 days, and a carrier’s support for that time on native diet costs at least 3d. per day. He has to carry his own rice, so that 50 lbs. of produce is the most he can deliver. This journey then costs 2s. 6d., equal to £5 12s. 6d. per ton, taking the worst form of slavery, and the loss to the master of the service of his man for ten days. There is a large amount of gum copal in the neighbourhood of Moyamba, and from here more is supplied than from any other place in Sierra Leone. The European traders I interviewed all told me the same, that in proportion as the natives grow more independent of their chiefs, the less the produce comes down, for not only the chiefs have more difficulty in procuring carriers, but also they are unable to get people to collect the material.

At such a distant place as this palm kernels are practically of no use. They are only worth about £6 per ton on the coast, and therefore cannot bear the rate of £5 12s. 6d. per ton for transport to Freetown.
[Note. – The palm kernels go to the coast ports where they form the principal export. See Colonial Secretary’s Statistics, September 1899 (Appendix B). S. & S.]

Some 60 miles farther up country there is rubber, but all the native traders I spoke to said the trade in it was almost quite undeveloped.

In looking at the existing map of the country, it will be observed that there are large tracts shown where apparently no roads or villages exist, but this is quite deceptive. These are merely places as yet unexplored, and are probably as thickly inhabited as are the well-known places. This I gather from the fact that wherever our party passed through such places they were found to contain populations quite as numerous as those in the better known districts, though shown on the map as if they were mere deserts. In all such places produce of some description is to be found, so that, in course of time, it will find its way to the railway. This appears obvious.

At present the natives have a custom of growing enough rice for their own consumption with a little more for the purpose of barter (in lieu of any currency), but were the railway to be near, and they found what a large price could be obtained for their labour by supplying Freetown, I think that that trade too would be soon developed. All such enterprise depends a good deal on the population, and as the country is so thickly inhabited, there is every reasonable prospect of a large goods traffic.

Colonial Secretariat,
Sierra Leone,
2nd October 1899.

SIERRA LEONE (KWALU) SURVEY.

Sir,

In accordance with the request contained in your letter of 10th August on above subject, I have the honour to enclose a statement prepared by the District Commissioner, Sherbro, which, I trust, is what you want.

I have, &c.

J.C. GORE.
Col. Secretary
W. SHELFORD, Esq.,

16th September, 1899. District Commissioners, in charge of Customs.
High Commissioner Sir F. Lugard to Mr. Chamberlain
(25 February 1903); held at the National Archives, CO 879/76/695, No. 41.

No. 41.

NORTHERN NIGERIA.

High Commissioner Sir F. LUGARD to Mr. CHAMBERLAIN.
(Received April 27, 1903.)
(No. 118.)
Kano, February 25, 1903.

Sir

I Have the honour to acknowledge the receipt of your confidential despatch of the 30th September, and of your No. 614 of the 17th October, and No. 716 of the 28th November, 1902, in which you invite a further expression of my views relative to railway construction in Nigeria. The correspondence on this subject has extended over so long a period that I trust you will pardon me if, to some extent, I unavoidably recapitulate the views I have, from time to time, put forward, with the bearing of subsequent developments upon them.

2. I have always maintained that the primary object of the railway both for commercial, administrative, and military reasons should be to connect Kano (vis-à-vis with the French at Zinder) with a point on the Niger which would be accessible for steamers all the year round, and for boats drawing six or eight feet at high water (vide despatch of the 18th August, 1899,† where I quoted a parallel opinion recorded by Lord Selborne’s Committee, of which Sir George Goldie¹ and Sir Ralph Moor² were members). Such a point can be found below the Kaduna mouth, but not above it, and recent investigations (vide attached report from the Director of Public Works and paragraph eight of this despatch) tend to show that Baro is the highest point which fulfils these conditions. All material for the construction of the railway can be brought to this port on the Kano to the Niger, not to the sea.
Niger by water transport, in vessels carrying from 500 to 1,000 tons, at high water, while vessels of less draught can reach it the whole year round.

3. I submit that on administrative, military, and commercial grounds, the necessity of this line is most urgent, and that its construction should be undertaken wholly independently of the Lagos Railway.

The goods which it will convey to the interior, and the produce which it will export thence will be carried by water transport. The Lagos Railway at present carries goods according to class at 9d., 6d., and 3d. per ton per mile, where there is no water competition, and where this competition exists, its rates are 4 1/2d., 3d., and 2 1/2d. – palm kernels at 2.16d. are recommended to be raised to 3 1/4d. – (vide Manager’s report for half year ending 30th June, 1902 page 6). Assuming, therefore, an average rate of 3d.per ton per mile, and that the railway reaches the Niger at the nearest point – Jebba – 322 miles, the cost of conveying a ton of produce to Lagos from the Niger will be £4. (A railway at Jebba, however, will not tap the main trade routes, and additional cost must be involved in conveying produce there or additional disadvantage incurred in its competition with water transport. If the Lagos railway came to Baro 50 per cent, would be added to the length of the line, and consequently to the cost per ton, which would then stand at £6.) I am sure, however, that produce can be conveyed at a profit from, say, Egga (a great traffic centre) to the sea at £1 per ton. (Mr. Watts, representing a Company which at present enjoys a monopoly, says about 30s.) In order, therefore, to compete with water transport it would appear that the railway would have to reduce its rates to a quarter (or a sixth) of what they are now fixed at in competition with water transport, at the most favourable calculation. I asked Mr. Eaglesome what are the known conditions of competition between water and rail transport, and he informs me that on the East Coast of India the railways have been carrying at three pie = 1/4d. per ton per mile to compete with water transport. It would seem to me that with the amount of produce which is likely to be available for a long time to come it is out of the question to suppose that a railway costing from £6,000 to 7,000 per mile can carry at anything like this rate, except at a very heavy loss. / Even at existing rates the gross earnings (including carriage of construction stores) only just exceeded working expenses without paying interest on capital, and this in the most densely populated and richest country which the railway will traverse. In considering any large extension of commerce there is also the additional cost of transhipment by means of branch boats over the Lagos bar to be taken into consideration, which will add considerably to the cost per ton as compared with water transport by the Night waterway.

4. Turning to the question of urgency, and the reasons for which I urge the importance of giving priority to the railway north of the Niger, they are as follows:

The French are pushing forward their line from Dahomey to Saye with great rapidity with the avowed intention of capturing the trade of the Haussa States (vide Intelligence Division, War Office, Memorandum of 15th May, 1902, Africa West, 647, p. 64, and Governor, Lagos, of the 9th April, 1901).” It was commenced

* No. 55 in African No. 647.
on the 1st May, 1900, and 108 kilometres were ready for the rails in one year, and it is said that it will be completed in three years' time. The Intelligence Division, War Office Memorandum, quotes data for the conclusion that £200,000 of merchandise has hitherto been brought down annually from Kano and Sokoto to Lagos. This does not take into consideration the great trade to the South done by the Niger Company, and by natives (which does not go to Lagos) nor the very great expansion which has taken place in the last three years since the roads were made safe by the Administration of Northern Nigeria, concerning which I hope to have a good deal of information to place before you in my annual report (1902). A British line, if constructed at once, would not only save the deflection of this trade, but would probably secure much of that from the French sphere, since the natives appear to prefer British routes to French. The important objects laid down in your letter to the Treasury of the 29th August, 1901, appear to be already greatly endangered. If the railway north of the Niger is postponed until after the Lagos railway reaches the river there will, of course, be a delay of several years. From Ibadany to Oshogbo is miles, thence to Ilorin and thence to the Niger 55. This 198 miles will probably take from five to ten years to construct the already constructed have taken seven years, and only covered 70 miles of the direct distance).

I may add that the efforts now being made by Residents to promote the growth of cotton, and the cultivation and collection of produce for export, will assuredly result in a great increase of trade, if only a means of transport to the Niger can be found, which will make it worth while to produce them in the interior, and this will make a corresponding increase in the revenue. As native manufactures are superseded by imported goods, it becomes a matter of urgency to provide new scope for their industry in producing produce for export, but in Northern Nigeria this produce, though valuable, is not such as can bear transport by men and animals for hundreds of miles.

The necessity for a means of transport for the supply of garrisons and administrative staff, at once cheaper and more certain than existing methods, is very urgent. Carriers are increasingly difficult to get, and it is an indication of successful progress that it should be so, for the adult labour returns to agriculture and to trade, with the cessation of slave raids and the increasing security afforded by the Administration. While regarding this with satisfaction, the inevitable dilemma is forced upon me of providing a substitute for absolutely necessary transport, for garrisons must be fed. &c.

(a.) By forced levies of carriers guarded by bayonets, a method repugnant to every British principle of rule and destruction of progress made.

(b.) By a large scheme of animal transport involving the construction of roads, and a considerable and costly organization of Staff.

(c.) By railways.

* No. 66 in African No. 647.
There is no question but that a combination of the last two forms the only tenable method, and it must be undertaken without delay to avoid the necessity of the first alternative. The system of carriers (besides being most costly) is moreover, altogether vicious. Chiefs when applied to for labour are apt to seize petty traders in the markets and confiscating their goods to assure the European that they are voluntary porters, while I have daily difficulties owing to the looting propensities of discharged carriers, who steal and rob the villagers in the name of the Administration.

(c) Military.

I have elsewhere pointed out the necessity for a means of rapid concentration of troops, increased mobility being equal to numerical increase, and saving at the same time a large unproductive expenditure on troops.

(d) Financially.

The cost to Government of providing essential transport, is enormous and increasing. A line on a 3-foot 6-inch gauge, of which the completed portion has so far cost from £6,000 to £7,000 per mile (the new extension is estimated at £7,000) will not be a very cheap method even if working expenses and interest on capital (without any provision for a sinking fund) are alone to be paid, but it will still be cheaper than present rates, which are about 2s. per ton per mile. The light surface line from Wushishi to Zungeru cost about £1,400 per mile, and repaid almost the entire sum in the saving of otherwise necessary transport in the first year. I have already alluded to the probable increase in exports which are at present not exportable, and the consequent increase in revenue which, in course of time, will, I hope render the Protectorate self-supporting. To hasten that time, you will concur with me, is a matter of urgency. The length of time taken at present by Officials in reaching, and returning from, their posts also cripples the Administration, and adds to its cost.

5. I have thought much over the points which I have ventured to lay before you, and with greater knowledge than I possessed a few years ago, with the result that I am compelled to somewhat modify earlier views. I realise now more fully the imperative urgency that exists for immediate railway construction, the importance of linking Lokoja with the Administrative centres of the Northern States, and the economy of utilizing water transport by the Niger, the more so that the latter exists while railway transport cannot be created for many years. I have come to the conclusion that a 3-foot 6-inch railway, which would cost at least 2 1/2 millions (350 miles), from the Niger to Kano, and probably another 1 1/2 million (200 miles), from Ibadan to the Niger, and would take at least 15 or 20 years to construct, does not meet the requirements, and is premature. (I do not include the cost of the Niger bridge, which need not be considered at present.) While such a railway was being constructed the objects in view would, to a large extent, be lost. The French railway will, it is said, be completed in three or four years. The Government of Northern Nigeria will have already spent enormous sums in archaic methods of transport, and should a difficulty
with France overtake us in the interval we should certainly be unable to maintain our position in the Northern States. I have naturally a keen desire to see this country self-supporting, to decrease the huge transport bill, and to increase the revenue-producing exports. I am convinced that the only method of doing this is by the rapid construction of a light surface line on a 2-foot 6-inch gauge, connecting the Lower Niger with Kano, or at least with Zaria, which is the central point from which the lines both of commerce and administration diverge. I have personally traversed the whole length of such a line, in company with Mr. Eaglesome, the Director of Public Works, who has a large experience of railway construction in India. From Baro to Zaria (excluding the Wushishi-Zungeru section) is 260 miles. There are no serious obstacles by the route selected, and thought no precise estimate, of cost can be made until after the location survey is complete, it may with tolerable safety be said that it will not exceed £1,570 per mile or a total of £410,000. Thence to Kano is a distance of 84 miles, the cost of which is estimated at £1,800 per mile (see paragraph 8) = £151,200. This gives a total of £562,000 for the whole line.

This surface line could be constructed to Zaria in four or five years, and to Kano in six or seven, if material were promptly delivered. Every yard that we opened to traffic would be a saving in carrier transport. I appears to me, moreover, premature to construct a line on so expensive a gauge as 3 feet 6 inches before the country has been thoroughly surveyed and, the approaches on both sides of the Niger from Lokoja to Leaba fully examined, and before we know fully its capabilities and arteries of trade. Very much has been learnt in the last year or two, but much remains to learn. The bulk of the present trade consists of articles, which have their origin in French West African and are not articles of import, viz. ‘potash’ and livestock, which come chiefly from Asben while the great Kola caravans come through French territory from Togoland.

I am not oblivious of the great bugbear of divergent gauges. The Crown Agents surveying the railway history of the world emphatically condemn the construction / of any light surface railways on a 2-foot 6-inch gauge, and point to the history of England and Australia, India, and America, as terrible warnings against the introduction of more than one gauge. It is, indeed, a matter of great importance, but there may bothers, such as time and cost, of even greater importance. Even assuming that the main trunk line were on a 3-foot 6-inch gauge, its enormous cost would only render it self-supporting if it had an equally enormous traffic, and that traffic can only be supplied, I venture to think, by extremely cheap feeder lines, the more so that the extension south of the Niger will have the steamer transport to compete against. For the cost of a 3-foot 6-inch gauge line it is possible to construct about five light surface lines of equal length. These costing about £1,500 per mile (of which £1,100 is for material) would have curves which no main line would contemplate, their rate of speed
need not exceed ten miles an hour, they would run only by day, and their fuel consumption, an important item when coal has to be imported from England to the heart of Nigeria, and costs 50s. to 60s. per ton (Lagos Manager’s Report) – and working expenses would be small. If the development of Nigeria justifies the supersession of such a line in later years by a main trunk line on a 3-foot 6-inch gauge on an identical route, the surface tramway can be taken up and laid elsewhere as a feeder, after distributing the material for the construction along the route of the main line.

6. Sir William Macgregor⁴ has urged the extension of the Lagos railway to Kano and Chad, on the grounds that the trade of Northern Nigeria was the ‘heritage’ of the Lagos people. I am fully in accord with him that such an extension would very greatly benefit the Lagos people, and that their enterprise and initiative deserves success, if they could pay for the cost of the line. But already they have reached the limit their financial resources. It remains, therefore, to consider how the line would best benefit the British taxpayer who pays for it, and Nigeria as a whole. It seems to me indisputable that a line feeding and not competing against the water transport, developing the trade now at the crucial moment, and not when it has already waned or passed into other channels, a railways whose expense are small, must be of greater benefit to the trade of Nigeria, and hence to Great Britain, than one whose construction will cost four millions at least (and more probably five or more), and which will, for many years, be worked at a loss. The Crown Agents, to whom you referred the question of a general railway policy, an say (in section 20 of their Memorandum of the 27th March, 1902)⁵ that the Lagos railway should only be constructed as far as it is found to pay, and again write as follows: ‘It appears to us that the extension of the Lagos railway should at present only be carried out to such an extent as will render it self-supporting, and that the vast area of Northern Nigeria should be served by a railway starting from some other point on the Coast.’ In their very latest dispatch (November 13th [? 15th], 1902. paragraph 3), they again express the view that the Lagos railway should support itself from the trade of the Lagos hinterland. I hope that the Lagos railway may eventually be extended to the Niger where it can take its own chance without favour or bias in the competition for the produce of the North. It will form a rapid route for passengers and mails ad urgent stores, and bring the central Administration of the Haussa States two or three days nearer Europe, and will save the waste of time (and salaries) which is necessitated by the present route, while in the case of a war with a European enemy on our frontiers the saving of time in the concentration of re-inforcements sent over-sea would be of importance. For these reasons I have always supported the extension of the Lagos line, chiefly for reasons of Imperial

⁴ Enclosure in No. 14.
defence and Administrative convenience, not for commerce, and still do so as far as the Niger, while urging that it is by no means so essential at present, or of anything like the urgency of the Northern extension (vide my despatch of the 11th May, 1900, and the 13th December, 1900)

7. I feel that even at the risk of being tedious, it is advisable that I should deal fully with this proposition. In your despatch, No. 685, of the 21st November, 1902, you informed me that you considered it inadvisable to incur any serious expenditure in connection with Zungeru lest it should not prove healthy. The expenditure already incurred is so great (and I may say that by the enthusiastic work of every one, so much has been done with the money), that in my view it is wholly out of the question to conceive the possibility of again moving the capital for many years, if ever. We shall shortly have erected 28 bungalows for Europeans, besides a large Hospital, Officers’ Mess, Supreme Court, and Government House. The Goal wall is a solid masonry structure of stone and brick, 12 feet high, and enclosing 2,000 square yards, the largest, probably, in Nigeria. Masonry bridges span the Dago stream, permanent brick barracks are in course of erection, Store houses, a Freed Slave Home, Clerks’ Houses, Stables and Outhouses of all sorts are springing up. The situation is admirably selected from a political point of view. Every new arrival expresses the same praise of it, and I do not remember to have heard a single contrary opinion. It is also considered healthy, and the last Medical return which has reached me shows, seven in Hospital at Lokoja and none at Zungeru, and, indeed the Hospital there has frequently been without a tenant. As regards health, however, it is beyond doubt that a change of air has a wonderfully beneficial effect in Africa. Europeans are frequently sent for a health trip from the comparatively healthy climate of Lokoja to the mangrove swamps of Burutu with good results. If it were possible to run up to Zungeru or down to Lokoja in 18 hours by rail and steamer it would be a most valuable restorative to health, and probably save many invalidings to England. But if ever the capital were moved it would certainly be in a north or north-easterly direction, so that the construction of this surface line would be equally valuable for the new, as for the present capital.

The necessity for rapid communication with Lokoja I have already alluded to in general terms. The minimum time at present taken is seven days by mail runners. By rail to Baro and thence by steamer it would take 18 hours only. Serious delay is thus incurred in the transaction of work, and a waste of valuable time during which African pay and allowances are being drawn. Departments are practically reduplicated at Lokoja and Zungeru, and the difficulties of Adminis-
The section of tramway from Wushishi to Zungeru is estimated to have carried fully 10,000 tons of Government Stores and material already. This by carrier transport (at 2s. per ton per mile) would have cost £12,000, while the cost of the section was only £16,800, and it is the most difficult section between Zungeru and Baro. The Bari-Juko section was delayed, owing to the abnormal difficulties we have experienced this year, owing to the lowness of the rivers, but it is now completed and open. Transport from Baro to Bari-Juko may be estimated to cost at present on an average throughout the year (say 10s. for three months and 25s. for nine months), about 3 1/4d. per ton per mile. If this rate were charged by a light line between these two places, the Director of Public Works calculates that after paying working expenses the tramway would certainly pay 5 per cent. on the capital expenditure, if the freight of produce and earnings from the Niger Company and natives be added. I trust that these facts and figures will convince you of the urgency and economy of constructing this section from Baro Zungeru without delay. With the highly expert knowledge of Mr. Eaglesome and Mr Scott it can be undertaken by the Protectorate Staff.

8. As regards the route to be adopted I am now able to place before you more definite information.

The Niger appears to flood great areas on one or the other bank through the greater part of its course above Lokoja. The attached report by Mr. Eaglesome consequently excludes the stretch between Shonga and Baro from consideration in the selection of a route across the river from south to north. Probably throughout this section of the river, and certainly from Baro to some distance above the Kaduna mouth, these flood areas extend along the northern or left bank, while at Egga the river floods on both sides. Baro (Siebong on the map) therefore is the / first point at which a railway – at any rate a surface line – from the Niger northwards can start. Here is an admirable place for a port with two fathoms of water at low river. It is the crossing place of a large caravan route from

* No. 31 in African No. 713 (Expedition to Kano).
Argeye, through which place the line would pass on its way to Bida, cutting the still more important route which debouches at Katsa. It is 90 miles from Baro to Bari-Jukko, over easy ground, the only obstacle of any importance being the Bako River. The cost, including bridges and a small rolling stock, would not exceed £1,500 per mile. I shall presently have an accurate survey made by Mr. Scott (than whom it would be difficult to find a more capable man with much experience of such work), so that a precise estimate of cost can be made. The essential point is to connect the head-quarters with a port on the Niger which can be reached by steamers doing the journey from Burutu and back again within the fortnight. Our present steamers can easily reach and return from Baro in this period, but could not reach a point much further up stream. Since it appears that any increase of speed in the larger vessels is not practically obtainable, Baro would form the most economical point possible for the working of the river flotilla which can just reach it and return in time to meet the weekly ocean steamers. The river service would therefore work in admirably with the railway service, and effectively connect Burutu, Lokoja and Zungeru. Finally, as regards this section, I would point out, that if you should over-rule my proposals regarding the main line and should consider that the Lagos 3’ 6” gauge line should be constructed north of the Niger, that line would come presumably from the south-west to Jebba, Rabah or Shonga, and touch at Zungeru, in which case it would, in no way, form a connecting link with Lokoja, while the surface line from Baro would form an invaluable means of transporting the material for its construction to Zungeru, and so enabling that construction to be taken up at that point, which would (as Mr. Gee says) ‘form an immense saving of time over the slow process of railhead construction.’

Turning to the further extension northwards of the surface line. The Kaduna offers no serious obstacle, and a bridge over it is essential in any case as part of the road communicating with our garrisons to the north. I have therefore included the greater part of its cost under the Public Works Department Extraordinary estimates for next year. It will not exceed £5,000 in all. Thence to Zaria as I have already stated there is no special obstacle, and it is estimated that the average cost per mile will not exceed £1,570. I shall shortly forward to you a more detailed description of the route with plans.

This section is the most difficult in the whole line from the Niger, and involves some eight bridges, exclusive of minor streams, in all about 1,250 lineal feet of bridging. The country, however, is level and easy. The cost of construction of this section will be about £700 per mile, viz., £1,800, including material. Its length is 84 miles, giving a cost of £151,200.

The whole line from the Niger to Kano therefore can probably be constructed from £562,000 (as stated in paragraph 5) spreading over six or seven years, and the more essential part from the Niger to Zaria for £410,000, spread-
9. The proposals I have made are based on the following considerations:—

(1) That the surface line will be only one-fifth of the cost of the larger gauge, probably much less, for the larger line will become more and more costly as it progresses further into the interior, and its cost will probably considerably exceed £7,000 per mile. The working expenses will be trifling in comparison, for the line will be content with the lowest speed, and its fuel will be less costly. It will compete with human and animal transport, and for many years to come will suffice to meet the needs of the country.

(2) Perhaps, however, the paramount advantage is its rapidity of construction, in view of the reasons for urgency which I have given.*

(3) In view of its cheap construction, and comparatively small working expenses, it can afford to carry at low rates. The produce to be conveyed can only stand low transport rates, and a farthing per ton per mile, more or less, may, for instance, decide the question as to whether the Hausa States can or cannot become one of the great cotton exporting countries.

(4) It will connect Lokoja and Zungeru, a matter of the first importance from an administrative and military point of view. The Lagos railway cannot do so unless deflected 120 to 150 miles out of its way, at an additional cost of another million, and with traffic rates consequently increased by nearly 50 per cent. per ton per mile.

(5) Its object would be to serve the water transport, not to compete against it, to the great advantage (as I maintain) of the progress of trade, and the development of the revenue.

10. There is, of course, an alternative to the proposals I have made, which is that a 3’ 6” gauge railway should at once be constructed from Baro to Zungeru, and carried northwards, but I deprecate the delay which would occur in constructing such a railway at present. If, however, this suggestion meets with your approval, the water transport, or whether it should eventually link up with the Lagos railway. If the latter, then the Lagos line should run eastwards from Oshogbo to a point somewhere opposite Baro, which may be selected as bridgeable. This would add a section about equal to half its entire length from Lagos to Jebba, viz., a million and a quarter sterling, to the length and cost of the line, and I doubt whether it would, with this extra burden, have any chance of competing with improved water transport. Still it would appear to be a more feasible pro-

* The Lagos railway has hitherto progressed at the rate of 10 miles per annum of direct distance towards Kano (17 1/2 of actual rail). Assuming a line to start from the Niger on this gauge and to make double the rate of progress (through construction will be slower the further railhead is from the base) it would take 18 years to reach Kano, and the Lagos railway would take another 10 to reach the Niger, disregarding the Niger bridge.
posal than that made by Mr. Gee, who, speaking of the central position of Lokoja, remarks that ‘a branch line of only 200 miles’ would connect it with Oshogbo. It would surely be more sensible to bring the main line within a reasonable distance of Lokoja than to carry it to the west through a sparsely populated country, where there are few trade routes, and to contemplate a branch line of more than half its whole length (total length to Jebba, 323 miles; length of branch, 200). Niger bridge.

11. The length to which this despatch has extended leaves me little space to express my views on the many questions connected with this subject. You have approved of the extension of the Lagos Railway to Ilorin, and I presume, therefore, that it will reach the Niger somewhere in that direction, since the section between Shonga and Baro appears from Mr. Eaglesome’s is report to the eminently unsuitable, and a point opposite or below Baro would, as I pointed out in the last paragraph, add 120 miles of direct distance, and probably at least 150 of actual construction to its length. I would strongly urge that the approaches to the river between Shonga and Jebba should be thoroughly examined, and borings taken in the river bed. Mr. Gee appears to have felt himself bound by his instructions to consider no place that had not a rock bottom, and though in his very able report he pronounces Jebba ‘the best possible site,’ he adds the words, ‘should you be disposed to modify and somewhat relax the stringency of your instructions under which I worked as to rock bottom, and foundations, &c.’ Though I advocate that the Lagos Railway should not at present be extended north of the Niger, it should, if extended to the river, undoubtedly debouch at the point which has been decided upon as the most feasible for bridging, and from thence northwards a feasible line for a main trunk line may in the future be built, should such an extension prove desirable by the light of fuller experience. Seeing that this point must be at or west of Shonga, I have no hesitation in saying that from the commercial and administrative point of view, Shongan (viz., the most easterly point possible) would be the best. If cheapness of construction is, however, the ruling consideration, then a point above Jebba where rocks emerge may be better, even as far as Leaba, where the whole channel is only 230 yards broad, and which is 12 miles further west. Mr. Eaglesome, whose report I attach, appears to consider that a multi-span bridge built up from caissons in a bed of deep sand or clay would be cheaper and better than one built on rock bottom at considerable depth. I can easily arrange to have a survey made of the country between Shonga and Zungeru from a railway point of view, by Mr. Eaglesome or Mr. Scott, which will ascertain its practicability. I do not anticipate that any serious difficulty would be met with. The crossing from Kasogi to Shonga and Lafiaji is one of the most important caravan routes from the north. The actual construction of the bridge need not, I think, be contemplated for another half century, and certainly not before a 3’ 6” gauge railway reaches Kano (vide my
Communications in Africa, 1880–1939: Volume 2

despatch of the 9th April, 1901†). Meanwhile, a waggon ferry, or a steamer, or a bridge of boats (as at Attock over the Indus) will amply serve the traffic of the railway. I submit that this question of the bridgeable point on the Niger is one which it will take a year or two to solve by itself, and it is not the least of the advantages of the scheme I have proposed that it can be put in hand at once, without this necessary delay.† If the railway crosses at Shonga, and is eventually extended to Zungeru, it will officer all the advantages to the Administration which I dwelt on in paragraph 6, and it will there tap the produce brought down from Kano, &c., by the surface line, and can (if it is able to do so successfully) divert it from the Niger steamers.

Port for Niger. 12. As I have no knowledge at first hand on this subject, I have not ventured to express any independent view. At the meeting on the 9th April, 1901, between Sir William MacGregor, Sir Ralph Moor and myself, I found a strong divergence of opinion, the former advocated Lagos as the port of Nigeria, the latter Sapeli (or Warri), and Old Calabar. I ventured the suggestion that as the railway from Lagos had already reached Ibadan, and had its workshops and depots already in operation, the question as to whether it should not for the present remain the port appeared to be beyond discussion, but that a branch line might be made to Sapeli (despatch of the 9th April, 1901‡). Sir Ralph Moor (despatch of the 25th April, 1901§) cordially endorsed this suggestion, proposing that the branch should be from Oshogbo. It appears to me premature to discuss this matter, but I should certainly be inclined to think that a railway from Sapeli to the Niger at Baro, 200 miles in length, running with the watershed, would be vastly more useful and probably not more expensive than a branch in competition with the Lagos line crossing the watershed at right angles, and only 45 miles less in length. I may point out that the distance from Ibadan to the nearest point on the Niger (Jebba) is given by Mr. Gee as 198 miles, while the Sapeli line would be only 200 (or direct distance) to Baro, and that Mr. Gee’s proposed branch to Lokoja is the same length.

Sir Ralph Moor, who speaks with unrivalled experience on the subject of ports, appears to me in his despatch of the 17th January, 1901,† to show conclusively that Lagos is exceedingly unsuitable for the eventual port, not merely on account of its bar, but for reasons of health, drainage, water supply, and area. Sir William MacGregor deprecates any expenditure on the Lagos harbour until after

* No. 53 in African No. 647.
† I may note that my proposals that the bridge should be in the neighbourhood of or below the Kaduna mouth have been taken rather ludicrously au pied de la lettre. I certainly had no intention of recommending that spot.

§ No. 41 in African No. 647.
¶ No. 13.
High Commissioner Sir F. Lugard to Mr. Chamberlain

The railway has reached Kano, and states that the present system will suffice till then. But it must be remembered that the cost of this system adds greatly to the total transport charges on produce exported, as would also the interest on the million sterling required to convert Lagos into a port, and I have already shown that even apart from this the railway can hardly compete with water transport.

The Crown Agents, in the passage I have quoted in paragraph 6, say that 'the vast area of Northern Nigeria should be served by a railway starting from some other point on the coast.' A line from Sapeli could tap the great centres of Lokoja and Onitsha.

13. The view put forward by Sir Ralph Moor and myself that the Western Railway could not alone adequately develop Nigeria, or meet its administrative needs for communication, has, I gather, received your general concurrence. I desire however to point out the essential difference in the general scheme put forward by myself on the one hand, and by Sir Ralph Moor and the Crown Agents on the other. They propose that the line should go from Old Calabar to Loko (or Ibi), thence to Bautshi (Yakoba) and Kano, thence to Chad. It would be almost or quite as serious an undertaking to bridge the Benue at Loko as to bridge the Niger, while the ascent of the Murchison Range and the crossing of the interminable hills of Bautshi (itself 3,000 feet) would be a gigantic task. The existence of this escarpment was pointed out in my despatch of the 1st March, 1902 (Enclosure 2). Nor is there any trade worth speaking of at Bautshi or any centre of population. Its trade was chiefly in slaves. I at first suggested Ibi as the lowest point for crossing the Benue, but, looking to the swamps in that neighbourhood and the ranges of hills immediately to the north of them, it would seem to me not improbable that the Calabar Railway ought to trend further east towards Lau (on the Benué), and thence passing eastwards of the Bautshi escarpment, ascend the Gongola valley and traverse the plains of Bornu to Kuka. Such a line would no doubt tap the trade of the Kameruns hinterland and form a strong strategic line on our eastern frontier. Kano will be fully served by the other line.

14. As a result of the unanimous proposal of the Administrators of Nigeria that a general railway policy should be laid down, you referred the matter to the Crown Agents.∗ But in effect their reply and that of Messrs. Shelford (of the 27th March, 1902†), is that, without further data to work upon, they cannot lay down any such policy. I cannot see that they could have given any other reply, since their knowledge of the country appears extremely meagre, as in the case of the proposal to build a railway over the Bautshi ranges via Loko, and their allusion to ‘the two’ trade routes in Northern Nigeria (Sokoto-Jebba and

Eastern railway.

General railway policy.

* No. 70A in African No. 647.
† No. 14 and enclosure.
Kano-Egbom). The Protectorate is a network of trade routes, a chart of which I shall submit with my next annual report. My own knowledge of the physical configuration of the country is still so imperfect that it is with diffidence that I have expressed the views contained in this despatch. Briefly, they are as follows:

(1) That the paramount urgency is to build a line from an accessible port on the Niger, connecting Lokoja and Zungeru, and traversing the main lines of trade and centres of population; that this line, for reasons of rapidity in construction, and economy in working should be on a 2’ 6” gauge, and a mere surface line. That, starting at Baro, it should be extended to Zaria at a cost of £410,000, and in a period of four years, so as to anticipate the French line to Saye.

(2) That later, if it be considered that a railway can compete with success against water transport, a line from the south, probably from the port of Sapeli, should be constructed serving Onitsha and Lokoja, and reaching the Niger near Baro. A waggon ferry or bridge of boats will serve instead of a bridge for very many years, and if the produce and trade of the north justify it, the main trunk line can be extended northwards along an easy country, superseding the 2’ 6” line, which would be taken up and used elsewhere as a feeder line.

(3) That in accordance with the Crown Agents’ dictum, the Lagos line should only be extended so far as it will be self-supporting; possibly this may necessitate its reaching the Niger at Shonga (some ten years hence). It will then be time enough to decide whether it shall be extended northwards as far as Zungeru. I am, however, much inclined to think that the money spent on the 200 miles of construction form Ibadan to Shonga or Jebba would be better spent on constructing a line of equal length from Sapeli to the neighbourhood of Baro.

(4) The points at which the big lines touch the Niger should be the ones selected for bridges (whether between Shonga and Leaba, or in the direction of Baro), though no bridge need be contemplated for 50 years. To ascertain these points, careful surveys of the approaches should be made, and the results submitted to a committee of experts.

(5) A feel little doubt that the line Sapeli-Baro-Bida-Zungeru-Nassarawa-Gwari-Zaria, is the best and most feasible line for a railway from every point of view. It will traverse populous areas, pass the main centres of trade, and connect with the river transport. Of this, the section north of the Niger should be constructed wholly independently of the southern section (which is doubtful and not urgent), material being brought by water transport to Baro.

(6) That the eastern railway should start from Old Calabar and cross the Benue at or above Lau, and thence proceed up the Gongola to Kuka or Chad.

(7) While contemplating that lines from the coast to the Niger may eventually connect with those to the north, I desire to emphasise once more most strongly my view that the northern line with a port on the Niger and connecting with the river transport should be independent of any such connection, and that
a through line to the coast would be mainly valuable for administrative convenience and for strategic reasons. Time and experience alone will show whether the connection would also be of commercial value, and supersede water transport.

(8) If my proposals meet with your concurrence, the costly survey to the north of the Niger, for which provision has been made in the estimate of next year will not be required.

15. The Crown Agents complain that they have little information from Northern Nigeria, which must form my apology for the inordinate length to which this despatch has extended, and which precludes my making any detailed comments on theirs, and Messrs, Shelford's and Gee's reports; I add therefore only the following brief notes:–

(1) Caravan traffic on Illorin Road. – Mr. Gee's figures for one month cannot be multiplied by 12 for the year. Traffic practically ceases during the rains. I hope to give some statistics in my annual report.

(2) Mr. Grey's route. – I trust that the statistics I am collecting, which will give the result of 18 months' careful study of the population, produce and volume of trade, will prove of more than the notes of a casual traveller, even though he be as shrewd an observer as Mr. Grey has shown himself to be. The statistics of exports contained in my report for 1901 show that many of the products indicated by Mr. Grey as of value for export have been developed for years past. Mr. Grey is rather apt to lose sight of the cost of carrier transport. Mr. Gee, quoting Mr. Grey, says that there are no difficulties between Zaria and Kano. It is inferred that Mr. Grey visited Kano. He was driven back at Bebeji on the Kano frontier, and one of his carriers, who was suffering from guinea worm, I am informed, died as a result.

(3) Crown Agents, paragraph 29. – There are no 'tropical forests' between Illorin and Jebba; sparse jungle and open country alternate. The line from Ibadan to the Niger must, of course, cross the watershed between the country drained towards the sea and that towards the Niger.

(4) Headway of bridge. – Need not be considered if the bridge is at or above Jebba; if below, a swing span will be necessary, about which I believe there should be no especial difficulty.

(5) Mr. Gee's section 2 (1). – I have already reported the seven years' flood, &c. I said the Niger was not liable to sudden floods, viz. that it rarely rises more than, say, four feet in 24 hours. The height of the 1900 flood is also recorded at Lokoja.

(6) Messrs. Shelford's sketch with report of the 13th November, 1902, shows the 'zone of construction, 1903–05,' up to Zaria. I cannot conceive how it is supposed that Zaria (270 miles from the Niger) would be reached in two years.
I will shortly submit to you a report and sketch by Mr. Eaglesome on the entire route from Baro to Kano.

I have, &c.

FOREIGN OFFICE to COLONIAL OFFICE.

(Received August 11, 1903.)
(Confidential.)

Sir, Foreign Office, August 10, 1903.

I am directed by the Secretary of State for Foreign Affairs to transmit to you, to be laid before the Secretary of State for the Colonies, the accompanying despatch from Captain Cromie, transmitting a report on the Dahomey Railway.

I am, &c.,

F. H. VILLIERS.

Enclosure in No. 1.

Captain C. F. Cromie to the Marquess of Lansdowne.

(Separate, Africa)

My Lord, Lagos, May 25, 1903.

I have the honour to transmit herewith, for Your Lordship's information, a report I have drawn up on the railway now under construction, and partly worked, in the French Colony of Dahomey.

During my recent visit to that Colony I was given every opportunity to inspect the line, and the officials were most courteous in giving me information.

I should be grateful if Your Lordship would cause a copy of my report to be forwarded to the Director of Military Intelligence.

I have, &c.,

C. F. CROMIE,

The Most Noble
The Marquess of Lansdowne, K.G., Captain.
&c., &c., &c. /

REPORT ON THE DAHOMEY RAILWAY.

Starts from the port of Kotonou, on the sea coast, and is to be continued to Karimana, near Say, on the River Niger. A short branch connects with Whydah.

In May, 1903, there were 103 kilometres open for traffic, i.e., from Kotonou to Toffo, on the main line, 88 kilometres, and the branch from Pahou Junction to Whydah, 15 kilometres.
The roadbed, without permanent way, is completed to Atcheribé, some 50 kilometres north of Abomey, and about 90 kilometres beyond Toffio, the present railhead.

The principle of construction adopted is as follows:—

(1) The roadbed, including culverts, bridges, cuttings and embankments is constructed by the military engineers at the cost of the Colony;

(2) When ready, it is handed over to the Railway Company, which has to lay the permanent way, build stations, &c., and work the line.

In return for this the Company is to receive an annual subvention of 2,000 francs per kilometre of line being worked for a period of six years from the date of opening for traffic, and in addition a territorial concession of 295,000 hectares of waste and unoccupied lands.

In the event of the gross receipts exceeding 6,000 francs per kilometre, the Colony is to receive a share graduated from one-third to one-half of the nett revenue.

Difficulties having arisen as to the territorial concessions, the Railway Company will probably receive a money compensation in lieu of them.

Country passed through.

Starting from the pier at Kotonou the line follows the coast in a westerly direction as far as Pahou, where it crosses the lagoon. From Pahou there is a branch 15 kilometres long to Whydah, and the main line turns directly north, following the watershed between the rivers Couffo and Sô. From Toffo to Kissa, a distance of 15 kilometres, the great Lama marsh has to be crossed, after which the line rises to the Abomey plateau and descends on the north slope to the river Zou, at Atcheribé, which is crossed by an iron bridge. Thence the line again rises to the plateau which extends from Paouignan to Parakou.

From the coast to the 27th kilometre the country is sandy and marshy, with scattered clumps of oil and fan palms. From the 27th to the 88th kilometre is a belt of dense tropical forest, very rich in oil palms. This belt is impassable except by native tracks, the dense undergrowth and creepers making penetration practically impossible elsewhere.

Between the 88th and 103rd kilometre is the Lama marsh, caused by the overflow of the Onémé and Couffo rivers, and which cannot be turned. This marsh is covered with dense vegetation, and is not easy to pass at any time – in the wet season it is virtually impassable. The line is carried across it on an embankment, except at one spot near the centre, where there is a piece of rising ground through which a short cutting has been made. The soil is treacherous and unstable, and at present the embankment is quite unfit for traffic, and has been refused by the Railway Company. It will probably have to be rebuilt on a sound foundation, which will take a long time and be very expensive. In the meantime,
the railway is at a stand-still, as it cannot proceed until the Lama embankment can be safely used for traffic.

From kilometre 103 the line rises gradually to the Abomey plateau, which at Dau attains an elevation of 248 metres, or over 800 feet. The country is now more open, but still consists of forest with numerous clearings for cultivation, which gradually increase in number and extent as the neighbourhood of Abomey is approached. The principal crops are maize, millet, cassava, beans of many varieties, and some ground-nuts. This part of the country is very deficient in water, and the natives have to go long distances to fetch it.

Single line, metre gauge. Rails single headed, 9 metres in length, weight, 200 kilos (about 43 lbs. per yard).

Steel sleepers, 12 per rail of 9 metres. The rails are bolted to the sleepers through two holes at each end of sleeper. Rails bolted together with fish-plates.

Points, counterweight, moving horizontally.

There are few bridges of importance. What will be the longest on the line is in course of construction over the river Zou at Atcheribé. It will be 95 metres in length. They are all of the same type – masonry columns carrying steel girders, which support the rails. No pathway or railing.

Near the Toffo side of the Lama marsh is a two-span bridge.

With the exception of the long embankment over the Lama marsh, and some in the marshy district near the coast, there are few embankments.

Beyond the sandy coast belt the embankments are all made of a very binding red laterite soil, which dries very hard and is little affected by water action if reasonable repairs are executed.

The Lama embankment, however, which is in very bad condition and liable to melt away under the influence of heavy rain, was made of the soil excavated from the marsh itself to avoid the heavy expense of transporting laterite soil. As there is no stone in the country there was no material available with which to make a solid foundation. I am informed that there is no stone nearer than Paouignan.

Cuttings are few in number, and owing to the firmness of the laterite can be made at a very steep angle without danger of slipping.

Buildings.

All station and other buildings consist of a steel framework sent out from France, filled in with cement blocks about 1 ft. cube, made at Kotonou, of one part cement to 3 parts sand.

Station buildings are divided into three classes:–

1st class. – Consist of a ground-floor, raised one metre from the ground, on steel and cement pillars, with a free circulation of air underneath; and an upper
storey: five rooms on each floor with a verandah all round. The upper storey is used as a residence for European employés.

2nd class. – Similar to 1st class without the upper storey.

3rd class. – Slightly raised off the ground on a wall, no upper storey, and only three rooms.

No platforms have yet been made, that at Kotonou being in course of construction. It will consist of concrete retaining walls about 1 ft. 6 in. high, filled in with laterite, and will be about 50 yards long by six wide.

*Watering Stations.*

At Kotonou, Pahou, and Toffo, water is obtained from wells, pumped by hand to raised cisterns by the side of the line. The water is also used for drinking purposes.

There is also a cistern at kilometre 91, which is supplied from the Lama marsh, but since the well has been dug at Toffo this has ceased to be used.

The water question promises to be a serious one, as there is practically no water on the Abomey plateau, where deep wells have been sunk without reaching it. The Government propose to try artesian wells, which may possibly prove to be the solution.

The large engines carry sufficient water to make the journey to Toffo and back with the existing watering stations, but the light engines have to be accompanied by a tank waggon, of which there are two.

*Rolling-Stock.*

Three tank engines of 30 tons weight, numbered 1 to 3, and a fourth is on order. Four small tank engines of about half the weight, lettered A to D.

All rolling-stock on the bogey principle.

Composite 1st and 2nd class carriages, with lavatory accommodation between, and the door in the centre. These are very hot, as they have neither hoods nor double roofs. They are roofed with corrugated iron.

3rd class, without seats, virtually roofed trucks with open sides. The latest pattern have brown canvas curtains to keep out the sun.

Closed wooden goods waggons, and open steel trucks, each of 10 tons capacity.

There has been little difficulty with axles heating, and so leakage of oil. Cotton pads are used with wicks hanging down into the oil in the grease box, the pad being then supplied by capillary attraction. Oil used is known as ‘Oleanap.’

*Personnel.*

350 all told. All drivers are natives, either Senegalese or from Sierra Leone. They receive from 150 to 200 francs a month, and appear to be fairly satisfactory. The European manager of the workshop inspects each engine before it goes out.
There are European stationmasters at Kotonou, Pahou, and Toffo; all others are natives. Ticket collectors, guards, and pointsmen are all natives. The pointsmen appear to be unsatisfactory, as they are apt to forget, and, if flurried, lose their head.

The permanent-way gang consists of 6 Europeans, 18 Senegalese, and 212 natives, to a total length of 103 kilometres being worked.

Heads of departments are all Europeans; skilled artisans mostly Senegalese.

Telegraphs, Telephones, &c.
All stations are connected by telephone but not by telegraph. The Government telegraph line follows the railway, but on separate posts. An arrangement has now been come to by which the telegraph wires are to be carried on the Railway Company’s steel posts.

At present there is no signalling system. No train leaves a station until ‘line clear’ has been received by telephone from the next. In the case of special trains telephonic instructions are given to clear the line.

For the convenience of traders trucks are sometimes left on the line midway between stations to be loaded with produce, and are pushed on to the nearest station by the first train passing. This would appear to be a very dangerous practice, and will probably end in disaster.

Fuel.
Patent fuel, or briquettes, are exclusively used. They appear to give good speed, but give off a very offensively-smelling smoke. They cost, placed in the yard 75 to 80 francs per ton (£3 to £3 4s.).

Speed.
By regulation speed is limited to 25 kilometres an hour, but as much as 45 kilometres has been attained without accident.

Rates.
Passengers. – 1st class, 50 centimes per kilometre.
2nd class, 25 centimes per kilometre.
3rd class, 7 centimes per kilometre.

Goods. – For produce sent down to the coast:–
Main line:–
Palm oil, 1 franc per ton per kilometre.
Palm kernels, 75 centimes per ton per kilometre.
Whydah branch line:–
Palm oil, 75 centimes per ton per kilometre.
Palm kernels, 60 centimes per ton per kilometre.
A reduction of 10 per cent. made for complete truck loads of 10 tons.
For goods sent up from the coast:—
I franc 50 centimes per ton per kilometre.
1st and 2nd class passengers are allowed 30 kilogrammes of luggage free.
Excess luggage at the rate of 2 francs per ton per kilometre.
The Dahomey Railway bears, at present, every mark of newness and hurry.
The permanent-way was laid at the rate of 1½ kilometres per day, and does not
appear to me to have settled yet. It will, however, have plenty of time to do so
before the Lama embankment is ready for traffic.
To save money, as few Europeans as possible were employed, with the result
that the natives are mostly half-trained and have got into slack and unbusiness-
like methods. Until quite recently there was no check on expenditure, so that the
finances are in a chaotic condition.
C. F. Cromie,
Captain,
His Majesty’s Consul.

Lagos, May 25, 1903.

No. 2.

FOREIGN OFFICE to COLONIAL OFFICE.

(Received August 19, 1903.)

Sir, Foreign Office, August 18, 1903.
I am directed by the Secretary of State for Foreign Affairs to transmit to you,
to be laid before the Secretary of State for the Colonies, the accompanying copy
of a despatch from the British Consul at Dakar transmitting a report on the
Conakry-Niger Railway.

I am, &c.,
F. H. VILLIERS.

Enclosure in No. 2.

Captain C. F. Cromie to the MARQUESS OF LANSDOWNE.
(Separate. Africa.)

My Lord,
Conakry, June 28, 1903.
I have the honour to transmit herewith to Your Lordship a report, with map,

* on the Conakry-Niger Railway.
I have recently spent four days, from Saturday, 20th instant, to Tuesday, 23rd, in inspecting the railway, accompanied by Captain Saleses, the Director. In addition, I have spent several days in closely inspecting the workshops and rolling-stock at Conakry.

On the 20th instant we went by train to the railhead at Tabili, 75 kilometres, and thence by hammock along the line to the Benty River Camp, where the officer in charge gave us accommodation. On the 21st we continued in hammocks, still following the line under construction, which in places was very rough going, as far as the section officer's camp at the 102nd kilometre. In the afternoon we proceeded to the 112th kilometre, from which to the 148th the roadbed is completed and subsequently returned to the camp, where we passed the night.

On the 22nd we started on our return journey, but instead of following the line, took native paths across the mountains, which have been improved for use by transport animals carrying provisions and materials to the advanced camps. At Tabili we again took train as far as Kowria, where we slept, and returned to Conakry in the afternoon of the 23rd.

I was thus enabled, under the very best auspices, to see practically the whole of the line under construction, which struck me as being excellently as well as economically made.

In my opinion two things have principally conduced to produce the good results obtained.

First, the employment, for construction purposes, of officers and men of the Military Corps of Engineers. Their professional attainments are of a very high standard, they are all picked men, and the esprit de corps of their service impels them to give their very best work. At the same time they do not receive the often very exaggerated remuneration which is demanded by civil engineers of any standing, and take a pride in doing their work as economically as possible.

In the bush they live in large huts constructed on the native principle, of native materials, which are excellently adapted for the climate and are also inexpensive to build.

The section officers are usually the first on the ground in the morning, and the last to leave at night; and are always to be found at the most difficult spot, directing and encouraging the workmen.

Some time ago the Governor-General told me how greatly satisfied he was with the excellent work done by the engineers in all parts of French West Africa.

Secondly, the system of small native sub-contractors introduced by Captain Saleses has proved most successful. By its adoption all difficulties with native labour have been avoided. The natives work under the orders of men of their own race, whom they have voluntarily joined on their own terms; while the railway authorities, by giving them rations, ensure their being properly fed, which
they otherwise might not be, as the resources of the country are unequal to providing food for the large number of men employed.

The sub-contractors enter into a signed contract to do a certain piece of work for a certain sum, so that they are sufficiently but not extravagantly paid and at before being accepted, their work has to pass the inspection of the section officer, these are sufficient guarantees that it is up to the proper standard.

That the system is a success is shown by the facts that the rate of contraction since it was adopted has been nearly four times as rapid as before; that there are always more sub-contractors willing to tender for tasks than are required; and that there are upwards of 8,000 voluntary workmen on the line, whereas during the two years that the construction was given to contractors, they had the greatest difficulty in obtaining labour.

As the second section of the line from Kindia to near Timbo will start unhampered by the difficulties which were left by the contractors on the first section, and as there are trained sub-contractors and a sufficiency of labourers only too willing to continue to work on the present terms, there is every reason to believe that the work on the second section will progress even more rapidly than on the first. As the construction will commence with a working railway behind it, the telescopic system of construction will be more fully adopted than has hitherto been possible.

I have, &c,

C. F. Cromte.

Captain.

The Marquess of Lansdowne, K.G.,
&c., &c., &c. /

This line is at present (June, 1903) in course of construction from the port of Conakry, in French Guinea. Its ultimate inland terminus will be Kouroussa, on the River Niger, a distance, according to the present plan, of 680 kilometres (425 miles) which will, however, be reduced to 600 kilometres (375 miles) as the result of new surveys.

History.

Captain Salesses, of the French Corps of Engineers, began, in 1895–96, to make surveys for the construction of a means of communication between Lower and Upper Guinea, and as a result of his studies warmly advocated the construction of a railway.

During the course of the year 1898 the construction of a railway was decided upon, and the principle favoured by the Colonial Ministry in Paris, was to have it built by a concessionaire company, which, in return for constructing and
Construction of Foreign Railways in West Africa

Working the line, should receive large territorial concessions, and an annual sub-
vention.

A proposal to that effect was put forward in January, 1899, the proposed
contract being somewhat similar to that unfortunately adopted in Dahomey,
except that the Company was to do the whole work of construction. This pro-
posal was finally rejected in August, 1899.

It was then proposed that the Colony should raise a loan of 8 million francs
(£320,000), subsequently increased to 12 millions (£480,000), for the construc-
tion of the first section of the railway, which was to be executed by contract.

A decree to this effect was issued on 14th September, 1899, and the contract
was given in February, 1900, to Messrs. Mairesse et Chrismant. They were to
construct 120 kilometres (75 miles) of road-bed with masonry, bridges, and cul-
verts in two years, i.e., by February, 1902.

This firm, not being financially strong enough, associated itself with Messrs.
Devès et Chaumet, of Bordeaux and Senegal, who undertook to furnish the nec-
essary money on the basis of receiving half profits.

In July, 1900, Monsieur Mairesse died, but in November of the same year the
contract was renewed with Mr. Chrismant, who was joined by a brother of the
deceased Monsieur Mairesse. Messrs. Devès et Chaumet continued to finance
the operations, but on much more onerous terms.

It was finally decided by the Ministry that the work of constructing and
working the railway should be done by the Colony itself.

Principle of Construction.
The Colony entrusted the work of construction to the military engineers who
had been employed to superintend the work of the contractors, and in May,
1902, they commenced work under the direction of Captain Salesses, who had
been connected with the enterprise from the very beginning, had made all the
surveys, and was thoroughly acquainted with the country and conditions.

Engineer officers were placed in charge of all departments; the line to be
constructed was divided into sections, to each of which an engineer officer was
appointed to superintend and direct the work of construction. The section offic-
ers were assisted by engineer non-commissioned officers and sappers, as well as
by a certain number of civilians who were taken over from the contractors.

Section officers subdivide their sections into tasks varying in length accord-
ing to the nature of the country and soil, which are undertaken by native sub-contractors, who enter into signed contracts and supply the necessary
labour. Rations of rice for the workmen and all necessary tools are supplied by
the railway administration.

This system has worked extremely well and economically, and has resulted in
the formation and training of a certain number of native sub-contractors, who,
as soon as they have finished one task, tender for another and take their own
gang with them to work on it. In this manner some 8,000 voluntary labourers
are employed.

The line is pegged out, and profiles and sections set up by the engineer officer,
the work is then carried out by the sub-contractor in his own way, but his work is
continually inspected and checked by the sappers, &c., and finally by the officer
in charge, who, when the task is finished, decides whether it has been done
according to contract.

The above system applies purely to the earthwork and ballasting; all masonry
work is done by masons under the direct superintendence of the section officer
and sappers.

When the work was first taken over by the Engineers, Captain Salesses was,
of course, obliged to continue and finish the separated uncompleted sections
begun by the contractors, but that being done he laid his rails on the completed
portion so as to utilize the line for the transport of materials, and especially of
provisions.

Once the roadbed completed, rails were laid at the rate of about 700 metres
a day.

In June, 1903, thirteen months after they took over, the result of the
Engineers’ work is as follows:—

The rails are laid, stations mostly built, and line working for construction
purposes to kilometre 75 (47 miles); line ballasted to kilometre 92, but masonry
not quite completed, and therefore bridges not in position; platform practically
completed to kilometre 148½.

By the end of the year 1903 it is expected that 150 kilometres (94 miles) will
be ready to open for traffic; and next year work will be begun on the second sec-
tion, for which 17 million francs have been put aside out of the recent French
West African loan.

The terminus of the first 150 kilometres will be Kindia, and of the second
section at a point close to Timbo, the capital of the Fouta Djallon.

Cost.

Down to the present the cost of construction by the Engineers has been as
follows:—

<table>
<thead>
<tr>
<th>Item</th>
<th>Cost per kilometre</th>
</tr>
</thead>
<tbody>
<tr>
<td>Earthwork</td>
<td>19,000 francs</td>
</tr>
<tr>
<td>Masonry</td>
<td>5,000 francs</td>
</tr>
<tr>
<td>Bridges</td>
<td>7,000 francs</td>
</tr>
<tr>
<td>Rails, sleepers, ballast and laying</td>
<td>22,000 francs</td>
</tr>
</tbody>
</table>

Including, in addition to small stations, the terminal station of Conakry,
the construction and equipment of workshops, and houses for the Director and
personnel, the line complete, ready for traffic, has cost 80,000 francs per kilome-
Construction of Foreign Railways in West Africa

tre (£3,200–£5,120 per mile), or if the amount of the indemnity given to the contractors is added. 89,000 francs per kilometre (£3,560 = £5,696 per mile).

Description of Country.
Conakry, the terminus, is a low island whose highest elevation is 12 metres (40 feet) above the sea. As the railway runs down to the wharf it may be said to commence at sea level.

As far as the 8th kilometre the country remains flat and is park-like in character, with large expanses of grass interspersed with groups of trees, including many palms. The soil is laterite rock and gravel, with some sand. From the 8th to the 45th kilometre the general characteristics remain the same, but there is a gradual rise the whole way.

At the 45th kilometre the line definitely enters the mountainous region, passing to the south of the Gibraltar-like mass of Mount Kakoulima. It rises in a series of steps to an elevation of 161 metres (525 feet) at Kowria, whence it descends to 70 metres (230 feet) at kilometre 88. From this point there is a continuous gradual rise to Kindia (kilometre 148), with an elevation of 444 meters (1,460 feet), the terminus of actual construction. / 

The actual highest point of the whole line will be at the Col de Koumi, on the second section, with an elevation of 726 metres (2,389 feet).

The mountains are formed of a hard variety of sandstone, with the exception of 7 kilometres of diabase granite belonging to Mount Kakoulima. They are bold and precipitous and traversed by numerous rivers and streams, the chief of which are the River Koukouré, which enters the sea at Dubiéka, and its affluent, the River Badi. Laterite is found in many places among the mountains.

The country traversed by the first 150 kilometres is not very productive at present, and much of it is practically sterile, except for a covering of bush, with groups of large trees in the river valleys.

Some of the trees furnish excellent wood for carpentering and ornamental purposes, and doubtless some of them will later on be exploited commercially. Under normal conditions, however, this region is thinly populated and labour is, consequently, comparatively scarce. The actual density of population averages seven per square kilometre.

The really productive part of the country is the Fouta Djallon and the slope to the River Niger, so that every effort is being directed to prolonging the line in that direction.

Permanent Way.
A single line of metre gauge, composed of single-headed rails 8 metres in length, weighing 25 kilos to the metre (about 50 lbs. per yard). Steel sleepers laid in the
proportion of 10 per rail of 8 metres. The rails are bolted to the sleepers through two holes by flanged bolts passed through from above, then turned round to catch, and a nut screwed on so as to secure an angle iron which grips the rail.

It is claimed for this system that it is stronger and more secure than the wedge system employed on the British West African railways. The rails are joined by tie plates. The ballast employed is laterite gravel, which is excellently adapted to the purpose, and exists in large quantities. It is laid to a depth of 40 centimetres.

The greatest curve employed has a radius of 120 metres (395 feet), and the steepest slope is 1/40 on the straight, but never so much on the curve.

Points are worked by hand horizontally with a counterweight.

There are several turntables at Konakry, and one at Kowria, which, in addition to being useful for reversing engines, is so placed as to enable goods wagons to be run into the goods shed for loading and discharging. Others will be placed at stations as required.

The line is well drained by means of side ditches discharging the water as occasion offers.

**Bridges, Embankments, &c.**

As might be expected from the mountainous nature of the country traversed, these are very numerous.

Owing to the generally rocky nature of the soil, blasting has had to be freely resorted to for cuttings – gunpowder having been employed in preference to high explosives as being cheaper and better understood by the natives.

The bridges are very numerous, owing to the number of rivers and streams. They are of all sizes, from 2 metres up to 80 metres (6 feet 7 inches to 265 feet), but there are many between 10 and 15 metres (33 to 50 feet). The longest is 80 metres long and 17 metres high (265 feet by 56 feet). / They all consist of one or more masonry piers, built of laterite stone which is found plentifully at hand. All lime has to be imported, as limestone does not exist in the country. The piers are traversed by iron girder bridges imported from France.

The cost of bridges and metal culverts (similar to those in use on the Congo Railway), apart from masonry, averages £280 per kilometre, or £42,000 for the 150 kilometres under construction.

Embankments are plentiful, the highest being about 40 feet. In several cases retaining walls have had to be built to hold them up. In this climate grass now begins to grow on the embankments and cuttings, which binds them together, and seeds are sown so as to expedite the growth.
**Buildings.**

With the exception of Conakry Station, all the present stations are temporary structures of wood with corrugated iron roofs, and are raised on 50 centimetre concrete piers, but they will be gradually replaced by permanent buildings.

Conakry Station consists of a ground floor and upper storey. The ground floor is built of laterite, the upper storey has a steel skeleton supported on steel posts forming a verandah for the ground floor. The upper storey is filled in with bricks and also has a wide verandah all round. It is roofed with Marmiller tiles. The steel-work, tiles, and bricks are imported from France, it having been found economical to use French bricks which resist moisture without covering, rather than the bricks made in Conakry, which, not being so dense, require to be covered with a coating of cement. All the station buildings will be of this character, as are also the head offices and quarters for the Director and staff.

The engine-sheds and iron-shop are of brick with corrugated iron roofs. Most of the existing goods-sheds are entirely of corrugated iron.

At Conakry there is an iron and fitting-shop, and also a carpenter's shop, both well fitted with the latest machinery. The resources of the fitting-shop can be judged from the fact that an engine recently landed was put together, several of the parts made over, as they did not quite fit, and sent on her first run on the eighth day after landing.

All the woodwork required for the various buildings is made in the carpenter's shop, in many cases of native wood, but at present nothing is made in the way of rolling-stock beyond the frames for construction wagons.

Most of the wooden furniture required is also made in this shop.

Later on workshops will be established at Kindia for the second section.

**Rolling-Stock.**

At present there are four large tank engines of 30 tons, loaded, having a water capacity of 3 cubic metres. They have three coupled driving wheels with a bogie. They are not compound.

There are also three small metre-gauge Décauville engines used for construction work. When the first section to Kindia is opened for traffic, these will be sent on to the second section.

First-class carriages are on two bogies, second-class on two pairs of wheels without bogies. There are four first-class carriages provided with lavatory accommodation, and eight second-class without.

There are no special third-class carriages, it being the intention to fit up of the present covered goods wagons with seats for native passengers.

There are 14 covered goods wagons, of about 8 tons carrying capacity, and 38 trucks, all without bogies. In addition, there are 11 long bogie trucks at present used for the carriage of rails and material.
There are 5 trollies and 4 pump cars for the use of the personnel. The construction plant consists of 5 waggons and 21 tip cars, holding from 2 to 3 cubic metres.

**Water.**

There is watering accommodation at every station, which are at distances varying from 15 to 25 kilometres apart.

The source of the water varies according to circumstances. At Simbaia, 17 kilometres from Conakry, a large rain-water tank is under construction, which is calculated to provide sufficient water for the whole year. Other stations have wells, and at others streams have been diverted so as to supply by gravitation. In each case the method of supplying the engines is the same. A hydraulic stand-pipe is erected by the side of the line, and the water arrives under pressure.

**Coal.**

As a rule briquettes (patent fuel) are employed, and are said to give equal steam results per ton as coal, while avoiding the dust and waste of the latter.

The cost at present is about 65 francs (£2 12s.) per ton landed at Conakry, but it is expected that, as the result of negotiations in progress, it will be obtained at about 45 francs (£1 16s.).

**Personnel.**

As the line is still under construction and not opened for traffic, the arrangements are temporary. All heads of departments are Engineer Officers, station-masters are usually sappers, but in one or two instances civilians. Engine-drivers are natives, mostly Senegalese, but natives of the country are being trained. Pointsmen are natives. In the iron-shop the workmen are Senegalese under European supervision; in the carpenter’s shop they are entirely Senegalese, the foreman in charge being of the same race, and the results are quite satisfactory.

The whole of the workshops are under the direction of a Captain of Engineers.

The construction personnel has already been described.

**Telegraphs, &c.**

Both telegraph and telephone are employed, the wires being carried alongside the line on iron T posts.

There are at present no signalling arrangements or staff system, line clear being obtained from the next station by telegraph or telephone.

At each station there is a European and a native telegraphist, the former to instruct the latter. As soon as practicable the Europeans will be got rid of on account of expense.
The principle has been laid down that the construction shall always be done by the Engineers, but once construction completed and the line open for traffic, a civil staff will be employed.

What is known as the regime of the French State Railways will be adopted, so that the Conakry-Niger Railway may be affiliated to them with the advantage of interchange of personnel, so that the Conakry Railway will be officered by volunteers from the State Railways, who will come out for a two-years’ tour, receiving, while in the Colony, double European pay, and at the end of their tour reverting to their original post on the State Railways. It is hoped by this arrangement to obtain a constant supply of trained personnel without burdening the Colony with a heavy pension list.

C.F. Cromie,
Captain,
His Majesty’s Consul.

Conakry, June 28, 1903.

No. 3.

CROWN AGENTS to COLONIAL OFFICE.

(Received May 28, 1904.)

Sir,

I have the honour to transmit, for the information of Mr. Secretary Lyttelton, with reference to the correspondence* noted in the margin, two copies of the report which we have now received from the Consulting Engineers upon the various railways constructed, undertaken, or proposed by foreign Governments in West Africa.

Colonial Office to Crown Agents, No. 12097/04, 19th April, 1904.
2. The original enclosures to your several letters are returned herewith.

I have, &c.,

E. E. Blake

Enclosure in No. 3.

REPORT UPON RAILWAYS CONSTRUCTED BY FOREIGN POWERS IN WEST AFRICA by Messrs. Shelford and Son, Consulting Engineers to the British West African Government Railways, May 14, 1904.[...]

* 10414 and 12097: not printed.
Communications in Africa, 1880–1939: Volume 2

2. This report is compiled from information extracted from voluminous literature, principally newspapers, either forwarded from the Foreign Office, through yourselves, and the Colonial Office, or obtained privately by us.

3. The information thus obtained is frequently contradictory and in many cases unofficial, but by judicious selection we hope we have been able to report herein only the actual facts concerning these railways. This report must, however, on account of the sources from which the information has been derived, be submitted with some reserve.

We were informed by your E./240/5, of the 2nd June, 1903, that the Secretary of State had decided that it was unnecessary to employ Mr. Glasier at present to inspect any of these railways, as had been suggested by us.

**French Colonies: Senegal.**

**St. Louis-Dakar Railway.**

4. The St. Louis to Dakar Railway has a gauge of one metre. It commences at St. Louis, the seat of the Government, and runs in a southerly direction to Dakar, which is one of the two important ports in French West Africa, the other being Konakry. This line is the only portion actually constructed out of an ambitious railway scheme put forward by Admiral Jaureguiberry about 1880.

The total distance between the above-mentioned towns is 264 kilometres (164 miles).

5. For the first 20 miles from St. Louis the country is flat and sandy, after which it becomes woody and undulating.

In the Cayor district the line passes through a large forest of palms until a distance of 92 miles is reached; then, after running through broken country, it traverses marshy ground until within a distance of 20 miles from Dakar, where the ground becomes again dry and sandy.

6. The concession for the making of the St. Louis-Dakar Railway was granted October 30th, 1880.

Under this concession the State guaranteed (1) the interest on the capital required for construction, *i.e.*, 3,400 francs per kilometre or 5 per cent. on the cost estimated at 68,000 francs per kilometre (£4,352 per mile); (2) the difference between the working expenses and the actual receipts.

Under this arrangement the Company could lose nothing, and took care not to charge more than 68,000 francs per kilometre to construction, and took no trouble to keep down working expenses. The terms were, in fact, extravagant.

7. This concession was amended by the Senate and replaced by a modified concession which became law on June 29th, 1882.

Under the amended concession the guarantee of 3,400 francs per kilometre was reduced to 1,154 francs per kilometre, but the State undertook to contribute...
12,680,000 francs towards the cost of construction, about three-quarters of the whole. The working expenses were to be agreed, when the conditions of working were better known, between the State and the Company and fixed at a certain amount.

The terms were still very liberal; the Company still ran no risk, and the shares were eagerly taken up and the railway pushed with feverish haste and completed in three years (1885).

8. The work was carried out so rapidly and so badly that in 1883, only one year after the concession was granted, a Commission of Engineers was appointed to visit the works. Their report showed that the Company intended to live on the guarantee of interest on the cost of construction, leaving the cost of permanent work to be debited to revenue, against loss upon which they were guaranteed by the State. / The working expenses became so high that in 1890 the Home Government intervened and placed the matter on a proper footing.

In 1898, for the first time the receipts exceeded the expenses.

9. The St. Louis-Dakar Railway has cost the State the following:–

<table>
<thead>
<tr>
<th>Fees (francs/£)</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>1. Contribution to the capital of construction</td>
<td>12,680,000</td>
</tr>
<tr>
<td>2. Guarantee of interest from 1883 to 1890</td>
<td>9,993,657</td>
</tr>
<tr>
<td>3. Guarantee of interest from 1890 to 1900</td>
<td>11,867,458</td>
</tr>
<tr>
<td>4. Guarantee of interest from 1900 to 1902</td>
<td>850,000</td>
</tr>
<tr>
<td>Total (francs)</td>
<td>35,391,115</td>
</tr>
<tr>
<td>(£1,415,644)</td>
<td></td>
</tr>
</tbody>
</table>

The length is 164 miles.

Cost per mile to the State = £8,630 per mile, to which has to be added the expenditure of the Company itself, the Company having a capital of £200,000 only. This amount is stated to have been 3,165,000 francs or £126,600, equal to £772 per mile.

The actual cost of the railway to date appears therefore to have been:–

<table>
<thead>
<tr>
<th>Per mile.</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Cost to the State</td>
<td>£8,630</td>
</tr>
<tr>
<td>Cost to the Company</td>
<td>772</td>
</tr>
<tr>
<td>Total cost of railway</td>
<td>£9,402</td>
</tr>
</tbody>
</table>

10. The road was constructed by European navvies, who could only work six months during the year, namely, during the dry season, from December to June. It was only possible to rely upon native labour for auxiliary duties. Native

*Colonial Office Note. – These figures are taken from a report by M. Lucien Herbert, printed for the Chambre des Députés in 1903. It must be remembered that a large portion of the sum given represents interest on capital, and loss on working, which are not included in the figures for British Railways (except net loss on working for a few months). A later Parliamentary Report of 1904. (Nos. 1959 and 1960, by M. Bourrat) gives (page 90) the final cost, including rolling stock, at 80,000 francs per kilometre, or, approximately £5,120 per mile.
labourers were to receive a daily wage paid to them personally; this sum was arranged between the Company and the heads of the various villages.

For 120 miles from St. Louis there are no quarries and all material for bridging had to be imported. Trouble was experienced with the foundations of St. Louis Station.

11. Originally creosoted pine sleepers 5 feet 3 inches long by 6 inches wide were used, but these are not being replaced by steel sleepers 5 feet 9 inches long and weighing 78 lbs. each. The weight of the rails is 20 kilogrammes (44 lbs.) per metre.

12. The only important work on the line is the Leyhar Bridge, four miles from St. Louis. This is an iron bridge of four spans, the two outside spans measuring 30 yards each, and the two inner ones 36 yards each, the total length of the bridge being 132 yards.

13. The rolling-stock consists of the following:

- Fourteen large locomotives (weighing 22 tons, exclusive of tender) having separate tenders, with a capacity of 1,760 gallons of water and 1 ton of fuel.
- Fifteen small locomotives with tenders attached (21 tons) with a capacity of 660 gallons of water and 1 ton of fuel.

14. Both types of locomotive have three coupled axles with the weight equally distributed over the six wheels. These wheels are on the larger locomotives 3 feet 9 inches in diameter with a wheel base of 8.85 feet and on the smaller locomotives 3 feet 6 inches diameter with a wheel base of 7.75 feet.

15. There are also 60 carriages, first and second class, some being corridor cars; and 24 third class carriages, 310 wagons, covered and open trucks. These trucks range in weight from three to four tons and carry eight tons; both carriages and trucks have two axles each, iron frames and wooden bodies.

16. The Dakar-Rufisk section, 19 miles in length, was opened for traffic in July, 1883; work had been commenced simultaneously at St. Louis, but did not progress so rapidly.

- Three more sections were opened in 1884.
- The finished line was opened and inaugurated on July 6th, 1885, having taken about three years to construct. The total length of the line is 164 miles; rate of progress, therefore, was 55 miles per annum.

17. Various difficulties had to be overcome, such as there being no quarries within 125 miles of St. Louis, the difficulty with the foundations of St. Louis Station, and the time wasted owing to the fact that European navvies could only work during the healthy season (December to June).

Epidemics of yellow fever occurred frequently.†

† Colonial Office Note. – It is mentioned in one report that a great many culverts were required over marshy ground between the 15th and 47th mile from Dakar.

* Colonial Office Note. – One source of information gives five tons.
The Kayes-Niger Railway.

19. The Kayes-Niger Railway has a gauge of one metre; its total length is 563 kilometres (349 miles). It starts from Kayes in a south-easterly direction, passes through Bafoulabe, Kita, and Bammakoo, and terminates at Koulikoro on the River Niger. From Koulikoro the Niger is navigable as far as to *Timbuctoo.

20. For a distance of 170 miles the railway passes through a wooded and broken country, following the course the Senegal River. Then it passes through a cutting 23 feet deep and 900 yards long through hard rock and finally emerges into a tract of country which is open and level as far as Kita. 301 miles (485 kilometres) distant.

The country around Kita becomes again broken, and from thence to the valley of the Niger the descent is fairly steep.

Up to Bafoulabe (82 miles) the gauge was one metre. From Bafoulabe, funds being attenuated, the metre gauge materials were used to prolong the line for 41 kilometres upon 50 centimetre gauge (1 foot 7 11/16 inches). Bridges were abandoned and traffic was hauled over rivers by mules. The timber sleepers rapidly decayed, and this portion of the railway was replaced in 1889 by a line of 60 centimetre gauge (about 2 feet) equally defective.

21. The railway was authorised on February 26th, 1880, and rough preliminary surveys were made 1880–1881. Stores were sent out in 1881, operations commencing in April, 1882.

At the time the first credits were voted the French were not masters of the Colony, as it was not subdued before the middle of 1882.

Great mistakes were made at first by not shipping materials early enough in the season for forwarding by river to Kayes; this alone caused considerable loss and delay. Other difficulties arose such as epidemics of yellow fever, difficulty in getting sufficient credits voted by the Chamber, and lastly, changes in the personnel. The work has been energetically pushed forward since 1898 only, owing to the fact that the direction of the construction of the line had changed hands frequently.

Proper surveys were not undertaken until 1891, although the work had been proceeding for 10 years. /  

22. From 1881 to 1888 construction was entrusted to civil engineers, from that date until 1892 it was in the hands of the Marine Artillery, from 1892 to 1896 a was under the direction of military engineers, and, finally, from 1898 it has been in the hands of the French Government, assisted by the Colony of Senegal and the Soudan.

* Colonial Office Note. – Captain Cromis states that from Koulikoro the Niger is navigable without interruption, not only as far as Timbuctoo (594 miles but beyond to Ansongo (377 miles lower again).
23. Native labour, as far as possible, is employed, and is under the supervision of European non-commissioned officers and privates of engineers. The labourers are paid 60 francs a day and rations. The native labourers are hired of their own free will, paid monthly, lodged in straw huts and rationed by the Government.

24. There are three important works on the railway, viz., the Galonge, Mahina, and Tukoto bridges.

The Galongo bridge is an iron girder of four spans, having a total length of 82 yards and a height of 60 feet.

The Mahina bridge which traverses the River Bafing is an iron one, having a total length of 480 yards. It is divided into 16 spans, 30 yards each in length, resting on brick piers.

The Tukoto bridge which spans the Bakoy River is a brick and iron structure 380 yards in length.

25. Since 1898, steel sleepers, weighing about 78 lbs., have been used, these have taken the place of the wooden ones formerly used which were destroyed by ants in about three years. The rails are 20 kilogrammes (44 lbs.) per metre.

26. Up to 1895, eight locomotives had arrived and a number of engines, not definitely known, have been sent out since that year.

The description of the locomotives is as follows:

Four locomotives (10 tons empty) having six coupled wheels (2 feet 3 inches diameter) capable of drawing a weight of 20 tons up an incline of one in forty.

One locomotive (20 tons) with six coupled wheels capable of drawing a weight of 40 tons.

One locomotive of the 'Kayes type' (15½ tons) empty and 20 tons located, having six coupled wheels (2 feet 6 inches diameter) cylinder (10 inches diameter) boiler to contain 242 gallons, tank 550 gallons, coal bunker, 17½ cwt., to burn either wood or coal, and capable of drawing a weight of 45 tons at the rate of 15 miles an hour.

All the locomotives supplies since 1896 are of the 'Kayes' type.

27. The coaches, which are first and second class composites, have been frames 30 feet long, and are mounted on bogies with steel axles and wrought iron wheels.

The bodies of the carriages are 8.85 feet wide and 8.5 feet high with a corridor at one side.

The third and fourth class carriages are also combined and have a length of 25 feet, and are mounted on two axles 12½ feet apart.

28. Progress, was very slow until after the ratification of the convention between the State and the Colony of Senegal upon April 13th, 1898. The first rail was laid in the early part of 1882.
In the year 1883, 10 ½ miles only were laid, and in 1888, railhead had only reached Baoulabe, at a distance of 80 miles.

At the end of 1896, eight years later, a distance of only 35 miles from Kayes had been reached, and not until March, 1899, did railhead reach Walis, a distance of 110 miles. The line was completed as far as Kita by the end of 1901, a distance of 193 miles (310 kilometres).

In December, 1902, the rail extended to the 200th mile, and in 1903, railhead was expected to reach 500 kilometres (312 miles); the whole line, a distance of 349 miles, is expected to be completed by April, 1905.*

The slow progress at first was chiefly due to the manner in which the funds were doled out.

In May, 1903, the mileage open for traffic was about 220 miles.

29. The total cost of this railway to the State to the end of 1903 is as follows:

<table>
<thead>
<tr>
<th>Period</th>
<th>Cost (Francs)</th>
</tr>
</thead>
<tbody>
<tr>
<td>1st period. Construction by the State, 1880–1884</td>
<td>25,287,536</td>

<td></td>
</tr>
</tbody>
</table>

The line is at the date of this report still unfinished, and the actual cost may be greater than the above.

30. Among special engineering difficulties the following may be mentioned:– The cutting at Manambugu, 23 feet deep and 900 yards in length, through hard rock; the broken country near Kita with the steep descent into the valley of the Niger, and the building of the three bridges, Galongo, Mahina, and Tukoto.‡

* Colonial Office Note. – The first train ran into Bammakoo (500 kilometres), on 19th May, 1904. (202 miles in five years, since March, 1899); and into Koulicoro on 10th December, 1904 (239 miles in 5 3/4 years).

† Colonial Office Note. – How much of this sum is interest on capital, and how much is excess of working expenses over revenue? An article in the Dépêche Coloniale of 25th May, 1904, gives the cost of construction at 75,000 fr. a kilometre, or about £4,800 a mile: and since 1898 Captain Cromie puts the cost at £4,224 a mile.

‡ Colonial Office Note. – Yellow fever epidemics in 1900 and 1901, and want of water in the Senegal in 1902 caused great delay.
31. In order to avoid the difficulties and delays of the present method, namely, by the Senegal River, of reaching Kayes from the coast, it has for some time been contemplated to construct a railway from Thières, a station on the St. Louis-Dakar line, to Kayes. Commandant Belle of the Engineers was accordingly ordered by the Colonial Minister to make a survey for the projected line. That officer has just submitted his report and the trace of the line as proposed by him is shown on attached tracing.*

It is estimated that the line will take five years to complete, but the first 147 kilometres (90 miles) through the rich Baol country could be finished in two years.

32. This is a single line of railway of one metre gauge; it runs from Konakry, on the coast of French Guinea, in an easterly direction, via Kindia and Timbo to Kardamania. 19 miles below Kouroussa in Mandingo. Kardamania is situated on the River Niger, which is navigable from Kardamania as far as Bammakoo, and thence / to Timbuctu. The total length of the railway to Kardamania is 550 kilometres (342 miles).

<td>Section III. Timbo-Couroussa</td>
<td>181</td>
</tr>
<tr>
<td>Total</td>
<td>550</td>
</tr>
</tbody>
</table>

33. The country as far as the 45th kilometre is flat and open, but groups of trees occur in places; after that distance a mountainous region commences which reaches a height of †444 metres (1,460 feet). Numerous rivers and streams intersect the course of the railway, and the valleys are well wooded.

The decree authorising the construction of this railway was issued September 14th, 1899, the constructors arriving in June, 1900.

34. The works were undertaken by a firm of contractors in 1900 (the earthwork and ballasting being done by small native sub-contractors), but in May, 1902, the contractors were at their own request relieved from their contract and the work was taken over by the Government of French Guinea, since which the line has been constructed departmentally.‡

* Not reproduced.
† Colonial Office Note. – This is the height at Kindia, but the highest point on the railway will be at the Col de Koumi, 726 metres – 2,389 feet.
‡ Colonial Office Note. – Under officers of the military engineers.
La Dépêche Coloniale, of 27th March, 1904, gives a comparison of the work done under contract and departmentally as follows:–

<table>
<thead>
<tr>

<td>120 kilom.</td>
</tr>
</tbody>
</table>

35. The rails weigh 50 lbs. per yard (25 kilos. per metre) have a length of 8 metres and were laid upon steel sleepers, 10 sleepers being used for each rail.

Some heavy gradients were encountered which in some places were as much as 1 in 40; these, however, did away with the necessity for tunnelling.

The dimensions of the longest bridge are as follows:– Length, 80 metres; height, 17 metres (265 feet and 56 feet, respectively).

36. The rolling-stock consists of the following:– Four tank engines (30 tons loaded); three small locomotives for construction works; four 1st class and eight 2nd class carriages and 14 covered goods wagons (8 tons); 38 trucks and 11 long logic trucks.

The four tank engines have three coupled driving wheels with front bogies, and their tanks have a capacity of 3 cubic metres.

The first class carriages have two bogies and the second class two pairs of wheels.

37. By June, 1903, rails were laid, stations mostly built, and the line was in working order for constructional purposes as far as Tabili at 75 kilometres (46.5 miles).

In May the same year the line was ballasted for 92 kilometres (57 miles), but the bridges were not completed, though for 150 kilometres (93.5 miles) the earthworks were practically completed.

Sir Edward Monson states from Paris under date March 27, 1904, that traffic now reaches 125 kilometres (78 miles). / The Governor-General M. Roume recently travelled to 102 kilometres (64 miles).

It is expected that the line will be opened to Kindia, 149 kilometres (93 miles), at end of April, 1904.

38. There have been, however, difficulties and delays, such as the breakdown of the contractors’ system, on account of which the work had to be done by the Colony itself under the direction of military engineers. Cement and lime had to be imported, but laterite for masonry was found in abundance.

There was a large quantity of rock blasting in cuttings (the rock here is a species of hard sandstone); numerous bridges had to be built, and many embankments, of which the highest was 40 feet.

39. The estimate for the cost of the whole work was placed at 44 million francs (£1,740,000) or £5,073 per mile.
The cost of the first section of 93 miles was reported to have come within the estimate of 12,000,000 francs (£480,000) or £5,161 per mile, but other reports give up to June, 1903, as much as £5,695 per mile (89,000 francs per kilometre) an additional expenditure of £622 per mile.

*La Dépêche Coloniale* gives the cost of the first section as 95,000 francs per kilometre – £6,100 per mile.

40. The cost of surveying, clearing, stations, telegraph, rolling-stock, administration, and engineering have not been ascertained, but the earthworks come out at 19,000 francs per kilometre, the bridges and masonry at 12,000 francs per kilometre, and ballast at 22,000 francs per kilometre.

41. An extension of this line to Bammakoo has been proposed in order to join the 'Kayes-Niger Railway.'

*The Dahomey Railway*

42. The Dahomey Railway has a gauge of one metre. It commences at Kotonu and runs for a short distance in a westerly direction, there changing into a northerly direction via Allada and Abomey.

There is a branch line 8 miles in length to Wydah.

43. The first section is a distance of 191 kilometres (118 miles) and runs from Kotonu to Paouignan, including the branch line to Wydah of 14 kilometres (8 miles).

This section commences in a marshy district near the coast, and is intersected with lagoons. For about 70 miles it rises with an even slope and is thickly covered with oil palm forests. After 70 miles the country becomes broken.

44. The second section, which is from Paouignan to Tchaourou, is 209 kilometres (130 miles) in length and is hilly and intersected with ravines.

The total distance of these two sections, *i.e.*, Kotonu to Tchaourou, is 248 miles, made up thus:

<table>
<thead>
<tr>
<th>Route, Length, &amp;c.</th>

</tr>
<tr>
<td><strong>Total</strong></td>
<td><strong>400</strong></td>
<td><strong>248</strong></td>
</tr>
</tbody>
</table>

45. The decree for the authorization of the Dahomey Railway was given by the President of the French Republic on the 26th of June, 1900.

This gave a concession to M. Borelli who, on June 7th, 1901, a year later, transferred it to the 'Compagnie Française des Chemins de Fer au Dahomey.'

The survey of the line had been previously undertaken by the French military engineers and was commenced in March, 1899. /

46. The following are the terms of the concession:–

(1) The Colony grants to the Company 295,000 hectares = 730,000 acres.
(2) The Colony binds itself to construct the ‘infra-structure’ and to hand it over to the Company in annual sections of 50 kilometres (31 miles).

(3) The Colony binds itself to pay to the Company a subvention of 2,000 francs per kilometre of railway worked (£128 per mile) for 8 years (i.e., a total sum of £1,024 per mile).

(4) The Company makes the superstructure (bridges, permanent way, rolling stock, and stations).

(5) The Company shares its profits with the Colony after the nett receipts exceed 6,000 francs per kilometre (£384 per mile).

(6) The concession is for 75 years, after which the Colony will become proprietors of the railway.

N.B. – The land grant referred to in (1) has brought forth vigorous protests from the natives from whom the land has to be taken. It will probably be revoked, but the Company will demand compensation.

The concessionary Company also has the option for 25 years to construct the extension of the line from Tchaourou to the Niger.*

47. Earthworks were commenced May, 1900, evidently prior to the actual date of the concession. The construction of the road bed, including culverts, bridges, cuttings, and embankments is carried out by the military engineers at the Colony’s expense; when this work is complete it is handed over to the Company, which has to lay the permanent way, build the stations, &c., and work the line.

48. The earthwork is carried out by the natives, who are hired through their chiefs, and is carried out on a system of piece work, the rate of pay being about one franc per cubic metre of earthwork.

For the first 30 miles there was practically no proper ballast; over this part a composition of gravelly sand has been used.

There are no tunnels or large bridges, the longest bridge being over the River Zoo; this has a length of 95 metres.

Single-headed steel rails, weighing 20 kilogrammes (44 lbs.) per metre, are task on steel sleepers placed 1,333 to a kilometre.

49. The rolling-stock will consist of three tank engines (30 tons) and four tank engines (15 tons).

* Colonial Office Note. – A new Convention was concluded with the Company in August, 1904. The territorial and mining concessions are renounced by the Company; the superstructure up to Tchaourou will be built by the Company at the expense of the Colony, according to a fixed scale of prices; the Company will work the railway up to this point for 25 years, but under an arrangement with the Government as regards profit and loss on working; the preference previously according to the Company for the construction of the superstructure of the line from Tchaourou to the Niger is revoked.
Under the terms of the concession all rolling-stock is to be on the bogie principle, and the locomotives are to be of the best type, all tenders and engines to be fitted with brakes on all wheels. All passenger carriages are to be fitted with springs and are to be of three classes, affording suitable protection against sun and rain. First class carriages are also to be similar to those used in the Congo Free State and on the Senegal Railway, whilst the third class carriages are to be railway trucks specially fitted up. Covered goods wagons and open steel trucks are to be of 10 tons capacity each. According to the contract one train a day is to run each way, two trains a week each way are to be for the carriage of mails and passengers exclusively, and are to have a speed of 25 miles an hour, excluding stoppages.

50. The following are the principal dimensions of the proposed rolling-stock:—

- The width of the locomotives is not to be more than 2.50 metres (8 feet 2 inches) and of the rolling-stock, including footboards and other projections, not more than 2.80 metres (9 feet 3 inches), and the extreme height of a load not more than 3.75 metres (12 feet 3 inches) above rail level.

Progress.

51. The progress has been as follows:— 8 miles completed to Wydah, June, 1902, and completed to Attogan on the 4th September in the same year. To the end of 1903, 55 miles were completed, and difficulty was experienced in crossing the Lama swamp. The whole of the first section to Paouignan, 118 miles in length, is expected to be finished in 1904, but this is not likely to be realised, and the Company have promised to finish the second section, which is a distance of 130 miles, from Paouignan to Tchaourou by 1908.

Cost.

52. The total cost of the Dahomey Railway is difficult to ascertain. It is given by M. de Bunsen in a memorandum accompanying Sir E. Monson’s, No. 56, Africa, of 23rd June, 1903, as follows:—

Kotonu to Paouignan is estimated (distance 118 miles, and Wydah branch 8 miles = 126 miles).

<table>
<thead>
<tr>
<th>Cost per mile</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cost of substructure paid by Colony</td>
</tr>
<tr>
<td>Cost of superstructure paid by Company</td>
</tr>
<tr>
<td>£937,146  £7,437</td>
</tr>
</tbody>
</table>

The accuracy of these figures is doubtful. From other sources we obtain:—

- Cost of substructure paid by Colony | £4,160 |
- Cost of superstructure paid by Company | £2,567 |
- £6,727

In either case the total cost appears to be about £7,000 per mile, but the proportions paid by the Colony and by the Company, respectively, are uncertain.

The Company receives a subsidy of £1,024 per mile, spread over 8 years, and the enormous land grant above referred to. The railway, when completed, will be
owned by the Company and not by the Colony. There is no loan to the Colony, and £40,000 is paid annually for construction out of the revenue of the Colony.

The railway belongs to the Company for 75 years, although a certain proportion of the cost appears to have been paid by the Colony and an enormous land grant has been given to the Company or compensation in lieu thereof. The cost of the railway to the Colony appears from the latter figures to be:

\[
\text{Per mile.} \\
\text{Expenditure by the Colony on infrastructure} & \quad £4,160 \\
\text{Subsidy payable to Company} & \quad £1,024 \\
\hline
= £5,184 \\
to which is to be added the land grant.
\]

The railway belongs to the Company and not to the Colony.

53. Considerable delay was caused in 1901 by the concessionary Company requiring more favourable terms; this was met by their being granted the large concession of land.

The difficulties of construction over the Lama swamp near Toffo (88–103 kilometres) have caused considerable delay. All the early attempts to build an embankment over this marsh failed, but according to the ‘Dépeche Coloniale,’ of January 31st, 1904, all difficulties have now been overcome owing to the ingenuity of the French engineer officers; and the earthworks, which are now complete as far as Paouignan (193 kilometres from Kotonu) will shortly be handed over to the Railway Company.

A detailed survey of the country between Paouignan and Tchaourou has been made and the trace of the line between these places definitively settled.

54. An extension is proposed from Tchaourou to Karimana near Say on the River Niger, making a total distance of 435 miles.

Ivory Coast Railway.

55. This railway, having presumably a gauge of one metre, has been recently authorised and is to commence at Abidjean on the mainland on the north side of the Grand Bassam lagoon, and about 8 kilometres from the sea at Petit Bassam. It then having touched Ery Macougié will take either of two routes, viz:– an eastern route passing through Tranou, Gramabasso, Azarekrou, and Djinois, or a western route through Ananguié Gonabo, Odiao, and Betimbo; both of these routes are under consideration and both terminate at Kouadiokofi.

56. The total length of the line from Abidjean to Kouadiokofi is 265 kilometres (165 miles) and the length from Abidjean to Ery Macougié is 49 miles.

57. The first section of this line passes through somewhat difficult country, which will necessitate a tortuous route. As far as Tranou the country is very similar to the first section, but to the north of Tranou it becomes much easier, and open plateaux are crossed.
58. Mr. Mackie, the British Consul at Dakar, reported, January 25th, 1904, that the authorization of the railway had taken place, but the War Office Intelligence Department reported that authority had been received on November 16th, 1903.

The line was surveyed in 1899 by Commandant Houdaille who is also to take charge of the work.

59. It is interesting to note that ‘To escape certain inconveniences met with in Dahomey, the Colony is constructing this line departmentally, both superstructure and infrastructure. The superstructure will follow close upon the earthworks. The railway will be used to carry the material forward.’

60. The difficulties of the line are stated to be intermediary between those encountered upon the Dahomey Railway and those upon the Guinea Railway.

The minimum curve has a radius of 100 metres and the maximum gradient will be 15 per 1,000 or 1 in 70. The highest bank will be 5 metres and the deepest cutting 2½ metres.

61. There are no great works such as there are on the Dahomey Railway. The largest bridge over the Bete has a span of 10 or 12 metres only, the bridge over the N’Zi a span of 80 to 100 metres, and the River Agneby a span of 40 metres.

62. The cost for the 49 miles from Abidjan to Ery Macougié is estimated at £247,000 (£5,050 per mile); to this a sum of £28,000 must be added, the estimated cost for cutting a canal through to the sea.

The canal is to be cut from the ocean to the Grand Bassam lagoon, 7 metres deep, admitting ships of 6 metres draft.

The cost beyond Tranou may be somewhat less, namely, 75,000 francs per kilometre (£4,800 per mile).

The sum of £400,000 has been allotted to the Colony for railway construction from the Imperial loan of 65,000,000 francs.

63. Operations may be taken to have commenced about February, 1904.

### Congo Free State Railways

#### Matadi-Leopoldville Railway

64. The Matadi to Leopoldville Railway commences at Matadi and has a gauge of 0.75 metres (29½ inches); it terminates at Leopoldville, having a total length of 400 kilometres (250 miles).

The line traverses a rough country which presents some difficulties and requires the construction of numerous bridges and extensive earthworks.

65. The construction of the railway was commenced at the beginning of 1891 and was completed as far as Stanley Pool in 1898. The staff employed in the construction of the line included from 200 to 250 Europeans.
66. The rails weighing 21.5 kilogrammes (47 lbs.) were laid on steel sleepers having a length of 1½ metres and weighing 71½ lbs. each. The steepest gradient encountered is 1 in 25, and the sharpest curve has a radius of 60 metres.

67. The locomotives have been specially designed for this railway and the wagons are mostly of 10 tons capacity.

68. The survey was commenced in 1887 and was completed in 1898.

69. The cost of the whole work is stated to have been 65 million francs, which is equal to £10,400 per mile.

Railways in Mayumbe.

70. The line from Boma is a single line of .60 metre (about 2 feet) gauge.

71. It was commenced in October, 1898, and by December, 1901, had progressed as far as the Lukula River, a distance of 80 kilometres (50 miles).

72. The rails weighing 18 kilogrammes (40 lbs.) per metre are laid on steel sleepers 1.25 metres in length and weighing 18.341 kilogrammes (about 40½ lbs.).

73. The locomotives weigh from 10 to 12 tons, and the goods wagons are designed to carry a load of 5 tons each.

    The speed of the trains is about 20 kilometres (12 1/2 miles) an hour.
    All bridges are made of wood.

Details of French Imperial Loan to West Africa.

74. From the report presented to the ‘Chambre des Députés,’ No. 848, dated 28th March, 1903, by M. Lucien Hubert on behalf of the Commission of Foreign Affairs appointed to examine the Bill authorising the Government-General of French West Africa to raise a loan of francs 65,000,000 for works of public utility and general interest, we learn that funds for the prosecution of the French West African Railways now in hand will be largely derived from this loan, of which the details are as follows:–

    Amount, 65,000,000 francs.
    Rate of interest, 3½ per cent.
    Redeemable, 50 years.
    Francs.

1. Sanitary works 5,450,000
2. Harbours 12,600,000
3. Railways:–
   (a) Survey of railway joining Kayes to Dakar-St. Louis Railway and improvement of Rivers Niger and Senegal 5,500,000
   (b) Konakry-Niger Railway 17,000,000
   (c) Port and railway on Ivory Coast 10,000,000
4. Repayment of remainder of loans of 8,000,000 and 4,000,000 contracted by Colony of French Guinea in 1899 and 1901 for the railway 11,648,053

5. Repayment of remainder of loan of 5,000,000 contracted by Senegal in 1892 2,654,662

Sundries 147,285
Total Francs 65,000,000

The loan is guaranteed by the French Government. All materials are to be of French origin and imported under the French flag.

**Rates of Progress.**

75. The rate of progress of the French and other West African Railways is shown in Diagram I, while for the sake of comparison the rate of progress of the British West African Railways is also given in Diagram II.

The progress is naturally somewhat irregular in each case owing to interruptions and unforeseen contingencies and is best studied in detail upon the diagrams. In Diagram I, the progress is shown as given in various reports and is not in close detail, but in Diagram II, the actual position of railhead month by month is shown. /

To make a general comparison the following table* is of interest.

<table>

* Colonial Office Note. – This table cannot be regarded as affording a fair comparison of the cost of construction of the British and Foreign railways. It is pointed out in previous notes that the figures given for the French lines represent, to a very large extent, interest on capital and deficits in working. The Sierra Leone railway is of only 2 ft. 6 in. gauge. As regards the Lagos railway, the total capital expenditure, including all buildings and equipment, is estimated on completion to reach about £1,085,000, or £8,680 a mile; but it is not clear whether such complete expenditure is included in the lower figures given for the French railways. /
Conclusion.

77. To summarize this report it may be stated that the St. Louis-Dakar Railway has been long completed; the Kayes-Niger Railway is now being pushed forward with activity and will shortly be completed to the Niger, while it is proposed to overcome the difficulty of navigating the Senegal River by connecting Kayes with the St. Louis-Dakar Railway. In French Guinea the Konakry Railway has been completed for 93 miles and is being rapidly pushed forward towards Couroussa on the Niger. The Ivory Coast Railway is now being started. The Dahomey Railway is finished for 55 miles and is being energetically pushed forward to Tchaourou, while it is obviously the intention of the French to extend it as soon as possible to Say on the Niger River.

78. In the aggregate the French Railways actually completed already exceed in length the British constructed lines, while the work now in hand entirely dwarfs the British West African Railways which have come to a temporary standstill. The railway schemes in French West Africa are naturally of a more ambitious nature than in the British Colonies on account of the greater area of territory belonging to France.

79. The British and French railways, constructed and in course of construction, are clearly shown on the map* accompanying this report.

80. With regard to the speed of construction it is clear that so far the French have not reached the rate of progress of the British railways† in spite of the reports to the contrary. The public often appear to be misled by the length of work in hand and to confuse this with the length of railway actually completed. For instance, in the case of the Dahomey Railway, where the earthworks are constructed by the Colony far in advance of the construction of the bridges, permanent way, stations, &c., the whole length up to the clearing and earthwork gangs is often spoken of as if actually carrying traffic.

81. With regard to cost of construction it will be seen that the British railways compare‡ favourably with the French, although it is true that the Gold Coast Railway has cost rather more than any other. Upon this, however, very special difficulties were encountered, and on the other hand the Sierra Leone Railway has cost less than any other railway upon the Coast. Here again the public is often misled, particularly in the case of the Dahomey Railway, where the substructure of the railway is being constructed at the cost of the Colony for some £4,200 a mile. The fact that the Railway Company is left to supply all that

* Not reproduced.
† Colonial Office Note. – See previous note on page 24.
‡ Colonial Office Note. – See previous note on page 24. On a fair view it would seem probable that the construction of the British railways has been distinctly more expensive than that of the French.
appertains to a railway at its own expense is ignored, as well as the fact that the Colony pays to the Company a subsidy, gives an enormous land grant, or compensation in lieu thereof, and does not own the railway until 75 years hence. The Company and not the Colony owns the railway and controls the rates.

82. As regards methods of securing the construction of railways, the French Government have had a bitter experience of granting a railway concession in the case of the St. Louis-Dakar Railway. They have also upon Government lines had unfortunate experiences of contractors as, for instance, upon the Konakry-Niger Railway where the contract system collapsed and was replaced by the ‘departmental system.’ The peculiar method adopted in Dahomey whereby the Colony constructs the substructure of the railway itself and leaves the Company to supply the superstructure appears to have been unsatisfactory, many questions having arisen between the concessionaire and the Government.

83. It may be assumed that the experience of the French Government in constructing railways in West Africa is embodied in the decision to construct the new Ivory Coast Railway upon the ‘departmental system’ which appears to be practically the same as that adopted by the British Colonies.

No. 4.

FOREIGN OFFICE to COLONIAL OFFICE.

(Received August 13, 1904.)

Sir, Foreign Office, August 12, 1904.

I am directed by the Secretary of State for Foreign Affairs to transmit to you, to be laid before the Secretary of State for the Colonies, the accompanying copy of a despatch from His Majesty’s Consul at Dakar, transmitting a report on the Senegal-Niger Railway.

I am, &c.,

F.H. VILLIERS.

Enclosure in No. 4.

Captain C.F. CROMIE to the MARQUESS OF LANSOWNE.

(No. 13. Africa.)

Dakar, June 9, 1904.

My Lord,

I have the honour to transmit herewith to Your Lordship a report on the Senegal-Niger Railway.
I have, &c.,
C.F. Cromie,
Captain.

The Most Honourable
The Marquess of Lansdowne, K.G.,
&c., &c., &c.

As far back as August 7th, 1863, General Faidherbe, then Governor of Senegal, indicated that the junction of the Upper Senegal and Upper Niger was necessary for the development of French influence and commerce in Africa. In September, 1879, Admiral Jauréguiberry, Minister of Marine and Colonies, proposed to the Chamber the ways and means necessary to carry out this junction. In 1880 Admiral Cloué, who succeed him, demanded a credit of 8,552,751 francs for the construction of a railway between Médine, on the Upper Senegal, and Bafoulabé, a distance of about 136 kilometres (85 miles).*

Work was begun in December, 1881, Colonel Borgnis-Desbordes being charged with the direction of the railway in addition to that of the military works and operations. M. Amandeau was the engineer in charge, but soon fell ill and went home. He was succeeded by M. Jacquies in 1882–83.

At this time there were employed on the works 52 Europeans, 35 Chinese, 37 natives and 607 Moors, with the result that 17 kilometres (10½ miles) were laid at a cost of 156,000 francs per kilometre.

In July–August, 1883, 4,677,014 francs were voted by the Chamber, and in March, 1884, 3,300,000 francs more.

By the end of 1884 the line had been laid to kilometre 53; by 1886 to kilometre 60, and at last, in 1888, to Bafoulabe, kilometre 132 (82½ miles).

This line was extremely badly laid, the gradients were too steep and the curves too sharp. Wooden sleepers were employed, which were eaten by the white ants; the line was not ballasted; and there were no culverts to let off the water. There was no regular train service, trains being made up as required, and generally broke down before reaching their destination. In 1888, Colonel Archinard handed the line over to the military authorities, and it was entrusted to the Marine Artillery under Captain Klobb, by whom many improvements were effected.

In 1892 it was transferred from the Artillery to a detachment of the 5th Engineer (Railway) Regiment. Colonel Joffres, of that corps, became Director, and it is only since that date that serious work has been done. The line Kayes-Bafoulabé was practically reconstructed, and continued in the direction of Bamako.

* 1 kilometre to equal 5 furlongs.
The present Director, Colonel Rougier, of the Engineers, took charge in 1895, and the successful completion of the railway is in a great measure due to his energy and knowledge.

In November, 1903, the line was open for traffic as far as Tabaco Station, 359 kilometres (224 miles), and the first trains entered Bamako, 496 kilometres (310 miles), in May, 1904. The terminus at Koulikoro, 559 kilometres (350 miles), will probably be reached before October, 1904.

The progress was greatly delayed in 1902 owing to failure of water in the river Senegal, so that none of the materials could be brought up to Kayes, but remained on the quays at Dakar, Gorée and St. Louis until they could be brought up in 1903.

It was found necessary to prolong the line from Bamako to Koulikoro, about 63 kilometres (40 miles), owing to the fact that the Niger is not commercially navigable between those points as there is a rocky barrier forming a difficult rapid at Sotuba, 8 kilometres (5 miles) below Bamako. Koulikoro, therefore, is the head of the navigation of the Niger and the headquarters of the flotilla.

The Senegal-Niger Railway, whose object is to join those two great rivers, has its terminus on the river Senegal at Kayes, 556 miles from St. Louis, and will reach the river Niger at a point between 3 and 4 kilometres above Koulikoro, a small town 63 kilometres below Bamako, which was originally designated as the Niger terminus.

Both the Senegal and the Niger termini have been imposed by nature, Kayes is the highest point on the river Senegal which it is possible for steamers to reach, as just above it the river is barred by rocks. Similarly, it was found impossible to employ Bamako as the terminus, although this place, being a natural market and the point where several trade routes converge, was otherwise the most advantageous. Unfortunately, however, 8 kilometres below Bamako is a great rocky barrier, known as the Sotuba rapids, which completely blocks the navigation for all except native canoes. It was considered better, therefore, to continue the railway to near Koulikoro, from which place the navigation of the river Niger is absolutely uninterrupted as far as Ansongo, 605 kilometres (372 miles) below Timbuctoo, itself 950 kilometres (594 miles) from Koulikoro, making 1,555 kilometres (966 miles) of uninterrupted navigation from the railway terminus.

Above Bamako the river Niger is navigable most of the year as far as Kouroussa, 380 kilometres (237 miles), which is to be the terminus of the Conakry-Niger Railway (vide my report*). When, therefore, these two railways, the Senegal-Niger and the / Conakry-Niger are completed there will be uninterrupted communication by rail and river from Dakar, the port of Senegal now

* See p. 7.
being developed, and the Soudan on one side, and the port of Conakry, in French Guinea, on the other.

The weak point of this line of communication is the river Senegal, which is only navigable for large ships during the whole year as far as Podor, and as far as Kayes during July, August and September. In October and November river steamers can generally go to Kayes and Bakel. The rest of the year navigation is conducted by lighters, a very slow and expensive process.

To remedy this inconvenience a mission has lately been studying on the ground the trace of a new railway, which, starting from the Thiés Station of the Dakar-St. Louis Railway, is to rejoin Kayes, thus doing away with the necessity of employing the river Senegal. This line, which would be about 750 kilometres, or 470 miles, in length, would ensure through communication between the port of Dakar and Koulikoro, on the river Niger. It is becoming more and more evident that, no matter what steps are taken to improve its navigation, the river Senegal will never be really reliable except during three months in the year.

The mission under Colonel Rougier, which in 1903 studied the trace of the proposed Thiés-Kayes Railway, found that it presented no difficulties of any kind, the greater portion of the country to be traversed being so flat that there is little to do beyond placing and ballasting the rails. There is only one bridge of any importance required, that over the river Falémé, not far from Kayes. The estimated cost is about 70 million francs (£2,800,000). It is proposed, and, I believe, practically decided to construct this line in the following manner:
The Senegal-Niger Railway, in 1903, made a profit of a little over 1,000,000 francs (£40,000). The proposal is to take one million as the average yearly profit, and on that as security to borrow 20,000,000 francs (£800,000). The line would then be begun simultaneously from Thiés and from Kayes. From Thiés a section about 250 kilometres (156 miles) in length would be built, passing through a country which exactly resembles the Coyor, where are grown the ground-nuts which have proved so profitable to the Dakar-St. Louis Railway, and which constitute the sole riches of Senegal. The population is the same, and it is confidently expected that, as in the case of the Dakar-St. Louis Railway, the people will begin to cultivate ground-nuts as soon as the rail affords the means of transport. If this expectation is realized, the first section will soon begin to pay. (In the case of the Dakar-St. Louis Railway the freight on ground nuts pays the whole of the working expenses, everything else being profit.)

At the same time a section about 75 miles in length would be built from Kayes to Bakel, which is open to navigation much longer than Kayes. It is expected that this section also would soon begin to pay. If these expectations are realized a further loan would be raised on the security of the profits of the section already in operation with which to complete the line.

As it stands the plan is to make the Senegal-Niger Railway pay for the beginning of the Thiés-Kayes Railway, which would then pay for its own completion.

It is to be noted that if the Thiés-Kayes Railway is constructed it will practically be the death blow to St. Louis, as, except during the three or four months of high water, nearly everything will pass by the railway, more especially as the Senegal river has a most difficult bar, whereas the fine harbour of Dakar is close at hand, and will be in direct railway communication with Kayes and Bamako.

From Kayes the line follows the valley of the river Senegal, and at once rises to the plateau above it. The valley is from 5 to 6 miles wide, fairly flat and covered with small trees, scrub and Guinea grass. The height and density of the grass makes passage through it difficult, so as soon as it is dry enough the natives are accustomed to burn it, when circulation is easy. The numerous small streams which feed the main river form a considerable obstacle. In the dry season, however, they dry up. The valley is bounded on either side by low hills, 500 to 600 feet high, forming an escarpment to a plateau which extends beyond them, with, as a rule, small parallel chains of hills divided by fertile and well-cultivated valleys. Most of the villages are to be found in these valleys. The formation is hard sandstone. Near kilometre 52 the hills have at some time been exposed to a tremendous erosion, as they become quite precipitous, with evident signs of water action. Here and there are isolated knolls, varying in size from 100 yards to a mile in length. They rise abruptly from the plain like the ‘droogs’ of Mysore. The upper part is quite precipitous, and even overhanging, the lowest consists of slopes formed by detritus which has fallen from above.

Nature of country traversed by Senegal-Niger Railway.
From the Senegal valley the line passes to that of the Bakhoy, which is similar in character to that of the Senegal. In neither case does the line pass very near the rivers, which are hardly ever in view. The country gradually becomes flatter, and the hills recede until just before Toukhorto the line crosses the Bakhoy (here divided into two arms by an island), by a long bridge. Nearing Kita the hills again approach the line, the town being situated close to the foot of a small mountain.

As far as the divide between the water-sheds of the Senegal system and the Niger, which is between the villages of Dio and Diago, the country remains the same – flat country traversed by numerous watercourses thickly clothed with Guinea grass, with trees 12 to 20 feet in height fairly close together, but not sufficiently to form an obstacle. After crossing the divide the difference is at once noticeable. The country, which is a high plateau, becomes more open, the Guinea grass less dense and less high, with many low shrubs scattered about, with real forest trees sufficiently close together to give a park-like effect. The vegetation has nothing African in character; many places might be in Europe. It is only in the actual beds of some of the watercourses that bamboos and dwarf palms appear. The villages also change their character. On the Senegal side they are composed of round thatched huts, frequently without an encircling wall; on the Niger side they are composed of square mud huts, running the one into the other, and thus forming a narrow street. The roofs are flat, and the village is always surrounded by a thick mud wall, with one or more narrow entrances.

At Kati the real descent into the Niger begins, but the railway has to traverse a high col (col de Nere) by means of a cutting about 450 yards long and some 30 feet deep. A long embankment at either end leads to the cutting. The line then follows the narrow and picturesque valley of the Farako until it debouches on the flat / cultivated plain of the Niger some 5 miles above Bamako. From this point the line follows the plain to its terminus at Koulikoro.

On the whole, with the exception of the numerous watercourses necessitating a great number of bridges, and the two cuttings of the Manambougou and Kati, the line passes through easy country. For the greater part of its length the only work necessary was clearing, levelling and ballasting. The result was attained by systematically following the river valleys, and the two cuttings just mentioned were unavoidable as being the only means of passing from one valley into another.

**Description of Railway.**

A single line of 1-metre gauge.

Rails. – Vignolles type; 6 metres long, 20 kilos. to the metre run.

Sleepers. – Steel, 33 kilos, in weight. Shape, construction, price and method of fixing rail to sleepers described in annexed official specification, with illustrations.*

* Not reproduced.
Points. – Hand, actuated by a counterweight.
When completed the line will be 559 kilometres, or 350 miles, in length, from Kayes to Koulikoro.

In October, 1903, the line was completed and open to traffic as far as Tabaco Station, 359 kilometres, about 225 miles. In May, 1904, it was completed to Bamako.

There is also a short branch line to Médine, 4 kilometres in length, which joins the main line 6 kilometres from Kayes.

In addition to the actual platform, which is 10 metres wide, the land for 50 metres on each side has been conceded to the railway throughout the whole of its length.

All materials must be purchased in France.

There are four classes of passenger carriages. 4th class consists merely of the open platform, where the natives sit on the top of their luggage. 3rd class are open at the sides, with wooden seats and curtains which can be let down to keep out the sun. 1st and 2nd are excellent corridor carriages with lavatory, the only difference being the upholstery, which is leather for the 2nd class.

The principle of construction adopted was what is known as the telescopic, the rails being pushed on behind the earthworks and masonry. At first a distance was adopted of 10 kilometres between the earthworks and advanced permanent way; this was found too near so 40 kilometres was subsequently adopted. In 1902, however, the system had to be abandoned altogether as, in consequence of the failure of water in the river Senegal, none of the material for the year could be brought up, but was left lying on the quays of Dakar and St. Louis, and was only brought up during the season of 1903. So as not to be obliged to stop work altogether the whole strength of the work was directed to pushing on the platform, with the result that when, in 1903, the material began to come up, the earthwork was finished to Koulikoro, and a great portion of the masonry.

The total length will be 559 kilometres, in addition to a small branch 4 kilometres long, which serves Médine.

The line will be open for traffic to the terminus at Koulikoro by the end of 1904.

Before commencing construction it was laid down as a principle that no gradients should exceed 25 m.m., and that no curve should have less than 300 metres radius, and this has been strictly adhered to.

Ballast is plentiful and good, and is laid to a depth of 40 centimetres.

The line is now being laid at the rate of 500 metres a day, work being so arranged by the Director that the materials in hand shall be exactly finished by the time the next year’s supply begins to be received at the high water of the river Senegal. By this arrangement no time is wasted, and there is less chance of the workmen having to wait in idleness for want of material.
The line is excellently and solidly laid, the bridges, culverts, &c., are well made and the trains run very smoothly. The worst part is the portion taken over from the old enterprise, which used to go from Médine to Bafoulabé. Although this portion has been greatly improved it is still rather unsatisfactory, and it is intended to entirely relay it, but not until the completion of the railway to Koulikoro.

Are very numerous owing to the quantity of small streams which have to be crossed.

The three longest are:
- Over the river Bafing at Mahina, 400 metres.
- Over the river Bakhoy at Toukhoto, 350 metres.
- Over the river Baoulé at Baoulé, 100 metres.

The smaller bridges are of 25, 20, 15, 10, 6, 5 and 4 metres.

They are all iron-girder bridges on masonry piers, and are, of course, imported from France.

Not very numerous considering the length of the line. There are two cuttings; the first at Manambougou, between Toukhoto and Kita, which is about 30 feet deep in hard sandstone rock, and about 800 metres long, the second at Kati, 440 yards long by about 35 feet deep in the centre. [...] There are no embankments exceeding 24 feet in height, and there are but few of these.

The important stations: Kita, Mahina, Toukhoto, Bamako and Koulikoro are one-storied buildings with an iron framework filled in with masonry. Four rooms below and four above. If one building is not sufficient for the purposes of the station extra ones can be erected; for instance, at Toukhoto there are four, one as station, one residence for employés, one as hotel and one as railway refreshment rooms.

Small stations are two square brick huts joined by a verandah, the whole roofed with thatch.

Kayes station is a heavy masonry building, and is a relic of the former enterprise. It will probably be changed.

There are repairing shops at Kayes, with iron and woodworking shops with modern machinery worked by steam.

At Toukhoto shops are in course of construction. A certain amount of work is being done there now, and when all the buildings are finished this will become the principal workshop of the railway. All the buildings are of stone or brick roofed with tiles. The bricks and tiles are made at Mahina. Later on, when the line is finished, there will also be a small repairing shop at Koulikoro.

At Toukhoto is situated the oil factory, where the oil for greasing the wheels is made from ground-nuts. The press is made by Messrs. Greenwood and Batley, Leeds. The oil costs 80 to 85 centimes a litre, the refuse being used to fire the engine which drives the press. 5,000 litres a month are used. At Toukhoto there
is also an ice machine, which supplies the employés of the railway with ice. It is made by / Douane, of Paris, and the system is the expansion of chloride of methyl. It is worked by the same engine as the machines in the workshops. The ice is very good and clear, and does not melt very rapidly.

At several points on the line where calcareous rock has been found, Fouti, Dinguirah, Toukhoto and kilometres 221 and 225, lime-burning plants have been erected, and all the lime necessary for the masonry work of the railway is now made locally. Formerly, most of it was imported at great expense.

At each station there is a double line for crossing purposes, and sidings at Kayes, Mahina, Kita, Toukhoto, as required for commercial purposes. At Kayes there are two combined end- and side-locking docks, but, generally speaking, at present there are neither station platform nor loading docks.

Water is plentiful, and is found everywhere, both for watering and for drinking purposes. It is always advisable, however, to filter or boil the water for drinking.

There are watering facilities at every station. There are three types of watering appliances: (1) For small station – a hand-pump with a stand-pipe by the line. This gives 150 litres per hour; (2) For medium stations – steam-pump, giving 4,000 to 5,000 litres per hour, which fill large elevated iron cisterns; (3) For large stations – steam-pumps, giving 4,000 litres per hour, which fill large elevated iron cisterns.

*Vide* annex, and illustrations Nos. 6 and 7.

Construction. Workmen. As the natives of the country were not prepared to work of their own accord, recourse had to be had to what really amounts to forced labour. The number of workmen required are recruited by the Civil Administration, each district having to supply a given number of men. They are enlisted for one year, during which time they are fed and paid. The rate of pay is from 60 centimes to 1 franc a day, and the ration {½ kilo rice or 1 kilo, millet,} 30 grammes mutton, 15 grammes salt.

After the expiration of their year the men are at liberty to return to their districts, and many do so, but, on the other hand many having got used to the work remain voluntarily. For instance, in October, 1903, of 5,000 workmen employed 3,000 are old hands who have remained voluntarily after finishing their year.

After the capture of Samory, 500 of his Sofas (or soldiers) who had been taken prisoners were sent to work on the railway. The Administration found them, as a rule, more intelligent than the Bambaras, and most of them have become useful artisans, masons, &c. These men, although long since released as prisoners, have all remained on the railway of their own accord. There are many Senegalese employed as artisans; they receive from 4 to 6 francs a day. Non-commissioned officers and sappers receive francs 2.50 a day working pay, in addition
to their ordinary pay. There are some civil European employés who receive 6,000 francs a year.

All engine-drivers and firemen are natives, either Senegalese or Bambaras, and have proved, as on all the other French West African railways, quite satisfactory. The highest wages paid to an engine-driver is francs 240 a month.

The superintendent of the engine-shed is a European, and inspects every engine before it goes out. He also superintends cleaning and repairs.

At important stations the station-master is a non-commissioned officer or sapper of Engineers; at small stations natives are employed. As they must have a knowledge of telegraphy a good many come from the schools of the White Fathers.

At present, October, 1903, the actual personnel of the Soudan Railway is as follows:

- **Director** – Colonel Rougier, Engineers.
- **Traffic Manager and Traction** – 1 Captain and 1 Lieutenant.
- **Permanent Way and Buildings** – 1 Captain, 1 Lieutenant.
- **Construction** – 1 Major, 1 Captain, 1 Lieutenant (this is only until construction is finished, say, 1906).
- **Accountant for Finance** – 1 Engineer Paymaster.
- **Accountant for Material** – 1 Engineer Paymaster.
- **120 non-commissioned officers and sappers.**
- **5,000 native workmen, &c.**

This service is not only responsible for the upkeep of the permanent way, but also undertakes the manufacture of lime, bricks, tiles, ice and oil.

The service is divided into sections and districts. A district comprises usually about 20 kilometres, or from one station to another, and is commanded by a corporal or sapper. They have a gang of from 20 to 25 natives, under a native ganger.

A section is formed by grouping several districts under a sergeant or superior non-commissioned officer. Every morning the district chief must have gone over the whole of his district before the passage of the first train. As a rule he travels by trolley pushed by natives.

On the whole, especially considering the fact that much of their work compels them to be out of doors during the hot part of the day, the health of the European personnel is fairly good. An average of about 10 per cent, are usually in hospital, but, as a rule, only with simple malarial fever without pernicious complications. Deaths are comparatively few, and as the line approaches completion the personnel will have more indoor work and be less exposed during the day. All are provided with mosquito nets and are encouraged to take preventive quinine. The country traversed is comparatively healthy, Kayes itself being the most unhealthy point owing to the existence of marshes in close proximity to the town. These are, however, being gradually filled up, and the head offices of
the railway are now established on the plateau above the town, where the climate is much better.

There is a well-organised medical service, and the doctors are posted at convenient points along the line, such as Kayes, Toukhoto and at rail-head.

It is almost impossible to calculate what was the cost of the first 109 kilometres. Large sums of money were voted ostensibly for the railway, but there is every reason to believe that much of this money was not used for that purpose. The period of conquest was in full swing and the officers commanding in the Soudan often found their military operations hampered by want of funds. Under the circumstances they did not hesitate to apply the money voted for the railway towards the really more important purpose of conquest.

From the 109 kilometre, however, to the end of the line at kilometre 559 or 450 kilometre, there will have been expended the sum of 30,000,000 francs, that is at the rate of 66,000 francs per kilometre. Of this amount 26,000 francs per kilometre has been expended locally, and 40,000 francs on material imported from France.

There is no telephone or special signalling system.

A telegraph line follows the railway, and there is an apparatus at each station, as a rule worked by the station-master.

At first the telegraph wires were carried on wooden posts and growing trees, where these were found conveniently situated. These have nearly all, however, been replaced by steel posts of two types:–

(a) Round telescopic posts;
(b) Steel girder pattern, four sided. These latter are to supersede the other in time.

There are still some miles of wooden posts towards railhead, but gangs are at work replacing them by girder poles.

There are five wires, three belonging to the railway and two to the civil administration.

The fuel used is coal briquettes or patent fuel. It costs, delivered at the terminus at Kayes, 120 francs a ton.

Three trains a day up and down; of these one is a material train, the other two merchandise.

One passenger train a week leaving Kayes on Thursdays.

One extra one on Mondays if passengers offer.

Appended is the time table for October, 1903, with the distances of stations. Those marked* are not opened for traffic yet (October, 1903).
Per Kilometre.

- 1 to 150. 150 to 350. Exceeding 350.

Passengers:–
1st class 0.35 0.28 0.20
2nd class 0.20 0.16 0.12
3rd class 0.12 0.10 0.08
4th class 0.05 0.05 0.05

Goods by passenger train, including passenger’s luggage:–
Per ton of 1,000 kilos 1.30 1.20 1.00

Goods train:–
Per ton:–
1st category 1.20 1.00 0.80
2nd category .80 .68 .40
3rd category .30 .20 .10

N.B. – 1st category includes feathers, ivory, kolas, stuffs; 2nd – gum, coffee, cocoa, karité, wines and spirits, preserves, foodstuffs, machinery, rubber, manufactured materials for construction; 3rd – ground-nuts, rice, maize, bamboos, sweet potatoes, millet, salt, primary building material, coal, &c.

- 1 to 150. 150 to 350. Exceeding 350.

Animals:–
Cattle, horses, mules .30 .25 .20
Donkeys, foals, ostriches .16 .12 .10
Sheep, pigs, dogs, calves .06 .05 .04

There are special reductions for complete truckloads.

Tonnage Carried by the Railway.

Mr. Lyttelton to Governor Egerton (6 January 1905); held at the National Archives, CO 879/76/695.

42513
No. 156.

LAGOS.

Mr. LYTTELTON to GOVERNOR EGERTON.¹

(Confidential.)

Sir,

Downing Street, January 6, 1905.

I have the honour to acknowledge the receipt of your despatches, No. 370A, of the 14th, and confidential, of the 26th of November,* on the subject of the extension of the Lagos Railway to Oshogbo.

2. I gather that the former of these despatches was written chiefly with two objects: (1) to secure the early execution of detailed surveys of the route; and (2) to deprecate the construction of the line by contract. As you have since been informed that the location survey party was despatched early last month, and that the idea of constructing this line by contract has been abandoned, I need not dwell any further on these points. But in both the despatches under acknowledgment you have expressed certain views as to the system on which the line should be constructed, and I have, after consulting the Crown Agents for the Colonies and the consulting Engineers, given careful consideration to those views with the object of ascertaining how far it is possible to give effect to them.

3. I transmit to you a copy of the reply† received from the Crown Agents and the Consulting Engineers to the letter of the 4th of November, enclosed in my confidential despatch to you of that date,‡ and a copy of the further letter§

---

* Nos. 140 and 147.
† No. 149.
‡ No. 128.
§ No. 157.
which I have caused to be addressed to them. You will see that Messrs. Baker and Shelford recommend that the work of construction should not be placed in the hands of the General Manager and the Open Lines Department, but that an independent Resident Engineer should be employed, and that I have acceded to this view. So far, then, the system of construction will remain the same as that on which the existing lines have been built, both in Lagos and in the other West African Colonies. But it has been arranged to take advantage of the presence of the Open Lines Staff by giving them facilities in two ways for advising you on the work while it is in progress. The correspondence between the Resident Engineer and the Consulting Engineers will be passed under flying seal through the General Manager and yourself, and the work will also be subject to personal inspection from time to time by the General Manager and the officers of his department whenever you may think it desirable to order such inspection. You will thus, in exercising the general supervision over construction which previous Governors have exercised, have the benefit of independent advice from your own officers on the spot, who, in addition to possessing general knowledge of railway engineering and administration, will also have had experience and knowledge of local requirements and resources, and who are themselves the men who will afterwards have to work the line.

4. A very important question in connexion with the work will be the division of responsibility between the Resident Engineer and the Consulting Engineers. In the 5th and 8th paragraphs of your confidential despatch of the 26th of November,* you point out very rightly that in a large work of this description the Government ought to have an adviser who is in a position to criticise those who are responsible for the execution of the work, and that, if the Consulting Engineers are so identified with the work done by the Resident Engineer as to be regarded practically as the constructors of the line through a local agent, they cannot be expected to bring to notice errors for which they would themselves be held responsible. It is, therefore, desirable to keep as separate as possible the functions of the consulting and executive officers. The ideal course in order to effect such separation would probably be, that a thoroughly able and reliable Resident Engineer should be appointed to do the work; that he should be given as free a hand as possible, not subject to the detailed control of the Consulting Engineers, but subject only to their guidance in matters specifically referred to them; that the Consulting Engineers should be responsible for the selection both of the Resident Engineer and of the rest of the European staff, for the selection of material upon indents forwarded by the Resident Engineer, and for the advice which they may give to that officer on any technical points referred to them; and that the whole of the residual responsibility for carrying out the wishes and orders of the Government should be centred in the Resident Engineer. Unfortunately, the special circumstances of West Africa render it impossible to carry out such
a system strictly. It would be a matter of very great difficulty to obtain for West Africa the services of a Resident Engineer of such professional standing and so thoroughly competent in every way that the complete confidence involved by this system could be reposed in him; and, quite apart from that difficulty, the frequent changes in the office of the Resident Engineer due to leave, invaliding, and so on, would inevitably lead to great confusion in the work, and would result in the responsibility being so divided between successive Resident Engineers that errors could in few cases be definitely laid to the charge of any officer. The Consulting Engineers for the West African Railways have therefore found it necessary in the past to take a much more active part in the direction of the work of construction than has been usual in other colonial railways. They have given instructions on many points of detail to the local staff, have anticipated by letters of advice the probable difficulties which the Resident Engineer would meet, and have frequently sent out rails and other material (ordered by the Crown Agents on their recommendation in the usual manner) without waiting to receive requisitions from the Colony. The assistance which they have thus given, although on a strict view outside their proper functions as Consulting Engineers, has undoubtedly been of great advantage to the efficiency of the work; but one result of it has unfortunately been a tendency on the part of the public, shared to some extent by the Colonial Governments, to identify them more completely with the work of the local engineers than was really justifiable. It is clear, however, that from this country the Consulting Engineers can effectively exercise only a limited control over the local engineers, and that the detailed execution of the work and a large part of the expenditure incurred are beyond their control. It is, therefore, hardly either practicable or fair to place the whole responsibility upon them; and I have also pointed out to them that the difficulty to which you draw attention, namely, the need of the Government for independent technical advice on the work of the executive officers, is a very real difficulty. It has therefore been arranged that while, for the reasons alluded to above, they will continue to give active assistance in various ways to the local officers, they will emphasize in their instructions to Mr. Bradford, the Resident Engineer, that a wide discretion is to be allowed to him in following their instructions, and they will maintain themselves in a position to give independent criticisms to the Colonial Government and the Secretary of State.

5. Such a relaxation of the hold kept by the Consulting Engineers upon the work might have been attended in the early days of railway construction in West Africa by serious disadvantages, and even by some danger of the work collapsing entirely; but now that the special difficulties of construction due to the nature of the country, the climate, the labour conditions, &c., are better understood, and it is possible to send out an engineer in charge like Mr. Bradford, with long, successful experience of those difficulties, the danger is much reduced, and may be
regarded as outweighed by the advantages of giving a free hand to the Resident Engineer and retaining the Consulting Engineers as independent advisers.

6. It is proposed that as each section of the line to Oshogbo is completed and handed over to the Open Lines Department, it should be inspected and reported upon by an engineer of undoubted competence specially selected for the purpose by the Consulting Engineers and acting under their instructions.

7. The Resident Engineer will, of course, be, as hitherto, a servant of the Colonial Government, subject to any orders which the Governor may give him; but I need hardly point out to you that it is desirable that the Governor should not intervene in his work unless necessary, so as not to impair his responsibility, and that, when the views of the Colonial Government are opposed by him on technical grounds, the advice of the Consulting Engineers should always be obtained before deciding against his opinion.

8. With the experience gained during the construction of the existing lines, it is hoped that it will be possible to exercise a better control over the expenditure on railway construction in future. The salaries of the European staff employed will be regulated by the enclosed correspondence,* and you will see that allowances will be paid on a scheme to be settled by the Resident Engineer, subject to your approval. In this connexion I may observe that although appointments and promotions will usually be made on the recommendation of the Consulting Engineers, it does not appear to me that this fact will disqualify them from reporting on the conduct of the staff any more than the Governor of a Colony is disqualified from reporting upon officers in the ordinary service of the Colony. Moreover, the Crown Agents could not select the staff without professional advice, and the delay and difficulty which would be inevitable if an attempt such as you suggest were made to get a continuous supply of men from India renders any such course impracticable.

9. Native labour will be engaged with the co-operation of the Open Lines Department, so that the wages paid may not be unnecessarily high; and I trust that this co-operation will be cordially extended to other branches of the work. The whole of the local construction accounts will be audited by the Chief Accountant of the Open Lines, acting (with the assistance of his department) as a local auditor under the instructions of the Comptroller and Auditor General. I attach much importance to the prompt examination of the accounts by the Accounts Department of the Open Lines as a means of checking expenditure, and instructions should therefore be given to the Resident Engineer to see that the accounts are kept up to date and always available for audit. It must be clearly understood that it will be the duty of the Chief Accountant as auditor to watch the rates paid for contracts, labour, &c., as well as the correctness of the

* Nos. 145, 150, and 152.
accounts, and to see that a proper system is maintained of supporting expenditure by receipts, vouchers, and other documents.

10. Mr. Butler Wright, in his minute of which a copy is enclosed in your despatch, No. 370A, of the 14th of November,* points out that in the construction of the present line detailed returns of the cost of each item of the work have not been kept. The Consulting Engineers, with whom the matter has been discussed, have explained that this system involves a great deal of labour and expense, is cumbersome and unreliable when used, and has been deliberately avoided hitherto in West Africa. They state that comparison of cost with the estimate is obtained more simply by the method adopted of monthly summaries of cost compared with the estimate under each head of the estimate, together with the monthly report of the work done. It is, however, quite open to you to ask the Resident Engineer for such returns as you desire, so that you may judge the work in the way you wish; and the scheme of organisation arranged by the Consulting Engineers, under which each department of construction will be open to the inspection of the corresponding department of the Open Lines, will help you to obtain the information which you may require.

11. With regard to your proposals for carrying out the location survey for the line, either in ten-mile sections or over the whole distance, and obtaining the approval of yourself and the Secretary of State before the commencement of any construction work, it is estimated by the Consulting Engineers that these proposals, if adopted in full, would involve a delay of eighteen months to two years in the completion of the railway, which at the present stage it would not, in my opinion, be desirable to incur; and the survey of one or more alternative routes before commencing construction, while it is very desirable in itself, would also be impracticable without indefinitely prolonging the construction of the railway. The Consulting Engineers agree, however, that it will be advantageous to push on the survey of the extension as far as possible ahead of construction, and they will arrange that, except in the case of the first few miles of this extension, plans and sections should be sent home to them for approval or criticisms before construction is commenced. You will be able to see these plans and sections on their way home, and will have an opportunity of making any remarks upon them and of acquiring any information which you may desire. The Consulting Engineers are, however, confident that any serious errors in survey or alignment are unlikely to occur while Mr. Bradford is the Resident Engineer, as he is an expert at this class of work.

12. The remarks which you make as to the general location and grading of the line, the employment of engineers of tropical experience, the giving out of small contracts to local native contractors, and so on, have been communicated

* No. 140.
to the Consulting Engineers, and you will no doubt discuss your views with Mr. Bradford on his arrival in Lagos. I will only touch here on the question of curves and gradients, as to which I invite your reference to the 7th paragraph of my despatch* of the 5th of December last, in which the general history of railway construction in West Africa was reviewed. You will see from that despatch that certain maximum curvatures and gradients were adopted on the basis that it was only necessary to provide in West Africa for an average speed of 15 miles an hour.

13. It is not clear to me why you do not think it possible that an expenditure in excess of £75,000 can be economically incurred on the Oshogbo extension during the year 1905–6. It is certainly not necessary in this case, as it was in that of the Gold Coast Railway, to push on the lines with the utmost possible speed and to sacrifice economy and other considerations to rapidity of construction; but, on the other hand, it is obvious that when a highly-paid staff of engineers is employed on a work, it is a waste of expenditure to let the work proceed so slowly that they are not fully employed. There is, in fact, an ‘economical speed’ of construction lying between the two extremes, and this is the speed at which the work should, as far as practicable, be carried out.

I have, &c.,

ALFRED LYTTELTON.

* No. 2 in [Cd. 2325]
MEMORANDUM BY MR. CHURCHILL ON RAILWAY CONSTRUCTION IN NIGERIA.*

I.

The Secretary of State recognises in principle the need and advantage of –

(a) a 3-feet 6-inches line from Lagos to Ibadan and on through Oshogbo and Ilorin to Jebba. This line is already constructed to Ibadan and is in process of extension to Oshogbo. The necessary funds to be raised by Southern Nigeria upon its own credit; and

(b) provided that Sir F. Lugard is able to establish his estimate of £2,000 per mile, a 2-feet 6-inches line from Baro to Bida, Zungeru, Zaria, and Kano, to include the 21 1/2 miles of tramway already constructed near Wushishi; the cost to be met out of Imperial funds.

The first is a railway trunk line, permanent and commercial;

The second is a tramway for strategic, administrative, and development purposes.

II.

These two schemes appear discordant, and are admittedly for the moment disconnected. Northern and Southern Nigeria are for the present to work out their fortunes on separate lines. But no ultimate divergence or separation is intended.

It will be three years before the Lagos line has reached Ilorin and no practical divergence can arise till then; for till the Lagos railway reaches the Niger (at

* This Memorandum (without the addendum) is also printed as African No. 850.
least one year later) no traffic that it could have carried will be diverted down the Niger by the Baro-Bida-Zungeru tramway.

On the other hand, as the Lagos Railway cannot afford any help to Northern Nigeria until it reaches the Niger, no reason exists for forcing Northern Nigeria to arrest its development and suspend its security pending the arrival of the Lagos Railway.

III.

Before the Lagos Railway reaches Ilorin, three years hence, we shall know for certain (1) the commercial value of that road; (2) the amount which it will cost to improve Lagos Harbour so as to admit ocean steamers, as to which definite proposals are now on foot; (3) the best point to cross the Niger; (4) the profit, cost, and practicability of the greater part of the Baro-Kano tramway; (5) whether the commercial advantages of the Jebba-Zungeru route justify the extension forwards of the 3-feet 6-inches Lagos Railway, or only a kick-back of the 2-feet 6-inches tramway.

IV.

More important still, the amalgamation of Northern and Southern Nigeria will probably be an accomplished fact, and all need of deciding between their respective claims, or disputing as to their respective revenues, will be at an end.

V.

The conclusion therefore is, that the extension of the Lagos Railway to Jebba, and the ultimate connection of Jebba with Zungeru, may be sanctioned, and funds may be provided for the work as far as Jebba (including the Niger bridge) forthwith; but that this policy should be reviewed when the railway reaches Ilorin in the light of all the facts referred to in III. and IV., which will be by then established.

VI.

The ground is now clear to consider the Baro-Kano tramway. It is proposed that this should begin at the head of the perennially navigable reaches of the Niger either at Baro or at Lokoja and thus give Northern Nigeria an immediate air-hole / of its own. Its justifications are first strategic and political. So great an extent of country cannot be conveniently held for an indefinite period by a considerable force of drilled troops in garrison unless buckled together by at least one central line of rapid communication. Large military economies and greater security resulting, first, from increased mobility and accessibility enabling fewer troops
to do more work, secondly, from the reduced expense of maintaining and supplying such troops in garrison, thirdly, from the improvement in the conditions of their service (food and housing) and consequently of their health (especially in the case of expensive white officers), are to be counted on. The effective occupation of a territory now precariously and loosely held, and the more complete fulfilment of our responsibilities to the natives over whom we have declared a Protectorate and to the foreign powers with whom we have made boundary conventions, are the political advantages. These are sufficient in themselves to justify a considerable amount of not directly remunerative expenditure; but additional to them is the prospect of the speedier development of local trade on which ultimately the capacity of the country to yield revenue depends.

The construction of the tramway, besides tending actually to increase the volume of production and trade, would have the effect of attracting in the direction of the Niger and the sea the existing trade of the inland Hausa states. The French across the border are eager competitors for this trade, seeking to maintain it in its present channel, through territory controlled by them, across the Sahara as to bring it to the Niger at the point where their own railway from Dahomey will eventually cut that river. A year may be of importance in the race, and a tramway built now may succeed in preserving Northern Nigeria trade which even a trunk line of railway would be unable to recover some years hence. Perhaps even more important is the prospect which the tramway opens up of a large increase in the export of cotton. The British Cotton Growing Association see in Northern Nigeria a most fruitful field for their labours, and are keen advocates of a railway to Kano, not only as facilitating the work which they propose in any case to undertake, but also as enabling them to open up areas of production which otherwise lack of transport would compel them to leave untouched. The prospect in this direction might almost of itself be said to be an adequate inducement to build the line.

VII.

Sir F. Lugard asserts that such a tramway can be constructed at a cost of £2,000 a mile if made departmentally by the Public Works Department of the local Government without constituting a special department for the purpose or employing Consulting Engineers. His figures are challenged by the Consulting Engineers, who point to the estimates made by them after a careful survey of the proposed route by competent engineers. The estimates of the Consulting Engineers, being put forward upon high expert authority, are unassailable by laymen; Sir F. Lugard states that the cost per mile of the Wushishi tramway was only £1,460. The Consulting Engineers contend that this figure is inadequate, because:–
(1.) Services were rendered by various departments of the local Government which have not been debited to the cost of construction and distributed over the mileage.

(2.) The line originally loosely constructed has subsequently been improved and perfected.

(3.) It is a specially easy stretch.

(4.) Even were the figure of £1,460 per mile correct for the Wushishi tramway, it could not serve as an accurate basis for the larger scheme, because the assistance which it has been in the power of the local Government to extend to a construction averaging only ten miles a year would not be sufficient to sustain a construction of 70 or 80 miles a year without definite expansion in the Public Works Department, and increased transport for carriage of materials, each involving a definite increase in expenses.

In regard to the first two points it may be answered that departmental assistance means local economies which are clear gain to the State; and that the interest of every officer and official in the building of the railway and its maintenance, if it were carried on by the local staff, would be the surest device for promoting thrift throughout the Protectorate.

In so far as such assistance can be given without any increase of the existing staff or existing means of transport, it is not fair, in discussing the practical question whether it is worthwhile to build the line, to claim that the line should be debited with the cost of services rendered, however necessary such a course might be from a strict accounting or audit point of view.

In regard to the third point, although the section occupied by the Wushishi tramway is less difficult than the section from Zungeru to Zaria, it is not much, if any, less difficult than the stretch from Baro to Zungeru. The report of the Consulting Engineers on this section says that it is ‘very easy,’ and that ‘a surface line was obtained for 62 per cent of the distance,’ the only heavy work being the crossing of the Bako river, which would be expensive. In reply to the fourth point, the average cost per mile of the proposed line is taken at £2,000 and not at £1,460, thus leaving a margin of £540 per mile to cover any increased cost which the extended scale of construction would involve.

VIII.

The best way of testing Sir F. Lugard’s estimate is, perhaps, as follows. The Crown Agents can give us the actual cost of the materials for the existing Wushishi line, including rails, sleepers, rolling-stock and anything else sent from England, with the cost of freight to the mouth of the Niger. We can also ascertain definitely the amount of salary and the cost of the passages of the one or two men specially engaged for helping in the construction. Sir F. Lugard alone can say how the
balance of his figure of £1,460 a mile for the existing line is made up. He should be asked to do so, showing clearly what was paid for local labour, what, if anything, was paid for transport of materials from the mouth of the Niger in vessels other than those belonging to Government, or by native carriers, and what was expended on materials locally. To make out such a statement he will probably have to refer to the accounts of the Protectorate. His Treasurer is at home on leave, and will no doubt be able to obtain the necessary figures from the accounts rendered to the Comptroller and Auditor-General.

Sir F. Lugard should, if possible, state in addition what officers of the Protectorate Staff, whether of the Public Works, Medical, Transport, or any other Department, assisted in the making of the existing tramway, and whether such assistance took them away from their ordinary duties largely or entirely, or was rendered incidentally. He might be asked, if possible, to put a money value on the services so rendered. It is probable, however, that any figure be could give would be little more than a rough guess.

With this information the Secretary of State will be in a position to form some opinion as to the accuracy of the figure of £1,460 per mile for the existing line.

Taking as a basis whatever figure per mile may have been arrived at by this process, Sir F. Lugard should then explain to what extent the greater scale of the present proposal will affect the cost. He should say whether he is deliberately of the opinion that a line of 400 miles can be built at a greater speed than the existing line of 21 1/2 miles by the existing Protectorate staff without neglecting unduly other works of importance, or whether additional officers will have to be engaged for the construction; and, if so, how many, and at what cost, whether engineers, doctors, or others. He should say also how the greater quantity of materials will affect the Government transport. Will it involve the hire of additional steamers, canoes, or carriers, or the payment of extra freight to the Niger Company?

IX.

If Sir F. Lugard is able to sustain his calculations to the satisfaction of the Secretary of State, the case for construction is established. It is perhaps unlikely that this will be done, and whatever the Secretary of State decides, grave elements of doubt will remain. Even so, assuming that the arguments are nicely balanced, the plan should not be abandoned without actual experiment. In this way only can certainty be achieved. /

Little is risked by having Sir F. Lugard’s figures resolved by practical proof. Some railways are useless till they reach a certain point. The desert railway in the Soudan from Wady Halfa was useless till it struck Abu Hamid and the Nile; the
Simplon tunnel till it was finished; the Uganda railway had a definite objective in the lake. Not so the Baro-Kano tramway. Every mile counts. Every mile constructed saves absolute manual portage of indispensable supplies, and increases military mobility. Therefore all the advantages detailed in paragraph VI, which are to flow from this line will not be withheld till its completion, and are not involved in reaching any particular point, but will be reaped evenly over the whole mileage as, and in proportion as the line is constructed. Therefore in this Baro-Kano tramway, as in the Lagos railway, it is possible to proceed tentatively, and necessary to proceed gradually; and as the first steps are sure in themselves, they will not be useless if unexpected circumstances or further consideration involve arrest or modification of the plan.

X.

Where, then, should construction – either definite construction, in the event of the figures being proved, or experimental construction in the event of doubt remaining – be begun! The section from Baro, or perhaps Lokoja, to Zungeru is the first and the most obvious. It connects immediately with a fairly accessible port on the Niger. It relieves Zungeru of dependence on the uncertain and sometimes useless waterway of the Kaduna, and brings the seat of administration within easier reach of the sea. It taps the district in which the first operations of the British Cotton Growing Association are to be undertaken. It is so situated that construction could be begun from both ends at once, and possibly, if greater speed is practicable and desirable, from some intermediate point also. Perhaps its chief claim is that, even if it starts from Baro, it brings the tramway within a comparatively short distance of Lokoja; and the British Cotton Growing Association in their memorandum for the Prime Minister have pointed out that it would be advisable to extend the railway as soon as possible to some point near Lokoja, or even to commence operations there. Lokoja, situated at the confluence of the Benue and the Niger, seemed destined to be the commercial centre of the Protectorate. It will be a matter of first importance to connect it with any line of railway that is eventually driven through Northern Nigeria, and a moderate extension southwards of the tramway between Baro and Zungeru would effect the connexion at trifling cost, whether the main railway ultimately is the tramway itself or a prolongation of the Lagos-Jebba line. Viewed in this light the tramway between the Niger and Zungeru is the first and larger instalment of a work which will eventually in any case be indispensable.

It should be stipulated that, if the tramway between the Niger and Zungeru is completed before the Lagos Railway reaches Ilorin, about three years hence, no further extension should take place until the Lagos Railway has reached Ilorin and the revision of the general railway policy of Nigeria contemplated...
in paragraph V. above has taken place. Some such arrangement is required to avoid prejudicing the question of the gauge of the trunk line northwards from Zungeru, that being the point at which the 3-feet 6-inches Lagos Railway, if extended into Northern Nigeria, will cut the 2-feet 6-inches tramway.

July 14, 1906. W.S.C.

ADDENDUM.

NOTE BY Sir F. LUGARD UPON PARAGRAPH VIII. OF THE ABOVE MEMORANDUM.

1. The total cost of the tramway, including rolling stock, was £31,505 3s. 5d., viz., £1,432 per mile. I had a detailed statement of how this had been expended, but unfortunately I appear to have left it in Northern Nigeria. I have written to the Comptroller and Auditor-General for the accounts. If not available the question can be asked by telegram, material, local construction, freights (river and sea) (other than Government vessels), and temporary foremen being shown separately. Any local material used (viz., material borrowed from other works), would have been charged to the railway. Since then the following sums have been spent:– Flooring and protecting bridges, estimate £180, actual £137 10s. (I think these were railway bridges only.) Station at Zungeru, estimate £400, actual £395. Saloon carriage, estimate £260 (Crown Agents). Accounts not yet received.

2. The pay of any foreman on temporary agreement, who was employed on the railway, would (like material) necessarily be charged against the railway account. There is no other way of meeting the charge. The salaries of officials on the permanent staff who were employed on the railway are provided under the head ‘Personal Emoluments, Public Works Department,’ and would not be so charged. Had the tramway not been constructed they would have been equally employed in transporting the building material to Zungeru. In fact, a special staff would have to have been engaged. The ordinary duties of the Public Works Department were carried out. They consisted in those two years chiefly of erecting the houses and other essential buildings at Lokoja and Zungeru, and the transport of material from the Kaduna to Zungeru was an integral part of the latter. No medical or other Departmental Officers were especially employed on the railway works. The Marine and Political Officers rendered assistance in river transport, engagement of labour, &c. It is a part of their duties. It would be impossible to put a money value on such services, – they were purely incidental. I rather think that a vessel of the Niger Company was chartered in each of the two years, and charged to the Marine Vote. If so, it should be added to the railway cost. Its inclusion would not greatly add to the cost per mile.
3. Undoubtedly the greater scale of the present proposal and the number of miles it is proposed to construct annually will necessitate a larger temporary staff of foremen, &c., which may add a little to the cost per mile. On the other hand a decrease should be effected by the possibility of ordering considerable consignments at one time, and bringing the material by contract without transhipment direct from Liverpool to Baro. Of course additional men, chiefly foremen, will be engaged for the construction, and their salaries debited to construction – this is provided for the estimate. I cannot say how many, without prior consultation with Mr. Eaglesome, and, indeed, he himself would be guided by the progress of the work, – the supply from England of material, &c. A greater or less number of expert supervisors would make little or no difference provided there was no hitch in the supply of material. The cost per mile would remain the same, the rapidity of construction would be affected. Other works of importance, viz., up to the limit of the sum available in the estimates for expenditure upon them, would certainly not be allowed to suffer.

4. *River transport.* – The chartering of vessels direct from England would greatly reduce river freights. The possibility of this depends upon having plenty of notice to order material, and take advantage of high water. This would effect a great saving. In the estimate for £1,600 per mile, £180 is included for freights.

SOME FEATURES
OF THE
WEST AFRICAN GOVERNMENT RAILWAYS.

BY

FREDERIC SHELFORD, B.Sc., M. Inst. C.E.

[...] By permission of the Council.
Excerpt Minutes of The Institution of Civil Engineers.

[...]
The railway systems which form the subject of this Paper are those of Sierra Leone, the Gold Coast Colony, Northern Nigeria and Southern Nigeria.[...]

Sierra Leone, which, together with the much larger Protectorate in the hinterland, extends over an area of 34,000 square miles, was the first to initiate railway construction in British West Africa. In 1893 the late Mr. (afterwards Sir) Williams Shelford, M. Inst. C.E., dispatched a survey party to examine the country, in order to report to the Crown Agents for the colonies upon the best route for the construction of a railway. Eventually it was decided to build one from Freetown, the capital, to Songo Town; and this line was extended tentatively, section by section, to Rotifunk, Mano, Mattru, Bo, and Baiima, and finally to Pendembu, which is 230 miles from Freetown, and within a few miles of the Liberian frontier. The construction of the first section was begun in 1896, and Baiima was reached in 1904, the work having been impeded by a serious native insurrection towards the end of 1898. The gauge adopted was 2 feet 6 inches. A short mountain railway has also been constructed from Freetown, to enable resi-
dents to sleep at an altitude of 800 feet above the sea, and away from the more unhealthy business centre of the town. This line was completed in 1904. The gauge is the same as the main line, namely, 2 feet 6 inches, but the gradients are as steep as 1 in 22. It is worked adhesively, and used mostly for passenger-traffic. / 

Railway construction upon the Gold Coast was the outcome of the working of the gold mines at Tarkwa, which demanded some means of mechanical transport. Before the advent of the railway the heavy machinery essential to gold-mining could only be conveyed to the mines in sections, at a cost of anything up to £40 per ton. In 1897, therefore, a survey was made from the coast to Tarkwa, a distance of 40 miles, and the then almost unknown place Secondee was selected as the coast terminus. There are no natural harbours on the Gold Coast, and Secondee was really a choice between evils. In 1898 construction was begun. The difficulties encountered were very great: much material was lost in landing at Secondee; the climate was very bad, and rainfall was very heavy; the entire route of the railway was covered by an exceedingly dense tropical forest; the ground was swampy, and ballast was not found in any quantity; while the gold-mining companies were sending up large quantities of machinery and stores to rail-head. Further, there was a formidable rising of the Ashanti tribe in 1901, and the country was generally in a disturbed condition. The gauge adopted was 3 feet 6 inches, with gradients of 1 in 50, compensated, and 5-chain curves, in spite of which the work was fairly heavy.

During 1898 the question arose of extending the Secondee-Tarkwa Railway to Coomassie, or, alternatively, of constructing another line from Accra, the capital of the colony, which is situated about 180 miles east of Secondee. A reconnaissance survey of the Accra-Coomassie line had been made in the year 1897, and the route had been found to be feasible; but nothing whatever was known of the country between Tarkwa and Coomassie, which was entirely covered by dense tropical forest, threaded by a few hunters’ tracks, and it was thought that the Adansi Hills might form an obstruction. In 1899 the Author undertook to go over both routes and compare them, and as the result of his report, it was decided to extend the Secondee – Tarkwa line to Coomassie, this route traversing the whole range of the Tarkwa main reef, and serving, in particular, the extensive concession of the Ashanti Goldfields Corporation and other mining-properties. The railway reached Coomassie in September 1903. Its length is 168 miles. A branch of the main line from Tarkwa to Prestea (20 miles) is now also completed. A railway between Accra and Mangoasi (40 miles), at the eastern end of the colony, was begun, under contract, in 1909, and is now completed. It is proposed to extend this line to Coomassie, a distance of about 100 miles by the eastern route.

Southern Nigeria, which has a large and industrious population and great wealth of natural products, has proved to be one of the / most important of the
Crown Colonies. Extensive reconnaissance surveys for railways to develop the country were made in 1894–5, and comparative estimates of cost and of probable traffic were made for various alternative schemes, upon which a report was made by Mr. William Shelford. As a result, a railway was authorized for 22 miles, from Lagos to Otta. In subsequent years extensions were further authorized from Otta to Abeokuta (with a population of more than 100,000), thence to Ibadan (150,000), thence to Oshogbo, and on to Ilorin, the Niger River, and thence to Zungeru, the capital of Northern Nigeria, about 420 miles from Lagos. At Zungeru the Lagos Railway joins the Northern Nigerian Railway, and as such continues to Zaria and Kano, about 700 miles from Lagos: it has thus become an important trunk line. A peculiarity about it is that it starts from the Island of Iddo, situated on the Lagos Lagoon. A road bridge connects Lagos Island, upon which the town of Lagos stands, with the railway terminus at Iddo. Twin road and railway bridges connect Iddo with the mainland, upon which is the principal railway depot, Ebute Metta. The gauge adopted is 3 feet 6 inches, and originally the gradients were 1 in 50 with 10-chain curves. In the upper section of the line gradients of 1 in 80 with exports, and 1 in 100 against exports, with 15-chain curves, were adopted. The railway reached Otta in 1897, Abeokuta in 1899, and Ibadan in 1900. There was then a pause of 4 years until 1904, when the line was continued from Ibadan, reaching Oshogbo in 1907, Ilorin in 1908, and the Niger River in 1909. The bridge over the Niger River is under construction, and the extension north of the river is approaching completion. The Lagos Railway passes through exceedingly fertile country as far as Oshogbo, and serves the native towns mentioned above and others near the railway route, many of which have populations of 30,000 and upwards.

Northern Nigeria was taken over from the Royal Niger Company on the 1st January, 1900. Its area is about 255,000 square miles, or one-and-a-quarter times that of France. In 1902 a short length of 12 miles of 2-foot 6-inch gauge tramway was laid to connect the site of Zungeru, the capital, with the Kaduna River, and this was extended to 22 miles. It was not, however, until 1907, upon the appointment of Sir Percy Girouard, K.C.M.G., as High Commissioner, that financial arrangements were made whereby money was advanced by Southern Nigeria to enable a railway to be built from Baro, upon the Niger River, to Zungeru, Zaria and Kano. This line is now approaching completion. Numerous surveys have been made from time to time for other lines of railway, but up to the present these have not been authorized.

Before passing to the technical features of the West African Government railways it will be of interest to mention that, since the completion of these railways, the natives, who in some districts were formerly frequently engaged in inter-tribal warfare, have settled down for the most part as peaceful traders or agriculturists, while a certain number of them have learned to fill all subordinate
posts upon the railways, from navvy and ganger to clerk and station-master. The railways have, in fact, brought about the complete pacification of these colonies, previously so subject to disturbance.

The financial benefit to the colonies is best shown by the growth of trade and revenue, which must be attributed to a large extent to the development of the colonies by railways.

* Railway opened 1899.
† Railway opened 1903.

**Surveying.**

The surveying of the railways in West Africa was rendered difficult by the very dense forest which exists from the coast for a distance of about 150 miles towards the interior, covering the whole of the routes of the Sierra Leone and Gold Coast railways, and a part of the Lagos Railway. Northern Nigeria is comparatively open country. /

The height and density of the bush varies, but generally speaking it is rare to obtain a view of a hundred yards. This forest, and the scarcity of paths through it, render it difficult to locate a line, and almost impossible to ascertain whether the line found is the best obtainable, without spending excessive time and money upon the work. The result is that sometimes, after the line has been built and the bush cleared for agriculture or other purposes, it is discovered that certain curves or gradients might have been ameliorated or avoided. In difficult country, under such circumstances, the best line that can be found within reasonable time must be adopted, and deviations, if necessary, left until a later date.

Reconnaissance surveys are particularly difficult in the West African forests. The Author has dealt in a previous Paper† with the subject of railway-surveying in tropical forests, and it is only necessary to add a few remarks from more recent experience. For preliminary traversing the ‘miner’s dial’ has been more appreciated, standing rough usage well, and being more rapid in action than a prismatic compass, although perhaps slightly less accurate. Steel bands instead of

chains have the advantages of not stretching and of not catching in the vegetation. Aneroids\(^1\) are particularly useful in the tropics, as the atmospheric pressure remains remarkably uniform except before and after tornadoes. Tachometers\(^2\) have also proved useful for taking long cross sections, saving the operator from traveling along the cross cut. They are also preferred by some of the engineers for main survey work. In open country, beyond the forest belt, the tacheometer is, of course, invaluable. A theodolite required for astronomical work should have the spirit-level for the vertical are placed upon the frame of the instrument and not upon the are itself. It should also be fitted with diagonal eye-piece and coloured glasses. An artificial horizon should be so made that the mercury very nearly fills the trough, otherwise it may be impossible to observe a star of low altitude.

A full chronometer\(^3\) cannot be carried long distances across country, as, even if the instrument be not broken altogether, its rate is certain to be affected. Half chronometers in watch form appear to be more reliable for inland work. Perambulator-wheels are very useful in reconnaissance work. The type usually offered, however, is imperfect and apt to become useless after being run a short distance, owing to wear and clogging with dirt. A type designed and used by the Author consists of a strong iron wheel with a plain iron rim, and is fitted with a form of bicycle-cyclometer. Such perambulators have been run for hundreds of miles without failure.

The methods of survey employed have been very numerous, depending mainly upon the fancy of the engineer engaged upon the work. Every possible method and form of survey has been used, from the roughest to the most refined. As a type of rough survey may be mentioned that of stepping distance and judging direction by shouting, a method which has given approximate results of value.

Between such a method and an accurate theodolite and spirit-level survey there are many gradations. The general principle, however, is the same in all cases, namely, to obtain a base-line by running a traverse and levels, from which a railway-line may be located by approximation.

In the course of reconnaissance surveying, information is usually required as to the names and positions of villages, the number of inhabitants, their occupations, the market for their goods, the direction of the local trade, the nature of the forest, and the probable amount of forest products, so that the railway may be run through the most profitable country; while notes as to the nature of the soil, size and direction of flow of rivers, and occurrence of ballast and water, are also required for the purpose of estimating the cost of construction. In order to carry out these duties effectively, the engineer in charge needs to possess considerable knowledge not only of surveying but also of botany, geology, and mineralogy; while his interest in his work is much increased by some knowledge
of ethnology, entomology, zoology, and other branches of natural science. Bushcraft, which is quite a science in itself, is sometimes very useful.

The study of native customs, land-tenure, folk-lore, and native administration, may be added as a pleasant and instructive pastime. Native languages in West Africa, where they are very numerous, are rather beyond the powers of Europeans unless long resident in the same district.

The units of measurement employed are usually left to the resident engineer, and in most cases the 66-foot chain and curvature expressed in chains of radius are preferred. In some instances, however, the degree curve and the 100-foot chain both been adopted. The degree curve has many advantages, but the 100-foot chain has the great disadvantage of not fitting in with the statute mile — a unit which it is difficult to eradicate from the British mind. The metric system has not been adopted for the same reason.

In location work contoured plans are prepared and the gradients are suited to the ground with due compensation for curvature. / Easement curves are also introduced, and it is essential that these should be taken into account during the survey, as they cannot be put in afterwards. Vertical curves are also employed.

The permanent marking of a surveyed line is difficult in most tropical countries, as a line cut through the bush is overgrown in a few months, and wooden pegs are apt to sprout into trees. Iron pegs are difficult to transport. In some cases where it has been necessary to mark a line on the ground with sufficient permanence to last for a few years, concrete blocks sunk level with the ground have been used, with the station marked upon them by cuts, the block itself being marked by a gas-tube embedded in the block and carrying a number stamped on a plate. The transport of the materials for such a system and the labour involved generally render the cost of such permanent marks prohibitive.

Clearing.

In order to render a line of railway through a dense tropical forest safe from interruption by fallen trees it is essential to cut down all trees which in falling would reach the railway or the telegraph-wires. When, therefore, the trees reach a height of 150 feet, as is not uncommon, it is necessary to cut a roadway 300 feet wide in addition to the width of the railway. This involves clearing about 40 acres per mile of line, and becomes a very serious matter when there are as many as twenty really large trees to the acre, as well as undergrowth. In such a case there would be about 80,000 trees to be cut in 100 miles of railway. Some of the trees met with in the West African forests are very large, measuring 20 to 30 feet in circumference at the base and being furnished with large buttresses. Such a tree will take 2 to 3 days to cut down by hand. Tree-felling machinery has not been employed extensively, as the native labourers are more efficient and reliable. Various devices have been adopted after the opening of a railway, whereby, by
means of blocks and tackle, some trees have been pulled down by a locomotive. Here again, however, there is difficulty in fixing the apparatus and in attaching it to the top of the tree.

The tree when felled is by no means disposed of. It has to be cut into sections and rolled aside. The very large mass of small branches, as well as the undergrowth, has to be cut up, dried, and burnt. The stump of the tree also causes difficulty. It has to be dug round, the roots have to be cut, and the stump must be dragged out and hauled aside, unless its position is such that it can be allowed to remain. Clearing entails, therefore, a considerable addition to the cost of the work.

The maintenance of the clearing also adds to the working-expenses. Owing to the hot moist atmosphere the undergrowth grows very quickly and requires cutting back about every 6 months. The trees also are sure to give trouble if, from considerations of expense, the clearing has been made of insufficient width. The effect of cutting a broad line through the forest is to let light into dark places, and the trees along the side of the clearing draw towards the light, the branches growing inwards so that the tree is more inclined to fall towards the railway in a high wind. The Gold Coast Government Railway has suffered since its opening from the falling, on an average, of more than two hundred trees per annum. Steps have been taken recently to widen the clearing, but the number of falling trees does not as yet show any sensible decrease. Trees of value are unfortunately rare, so that letting out timber-concessions has not proved a means of alleviating this trouble.

**West African Forest.**

The area covered by forest in West Africa is so vast, and the quantity of timber is so prodigious, that passing reference may be made to the nature of the forest met with. The Gold Coast Railway is perhaps the most interesting in this respect.

Shortly after leaving the coast the railway plunges into ‘tropical rain forest’ (Schimper), which is a lofty and luxuriant evergreen forest. This forest includes trees of giant growth, amongst which are mahogany (*Khaya*), ceder (*Pseudocedrela*), Odoum or Iroko of Southern Nigeria (*Chlorophora*), Waw-Waw, Offram (*Terminalia superba*), and the silk-cotton trees *Eriodendron* and *Bombax*. These trees are mostly buttressed to a considerable height. The rest of the forest consists of smaller trees, many of which have not been identified. There are also a number of oil-palms (*Elaeis Guineensis*), and the beauty of the forest is much enhanced by the woody lianas which stretch from tree to tree. The mahoganies, cedars, Odoum, Baku, and other trees are exported to Europe; others again are used locally for mine-props and other purposes. The *Elaeis Guineensis* or oil-palm is the source of the commercial ‘palm oil.’ The rubber-producing plants *Funtumia*
elastica and Landolphia are found in the forest, while various fibre-producers also occur.

Farther inland, as the railway approaches the Offin River, dividing the Gold Coast from Ashanti, the forest becomes more of a mixed deciduous type, containing most of the types found in the rain-forest, together with a large number of smaller trees, many of which have not been identified. In this class of forest there occur the mahogany, cedar, Odoum, ebony, Waw-Waw and Emril, with Funtumia and Landolphia, and Raphia and other fibres.

Beyond the deciduous forest is found the savanna forest, a park-like formation common in many parts of tropical Africa and America.

Earthworks.

When the railways in West Africa were first mooted there was a cry for ‘surface’ railways, and there is no doubt that the construction of the West African railways was in the first instance affected to some extent by this popular idea, which had obtained a hold upon the minds of the authorities of the time. However, the physical features of the country in most parts of West Africa prohibited the adoption of real surface lines, and the earthworks required upon most of the railways proved to be heavy.

No costly plant was used upon the earthworks of the West African railways. ‘Overland routes’ were rarely practicable because of the forest. Cuttings were not tipped to bank but to spoil. Banks were built from borrow-pits, which were usually extended over large areas on account of the tree-stumps to be avoided. They require to be drained to avoid the formation of stagnant and mosquito-breeding pools.

The main difficulty with banks in the tropics is that, whereas they ought to be permitted to stand through a wet season before ballast or permanent way is carried over them, it is impossible in ‘telescopic’ railway construction to allow the time for this, as supplies must be carried over the completed line. The result is that ballast is thrown upon a green bank and much of it is lost; or permanent way is laid over the bank and is damaged thereby. It is hoped that the discussion upon this Paper may throw some light upon the difficulty as solved, possibly, elsewhere.

Cuttings were taken out by native labour with picks, hoes, and baskets, and carried to spoil. The slopes of cuttings were frequently left vertical when the material was suitable, the rain, which is torrential, often doing less harm to a vertical face protected by vegetation than to a sloped face. Rock-cutting is usually bored by hand-drills, machine drills being less economical than hand-labour owing to the supervision required.

The earthwork in most cases is done by ‘petty contract,’ a group of natives of one tribe or of one family taking a few chains, for which they are paid upon
The prices paid depend on the height of the bank or the depth of the cutting, and on the material. This system has proved satisfactory, both to the Governments concerned and to the natives, who quickly learn to appreciate its advantages.

The number of natives engaged upon the earthworks has at times been large: for instance, the Sierra Leone Railway at one time employed more than 4,000, the Gold Coast Railway, 16,000, and the Lagos Railway, 19,000. In the case of the Gold Coast Railway, where the country was sparsely populated, arrangements were made for importing about 40,000 labourers partly from Sierra Leone, but mostly from Southern Nigeria, all upon 12-months agreements. Food-supplies were shipped monthly from Liverpool to provision the labour engaged upon the work.

At no time has there been serious trouble with the natives engaged upon any of the works. They have been for the most part very glad to supplement their ordinary means of subsistence by earning money upon railway construction. Recruiting has been done by the various District Commissioners, and almost all the natives, once realizing that they would be paid regularly and in full, have made good workmen. When, at a later date, the railways have been opened, all subordinate posts have been readily filled with natives of the colony; the unskilled posts have gone to the uneducated natives, while posts in the clerical, traffic, management, and telegraphic departments have gone to the educated class of natives, which is becoming increasingly numerous.

All the railways in West Africa, forming as they do by far the best footpaths in the country, suffer from trespassers, who march along the railways, at some danger to themselves, and damage the cress of the banks. Low transport-rates seem to be the only efficient check to this abuse of the railways.

Pipes and Culverts.

For small drains, earthenware pipes would be the most convenient for construction, but high shipping-freights and considerable breakage in transport make their employment costly. To overcome the difficulty, pressed-steel culvert-pipes 18 inches to 4 feet in diameter have been largely used. These have head-walls, but no concrete reinforcement. Corrugated iron pipes have also been used 2 feet to 6 feet in diameter. These are easily carried in sections as head-loads to the site of the work, but their employment has been confined either to pioneer lines for use under small / banks, where they would be readily accessible for repairs, or in conjunction with concrete reinforcement.

The usual arched and open culverts have been used from 2 feet to 20 feet in span, and do not require special reference in this Paper.

For some of the smaller culverts steel centering has been employed successfully, enabling concrete culverts to be constructed in place of earthenware pipes.
Concrete has been generally used instead of masonry in all culvert work, on account of the absence in many places of suitable stone and the general lack of skilled masons.

**Bridges.**

The railways in British West Africa aggregating about 1,300 miles, bridges are naturally very numerous, and it is impossible within reasonable limits to describe in detail either their construction or the methods of their erection. A list of some of the more important bridges is given in Appendix I.

Generally speaking, the bridges are of utilitarian design and devoid of any attempt at decoration, but in some of the larger bridges the simple lines of steel-work with plain piers and arched approaches have produced quite artistic effects. Most of the steel spans are of the deck type, except where the want of headway called for a half-through type.

The first steel viaducts were erected by means of a traveling overhanging gantry crane, but this was found unnecessary and was abandoned. Falsework has been rarely used, except in some of the smaller spans where sleeper cribs were employed.

The 170-foot spans of the Sewa and Moa bridges (Sierra Leone) were built out from the two ends. Adjusting-wedges worked by screw-gear were placed at the bottom of each end-post for the purpose of raising or lowering the meeting ends before finally bolting up. The strains were calculated for these girders accordingly.

The 180-foot span of the Ancobra bridge (Gold Coast) was erected cantilever fashion, the side spans acting as anchorages.

All steelwork was sent out in riveted sections, all field connection being made by turned bolts.

The bridges upon the Lagos Railway or in connection therewith are of considerable importance. In addition to the railway-bridges there are the following bridges connecting the Island of Lagos with the mainland. /

*Carter Road-Bridge.* – The Carter bridge which crosses the Lagoon from Lagos to Iddo Island is 2,104 feet in length, and is provided with a swinging span giving a clear opening of 50 feet for navigation.

From the Lagos shore the first thirteen piers (twelve of which are in deep water) consist of four piles each completely braced in both directions. The twelve spans of lattice girders between these piers are each 71 feet 6 inches long, and the piers are 90 feet apart from centre to centre. The swing is situated between the thirteenth and fourteenth piers and is supported on a special pier. Between the swing span and Iddo Island there is shallow water, and the bridge consists of fifteen 50-foot lattice spans supported on piers of two piles braced transversely,
but piers of four piles braced both ways are provided every fourth and third span alternately.

The Lagos steam-tramway, of 2-foot 6-inch gauge, from Lagos to Iddo station, runs over this bridge.

_Denton Bridges._ – The two Denton bridges connect Iddo Island with the mainland; they are 917 feet long and run side by side 21 feet 6 inches apart between centres; the railway-bridge consists of seventeen 50-foot spans of plate girders, and the road-bridge consists of seventeen 50-foot spans of lattice girders; both bridges have trough flooring. The piers are similar to the piers on the Carter bridge between the swing span and Iddo Island.

_Erection of the Carter and Denton Bridges._ – The piles were screwed (in some cases to a maximum depth of 87 feet) by means of a specially constructed screwing-pontoon 60 feet long, and 25 feet in beam, with a draught not exceeding 3 feet. This was fitted with hydraulic pumps, engine, boiler, steam-winching gear, 5 booms, anchor winches, etc. The hydraulic pumps were connected, by flexible hydraulic tubing, with a capstan on the pile.

The main girders were put together in the shops and carried into position by a specially designed twin lighter, the two hulls of which were 50 feet long, 12 feet wide, and 6 feet deep, and were propelled by screws; the lighter was fitted with an upper deck, 26 feet by 25 feet, which, by means of steam-driven screws, could be raised or lowered a distance of 8 feet. The flooring, in lengths of 25 feet, was also put together in the shops and brought on the lighter.

At Jebba, on the Niger River, temporary transport across the river has been provided by a steam wagon-ferry with slipways on each bank. At the same time considerable progress has been made upon both the northern and the southern sections of the Niger bridge. These works form an undertaking of considerable magnitude, and the Author hopes to be able to present another Paper on the subject at a later date.

**STATIONS.**

The stations on all the West African railways are of a simple country type. There are no platforms, and usually only a loop siding for passing trains, with a second loop or dead-end siding for local traffic. The terminal stations, however, are more pretentious.

The earlier station-buildings were of timber and corrugated sheeting, owing to the absence in some cases of stone and bricks and the general lack of masons and bricklayers. These buildings could be framed and put together at home, and were thus readily re-erected in the Colonies, even by unskilled labour. The buildings intended for European quarters were usually placed upon stone or concrete pillars, to keep them out of the damp and to ward off attacks from white ants.
The terminal station of the Sierra Leone Railway has a building of moderate proportions, constructed of stone blockwork with ashlar quoins. This was the first station-building constructed in stonework in the West African colonies.

The station-building at the terminus of the Gold Coast Railway (Secondee – Coomassie line) is a building of some pretentions. The walls are constructed of rubble masonry, with timber roof-trusses, and the roof-covering is of corrugated sheeting. It is a two-story building, 250 feet in length, with a large central hall, booking-office, station-master’s room, telegraph-office, two parcel-offices, waiting-room and station stores above.

At Accra the station-building is more advanced and are all of concrete, with roofs of “eternit” slates. The main station-building is of some architectural merit, being a single-story building with large overhanging eaves and with the valance-boards coming down to within 8 feet of the ground, thus affording ample shade for the offices within.

It has a spacious waiting-hall and is surmounted with a turret with a large four-faced clock. Both the roof and the sides of the turret are covered with eternity slates of a dull red colour.

Wayside stations have buildings of simple design, sometimes in one floor, sometimes in two, carried out in the majority of cases in timber.

Concrete buildings with flat roofs of a more or less oriental type have been built in some cases and are cool and effective. Such a building has recently been erected for the station at Jebba, and one will shortly replace the existing timber building at Ibadan. Lagos has no important station-building, but both at Ebute Metta and at Offa on the Lagos Railway some very extensive workshops have been constructed.

The general quarters, running-sheds, and construction-workshops at Secondee were all built of corrugated sheeting on timber or iron framing, but at Lagos the new shops have been constructed of concrete and roofed with Welsh slates, and several of the existing timber buildings were extended in similar material.

Among the buildings recently constructed at Ebute Metta was a carriage and wagon repair-shop, 300 feet long and 70 feet wide, and a locomotive sub-store 200 feet long and 30 feet wide, both in concrete with Welsh slated roofs.

As it is important in a tropical climate to obtain sufficient light in the buildings without the direct rays of the sun, all the buildings where possible, such as the engine running-sheds, carriage-sheds, and paint-shops, have been constructed with saw-tooth roofs.

Small coal-stores have been constructed at intervals along the railways, and at Ebute Metta a coal-store to accommodate 1,000 tons was built. The lower portion, up to a height of 9 feet, is constructed of concrete, and the roof, which has a span of 48 feet, is carried on steel trusses. Two high-level tracks run down the
whole length of the building, so that full wagons may be shunted in and quickly unloaded. Narrow-gauge tracks also run on the same level; these carry ½-ton skips, which are propelled by hand and from which the coal is tipped direct into the tender or coal-bunkers of the engines, each skip being automatically weighed and registered. A similar building is now in course of construction at Offa.

The officials’ quarters have mostly been constructed in timber and corrugated sheeting, but these again are giving way to concrete buildings with roofs of Welsh or ‘eternit’ slates. The main feature of these buildings is the wide verandas with overhanging roofs, many of them 9 and 10 feet wide. The doors and windows in many cases are fitted with inner frames filled with mosquito gauze, thus enabling the outer doors, when the weather permits, to remain open after sunset. Several quarters have the whole of the veranda mosquito-proofed by filling in with gauze from the floor to the fascia-board, a double entrance-door being provided, so that the outer door may be closed before the inner door is opened.

The water-tanks at wayside stations are generally of cast iron, having a capacity of 2,000 to 15,000 gallons, and are carried on steel framework varying in height up to 28 feet. At Ebute Metta a larger tank of 40,000 gallons capacity is now in course of erection. / This also is of cast iron and will stand on steel trestlework 60 feet high.

Owing to the lack of a permanent natural supply of water, a storage-tank was constructed at Accra, having a capacity of 72,000 gallons. It is a circular tank 36 feet in inside diameter, constructed of plain concrete sides and bottom, with a reinforced-concrete top. It is built below ground-level and takes the whole of the catchment from the station-buildings.

At most of the wayside stations the water-supply is dependent on the wells which have been sunk, but where a natural supply has been available only for certain periods of the year a reservoir has been constructed, to enable a supply to be provided during the dry season also.

PERMANENT WAY.
On all the West African railways steel rails weighing 28 lbs. to 55 lbs. per lineal yard, keyed with steel keys to steel sleepers, are in use. Earth ballast has been used where stone was not procurable, and the first 60 miles of the Lagos Railway ran for some years with earth ballast only. Native timber sleepers have not been successfully used, but creosoted Baltic sleepers have a fair life.

SIGNALLING.
The electric-staff system is installed on all the West African railways, the trains being flagged into the station. The first train in takes the platform-road. The switches outside stations are locked with a point-indicator. Night running has been unnecessary so far, but the increase of traffic will compel it upon the Lagos
Railway, and steps are being taken to install an interlocked semaphore system. One objection to night running in the forest belt is the danger from falling trees.

ROLLING STOCK.
The rolling stock of all the railways has been built to meet the requirements of the time, and with the growth of the traffic the locomotives have increased in size while the passenger-coaches have improved in comfort.

The Sierra Leone 2-foot 6-inch gauge railway has been worked for many years with six-coupled tank-engines having cylinders 10 inches by 15 inches and 10¾ inches by 15 inches, Walschaert valve-gear, driving-wheels 28 inches in diameter, boiler-pressure / 160 lbs. per square inch, grate-area 6·25 square feet, heating-surface 312 and 381 square feet, screw reversing-gear, underhung laminated springs, steam and hand-brakes, ’W.A.G.R.’ draw-gear, and a pony truck9 at each end, their weights in working order being 18·5 and 20·1 tons.

Of the more recently-introduced types one is an eight-coupled tank 2 – 8 – 0 engine, having cylinders 12 inches by 16 inches, driving-wheels 28 inches in diameter, grate-area 10·9 square feet, and heating-surface 495 square feet, the weight in working order being 23 tons 8 cwt. The latest is a 4 – 8 – 0 tender locomotive with six-wheeled tender, cylinders 13 inches by 16 inches, coupled wheels 28 inches in diameter, grate-area 12 square feet, and heating-surface 724 square feet, the weight in working order being 22 tons for the engine and 10·9 tons for the tender.

The Lagos and Gold Coast locomotives, 3-foot 6-inch gauge, are similar, and include:–

Six-coupled tank shunting-engines:
Cylinders, 13 inches by 18 inches; driving-wheels, 39½ inches in diameter; grate-area, 9·2 square feet; heating-surface, 531 square feet. Weight, in working order, 27 tons.

Cylinders, 14 inches by 18 inches; driving-wheels, 40½ inches in diameter; grate-area, 11½ square feet; heating-surface, 723 square feet. Total weight, in working order, 38·65 tons.

2 – 6 – 0 tender-engines (Gold Coast Railway):
Cylinders, 14 inches by 18 inches; grate-area, 11½ square feet; heating-surface, 723 square feet. Weight, in working order, 38·7 tons.

2 – 6 – 0 tender-engines:
Cylinders, 14 inches by 18 inches; driving-wheels, 39½ inches in diameter; grate-area, 12 square feet; heating-surface, 703 square feet. Weight, in working order: engine, 26 tons; tender, 18 tons; total, 44 tons.

2 – 6 – 0 tender-engines:
Cylinders, 15 inches by 20 inches; driving-wheels, 40 inches in diameter;
grate-area, 14 square feet; heating-surface, 987 square feet. Weight, in working order: engine, 33 tons; tender, 22 tons; total, 55 tons.

2 – 6 – 2 passenger-engines (Lagos only):
Cylinders, 15 inches by 20 inches; driving-wheels, 48 inches in diameter;
grate-area, 14 square feet; heating-surface, 989 square feet. Weight, in working order: engine, 39 tons; tender, 23 tons; total, 62 tons.

2 – 8 – 0 mixed-traffic engines:
Cylinders, 17 inches by 21 inches; driving-wheels, 40 inches in diameter;
grate-area, 16¼ to 17¾ square feet; heating-surface, 1,001 to 1,287 square feet. Weight, in working order: engine, 39 to 43 tons; tender, 22 tons; total, 61 to 65 tons.

4 – 8 – 0 tender-engines (Gold Coast Railway):
Cylinders, 17 inches by 21 inches; driving-wheels, 40½ inches in diameter;
grate-area, 16¼ square feet; heating-surface, 1,061 square feet. Weight, in working order: engine, 42 tons; tender, 25 tons; total, 67 tons.

4 – 8 – 0 tender-engines (Lagos Railway):
Cylinders, 17 inches by 23 inches; driving-wheels, 42¾ inches in diameter;
grate-area, 17½ square feet; heating-surface, 1,088 square feet. Weight, in working order: engine, 48 tons; tender, 25 tons; total, 73 tons. The latest engines of this type have been fitted with Schmidt superheaters.

The ‘W.A.G.R.’ coupler is a unique type of tight centre coupling, and has been used successfully for many years. It is now, however, giving way on the Lagos Railway to the ‘A.B.C.’ automatic coupler, which was first introduced by the Author on the Cyprus Railway.

GOODS STOCK.
There is a very large variety of rolling stock upon the West African railways, but most of it is bogie stock with pressed steel underframes. There is practically no four-wheeled stock. The Gold Coast Railway has some rolling stock with timber framing, which was used on account of the necessity for floating the underframes to shore. The Lagos Railway for some time favoured built-up steel frames as being more readily repaired after accident.

Chilled cast-iron wheels are in use on the Sierra Leone Railway and on the Gold Coast railways. At Lagos they have been abandoned in favour of steel-tired wheels with spoked or pressed steel centres.

The brakes have been hand-brakes worked at either end by wheel and ratchet. Vacuum brakes are being introduced on the Lagos Railway.

CARRIAGE STOCK.
The stock under this head is not very numerous, but from the commencement it has been of the end-door corridor type, with the brake-wheel on the platform.
Seats are placed corridor fashion and are of cane or upholstered. Third-class carriages are usually fitted with benches only. For the use of colonial and railway officials there is a preference for cars consisting of an almost empty shell fitted with canvas deck-chairs.

Kitchen-cars, and cars fitted with sleeping-berths, baths and other luxuries, are to be found.

The cars are fitted with sunshades, the roofs being covered with canvas and painted with white lead. They are lighted by paraffin-oil lamps, but lamps are not much in use. Electric light is being tried, and experimental sets of the Stone and Leitner systems have been sent out.

Teak for the outside finish is favoured, but many varieties of inside finish have been tried. The windows are fitted with louvers, sometimes also with glass.

Various systems of lavatory arrangements have been tried.

It is impossible to deal in a reasonable space with all these matters, but it is hoped that some discussion may be raised by the foregoing remarks.

For inspection purposes, push-trollies, ‘pump-cars,’ and motor inspection cars have been used.

**COST OF CONSTRUCTION, AND RESULTS OF WORKING.**

The Sierra Leone Government Railway, 2 feet 6 inches gauge, has a total length, with branches, of 255 miles. The total cost amounted to £1,020,120, and the results of working have been as follows:–

<table>
<thead>
<tr>

In all these colonies a large increase in the trade of the colony and in the customs receipts has resulted from the construction of the railways.

RAILWAYS IN FOREIGN WEST AFRICA.

It may be of interest to note that France has been very active in railway construction during the last 20 years. The principal French railways are:

- Dakar – St. Louis Railway, 165 miles in length, reported to have cost about £5,200 per mile.
- Kayes – Koulikoro Railway, 345 miles in length, reported to have cost £5,750 per mile.
- Thies – Kayes Railway, not yet completed, but will have a length of 370 miles.
- Konakri-Couroussa Railway, 365 miles in length, stated to have cost £2,380,000 (£6,525 per mile).
- Ivory Coast Railway, in course of construction, the first section to be 195 miles in length.
- Dahomey Railway, now built to Savé, a distance of 160 miles.

APPENDIX.

The Nigerian Railway. Some General Particulars, a Short Historical Sketch and Interesting Statistics (Lagos, [1925]).

NIGERIA

British West Africa

The

Nigerian Railway

Some General Particulars

a short Historical Sketch

and Interesting Statistics /

NIGERIAN RAILWAY

GENERAL PARTICULARS.

The Nigerian Railway has been constructed, and is owned and worked by the Government. It incorporates the Lagos Government Railway from Lagos to Minna, and the Baro-Kano Railway; giving an all-rail route from Lagos to Kano, 704 1/2 miles. There are, in addition, the following branch lines:

- Baro to Minna 111 miles
- Zaria to Bukuru 143 miles
- Aro to Abeokuta 1 3/4 miles
- Ifo Junction to Ifo 2 miles
- Ebute Metta to Apapa 3 3/4 miles
With the exception of the branch to Bukuru (which is 2'6"), the gauge throughout is 3'6".

2. In addition to the above, a line of 292 miles (3'6") known as the Eastern Railway runs from Port Harcourt to Makurdi on the Benue River via Enugu and the Udi Collieries. This will eventually be linked up with the Western Line at Kaduna, and, at the present time, Construction work is being carried on over the 476 miles separating the latter place from Enugu. The section between Enugu and the Benue River (Makurdi Station) was opened to Traffic on the 1st April, 1924, and it is hoped that the Section from the Benue to Kaduna will be completed by the end of 1925. From Kagora, a point on the projected Railway 108 miles from Kaduna, a branch line will run to Bukuru and Jos; thus giving direct access to the Tinfields by the 3'6" gauge. It was originally intended to build a bridge over the Benue River, but, owing to the heavy expense involved, the scheme has had to be abandoned for the time being, and trains will be ferried across.

3. A well-appointed Boat Train is run between Lagos and Zaria in connection with inward and outward mails. This train provides both sleeping and dining accommodation of an up-to-date nature. Beyond Zaria a special connecting train runs to Kano and another to Bukuru.

4. The time taken by these trains in their run from Lagos (Iddo) to the chief towns on the line is approximately as follows:

<table>
<thead>
<tr>
<th>Town</th>
<th>Distance</th>
<th>Time</th>
</tr>
</thead>
<tbody>
<tr>
<td>Oshogbo</td>
<td>182 miles</td>
<td>10 hours</td>

<tr>
<td>Kano</td>
<td>705 miles</td>
<td>44 hours</td>
</tr>
<tr>
<td>Bukuru</td>
<td>761 miles</td>
<td>49 hours</td>
</tr>
</tbody>
</table>

5. Besides the Boat Train, there is a service of Through Trains between Iddo and Kano twice a week, the time occupied on these runs being approximately 50 hours. Sleeping and dining accommodation are provided on the Through Trains.

6. There are in addition, Local or Suburban Passenger Trains run on the different sections of the line.

7. On the Eastern line a daily service of passenger trains is maintained between Port Harcourt and Enugu; the journey being completed in 9 hours, and a daily suburban service between Port Harcourt and Aba (38 1/2 miles).

8. The passenger fares in operation per mile are:

<table>
<thead>
<tr>

Half-yearly tickets are charged at sixty (60) per cent and quarterly tickets at thirty (30) per cent of the above rates respectively.

10. Passengers' luggage not exceeding 2 cwts for First Class Passengers, 1 cwt for Second Class Passengers and 28 lbs for Third Class Passengers is carried free of charge.

11. The prices of Meals in the Restaurant Car are:

- Breakfast: 3/6
- Afternoon Tea: 1/6
- Luncheon: 4/6
- Dinner: 5/6
- Early Morning Tea: 6d.

GOODS TRAIN SERVICE.

12. A Through Goods Train is run in each direction between Iddo and Kano weekly, and additional Through or Sectional Goods Services are run as traffic demands.

13. A tariff of freights is published, and below will be found the rates charged on a few of the main articles of Nigerian trade:

20. In 1908, the Northern Nigeria Government commenced the construction of the Baro-Kano Railway for Military and Political purposes, and the line (353 miles) was completed in 1912.

21. It was considered desirable that the two systems should be linked up, and the Lagos Government Railway, with this object in view, commenced building from Jebba in 1909; reaching Minna, the junction with the Baro-Kano Railway, in 1912. In the latter year the two lines were incorporated under the title of the Nigerian Railway.

22. Prior to January 1916, there was no rail connection between the lines North and South of the South Channel of the River Niger at Jebba, and traffic was worked across by means of the ferry ‘Fabius.’ This was a vessel capable of carrying six large wagons or four passenger coaches at a speed of 7 knots per hour, and could also convey, when required for purpose of repair or replacement, any of the heaviest engines on the Railway.

23. The boat was fitted with machinery for loading and unloading wagons, and provided shelter for passengers of all classes while crossing.

24. An inclined slipway was constructed on each River bank at a suitable angle to the stream to enable the ferry to come alongside or leave without difficulty. Vehicles were hauled up or lowered by means of a winding engine and cable.

25. The best month’s work performed by the ‘Fabius,’ including Sundays, was 38.8 vehicles per day of 8 hours. The only difficulty experienced in the working of the ferry was in connection with the steering, which proved difficult at times on account of the strong current at this part of the River.

26. In January 1916, the bridge over the South channel at Jebba was opened to traffic, thus establishing through rail connection. This bridge consists of seven spans of 183’ between centres of bearings with viaducts of three concrete arches.
at each end. The total length is 509 yards, and total weight of girders about 1,020 tons. There are six piers in the river, of which four were sunk in sand to 77’ below water level; one was built on rock 12’ under water at low river. The other was sunk through sand until it rested near one end on a ridge of rock 25’ below the level of river bed. Preliminary borings had given an erroneous idea of the lie of the rock which was found actually to descend in steps to a depth of 57’ below river bed. Steel sheet piling was driven to rock all round the pier. The space under the pier was divided by steel shuttering into three sections to which access was obtained through the dredging holes in the pier. Sand was excavated down to rock and concrete filled in to underside of caisson, each section having to be completed before the next was begun.

27. All this difficult work in connection with the underpinning was done by divers and occupied fully two years. / 28. The time occupied in building the bridge was a little under 5 years, and the total cost about £130,000.

29. The bridge has done much to develop trade and facilitate intercommunication.

30. The Bukuru line, the 2’ 6” gauge Railway (143 miles long), which connects the Tin fields area with the main line at Zaria, was completed in 1914.

31. The discovery of the Coal Field at Udi led to the selection of Port Harcourt as being the most satisfactory port through which shipment of the coal should be made. The construction of a connecting Railway 151 miles was commenced in 1913, completed in 1915 and opened to traffic in 1916.

**COMPARISON WITH ENGLISH STATISTICS.**

32. The Colony of Nigeria is the largest of the British West African possessions; its approximate area being 346,000 square miles practically three times that of the United Kingdom, whilst its population is 18,500,000 against the 46,000,000 of Great Britain.

33. The total length of line open to traffic in the United Kingdom is 23,724 miles, roughly 20% of the total area of 121,633 miles. Nigeria’s 1,126 miles of Railway gives only a percentage of .33 to its area of 346,000 square miles. /

34. The Home Railways in 1921 (the latest figures available) earned £51,923,453 net, representing a return of practically 4% on their Capital of £1,328,049,749.

35. The amount of Capital expended on the Nigerian Railway at the end of March 1923, was £12,699,255, and the net receipts £447,702; the percentage of return being 3.5.

36. The total number of passengers carried on the English Railways during the period under review was 1,252,056,386; or equal to each head of population
making 27 journeys. The number of passengers over the Nigerian Railway was 1,608,713 equivalent to only 87% of the population travelling.

37. The gross tonnage handled by the Home Railways in 1921, was 222,129,313, or 4 tons 16 cwts. per head of population; whilst in Nigeria the gross tonnage conveyed was 560,741; approximately 68 lbs per head.

38. Taking into consideration the sparse population and the small percentage of Railway mileage to total area in Nigeria compared with conditions obtaining in the United Kingdom, the results are encouraging.

39. The Agricultural Department are making every effort to get Africans interested in the cultivation of Cotton, Cocoa, Ground provisions, etc., and as they become educated to the advantages and facilities offered by the Railway for the transport of their produce, there is little doubt that traffic will materially develop
THE FAILURE OF OFFICIALISM.

The Disastrous Record of Government Railway Building.

By Sir Walter de Frece, M.P.¹

It has been left to a Conservative Government, which is opposed to direct State enterprise at home, to readopt for future railway work in East and West Africa the discredited policy of Departmental construction. This policy has been thoroughly tested in the last thirty years. It has on practically every occasion during this period been a lamentable failure. It was only adopted as a costly experiment in bygone times when private enterprise did not exist like it does to-day. In these thirty years it has wasted public money and been denounced in Parliament. It has compelled the Governments, who have resorted to it, to apologise and explain. Yet Conservatism revives this discredited policy of officialism, but before there is further waste of public money the public should realise the gravity of the proposed step and appreciate the hopeless muddles of the past. There is hardly a single railway built by the Departmental System in East and West Africa over which large sums of public money could not have been saved.

Now what is the ‘Departmental System’ of building railways? It is thus stated in the Final Report of the Uganda Railway Committee, which published in 1904 the apologia for the supreme muddle in constructing, by the ‘Departmental System,’ the Uganda Railway; and also set out, as follows, the high hopes with which the Government entered on the work:

‘The Government would in this way profit to the full by its high financial credit; it would not raise one penny of capital beyond that required for the work; it would be able to exercise complete control over the working of the line; it would have at its command men of the highest experience in such matters, actuated by the sole idea of doing the best they can in the interests of the Government; and, above all, it would have a more free hand in respect of rates and

¹ Mr. Ormsby-Gore,² H. of C., June 4. Acting-Governor in Kenya Legislative Council, 1923.
fares; and it would be in a position to profit by the success of the line, instead of merely taking the risk of losses without the chance of profit.’

Such, presumably, is the profession of faith with which any Government starts on this form of railway construction, though, as will be seen below, the Crown Agents had still more comical, but equally misleading, ideas on the Departmental System, in regard to railway building in West Africa. How have all these advantages claimed for the system been justified by experience in East Africa or West Africa? The present generation may forget what has happened, but here are the facts, and it should be recollected that in the history of railway construction there has never been such a reckless, disordered enterprise as the construction of the Uganda Line, whose entire record is an unvarying tribute to official incompetence. Yet in 1896, at the very start of the work, the Foreign Office, which then ‘ran’ the Colonies, priding itself on the Departmental System of construction, remarked with delightful, but misplaced, insouciance that, as against private enterprise, it possessed all the advantages, ‘Authoritative supervision and control of the work,’ ‘smooth and economical method,’ ‘special advantages in respect of labour,’ ‘vigilance, judgment and experience.’ In other words, the Foreign Office, with all these advantages, muddled from start to finish on a truly gigantic scale.

THE UGANDA RAILWAY.

The real cost of the Uganda Railway will probably never be known. Yet it was ‘a line not difficult to construct ... and running over easy country.’ It was first planned to cost £2,227,323 for a length of 657 miles, or if fitted for heavy traffic, £3,685,400, or about £5,600 per mile. Private enterprise of the very highest standing (Messrs. Pauling and Co.) offered to build the line in four years for £2,500,000, all included, or nearly £4,300 a mile.

From its actual inception (December, 1895) the scheme was never worked out properly; the surveys were wholly inadequate, and it was notorious that the cost was underestimated, but the Foreign Office was unperturbed.

At a very early date the Railway fell into the hands of the officials. Sir Percy Anderson’s Committee (1895), on which served men without much, if any, knowledge of Railway construction, cut down the original estimate to £1,755,000 by selecting a lighter road and a narrower gauge. Then the Uganda Railway Committee came into existence, sitting at the Foreign Office, and it substantially took over the Anderson scheme. From the start there was confusion and conflict of views which prejudicially impressed the House. The incompetence characterising the estimate was well known to experts in Parliament, who denounced both it and the ineffective management. Mr. Lloyd George was one of the strongest critics of Foreign Office recklessness of procedure. The progress
of the railway was never kept up to schedule. The provision of labour was badly muddled and inefficient, poorly paid workers being imported from India. Meanwhile, the Government, which (see above) was claiming that it would 'profit to the full by its high financial credit,' was merely at intervals financing the railway out of British public funds, and not attempting to use credit at all. Progress was so slow that the House of Commons were constantly complaining, criticising the methods of management, calling attention to the mortality among native workers, and grumbling at the extra outlay, which in April, 1900, had reached £3,020,000, as against the original estimate of £1,865,000.\(^*\) On this occasion the whole finance was the subject of severe criticism in the House. Even Lord Midleton, then at the Foreign Office, was about £1,000 per mile, 'out' in his estimate of the total cost – five years after the line was started. The one per cent, overriding commission, paid in addition to salaries to the Crown Agents on all stores purchased, was much disliked in the House. No wonder the transference of the work to private enterprise was constantly urged. Still, £1,930,000 more was voted. In 1902, £600,000 more was obtained. By this time it was clear that not only had the cost of the line been grossly underestimated, but the administration charges had been swollen, and the only way money was ever saved was by buying cheap locomotives in America instead of helping British trade. Owing to faulty supervision, vast quantities of the stores were stolen by the natives. In this Debate, Mr. John Burns, as a mechanical engineer with West African experience, expressed himself 'ashamed at the incapacity shown in the construction of the railway.' Mr. Herbert Samuel (now Governor-General in Palestine), who had visited East Africa, recorded the unanimous opinion of all on the spot that there had been 'gross extravagance ... frequent waste and laxity of financial control.'

Ultimately the line was finished early in 1903, whereas the Departmental System engineers had originally expected it to be built in three to four, instead of, as it was, in seven to eight years. The total officially-stated expenditure up to the date when the Committee ceased to control the outlay was £5,297,808. In its apologia, issued in 1894, the Committee claimed that the 'cost had not been excessive.' It was, however, £9,900 per mile as against its own estimate (revised) of £2,840 per mile, and as against an ignored private contractor's tender (Messrs. Pauling) of £4,280 per mile.

\(*\) Including interest (£110,000) during the four years of construction.

THE WEST AFRICAN MUDDLES.

The record of railway construction in West Africa is almost as melancholy a story as the history of the Uganda Railway. The pioneers of railway construction in that part of the Empire were the firm of Messrs. Shelford and Co., the Consulting Engineers to the Colonial Office, who were practically, to all intents

Mr. Brynmor Jones, H. of C., May 7, 1900.
Mr. Col. Williams, April 8, 1897.

Mr. Gibson, H. of C., May 7, 1900.
Mr. J. Burns, H. of C., December 9, 1902.
Mr. Herbert Samuel, H. of C., December 11, 1902.

March, 1903.
and purposes, the chief Government Authority on the spot. They thus officially
summed up the virtues of the Departmental System, which, read in the light of
cold fact, are still more absurd than the merits claimed for it by the pioneers of
the Uganda Railway:

\textit{Cd. 2325.} (\textit{a}) The construction of a railway through an unknown country may be com-
menced departmentally without the delay inseparable from the carrying out of
detailed surveys and the preparation of a contract.

(b) The route of the railway, the accommodation provided, or any other
detail, may be altered to suit the ascertained requirements of the Government
during construction without inconvenience or claims for extras in consequence
of the alterations and modifications usually found to be necessary during the
progress of any works of magnitude.

(c) The construction can follow immediately upon the operations of the sur-
vey parties, thus saving perhaps a year or more in the eventual completion of the
work.

(d) There is no risk of failure to carry through the work if unexpected diffi-
culties arise.

(e) In the case of a hostile attitude of the natives the interference to the work
is minimised.

(f) The facilities for importation and repatriation of labour are increased
under Government auspices.

(g) Confidence in engendered in the native mind by the fact that he is deal-
ing with the Government.

Before proceeding to details, it only needs to be pointed out with regard
to the above that the State in West Africa entirely failed to realise any of the
‘advantages’ specified. The work was rarely done economically; because \(a\) much
was apparently left to chance or \(b\) modified as the work went along. The pre-
liminaries were never fully prepared, and the work was usually in arrears \(c\); the
‘unexpected difficulties’ always found the Departmental System at fault \(d\); and
the arrangements with the natives were always breaking down \(e\) and \(f\); and
the expected confidence was entire absent \(g\). The slip-shod ‘go-as-you-please’
method of constructions simply bled the British taxpayer, while the Departmen-
tal Systemi proudly, in effect, remarked: ‘But we pay nothing to the contract
for any variations in any contract with us.’ It was, however, absence of any fixed
policy which has proved so disastrous.

Indeed, the criticisms of the working of the entire railway constructional sys-
tem in West Africa was so acute that in 1904 Alfred Lyttelton, who was then
Colonial Secretary, felt compel to issue an elaborate defence of it, and called on
Messrs. Shelford Co. to put their case before the public, which they did to the of
their ability and in the most appealing terms.
Such were the general deductions. The railway work can be analysed in detail, though the report referred to is one lamentation against natural difficulties, which were well known to all, against which, to avoid delay, of which there was constant complaint any contractor would have adequately provided in advance.

**THE SIERRA LEONE GOVERNMENT RAILWAY.**

This was built by Messrs. Shelford, and is a narrow-gauge line of relative simplicity of construction. It cost £958,150 for 222 miles, at a cost of £4,316 per mile. It may be added, as an amusing commentary upon the Shelford advantages of the Departmental System (see above), that when this line was being built there was a great deal of trouble with the natives, and there is nothing whatever to show that private contractors would have suffered more from it than State contractors. The cost of Administration was utterly underestimated — indeed, few estimates were correct. There were various additions to the main line when built, which brought the total mileage up to 337, by which time the cost per mile had gone up to £5,020.

**THE GOLD COAST RAILWAY.**

The record of railway construction in the Gold Coast, even among illustrations of the working of the Departmental System, stands out as absolutely unparalleled in inefficient results. The total capital cost of all lines open on December 31, 1921, was £6,081,000, or about £20,000 per mile. This ought easily to establish a record in extravagance. It was built in sections, and the best criticism of how any of them were built is supplied by a remark of the Governor in his speech 1922–23, in which he observed that they had been ‘able to reduce the cost of construction to the neighbourhood of £11,000 per mile.’ This illuminating phrase, ‘neighbourhood of,’ is about as near as the Government ever got to anything in the West Coast. The less said about the construction of the first section of the Gold Coast Railway (Sekondi to Kumasi) the better. There were 167 miles, and they were built at a cost of £1,753,488, or £10,000 a mile, whereas private enterprise offered to build the greater part of the line (Tarquah to Kumasi) for £6,650 per mile, and at a much earlier date than the railway was finished by the Departmentalists. The character of the works was underestimated; the plans were evolved in piecemeal and expensive form; the sickness was abnormal; the scale of labourers’ remuneration was altogether wrong; and the Department cannot cover up its shortcomings by lamenting the ‘competition with the mining companies.’ There was a great deal of labour trouble, which synchronised with the last Ashanti War, which hardly, despite all claims, suggests pleasant relations.

* The actual cost about doubled the official estimate.
between the railway authorities and the local labour. Yet workers were rarely short if properly handled. The Departmental engineers complained pathetically of the scarcity of ballast, which was responsible for very bad work on the permanent way, and of the shipping and landing difficulties, in a form which suggests that they never, anticipatorily, took these properly into account. In fact, nothing worked properly. Small subsequent sections were built, at a cost of £6,100 per mile, and £9,860 per mile. The heavy outlay referred to in the capital cost of the line is, of course, due to very extensive repair and / replacing work. To this it may be added that on June 20, 1923, in the House of Commons, Mr. Ormsby-Gore, on behalf of the Colonial office, admitted the ‘excessive’ cost, but made an *ad misericordiam* appeal.

‘It was a pioneer line made in haste, without adequate surveys, in order to serve the gold mines, which could not otherwise have been worked. It had to be carried throughout almost its entire length through trackless tropical forest, the local labour was entirely inexperienced, and the conditions extremely unhealthy for Europeans.’ Yes ... but the existing difficulties were known in advance and they need not be exaggerated. There were only 40 miles to be built to the mining centres, the country was well known, the surveys and preliminaries lasted for over 12 months. It took about 3 years to build 40 miles (to Tarquah), while even from Tarquah to Kumasi the rate of construction was only 4.8 miles *per month*. Private enterprise was ready to build cheaply, without making lamentations.

**THE LAGOS RAILWAY.**

The Lagos Railway, which started the South Nigerian Railways, was an equally illuminating undertaking. The original section of 125 miles long cost £882,961, or £7,064 a mile, and here again Messrs. Shelford naturally praised their own work, though they complained of the local difficulties, especially the scarcity of ballasting material, which would indicate lack of prevision, since the fact is known to anyone with even the merest casual acquaintance with West Africa. Labour troubles seem, to have been perennial, and in places, so it has always been asserted, a form of forced labour was employed. Moreover, Sir William MacGregor, who was Governor at the time, expressed keen dissatisfaction of the whole system of construction, though the Colonial Office endeavoured to whittle down his remarks to denunciation of the arrangements for medical attendance on the construction staff, which were notoriously bad. It is also an interesting commentary on the work that in 1920 the Colonial Office had to devote £1,107,000 towards relaying the track over a section of this line – not before it was needed. Innumerable complaints have always been made about this railway. Speaking in the House before the War, Sir George Lloyd, now Governor of Bombay, called attention to the totally inadequate provision of almost...
everything needed by traders using the line, such as engines, wagons, tarpaulins, etc., and lamented that it was impossible to obtain redress. The complaints were, in fact, taken up by the London Chamber of Commerce. In later years this line was extended to Jebba and towards Zungeru, but the Colonial Office admitted. ‘a considerable excess in expenditure’ due ‘partly to labour difficulties and partly to the country proving more difficult than was anticipated’ – instances of faulty calculation. Stores were, too, stolen wholesale. The whole of the cost of the 307 miles worked out at £9,478 per mile. The line eventually reached Minna, 467 miles in all from the sea; the constructional costs spread over the whole distance represented £9,209 per mile. In fact, the Colonial Office never seemed able to reduce this vast outlay, and the railway still continues to need additional expenditure. /

THE NIGERIAN RAILWAYS.

The building of the main Nigerian line (Baro-Kano, 356 miles), which was described by Mr. Lewis Harcourt8 as a ‘Splendid achievement,’ was started in 1907 and finished in 1911, at a cost of £3,570 per mile. It is on this line that the Colonial Office prides itself that it can build railways. Its history is interesting. The Blue Book, entitled ‘Correspondence relating to Railway Construction in Nigeria (1905),’ gives an amusing story of the hopeless conflict of opinion as to what should be done. This was substantially due to inadequate survey work; but eventually the Colonial Office, rejecting the advice of Sir Frederick Lugard to build a cheap lightish surface railway (£526,600), recommended on the ground of cost and potential traffic, selected a 3 feet 6 inch gauge, and estimated the cost at £2,015,896, or £5,693 per mile. The line was completed in 1911 at a capital cost of £1,390,251(1912), or £3,905 per mile, an instance, which ought to be historic, of administrative blundering in estimating. This was just over ten years ago. The line may have been built quickly, but it is significant that it has needed large sums to keep it going, and in 1920 £1,093,008, nearly as much as the original cost, was expended on relaying the small section between Minna and Kaduna (on this line) and the reconstruction of bridges between the still smaller section, Zungeru to Minna. The brains of the work, such as they were, were contributed by Royal Engineers lent by the War Office and by South African Railway experts. Anyone can cheaply build railways in Northern Nigeria. The ‘splendid achievement’ was for the most part over very easy country, which presented no serious obstacles. Events have proved Sir Frederick Lugard to be correct in anticipating that the heavy cost of construction would compel the charging of freights which would seriously interfere with traffic, a view which was endorsed by the Earl of Ronaldshay,9 and now proved to be true.

H. of C., June 27, 1912. Cd. 2787.
H. of C., June 20, 1923.
Mr. Ormsby-Gore, H. of C.,
June 20, 1923.
Cd. 2787.
H. of C., August 22, 1907.
The Eastern Railway cost £12,828 per mile to build, and, apart from the Gold Coast, furnishes one of the highest rates on record in the annals of normal railway construction in the British Empire.

The Bauchi Line (88 ½ miles), over very good level country, was only a light railway, but cost £1,977 per mile; moreover, by adding this reduced figure to the cost of all the other Nigerian lines, the Colonial Office manages to bump the average mileage rate down to £10,685, an instructive figure when it is recollected that the French built the Kayes-Niger, Dahomey, Porto Novo-Saketel, French Guinea and Ivory Coast lines at an average mileage rate of £5,370.

No further comment is needed, save the very obvious explanation that these Colonies have railway staffs and railway engineers who have to be provided with something to do. They get that ‘something’ all right under the Departmental system, but it crushes the finances of the various Colonies, it does not lead to satisfactory results, and the traders of this country suffer bitterly, by the heavy freight charges which are inevitable if the railways are even approximately to pay.

CORPS OF ROYAL ENGINEERS.

(OCCASIONAL PAPER SERIES).

1900.

VOL. XXVI. Paper VIII.

UGANDA RAILWAY.

BY

F. L. O’CALLAGHAN, Esq., C.S.

[...] The general configuration of the country shows a steady rise from the coast inland for about 350 miles to the highlands of Kikuyu, then a sudden dip into a valley, varying from 15 to 20 miles in width, and running generally in a north and south direction, an equally sudden rise to a second ridge, the Man, and a gradual descent to the lake.

The valley, called the Great Rift Valley, is one of the remarkable features in this part of Africa, and extends for several hundred miles. Apparently it is due to an immense subsidence or ‘down-throw.’ It has several extinct volcanoes along its floor, and many lakes, most of which are salt. The crest of the eastern escarpment varies from 7,000 to 11,000 feet in height above sea level, and that of the western one is somewhat higher.
The descent into and ascent out of this valley were the two difficult problems in the construction of the railway, so far as the physical features of the country are concerned.

In August, 1895, Her Majesty’s Government having decided to construct the railway, a small grant for preliminary expenses was obtained from Parliament, a supervising Committee, with Sir Alexander Rendel1 as Consulting Engineer, was appointed in London, while a Chief Engineer, with a proportion of staff sufficient for the work to be at first undertaken, was despatched to Mombasa, where the party arrived towards the close of December in the same year.

The matters requiring the Chief Engineer’s immediate attention were the preparation of a base on the coast and the survey of the best route to the summit of the coast hills, these hills rising rapidly for the first 15 or 20 miles inland from the sea.

It was at once obvious that the best site for a base was to be found on the island of Mombasa, because excellent harbours existed on both sides of this island, and on it was the only large piece of open and tolerably level ground available, as had already been noted in Capt. Macdonald’s report.

The preparation of the base included the following:–

1. Housing of staff and shelter for imported labour.
2. Preparation of a station site, and sites for store yard, stacking ground for permanent way materials, girders, and such like.
3. Construction of a landing stage for stores, and its connection by rail with the stores yard, and stacking grounds.
4. Construction of workshops for the erection and repairs of locomotive engines and rolling stock, and for other work connected with the railway.
5. Organization of offices for accounts and stores.
6. Connection of the island with the mainland by a temporary bridge.
7. Water supply, including erection of condensing plant.
8. Organization of an agency in India for the supply of labourers and of food for them, besides sundry stores procurable in that country.

The survey parties arranged were eventually three in number. The first, a strong party, examined the country in detail, staked out the railway, for construction, ahead of the working parties, and prepared the usual large scale plans (400 feet to 1 inch) and working sections.

The second party was despatched to Kibwezi (mile 190) to work backwards until met by number one party. This was desirable, as the country is somewhat intricate between the 150th and 190th miles, and it was important that the plans and sections should be ready in time to prevent any delay to construction works.

The third survey party was sent on to Kikuyu to investigate the different routes that might be possible from the Athi plains across the escarpment and into the great Rift Valley, and, when the best route was ascertained, to mark it
out and complete the working plans and sections; then to go forward and similarly examine the Mau range on the west side of the valley, fix on the best point for crossing this, the last and highest of the two great ridges to be surmounted, settle on the best route to the lake, and finally to prepare working plans and sections.

The first and second parties joined up in November, 1897, and these continued the location work from mile 190 onwards to mile 325, where the third had started, completing this work by October, 1898; but the third party did not finish its task until April, 1900. / The difficulties which had to be overcome by these parties varied somewhat in different localities, but on the whole their work was of an arduous nature.

On the first 200 miles from the coast the country, for the most part, is covered by dense thorn bush, which has to be cleared for every survey line run.

This bush is infested with tsetse fly,² fatal to all beasts of burden, thus limiting the means of carriage to that by native porters; the ‘fly’ district extends for some 30 miles or so beyond the thick bush, or up to the 220th mile.

The Kikuyu and Mau ranges are clothed by heavy forests with thick undergrowth, making survey work tedious and difficult.

Up to mile 320 the country is sparsely inhabited and produces no surplus food stuffs, while water is scarce and bad, being in most cases impregnated with salts injurious to health.

Moreover, in addition to these difficulties inherent to the country, the first party, during the early months of 1896, was impeded by disturbances due to a local rebellion, which made it dangerous to establish isolated camps without strong escorts, and escorts were not readily available, all troops being employed in suppressing the rising.

The positive hardships endured by the first survey party were severe; frequently, by the desertion of porters, they were in danger of starvation and of the horrors of thirst, while all, both Indians and Europeans, suffered severely from malaria fever, and the former from ulcers and sores due to the thorns of the aloes,³ cactus, and other bushes through which they had to cut their way.

The third survey party found that, as surmised by Sir Guilford Molesworth⁴ in 1891, the lowest point on the Mau range was between the Guaso Masai Valley on the east and Nyando Valley on the west, the summit being 8,321 feet over sea level, the ground falling away very quickly on both sides. The highest point is in the 489th mile, and for some little distance on either side works will be easy.
The ruling gradient adopted for the coast section was 2 per cent., with 10°* curves as a maximum, and the same ruling gradient has been used over the Kikuyu and Mau ranges, but in combination with 7°† curves.

Wherever the permanent working section showed heavy earthwork, which could not be completed in time to allow of the rails being laid over them, temporary lines, commonly called ‘diversions,’ were marked out, with gradients as steep as 3 per cent. and curves of 14° in order to keep these diversions as near the natural surface of the ground as possible, and thus keep down both their coast and the time necessary to construct them.

On the first portion of the railway up to Nairobi (326th mile) the aggregate length of diversions was about 40 miles. On the second portion the total length of these temporary lines will not fall far short of 44 miles.

The selection of temporary lines, as a rule, preceded that of the final permanent location, and required quite as much care and study of the ground.

Notwithstanding the care taken, some of the temporary works were of considerable magnitude; the first, of course, was the temporary bridge connecting the island of Mombasa with the mainland; next, a trestle structure across a ravine in the 12th mile; while every river met had to be temporarily crossed by bridges made with sleeper stacks and girders. Many other temporary structures were required, such, for instance, as stages for water tanks at temporary stations, for which timber is used.

While the first party of Engineers was on its way to East Africa, permission was obtained from the Government of India to recruit labourers in that country, this permission being necessary under the Indian Emigration Laws; arrangements were also made with that Government for the loan of an experienced engineer from their Public Works Department, as well as of a medical officer, with sufficient hospital staff. These in the first instance were engaged in selecting labourers, and about one thousand Indian navvies, with a proportion of carpenters, blacksmiths, rivetters, masons, etc., were shipped for Mombasa; several surveyors and draughtsmen, and also European and Eurasian overseers, were procured and despatched. An accounts officer was borrowed from the same source, who selected and engaged a staff of Indian accountants and clerks, and arrived in Africa with them during February, 1896.

In England a supply of tools, plant, workshop machinery, tents, iron houses, permanent way materials, small bridge girders, timber beams and scantlings, locomotives and rolling stock were contracted for, and the first shipment reached Mombasa in April, 1896, followed by others at frequent intervals.

* 573 feet radius.
† 816 feet radius.
The temporary bridge to connect the island with the mainland — over a channel about one-third of a mile wide, with a depth of water up to 17 feet at high water — was then put in hand and completed by the 4th August, 1896, on which date the rails were laid over it, and plate laying may be said to have commenced. This bridge had to carry the whole of the traffic passing up the railway for a period of nearly three years. Before two years had elapsed the supporting piles were nearly destroyed by that marine pest the teredo navalis, and heavy renewals were necessary. [...] It is usual to guard timber used in marine works either by sheathing it with zinc or by covering all exposed surfaces up to highwater mark with ‘scupper nails,’ i.e., a nail with a large flat head and a very short shank. These nails very quickly rust and cover the timber with a hard layer of red oxide of iron, thus preserving the timber from attack.

The conditions under which construction had to be carried on precluded heavy works of any kind being executed far from the rails, because the carriage of food and water in large quantities, except by rail, was practically impossible. The ‘telescopic’ method, therefore, was imperative, and no pains were spared to obtain, even at the cost of very steep gradients and sharp curves, as nearly a surface line as possible. Once the rails were laid, the heavier permanent cuttings, embankments, bridge, and culverts could be attacked with large gangs of workpeople to the full extent that economy of construction rendered advisable, and completed without further difficulty.

In the first instance the utmost that could be done was to keep a gang of about 300 Indian earthwork coolies at from one to two miles in advance of railhead, clearing away the bush and preparing the temporary surface line.

The supplying of these coolies, as well as the plate laying gangs, with food and water was a constant source of anxiety. The accumulation of spare food sufficient for some few days was not a matter of very great difficulty, but water, which had to be carried daily by train, and of which the supply in Mombasa was limited, was a serious matter, and any breakdown in its supply might have been followed by terrible consequences. At the railway base it was necessary to erect heavy plant for the supply of fresh water by distilling sea water, because the wells in the island gave little more than sufficient for the requirements of the fixed population.

[...] On the 10th November the railhead was at mile 460 on the eastern slope of the Mau range. The number of labourers had attained its maximum during August last, and the full supplies of locomotives and rolling stock were completed in December, 1899, and in April, 1900, respectively.

The number of workpeople to be employed depended on the amount of work opened up by the advance of the rails, and thus their increase, as shown in the diagram, is proportionate up to a certain point to the advance of the line.
The principal permanent structure on the first 360 miles of the railway, i.e., up to the Kikuyu Escarpment, is the long steel bridge on screw piles connecting the island of Mombasa with the mainland, completed on the 28th June, 1899, and now called the Salisbury Bridge [...]. The spans are 60 feet in the clear each, and the roadway, with a footway for men engaged on the railway, is on the top of the girders.

The next largest bridge is one of four spans of 60 feet over the Tsavo River, mile 132 [...].

Twenty-six other girder bridges of 40-foot span and upwards have been built, or are building, on this length, as well as a very large number of drains, culverts, and minor girder openings.

The bridges are of three types as regards piers and abutments – first, masonry piers and abutments; second, piers and abutments of concrete; and, lastly, trestle piers, composed of 3-foot diameter steel cylinders, braced together with cross girders and angle iron, the cylinders being filled with concrete.

Small drains are provided for by stoneware pipes, 12 inches and 18 inches diameter, laid on a concrete bed; larger drains are of oval steel cylinders on concrete, while arched culverts from 3-foot to 15-foot spans are usually of concrete. The whole of the masonry and concrete work is made with Portland cement, because no limestone, except coral, on the coast, is to be found; concrete and masonry, therefore, are very costly, and when possible they have been avoided.

The largest single-span girder bridge on the railway is 100 feet clear span, and there are two such spans (both with ‘through’ roads). The girders are triangulated open web, weighing with cross girders, etc., 65.6 tons each span; all other girders are of the plate web type, with road on top of girders, and are classed as follows:

- 60-foot spans, weighing 22.3 tons each span.
- 40-foot spans, weighing 10.15 tons each span.
- 20-foot spans, weighing 3.16 tons each span.
- 12-foot spans, weighing 1.16 tons each span.
- 10-foot spans, weighing 0.19 cwt. span.
- 6-foot spans, weighing 0.11 cwt span.

On the 13 miles required for the descent from the Kikuyu summit to the floor of the Great Rift Valley eight ravines are met with, which are being crossed by steel trestle viaducts varying from 120 feet to 780 feet in length, and from 32 feet to 85 feet in height at the deepest points. Embankments over these would have necessitated very long and costly culverts owing to the steep side slope of the escarpment, and in many instances it is doubtful if the earthworks would have stood, while they would in any case have been a constant source of trouble and anxiety. [...]

...
The viaducts are of the ordinary trestle type, the tower spans being 20 feet, the intermediate spans 40 feet, and the batter of the legs 1 in 6.

[...] As regards the method of erection. A traveller, with jib 8 long enough to reach to the forward tower, stands on the last completed span, and the pieces being brought up on a lorry which passes underneath the traveller, [...] are then laid hold of by a tackle and traversed forwards into place, or raised and lowered by winding on one winch and paying out on the other.

A third tackle at the mast takes the tail of the 40-foot girders, which are the heaviest pieces, when putting them into position. Besides these main tackles there are light ones worked by hand for raising and holding in position the smaller parts. By these means the viaducts can be erected very rapidly, and when one is finished the traveller is conveyed on its own wheels to the next.

The erection of these is now in progress. That the spans adopted are the most economical is proved by the fact that the total weight of the girder work is almost exactly equal to the total of the bents or piers.

Along the floor of the Rift Valley itself, which is crossed / very obliquely, the works are of a simple character, only two streams of any magnitude being met with. The first 15 miles up the slope of the Mau range is also easy, but from mile 465 onwards to 539 is the most difficult and costly part of the whole of the railway. On these 74 miles there will be twenty-eight steel viaducts, similar to those on the descent from Kikuyu, varying in length from 160 feet to 880 feet, and in height from 30 feet to 110 feet, the severe side-slopes here also rendering embankments with consequent culverts inadvisable. In the 526th mile a narrow high spur necessitates a short tunnel about 200 yards long, the only one, strange to say, on the whole length of this railway. Between mile 539 and Port Florence (mile 582) eleven rivers have to be crossed by bridges varying in size from one span of 40 feet to three spans of 60 feet.

At Port Florence there will be a small engine-repairing shop, and a jetty at which steamers can load and discharge cargo.

Station buildings are of the simplest character, made of timber framework covered with galvanized corrugated iron, easily removable to other sites when advisable.

The headquarters station has been fixed at Nairobi (326th mile), 5,600 feet above sea level, the last point at which an open level plain is found before entering the broken country of the Kikuyu range. Here are being constructed the central workshops and offices, the elevation insuring a tolerably cool climate. Other engine-changing stations, besides the two termini, are at Voi (mile 100), Makindu (mile 207), and Nakuru (mile 450).

On the portion of the railway between Kikuyu and the Lake the first temporary structure is in the 363rd mile [...]. Here the heavy works on the descent into the valley commence, and as they would evidently take considerably over a year
to complete, it was decided to construct a rope lift to lower materials into the valley. This lift or incline overcomes a difference of level of 1,523 feet, and consists of four portions. Two of them – one at the top and one at the bottom having inclinations of 16 per cent. and 9 1/2 per cent. – are laid as double lines, with drums at the top of each, round which a steel wire rope is passed. The railway wagens are run down and up these inclines, the full wagons going down, hauling the empty ones up, speed being regulated by brakes on the drums. The two middle portions are on inclines of nearly 50 per cent., similarly worked by steel wire ropes, 1 1/4 inches in diameter, passing round 'Howard' Clip drums attached to winding engine. On these inclines the wagens are taken on a carrier built with its top horizontal, having a pair of rails to take the wagon, and suitable clips and fastenings to keep the wagens in place while being lowered.

The gauge of the carrier inclines is 5 feet 6 inches, in order that lateral stability may be insured.

At the top the carrier comes up against a platform (beneath which is fixed the clip drum), so that the rails on the carrier form a continuation of a road ending on the stage front, thus allowing a wagon to be pushed on to the carrier by hand. At the bottom the carrier goes into a pit until the rails similarly coincide with a road, on to which the wagon is pushed off.

The line is a double one, but on the lower side of the middle point the rails overlap so as to save width in the cuttings and to economize sleepers.

From the foot of this lift a temporary line is laid until the permanent alignment is reached at mile 375.

Besides ordinary temporary bridges over the Morendat and Gilgil Rivers no diversions are needed until the 460th mile is reached, but between that point and Mau summit there will be 15 miles of temporary railway with 3 per cent. grades and 14” curves, and with several reverses or zigzags. Between the summit and mile 539 22 miles of diversions are laid out, the steepest grades in this case being as much as 4 per cent., as they will be with the load.

The permanent way used consists of 50 lbs. per yard 'Vignoles' pattern steel rails, laid for the most part on steel transverse sleepers of the 'pea pod' pattern, with clips punched up out of the solid, and the rails fastened in with a taper steel key. Where much salt is found in the soil creosoted pine sleepers are substituted for the steel.

For details of the permanent way material reference may be made to *Instruction in Military Engineering*, Part VI., Plate XX., and *Notes on Permanent Way Material, etc.*, by W. H. Cole.

In the first instance the road has been laid without ballast, as it seems to have been a leading idea with every engineer who advised on the project that ballast would be a luxury. On the first section, across the desert portion, the natural soil, being of a sandy nature, has up to the present answered fairly well, but the black
soil between mile 275 and Nairobi turned into a quagmire during the first rainy season after laying, and blocked the traffic for over a month. This was foreseen by all who had had experience of similar country and of tropical rains, and the Chief Engineer had made arrangements to collect ballast for this section in any case. The result of this experience was that the Supervising Committee at home decided to ballast the whole length of the line.

The locomotives built specially for the railway are 6-wheeled coupled, with a load of 10 tons on each axle. Just over one-half of the total number were purchased from the Baldwin Company in America, and these have a pony truck (two-wheeled bogie) in front which on the sharper curves is of much advantage, and enables the coupled axles to be kept closer together.

The total number of locomotives on the line is 92, made up as follows:—
Six second-hand shunting engines from India.
Sixteen second-hand 6-wheeled coupled engines with pony trucks, also from India, but of low power.
Thirty-four standard type engines from England.
Thirty-six standard type engines from America.

The particulars of these standard engines are:—

- Diameter of cylinder: 14 1/2 inches.
- Length of stroke of piston: 20 inches.
- Diameter of coupled wheels: 42 1/2 inches.
- Firegrate area: 13.4 square feet.
- Heating surface: 766 square feet.
- Working pressure in boiler: 160 lbs. per square inch.
- Wheel base (rigid): 11 feet.

**Tender:**

- Number of wheels: 6.
- Wheel base: 7 feet 10 1/2 inches.
- Capacity of tank: 2,000 gallons.
- Capacity for fuel: 180 cubic feet.

The rolling stock has steel underframes in all cases, and the goods stock built for the line is wholly of that metal. The 120 old ballast wagons purchased in India have wooden frames, but these are nearly worn out.

The whole of the stock is fitted with central buffers and the Norwegian pattern coupling hook, which seems to be stereotyped by English makers, but which is a fruitful source of breakaways during the time the road is rough and unballasted.

Rolling stock consists of
149 passenger vehicles,
3 horse boxes,
25 cattle trucks,
3 powder vans,
60 special water tank wagons,
50 brake vans,
850 goods wagons.

The peculiarities appertaining to this part of Africa have thrown upon the Chief Engineer many duties beyond those which ordinarily fall upon the railway builder. Although it was known that skilled labour did not exist, it was hoped and supposed that the natives would readily take up earthworks, and for over two years every possible effort was made to induce them to labour. On several occasions it seemed as if these efforts would be successful, and at one time as many as 1,700 local men were on the works, but their stay was always fitful, and after a week or two the numbers quickly melted away. Even the pressure of famine, which in 1899 was heavy in the land, failed to make them work – they preferred to die.

Indian labour, therefore, had to be relied on altogether, and although costly, owing to the expenses of importation and repatriation, the Indian navvy has been the only sure workman. The outbreak of plague in India during 1897 was the cause of much delay and great additional trouble and expense, adding considerably to the work of the agent in India.

Transport was another serious undertaking. Many efforts were made to work animal transport in the ‘tsetse fly’ region, as porters were very difficult to obtain in sufficient numbers, but after a loss of nearly 1,500 animals their use had to be abandoned. Towards the end of 1897 the Consulting Engineer recommended the trial of traction engines of an improved pattern, manufactured by Fowler & Co., of Leeds; two were ordered and delivered in March, 1898. After a few months’ trial they proved so satisfactory that two more were asked for and sent out, and all of these have done excellent service ever since.

The particulars of these traction engines are as follows:

The engines are compound.

Water in tender 900 gallons.

Beyond mile 250 mules and oxen have been employed with success.

The provision of food for the small army of labourers now nearly 20,000 strong is no light undertaking. Flour in large quantities has to be imported from India, but as a check on the suppliers corn mills had to be set up in Kilindini, and wheat is occasionally imported from England.

The amount of bridging to be provided for the passage of maximum floods called for early decision on the part of the Chief Engineer. This question is one of the most difficult matters to determine in any country which has not a long series of rainfall records, and particularly so within the tropics. To the railway engineer the average annual or monthly rainfall is not a matter of so much moment as the maximum fall that may take place in 24 hours, or 6 hours, or 1 hour, depending on the areas affected in each case. Mere inspection of the watercourses is, as a rule, misleading, more especially as the railway works tend to concentrate the flow that would otherwise pass by many small and, in the dry season, unnoticeable channels into the main depressions. Already on this railway there have been several instances of pipe drains being superseded by large culverts, and one in which a drain has been replaced by a girder bridge of 40 feet span. It is very possible, / indeed probable, that longer experience of the country will show other weak points necessitating revision of the provision for waterways. Within my own experience I have come across several instances where maximum floods occurred at intervals of from 30 to 50 years. In the case of one of these, where I was fortunate enough to obtain a very precise record of an old flood, the reliability of the information was doubted by those in high authority, and the waterway provided in the design for a bridge was curtailed. Many years after I witnessed a flood in this river which rose 2 feet higher than the level shown by the old record, resulting in considerable damage to a large military station, aggravated by the still further rise caused by the throttling of the river by the bridge so built. The river above the bridge drains an area of over 3,000 square miles, and at several places within that area a rainfall of upwards of 20 inches within 24 hours was registered on this occasion. Over smaller areas the intensity of rainfall is frequently much greater. I have known of a fall equivalent to 4 inches in 50 minutes registered in a basin of 5 square miles.

In another case of a bridge of three spans of 150-foot girders the under side of the girders was at a level of 15 feet above the roadway of an adjacent public road bridge which had been in existence for over 20 years. Both were swept away by a flood, which must have been 20 feet at least above the level of any previously recorded.
During the present year the Rajputana railway in India (a line 25 years old) has been breached in many places by floods, although hitherto it has been considered that the waterways allowed on this line had been excessive.

These instances, out of a very large number on record, show the amount of care and of study of all data and records available, which is necessary in deciding on the openings to be allowed for the passage of flood waters through a railway. It is desirable, however, that over-caution in this respect should not lead to extravagance; neither, on the other hand, should too great a regard for present economy lead to ultimate waste of time and money.

In order to provide for the traffic that may be gathered from the shores of Lake Victoria, and for the distribution of imported goods, steamers will be placed on this inland sea to be worked in communication with the railway. The whole of the material and engines will be prepared in this country ready for erection, and will be forwarded directly the rails reach Port Florence. /

The leading dimensions of these vessels will be as follows:–

Engines, triple expansion with twin screws.

**Supplementary Note on Traffic.**

A few remarks on this subject may not be out of place. The railway is opened for public traffic up to the last complete station interval as soon as possible after the rails are laid, generally within a month or two, to the great convenience of travelers and of the Protectorate Authorities. The public traffic, i.e., all traffic not on account of the railway itself, has averaged about £4 per mile per week since the first length of 100 miles was opened in February, 1898.

Stores, troops, and other passengers connected with the Protectorates have been conveyed to the extent of 5,000 tons of stores and 47,000 passengers, including troops. The difference in cost of conveying these by rail as against road transport has up to June, 1900, amounted to about £300,000; while during the Soudanese Mutiny in Uganda in 1898 the saving in time in transport of reinforcements just saved the situation. /
APPENDIX I

Summary of Captain Pringle's Description of the Method of Surveying for the Reconnaissance Survey of 1891.

The daily route was traversed with compass, aneroid barometer, and pedometer, and the plan plotted on the field. The general slopes of the country at right angles to the traverse were observed with Abney's levels. By a combination of these cross sections with the barometer observations the plans were approximately contoured at vertical intervals of 100 feet. A section was at the same time prepared from the barometer readings, corrected as far as possible for the daily wave and for atmospheric changes. These field plans were re-plotted in camp, linked together by triangulation where feasible, and otherwise by astronomical observations, and were amplified by sketching in surrounding country by means of plane tables set up on commanding points.

The dense nature of the bush and want of time preventing regular triangulation, astronomical observations were made to check the positions occupied at the end of each day's march, one or other of the following methods being used as was found suitable:–

(a). Latitude and azimuth observations to any well-defined point previously fixed to the north or south of the camp.

(b). Latitude and distance observations where the only previously determined points lay east or west of the camp, the distance being determined by measuring a short base, and taking theodolite or sextant observations from either end.

(c). When the above two methods failed, the position of the camp was determined by latitude and longitude observations, the latter depending for their accuracy on the ratings of watch chronometers.

(d). Observations for absolute longitude were taken whenever opportunity occurred of occultations, either of a star by the moon or Jupiter's first satellite, and thereby the ratings of chronometers were checked.

During halts of 24 hours or over diurnal wave curves were made for each aneroid barometer, and instruments were frequently checked and adjusted. Notes were made during each day's march on the following points:–

Number and position of all small waterways crossed; breadth height of banks, high flood marks, nature of soil in bed and banks, slope of bed and depth of water, if any, of all streams of 20 feet in width and upwards; and of the general, physical, and geological features of the country.'

APPENDIX II.

Method Employed for Final Survey.

The method adopted for the final survey was the usual one of a theodolite and chain traverse following a route determined by preliminary trial lines. This
traverse is levelled over with sights taken at every chain; and, where necessary, frequent cross-sections with the spirit level extending according to circumstances for so much as 400 yards on either side of the traverse are made. By means of the longitudinal section combined with the cross-sections a contoured plan is plotted, with contours at 10 foot vertical intervals.

On this plan in the office a centre line is laid out, and a rough section prepared from the contours; when found satisfactory it is transferred to the ground, and then a final set of levels is taken over it, from which the working section is prepared.

It may be explained that for railway work a transit theodolite is the instrument usually employed, and for measuring a 100-foot chain is used, pickets being driven at every chain length nearly flush with the ground on which levels are taken, as well as intermediate points where necessary.
To construct a railroad of over 500 miles in length, under the most favourable conditions and in the most highly-civilized country, is not a task to be lightly undertaken; but when a work of such magnitude has to be carried out in the heart of the Dark Continent of Africa the difficulties are well-nigh appalling – and, judging by what has been done or attempted by foreign Governments in their African dependencies, only surmountable by British engineers and under British administration. Such a work has not only been planned and commenced, but will at no distant date become an accomplished fact, and the silence of the shores of the Victoria Nyanza, that great inland sea in the very heart of Africa, will be broken by the whistle of the locomotive and the bustle inseparable from a great railway terminus.

Every reader of The Wide World has heard of the Uganda Railway, but it is a matter for speculation as to how many realize what these two words mean. Well, then, they mean that a wide track has been cut for a distance of 500 miles, or about the same distance as from Euston to Aberdeen, across swamps, through primeval forest, through malarial and tsetse-fly ridden belts, where horses cannot live and man becomes fever-stricken, across high, wind-swept plateaus and round mountains in places almost as steep as the sides of houses, until the beautiful Nyanza with its wave-lapped shores is reached. The wonders of this line cannot be better summarized than in the words of Sir Harry Johnstone, His Majesty’s Commissioner in Uganda, one of our ablest administrators and certainly our most interesting despatch-writer.
‘I wonder,’ he says, ‘if in England the importance of one aspect of this railway construction has been realized! It means the driving of a wedge of India, two miles broad, right across East Africa, from Mombasa to the Victoria Nyanza. Fifteen thousand coolies, some hundreds of Indian clerks, draughtsmen, mechanics, surveyors, and policemen are implanting the use of the Hindustani language, are carrying the Indian Penal Code, Indian postal system, Indian coinage, Indian clothing, right across these wastes, deserts, forests, and swamps, tenanted hitherto by wild, naked savages or wild beasts. It is one of those strong gouges which civilization employs to rough-hew her ends – a gouge which leaves a great, clean track of good, sprinkled at its edges with items of suffering, little deeds of harm and unintentional injuries of atoms. As you roll by so smoothly in a well-appointed carriage you see occasionally from the windows, perhaps twice in three hundred miles, a headless corpse flung on to the grass below the embankment. It is a native who has not yet realized the truth, so frequently told at British railway stations by placard, that “it is dangerous to walk along the line.”’ Contrasting the lesser ills, Sir Harry Johnstone says that ‘the railway has taught the negro the value of honest work and has saved thousands from death by famine. To the hungry people of East Africa dying from the result of three years’ drought the railway has brought food and shelter, and the Masai who, a year ago, were chiefly engaged in raiding and slaughtering are now working as navvies on the line, decently clad for the first time in their lives.’

Before proceeding with my more immediate task – the recital of some of the difficulties encountered from wild beasts – it will not be inappropriate to give a few ‘dry’ but useful particulars concerning this line.

It has now been five years under construction, having been commenced in January, 1896, and at the time of writing rail-head is somewhere about the Salt Lake Nakuro, some 460 miles from the coast terminus of Kilindini, at Mombasa, thus leaving a distance of 120 miles to be constructed before the terminus at Port Florence, on the Victoria Nyanza, is reached – probably in another year.

The photograph on the preceding page (not included) shows a portion of the line near Mackinnon Road Station, in the Taru Desert. A curious contrast is here shown – a group of naked Wateita natives standing complacently at the side of the track watching the inspection trolley, which has just returned from a trip along a section of the line. This vehicle is worked by the Indian coolies, a number of whom are shown in the photograph (not included).

For the first 200 miles the line has had to be constructed through dense forest; and the second picture, taken near Masongoleni Station, 180 miles from Mombasa, shows the method of working, after a path has been cut through the trees and thorns for the railroad track. Here a gang of coolies are seen engaged in making a cutting, the baskets of earth as removed being used to form the embankment. On some parts of the line the earth-work has been insignificant
compared with the dense, thorny jungle and the difficult work of grubbing up and removing stumps from the track.

But, as I said earlier, this great railway line is an accomplished fact for a considerable distance, and in order to show what travelling is like on a Central African railway I will give a few extracts from a letter recently received from a friend who has by this time safely reached his destination in Uganda.

‘Last Thursday,’ he says, ‘we got a special train to take us up as far as Kikuyu, 340 miles from the coast, where we spent some time encamped beside the railway siding at Kikuyu Road. There was, of course, much to interest and instruct along the railway route. We have journeyed the 340 miles from Mombasa in about a day and a half. Starting at noon on Thursday we arrived at Kikuyu about midnight on Friday – not a bad speed considering that we have ascended over 6,500ft. on African soil on a single line. The first stage of the journey, to Voi, ninety-five miles, took till midnight to traverse – just twelve hours. But this included, besides various short stoppages on the line, a halt of four hours at a place called Samburu, occasioned by an accident to a train ahead. The country between Mombasa and Voi was fairly interesting. The scenery was pretty ordinary, and reminded one very much of Surrey at times – low thorn bush and scrub in the foreground, with hills behind. A few villages and occasional signs of cultivation appeared at intervals. At Samburu, which is in the waterless Taru Desert, our enforced detention enabled me to go off for a good long walk, mostly along the rails, for fear of missing the train when she should start. I walked on so far, in fact, that I did not hear the warning whistle of the engine, and had to stop the train when it overtook me. I must have wandered ten miles or so, but it was in the late afternoon and was very pleasant. I took my place in the train, and at midnight was awakened with the news that we had reached Voi, a hundred miles up the line, and that a dinner awaited us hard by the station. And, sure enough, a bare 100 yds. from this Central African station we found a well-kept, spacious restaurant, where a hot six-course dinner was immediately served at 2 1/2 rupees a head! We had soup, fish, game, mutton, plum-pudding, and fruit. Voi is a large and important station, just like any country station in England. After dinner, contrary to custom, we again entrained, and, travelling all through the night, reached Makindu, another large station, at 9.30 the next morning, just in time to do justice to breakfast, which was ready immediately on the arrival of the train, as at Voi. Makindu, 200 miles from Mombasa, was not even known two years ago, but is now a large Indian settlement – all railway hands, of course. The luxury of dining-cars being at present unknown on the Uganda Railway, we bought at this place cold meat, vegetables, and fruit, and took them on board to eat for the midday meal on the way.

‘After leaving Makindu we saw a good deal of monotonous desert scenery. Taken as a whole the country through which the line passes is very thinly inhabited. As
we sped along we passed a few swamps with long grass, which, we were told, would be the sort of thing we should have to march through later on. The mountains we saw varied in range from 3,000ft. to over 7,500ft., and included the grand Kilimanjaro range. Numerous Indian encampments, consisting chiefly of breakdown gangs, were scattered along the line. Some of the temporary bridges over which we passed were decidedly shaky, and occasionally have given way under the weight of heavy trains. We were told that we were very fortunate to have escaped accident or breakdown. During the journey I espied two rhinos, some ostriches, two elands, and several wildebeestes and antelope. Thirty miles beyond Makindu we stopped at the station of Simba, which, being interpreted, means ‘Lion.’ It is in the heart of the lion country, and we saw several very ingenious lion-traps near the station. Two of our party went off for a long tramp while the train was at rest here, forgetting about the lions, and as they did not return till after sunset fears were entertained for their safety. But on their return they assured us that they had not met a specimen of King Leo’s tribe or even heard aught of his voice. Another fifteen miles brought us to Kibwezi, situated amid beautiful hills, and I longed for a camera to snap-shot a few of the glorious, verdure-clad ranges. At 9.30 at night we steamed into Nairobi, the railway head-quarters, 330 miles from Mombasa. After an hour’s halt for dinner in the vicinity of the station we started off on the last short nine miles to Kikuyu, which was reached at about midnight.

[...]

The third photo is a curious one and shows how in the tsetse-fly belt which extends for some 250 miles from the coast attempts are being made to prevent the enormous mortality among transport animals. As will be seen, the animals are attired in a complete suit, which I understand is only partially successful in keeping off the fatal fly. In the tsetse zone it is quite impossible for horses to live, but by the help of the railway animals are gradually being got up to the healthier districts of the interior.

The old ‘safari’ or caravan road runs parallel with the railway, and the next photograph (not included) shows a caravan on its way. The long line of native porters in Indian file is clearly depicted in this snap-shot. The natives are particularly fond of flags and drums, and with the latter keep up a continuous ‘tum-tumming’ as with their loads on their heads they march to and from the coast. Not infrequently the tired natives fall out en route, and when camp is pitched for the night the drummers do good service in scouring the vicinity for their missing comrades.

Some of the engineering difficulties connected with the construction of the Uganda Railway have been very great, and in many places tremendous gradients have to be negotiated. The highest of these summits is that at Mau, with an altitude of 8,300ft., whence there is a sheer drop of nearly 5,000ft. to the level of Lake Victoria. /
The next photograph (not included) is a view of the second highest point on the railway – the Kikuyu escarpment (7,500ft.) – and it also shows a rope incline which has been constructed temporarily so that the completion of the permanent line round the gradient may not be delayed. This temporary line is a most interesting piece of engineering work. In the photograph the ‘carrier,’ which is hauled by steel ropes, is just about to ascend to the summit with a loaded truck, which it will deposit on the more level line at the top, the whole being pulled up by a weighted truck coming from the summit, and which is easily discernible in the picture.

A peculiar interest attaches to the next photograph (not included). Equator Camp is some distance off the railway line, being in reality on the old caravan route, and situated some little way beyond the Eldoma Ravine Station. Although no positive observations have been taken, this is supposed to be the spot where the Equator crosses that part of the country, and the sign announcing the fact was erected by one of the officials. It is in the midst of a vast stretch of desolate and uninhabited country; and with the exception of an occasional passing caravan there is no sign of human life. Close by this notice-board is a clearing, which has been made on the site of a camp which has been used probably for hundreds of years by the old ivory traders.

In the letter I have quoted my friend speaks of the quantity of big game he saw from the track; and some of the photographs I have been permitted to reproduce will sufficiently indicate that the Uganda Railway passes through a country that is indeed a paradise for sportsmen. The great stretches of grass land are often literally covered by herds of game, and numbers of the animals approach fearlessly quite close to the trains. Instead of the cows and horses to be seen grazing close to the English railway the traveller on this great Central African line will see zebras, gnus, gazelle, hartebeest, jackals, ostriches, giraffe, and lion within easy distance of the rails. In the earlier days of the railway it was no uncommon thing for the train to be pulled up while the passengers alighted to have a shot at some lion or zebra that had strayed on the track.

[...] Rhinos, too, occasionally cause trouble on the railway. One day while running between Makindu and Tsavo stations the train crashed into one of these animals which was walking unconcernedly along the metals. As in the encounter between Stephenson’s engine and the ‘coo,’ the locomotive came off best, and the unfortunate rhino after getting pushed along the rails was caught, becoming entangled in the cow-catcher, whereupon the engine-driver got down and shot him. On another occasion the train ran into a herd of zebra on the Athi Plains, where these animals congregate in hundreds.

Sir Harry Johnstone, in a recent report, gives a graphic account of the big game to be met with on the Uganda Railway, and I cannot do better than give an extract from his despatch.
‘From Makindu,’ he says, ‘I travelled on through the night towards Nairobi. As the dawn diffused itself over the Athi Plains we saw from the windows of the train a rare and beautiful sight. These immense level stretches of grass land, reduced in the present drought to uniform grey-yellow stubble, were literally covered by herds of game, individuals of which would approach quite close to the line, as though they had already lost all fear of the rushing, jointed monster with the smoking head. We saw zebras as close as one might see horses grazing in the meadows along an English railway, and gnus were to us as cattle lazily flicking the flies off their haunches. Grant’s gazelle and Thomson’s gazelle would graze and merely lift their lovely heads as we rattled by. Hartebeestes faced us and shook their horns with mock indignation. Three or four giraffes, even, could be discerned on the sky-line, while pallah and oribi, wart-hog and jackals were things of no account. Ostriches were constantly seen, and I noticed a group of three very handsome males – black, with white plumes – in a dry stream-bed just as we were entering the precincts of Nairobi Station. The whole hour’s panorama of this wonderful zoological garden was like a sportsman’s dream, but the fact was we had been crossing the Athi Game Reserve, where some two years of strenuously enforced respect for the game regulations has brought about this wonderful collection of animals, so rapidly growing in confidence of the protection accorded them, that herds of zebra frequently gallop like runaway horses through the stretched-out township of Nairobi.’

In the early days of the railway construction the English guards and travellers are said to have done a good deal of indiscriminate shooting. The sum total of their shooting, however, was as nothing compared with the disastrous / organized raids of military officers travelling backwards and forwards to Uganda (and tales are even told of their good-natured desire that the passengers should share in these delights). The train was sometimes brought to a standstill, and the eager-faced guard would look in at a first-class carriage to say: ‘There is a fine rhino over there, sir, and I will give you a quarter of an hour’s stop if you like to go after him.’ In the interests of game preservation this is now, however, prohibited.

With so enormous a staff as that employed on the railway the medical needs are necessarily great, and in the picture given on the previous page we see the hospital which was established at Kibwezi, about 180 miles from the coast, for sick coolies. Wherever rail-head happens to be there is now always a flying hospital, chiefly consisting of tents, where both medical and surgical cases are treated.

The last photo. of this series shows how one of the steel boats which have been taken out from England in sections is being bolted together, preparatory to being placed on the Lake, a portion of which is also shown in the picture.

[...]
MEMORANDUM

– for –

THE PRIVATE ENTERPRISE COMMITTEE

by

THE HONOURABLE GIDEON MURRAY, MASTER OF ELIBANK.¹

During the past three years I have been studying the question of railway development in East and Control Africa and in 1920 was in this connection in close consultation with my Parliamentary colleague and friend, the late Mr. Henry Wilson Fox,² M.P., who at that time submitted comprehensive development proposals to the Imperial Development Committee (now defunct). I have officially resided in and have a knowledge in a business capacity of many parts of the British Empire, including South Africa, also of America. I venture, therefore, to lay before the Committee the following views and suggestions with regard to the questions raised in their Terms of Reference.

I understand that the Committee is interested particularly in the transportation problems in Africa and that to interpret the terms of reference the two main issues which the Committee are primarily considering are (a) whether the Railways, existing and future, should be under private or departmental control and (b) whether any future Railways should be constructed privately or departmentally.

The first issue is already very such complicated by the fact that the Railways in East, Control and West Africa are already under departmental control, and that around these Railways there has been built up a system founded upon the
Colonial Office Regulations which will be difficult to break through. To begin with, therefore, even if the Committee were to report in favour of the transfer of these Railways to private control the Colonial Office would, I expect, find themselves met by many cogent arguments in opposition on the part of the Governments concerned. I wish to emphasise this point, because it may have to be taken into consideration by the Committee. On the other hand, I hope that the Committee will not allow a point of this nature to influence their judgment in their final recommendations should they come to the conclusion on reasoned facts that the preponderance of argument is in favour of private, or partially private, control. The transition period of any transference of control in a large undertaking must necessarily be difficult and sometimes complicated, but should not be allowed to stand in the way of a practical solution.

In my view, Railways are always better and more efficiently administered when under private control. The Railway Staff and Officials under private control regard themselves as servants of the public. Under Government control they are apt to regard the public as their servants. This is principally due to the fact that under departmental control there is always considerable difficulty and usually a long delay in discharging an inefficient Official. Secondly, the Railway Staff and Officials have not the same inducement to make the Railway pay, not being dependent to the same definite degree upon the revenue of the Railway as they are when under private control. With government Railways any deficit on working is invariably made good by the taxpayer. With private Railways they must out their cost according to their cloth or otherwise go into liquidation. This leads to greater keenness on the part of all to increase the Railway’s earnings and efficiency. /

In a new Country development of local resources should go hand in hand with railway development. When a Railway is under private control the Company owning and administering it takes every possible opportunity of promoting the development of the local resources by assisting to find new markets, possibly in some cases by assisting to find Capital, in other cases by opening up lands and by promoting through-freights; and this they do by methods of enquiry and business connections which are open to no Government Department. The Canadian Pacific Railway is one of the best examples of the development of a country’s resources by private railway enterprise.

The reason why in the past in our Crown Colonies we have not seen the same degree of, and swiftness of, development as in the Dominions is due largely to the fact that the policy of development has been so cautious and so slow. In the Dominions and in South America if a Railway is required the Government concerned calls for Tenders, accepts a Tender, and the thing is put through at once, or else if the Government has not the necessary funds wherewith to pay for the railway construction themselves they offer to an individual or group a
concession under which the individual or group finds the money to build the Railway, and in return for this is given substantial reward in the shape of guaranteed interest on a substantial scale and grants of lands or minerals or both. In South America the guaranteed interest is never less than 6%.

On the other hand, what is the policy in our Crown Colonies? Usually the Colony is unable to find the funds for railway development. They then cast about for a concessionaire. Individuals or groups come to them or to the Colonial Office or to the Crown Agents and long and lengthy intricate negotiations ensue. The Colonial Government, the Colonial Office and the Crown Agents together in consultation will perhaps decide that they will grant a concession to build the Railway, but that the interest to be guaranteed for a term of years by the Colonial Government shall be 5% at the outside and that there shall be no guarantee of Principal and no concession of lands or any return for the risk which the Capitalist undertakes when he launches his money often into the midst of a virgin jungle. British Financiers, therefore, prefer to go to those Countries like South America where they can expect some ultimate return commensurate with the speculative risk of the outlay.

I would suggest, therefore, that in future where Colonial Governments desire railway development they should grant more generous terms both in the way of guarantee of principal and sinking fund and where the Principal is not guaranteed, of grants of land, together with their mineral deposits, upon freehold or long leasehold basis.

I am of the opinion that the construction of Railways where Government funds are available should be thrown open to competitive Private Tender. In my judgment a Government Department should not be allowed to tender for big railway contracts because, as I have already pointed out, speed is requisite and no Department as a rule has the means of carrying through a large contract quickly. Furthermore, how can a private firm tender upon equal terms with a Government Department. The Department is obviously in a superior position because if it breaks any conditions of the Tender it is only breaking its own conditions and there is no enforcement of penalty against it. Speed and efficiency in railway construction is especially desirable in the Tropics and this the private contractor can give. The Government Department cannot do so. There were some very interesting figures given in a leading article in the Morning Post of 18th, August, 1923, showing the cost of railway construction in West and East Africa and comparing the estimates of construction under a private or department system, and the times taken to construct by Government machinery.

Let me give two instances of this:

In the case of Uganda Railway, the cost of the railway was at first estimated at £5,600 per mile as compared with the estimate of £4,300 a mile supplied by
a private firm. The cost was actually £9,900 per mile and the time taken in con-
struction, instead of three to four years, was seven to eight years.

Take another case. The cost of the Gold Coast railway was double the official
estimate and amounted to nearly £11,000 per mile and three years were occu-
pied in completing 40 miles.

From what I have stated above the Committee will appreciate that I am in
favour of private construction and private control so far as possible. I admit that
Government control may be necessary in regard to supervision of freight rates.
Also if War took place power must be reserved for any or all Railways to revert
to Government control during that period.

I appreciate, however, that for various reasons complete private control may
not be realisable or practicable in Africa and that therefore endeavours should be
made to find a via media. I have in mind the example of the Anglo-Persian Oil
Co. which whilst administered entirely as a private Company has on its Board
Government Representatives and also Government Share Capital. I see a way in
which this principle might be applied to certain of the African Railways.

UGANDA AND BRITISH EAST AFRICAN RAILWAY
SYSTEM.

My suggestion in short is that a strong private Company should be formed, con-
sisting of a combination of several important Contracting and Shipping groups;
that the Uganda Railway, with its branch lines and including the Busoga and
Kampala railways and the railway now being constructed at Uasin-Gishu,
should be valued as they stand to-day; that these Railways should be handed
over to that Company at a Valuation agreed upon between the Government
and the Company; that the Valuation so arranged together with a certain addi-
tion for Working Capital be the declared Capital of the Company; that 40% of
the Capital be allocated free to the Imperial and Colonial Governments and
that the Company then should go to the public for the remaining 60% in the
form of Debentures, the Imperial Government guaranteeing a low rate of inter-
est thereon and repayment of principal. The Debentures so raised should be
secured upon the whole agreed value of the Railways. The Government share
of 40% would be paid to them in free ordinary shares. Of the capital thus raised
sufficient should be retained for Working Capital, the remainder to be paid to
the Imperial and Colonial Governments as purchase money for the Railways
required.

With regard to this purchase money, however, there should be this under-
standing, that it should be there should be this understanding, that it should
be utilised again as soon as possible and after careful investigation by the Gov-
ernment and the Uganda Railway Company upon further railway development
in British East Africa and Uganda – any Railway constructed out of such purchase money to be placed under the managing direction of the Uganda Railway Company upon financial terms to be agreed between the Government and the Company. The new Railway would in other words become a subsidiary of the principal Uganda Railway Company and would provide security for the additional raising of Capital for further construction.

I should, moreover, as in the case of the Anglo-Persian Oil Co., add two Government Representatives to the Board so that the Government may keep in close touch with the policy of the Company. The parent Company should have its headquarters in London with a Local Committee in British East Africa. / It would also be advisable to arrange that a Port Authority be established at the Port of Mombass, upon which should sit a Representative of the Government and a Representative of the Railway Company. This would enable the Government, Railway Company and the Port to work in close co-operation, although I should prefer to see the Port directly administered by the railway authority.

**TANGANYIKA RAILWAY SYSTEM.**

Whilst in the case of the Uganda Railways a net annual profit is now shown which therefore makes my foregoing proposals immediately financially possible, the same does not apply to the railway system of Tanganyika, and therefore, in that territory, at any rate in the meantime, different action would be necessary.

The mainline railway running from Dar-es-Salaam to Kigoma shows at present a heavy annual loss and so far a I can judge this loss will continue until this line, which is the main artery of Tanganyika and East Central Africa, is supplied with feeders opening up the rich territories near and around the adjacent Lakes. It would therefore seem desirable for the Government to press on new railway schemes with that object.

Those most important in my opinion would be a railway connecting –

(a) Lake Nyasa with Lake Tanganykia, 200 miles in length (Mwaya to Kasanga) with a small extension from Kasanga to Aberoon, about 30 miles. This would open up a most fertile part of Central Africa and add to the world's food supplies in both beef and cereals. It is a country that has hitherto been untapped, and also a part of the country in which I understand Europeans could live in comfort.

(b) Lake Tanganyika with Lake Kivu, about 60 miles in length, along the Rusisi River Valley, opening up another very fertile area and incidentally bringing nearer the territory of Ruanda, alleged to contain some two to three million head of cattle, sheep and goats, and thickly populated with an industrious people.
(c) Mwanza, on the southern end of Lake Victoria-Nyanza with Tabora (on the main Dar-es-Salaam line about 200 miles east of Lake Tanganyika) about 190 miles in length.

(d) Kelossa (situated on the main Dar-es-Salaam railway about 150 miles from Dar-es-Salaam) south-west through rich territory with the north end of Lake Nyasa, a distance of about 250 miles.

Another projected railway is that of Tabora in a north-eastern direction to Kasseke on the edge of the Ruanda country between Lakes Kivu and Lake Victoria-Nyanza. There has, however, been considerable controversy regarding this railway both as to route and point of terminus, and I do not bring this into the scheme for the moment although ultimately I think it is clear that a railway will have to be built somewhere in that direction.

There are two possible methods under which these railways might be financed and constructed;– Either the Imperial Government could provide the necessary funds for their construction in the same manner as they did for the Uganda Railway and that they be constructed by private contract; or else a private company might be formed for this purpose, which would go to the London money market for the necessary funds with an Imperial guarantee as to interest and principal for a period of say 30 years or instead of guarantee of principal the company might be granted concessions of lands and minerals upon a freehold or long leasehold basis alongside the railway lines.

In any event, I would suggest that a private company, with government representation, similar to that which I have proposed for the Uganda Railway, should be formed in connection with Tanganyika to administer all the railways of that territory. In the case of the main Dar-es-Salaam Railway this Company should act as managing directors, receiving agreed payment for this service, for obviously the present financial circumstances would not admit of this line being taken over entirely by any private company unless guaranteed by the Government both as to principal and interest, until such time as it showed sufficient profit to pay its own way.

CO-ORDINATION OF RAILWAY SYSTEMS OF EAST AND CENTRAL AFRICA.

Some form of co-ordination for the purposes of policy between the two railway systems of British East Africa and Tanganyika is obviously desirable, but I am not at present prepared to make any recommendation on this point.
IMPERIAL DEVELOPMENT OF RAILWAY SYSTEMS.

Finally, I would like to submit this recommendation. I believe that the time has come when the Imperial Government should consider, very seriously indeed, the more speedy development of their large central and East African tropical possession. Such development, however fast, must necessarily take considerable time and a generation passes very quickly when development on this large-scale nature is proceeding. During the late Great War Central Africa was useful, even with its present small degree of development, in assisting the food supplies of the world, especially by export to India. If there is ever another war the food supply position is likely to be more complicated and difficult even than in the last. Central Africa contains enormous food resources only awaiting development. I venture to go so far as to say that it is the duty of the Imperial Government to take every reasonable measure to develop those resources.

It should, moreover, not be overlooked that where railway construction is concerned, much employment can be given in Great Britain, and so the Government could with domestic advantage also initiate a bold policy in connection with the development of African transportation and of transportation in her other Crown Colonies. Legislation might be introduced to enable the Government to borrow on the London market up to fifty million pounds for that purpose, as and when it is required. When we remember that in the past three years we have spent £400,000,000 in hard cash in unemployment benefits to the workless in this country and that our national debt is some £8,000,000,000 to-day, 50 or even 100 millions for the Imperial purposes outlined in this memorandum seems a mere bagatelle, especially as a very great percentage of it would come back to the unemployed in this country and create good profitable employment of a reproductive nature.

I venture to hope that this memorandum may be of some service to the Committee and I shall be very glad to elaborate any of the points in it should it be possible for me to arrange a meeting with them.

[...]
When the British South Africa Company first took over the administration of the country, the nearest centre of railway communication was Kimberley. Appreciating the importance of keeping in touch with Cape Colony, and of having railway connection with a British port through British possessions, one of the first steps which the Rt. Hon. C. J. Rhodes took after the Charter had been signed, was to obtain permission to extend the Cape Government’s railway from Kimberley to Vryburg in Bechuanaland. The extension was begun in November, 1889, and was opened to Vryburg in December, 1890, the distance (126 miles) having been completed in a little over a year.

Before extending the line northwards from Vryburg, it was deemed expedient that a separate Railway Company should be formed, and the Bechuanaland Railway Company was accordingly incorporated in May, 1893, in which month the extension was begun. The line was gradually pushed on through Mafeking, Palapye, and Francistown, until on the 19th October, 1897, it reached Bulawayo, which, from being the head kraal of Lo Bengula in 1893, had by this time become an important and thriving township.

The urgency of having railway communication right through to Bulawayo was intensified firstly by that fatal cattle disease, the rinderpest, which denuded the country to a very large extent of its means of transport, and secondly by the
Matabele Rebellion which broke out in the beginning of 1896, during the worst period of the cattle epidemic.

These two causes hastened on the completion of the Railway to such an extent that the last 228 miles from Palapye to Bulawayo were completed in the incredibly short space of four and a half months; and taking into consideration the fact that all the railway material had to be carried over a single line, on which for the greater part of its length a large amount of additional traffic had to pass, it must be admitted that this achievement was a triumph of railway building.

Thus the iron horse reached Bulawayo, and the formal opening of the line on the 4th November, 1897, at which a large gathering of distinguished and influential visitors was present, will always be remembered as the birthday of a new epoch in the history of Matabeleland.

Whilst the Bechuanaland Railway Company (now known as the Rhodesia Railways, Limited) was bringing the line up from the South, railway construction was also being carried out in Mashonaland, the Eastern portion of Southern Rhodesia. Salisbury, the capital of Rhodesia, being less than 400 miles from the coast, was naturally anxious to obtain railway connection with the Portuguese port of Beira as soon as possible.

In spite, however, of the comparatively short distance over which the line had to be laid, there were many obstacles in the way of constructing it.

In the first place, the country from Beira inland for about 200 miles belonged to Portugal, and though in 1891 a treaty was made between that country and Great Britain, in which the former agreed to construct, or cause to be constructed, a railway from the Pungwe River to the British sphere of influence (Rhodesia), it was not until the right to construct this line had been handed over by the Portuguese Government to the Mozambique Chartered Company, by this Company to Mr. Van Laun, and by Mr. Van Laun to the British South Africa Company, that through them the Beira Railway Company was finally formed.

Another more serious obstacle to the actual construction of the railway was the nature of the country through which it had to pass. To say that the altitude steadily rises from sea level until only 330 miles from Beira it reaches 5,600 feet, gives only a faint idea of the sort of difficulties with which this little Pioneer Railway Company had to contend.

Fontesvilla, 35 miles up the Pungwe River, was the spot chosen as the starting point of the line, which was of a two-foot gauge, and from here the first section was laid in a westerly direction for a distance of 75 miles, and was opened in October, 1893.

For the first few miles, across what are known as the Pungwe Flats, the actual laying of the rails was not a difficult task, in spite of the frequent washaways that occurred; but in such a low-lying and swampy country, situated within the Tropics, the awful ravages of malarial fever worked terrible havoc amongst
the construction parties. Slowly but surely, however, the work went on, and in November, 1894, the line was opened to Chimoio, a distance of 118 miles from Fontesvilla.

As Chimoio continued to be the railhead for some years, it may not be out of place to give a short account of the line as it then existed.

Nobody who travelled to Salisbury via Beira in those days, can forget the excitements, the diversions and eccentricities, not always delightful, in which this curious little railway indulged; but, primitive though the railway no doubt appeared to one only accustomed to English travel, no one could have heard the shrill whistle, or seen the puff of real train smoke rising above the malarial mist on the banks of the Pungwe, at 6 o’clock in the morning, without experiencing a joyful thrill in the thought that, in spite of all his previous hardships, in spite of his two or three hours’ rest on some mud bank up the river the night before and his subsequent introduction to ‘all the comforts of a modern Hotel’ at Fontesvilla, he had at length regained a portion of that civilization which he seemed to have cast off for ever when he left the boat at Beira.

In Mr. Leo Weinthal’s Guide Book ‘Round Africa,’ Beira is described in 1902 as ‘one of the bleakest places on the whole East Coast,’ and its streets as being in a ‘disgraceful state.’ This is as it may be, but nevertheless Beira might almost be called a paradise to-day, compared with what it was in the days when the Fontesvilla-Chimoio Railway was opened.

At that time it was nothing but a narrow strip of sand, the monotony of which was only relieved here and there by a low galvanized iron house, an evil-looking kiosk or drinking saloon, and a so-called hotel. To-day it has got streets, and its streets are paved on either side throughout the town. Then, so far from having pavements, the barren waste spaces of sand between the houses could not even be honoured with the name of streets. The ‘Upper Ten,’ or probably less, had their own private bogey carriages / which were pushed by natives along tiny tramway lines, but the rest of the inhabitants had to plough through the sand as best they could.

Gladly did the traveller turn his back on Beira, and face with alacrity the little steam launch on the Pungwe River, on which, to distract his attention from gloomy thoughts, he could usually interest himself while the daylight lasted, in watching the monkeys playing in the forests, whilst every now and then a gaping crocodile would glide from the muddy bank into the water, and in the distance could be discerned the snout of a great hippopotamus.

Not so interesting did he find the situation when the night had fallen, and the steam launch, as was often its wont owing to the shifting of the river channels, had unceremoniously landed him on a bank of sand or mud; and when it finally reached its destination late at night, the traveller might well have wondered by what strange chance the name of Fontesvilla had been given to it. Surely the Por-
tuguese Dom who christened it must have been akin to the Muses themselves, that he found scope for his poetic fancies in such an abandoned spot, and could picture fountains playing through the poisonous reeds of that miasmic swamp!

In short, the traveller found in Fontesvilla an infinitely worse place than Beira, and it is not surprising that he hailed with delight the little railway train which was to carry him far away from such dismal surroundings, towards the higher and purer altitudes of Mashonaland.

The discomforts of that railway journey were speedily forgotten in the joy of being once more in a train, and in the new and varied excitements which the stranger found everywhere along the line.

He heeded not that his favourite rug, which had so often reclined in safety on the rack of an English railway carriage, was being steadily reduced to ashes by the sparks from the wood fuel, which for many years had to do service for coal, whilst he watched, with all the joyous wonder of a child first visiting the Zoological Gardens, zebras, buffalo and eland, and many other strange and beautiful animals in all the wildness of their natural freedom.

Time was no object in those old days, and it was not considered unusual for the engine driver or guard to stop the train occasionally, in order to bag a brace of partridges, or risk a shot at a wandering lion, who, with all the proud indifference that might be expected from the Lord of the Forest, shewed very little respect for the Beira Railway Company.

A great many stoppages were inevitable, for besides the halts for fuel and water, the gradients at some points along the line were so steep that the little engine had sometimes to make several attempts before it reached the top, and before each attempt it would go back a little way and wait until it had accumulated sufficient steam to make it worth its while to try again. Up some of the worst of the zigzag ascents the services of natives had even to be employed, whilst the traveller himself would perhaps be requested to take his share in the performance by walking before the engine and throwing sand on the rails.

The 118 miles were travelled in anything from 18 to 30 hours according to the diversions en route though it must be admitted that very liberal time was allowed for dinner at the 80 mile Peg. Still, no one who travelled by that first railway could complain that he had not been given sufficient time to observe the scenery, which, whether flat or mountainous, wooded or bare, cannot fail to attract through the mysterious charm of its unbounded wildness. The only regret he could have felt was that the railway line did not go farther; for a coach journey, except apparently in the 'good old coaching days,' is as a rule a most uncomfortable experience, the more so when one does not know for how many days and nights one may have to endure it; and, when coaching in the rainy season, this is always an open question.
On the 29th October, 1896, railway connection was opened between Beira and Fontesvilla by the Beira Junction Railway Company, and in 1897 the Mashonaland Railway Company was formed for the purpose of constructing a line of a 3 ft. 6 in. gauge from the border of the Portuguese territory to Salisbury. Owing to great survey difficulties the small gauge line of the Beira Railway Company was not opened from Chimoio to the border until February, 1898, and in the meantime the Mashonaland Railway Company had entered into a contract with the British South Africa Company, whereby the latter agreed to construct the broad gauge line to Salisbury, and provide the necessary funds. Work was begun on the 11th January, 1898, and the line was completed in May, 1899.

The Beira Railway being only of a two-foot gauge, considerable delay and expense were entailed in transferring goods at Umtali from one line to the other; also, owing to the narrowness of the line, only a limited amount of traffic could be passed along it. It was therefore decided to widen the line to the standard gauge of 3 foot 6 inches, and the work was completed and handed over on the 1st August, 1900, on which date also an arrangement came into operation for the working of the entire system from Beira to Salisbury under one management. Before laying down the broad gauge between Beira and Umtali, the line was partly re-surveyed, with the result that some of the worst gradients were avoided, and a saving of 18 miles in the whole distance was effected. From this date the line has been steadily improved; coal has, to a large extent, superseded wood, and the corridor carriages are as comfortable as anyone could wish them. True, some of the excitement of the old time have disappeared, but these things must always happen with the advance of civilization.

It is between Chimoio and Umtali that the most beautiful mountain scenery is found, especially in Manicaland, where the little Portuguese township of Massikessi and the Revue River are particularly mention; whilst the approach to Umtali through the Christmas Pass is one of the most perfect pieces of scenery imaginable.

Though none of the mountains seem to be individually high, owing to the altitude of the whole country, they nevertheless have a peculiar grandeur of their own; and the view round this portion of the line, particularly if seen on one of those evenings when the silver glory of a tropical moon blends with the last rays of the setting sun, whilst distant veldt fires, slowly creeping up the mountain sides like fiery centipedes, add weirdness and wildness to the scene, is quite beyond all description.

The site on which the township of Umtali is steadily growing is one of the prettiest that could be found throughout the country. It is entirely surrounded by hills, some of great beauty and magnitude, and the colouring of which the artist would find it difficult to faithfully depict. If the traveller has sufficient time
to spare, the park at Umtali, with its little river now running past banks of rich green sward, now breaking into tiny cascades, is well worth a visit.

After leaving Umtali the hills become more scattered, and the great rugged clumps of granite boulders, one of the most characteristic features of Mashonaland scenery, gradually appear. The marvellous formation of these clusters of rock, interspersed with trees and undergrowth, cannot fail to attract the stranger’s attention. Their picturesque irregularity, the extraordinary and fantastic positions which these great boulders have taken, some appearing to be hardly balanced, so easy does it look to push them over with one’s hand, make it seem as though in the bygone ages they must have been the playthings of some Her-culean race.

Whatever the origin of their formation, and it is generally believed to be the result of the heavy rains which for thousands of years have washed away the land around them, they proved very formidable and often impenetrable strongholds for the Mashonas, who were quick to take advantage of these natural strongholds, both against the Matabele who used to raid their cattle and carry off their women from the lands, and against the white men during the rebellion in 1896.

The highest point on the Beira-Salisbury Line is Marandellas, 45 miles from Salisbury, where there is a good hotel. The altitude is 5,600 feet, and from this point there is a gradual descent into Salisbury, which is situated about 4,800 feet above sea level.

The principal rivers spanned by the line between Umtali and Salisbury are the Odzi and the Ruwa, each about 12 miles from these respective townships.

Though there is plenty of bush country all along the line the nature and the size of the trees alter considerably as one rises to the plateau of Mashonaland; the tropical vegetation is left behind, and the larger trees disappear.

Salisbury, the capital of Rhodesia and the seat of the Government, has a white population of nearly 2,000. There are some good buildings, notably the Administrator’s Office, Victoria Memorial, Volunteer Drill Hall, Town House and Standard Bank. There are Churches and Schools, several Hotels, Clubs and Boarding Houses, a Public Library, and many excellent shops. A large and attractive park has been tastefully laid out, and it seems almost miraculous that what but a few years ago was dry and barren veldt, is now a profusion of flowers of all kinds, trees and grass lawns.

The usual amusements of a British colonial town – sports, dances, racing, concerts, etc. – are freely indulged in.

Having described the building of the railway from the East to Salisbury, let us see what improvements and extensions have been made in the West by the Rhodesia Railways, Limited.
It has been shown how in 1897 the line from the South reached Bulawayo, more than eighteen months before Salisbury had railway communication; and in consequence of this, the former township, though three years younger than Salisbury, very soon exceeded it in population, and in the number and size of its buildings.

Some of these for such a young town are exceedingly handsome and costly, those built with the red stone which is quarried in the neighbourhood being particularly imposing.

Owing to heavy working expenses, granite, which is found in large quantities throughout Rhodesia, has hitherto been utilized only in building bridges, and in making foundations, etc. Doubtless, if the Romans had colonized Rhodesia, the Pioneers in ’89 would have found whole cities of this imperishable stone scattered over the country, but labour must have been plentiful and labour questions scarce ‘in the brave days of old.’

Notwithstanding modern difficulties, however, the Roman Catholics at Bulawayo recently opened their new church, which is being built entirely of granite. Although little more than the centre nave has been completed – the church will eventually be cruciform – it is already an imposing structure, the massive stone giving full justice to the early Gothic style of architecture, in which it is built.

In 1898 Mr. Rhodes formulated a scheme for the extension of the main trunk line from Bulawayo, via Gwelo, to the Zambesi, and thence to Lake Tanganyika. One of his great ambitions was that railway communication from the south would gradually join that from the north, so that finally a Cape to Cairo Railway would become an accomplished fact. He endeavoured to obtain the co-operation of the Imperial Government to this important undertaking, but without success. The various mining and exploration companies were then approached, and sufficient funds for the construction of the first section of about 150 miles were at once obtained. At the same time it was decided that whilst the railway was being pushed northwards, via Gwelo, a line was to be built from Salisbury to meet this extension.

The line from Bulawayo to Gwelo was begun on the 30th of May, 1899, and the work of construction was progressing rapidly when the Transvaal War broke out. Owing to the impossibility of obtaining the permanent way for carrying material and stores from the south, the contractors were obliged to suspend work.

The Directors of the Rhodesia Railways, Limited, then decided to extend the railway from Salisbury so as to meet the line from Bulawayo, and by the 1st of June, 1902, the 188 miles from Salisbury to Gwelo were opened to the public. It is worthy of notice that this line was built whilst the Boer war was raging on the borders of Rhodesia, and at a time when all the supplies for its inhabitants,
in addition to the requirements for the commissariat and transport of a large force of Imperial troops, had to be carried on the single line from Beira to Salisbury. After peace had been proclaimed it gradually became possible to utilize the Southern line for the transport of railway material. The construction of the line from the Bulawayo end was proceeded with and on 1st December, 1902, only six months after the line from Salisbury to Gwelo had been completed, Cape Town and Beira were connected by rail.

An arrangement has now been made with the Cape Government Railways, under which circular tourist tickets, available for one month, are issued for all stations on the Cape and Rhodesia Railways. It is also proposed to provide saloon carriages, which will be hired out for one month or longer, to persons wishing to visit the chief objects of interest in South Africa, at a charge which will include catering. These facilities will be granted over the whole of the South African Railway system, and will no doubt attract travellers and shooting parties, since the saloon so hired will be taken to any part of the system, and kept for as long as desired in a siding, thus forming the headquarters of the party. / 

The accommodation provided on the ordinary passenger trains in Rhodesia is the same as that on the Cape Government Railways, whilst the Train-de-Luxe, which at present carries the oversea mails once a week, in each direction, between Cape Town and Bulawayo, is fitted up for the comfort of its passengers in as luxurious a style as any of the first class saloon trains in England or on the Continent. This train contains dining and sleeping cars, an observation car and lounge (in which is a writing table and a small library of handsomely bound books at the disposal of the passenger), a card room, kitchen, pantry, lavatories and bathrooms. The dark red leather upholstery, the handsome oak panelling and white metal fittings in which the whole of the state-room accommodation has been tastefully carried out, give an air of solidity and comfort which one seldom expects to find except in a first-class hotel or on one of the large Ocean Liners, and which has / certainly hitherto never been approached in Africa. Though the train itself was not built at the time of Mr. Rhodes’ death, the Railway Company hastened on the completion of one of its saloon carriages, which was used to convey his body to Bulawayo. Since then the train has been placed at the disposal of their Royal Highnesses the Prince and Princess of Wales on the occasion of their visit to South Africa, and has subsequently become famous as the travelling home of the Right Hon. Joseph Chamberlain during his recent tour through the country at the conclusion of the war. /

The country through which the line first passes on leaving Bulawayo will always be memorable as being the opening scene of the Matabele Rebellion in 1896, when men, women and children were treacherously murdered in their homes in all the outlying districts of Bulawayo, and in most of the wayside inns along the old coach road, near which the Railway runs.
As the train crosses the Shangani River one cannot help recalling the heroic stand made by Major Alan Wilson and his gallant companions in their attempt to capture Lo Bengula in 1893, an example of such great coolness and fearlessness in the face of certain death, that even the Matabele themselves were amazed at it. It is by such mournful though glorious incidents that the progress of our race has ever been marked, and it is by such brave men as these that the British Empire is being built. In the Matopos, near Mr. Rhodes' grave, there has been erected a memorial to the heroes of the Shangani, and, as desired by Mr. Rhodes, and with the consent of their relations, the remains of these men have now been laid to rest in that unique and beautiful burial ground, in which only those who have deserved well of their country are to be interred.

Between the Shangani and Gwelo the line passes through the Somabula Forest, and throughout the whole of Matabeleland the country is more thickly wooded than Mashonaland.

Gwelo is a rising township in the centre of some of the best gold producing country, so far as is yet known, in Rhodesia. Besides several hotels and stores, there is an English Church, a school, a good club, a race course, and a small river on which regattas are sometimes held.

Twenty-two miles from Gwelo is the Globe and Phœnix, one of the principal gold mines in the country. Shortly after leaving the station the line crosses the beautiful Sebakwe River, which forms a portion of the boundary between Mashonaland and Matabeleland.

The next place of importance along the route is Hartley, situated 111 miles from Gwelo and 77 from Salisbury. Hartley has been laid out as a township and already possesses besides several stores, a well-built hospital, a Magistrate's house and Government Offices. There are many gold mines in the vicinity, and the country round is a favourite hunting district, game of all sorts being very plentiful. It used to be noted for buffalo also, but, owing to the dangers of the tsetse fly which is always found in the neighbourhood of these animals, they have been gradually shot out or driven away.

The little station of Norton at the Hunyani ‘Poort,’ or opening in the hills through which the river flows, is the last on the line before the capital is reached. It is a lasting memorial to the family who first occupied the adjoining farm. When the Mashonas, at the instigation of the Matabele, rose in rebellion in June, 1896, Mr. and Mrs. Norton, their little child and an English nurse were amongst the first victims of their cruel and cold-blooded murders.

If railway communication conferred no other blessings on the country than that of preventing to a large extent the recurrence of similar horrors in the future, the money spent on their construction could never be said to have been thrown away.
It has been previously stated that the original intention of the Rhodesia Railways, Limited, was that the line from Bulawayo should branch off at Gwelo towards the North, traversing the Mafungabusi district and crossing the Zambezi River near the Kariba Gorge.

It was found, however, after further examination of the proposed route, that, if the Zambezi were crossed at this spot, very heavy expenditure would be necessary owing to the nature of the country north of the river being exceptionally difficult for railway construction. The Directors of the Rhodesia Railways, Limited, accordingly decided on another route farther to the westward, starting from Bulawayo instead of Gwelo, and passing through the vast timber forests in the district of the Gwaai River, through the great WANKIE coal area, and so on to the Victoria Falls, proceeding thence through North-Western and North-Eastern Rhodesia to Lake Tanganyika.

On 9th May, 1901, the construction of the line was begun, and by 21st September, 1903, it was opened to WANKIE, a distance of 200 miles from Bulawayo. After running parallel with the Khami River for several miles, the line crosses the Insese and the Umguzo rivers, and enters the great forest district which stretches from the Gwaai River for many hundreds of miles to the North, and as far as the Shangani to the East. It is curious that on the west bank the formation of the country is entirely different, for on this side for hundreds of miles there are great sandy plains, broken here and there by salt pans and numberless little vleis or water pools, and in the rainy season covered with a poisonous weed which is deadly to horses and cattle.

The most valuable timber found in the forests is mahogany, teak, and mopani. The teak is a very handsome wood, hard and close grained, and of a somewhat redder colour than American teak. It takes a beautiful polish and some excellent furniture has been made of it in Bulawayo. Sir Arthur Lawley,1 who was at one time Administrator of Matabeleland, in an article which appeared in 'Blackwood’s Magazine'2 in 1898, describes the peculiar shape of the mopani trees3 in this part of the country. Their trunks are usually straight and are largely used in timbering mines, but here they have been twisted into strange fantastic shapes through having been torn and trampled upon, when saplings, by elephants which not many years ago roamed in herds all over the district. The forests still abound in game of all sorts, and the country is therefore good, or some people may think bad, for lions also, but they, like the elephants, are being driven farther away by civilization. The more humble hunter can always get as much pheasant and guinea fowl shooting as he likes.

The railway crosses the Gwaai River at a spot about 90 miles from Bulawayo. The altitude here is 3,240 feet, or about 1,200 feet lower than that of Bulawayo; the vegetation has in consequence a more tropical appearance.
From this point the line leaves the Gwaai River, which makes a big horseshoe bend, and traverses a stretch of sand plains for many miles until, before reaching Wankie, it once more runs parallel with the river.

Wankie, called after the name of the native Induna of the district, is a vast coal area, which promises to be one of the most important discoveries in Rhodesia. The many advantages which a local supply of good coal will confer upon every branch of industry in the country are obvious, and on high authority Wankie coal is considered to be second only to the best Welsh, whilst its supply is apparently inexhaustible.

Between Wankie and the Victoria Falls the country becomes more hilly. The railway over this distance, about 75 miles, was completed on the 25th April last.

Of the branch lines in Rhodesia the longest is that between Bulawayo and the Gwanda District, which is being constructed to open up the gold and coal fields to the south-east of Bulawayo. The line was begun in 1899, but work was stopped on the outbreak of the War. In March this year it was opened to Gwanda township (91 miles), and 13 miles more have to be completed. A branch line was opened last year from Gwelo to Selukwe, a distance of about 22 miles. Selukwe is a rapidly growing township in the centre of one of the largest gold mining districts in the country.

A railway is also to be made from Salisbury to the mining district around the Mazoe Valley. The survey has already been completed. The road between Salisbury and the Mazoe, about 26 miles, will always be remembered as that along which Captain Randolph Nesbitt, V.C., and his brave patrol fought their way back in 1896, after rescuing from the hands of the Mashonas the little band of men and women who had been subjected to such terrible dangers and privations in their improvised laager at the Alice Mine.

In August, 1902, a two-foot gauge line, the property of the Ayrshire Gold Mine and Lomagunda Railway Company, was opened between Salisbury and the Ayrshire Gold Mine, which is one of the most promising propositions in Mashonaland. The mine is about 84 miles from Salisbury, by rail.

It is also contemplated to build a line to Zimbabwe, near Victoria, which will give visitors a chance of seeing some of the oldest and most curious ruins in the world.
An Agreement made the day of 1897 Between SIR MONTAGU FREDERICK OMMANNEY K. C. M. G. ERNEST EDWARD BLAKE Esq.¹ and MAU- RICE ALEXANDER CAMERON² late a Major in Her Majesty’s Corps of Royal Engineers all of Downing Street in the City of Westminster the Crown Agents for the Colonies (who and the Crown Agents for the Colonies for the time being are hereinafter referred to as ‘the Crown Agents’) acting for THE SECRETARY OF STATE FOR FOREIGN AFFAIRS on behalf of HER MAJESTY’S GOVERNMENT (hereinafter referred to as ‘The Government’) of the one part and (hereinafter called ‘the Contractors’) of the other part.

Whereby it is agreed between the said parties hereto as follows that is to say:–
1. If the Contractors within calendar months from the date of this Contract at the expense in all things of the Contractors or of the Company to be formed as hereinafter mentioned shall procure to be formed and registered under the Companies Acts 1862 to 1893 a Company (hereinafter called ‘the Company’) with the object inter alia of entering into and carrying out such Contract as is hereinafter mentioned and with Articles of Association containing provisions to the effect that the Company shall not borrow or raise any money except in the manner to the extent and for the purposes specified in the Contract hereinafter mentioned and if the Contractors shall prove by the statutory declaration of the Secretary of the Company and otherwise to the satisfaction of the Crown Agents that the share capital of the Company to the extent of the prescribed sum has been bond fide subscribed so as to be payable in cash by responsible persons within a reasonable time and that such arrangements have been made as in the opinion of the Crown Agents shall be sufficient to / ensure both that the full nominal amount of the said capital so subscribed to the extent of the prescribed sum will as and when received be without any deduction whatever paid into a separate account at the Company’s bankers entitled ‘The Central Africa Railway Account’ and that such account can and will only be drawn upon by drafts signed by a Trustee or Trustees (who shall be nominated for that purpose by the Company and approved by the Crown Agents) and countersigned by the Crown Agents and only for the purposes hereinafter mentioned free from any charges or liabilities whatever in respect of the formation of the Company or any other matter whatsoever and shall procure the Company to execute and deliver to the Crown Agents a Counterpart of the Contract hereinafter mentioned and shall pay to the Crown Agents on behalf of the Government the sum of £10,000 as and for the guarantee mentioned in such Contract then the Government by the Crown Agents will enter into a Contract with the Company in the terms of the draft Contract set forth in the Schedule hereto.

2. The expression ‘the prescribed sum’ shall mean such a sum as shall be fixed by the Certificate in writing of the Government Engineer in the said Contract mentioned after the Survey now being made or now about to be made of the Railway mentioned in the said Contract shall have been completed as representing the estimated cost of constructing and equipping the said Railway and all works connected therewith in accordance with the provisions of the said Contract and in fixing the amount of the prescribed sum the Government Engineer shall allow in addition to the amount obtained by the pricing of the actual quantities such provision for unforeseen contingencies as he may consider necessary not exceeding £10 percent.

3. The prescribed sum shall be applied in or for the purpose of the construction or equipment of the said Railway and Works or for the acquisition of the land required therefor or for any other purpose which the Crown Agents or
the Government may deem incidental to any of the above-mentioned purposes according to proper certificates of the said Government Engineer of the value of the work for the time being executed or materials or equipment or land (other than lands given by the Government) provided by the Company on or in connection with the said Railway and Works. After the cost of constructing and equipping the said Railway and Works and of all matters incidental thereto shall in the opinion of the Crown Agents have been fully paid the residue (if any) then remaining of the prescribed sum shall be paid or transferred to the Company or otherwise dealt with as the Company shall direct.

4. The prescribed sum shall also be subject to the provisions contained in the said Contract with respect thereto in the event of the Company making default in the performance of the said Contract.

5. Every statement representation or reference to this Agreement or to the said Contract to be set forth in any prospectus notice advertisement or circular to be issued by or on behalf of the Contractors or the Company shall together with the whole of the documents containing the same be first submitted to the Crown Agents before such prospectus notice advertisement or circular shall be issued and the same shall not be issued if the Crown Agents shall within seven days after any such prospectus or other document shall be submitted for approval serve on the Contractors notice disapproving of the same. And in the event of any breach of the present Clause it shall be lawful for the Crown Agents by notice in writing served upon the Contractors to determine this Agreement.

6. Every approval or notice to be given or served by or on behalf of the Government or the Crown Agents may be given by writing signed by the Commissioner for the time being of the British Central Africa Protectorate or by one of the Crown Agents.

7. The Contractors will on the execution of this Agreement pay to the Crown Agents all costs charges and expenses incurred by them in or about the negotiation preparation approval execution and printing of this Agreement.

In Witness whereof the Crown Agents and the Contractors have hereunto set their hands and seals the day and year first above written. /
Majesty’s Government of the one part and THE COMPANY LIMITED (hereinafter called ‘the Company’) of the other part

Witnesseth that in consideration of the benefits and advantages to be derived by the Government and the Protectorate from the construction of the Railway and Works hereinafter mentioned and from the working of such Railway and in consideration of the mutual stipulations and obligations hereinafter contained the Government do hereby grant unto the Company the right to construct and work one line of Railway between the points hereinafter mentioned as the points of commencement and determination of the Railway hereinafter described the general route and direction of such Railway being shown on the plan hereunto annexed (hereinafter referred to as the annexed plan) subject to the covenants conditions agreements and provisions hereinafter contained.

And this indenture further witnesseth that for the consideration aforesaid the Company so far as the stipulations and agreements hereinafter contained are to be performed and observed by them do hereby for themselves their successors and permitted assigns covenant and agree with the Government and the Government so far as the said stipulations and agreements are to be performed and observed by the Government and so as to bind the Government / but not so as to impose any personal liability on any Member thereof do hereby covenant and agree with the Company their successor and permitted assigns as follows that is to say:—

1. In this Contract the following expressions or terms shall have the following meanings respectively:—

(a) ‘The Protectorate’ means the British Central Africa Protectorate.

(b) ‘The Government’ means and includes Her Majesty’s Government and the Secretary of State for Foreign Affairs for the time being thereof or other the Official for the time being administering the Government of the Protectorate.

(c) ‘The Commissioner’ means Her Majesty’s Commissioner for the time being of the Protectorate or the person for the time being acting as such.

(d) ‘The Crown Agents’ means the person or persons for the time being authorised to act and acting as Crown Agents or Crown Agent in England for the Protectorate.

(e) ‘The Railway’ means the Railway hereinafter described together with all Works and conveniences to be made in connection therewith.

(f) ‘The Government Engineer’ means (1) so far as regards matters and works in the United Kingdom the Engineer for the time being appointed by the Crown Agents to act in the United Kingdom for the purposes of this Contract and (2) so far as regards matters and works in the Protectorate the Engineer for the time being appointed by the Government to act in the Protectorate for the purposes of this Contract.

(g) ‘Month’ means calendar month.
2. Subject to the provisions of this Contract the Company may and shall with due diligence and expedition construct to the satisfaction of the Government and make ready and fit and equipped for being opened for the public carriage of passengers, animals and goods throughout within the time hereinafter prescribed.

(a) A Railway wholly in the Protectorate commencing at the terminus station to be situate at such point as may hereafter be fixed by the Government Engineer at Chiromo and thence proceeding to Blantyre and on to Lake Nyasa where it shall terminate at such point on the said Lake as may hereafter be fixed by the Government Engineer the general course of the Railway on land being shewn on the annexed plan and marked thereon with dotted lines but the whole route thereof shall be subject to the approval of the Government Engineer.

(b) All such necessary sidings passing places, stations, lights, offices, engine houses, goods and cattle depôts, turn tables, signals, signal cabins, telegraphs and other works (including suitable landing places, piers, wharves and other conveniences and accommodation at the terminus of the railway both at Chiromo and at Lake Nyasa) as in the opinion of the Government Engineer shall be necessary for the due and efficient maintenance and working of the Railway and for the connection of its traffic with the water-borne traffic at Chiromo or on Lake Nyasa.

(c) All such necessary under and over bridges and level crossings accommodation roads, approaches, cattle creeps, water courses, drains, culverts and other works as may in the opinion of the Government Engineer be necessary for the accommodation or protection of the lands intersected by the Railway.

3. A certificate signed by the Commissioner or by some other official duly authorised to sign on his behalf shall be conclusive evidence of any order requirement determination or appointment of the Government mentioned in such certificate.

4. All notices to be given to the Company for the purposes of this Contract shall be in writing under the hand of the Commissioner or of some other official duly authorised to sign on his behalf or the Government Engineer or of one of the Crown Agents and shall either be delivered or left for the Company with such person and at such convenient place as the Company shall from time to time appoint in the Protectorate and London respectively (which appointment the Company hereby undertake to make) or failing such appointment at the Registered Office for the time being of the Company or at their principal or last known place of business in the Protectorate.

5. The Government Engineer may from time to time delegate to assistants to be named by him such of the powers rights authorities and discretions vested in him by this Contract as he may think fit and the Company shall recognise such assistants on written notice of their appointment and of the powers rights
authorities and discretions respectively delegated to them as lawfully exercising for the purposes of this Contract the powers and authorities so delegated.

6. Every certificate in writing of the Government Engineer given under his hand shall be binding on the Government and the Company in respect of all matters hereby in effect referred to the decision of such Engineer.

7. The Company shall within the time limited by Clause 14 hereof at their own expense cause a survey of the Railway to be made and prepare and submit to the Government Engineer for his approval proper and sufficient plans and drawings to his satisfaction shewing on a scale not less than two chains to the inch the Railway proposed to be constructed and the route thereof and also plans sections type drawings of works of art and specifications shewing to the like satisfaction the manner in which it is proposed to construct the Railway.

8. The Company shall be entitled free of charge to the use of such plans surveys and reports (if any) of and relating to the Railway as are in the possession of the Government but the Company shall take upon themselves all risks arising from errors in the said plans surveys and reports or any of them or in any local information supplied to them.

9. The Railway shall be considered as divided into sections of twenty miles each which shall be commenced and continued as hereinafter mentioned and the Company may in respect of any such section deviate from the line shown on the said plans to such an extent as may be approved in writing by the Government Engineer.

10. The Company will within 12 months from the date of this Contract deliver to the Government copies of the plans and drawings approved by the Government Engineer showing the lands proposed to be taken for the Railway and the Government will thereafter from time to time put the Engineers or Agents of the Company in quiet possession of the lands shown on such plans or of such other lands equivalent thereto within such limits of deviation as aforesaid as may in the opinion of the Government Engineer be required for the purposes of the Railway but only on payment by the Company of all such compensation as may be payable to any owners tenants or occupiers of such lands and for the purposes aforesaid the Government shall if and so far as may be requisite exercise all such powers of entry and resumption as may have been reserved to the Government by the deeds of grant of such land. No compensation shall be paid in respect of any / lands being the property of the Government except to the person or persons (if any) who shall be tenant or tenants occupier or occupiers thereof. The amount of all compensation payable under this Clause shall be assessed and finally determined by the Government Engineer.

All costs of surveys construction &c. to be borne by the Company

11. The whole of the costs of surveying staking and laying out the Railway and the lands to be taken as aforesaid and of the subsidy lands hereinafter men-
tioned and the costs of the construction and equipment of the Railway and of
the maintenance of the Railway and of all labour and materials for the same shall
be borne and paid by the Company.

12. The whole of the Railway shall be the absolute property of the Company
subject to the rights hereby given to the Government in respect of the same and
subject also as to the accommodation works to the right of user and enjoyment
thereof by the persons for whose benefit the same shall be constructed.

13. The Company will lay out and construct and equip the Railway upon
the 3 ft. 6 in. gauge with a single line. The maximum gradients will be 1 in 50
on straights and 1 in 66 on sharp curves and the sharpest curve allowed will be
of 4 chains radius. Rails to be of steel not less than 41 lbs. per yard run. Sleepers
to be of steel unless the Government Engineer shall require the use of creosoted
timber or hard wood on any part of the line and not less than 2,100 shall be used
to the mile. Formation width in banks to be 10 ft. 6 ins., in cuttings 8 ft. 6 ins.,
exclusive of side drains. Ballast to be 6 ft. 6 ins. wide and not less than 1 cube yard
per yard run. The Company shall equip the Railway with such plant and rolling
stock as shall in the opinion of the Government Engineer be sufficient for the
efficient working of the same and the whole of the permanent way plant and
rolling stock used in the construction equipment maintenance and working of
the Railway shall be such as are in the opinion of the Government Engineer suit-
able to the Protectorate and shall in all other respects be subject to his approval.
All stations, piers, wharves, conveniences and other works which are to be con-
structed under this Contract shall be constructed with such materials and in
such positions and generally in such manner as the Government, may require
Provided that the Company may at any time with the previous consent of the
Government lay down on all or any parts or part of the Railway an additional
line of rails.

14. The survey for laying out the Railway shall be bond fide commenced
within three months from the date of this Contract and shall be carried out by a
sufficient staff of engineers and assistants to the satisfaction of the Government
Engineer and shall be completed to the like satisfaction within nine months from
the same date and the /actual construction of the Railway shall be commenced
within fifteen months from the same date and shall be diligently continued with-
out unreasonable delay or intermission and the whole of the Railway shall be
completed and equipped in all respects in accordance with this Contract and
opened for public traffic on or before the 30th day of June 1902.

15. The Government Engineer may from time to time (if in his discretion
he think fit so to do) on the request in writing of the Company extend the time
for the construction of any of the Works mentioned in Clause 2 hereof for such
period as he may allow.
16. Before commencing the construction of any section the Company shall deposit with the Government Engineer two copies of the plans drawings sections type drawings and specifications mentioned in Clause 7 hereof.

17. On the completion of each section and before opening the same for public traffic the Company shall erect at the termination of such section and thereafter maintain a substantial stone pillar with marks cut thereon designating the number of miles from the starting point at Chiromo and the number of the section ended thereat.

18. The Company shall be entitled to take and get from such places on Crown lands for the time being unoccupied as may have been previously approved in writing by the Commissioner and to use but only for the purpose of the construction of the Railway any suitable timber stone gravel brick earth clay or other like materials which shall for the time being be the property of the Government PROVIDED that the Company shall exercise the powers given to it by this Clause in such manner as shall be approved by the Government Engineer.

19. No import duties or harbour or other dues fees or tolls shall be payable or levied by the Government upon or in respect of (1) any plant materials goods or rolling-stock imported into the Protectorate for the purpose of the construction or equipment of the Railway or (2) any goods or food which in the opinion of the Commissioner shall be imported into the Protectorate for the purpose of and shall be bond fide employed in paying or maintaining any labourers or official employed in or about the construction equipment or maintenance of the Railway. No stamp duty shall be chargeable on or in respect of the engagement of any labourer or other person intended to be employed in or about the construction of the Railway.

20. The Company shall within six months after notice in that behalf from the Government Engineer at their own expense erect fences on such parts of the Railway and in such manner as the Government Engineer shall require and the Company shall thereafter at their own expense maintain such fences in good state.

21. All tolls and rates for the conveyance of passengers animals goods merchandise or other things carried over the Railway or for the use of any pier or wharf connected therewith and bye-laws for the due management thereof shall be subject in all respects to the approval of the Government and such tolls and rates may be demanded and received for all passengers and goods transported and carried upon the Railway or for the use of any pier landing place or wharf constructed under this Contract and shall be paid to such persons and at such places at such rates per mile or fixed charges between stations and otherwise in such manner and under such regulations as the Company may by any bye-law made with such approval as aforesaid direct.
22. The Company shall from time to time print and exhibit or cause to be exhibited in the office and in all and every of the places where the tolls or rates are to be collected in some conspicuous place there a written or printed or partly written and partly printed board or paper exhibiting all the tolls and rates payable and particularizing the price or sum of money chargeable or to be taken for the convenience of any passenger or the carriage of any article or for the use of any pier landing place or wharf.

23. Every bye-law fixing and regulating tolls and rates shall be subject to revision from time to time by the Company with the approval of the Government.

24. Her Majesty’s Naval Military and other forces of every description (whether Imperial or local) and every other person (whether Civil Naval or Military) in the service of Her Majesty when travelling on such service and all prisoners in the custody of any police or other official and all artillery boats sections of vessels machinery horses mules ammunition goods stores and things of every description belonging to Her Majesty and required for any of the purposes of any such forces as aforesaid shall at all times he carried on the Railway at such rates as shall be less by 33\% per cent. than the rates for the time being in force on the Railway and paid to the Company by others for similar fares or freights and so that any Naval Military or Police Forces of Her Majesty and any artillery horses mules ammunition baggage and stores for the use thereof shall if so required by the officer or other person in command of such forces be conveyed with the whole resources of the Company.

25. The Company shall at all times on the requisition of the Government convey on the Railway all mails and all Government provisions and stores (other than those mentioned in the last preceding Clause hereof) at such reduction from the rates for the time being in force on the Railway and under such regulations as the Government and the Company may from time to time agree upon. The expression ‘mails’ in this Clause shall include all letters parcels and other articles for the time being transmissible by post and all bags baskets and other receptacles for the same.

26. The Company shall not without the consent of the Government undertake the transmission by telegraph or telephone of messages for the public nor use or allow to be used their telegraphic or telephonic apparatus for any purpose other than the working and management of the Railway.

27. The Government may at any time cause a line or lines of electric telegraph or telephones to be constructed along the line of the Railway for the use of the Government and for that purpose may from time to time enter upon and occupy so much of the lands of the Company taken under the powers aforesaid as may be necessary for the purpose without making any compensation therefor but making good all damage done and so constructing the said telegraphs and telephones as not to interfere with the efficient working of the Railway by the Company and
such telegraphs and telephones may be used by the Government or its nominees for the purpose of transmitting messages by any system or invention now or at any time hereafter in use. In the event of accident to the telegraphic or telephonic apparatus of the Company the Company shall with the consent of the Government be at liberty to use for the business of the Railway free from charge any telegraphs or telephones constructed under this Clause during such time as the Government shall allow and the Company may at any time or times attach any of their wires to those of the Government with the consent of the Government upon such terms as shall be agreed upon between them and the Company.

28. The Railway shall not nor shall any section thereof be opened for the public conveyance of passengers until one month after notice in writing of the intention to open the same has been given by the Company to the Government Engineer and until 10 days after notice in writing has been given by the Company to the Government Engineer of the time when the Railway or the completed portion thereof will in the opinion of the Company be sufficiently completed for the safe conveyance of passengers and ready for inspection.

29. If the Railway or any section thereof be opened without such notice the Company shall forfeit to the Government the sum of £50 for every day during which the same continues open until such notices as are mentioned in the last preceding Clause hereof (hereinafter called ‘the prescribed notices’) have been duly given and have expired.

30. The Government Engineer upon receiving such notification shall examine and inspect the section of the Railway proposed to be opened and all bridges culverts tunnels road crossings and other works and appliances intended to be used thereon or in connection therewith and if the Government Engineer report in writing to the Government that in his opinion the opening of the said section would be attended with danger to the public using the same by reason of the incompleteness of the works or permanent way or the insufficiency of the establishment for working the Railway together with the grounds of such opinion the Government may from time to time as oft as the Government Engineer after further inspection thereof so report order and direct the Company to postpone such opening for a period not exceeding one month at any one time until it appears to the Government Engineer that such opening may take place without danger to the public. PROVIDED ALWAYS that subject to the exercise of such powers of postponement if the occasion should arise the Government Engineer shall be bound to issue his certificate for the opening of the Railway within fourteen days from the end of the month or ten days mentioned in the last preceding Clause but one hereof whichever of such periods shall last determinate.

31. If the Railway or any section thereof be opened contrary to such order or direction of the Government the Company shall forfeit to the Government
the sum of £50 for every day during which the same continues open contrary to such order or direction.

32. No such order shall be binding on the Company unless therewith is delivered to the Company a copy of the report on which the order is founded.

33. The Company shall at all times after the opening of the Railway and the several sections thereof keep the same and all the bridges level crossings stations permanent way and other works thereon or connected therewith and the rolling stock used thereon in good and proper repair and from time to time renew the same to the satisfaction of the Government Engineer.

34. The Government Engineer whenever he receives information to the effect that any bridge level crossing culvert viaduct or tunnel or any other part of the Railway or any engine car or carriage used or for use on the Railway is dangerous to the public using the same from want of repair insufficient or erroneous construction or from any other cause or whenever circumstances may arise which in his opinion render it expedient may examine and inspect the Railway or any portion thereof or the engines and other rolling-stock in use thereon or any portion thereof and upon such inspection may condemn the Railway or any portion thereof or any of the rolling-stock or other appliances used thereon and with the approval of the Government may require any change or alteration therein or in any part thereof or the substitution of any new bridge culvert viaduct or tunnel or of any material for the Railway and thereupon the Company shall after notice thereof in writing signed by the Government Engineer proceed to make good or remedy the defects in the said portions of the Railway or in the locomotive car or carriage which have been so condemned or shall make such change alteration or substitution as shall have been required in manner aforesaid by the Government Engineer.

35. If in the opinion of the Government Engineer it is dangerous for trains or vehicles to pass over the Railway or any portions thereof until alterations substitutions or repairs have been made thereon or that any particular car carriage or locomotive should be run or used the Government Engineer may forwith forbid the running of any train or vehicle over the Railway or portion of Railway or the running or using of any such car carriage or locomotive by delivering or causing to be delivered to the Company or to any officer having the management or control of the running of trains on the Railway a notice in writing requiring the defects or the nature of the danger to be apprehended.

36. The Government Engineer shall forthwith report all proceedings taken permitted or suffered by him under any of the Clauses 30, 34, and 35 hereof to the Government who shall with all speed either confirm modify or disallow the act or order of the Government Engineer and such confirmation modification or disallowance shall be duly notified to the Company and the Government
Power for the Government Engineer to enter for purpose of inspection

The Company to give information to Government Engineer

Government Engineer to be conveyed with out charge
And have use of telegraphs and telephones

Notice of accidents to be given to Government Engineer

Provisions of this contract not to relieve the Company from liability

Section when certified to be opened and continuously worked Number of trains to be run daily and average speed

No competing line is to be constructed in the Protectorate

Engineer on receipt of such confirmation modification or disallowance shall forthwith duly notify the same to the Company.

37. The Government Engineer may at all reasonable times enter upon and examine the Railway and the stations fences or gates roads crossings cattle guards works and buildings and the engines cars and carriages belonging thereto.

The Company their agents and officers shall afford to the Government Engineer such information as may be within their knowledge and power in all matters inquired into by him and shall submit to the Government Engineer all plans specifications drawings and documents relating to the construction repair or state of repair of the Railway or any portion thereof whether a bridge culvert or other part.

39. The Government Engineer shall have the right whilst engaged in the business of such inspection to travel without charge on any of the trains running on the Railway and to use without charge the telegraph and telephone wires and machinery in the offices of or under the control of the Company.

40. The operators or officers employed in the telegraph or telephone office of or under the control of the Company shall without unnecessary delay obey all reasonable orders of the Government Engineer for transmitting messages.

The Company shall as soon as possible after the occurrence upon the Railway of any accident attended with serious personal injury to any person using the same or whereby any bridge culvert viaduct or tunnel on or of the Railway has been broken or so damaged as to be impassable or unfit for immediate use give notice thereof to the Government Engineer and if the Company willfully omit to give such notice the Company shall forfeit to the Government the sum of £20 for every day during which such willful omission to give the same continues.

42. No inspection under this Contract nor anything in this Contract contained or done or ordered or omitted to be done or ordered under or by virtue of the provisions of this Contract shall relieve or be construed to relieve the Company of or from any liability or responsibility resting on them by law either towards the Government or towards any person.

43. On the expiration of the prescribed notices and as soon as any section of the Railway shall be completed and certified to be fit for traffic as aforesaid the Company shall forthwith proceed to open and shall continuously thereafter except when prevented by causes which shall be certified by the Government Engineer to be beyond the control of the Company keep open and work the same for public and general traffic and shall run thereon in each direction at least one as train on every day at an average speed of not less than 20 miles per hour.

44. So long as the Company shall keep open and work the Railway in accordance with the provisions of this Contract to the reasonable satisfaction of the Government no line of railway directly competing with the Railway shall be constructed in the Protectorate and (subject to the next succeeding Clause hereof)
the Company shall have the first offer of constructing and working in the Protectorate extensions of the Railway and branch lines connected therewith upon such terms as may be agreed upon between the Company and the Government.

45. If the Government shall accept the offer of the Company to construct and work in the Protectorate any extension or branch of the Railway under the last preceding Clause hereof and if the Company shall refuse or neglect to construct such line or lines within such time and upon such terms as shall have been agreed as aforesaid then the Government may at its option either itself construct and work such line or lines or may grant a concession for the construction and working thereof to any other company or to any persons upon such terms as the Government may think fit.

46. The Government will (if and so far as it lawfully can) grant or procure to be granted to the Company running powers over and facilities for interchange of through traffic with any Railway directly or indirectly connected with the Railway which may consistently with the stipulations of this Contract be constructed in the Protectorate such powers and facilities to be exercised and enjoyed upon such terms as may be agreed upon between the parties or in case of difference as may be determined by arbitration under the provisions hereinafter contained. /

47. Subject to the provisions, hereinbefore contained the Government or any Authority Company or other person constructing or working any Railway within the Protectorate or any adjoining territory or country may at any time hereafter construct any branch or main lines to join the Railway and the Company shall permit all such junctions and works to be made and executed on their Railway as may in the opinion of the Government Engineer be necessary for forming such connections.

48. The Government and any Authority Company or persons lawfully using any Railway either in the Protectorate or in any adjoining Territory or Country or any such branch or main line as aforesaid may upon terms and conditions to be agreed upon between the Government and the Company or in case of difference upon such terms and conditions as may be settled by arbitration in manner hereinafter provided run over and use with their engines and carriages of every description and with their clerks officers and servants the Railway together with the stations booking offices warehouses sidings passing places and other works and conveniences connected therewith respectively.

49. The Company will subject to the due payment to them of the proper tolls and rates forthwith and without unreasonable delay forward over the Railway all passengers goods or merchandise which shall have been carried or be intended to be carried over such branch or main line as aforesaid or any parts thereof or any other line for the time being in connection with the Railway.

50. The Company shall on the requisition of the Government or of any other authority company or person for the time being owning or working any
Railway in the Protectorate or elsewhere in connection with the Railway make such arrangements for the regulation and interchange of traffic passing to and from the said respective Railways and for the working of the traffic over the said Railways respectively and for the division and apportionment of tolls rates and charges in respect of such traffic and generally in relation to the management and working of the said Railways or any of them or any part thereof so that the Railway may be worked for the greatest convenience of the public. And in case the Government and / the Company shall be unable to agree as to the terms of such arrangement such terms shall be settled by arbitration in the manner hereinafter mentioned.

51. The Company shall according to their powers afford all reasonable facilities to the Government and to any other Authority Company or persons lawfully using any other Railway for the receiving and forwarding and delivering of traffic upon and from the several Railways belonging to or worked by the Government or by such other authority company or persons and for the return of carriages, trucks and other vehicles and the Company shall not give or continue any preference or advantage to or in favour of any particular company or person or any particular description of traffic in any respect whatsoever nor shall the Company subject any particular authority company or person or any particular description of land-born or water-born traffic to any prejudice or disadvantage in any respect whatsoever and the Company shall afford all reasonable facilities for the receiving and forwarding by their Railway all the traffic arising from any other Railway in connection therewith and all water-born without any unreasonable delay and without any preference or advantage or prejudice or disadvantage and so that no obstruction may be offered in the using of the Railway as a continuous line of communication and (in the case of any water-born traffic) in connection with the vessels or boats conveying such traffic and so that all reasonable accommodation may at all times by the means aforesaid be mutually afforded by and to the authorities companies or persons working railways adjoining to or connected with each other and any agreement made by the Company contrary to the foregoing provisions shall be unlawful null and void.

52. The Company may from time to time and at any time after the Railway has been constructed equipped and opened for traffic in accordance in all respects with this Contract borrow or raise upon the security of the Railway monies to such an amount as shall have been previously approved in writing by the Government (which monies are hereinafter referred to as ‘the Debenture Capital’) subject to the following conditions:–

(a) All Debenture Capital shall as and when received be paid to the Bankers of the Company to the credit of such Trustees or Trustee as shall have been previously approved by the Government and shall be held by such Trustees or Trustee upon trust to apply the same in such expenditure as in the opinion of the
Government shall be calculated to improve or develop the Railway and as shall in the like opinion be properly chargeable to capital. PROVIDED that no part of the Debenture Capital shall be so applied except / on the production of proper certificates signed by the Government Engineer.

(b) In the event of the Government purchasing the Railway under the powers hereinafter contained the Debenture Capital for the time being outstanding and the interest thereon shall as from the date of such purchase cease to be a charge upon the Railway or upon any rolling stock or other assets included in such purchase and shall thenceforth be a charge upon so much of the purchase monies of the Railway as shall be payable to the Company.

(c) Every instrument issued by the Company to any holder of any part of the Debenture Capital shall contain or be endorsed with a statement to the effect of the last preceding sub-section.

(d) Except as aforesaid the Company shall not at any time borrow or raise any money upon the security of the Railway or of any rolling stock or other chattels used in connection therewith.

53. The Government may upon giving to the Company twelve months’ previous notice in writing expiring at any time after the expiration of twenty-five years from the date when the whole of the Railway shall have been opened for public use of their intention in that behalf purchase the Railway together with all telegraphs telephones and other works and conveniences connected therewith and the engines carriages stock plant and machinery belonging to the Railway and on the expiration of 12 months from the date of such notice all land provided by the Government or otherwise acquired by the Company for the purposes of the Railway or any works and conveniences connected therewith (but not including any of the subsidy lands hereinafter mentioned) and the Railway and all buildings works piers landing places wharves fixed machinery rolling stocks telegraphs and conveniences whatsoever connected with or used for or in respect of the Railway shall become the absolute property of the Government as the owners thereof by purchase free from all incumbrances and they shall thereupon be entitled to and shall take possession thereof and the Company shall at the same time deliver to the Government the engines carriages stock plant and machinery belonging to the Railway and all plans surveys sections books printed matter writings and documents whatsoever in anywise connected with the undertaking and affairs of the Railway and the Government shall on its taking such possession pay to the Company or their assigns in London

(a) A sum equal to the aggregate amount of so much of the / prescribed sum as shall in accordance with, the provisions hereinafter contained have been from time to time paid to the Company or certified to be due to them.

(b) Such further or additional sums as shall from time to time have been certified in writing by the Government Engineer to have been expended by the
Company in the improvement or development of the Railway and to have been properly charged against capital and

(c) A sum equal to five years’ purchase of the average net receipts of the Company for the five years ending on the 31st day of December last preceding the date of the notice to purchase after deducting therefrom such a sum if any as ought in the opinion of the Government Engineer to be deducted for depreciation and also such further sum as ought in the like opinion to be deducted in respect of the cost of any rolling-stock or plant which shall then in the opinion of the Government Engineer be unfit for use.

It shall be lawful for but not obligatory upon the Government to retain and satisfy out of any moneys payable to the Company hereunder the amount of all or any of the wages and other claims and demands of any kind then existing against the Company and for which they may then be legally liable and which would in the opinion of the Government be properly chargeable against the revenue account of the Company in respect of the Railway and which shall not be shown to have been fully satisfied and discharged or otherwise provided for to the reasonable satisfaction of the Government. The purchase by the Government of the Railway in manner aforesaid shall effectually release and discharge the Company from all liability in respect of the then future working and maintenance of the Railway.

54. The Company shall keep proper books of account showing all the particulars of their receipts and expenditure and all other matters usually entered in the books of concerns of the like nature in such form and manner as the Government may from time to time reasonably require and the same together with all vouchers and other books and papers in anywise necessary or useful for the verification of such accounts shall at all times be open to the inspection of any officer or accountant appointed by the Government for the purpose who shall be at liberty to take copies thereof and extracts therefrom and the Company will supply all such evidence and information as the Government shall reasonably require for verifying the accounts aforesaid and enabling the Government to ascertain the amount of the receipts and of the cost of working the Railway.

55. After the expiration of 20 years from the date when the whole of the Railway shall have been opened for public use the Company shall within 30 days after the expiration of every subsequent year ending on a 31st day of December furnish to the Government accounts shewing the gross receipts the working expenses and the net receipts of the Railway during such year and every account so furnished shall from time to time and at such time as the Government may require be audited by some person or persons to be from time to time appointed and employed by the Government and such person or persons is and are hereinafter included in the expression ‘the Government’ Auditors.’ The Company shall produce to the Government Auditors all vouchers books accounts papers and
documents of the Company which such Auditors may require for the purpose of their audit and shall afford them all possible facilities for the performance of their duties. Among the functions of the Government Auditors shall be included the duty of seeing that the gross receipts, the working expenses, and the net receipts of the Railway are correctly stated in the accounts furnished by the Company under this Contract. Any correction made in such accounts by the Government Auditors and assented to by the Company shall be conclusive. If in consequence of the audit of the Government Auditors the Government shall require any alteration to be made in the accounts furnished by the Company and the Company shall object to such alteration the matter in difference shall be referred to and settled by the Government Engineer.

56. For the purposes of all such accounts the net receipts of the Railway shall be ascertained by deducting the working expenses of such Railway from the gross receipts thereof and working expenses shall mean and include only such payments as in like concerns are usual and properly chargeable to revenue and so that if any question shall arise as to what constitutes working expenses such question shall be determined on the general principle that capital is to bear the cost of new works of additional rolling-stock plant and machinery and of substantial improvements of and additions to old works rolling-stock and machinery including the cost of temporary new work the construction of which is requisite for the construction of a work properly chargeable to capital and that the cost of repairs, restorations, renewals, replacements and substitutions other than such as may be due to defective construction is to be borne by revenue.

57. In consideration of the obligations imposed on the Company by this Contract the Government shall subject to the provisions hereinafter contained grant in fee simple to the Company by grants in the form prescribed by the laws or regulations for the time being in force in the Protectorate a subsidy of 1,000 acres of land for each mile of the Railway and so that such lands (called in this Contract ‘the subsidy lands’) shall be Crown lands and shall be selected and allotted in manner hereinafter provided. Provided that such grants shall contain provisions in such form as the Government may think fit entitling the Company to win get and take away all minerals and other like substances usually reserved to the Government in grants of Crown lands subject to the payment to the Government of a royalty of 5 per cent, upon the gross value of all minerals and substances so gotten.

58. The subsidy lands shall be selected and allotted by agreement between the Government Engineer and the Company subject to the following provisions and conditions:

(a) Subject to the provisions hereinafter contained the subsidy lands to be granted in respect of each section of the Railway shall (when such section shall have been duly completed and opened for traffic) be selected within an area
bounded on two sides by lines drawn on each side of and parallel to the Railway at a distance not exceeding two miles therefrom and on the other two sides by lines drawn at right angles to the Railway through the termini of such section. Each such quantity shall be selected in one block or in blocks of not less than 500 acres each in extent.

(b) The boundaries of such block or blocks (except so far if at all as they shall be bounded by the lands taken for the Railway) shall (unless the Government Engineer shall otherwise think fit) be in the direction of and at right angles to the meridian.

(c) Half the Crown lands fronting on the Railway along each section either wholly on one side or partly on one side and partly on the other side of the Railway shall be reserved to the Government. Provided that if in respect of any mile of the Railway (computed from the commencement of any section) there shall be no Crown lands fronting on the Railway the subsidy lands in respect of such mile may be selected from such other Crown lands in the Shire District of the Protectorate as may be approved by the Government Engineer.

(d) Nothing herein contained shall entitle the Company to a grant of any subsidy lands in Chiromo or Blantyre or within three miles of either of such places.

(e) The decision of the Government Engineer as to all questions arising under this Clause shall be final.

59. On the completion and opening of each section of the Railway the Government will issue to the Company Deeds of Grant of one moiety of such of the subsidy lands as front on or are adjacent to such section such moiety to be selected by the Government Engineer but it shall if required include a reasonably fair proportion of the frontage of such subsidy lands upon the Railway.

60. On the completion and opening of the whole of the Railway within the time limited for that purpose by this Contract the Government will issue to the Company like Deeds of Grant for the remaining moiety of the last-mentioned subsidy lands.

61. On the Company becoming entitled to the Deeds of Grant mentioned in the last preceding Clause hereof the Government will grant to the Company in fee simple such of the lands belonging to the Government as shall have been taken under the provisions of this Contract for the purposes of the construction of the Railway.

62. If the Railway shall not be completed and opened within the time limited in that behalf the said remaining moiety of the subsidy lands to which the Company would otherwise have become entitled as aforesaid shall be absolutely forfeited to the Government unless such non-completion shall in the opinion of the Government Engineer have arisen from some inevitable cause or from some act of the Government.
63. In case any part of the subsidy lands shall be in the occupation of any
lessees or licensees from the Government the Company shall pay them fair com-
ensation for all improvements made by them or their predecessors upon their
holdings such compensation to be assessed by arbitration in case of difference.

64. The sum of £ (in this Contract called ‘the prescribed sum’) which has
been placed by the Company to the credit of and at the Bank shall be held by
the said and or other the trustees or trustee for the time being thereof upon
trust to apply the same in or for the purpose of the construction or equipment
of the Railway or for the acquisition of any land required for the Railway or for
any other purpose which the Government may deem incidental to any of such
purposes and such application shall be made in accordance with proper certifi-
cates of the Government Engineer of the value of the work for the time being
executed or equipment or land (other than lands given by the Government) or
materials provided by the Company for the purposes of the Railway based on a
Schedule of Prices agreed upon between the / Government Engineer and the
Contractors at the time of fixing the prescribed sum and the residue (if any) of
the prescribed sum shall so soon as the Government Engineer shall have certified
that the Railway has been constructed completed and equipped in accordance
with this Contract be paid or transferred to the Company or otherwise dealt
with as the Company shall direct.

65. If the Company from any cause whatever fail to construct complete and
equip the Railway in accordance in all respects with this Contract and within
the time thereby prescribed or if in the opinion of the Government Engineer
the Company shall fail to proceed with due despatch in the construction of the
Railway having regard to the time within which the same are to be completed or
in any other respect fail in the due performance or observance of this Contract
then and in every or any such case if the Government Engineer certifies that it is
in his judgment proper for the Government so to do the Government may take
possession of the Railway and of all plant materials and appliances provided for
the same and may employ such persons or corporations as the Government may
think fit either by contract or otherwise as the Government Engineer certifies

Company to compensate lessees for improvements
Application of the prescribed sum

Rights of Government on default by Company

As to completion of Railway and Works by the Government

66. If the Government under the last preceding Clause elect to proceed with
the Railway all monies which shall in the opinion of the Government Engineer
be required for the purpose of constructing completing and equipping the Railway in accordance with this Contract and for otherwise fulfilling the obligations of the Company under this Contract shall be paid out of the prescribed sum if and so far as the same shall suffice and if and so far as the same shall not suffice shall be paid by the Company to the Government on demand and until such payment shall together with interest thereon at the rate of 5 per cent. per annum from the date of such demand be charged upon the Railway and undertaking of the Company in priority to all other claims thereon.

67. If the Company shall fail to comply with any of the provisions of Clause 43 hereof the Government may enter upon and take possession of and use the Railway and all the rolling stock machinery engines and plant of the Company and use and work the same and appropriate the receipts and profits arising therefrom without being liable for any loss or damage incurred thereby and the Company shall pay to the Government all expenses incurred for the user working maintenance and repair of the Railway rolling stock machinery engines and plant during such time as the Government shall be in possession as aforesaid. The Company shall also be subject to and shall pay to the Government a daily fine of £100 so long as they shall continue in possession as aforesaid.

68. As a security for the due performance of the covenants and conditions contained herein the Company shall on the execution of this Contract pay to the Government the sum of £10,000 which sum together with the yearly interest or income thereof shall be invested at the risk of the Company by the Government in the names of nominees of the Government and upon such securities or investments as the Company may select and the Government approve. This sum and all accumulations thereof or the investments representing the same together with all interest and dividends thereon shall (subject as hereinafter mentioned) remain in the hands of the Government as a guarantee fund and are hereinafter collectively referred to as 'the Guarantee Fund.'

69. If the survey for laying out the Railway shall not be bona fide commenced within three months from the date hereof or if the actual construction of the Railway shall not be bona fide commenced within 15 months from the same date or if the Railway shall not be completed equipped and fit for public traffic and opened on or before the 30th day of June 1902 or if the Company shall fail to comply with any other of the conditions or stipulations herein contained then without prejudice and in addition to any other rights given to the Government by this Contract the Government may if they shall think fit rescind or annul this Contract and thereupon the guarantee fund shall be transferred to and become the absolute property of the Government provided always that the rescission or amendment of this Contract shall not take away or affect any right claim or demand which the Government may have against the Company under this Contract or on account of any breach thereof by the Company.
70 If the Company shall duly carry out the provisions of this Contract then upon the expiration of three months from the opening of the whole of the Railway the guarantee fund shall be transferred to the Company or as they shall direct. Provided always that the Government may from time to time pay and deduct out of the guarantee fund any monies which the Company may have become liable to pay by way of fine penalty or otherwise under the provisions of this Contract.

71. The Company shall not assign lease or otherwise dispose of the benefit of this Contract or the Railway or the undertaking of the Company without the previous consent in writing of the Government and such consent may in the case of an assignee or lessee not approved by the Government be refused without their being bound to give any reason for such refusal.

72. The Government shall have the same rights and remedies against any such assignee and such assignee shall have the same rights and remedies against the Government as would have been the case if such assignee had been a party hereto instead of the Company.

73. The Company shall always be and remain British in character and shall have its principal office in Great Britain or in some town in the Protectorate and the Company’s principal representative in the Protectorate and all its Directors shall always be natural born British subjects or persons who have been naturalized as British subjects by or under an Act of Parliament of the United Kingdom or by or under some Statute or Ordinance of some British African Colony or territory.

74. Nothing contained in this Contract shall exempt the Railway or the Company from the provisions of any General Ordinance Law or Regulation now in force or hereafter to be passed relating to Railways in the Protectorate.

75. Except in so far as is by this Contract otherwise expressly provided nothing herein contained shall in any manner affect the rights of Her Majesty or any person or corporation.

76. No member or officer of the Government and none of the Crown Agents shall be in anywise bound personally for the acts and obligations of the Government under this Contract or answerable for any default or omission in the observance performance or fulfilment of the acts matters or things which are hereby made obligatory on the Government.

77. In case and so often as any dispute difference or question shall arise between the said parties hereto or any Government person or corporation claiming through or under them respectively or between any of such Governments persons or corporations or between the Government Engineer and the Company concerning or relating to the Railway or any part thereof respectively or the construction meaning or effect of this Contract or any Clause or thing herein contained or the rights or liabilities of any party hereto or of any...
such Government person or corporation as aforesaid under this Contract then (except in any case and as to any matter for which other provision is hereinbefore made) the subject of every such dispute difference or question shall in every case on the demand in writing of either party be referred to the arbitration and award of an umpire if the parties can agree to an umpire and in case they cannot so agree then of three arbitrators one to be appointed by each party to the reference and the third by the two arbitrators so appointed. The decision of such umpire or arbitrators or of any two of such arbitrators as the case may be shall be final and without appeal and binding upon all parties. If either party to any such dispute difference or question make default in appointing an arbitrator within 14 days after the other party has given him or them notice to appoint the same the party who has appointed an arbitrator may appoint that arbitrator to act as sole arbitrator in the reference and his award shall be final and binding on all parties and all the provisions herein contained with reference to the proceedings of two arbitrators and an umpire shall mutatis mutandis be applicable to such sole arbitrator.

78. The arbitrators and umpire shall have full power to make if they or he think fit several awards instead of one award and every such award though not on the whole matter shall be final so far as it extends and as if the matter awarded on were the whole matter referred.

79. The Arbitrators and Umpire shall have full power to proceed in the absence of both or either of the parties after giving to both parties such notice as the Arbitrators or Umpire may think sufficient of their or his intention to proceed.

80. The Arbitrators and Umpire shall have full power to inspect the books documents and accounts of both parties and examine on oath or affirmation or on Statutory declaration in lieu of oath the officers agents servants and witnesses of the parties respectively. / 

81. The costs of the Reference and the Awards shall be in the discretion of the Arbitrators and Umpire and such costs may be awarded as between Solicitor and client.

 [...]
Central Africa Railway Company Limited and Shire Highlands Railway Nyasaland Limited and the Crown Agents for the Colonies on behalf of the Nyasaland Government: Conditional Agreement (1930); held at the National Archives, CO 525/139/2.

NOTE ON THE REQUEST OF THE NYASALAND RAILWAY COMPANIES FOR CONFIRMATION OF THE CONDITIONAL AGREEMENTS OF 15TH MAY, 1930.

The two Agreements dated 15th May, 1930

(1) with the Central Africa and Shire Highlands Railway Companies, and

(2) with the Trans-Zambesia Railway Company, are, as, regards certain important clauses, conditional, *‘inter alia,’ on ‘All necessary consents from the Portuguese Government and the Mozambique Company to the carrying out of the operations contemplated by the Agreement being obtained within six months from the date† hereof, or such extended period to which the Government may agree.’

The CAR/SHR Agreement is also dependent upon the T.Z.R. Agreement becoming unconditional.

On the 8th December, Sir Ernest Roney, the Companies’ Solicitor, appeared before the Zambesi Bridge Committee with the request that the Conditional Agreements should be made unconditional without waiting for the stipulated Portuguese consents. He said that the following documents required the approval of the Portuguese authorities:—

(i) The Articles of Association of Nyasaland Railways Limited

* See Clause 29 of CAR/SHR Agreement, and Clause 20 of T.Z.R. Agreement.

† i.e., 15th May 1930. The period has been extended until 15th Feb. 1931, and a further short extension will be necessary.
(ii) The form of the Bridge Debenture
(iii) The form of the additional Debenture of the Trans-Zambesia Railway
(iv) The form of the Southern Approach Income Bonds of the Trans-Zambesia Railway.

He said that (iii) and (iv) were ready for to the Portuguese Government submission/but that it was not possible to submit (i) and (ii) until the constitution of the new Company (Nyasaland Railways) had been completed, i.e., / until the purchase of the Shire Highlands Railway and of 90% of the share capital of the Central Africa Railway by the new Company had been effected. Sir Ernest said that he was not in a position to complete this transaction until he was able to inform the shareholders of S.H.R. and C.A.R. that the Agreement was no longer conditional.

The Zambesi Bridge Committee saw considerable objection to varying the terms of the Conditional Agreement in the manner suggested, and they did not see why the completion of the purchase of the S.H.R. and C.A.R. shares should not be carried through forthwith. The Committee suggested to Sir E. Roney that his difficulty might be met by the Government agreeing to make provisional advances, under Clause 26 of the SHR/CAR Agreement, to the new Company, pending the Portuguese Government’s approval of the scheme.

The following day General Hammond received a letter from Mr. Codrington, the new Chairman of S.H.R., renewing the suggestion that the condition as to Portuguese consent should be waived. In this letter it was for the first time pointed out that the Resolutions in favour of the whole Scheme which had recently been passed at Meetings of the S.H.R. and T.Z.R. debenture holders and shareholders, were conditional on the Agreements of 15th May becoming unconditional, and that unless the Companies’ suggestion could be adopted, it would be necessary / to call further Meetings of the debenture and shareholders in order to pass revised Resolutions. This would have a deplorable effect both in London and in Portugal.

This letter was discussed on the 10th December at a Meeting at which Sir John Campbell, General Hammond, Mr. Skevington and I were present. It was generally agreed that it would be most undesirable that further Meetings of the S.H.R. and T.Z.R. debenture holders should be called, but it was felt strongly that in omitting to mention the point raised in Mr. Codrington’s letter with regard to the form of the Resolutions passed by the Companies, Sir E. Roney had not dealt frankly with the Zambesi Bridge Committee and that it was in any case difficult to understand how the Resolutions came to be passed in such an inconvenient form. It was decided to ask Mr. Baird, the Solicitor employed by the Government, for his observations in the first place, and then to refer the whole question again to the Zambesi Bridge Committee.
Mr. Baird was at first disposed to accept the Companies’ proposal. He hoped that any dangers which we might run by so doing would be rather theoretical than practical, and he had no doubt that whatever they might be, we should succeed in surmounting them. He agreed that there had been a want of frankness in the matter, and was not surprised that we suspected ulterior motives on the part of the Companies. Later, however, Mr. Baird changed his view, and definitely advised that the Companies proposals should not be accepted. He argued as follows:—

The Resolutions of the shareholders in favour of the scheme were passed subject to the Conditional Agreement becoming Unconditional.

In the circulars sent out to the shareholders and debenture holders of C.A.R. and S.H.R. it was made clear that the Conditional Agreement would not become unconditional until any necessary consents were obtained from the Portuguese Government.

The Conditional Agreement was offered for inspection and the shareholders and debenture holders concerned must be taken to have full notice of its contents.

When the Resolutions in favour of the Scheme say that they were passed ‘Subject to such Agreement becoming unconditional’ that must mean unconditional owing to the fulfilment of all the terms laid down in Clause 29 of the Agreement including the consents of the Portuguese Government.*

If that were not so there would be nothing to prevent the Government from agreeing with S.H.R. and C.A.R. that the Agreement shall become unconditional on the fulfilment of a set of terms differing from those set out in Clause 29. It was not now possible by means of a new arrangement made between the Government and the Companies, without the knowledge and sanction of the shareholders and debenture holders, to vary as against them, the terms upon which the Conditional Agreement was to become unconditional. / If that were done, the shareholders would, in Mr. Baird’s opinion be able to upset the Scheme on the ground that the terms of the Government Agreement had been varied without their consent.

In the circumstances, Mr. Baird advised that the only thing to do was to continue to make temporary advances for the present and to defer the taking over of the assets of the S.H.R. and the shares of C.A.R. until any necessary consents from the Portuguese Government had been obtained.

On the 16th December, Mr. Baird’s letter was considered by the Zambesi Bridge Committee and it was agreed that a letter should be sent to the Railway Companies refusing their request for the reasons advanced by Mr. Baird, but informing them that the Committee would be prepared to recommend, as a satisfactory fulfilment of the condition as to Portuguese consents, the production of a letter from a responsible Portuguese official signifying approval of the
documents which required to be presented to the Portuguese Government and stating that the necessary decree would be issued in due course.

The Foreign Office representative on the Committee pointed out that the political situation in Portugal was at the moment unusually favourable as that country was evincing its desire in more than one direction to prove its goodwill towards Great Britain; furthermore, the present Ambassador (Sir F. Lindley) had acquired considerable personal prestige with the Portuguese Government. This information was communicated privately to the Chairman of the Nyasaland Railways Limited.

On the 5th January, I had a letter from the Foreign Office representative on the Committee (Mr. Wiggin), saying that Mr. Oury had discussed the matter at the Foreign Office. Mr. Oury had explained that the question was one falling within the competence of the Portuguese Colonial Council at Lisbon, a body over which the present Government exercised comparatively little control. He said that the Colonial Council in their turn was effectively guided in matters of this kind by a M. Lisboa de Lima. He was due in London in a week’s time and could be invited to state in writing that the documents were in order. As a prior step, Mr. Oury recommended that the Companies should enlist the aid of M.R. Lopes, who was due in London immediately and who is the lawyer in Lisbon both of the Nyasaland Railways and of the Port of Beira. Mr. Oury said that M. Lopes was highly regarded by H.M.’s Embassy at Lisbon and that the Portuguese Government had given repeated proof of the weight which they attached to his opinions on African Colonial problems. He suggested that we should be satisfied with a statement in writing to the Companies’ Lawyers from M. Lisboa de Lima agreeing with an opinion by M. Lopes that the documents were open to no objection.

The Foreign Office telegraphed the substance of this interview to the Ambassador at Lisbon and asked for his opinion on Mr. Oury’s suggestion. In the meantime a Meeting of the Zambesi Bridge Committee was called to consider the question further. At this Meeting Mr. Oury and Mr. Codrington attended and produced a letter from their Portuguese local adviser, M. Lopes, in which the opinion was expressed that everything done by the Companies so far was strictly in order from the point of view of Portuguese law, and that the further steps required were of a purely formal nature, amounting to a little more than registration.

Mr. Wiggin informed the Committee that Sir F. Lindley had telegraphed that he had no personal knowledge of M. Lopes. The late Charge d’Affaires at Lisbon however knew M. Lopes personally and had a high regard for his character and ability.

Mr. Oury then informed the Committee that M. Lisboa de Lima had been prevented from going to London, but that he now saw no advantage in getting
M. de Lima’s opinion since it had been ascertained that the necessary documents would not have to go before the Colonial Council at Lisbon. Both he and Mr. Codrington urged that the procedure now required in Portugal was merely equivalent to registration of documents in Somerset House in this country.

The Committee felt that, however high the reputation of M. Lopes, it would be desirable to obtain some official confirmation of his opinion through the Diplomatic channel.

The Companies’ representatives were inclined to demur to this step as investing a purely commercial matter with a false importance, and involving the risk of raising unnecessary and inconvenient queries / in Portugal. It was, however, explained that it was not proposed that an official note should be addressed to the Portuguese Government, but that Sir F. Lindley should be asked to satisfy himself by informal enquiries in Portuguese official circles that no difficulty would be experienced when the documents were presented for the necessary consents.

It was accordingly agreed that Mr. Codrington should send to the Foreign Office a full memorandum explaining the situation, and that the Foreign Office should send this memorandum with copies of all the relevant documents by despatch to Sir F. Lindley asking for a telegraphic reply. It was also agreed that M. Lopes should get into touch with Sir F. Lindley at an early date. A copy of the telegram received from Sir F. Lindley has now been sent to us by the Secretary of the Zambesi Bridge Committee.

There has been no further Meeting of the Committee but the members have been consulted separately and, as will be seen from Mr. Bradstreet’s letter, they agree in recommending that the result of Sir F. Lindley’s enquiries should be regarded as satisfactory. The gist of the information which Sir F. Lindley has obtained from the Portuguese Foreign Office is that as soon as the Companies ask for approval of the Articles of Association of the new Company, and of the form of the various debentures, &c., such approval will be quickly granted provided that the documents satisfy all local conditions and are in harmony with the interests of the Portuguese Republic. Sir F. Lindley would have preferred the omission of the last ten words, but he is satisfied that these have only been added as a matter of formality.

M. Downie 13.2.31/

An Agreement made the —day of February 1931 BETWEEN THE CENTRAL AFRICA RAILWAY COMPANY LIMITED whose registered office is at 3 Thames House Queen Street Place in the City of London (hereinafter called’ C.A.R.’) of the first part SHIRE HIGHLANDS RAILWAY NYASALAND LIMITED whose registered office is at 3 Thames House aforesaid (hereinafter called ‘S.H.R.’) of the second part and THE CROWN AGENTS FOR THE COLONIES of 4 Millbank in the City of Westminster (who and
the Crown Agents for the Colonies for the time being are hereinafter referred to as ‘the Crown Agents’) acting for and on behalf of the Government of Nyasaland Protectorate (hereinafter called ‘the Government’) of the third part and NYASALAND RAILWAYS LIMITED whose registered office is at 3 Thames House aforesaid (hereinafter called ‘the New Company’) of the fourth part.

Whereas:–

(1) This Agreement is supplemental to a Conditional Agreement dated 15th May 1930 and made between C.A.R. of the first part S.H.R. of the second part and the Crown Agents acting for and on behalf of the Government of the third part (hereinafter called ‘the Conditional Agreement’) whereby it was agreed (inter alia) that C.A.R. and S.H.R. should forthwith take steps with a view to the incorporation of the New Company therein mentioned under the Companies Act 1929 having for its primary objects:–

(a) the acquisition of not less than 90 per cent. of the issued share capital of C.A.R., and

(b) the acquisition of the undertaking and assets subject to certain of the debts and liabilities of S.H.R. in accordance with the provisions of the Conditional Agreement.

(2) In pursuance of the Conditional Agreement the New Company has been incorporated with a Share Capital of £475,000 divided into 420,000 Ordinary Shares of £1 each and 1,100,000 ‘A’ Ordinary Shares of 1s. each with the rights and privileges set out in its Memorandum and Articles of Association and having for its objects (inter alia) the acquisition of the said shares of C.A.R. and the undertaking and assets subject to the debts and liabilities of S.H.R. before mentioned and otherwise to give effect to the terms and conditions of the Conditional Agreement.

(3) The Portuguese Government and the Mozambique Company have approved the plans for the Bridge over the Zambesi River and the Northern and Southern Approach lines thereto and have given such consents to the Scheme for the Zambesi Bridge and Connecting Railways as are required of them up to the date hereof.

(4) Contracts for the construction of the said Bridge and the Southern Approach line have been entered into by C.A.R. and the Trans-Zambesia Railway Company Limited (hereinafter called ‘T.Z.R.’) respectively with The Cleveland Bridge and Engineering Company Limited and the construction of the Northern Approach line to the Bridge is being carried out by C.A.R.

(6) The New Company has agreed with C.A.R. and S.H.R. to take over adopt and carry into effect the Conditional Agreement and the terms condi-
tions and obligations thereby provided to be undertaken and carried out by the New Company as if it had been a party to the Conditional Agreement.

Now these Presents Witness and Declare as follows:–

1. The Conditional Agreement is hereby adopted by the New Company and shall subject as hereinafter provided be binding on C.A.R., S.H.R., the Crown Agents acting for and on behalf of the Government and the New Company in the same manner and take effect as if the New Company had been in existence at the date thereof and had been a party thereto.

2. S.H.R. will sell and transfer and the New Company will acquire and take over the undertaking and assets of S.H.R. and the New Company will satisfy the purchase consideration as stated in the Conditional Agreement and undertake the debts and liabilities of S.H.R. (other than the Debenture Stock and Second Debentures of S.H.R.) and the payment of the costs of winding up and dissolving S.H.R. and otherwise upon the terms and conditions mentioned in the Conditional Agreement.

3. For the purpose of carrying into effect the said sale and the distribution of the purchase consideration in accordance with the provisions of the Conditional Agreement and these presents S.H.R. shall forthwith procure the passing of the necessary Resolutions for placing S.H.R. in liquidation and authorising the Liquidator to execute and do all instruments acts and things required to carry out the said sale and distribution as aforesaid.

4. If any holders of Debenture Stock Debentures or Shares in S.H.R. shall become entitled to fractional parts of a share in the New Company the New Company shall issue fractional certificates therefor in such form as S.H.R. or its liquidator may reasonably require. /

5. The New Company shall accept the title of S.H.R. to the undertaking and assets hereby agreed to be sold and transferred.

6. The New Company shall until the dissolution of S.H.R. at its own expense produce and show at such times and to such persons and in such places as the said Liquidator shall require all the books documents and papers of S.H.R. hereby agreed to be sold.

7. The New Company will purchase the whole or at least 90 per cent. of the fully paid Preference Shares and Ordinary Shares respectively of C.A.R. and for that purpose will forthwith make a formal offer to all the holders of shares in C.A.R. to purchase their shares upon the terms and conditions of the Provisional Agreements already made by C.A.R. with some of the holders of such shares. A specimen of the said Provisional Agreements and a list of such holders and the shares held by them respectively are annexed hereto.

8. The New Company will also repay to C.A.R. all expenses incurred by C.A.R. in the investigation of the Zambesi Bridge Site Southern Approach and Northern Approach in the Conditional Agreement referred to and of and
Communications in Africa, 1880–1939: Volume 2

incidental to the negotiation and completion of all arrangements in connection with the scheme for the construction of the Zambesi Bridge Southern Approach and Northern Extension and the purchase of the shares of C.A.R. as mentioned in the Conditional Agreement.

9. The purchases of the undertaking and assets of S.H.R. subject as aforesaid and of the said shares of C.A.R. respectively shall be completed on or before the 31st day of March 1931 or at such later date as may be agreed at the office of the New Company aforesaid and/or in Nyasaland when S.H.R. and its Liquidator shall execute and do such documents acts and things as the New Company may require for the completion in Nyasaland of the transfer of the undertaking and assets of S.H.R. to the New Company and the said shares shall be transferred to the New Company and the New Company shall allot and issue the ‘A’ Debenture Stock and fully paid shares of the New Company to be allotted and issued in satisfaction of the purchase considerations respectively to the respective parties entitled thereto in accordance with and pursuant to the Conditional Agreement and these presents.

10. Forthwith after the execution of these presents the Government will subscribe and pay for in full at par 1,081,625 ‘A’ Ordinary Shares of 1s. each and as and when required by the New Company in accordance with Clause 16 of the Conditional Agreement the Government will subscribe and pay for at the price of £97 10s. 0d. per cent. £163,250 ‘A’ Debenture Stock in the New Company and the New Company shall on payment being made therefor as aforesaid allot such shares and ‘A’ Debenture Stock to the Government or as it shall direct.

11. Upon completion of the purchase of the said undertaking and assets of S.H.R. and of the said shares of C.A.R. by the New Company and upon the allotment and issue of the shares of the New Company before mentioned the Government shall thereafter from time to time make advances to the New Company of the amounts and for the purposes set out in Clause 26 of the Conditional Agreement and the New Company shall apply such advances as in the Conditional Agreement provided and shall as and when required allot to the Government or its nominees the 5 per cent. Bridge Debenture Stock and/or 5 per cent. ‘B’ Income Debenture Stock of the New Company prescribed by Clause 3 of the Conditional Agreement and C.A.R. shall allot and issue or undertake to allot and issue to the New Company as soon as possible the Debenture or Debentures to be transferred to the Trustees for the said Bridge Debenture Stock as provided in the Conditional Agreement. The New Company and C.A.R. will use their best endeavours to procure T.Z.R. to allot and issue or to undertake to allot and issue to the New Company as soon as possible certain Income Bonds to be transferred to the Trustees for the said Bridge Debenture Stock as provided in Clause 7 of the Conditional Agreement.
12. The New Company and C.A.R. respectively undertake as soon as practicable after the transfer to the New Company of at least 90 per cent. of the shares of each class in the capital of C.A.R. to take the necessary steps for the adoption of new Articles of Association by C.A.R. in the form already approved on behalf of the Government. The New Company and C.A.R. also undertake to take all such further steps as may be required to procure without undue delay the creation and issue by C.A.R. of the said Debenture or Debentures to be transferred to the Trustees of the said Bridge Debenture Stock.

13. The Conditional Agreement shall forthwith after the execution of these presents become absolute and freed from the conditions contained in Clause 29 thereof.

IN WITNESS whereof the Companies have caused their respective Common Seals to be affixed hereto and— one of the Crown Agents for the Colonies has hereunto set his hand and seal the day and year first above written. / ...

_________ Secretary. /
Dated February 1931.

THE CENTRAL AFRICA RAILWAY COMPANY LIMITED
SHIRE HIGHLANDS RAILWAY NYASALAND LIMITED
THE CROWN AGENTS FOR THE COLONIES
AND
NYASALAND RAILWAYS LIMITED.

Agreement OF ADOPTION AND CONFIRMATION OF CONDITIONAL AGREEMENT OF 15th MAY 1930. /

CENTRAL AFRICA RAILWAY COMPANY LIMITED.

To _____

_________

Dear Sir,

I am directed by my Board to enclose a Memorandum relating to the proposed fusion between this Company and the Shire Highlands Railway Nyasaland Limited, the formation of a new Company to be called ‘The Nyasaland Railways Limited’ and the construction and equipment of a Bridge over the Zambesi River and additional lines of Railway. It will be seen from the Memorandum
that a very important development is proposed to be made in connection with
the Railway system connecting Lake Nyasa with the Port of Beira, involving an
expenditure of approximately £3,200,000, which if the Scheme is accepted by
all necessary parties will be provided by the Nyasaland Government on advanta-
geous terms.

The proposal comprises the formation of the Nyasaland Railways Limited
to effect the fusion between the Shire Highlands Railway Nyasaland Limited
(the S.H.R.) and this Company (the C.A.R.), by purchasing the whole of the
Railway and Undertaking of the S.H.R., and liquidating that Company, and
acquiring the whole or at least 90 per cent. of the shares of the C.A.R. from the
present holders.

Under the terms of the Agreement which has been entered into with the
Nyasaland Government, the Shareholders of the C.A.R. are to receive in exchange
for their present holdings the following securities in the New Company, viz.:–

For every Twenty £1 Preference Shares fully paid in C.A.R. £8 five per cent.
‘A’ Debenture Stock and three Ordinary Shares of £1 each fully paid in the New
Company and

For every Four Ordinary Shares of 5s. each fully paid in the C.A.R. One fully
paid Ordinary Share of £1 in the New Company.

In the case of fractions of shares Certificates will be issued or other arrange-
ments made convenient to Holders.

The Directors consider that as the development of the C.A.R. by itself is
difficult without the help of funds far beyond its resources the exchange of the
existing Preference Shares for Debenture Stock and Shares in the New Company
and the existing Ordinary Shares for Ordinary Shares in the New Company
which is to be provided with a very important amount of additional capital
for immediate development will be a beneficial and profitable arrangement for
every holder of Preference or Ordinary Shares in the C.A.R.

The Directors therefore confidently recommend the acceptance of the pro-
posal that you should exchange your present holding of Preference Shares and/or
Ordinary Shares in the Company for the ‘A’ Debenture Stock and/or fully
paid £1 Ordinary Shares in the New Company to which you would be entitled
under the Scheme.

Many of the largest Shareholders in the C.A.R. have already expressed their
intention of accepting the offer for their shares when in due course it is made by
the New Company. I shall be glad if you will signify your acceptance of the terms
to be offered by signing and returning to the Company in the envelope enclosed
the annexed form marked ‘Acceptance of Offer,’ on or before the 28th inst.

By Order of the Board,

3 Thames House, Queen Street Place, C. MacL. CAREY,
17th May, 1930. / Preference Shares. 
Acceptance of Offer. 
1930. 
To the Directors of Central Africa Railway Company, Limited, 
3, Thames House, Queen Street Place, E.C.4. 
Gentlemen, 
I/We acknowledge receipt of your letter of the 17th May, 1930, relating to the proposed fusion between the Shire Highlands Railway, Nyasaland. Limited, and Central Africa Railway Company, Limited, the construction and equipment of a Bridge over the Zambesi River and the construction of additional lines of Railway and which contemplates amongst other things the exchange of the issued Preference Shares and Ordinary Shares in the Central Africa Railway Company, Limited for 5 per cent. ‘A’ Debenture Stock and/or Ordinary Shares in a New Company to be formed to be called ‘The Nyasaland Railways Limited.’ 
As the holder(s) of Preference Shares of —£1 each fully paid of the Company and in consideration of the holders of the whole or at least 90 per cent. of the issued Share Capital of the Company agreeing to exchange their shares on the same terms I/we agree to accept £ — in 5 per cent. ‘A’ Debenture Stock and —Ordinary Shares of £1 each fully paid in the New Company when formed in exchange for my/our said holding of Preference Shares in the Company. 
I/we further agree that upon receipt by me/us of a notification from the New Company that it is prepared to take over my/our said shares and to issue to me/us the 5 per cent. ‘A’ Debenture Stock and Ordinary Shares in the New Company to which I/we shall be entitled for effecting such exchange I/we will execute such transfer or transfers of my/our said Preference Shares in the Company and such other documents in favour of the New Company or as it may direct and do all such other acts and things as may be necessary to carry out the intention of this Agreement. 
Yours faithfully,

CENTRAL AFRICA RAILWAY COMPANY, LIMITED. 
To __________ 
__________ 
__________

Dear Sir,
I am directed by my Board to enclose a Memorandum relating to the proposed fusion between this Company and the Shire Highlands Railway Nyasaland, Limited, the formation of a new Company to be called ‘The Nyasaland Railways Limited’ and the construction and equipment of a Bridge over the Zambesi River and additional lines of Railway. It will be seen from the Memorandum that a very important development is proposed to be made in connection with the Railway system connecting Lake Nyasa with the Port of Beira, involving an expenditure of approximately £3,200,000, which if the Scheme is accepted by all necessary parties will be provided by the Nyasaland Government on advantageous terms.

The proposal comprises the formation of the Nyasaland Railways Limited to effect the fusion between the Shire Highlands Railway Nyasaland, Limited, (the S.H.R.) and this Company (the C.A.R.), by purchasing the whole of the Railway and Undertaking of the S.H.R., and liquidating that Company, and acquiring the whole or at least 90 per cent. of the shares of the C.A.R. from the present holders.

Under the terms of the Agreement which has been entered into with the Nyasaland Government, the Shareholders of the C.A.R. are to receive in exchange for their present holdings the following securities in the New Company, viz.:–

For every Twenty £1 Preference Shares fully paid in C.A.R.
£8 five per cent. ‘A’ Debenture Stock and three Ordinary Shares of £1 each fully paid in the New Company and
For every Four Ordinary Shares of 5s. each fully paid in the C.A.R.
One fully paid Ordinary Share of £1 in the New Company.

In the case of fractions of shares Certificates will be issued or other arrangements made convenient to Holders.

The Directors consider that as the development of the C.A.R. by itself is difficult without the help of funds far beyond its resources the exchange of the existing Preference shares for Debenture Stock and Shares in the New Company and the existing Ordinary shares for Ordinary shares in the New Company which is to be provided with a very important amount of additional capital for immediate development will be a beneficial and profitable arrangement for every holder of Preference or Ordinary Shares in the C.A.R.

The Directors therefore confidently recommend the acceptance of the proposal that you should exchange your present holding of Preference Shares and/or Ordinary Shares in the Company for the ‘A’ Debenture Stock and/or fully paid £1 Ordinary Shares in the New Company to which you would be entitled under the Scheme.

Many of the largest Shareholders in the C.A.R. have already expressed their intention of accepting the offer for their shares when in due course it is made by the New Company. I shall be glad if you will signify your acceptance of the terms
to be offered by signing and returning to the Company in the envelope enclosed
the annexed form marked 'Acceptance of Offer,' on or before the 28th inst.

By Order of the Board,
3, Thames House, Queen Street Place, C. MacL. CAREY,
17th May, 1930. /
Ordinary Shares.
Acceptance of Offer.
1930.
To the Directors of
Central Africa Railway Company, Limited,
3 Thames House,
Queen Street Place, E.C.4.
Gentlemen,
I/we acknowledge receipt of your letter of the 17th May, 1930, relating to
the proposed fusion between the Shire Highlands Railway, Nyasaland, Limited,
and Central Africa Railway Company Limited, the construction and equip-
ment of a Bridge over the Zambesi River, and the construction of additional
lines of Railway and which contemplates amongst other things the exchange of
the issued Preference Shares and Ordinary Shares in the Central Africa Railway
Company Limited for 5 per cent. 'A' Debenture Stock and/or Ordinary Shares
in a New Company to be formed to be called 'The Nyasaland Railways Limited.'

As the holder(s) of — Ordinary Shares of 5s. each fully paid of the Company
and in consideration of the holders of the whole or at least 90 per cent. of the
issued Share Capital of the Company agreeing to exchange their shares on the
same terms I/we agree to accept Ordinary Shares of £1 each fully paid in the
New Company when formed in exchange for my/our said holding of Ordinary
Shares in the Company.

I/we further agree that upon receipt by me/us of a notification from the
New Company that it is prepared to take over my/our said shares and to issue to
me/us the Ordinary Shares in the New Company to which I/we shall be entitled
for effecting such exchange I/we will execute such transfer or transfers of my/
our said Ordinary Shares in the Company and such other documents in favour
of the New Company or as it may direct and do all such other acts and things as
may be necessary to carry out the intention of this Agreement.

Yours faithfully,

CAPE OF GOOD HOPE

A REPORT AND ESTIMATE

BY

MR. A. G. DALTON,

CONCERNING THE

CONSTRUCTION AND EQUIPMENT

OF A

RAILWAY

BETWEEN

OUDTSHOORN & KLIPPLAAT STATION

(*Via WILLOWMORE*), WITH FULL DETAILS.

Presented to both Houses of Parliament by command of His Excellency the Governor.

1894.

[...]

– 259 –
Sir, – I have the honour to advise you that the Survey referred to in your No. 327/5441 of September 14th, 1893, is now completed, and to transmit to you herewith a report on, and Estimates for, the Construction and Equipment of a Railway between Oudtshoorn and Klipplaat Station via Willowmore.

Also Plan and Section of the Centre Line which would have to be staked out before Construction could be commenced.

The total length of the Oudtshoorn-Klipplaat Railway would be approximately 153 miles 72·75 chains.

I was verbally instructed to prepare an estimate for the construction of a cheaper class of line than has hitherto been usual on the Cape Government Railways.

I estimate that, under certain conditions, the line can be constructed for £4,450 per mile.

The total cost being 154 miles at £4,450 per mile – £685,300.

For details of Estimate A see pages No. 12 to Nos. 16. /

I would specially direct attention to the conditions, pages No. 9 to No. 11, on which the Estimate A has been prepared, as unless these are strictly adhered to, the cost of Construction will probably exceed this estimate which includes every cost connected with the line.

It should specially be noted that as nearly a quarter of the whole amount is for cost of permanent way material at Port Elizabeth, the estimate can only be considered approximate as by a slight alteration of the home markets or freight, a considerable difference would be made.

The present is an exceptionally favourable time for purchasing permanent way material, as prices are lower probably than ever before, and a rise is almost certain before long.

The Estimate A, although fairly low, provides – as shown by details pages 12 to 16 – for a line well found in every respect, and capable of dealing with a large amount of traffic.

Should any further accommodation be eventually thought desirable, special authority would have to be given, and the expenditure would not form a charge against the amount – based on this estimate – provided by Parliament for the construction of the line.

The Estimate B on page 16 is for a line with 60lb. rails, &c., equal in every respect to the main line on the Cape Government Railways, the cost would be £6,058 per mile, the total cost being £932,932.
Another Estimate C has been prepared on the chance of second-hand permanent way material being available; the Estimate is based on the same prices as were charged for second-hand permanent way material, on the Midland and Eastern Junction, as no other prices are obtainable.

The Estimate C amounts to £4,046 per mile, or a total cost of £623,081.

The following is a short summary of the Estimates, details of which are given on page 16:

Estimate A – New permanent way material, 45lb. rails, &c., for details see pages 12 to 16:

£4,450 per mile. Total cost £685,300.

Estimate B – New permanent way material, 60lb. rails, everything equal to Cape Government Railways:

£6,058 per mile. Total cost £932,932.

Estimate C – Second-hand light section permanent way material, otherwise same as Estimate A:

£4,046 per mile. Total cost £623,084.

From Oudtshoorn to Klipplaat the following would be the grades:

<table>
<thead>
<tr>

<td>5 chains</td>
<td>284:80</td>
</tr>
<tr>
<td>123</td>
<td></td>
<td>665:00</td>
</tr>
</tbody>
</table>

It is proposed that check rails should be used on 5 and 6 chains curves.
Taking total cost of line as £685,300
The interest to be paid would be at 3½ per cent., say 24,000
And the cost of working, say 76,000
Making total yearly return required, say £100,000

To earn the £100,000 the following daily average traffic would be necessary:—
Taking number of days in year as 300,
Amount to be earned per day would be £333.
Estimating average rate of carriage per ton at 3d. per mile,
The total length of the line being 154 miles,
The tons required per day over whole distance would be 166 tons.
Or say in each direction 83 tons.
That is 20 fully loaded short flat trucks,1 and a coach containing 2 first-class,
4 second-class, and 10 third-class passengers, passing each way over the whole
distance, for 300 days out of 365, would enable the line to pay interest and working
expenses.

The trucks received and forwarded from the stations of Barroe and
Klipplaat during the year 1893 averaged for 300 days out of the 365 approximately,
two per day, each way. This traffic represents practically the trade of
the district between the Graaff-Reinet line and Willowmore. It may fairly,
therefore, be anticipated that the districts of Oudtshoorn, George and
Uniondale, which are far more thickly populated, will require at least the
desired 18 trucks per day each way to accommodate their trade, and that
all the districts together will contribute the small number of required pas-
sengers.

With regard to the position Oudtshoorn would be in with the Free State
and Transvaal trade, taking Naauwpoort Junction as the common point
it would be 37 miles nearer than Cape Town, or in other words would be
approximately on an equality with Stellenbosch and Paarl.
The present line has been started from a point near the Old Dutch
Church at Oudtshoorn, as this was the selected station site on the through
surveyed line from the westward, but the question of station site would
have to be thoroughly investigated, should construction be decided on, as
it would be advisable to place the station very much nearer the centre of the
town, but this could be done probably without any increased cost.

13. – From Oudtshoorn to Hazenjagh River at 13 miles the line passes
through an easy country, rising 200 feet. A bridge of two openings of 50 feet
each will be required over this river, and 6 feet arches at 3¼ miles, 7¾ miles, and
9¼ miles. A 15 feet arch at 3¾ miles, and a 10 feet arch at 8¾ miles, will also be required. / 

18. – From 13 miles to Le Roux River at 18 miles the country rises 133 feet and is fairly easy. Up to this point the line is located in the valley of the Oliphants River, but leaves it here owing to the heavy Krantzes close to the river. Between the 13th and 18th miles, the principal masonry would be:–

- 10 feet arch at 14¼ miles.
- 6 feet arches at 15½ miles and 16¾ miles.

Bridges of two spans of 50 feet each at 18 miles.

20. – The line as surveyed passes in front of Mr. Du Plessis’ store over a nek and into the valley of the Meirings Poort River; the section about 20 miles shows a considerable amount of work, most of this will be avoided when staking out, by crossing Le Roux River further north and attaining the summit at Hoole’s Nek – 730 feet above Oudtshoorn – by contouring on the slopes of the main foot hills instead of on the spur running south. The descent of about 250 feet on the east side necessitates a fair amount of work and some long and sharp curves.

21¾. – There will be a Bridge of two spans of 20 feet each over Huis River at 21¾ miles; 6 feet arches at 22 miles, 22 miles 10 chains, 22 miles 35 chains, 22 miles 67 chains, and three spans of 30 feet each over Meirings Poort River, the latter being on the skew and on an 8 chain curve.

27. – The line returns to the Oliphant’s River Valley, about 27 miles, the work being fairly easy except in the neighbourhood of Doorn River (26¼ miles), over which a bridge of 30 feet span will be required, the only other masonry of any consequence being a 10’ arch at 24½ miles.

31. – From 27 miles on to near Kruis River (31 miles) the work will be light, but here for a few miles, owing to Krantzes, the line again leaves the Oliphants River Valley, and passes over the same nek as the waggon road, necessitating some rough work and sharp curves. Kruis River itself will be crossed by a Bridge of three spans of 20 feet each, and between 27 miles and 33 miles there will be, in addition, a Bridge of 15 feet span at 27¾ miles, a Bridge of 15 feet at 28¼ miles, a Bridge of three spans of 9 feet each at 29 miles, one of three spans of 9 feet each at 31 miles 8 chains, and arches of 10 feet span at 31 miles 43 chains, and at 32 miles 28 chains.

From 33 miles to 50½ miles the line keeps to the Oliphants River Valley, with over the greater portion fairly easy work.

The principal masonry work required would be:–

<table>
<thead>
<tr>

50½. – At 50½ miles the line crosses the Oliphants River with a bridge of 4 spans of 100 feet and 1 span of 20 feet. A portion of the bridge would be on cylinders. The site selected is fairly favourable and undoubtedly better than any other for some miles on each side.

53½. – After crossing the river the line runs over easy country to 53½ miles, where somewhat heavy works are necessary at a Krantz, and also at 54¾ miles. The principal bridges will be:— /

<table>
<thead>

</tbody>
</table>

At this point the line is 817 feet above Oudtshoorn.

53¾. – After leaving Wilge River, 54¾ miles, the work would be very light on 56 miles, where there is another bad Krantz; to avoid this the line has been taken over a nek south of the Krantz, but not without some heavy works.

56. – From 56 miles the country opens out, and for some miles is very easy. At about 58 miles the line leaves the Oliphants River Valley and runs through a country giving very light work, except at 59¾ miles and 60¼ miles, where there would be some work and sharp curves to Leeuw Kloof River at 67¾ miles. This river would require a Bridge of two spans of 20 feet each, and the other principal masonry would be:—

70¼. – After crossing Leeuw Kloof River the line rises over a small summit with some work and then falls through an easy country to the second crossing of the Oliphants river at 70¼ miles, where 1 span of 100 feet, 1 span of 50 feet, and 1 span of 20 feet will be sufficient opening, a portion being on cylinders.
From here the line keeps along the north side of the river to 76½ miles, the country being as a rule easy, with broken portions at 72 miles and 73¼ miles, but probably when staking out there will be an improvement over this portion. The principal masonry, in addition to Oliphants River Bridge, would be:

<table>
<thead>
<tr>

76½. – At 76½ miles, Outspan Reserve, 1, 400 feet above Oudtshoorn, the line enters Zuurberg Poort, and rises with a considerable amount of 1 in 40, and numerous sharp curves to the summit at 86½ miles – 2,371 feet above Oudtshoorn 3 – a rise of nearly 1,000 ft. in 10 miles.

There would be a considerable amount of earthwork on this length, although not specially heavy at any one point. The masonry also would be above the average as the line runs on the slopes of the Zuurberg:

<table>

94. – The line from the summit at 86½ miles falls rapidly – 700 feet – to Willowmore at 94 miles over an easy country.

The Station site selected is north-east of the town, and in close proximity to the present main road. There would be a 15 feet arch Bridge at 88 miles, and the river through Willowmore itself would require one span of 40 feet and one of 20 feet.

117½. – From 94 miles to Waai Kraal at 117½ miles, the line passes over a very easy country except for about a mile in Wet Poort (114¾ miles). The principal openings would be:

<table>
<thead>
<tr>

</tbody>
</table>

117½. – At 117½ miles Groot River is crossed by a bridge of 2 spans of 100 feet each. The traverse was taken north of the drift, but the bridge would be built just
south of the drift, where there is an excellent crossing. This point is 1,046 feet above Oudtshoorn and 1,417 feet below the summit on the Zuurberg.

119. – From Groot River the line passes over easy country into the Valley of the Plessis River, and crosses this river at 119 miles with 2 spans of 75 feet each, and follows up the east bank to 128 miles through Naroegas and Swanepoel’s Poorts. A considerable portion of this length is fairly easy, but there would be somewhat heavy work at two Krantzes at 121½ miles and 127½ miles.

The principal masonry on the length would be:–

1 opening of 6 feet (arch) at … 124 miles 17 chains.
1 ” 6 ” ” … 127 ” 17 ”
1 ” 10 ” ” … 127 ” 9 ”

128.– After leaving Swanepoel’s Poort, the line continues to rise over an easy country to a summit at 136¾ miles – 1,700 feet above Oudtshoorn – the principal openings being:–

1 opening of 20 feet at … … 131 miles 8 chains.
2 ” 9 ” ” … … 135 ” 50 ”

and then falls, the country being very easy to the Junction with the Graaff-Reinet line near Klipplaat Station.

The masonry will be:–

4 openings of 9 feet each at … 137 miles 32 chains
2 ” 20 ” ” … 139 ” 70 ”
3 ” 9 ” ” ” … 140 ” 44 ”
4 ” 9 ” ” ” … 144 ” 47 ”
4 ” 20 ” ” ” … 151 ” 25 ”
3 ” 50 ” ” ” … 151 ” 45 ”
4 ” 9 ” ” ” … 152 ” 70 ”
2 ” 9 ” ” ” … 153 ” 66 ”

154. – The Junction point, at 153 miles 72-75 chains from Oudtshoorn and 123 miles 60-66 chains from Port Elizabeth, is 2,077 feet above sea level, and 1,028 feet above Oudtshoorn, and is just north of the 30 feet Bridge about half a mile north of the Klipplaat Station.

The line has been located and graded to give light work, but notwithstanding this, as shown by the details of the estimate, the earthwork would cost £703 per mile. The masonry also is a heavy item, £752 per mile; all the Bridges and Culverts being, however, of the same class, as on the main line, they will cause no expense in the future should the traffic require heavier engines, &c. / Ballast will as a rule be plentiful and good.

Building stone is scarce except in a few places, therefore it is intended to use concrete to a great extent for Bridges and Culverts.
Excellent water is found south of the Zwartberg Range – Oudtshoorn to 86 miles – but north of the range to Klipplaat good water, as is usual in the Karroo, is not obtainable; although of a certain quality a fair supply will probably be procurable.

I have heard indirectly that there is a probability of the Klipplaat Outspan, on which the Junction will be situated, being sold before long, and would suggest the advisability of reserving the land required for Railway purposes.

The staff, consisting of Mr. A. M. Shaw, District Engineer; Mr. J. G. Hallack, Acting District Engineer; and Messrs. G. R. Whitaker, A. Heatlie, E. A. Childe, and E. Simpkin, Assistant Engineers, collected at Oudtshoorn early in October, 1893. Fieldwork commenced October 9th and was completed January 8th, and the office work was finished and the staff disbanded at end of February.

The amount allowed for Survey was £4,000.

The total expenditure to the end of February was £2,695 7s. 9d., and as the future charges will be small, there will be a considerable alance.

I have the honour to be,

Sir,

Your obedient Servant,

(Signed.) ALAN GRANT DALTON,

Resident Engineer.

OUDTSHOORN-KLIPPLAAT – 154 MILES.

Conditions on which a line could probably be constructed between Oudtshoorn and Klipplaat for £4,450 a mile. (See pages 12 to 16 for details of estimate).

Grade. – Ruling grade to be 1 in 40.

Curves. – Radius of 5 chains to be allowed, but if possible the grade will be reduced on curves of 8 chains radius and under.

Speed. – Limited to 15 miles per hour.

Staff. – The Resident Engineer to be consulted on the appointment of every member of his staff, and to be given as free a hand as possible.

The members of the staff, representing every Department, to be directly under the Resident Engineer’s control, and every one coming on the works, to take instructions only through the Resident Engineer.

Contracts. – Work to be let in the same manner as on the Kimberley-Vryburg Railway, that is to a great extent work to be let by verbal agreements between the Engineers and Contractors – the Resident Engineer being final arbitrator in all disputes on the works – his decision to be without appeal.

Opening. – The opening of the line for traffic not to be hurried, so that no high expenditure on temporary structures may be incurred, and no interference with economical ballasting.
Use of Line during Construction. – As completion of the line is sufficiently advanced, construction to have authority to carry passengers, parcels and goods entirely without risk. / Line to be opened to Willowmore when ready, but to be maintained and worked by Construction, and Construction to get all receipts, a special tariff being arranged.

Passengers and goods to be re-booked at Klipplaat.

Survey. – The estimate is for the staking out of the centre line, and other expenses that may be incurred after the Construction of the line has received the sanction of Parliament.

Expropriation. – £80 per mile has been allowed, but this amount must be taken as only approximate.

Fencing. – The line is to be fenced in on both sides, through all farms completely fenced at the time of the Survey.

The total fenced line at present is about 35 miles, another 20 miles has been allowed for against compensation.

The fencing estimated for is Sneeze, Olive or other good hard-wood poles 6¢ 6² to 7¢ 0² long, 3½² diameter at small end, placed 30¢ apart on easy curves and straights, distance reduced on rough ground, neighbourhood of stations, &c.

Straining posts about every 200 yards with eye bolts and wire ties. Wire No. 6 steel for 2 wires, No. 7 steel for 4 wires, laced every 3 feet with double No. 10 steel wire, poles to be 2¢ in ground and 4¢ 6² above.

Supervision, Head Office, &c. – The head office expenditure on the Midland and Eastern Junction amounted to about £20 per mile; the same amount has been included in present estimate.

Temporary Works. – The amount allowed under this heading is small on the assumption that it will not be necessary to push on the works so rapidly as to entail heavy expenditure on temporary bridges, &c.

Earthworks. – Ordinary formation width to be 12 feet increased to 14¢ on banks of 10¢ and over, and possibly in some cuttings. All cesses to be 8 feet wide to allow of banks being economically increased in width hereafter.

Bridges and Culverts. – Superstructures to be equal to those on Main Line (same type as on Midland and Eastern Junction). Cylinders will be used on portions of the Oliphant’s River Bridge, and cement concrete will be freely used in place of masonry owing to the scarcity in many places of good building stone.

Gradient and Distance Posts and Level Crossings. – Posts constructed of old rails; gradient arms sheet iron; distant discs cast iron. Level crossings with guard rails, &c., as usual.

Permanent Way. – Rails to be 45lb. new steel. Sleepers on straights and curves of 10 chains radius and over to be steel, 70lbs. each – costing in Port Elizabeth about 4s. 6d. each; 1,980 to be laid to the mile.
On curves under 10 chains radius, wooden sleepers to be used, Colonial if they can be supplied at the same price and of the same quality as imported.

**Fastenings.** – New.

**Points and Crossings.** – New. Curves of 5 and 6 chain radius to have check rails.

The price of rails has been supplied to me as the present price on trucks in Port Elizabeth, and that of sleepers is about the approximate price of those recently imported for the Mafeking line. These prices are, of course, liable to large and sudden fluctuations. / 

**Ballasting.** – Rail level to be 12 inches above formation instead of 18 inches as is usual on the Cape Government Railways.

**Note:**– On light work in the Karroo the quantity of Ballast may be still further reduced at the discretion of the Resident Engineer.

**Stations and Buildings.** – Earthworks, permanent way, material and ballasting at Stations and Sidings is not included under this heading, but only accommodation, &c., for the Locomotive and Traffic Departments.

The type drawings show the class of buildings, and give full details of everything that has been included in the estimate.*

All dwellings, offices, &c., will consist of wooden huts, either erected singly or grouped together. Many of these huts will be used by officers during construction.

Huts placed at sites that are practically certain to be permanent will be erected on rough stone foundations, others on hardwood stumps.

Iron tanks on masonry have not been included for engine watering stations, as the wooden construction tanks on ‘old rails’ or other substantial supports will last for many years. Hand pumps and windmills are included for the Water Stations.

**Platelayers Cottages.** – To be erected every five miles, and as they are required permanently, the exterior walls will be built of rough masonry, using any stone in the neighbourhood that will not weather; interior walls of wood, wooden sills, lintels, &c., and no dressed quoins.

**Telegraph.** – For 113 miles, new poles, &c., will be required on the remaining 41 miles (0 miles to 23 miles and 76 to 94 miles) the poles now erected will only require to be moved to the neighbourhood of the line. Special telegraph officers have not been included as it is intended that the instruments should be placed in the Stationmaster’s Offices. No Post Offices or Post Office fittings are included in the estimate.

**Maintenance.** – No Maintenance to be charged against Construction from the date of the opening of the line through Oudtshoorn, but Construction after that date to bear only the cost of completing purely Construction items.
‘Construction’ to bear cost of maintaining the portions of the line that may be opened as completed, but such portions are to be worked by, and the proceeds placed to the credit of ‘Construction.’

At the date of the opening through to Oudtshoorn, an estimate to be made by the Resident Engineer of the cost of completing Construction items, the cost of everything not included in such estimate, to be charged to and paid for by Maintenance.

**Rolling Stock.** – As the specified speed is limited to 15 miles an hour, undoubtedly the line will be worked with Rolling Stock, of which I understand there is every probability of there being an ample supply available shortly, that has fallen out of date on the main line, but is suitable for branch line traffic. The estimate, therefore, for Rolling Stock has been placed at £300 per mile, which will be ample. /

| ESTIMATE A (Per Mile of Main Line for Oudtshoorn-Klipplaat Railway) |
|-------------------------|-----------------|-----------------|

Dalton, A Report and Estimate Concerning the Construction of a Railway 277

CAPE OF GOOD HOPE.

REPORT AND ESTIMATE

IN CONNECTION WITH

CALEDON SURVEYS

WITH A VIEW TO THE CONSTRUCTION OF A LINE OF RAILWAY.

MADE BY G. S. OWEN DURING 1896 AND 1897.

Presented to both Houses of parliament by command of his Excellency the Governor.

[...]
Sir, – I have the honour to transmit to you

1. Plans, sections, and estimate of the proposed railway from Sir Lowry’s Pass station, via Houw Hoek, Caledon, Swellendam, Zuurbraak and Heidelberg to Riversdale.

2. Similar particulars for an alternative route from Klapmuts to Caledon, via French Hoek and Bot River, joining the above survey on the farm Boontjes Kraal, 9 miles 18 chains of Caledon.

3. Small scale plan showing the direction of the above surveys.

The line from Boontjes Kraal as far as the Northern end of the French Hoek tunnel, has been surveyed by my Staff. Thence to Klapmuts, the previous survey and estimate of Mr. Shaw have been adopted.

For convenience of reference the estimates have been divided into four parts.

1. Sir Lowry’s Pass to Caledon.
2. Klapmuts to Caledon.
3. Caledon to Swellendam.
4. Swellendam to Riversdale.

The estimates are framed on earthworks of the light type of Railway recently authorised by Parliament, new steel rails, 60 lbs. per yard, 3ft. 6in. gauage, wooden sleepers, and stations similar to those adopted on the Graaff-Reinet-Middleburg Railway, and include all the necessary works such as:–

- Earthworks
- Fencing throughout.
- Bridges.
- Culverts.
- Locomotive requirements.
- Telegraph.
- Rolling stock.
- Permanent Way and Ballast.
- Stations.
- Platelayers’ Cottages.
- Expropriation, and / Sums of 5% for contingencies and 5% for raising the loan.

The total distances are:–
Sir Lowry’s Pass to Caledon

Commencing at the present terminus at Sir Lowry’s Pass Station, the line contours up, until it crosses the main road to Caledon on the level, about half a mile above the station; thence it contours up the slope of the Hottentot’s Holland Mountains, keeping on the north side of the road to a point above the toll-bar, about half a mile from the summit of the pass; here it crosses under the road, and, running immediately below it, passes under the summit with a tunnel 203 yards long.

The grade from the Station to the summit is chiefly 1 in 40.

After leaving the summit, the post road is again crossed on the level, and twice again before the Steinbrass River is reached; thence it diverges considerably to the north, and contouring down on a 1 in 40 grade, crosses the Palmiet River and adjoining valley, about a mile above the present road bridge.

At the Palmiet River four span of 100 feet have been provided.

In close proximity to this bridge, and about half a mile from the road bridge, a station site for the Palmiet River and adjoining farms has been selected.

From here, the line gradually rises to the next watershed above Knoplocks Kraal River, and descending, crosses the river at the farm De Rust, about one mile above and to the north of the present road bridge; from here it contours up, generally on a 1 in 40 grade, to the watershed above Mr. Jackson’s homestead, the commencement of the Houw Hoek Pass.

The main road is here crossed on the level, and the line, now on the south side of the road, commences the descent on a 1 in 40 grade towards the Bot River, keeping to the south of Houw Hoek Hotel, where a station is provided for; a short distance east of the hotel, the road is again crossed and the northern bank of the Jackalls River reached.

Klapmutts Junction to Caledon

Caledon to Swellendam

Swellendam to Riversdale

Cape Town, via Sir Lowry’s Pass to Caledon

Cape Town, via French Hoek to Caledon

Cape Town, via Sir Lowry’s Pass to Riversdale

Cape Town, via French Hoek to Riversdale

GENERAL DESCRIPTION OF ROUTE.

Sir Lowry’s Pass to Caledon.
Here the most difficult part of the Pass occurs, and the Jackalls River is crossed twice on viaducts, each 300 feet long, thence, running immediately below the post road, to the bottom of the Pass, where it crosses the post road on the level, and after considerable detour to the south returns, re-crossing the road immediately above the houses at the Bot River. Shortly after this the Jackalls River is finally crossed, then the Bot River, about half a mile above the present bridge.

From the Bot River, a long gradient of 1 in 40 brings the line to the north of the post stables at Lange Hooghte, whence it descends on a 1 in 40 grade, on the north of the post road, to the Zwaart River at Boontjes Kraal.

From this point it keeps still on the north-side of the road, till reaching Zee-koe Gat, crosses the road, and passes up the valley of the Bath River to Caledon station which has been placed close to the Vley, below the town. The heaviest work occurs for two miles south of Sir Lowry’s Pass, and two miles in the Houw Hock Pass.

**Caledon to Swellendam.**

On leaving Caledon station, the line keeps close to the south side of the post road, till nearing Mr. Metcalf’s farm; here it takes a sharp bend to the right, passing about one mile to the south of the homestead. Between this and Drayton, the road is crossed three times, and the line, running about ¾ mile to the north of the homestead, passes about half a mile to the north of Spielman’s River, and recrosses the road at about two miles east of the latter homestead; thence it runs to the head waters of the Droogas River, leaving the homestead at Zandfontein about two miles to the left.

The north bank of the Droogas River is followed to Mr. Philips’ house, near which a station is provided, and the Droogas River crossed just below the homestead.

Thence the line continues on the east bank of the Droogas River, to its junction, with the River Zonder End, at Schuitsberg.

From this junction the line keeps on the south bank of the River Zonder End as far as its junction with the Breede River, leaving the Post Office Zonder End, where a station is provided, the main homestead of the Drooge Boom, Tygerhoek, Appels Kraal, near which a station is provided, on the left, and Groote Vlaakte on the right; thence passing close to the south of Stormsvlei homestead, where a station site has been selected, through the Poort to the Breede River, which is crossed with six spans of 100 feet each, close below the junction of the Breede and Zonder End Rivers.

From this point the line continues on the north bank of the Breede River, crossing the Leeuw and Klip Rivers, to Swellendam, the station site for which has been placed immediately below the town on the south side of the Klip River.
Swellendam to Riversdale.

From Swellendam, the line immediately mounts the hill on a grade of 1 in 40 eastwards, about half a mile from the post road throughout, then descends until reaching the valley of the Buffelsjagt River, where it crosses successively the post road, the Applebosch, and Buffelsjagt River.

The site selected for the bridge over the Buffelsjagt River, where four spans of 100 feet each are required, is about half a mile north of the toll-house at the present bridge; thence the line is direct to the confluence of the Rietkuils and Buffelsjagt River, where it crosses the former, just before reaching the village of Zuurbraak.

At Zuurbraak, the ground best suited for Railway purposes is occupied by the post road and the village, and the line has consequently followed its southern border, escarping the cliffs on the south side of the road.

A station to serve Zuurbraak has been placed at the nearest suitable ground, viz., Tradouw.

After following the post road for some distance, the line commences to contour up Moodie’s Heights, on a tortuous grade of 1 in 40, in a south-easterly direction to the summit, and contours down on a 1 in 40 grade into the valley of the Doorn River, which is followed on its northern bank to Heidelberg.

The only available station site at Heidelberg is occupied by a portion of the township, near the Market Square and Post Office. Plans and sections of the proposed works have been submitted to the Municipality, and received their sanction.

Immediately after leaving Heidelberg, the Duivenhok’s River is crossed on four spans of 100 feet each, and the line crosses the ridge to the Krombeks River Valley, which it follows to the foot of the Vette River heights.

After contouring up these heights, on a long grade of 1 in 40 with occasional heavy cutting, a similar descent is made into the valley of the Klein Vette River, which is followed on its right bank into Riversdale.

The Riversdale station has been placed on the Commonage close to the town.

Frech Hoek.

The mountain at French Hoek has been thoroughly surveyed, with a view to selecting a suitable tunnel site for the line from Klapmuts to Caledon.

Contour lines, some three miles long on each side of the mountain, have been surveyed and connected by accurate levels and triangulation over the mountain.

From the southern face of French Hoek Mountains, three routes have been inspected.

1. Following the River Zonder End, through the ‘Poort’ to Middelplaats, and thence via Long Kloof and Zwaart River to Caledon.
2. A direct line over Ezeljagt to Caledon.
3. A line leaving the survey from Sir Lewry’s Pass to Caledon at a point 9 miles 18 chains west of Caledon and following the Bot River towards the French Hoek Mountains.

This latter line is superior in every respect to the other two, and consequently has been surveyed in detail, and forms a part of the line from Klapmuts to Caledon.

Klapmuts to Caledon (via French Hoek)
The line leaving the main line 30 chains east of French Hoek level crossing, crosses the main road half a mile further on; at 1½ miles it passes to the right of Mr. Basson’s homestead and west of the road, from which point it runs close to the road, passing to the right of Simondium Church, crossing the Dwars River about 100 yards above the road, crossing the road at 8 miles and re-crossing it at 8½ miles.

At about 10 miles, it runs to the right of the Berg River, which it crosses at 13 miles on Mr. Schalkwyk’s farm, and crosses the main road again at about 14 miles.

At 16½ miles, the nearest point to French Hoek village, which it leaves about a quarter of a mile to the right, it contours on a 1 in 40 grade and passes to the left of Messrs. Marais, Lather and Kriel’s homesteads, and enters the tunnel on the farm Scherpenheuvel. This tunnel is 3,159 yards long, and owing to the large amount of water issuing from both sides of the mountain the gradient has been laid so as to drain this off, and admit of work being carried on at each end simultaneously.

Emerging on the southern face of the mountain, the line contours, in a westerly direction, on a grade of one in 40 down the face of the mountain, to the valley of the River Zonder End, at the mouth of Bushman’s Kloof.

After leaving Bushman’s Kloof and crossing a low watershed, dividing two tributaries of the River Zonder End, the line runs to the main stream, which it crosses, and then ascends to the watershed between the River Zonder End and one of the upper sources of the Bot River; thence it follows down the valley of the Bot River, which it crosses twice.

Leaving the valley of the Bot River on the farm Phesante Kraal, the line contours up tributary kloofs, and crossing the watershed between the Bot River and Zwaart River, above the farm Lange Hoogte, contours down to the junction with the Sir Lowry’s Pass Caledon Survey, on the farm Boontjes Kraal, about 9 miles 18 chains west of Caledon.

LIST OF FARMS THROUGH WHICH THE LINE PASSES. Owing to the sub-division and re-naming of farms, the following farms have been taken from the Surveyor-General’s Census Map:–

**Sir Lowry’s Pass to Caledon.**

**Caledon to Swellendam.**
Veltereden, Roode Bloem’s Kraal, Spielman’s River, Zandfontein, Driefontein, Grauw Heuvel, Droogas River, Schuitzberg, Bloem’s Kraal,

**Swellendam to Riversdale.**
Swellendam Commonage, Outspan, Sparre Bosch, Oudepost, Zuurbraak,
Melkhoute Boom, Coester’s Vallei, Tradouw, Slange Rivier, Doorn Rivier,
Uitspan Kraal, Heidelberg Commonage, Doorn Boom, Duivenhok’s Rivier,
Karnemel Rivier, Melkhoute Kraal, Kragga Kraal, Vette Rivier, Aan de Vette Rivier, Zeekoe Gat, Doornkraal, Riversdale Commonage.

The survey was commenced in May, 1896, and the filed work completed in February, 1897. The progress of this work has been considerably hampered during the winter months by fog and wind. The whole length of the line has been carefully contoured, with a view to laying out the most economical centre line.

The Locomotive and Traffic Departments have been consulted as their respective requirements.

N.B. – Cost of Rolling Stock and Locomotive requirements has been distributed over the whole length from Sir Lowry’s Pass to Riversdale, and in the event of a portion only being constructed, will require re-adjustment.

I have been honour to be,

Sir,

Your obedient Servant,

(Sgd.) G.S. Owen,

Engineer in Charge of Surveys.

The Engineer-in-Chief,

Cape Town.

Railway Construction,

Zoutpansberg District,

1909.

Presented to both Houses of Parliament by Command of His Excellency the Governor.

PRETORIA:
[...]
The Chairman of the Railway Board.

27th May, 1909.

RAILWAY CONSTRUCTION – ZOUTPANSBERG DISTRICT.

With reference to my report and recommendation dated 25th February, 1909, (Annexure 'A'), and to the decision of the Railway Board as recorded in Minute No. 4752 of the 20th March (Annexure 'B'), I transmit herewith copy of the report of the Chief Engineer dated 5th April, 1909 [...]. (Annexure 'C'.)

The question upon which the decision of the Transvaal Government and of the Transvaal Parliament will require to be taken, after considering the advice of the Railway Board, divides itself into three sections, viz.:

(1) Railway extension in the high veld of the Zoutpansberg District.
(2) Railway construction for the development of the low veld area of the Zoutpansberg District, including the Leydsdorp and Murchison Range Districts.
(3) The advisability of
   (a) assisting the most cultivated area at present of the low veld, i.e. as far as Tzaneen, and at the same time bring railway communication fairly accessible to Leydsdorp from the high veld to begin with in preference to completing and extending the Selati Line.¹
   (b) Alternatively, complete and work the partly-constructed portion of the Selati Line and extend it so as to more adequately serve the whole of the low veld than (a) probably would.
   (c) Construct the light narrow gauge line suggested in alternative (a) and at the same time complete (at a cost not exceeding £35,000) the Selati Line to its present terminus and extend the latter of such gauge, in such direction, and for such distance as the growth already and the reasonably certain prospective further growth of the trade warrant. This may be taken from present information to involve the extension of the Selati Line from its present terminus to the Great Letaba River, and if possible to Tzaneen, via Leydsdorp, an estimated distance of 150 miles to Great Letaba, and 168 miles to Tzaneen. The line should by preference, if economically practicable, traverse as near as may be the foot of the Murchison Range to Leydsdorp.
   (d) Confine operations to completing and working the Selati Line to its present terminus at an estimated cost of £35,000.
Section 1.

Railway Extension in the High Veld of the Zoutpansberg District.
The urgent need for further considerable railway extension in the high veld of the Zoutpansberg District does not seem open to doubt. What requires to be settled is the length of the extension that should be authorised at once and the direction in which it should proceed.  

(a) If the sole purpose of the extension is to serve the Messina Copper Mine\textsuperscript{2} as economically as possible, coupled with reaching Rhodesia in the shortest distance, then the line should either take the most direct route from Pietersburg, via Blaauwberg Gap, or else to Bandolier Kop, and be continued thence in a north-westerly direction. The direct line, via Blaauwberg Gap, will not, I apprehend, be considered, having regard to the nature of the country it will traverse. The direct line to Bandolier Kop would cost substantially less to construct, would be about 13 miles shorter to Bandolier Kop than the alternative line via Spelonken, which will be referred to later, and, what is of not less importance, would probably have grades about 10 per cent. to 15 per cent. more favourable if the recommendation I make later is adopted. But such a line would (next to the Blaauwberg Gap route) pass through the least fertile and cultivable part of the district, and would be of comparatively little service for local development purposes.  

(b) The alternative route shown in red on the blue print which accompanies this report, on the other hand, has been diverted as far east as the hilly nature of the country permits so as to pass through the Spelonken District, thereby travelling through a fertile area almost the whole way in order to be of service to farmers along the route as well as to farmers still further east thereof. I am informed there are also considerable copper deposits and possibly other minerals awaiting development which such a line would serve. As against this the line would, as already stated, be longer, more costly, and probably have less favourable grades than the alternative and more direct route. For each of these reasons it might seem at first preferable to adopt the first alternative, but it has to be remembered  

(1) that Rhodesia is already served by a railway from Beira and another from Capetown, Port Elizabeth, and East London. It is true that if there is any special reason therefor, a shorter line via Pietersburg could be built from Lourenco Marques than either existing route to Bulawayo, and that such a line could quite successfully compete with both. But there is no particular reason why we should seek at much cost to ourselves to deprive those lines of such trade as they have, even as things are now, and there will be still less reason under Union, when the ownership of the railways will be joint;  

(2) that a railway from any port to Rhodesia or to the Limpopo, near which the Messina and adjacent copper mines are situated, must be hundreds of miles
in length, and an addition of 12 to 15 miles in distance is therefore not really vital. A substantially less favourable grade is a more serious matter, and this will need to be fully weighed when deciding upon the expenditure to be incurred in constructing the line if the Spelonken route is decided upon;

(3) the area between the Limpopo River and the northern side of the Zoutpansberg Range is known to be extensively mineralised, especially of copper ore deposits. But while large bodies of copper ore have been located at the Messina, the whole area has been by no means fully prospected. Indeed a large portion of the district has not even been surveyed, and is Government ground.

In these circumstances it does not seem to be by any means established that a line trending from Bandolier Kop in a north-westerly direction to the Limpopo River would best serve the bulk of the mineral belt or belts known to exist north of the Zoutpansberg Range.

(4) The main ground for urging expenditure on railway extension is to assist in developing the resources of the district.

The Chief Engineer in his report indicates that at or near Bandolier Kop, about 55 miles beyond Pietersburg, will be a common and first objective whichever of the two routes is adopted. This confirms the impression we formed during the recent tour of inspection.

Mr. Wall recommends authority being taken at once for an extension from Bandolier Kop, first in a northerly direction to within about 6 miles of Louis Trichardt, and then easterly to Pisang Kop – a distance in all of about 40 miles, and at an estimated cost of £160,000. His reasons for doing so are:

(a) Pisang Kop is the meeting place for several roads leading north-east and south-east, all of which are trade routes largely used by natives from and to Portuguese Territory, Rhodesia, and the low veld. The large native population of the districts going to and returning from Johannesburg and other labour centres in the Transvaal as well as trade of other descriptions, and considerable in extent, traverses these routes. Mr. Wall thinks, quite reasonably, that a terminus at Pisang Kop would tap as well as materially increase this trade better than a terminus at Bandolier Kop would.

(b) Pisang Kop will most probably form the junction with the line to the north from Komatipoort when it is built.

(c) With the line at Pisang Kop it would be of more value for the gold mines at Birthday and Louis Moore, as well as the copper mines, when worked, that can be served by way of the N’Jelele Valley. The distance from the suggested terminus at Pisang Kop to the Birthday Mine will be about 52 miles, and to Louis Moore 42 miles, both over, I am informed, easy country.

(d) The line would be available for more rapid extension up the N’Jelele Valley when the time for doing so has arrived, and the funds for the purpose are available. /
There is much force in what is pointed out, but I regard it as only prudent at the present stage to decide definitely on the extension as far as Bandolier Kop only. To do more than this would in a measure amount to anticipating the result of the further investigations that are necessary north of the Zoutpansberg Range, as well as serve to place the Messina mines at a disadvantage.

I therefore recommend

(1) that the line from Pietersburg be extended to Bandolier Kop via Spelonken, of an estimated length of 64 miles, at a cost not exceeding £250,000. This mileage is less than that shown in the Chief Engineer’s report because it is proposed to construct the line to a 1 in 50 instead of a 1 in 80 gradient;

(2) the rails and other permanent way material available from relaying main line to be utilised for constructing the extension;

(3) that the Messina Copper Company be informed of this decision, together with the intimation that if the company desires to undertake any extension from Bandolier Kop to its mines, either of the standard gauge or of 2 ft. gauge, or from Leydsdorp to the Messina, the Administration will be prepared to take the same into consideration on the understanding that no guarantee can be given in regard to interest on capital expenditure, and that while the Administration reserves the right to take over and work any railway permitted to be built, on equitable terms, it does not guarantee to take over such line at any time;

(4) such further investigations to be made of the agricultural and mineral resources of the area between the Zoutpansberg Range and the Limpopo River as will enable a decision to be taken as to the extent, character, and route of the railway extension to and within that area which would be warranted, as well as the probable time when such railway construction should be undertaken.

Section 2.

Railway Construction for the development of the low veld area of the Zoutpansberg District, including Leydsdorp and Murchison Range Districts.

The urgent need for railway communication in the low veld of the Zoutpansberg District, including the Leydsdorp and Murchison Range Districts, has been recognised for many years, and the diminished revenue from claim licences and other sources derived by the Government of late, as compared with what was formerly received, is without doubt due to the languishing hopes of such communication being provided.

Whatever may be the prospects of any railway or railways built in the districts being themselves remunerative or otherwise from the outset, that it or they would permanently increase the occupation, enhance the value of the district, and largely increase the revenue derivable by the Transvaal Government therefrom both immediately and permanently, is not open to doubt. Copies of
the latest report of the Government Mining Engineer, dated 11th March, 1909 (Annexure ‘D’), a letter dated 22nd January, 1909, from the Zoutpansberg Cotton Syndicate of Manchester (Annexure ‘F’), and extract from a letter dated 18th May, 1909, from the Transvaal Director of Agriculture (Annexure ‘E’) are attached hereto as bearing on the subject.

But while railway communication has for long been regarded as vital to the needs of the district, a perusal of the reports and correspondence, and an examination of the plans attached thereto in connection with the sanctioning and construction of the Selati Railway, and the representations made from time to time by the Pietersburg community through their Chamber indicates that there has been considerable diversity of view as to the direction railway communication should take.

I have not had an opportunity of going through the districts, and can therefore only form an opinion as yet from the several reports I have received from engineers and other documents available for perusal.

On one question, however, there can be no doubt, and that is the partially completed Selati Line from the junction with the main line at Komatipoort to Newington, about 22 miles north of the Sabi River (a length of about 74 miles in all) should either be removed altogether or sufficiently completed to enable it to be used.

To put the line in running order to its present terminus at Newington will cost £35,000. The intention was to abandon the railway altogether, and to use the greater part of the material elsewhere – unless it could be shown, after further / enquiry, that advantageous use could be made of the line as far as it was laid – and the reasons why abandonment is undesirable and the urgent necessity for the line being put into working order and extended to the areas where it will be of great use are set out in the Government Mining Engineer’s report (Annexure ‘D’) and in the extract from the letter of the Director of Agriculture, Transvaal (Annexure ‘E’). The disadvantages of the railway to its present terminus are given in the Chief Railway Engineer’s report. (Annexure ‘C’.)

The existing partially constructed Selati Line has cost the Transvaal Government £1,283,814, and the money has been paid. The line is not worth this to the Central South African Railways Administration, but in the light of our later information I consider it is worth to us as it stands £300,000 subject to the condition that any money paid for its purchase is devoted to placing it in running order, and its extension to Tzaneen by a route that will be reasonably near to Leydsdorp.

I therefore recommend

(1) that the Transvaal Government be offered by the Central South African Railway Administration £300,000 for its Selati Line assets on condition
(2) that the money is devoted exclusively to placing the existing line in running order to its present terminus and extending it via Leydsdorp to the Great Letaba River – an estimated distance of 150 miles, and if possible to or near Tzaneen, an estimated distance of 168 miles, the route, cost, and character of the line to be left to the discretion of the Railway Board, who will, however, consult in regard to details such of its officers as the Transvaal Government may appoint;

(3) the Transvaal Government to have no further independent claim to the Selati Line or to the £300,000;

(4) the £300,000 to be provided out of the surplus net railway revenue realised during the financial year ending 30th June, 1909. The surplus net revenue that will accrue from the results of the working during the financial year ending 30th June, 1909, will be considerable and is due

(a) to the railway trade recovery during the year;

(b) to the economies in working as the result of reorganisation to which I have referred in detail in my annual report for the year 1908;

(5) the Transvaal Government to be asked to provide from the 1907 Guaranteed Loan or other source a further amount of £250,000, and if possible £300,000 to complete the extension to the Great Letaba River or Tzaneen, as indicated in this report.

I do not therefore recommend the construction of a light 2 ft. gauge line from a junction with the Pietersburg-Bandolier Kop extension to Tzaneen at a cost of £145,000, as suggested by the Chief Engineer, being undertaken at present.

Section 3.

This section has been covered by what has been brought out in dealing with the two previous sections, and repetition is unnecessary.

The Zoutpansberg Cotton Syndicate’s letter shows the urgent need and the importance to the Transvaal of being in a position to successfully grow and export its cotton. Such a line would afford the means of doing so. If it can be shown that the building of this line is the quickest and cheapest means of providing such communication, then that is a strong argument in its favour.

It has to be remembered, however, that the Transvaal cotton, while possessing the superiority indicated, will have to compete with cotton grown in all parts of the world. In practically every instance the cotton competed with grows nearer Manchester, and in many, if not most, cases also the cotton grows nearer the sea coast than ours does. To send Tzaneen cotton for export via Pietersburg means expensive land transport for hundreds of miles more than would be involved by a comparatively direct line to Komatipoort. While therefore transport via Pietersburg could be put up with for a time, it is not reasonable to expect it would be submitted to for long.

Summary of Recommendations made in this Report.
I therefore recommend

(1) that the line from Pietersburg be extended to Bandolier Kop, via Spelonken, of an estimated cost length of 64 miles, at a cost not exceeding £250,000. This mileage is less than that shown in the Chief Engineer’s report because it is intended to construct the line to a 1 in 50, instead of a 1 in 80, gradient;

(2) the rails and other permanent way material available from relaying main line to be utilized for constructing the extension;

(3) that the Messina Copper Company be informed of the decision in recommendation No. 1, if adopted, together with the intimation that if the company desires to undertake any extension from Bandolier Kop or from Leydsdorp to its mines, either of the standard gauge or of 2 ft. gauge, the Administration will be prepared to take the same into consideration on the understanding that no guarantee can be given in regard to interest on capital expenditure, and that while the Administration reserves the right to take over on equitable terms and work any railway permitted to be built, it does not guarantee to take over such line at any time;

(4) such further investigation to be made of the agricultural and mineral resources of the area between the Zoutpansberg Range and the Limpopo River as will enable a decision to be taken as to the extent, character, and route of railway extension to and within that area which would be warranted, as well as the probable time when such railway construction should be undertaken;

(5) that the Transvaal Government be offered by the Central South African Railways Administration £300,000 for its Selati Line assets on the conditions set out in paragraphs 2, 3, and 4 on page 6 of this report;

(6) that the Transvaal Government be asked to provide from the 1907 Guaranteed Loan or other source a further amount of £250,000, or if possible, £300,000 to complete the extension to the Great Letaba or Tzaneen, as indicated in this report.

T. R. PRICE,
General Manager.

25th February, 1909.

Memorandum by General Manager for Railway Board.

RAILWAY EXTENSION – ZOUTPANSBERG DISTRICT.

A recent tour of inspection of the district from Pietersburg via Bandolier Kop, Fort Edward, and Louis Trichardt across the Zoutpansberg Range to about 12 miles north of Louis Trichardt, and the development observed, as well as the
reliable information afforded, made it clear that railway extension is not only warranted, but urgently needed.

The consensus of testimony was to the effect that:–

1. Taking the present main road from Pietersburg to Louis Trichardt as a rough dividing line, the country to the west thereof was much less fertile, less occupied, and less developed than the country to the east of the road.

2. The very large native population available for service on the Witwatersrand mines and for other labour purposes live east and north-east of Bandolier Kop – not only to the Transvaal border, but beyond to Portuguese East Africa and to Rhodesia. These natives rank as among the very best class of workers on the gold mines; their route of travel is via Fort Edward and Bandolier Kop to Pietersburg and thence by rail. With the extension of the railway they would join the trains at or about Bandolier Kop, and it is stated with confidence that the extension of the railway to or near Bandolier Kop will result in a substantial increase in the labour supply from the district to the mines and for other industrial and agricultural purposes.

3. The mineral wealth of the district is also east of the road both north and south of the Zoutpansberg Range so far as at present ascertained. The Messina Copper Mine seems to be approximately the eastern limit of the mineral area of the district, with the exception of the large salt pan in the vicinity of the Blauberg. The copper concentrates received at Pietersburg from the Messina mines for despatch oversea amounted during the six months ended 31st December, 1908, to 659 tons, or an average of 110 tons per month.

It should be stated that the district north and south of the range does not seem to have been by any means thoroughly prospected or examined to ascertain the mineral resources thereof./

4. The eastern district consists of, roughly speaking, a high-level and low-level plateau, the descent from one to the other being so precipitous as to render railway communication between the two well-nigh impossible, except at an initial expenditure and a subsequent cost in working that the circumstances do not warrant. It seems clear that if this low-level plateau requires to be served by railway communication, such communication should be afforded by way of the Selati Line. I have not been over this area yet, and cannot offer any recommendation based on personal observation and enquiry as to what should be done. I hope to visit the district about August next.

5. With regard to the high-level plateau, the desire of the district is for a railway almost due north from Pietersburg to the Limpopo, at or near Messina via Bandolier Kop and a little east of Louis Trichardt, and a second line from Pietersburg running about east-north-east to near the boundary of the plateau.

In regard to these proposals I have to report:–
(a) The circumstances do not appear to warrant the construction of both lines.

(b) That while an extension north as far as Bandolier Kop, which is about 52 miles by direct road beyond Pietersburg, is urgently called for, it does not seem advisable to proceed much beyond this until the mineral, agricultural, and other resources beyond are so much more clearly ascertained as to make it certain which will be the best route for the extension to take, having also in view that the line is likely to be built to the Limpopo River and on from there to Rhodesia.

(c) The line can with safety be taken to or near Bandolier Kop as being the direction the line will take whichever route is followed beyond that point.

(d) Two routes from Pietersburg to Bandolier Kop should be surveyed, viz.:–

(1) By the most direct route.

(2) By a route making a detour to the east so far as the contour of the country economically allows, and subject to the distance to Bandolier Kop not being exceeded by, say, ten miles, for the purpose of making the line more accessible to the eastern residents of the district, and thereby increase the usefulness of the line and the volume of trade to be carried.

I recommend that authority be given for these two surveys to be undertaken as early as practicable.

6. I further recommend that the Messina Copper Company be informed of the foregoing being the intention of the Administration, and that if the company desires to submit any proposals in regard to communication between Bandolier Kop and Messina the Railway Board will be prepared to take the same into consideration on the understanding that no guarantee can be given in regard to interest on capital expenditure, and that while the Administration reserves the right to take over any railway permitted to be built on equitable terms, it does not guarantee to take over such line at any time.

T. R. PRICE,

General Manager.

5th April, 1909.

Copy of letter from Chief Engineer to General Manager.

General Manager.
RAILWAY EXTENSION IN THE ZOUTPANSBERG DISTRICT.

I have the honour to submit the following report on the investigations carried out by me in the country north of Pietersburg.

I understood from the verbal instructions I received that it was required to make a careful inspection of the Zoutpansberg District bounded by the range of that name in the north, the Pietersburg-Louis Trichardt road on the west, the low country on the east, and the Woodbush Mountains on the south. The first object was to find out the difference in cost between a direct line from Pietersburg to Bandolier Kop, and an alternative bearing more to the east, both to be run at a grade as near as possible to 1 in 100 owing to the small amount and low grade of traffic likely to offer. I was further to find out the feasibility of crossing the Zoutpansberg with a railway should an extension beyond some such point as Bandolier Kop be considered advisable. Also your letter (G. 5194) of the 23rd February, 1909, and a copy of your preliminary memorandum on the subject of railways to serve the districts concerned, brought the extension of the Selati railway into the problem.

In the course of the tour I travelled over 360 miles, and interviewed every person who was likely to be interested in the question, and the conclusions I arrived at are embodied in this report [...].

Previous reports on the subject, which have from time to time been submitted to you, are those prepared by Mr. de Wildt in 1903, Mr. Fletcher in 1906, and Mr. Tower in September, 1906. In my covering letters I was naturally guided by the facts related by the reporting officers, and it is probable that you will find the opinions I now express different in many instances from those I held when writing before. This is only natural after having visited the country personally and reading the later reports of the Mines Department and others.

[...] The routes examined were (1) from Pietersburg via Buffles to Duivel’s Kloof, near Tzaneen; (2) via Bandolier Kop and Louis Trichardt, the Zoutpansberg, for a distance of 35 miles east and west, and to the north through Wylies Poort, where the new road crosses the Tweedeberg; (3) to Pisang Kop and through Bandolier Kop to Pietersburg along the main road. Beyond the berg and for a hundred miles west and north it is easy to see that the country is flat, offering no physical difficulties for a railway. While at Duivel’s Kloof I also climbed to the top of the last range bordering the flats, and got an excellent idea of the country lying to the east.

The country from Pietersburg to Buffles is very similar to that between Marabastad and Pietersburg, 1 in 50 or, at best, 1 in 60 country, and the nearest that I would care to try to the gradient laid down in my instructions would be 1 in 80, at which the calculated distance is 35 miles. Between Buffles and Bandolier Kop
the undulations are less pronounced, and I estimate the distance to be 33 miles, or a total of about 68 miles. This route would be from 13 to 15 miles longer than a line run direct from Pietersburg to Bandolier Kop, but every mile of it would be through cultivated land; and it would probably make all the difference to some hundreds of farmers in the Spelonken; it would tap a large labour supply; and, even if the proposals given below for assisting the mineral and agricultural interests of the low country are not approved, it would at least bring those interests some 30 or 35 miles nearer to railhead at Pietersburg. Woodbush village would not be more than 10 or 12 miles from the route. On the other hand, the direct route to Bandolier Kop would not only be shorter but would be much cheaper, and, if the objective is Messina or Rhodesia, worthy of consideration.

The choice lies between a short route, measuring 55 miles and costing about £238,829, or a longer development line costing £319,925, according to the details attached in Statements ‘A’ and ‘B.’ You will notice that the ‘works’ estimates for these lines are £3,851 and £4,042 per mile, but by adding loan charges, interest, and contingencies these figures are increased by nearly 15 per cent. to £4,342 and £4,705 respectively. The difference between Mr. Tower’s estimate of £2,890 and mine of £3,851 is easily explained. His gradient was 1 in 65 against 1 in 80, standard was for 6\textsuperscript{th} class engines against 8\textsuperscript{th} class, structures of wood and iron against brick or stone, one station against three, and prices for materials are now 20s. to 25s. per ton higher for my estimate.

Beyond Bandolier Kop the direction for a railway to the north depends on the feasibility of crossing the Zoutpansberg Range, assuming of course that the alternative direct route from Pietersburg to West Nicholson through the gap in the Blauuwberg Range is out of consideration. Owing to the state of the weather I was prevented from seeing all that I wanted to of the berg, but I examined three possible routes, and a fourth that was impossible. The mountain might be climbed by one of the spurs near Louis Trichardt until the headwaters of the Matamba are reached, and there is a crooked but not very difficult way down the valley. The actual distance from flats to flats would be 30 miles, and, besides a tunnel costing £53,000, the cost per mile would be £8,000. This is the most westerly route over the mountains, and its advantages are (1) that it is the shortest, (2) that the three ranges are here merged into one, thus affording continuous foothold, and (3) it would pass near some recent copper discoveries.

The second feasible route is, roughly, along the new road. A tunnel through the second range and some high viaducts would be necessary, and owing to having to fall between the ranges the length of this mountain line would probably be 35 miles. The cost would be heavier than No. 1 Route, probably £10,000 per mile and £50,000 for a tunnel.

The third route [...] runs up the valley of the Levoeboe through Pisang Hock, drops into the Jouberstroom and White Flag Valleys, and then follows
the N’Jelele to Sulphur Springs. This route takes 67 miles to advance 30 miles northward, and does not, in my opinion, concern the present proposition, but another which will be mentioned later. About 20 miles of the route would be very heavy, the Joubertstroom and White Flag Valleys being narrow and steep.

All the above routes were prospected for a 1 in 40 or, at least, a 1 in 50 line, and there remains to consider a rack railway. The lowest nek in the range lies behind Trichardt, and is 1,200 feet above the plain. At 1 in 20 this would take four miles to surmount, and another 4 miles to descend from. In 12 or 13 miles the three ranges would be crossed, and the road would be clear for a 1 in 80 line beyond. The rack railway would also require a tunnel in the Tweedeberg, costing £50,000, four rack engines, £25,000, and 11½ miles at £8,000=£92,000. Total for a rack proposition, £167,000.

Beyond the gratification of a few engineers, who would naturally enjoy carrying out the difficult work, I can find nothing to recommend in any of the four routes mentioned above, but, for reference purposes, it would be useful if I tabulated the proposals in abstract form:

<table>

The Zoutpansberg Range has been well occupied by white settlers for some years, and, so far as the country affected by the four routes is concerned, I heard of no mineral deposit or agricultural possibility which would turn the scale in favour of any of the routes, while the proposal given later in this report will, I think, be of greater benefit to the district and be much cheaper to carry out.
loan charges and contingencies. I do not know what the 11 miles through the poort would cost, but £88,000 should be ample if no tunnelling is required. The distance between Bandolier and Messina would therefore be 87 miles, cost of line £392,000, and gradient 1 in 80.

This railway has been constructed for 119 kilometres (74 miles), that is to say, the rails have been laid that far. In your G. 5194 of 23rd February I was asked to submit an estimate for extending the railway for such a distance as would place the terminus at a healthy spot, to complete the Sabie bridge (eight spans of 100 feet), and to put the remaining 74 miles into order for light engines. I have not been able to visit the line or the country beyond, but have obtained information from Major Hamilton, a copy of whose letters I enclose. He agrees with what Mr. Wheelwright told me that south of the Great Oliphants River the country is an uninhabited wilderness. Considering the unhealthiness of the district, the difficulty and cost of importing skilled and unskilled labour, I think it would be unwise to submit a lower estimate than the following:–

<table>

</tbody>
</table>

£123,938 (say £125,000)

This extension would reach Farm Acornhoek No. 670, and the terminus would be 684 feet higher than where the railway now ends on Newington. Acornhoek, on Mr. De Wildt’s survey, is 91 miles from Leydsdorp; that is, from all the known mineral and agricultural wealth of this part of the district, and from an unlimited labour supply of the best kind. It is agreed that the area to be served eventually by the Selati Railway is bounded by the Great Oliphants on the south, the Zoutpansberg and Limpopo on the north, the Drakensberg on the west, and Portuguese territory on the east. The route of the original concession struck the Great Oliphants or southern boundary in the middle, and was projected to proceed in a northerly direction. Subsequent surveyors made Pietersburg their objective, and ran into extremely difficult country almost the very moment they touched the area they came all the way from Komatipoort to serve. I consider that, confined to its proper function of developing the low veld, the Selati Railway would be both a necessary and useful line to construct. Its destiny as a competitor with our own Pretoria- Pietersburg, or later, with Beira, at West Nicholson, will be accomplished when existing lines have developed the areas they serve and can afford to lose some oversea traffic. For this reason I advise that, when extended, the Selati Railway should follow the direction of
the traffic immediately offering, the gold reefs of the Murchison Range, copper at Palabora, and the large centres where the needs of natives will develop trade. Its alignment should be almost due north for 200 miles from Acornhoek, and it should then run up the valley of the Levoeboe along the southern slopes of the Zoutpansberg, passing six miles east of Trichardt, and then joining in at Bandolier Kop [...].

It will be noticed from what I have said that owing to the character of the country no extension of the Selati Railway would be of much use till it reached the Great Oliphants River, 60 miles, and that then the distance to the goldfields would still be 56 miles further. These 190 miles from Komatipoort would practically produce no local traffic, a serious matter for such a long and expensive line. Alternative schemes for affording temporary relief and collecting revenue were, therefore, investigated and are here submitted for consideration.

The first depends on the decision as to the route between Pietersburg and Bandolier Kop. On the assumption that the circular route will be adopted, there should be a station on farm Netrecht at the top of Bufflotes Range, 35 miles from Pietersburg. From this point to Leydsdorp is 78 to 80 miles. A standard gauge railway down the steep descent to the low veld would be a very expensive undertaking, but from observations I have taken I consider that a 2 feet gauge railway of the type constructed in Natal to Weenen and Stuartstown, and costing £2,750 per mile (exclusive of rolling stock), to a gradient of 1 in 33, would bring Tzaneen (40 miles) into railway communication with the world for the same money that an extension of the Selati Railway would carry the line to Acornhoek. Leydsdorp would then be 38 to 40 miles from the terminus, and the worst or hilly portion of the journey would have been accomplished. The route followed would pass for the last 20 miles through well settled farms, such as Westphalia and Tzaneen, a filip would be given to cotton growing, and the gold industry of the district would go ahead, while a considerable native population would be tapped for the Witwatersrand mines. Supposing half the claim licences paid in the district in 1903 were renewed in consequence of this light railway, the revenue accruing to Government would be more than 10 per cent, on the outlay now suggested. It may be suggested, in passing, that the similar problem in the Lydenburg District may be solved more quickly by the same means with equal or perhaps better prospects of handsome returns.

The Buffles-Tzaneen proposal would hardly suffice for the needs of the district, and there is a further factor which enables me to recommend an extension of the railway from Bandolier Kop to the slopes of Pisang Kop on the left bank of the Levoeboe.

I was informed by the Native Commissioner of the district that about 36,000 passes were issued for natives leaving the district for work during 1908. There is a chance that these natives, who may also be counted upon to return during
the year, would continue to walk to Pietersburg unless the railway were brought nearer to them. It is also necessary to push on the agricultural development of the Zoutpansberg, and for this purpose a light standard gauge railway to 1 in 50 gradient would be useful. It would really be eventually a section of the Selati Railway, and at its terminus would point to the easiest, or, indeed, the only easy way of passing from the high to the low veld. The cost of this line, if extended to 40 miles, at £3,500, plus £500 for loan and contingencies, would be £160,000.

It is near the terminus of this line, that is, at Pisang Hoek, that one of the routes across the mountains enters the range, and proceeds, via Joubertstroom, the White Flag Valley, and N’Jelele to a point on the Zand River Poort-Messina Line [...]. There is nothing to recommend this route till the Selati Railway is completed as far as Pisang Kop, when it might afford a short cut to Komatipoort.

Summarising, the routes dealt with in the above remarks comprise

<table>

/ Sabie Bridge, 22nd March, 1909.

Dear Mr. Wall,

Thanks for your letter of the 10th instant. I would be very glad to see you any time you can come up here, and to give you all the information I can. I hardly think however that I should be able to go up in that direction next month myself.

I do not think you could possibly find a place at all healthy at a less distance than 25 miles from present railhead of the Selati in a north-western direction.

The ridge on farm Acornhoek No. 670, which is probably the highest point on the present surveyed extension might be healthy in winter, but would certainly not be so in summer. You would have to go considerably further west in my opinion to get a reasonably healthy site. Due northwards the country remains low and malarial all the way to the Drakensberg, the higher becomes the terrain, and, consequently, the healthier it is.

There is a considerable native population and a few white storekeepers on the foot-hills, whereas the low country proper due north by railhead is inhabited now by natives, south of the Oliphant.

We have had, and still have, floods from the high country, but no great amount of rain has fallen here (about 17 inches since October).

Further north toward the Oliphants River there has been hardly any rain, and streams taking their rise in the low country are lower than they were in October.

Yours truly,

J. H. HAMILTON.

Annexure ‘D.’

11th March, 1909.

Memorandum by the Government Mining Engineer on the Mineral Possibilities of the Murchison Range and neighbouring territory:

1. The area that would be served by continuing and running the Selati Railway to Leydsdorp, or alternatively by working the present line and constructing a road from Newington to Leydsdorp, extends north as far as the Klein Letaba, and takes in the country between the edge of the Drakensberg and the Portuguese border. The construction of a branch line up the berg towards the Pilgrims Rest fields is also possible, but this, though a possible contingency, will not be taken into consideration in regard to its bearing on this latter area.

2. South of the Oliphants River no mineral discoveries of any note have as yet been made below the berg, so that the area to be considered is practically that
between this river and the Klein Letaba, or a little further north, and extending from the border westwards as far as the Drakensberg, taking in the banket and other reefs in the neighbourhood of Haenertsburg.

3. Within this territory the mineral discoveries of potential value comprise deposits of gold, copper, antimony, and mica. The geological formation throughout this area is one that is well known as containing promise of the presence of many other minerals besides those mentioned, and a large part of the district is still practically unknown territory.

Gold.

4. The auriferous deposits are found respectively along the edges of the Drakensberg, in the Murchison Range, and at the Louis Moore and Birthday properties near the Klein Letaba River.

5. In the krantzes and slopes of the Drakensberg, numerous banket reefs are found to outcrop. Some of these contain gold, and have been worked to some extent, but have not hitherto been found to be payable, the gold contents being erratic and the grade low. The better known properties are in the neighbourhood of Haenertsburg, and would receive no benefit from the construction of a road from Newington to Leydsdorp. A railway to Leydsdorp would, however, cheapen transport from the coast considerably.

Some of these reefs may in places yield sufficient payable ore to support individual diggers or small syndicates. Adit working is invariably possible, and water power generally available, so that working costs should be low.

6. The Murchison Range has been the principal prospecting field in the past, and numerous syndicates and companies have at one time or another carried on operations on its reefs. There are two main lines of reefs, known respectively as / the Northern or Antimony Belt, and the Southern or Spitzkop Belt. Both of these lines extend for many miles, not as continuous reefs, but as well defined belts in which reefs of greater or less width and longitudinal extent are found.

7. The better known properties in the Murchison Range are the H.E. Proprietary, which is interested in the Blue Jacket and Free State Mines, the Gravelotte Mine, the Sutherland Reefs Company.

8. The H.E. Proprietary Company is connected with many low country ventures, and its holdings are typical of the mining propositions found in it. On both the Blue Jacket and the Free State Mines rich chutes of ore have from time to time been struck, but the average value of any considerable bodies of ore are considered too low to justify further expenditure at present. These rich chutes would, however, be large enough to keep tributors or small syndicates at work. The company reports that it has spent £60,000 in the district, and is at present employing seven diggers. It recently erected a small steam stamp mill, and won £2,700 worth of gold in a few months from the Blue Jacket Mine, but after thus
testing the property it finds the conditions of working too onerous to continue. The company now owns 357 claims as against some 3,000 formerly held by it.

9. The Gravelotte Mine of 113 claims, now owned by the Consolidated Mines Selection Company, has been opened up to a depth of 220 feet, and is very patchy as regards gold contents. The antimony reef on this property contains both stibnite and gold of very irregular values, not very promising at depth. The property as a whole offers certain inducements for working if transport and working costs could be materially reduced.

10. The Sutherland Reefs Proprietary Company owns 800 acres on the farm Potsdam, near Leydsdorp. The company claims that it has a reef of 5 feet developed, averaging 9 dwts., but the Inspector of Mines cannot confirm this. He is, however, of opinion that the property could be worked successfully on a small scale with cheaper transport.

11. Besides these propositions there are a number of other blocks and properties along the two mineralized belts of the Murchison, such as the Caledonian, Lawrence, Pioneer, Coblenz, Rainbow, etc. The formation and the reefs are very similar to those found in Rhodesia, and the advent of cheap transport is likely to induce prospecting operations being resumed, and possibly to lead to the establishment of small plants wherever payable chutes are found.

12. The Louis Moore and Birthday properties near the Klein Letaba River are owned by the same company. The latter mine has not been worked for the last fifteen years, but the Louis Moore is not erecting a new 20 stamp battery with cyanide plant, which is expected to be in running order shortly. On both these properties very large sums of money were spent in past years. The present owners bought them for a mere song and should be able to make them pay fair dividends if the capital is kept low. The mines are 120 miles by road from Pietersburg, and are situated in a very unhealthy area. The Louis Moore Mine is in a belt of mineralized schist, much shattered in places, rather resembling the ore deposits of Western Australia, and containing large bodies of low grade rock.

COPPER.

13. Copper is found at Palabora, about forty miles east of Leydsdorp. There are extensive old native workings, and the indications are promising, but the company owning the claims (the H.E. Proprietary) has not, under present transport conditions, deemed it advisable to prospect and open up the deposit.

ANTIMONY.

14. Antimony is found in the Murchison Range, along with gold, in the so-called antimony line of reefs. The best deposit is found on the Gravelotte Mine where the metal is found in abundance in the upper oxidized portion of the lode, but decreases in quantity when the pyritic zone is reached. Little attention has
hitherto been paid to the commercial aspect of this occurrence, probably owing to the low prices prevalent in former years, and to the fact that the oxide, which is principally found near the surface, escaped notice.

Mica.

15. The Godiva Syndicate is working this mineral some 30 miles south-east of Leydsdorp. The syndicate recently shipped some mica to London, but found it difficult to sell its product owing to the alleged existence of a mica ring which is said to have absolute control of the market. Mica of fair quality is known to occur at several localities in the district, but has not hitherto been successfully exploited. /

General Remarks.

16. The principal drawback to the development of the district has been the lack of cheap and quick transport for men and supplies, and this was accentuated when the outbreak of tick fever amongst cattle took place. The mineral indications are plentiful, but even claims of considerable promise have been allowed to lapse owing to the fact that money could not be found for prospecting, as the district was considered more or less out of the pale by reason of its isolation and the prohibitive cost of transport.

17. The bad climate has also militated against the opening up of the district. Railway facilities indirectly improve the climatic conditions by allowing improved methods of working, the better housing of employees, cheaper luxuries and comforts, and, above all, the feeling that a man can easily get away for a change when necessary. As regards malaria, good feeding and housing are recognised as being very large factors in warding off the disease. With such improved conditions a better class worker will be introduced instead of the unsatisfactory class of man with which the low country has hitherto had to put up. To the better class man the risk of fever may not be a very formidable barrier, but he cannot long endure the sense of isolation and lack of stimulus attaching to a district cut off from the larger centres of population.

18. The Geological Survey Department refers in the following terms to this district in its report for 1906:– ‘There is no doubt that these fields could support a fair number of independent workers or small groups of miners were it not that under present conditions transport rates are practically prohibitive ... Although the country offers so many opportunities for small ventures it is not without promise for enterprise on a more extensive scale. Ore deposits of the kind described in connection with the pyritic reef of the Free State Mine, and possibly also those of the type of the Coblenz Reef, give promise of mining operations of considerable magnitude once the difficulties of transport are overcome. The district forcibly impresses the visitor as much by its possibilities as a highly
mineralized area as by the very small amount of work which has hitherto been expended upon it, and which has been almost entirely limited to a few comparatively restricted areas."

19. In order to improve the water supply – which is rather poor along the Murchison Range – it is contemplated to put down a series of 13 boreholes at a total cost of £3,400.

20. There can be no question that the extension of the line to Leydsdorp would put new life into the various prospecting and mining ventures, and that the pulling up of the present Selati Line would, on the contrary, be the deathknell of the hopes of all parties interested in that district.

21. From returns made to this department, it appears that during 1908 10 concerns, employing 17 whites and 240 natives, produced gold of the value of £15,290. In addition there are some individual diggers who make no returns to the Government.

22. There were at one time some 45 companies interested in the district, with a nominal capital of over £4,000,000. Of these some 14, with a capital of £1,570,000, are still in existence. This large capital is accounted for by a few companies, such as the Harmony Proprietary (£1,000,000) and H. E. Proprietary (£150,000), which have large capital and holdings, but are doing little development.

23. The number of claims at present held in the Leydsdorp District is about 6,200. The number formerly held, and which would again be held if the district were opened up by a railway, would undoubtedly be much larger. In estimating revenue for railway purposes the increased amount paid to the State in claim licences should not be lost sight of, nor the probability that an influx of population will to a greater or less extent take place, and lead to the increased revenue by way of custom and transfer dues, and other indirect ways.

24. It is manifestly impossible to form an estimate of the number of stamps that would be at work or of the number of persons likely to be employed in mining and prospecting were the district linked up to the railway system. Beyond the 20 stamps now being erected by the Louis Moore, there are no signs of increasing activity, nor are any likely to be seen until conditions change.

25. The mineral resources of this area are so promising that the Government should seriously consider the advisability of giving it railway communication. The agricultural and cotton-growing possibilities of the district will no doubt be taken into account when coming to a decision in the matter. The completion of the Selati Line as far as Leydsdorp is suggested as the most direct way of connecting up with the Transvaal railway system. Without such improved means of communication the fields would continue to lie fallow for want of sufficient stimulus to mining enterprise, since such enterprise would have little hope of meeting with a sufficient reward.

R. N. KOTZE. /
Annexure ‘E.’

Extract of letter from the Director of Agriculture, Transvaal, dated 18th May, 1909.

With respect to railway communication to the eastern part of the Transvaal, I trust you will bear in mind the probability of there being a serious shortage in timber for pit props before long, and that the eastern portion of the Transvaal is by far the best part of the country for timber growing. All along the edge of the berg, from Pilgrims Rest northwards excellent timber can be grown, and I suppose we can raise timber in the neighbourhood of Tzaneen more rapidly than anywhere else in the Transvaal; it will also be possible to grow wattles in these areas.

We have about 250 acres of cotton growing at Tzaneen, which promises well, but I am inclined to think that mealies, alternated with ground nuts, will prove even more profitable for that district than cotton – always supposing railway communication can be established thereto.

Annexure ‘F’

The Zoutpansberg Cotton Syndicate, Limited,
413 Produce Exchange,
Manchester, 22nd January, 1909.

Colonel Seeley, M.P.,
The Colonial Office.

Sir,

In the summer of 1907 representations were made to spinners here that cotton as used in our Lancashire mills could be grown to mutual advantage in the Zoutpansberg District (Northern Transvaal).

The above experimental syndicate was accordingly registered [...]

No time was lost in sending out Mr. A. Niven Whyte, an expert in cotton growing, to superintend the experiment and to advise the farmers as to the proper cultivation of the plant.

Owing to delays in securing good seed from America, and to the Transvaal authorities’ very proper desire to have the seed thoroughly fumigated, the sowing only took place in January and February, whereas it should have been completed by mid November. Notwithstanding this, Mr. Whyte is completely satisfied that the Transvaal is eminently suited for cotton growing for the following reasons, viz.:

(a) The soil is good;
(b) the rainfall is plentiful;
(c) there is an entire absence of frost;
(d) the necessary heat requisite for the maturity of the bolls can be counted upon at the right season;

so that Mr. Whyte believes that the Transvaal is better adapted to cotton growing than America.

On the other hand, however, the absence of any railway communication in the district most suitable for the industry entails so heavy a charge for transporting the cotton from the ginnery to the broker’s warehouse in Liverpool that, with low prices ruling here, it might be difficult to secure a profit for growers, and for those who have to handle the product. (Indeed, at the present time tons of good fruit are allowed to rot on the land because the cost of conveying it to the nearest market town is so heavy.)

From the eagerness with which the farmers have taken up cotton growing, it is evident that they are satisfied that the industry will benefit them, and it must be remembered that they do not require any balance at their bankers to embark them upon it, so that any industrious farmer can make a profit by growing cotton once the matter of transport is settled.

As an evidence of what the transport now costs, we may inform you that we secured some 49 bales from our planting, and paid, apart from the charges of carrying the cotton to our ginnery:

- Transport on 2,000 lbs. from Pietersburg Railway Station … £2 0 0
- Railway charges on 2,000 lbs. from Pietersburg to Delagoa Bay … 1 6 4
- Freight from Delagoa Bay to Liverpool … … … £3 8 9

In view of the fact that to take the cotton the 80 miles per road costs us so much more than to carry it over 580 miles per rail is sufficient reason for believing that the extension of the railway by Selati would enable the farmers to make a profit, and thus secure the industry permanently. We shall, therefore, be glad if you will kindly use your influence with the necessary authority at Pretoria to get the Selati route extended as early as possible, a step which will not only encourage us to continue nursing the industry, but which will also benefit the many farmers whose dire poverty requires such help.

From the information given you at the interview which you were kind enough to grant to our Secretary and Mr. Whyte, you already know the terms on which we have dealt with the farmers, and that we are not by any means speculators trying to exploit inexperienced people; and further, that should the Transvaal be able to secure the continuance of the industry, not only will the benefit be felt in the Transvaal, but also very much in our own country.

Inasmuch, then, as the successful carrying on of our business tells for the prosperity of the Transvaal, as well as for the millions of Lancashire, we should be glad when you address the official at Pretoria if you would recommend that all necessary facilities be granted to us.
We are aware of the hearty support you have so kindly afforded to the British Cotton Growing Association in Nigeria and elsewhere, and as we are working in conjunction with them we trust we may receive like consideration.

I have, etc.,

FREDK. WHOWELL,
Chairman.

Printed for the use of Colonial Office.

AFRICAN (EAST).
No. 1099.
CONFIDENTIAL.

TANGANYIKA TERRITORY

PROPOSED LOAN

FOR

RAILWAY AND HARBOUR DEVELOPMENT.

COLONIAL OFFICE,
November, 1924.
NOTE. – At a meeting of the sub-committee of the Unemployment Committee, held on May 12th, 1924, the Right Hon. T. Shaw,¹ C.B.E., M.P., Minister of Labour, in the chair, it was agreed as follows:–

‘To request the Secretary of State for the Colonies, on receipt by him of full information from the Governor, and after consultation with the Treasury, to furnish them with a detailed Memorandum on the Tanganyika Development proposals, indicating the annual burden which would be imposed on the Exchequer by their adoption, and the extent to which they would relieve unemployment.’

The late Government, on the recommendation of the Committee on Unemployment, authorised the adoption of the following proposals for development expenditure in Tanganyika Territory:–

(a) Purchase of a steamer for use on Lake Tanganyika, estimated cost, 35,000/.

(b) Extension of the light railway or tramway, running from a point near the port of Lindi, for about 90 miles into the interior, estimated cost, 50,000/.

The approval of these proposals was announced by Sir Montague Barlow² in his speech on the adjournment (‘Official Report,’ August 1st, 1923, p. 1572), and he added that the financial assistance would take the form of a loan ‘free of interest, at any rate for a time.’ Sir Montague explained that proposal (b) above was strongly supported by the Empire Cotton-Growing Corporation.

The total expenditure contemplated under the two proposals was, therefore, 85,000/.

Shortly after the change of Government, Mr. Thomas decided to consider the advisability of extending the limited authority conveyed in the decision quoted above, both in the interests of unemployment relief, of the territory, and of the extension of cotton-growing, for which the territory is a very promising field. The Governor was invited to make recommendations with approximate estimates of cost.

These recommendations and estimates have now been received. They are contained in two despatches which are printed as annexes to the present Memorandum. The total expenditure involved is estimated at 1,500,000/., whereof 590,000/ represents expenditure in this country and 910,000/ local expenditure. The development schemes recommended are set forth in paragraph 2 of Annex 1, but are summarised here for convenience:–

It will be observed that of the two schemes referred to at the beginning of this memorandum as having been ‘authorised’ by the late Government, only (b), the Lindi Railway, appears in the list. The reason is that the Governor expressed a strong opinion that (a) the lake steamer was not urgently required; and that the money might be more profitably employed for other purposes.

Annex 1 to the present memorandum deals with the schemes generally, but as regards Scheme A (Dar-es-Salaam Harbour improvements), reference is made (in paragraph 3) to another despatch dated December 3rd, 1923. This despatch is printed as Annex 2.

The following observations are supplementary to and explanatory of the contents of the Annexes.

General.

Tanganyika Territory (formerly German East Africa) is larger than any other British Dependency without Dominion status. It was an active theatre of war up to the Armistice, and suffered very great material damage by destruction of buildings, bridges, rolling stock, harbour works, &c. There was, of course, a complete cessation of trade, and the attitude of the native inhabitants was doubtful. It was necessary to institute an administration in all its branches, repair the ravages of war, and give the natives a better government than they had under the Germans; all this at a time when neither men nor money were easily obtainable. The country is now administered by His Majesty’s Government under Mandate from the League of Nations, which among other things secures non-preferential
trade and the principle of Trusteeship for the natives. In accordance with that principle slavery has been abolished and land legislation enacted, under which large concessions or alienations to Europeans are inadmissible. The Territory lies just south of the Equator, and only a very limited area is suitable for European settlers.

The 'Loans in Aid' of the Administration from Imperial funds for the last three years have been 914,000l. (of which 164,000l. was a 'grant'). 800,000l. and 750,000l. The Loan asked for in the current year is 350,000l. These loans-in-aid are repayable with interest when the financial circumstances of the Territory permit. At present interest is only paid on the amounts provided for certain revenue-producing undertakings.

The Treasury, in approving the Estimates for the current year, expressed their satisfaction at the improvement in the financial situation. The local revenue, which was 946,844l. in 1920–21, is estimated to reach 1,324,670l. this year. The total volume of trade increased from 2,815,759l. in 1921 to 3,798,865l. in 1923, and the value of local produce exported in the same period from 1,246,870l. to 1,657,601l. It may be observed that the latter figure is higher than that of Kenya for the same year. The great need of the country is the improvement of communications. Its capacity for development is immense.

Scheme A. – Dar-es-Salaam Harbour Improvements (see Appendix 2).

It will be seen that the present scheme is a modest substitute for a much more ambitious one which had been previously put forward, but is considered sufficient to meet the requirements of the port for many years to come. The improvement of the harbour is considered by the Governor to be the most urgently necessary of the works included in the general schedule, and he originally made provision for it in his Estimates for the current year – that is to say for a first instalment in payment of the cost of works to be spread over a total period of three years. The present facilities at the port are totally inadequate and have been the subject of frequent year from the East African Steam Conference, supported by evidence from the Union-Castle Line and the British India Steam Navigation Company. The former reported a delay of eight days in discharging 1,768 tons 'owing to the inadequacy and inefficiency of the port facilities for the handling of cargo,' and stated that 'the serious disabilities now experienced by steamers visiting Dar-es-Salaam lend no encouragement to vessels to continue calling at the port.' The British India Company mentioned a case in which a steamer took 15 days to discharge 2,200 tons, and described the facilities as 'totally inadequate,' adding that 'in consequence of these delays it has been necessary to limit the quantity of cargo shipped to Dar-es-Salaam to avoid steamers missing their scheduled dates at later ports of call.'
Since the Governor’s despatch (Annex 2) was received the Acting governor has telegraphed that the congestion is becoming so serious as to jeopardise the continuance of the important and increasing transit trade with the Belgian Congo, which is conducted via the Central Railway from and to Dar-es-Salaam, a trid, which is very lucrative to the railway and which it is our policy to encourage and facilitate in every way. The Belgian Congo includes the western shore of Lake Tanganyika, and the Belgians are finding it very difficult to supply this vast territory from the western side of Africa, and are now sending large consignments of railway material, &c., via our railway. There is also an increasing outward traffic in Belgian copper. Last year some 1,700 tons were carried, and this year the Belgians want us to transport 10,000 tons. All this has to be shipped at Dar-es-Salaam, and the difficulty of handling it is becoming so great that the position may be described as critical.

It may be added that the increase of exports which is certain to follow on the construction of the feeder lines under schemes B and F will make further demand on the facilities of the port. As they exist at present, no such demand could be adequately dealt with.

In consequence of the specially urgent necessity for the harbour improvements, this scheme A is on a somewhat different footing from the other schemes in the schedule. It has been decided (and the Treasury have agreed) that harbour works must be undertaken whether as part of the scheduled works or not. The scheme was only included in the schedule because it is clearly an important feature in any general programme of development and because a considerable proportion, estimated at 34,000l., of the expenditure involved will be spent in this country and so help to relieve unemployment.

**Scheme B. – Tabora – Shinyanga Feeder Line.**

The advantages and prospects of this line are fully explained in Annex 1. As stated in paragraph 6, the original proposal was for a line of 80 miles in length, for which the earthworks, constructed by the Germans, are already in existence. This accounts for the fact that in this despatch (and in the summary in paragraph 2) the scheme is treated in two parts: from Tabora to Kahama (80 miles) and from Kahama for 40 miles further, to the neighbourhood of Shinyanga. The desirability of this feeder line to the most promising cotton district in the Territory was recognised by the Germans (who had begun construction shortly before the war) and has been pressed upon the Colonial Office from various quarters, including the local specialist of the Empire Cotton-Growing Corporation.
Schemes C and D. – Works at Kigoma (Lake Terminus) and Electric Power Station at Dar-es-Salaam.

These minor schemes may be regarded as subsidiary to the improvement of the traffic facilities on the Central Railway and to the Harbour Works (Scheme A). As stated in Annex 1, the slipway on the Lake was left unfinished by the Germans. Facilities at Kigoma are essential for the Belgian transit traffic referred to under Scheme A.

Scheme E. – Lindi Light Railway.

In paragraph 10 of Annex 1, and in the enclosure to that despatch marked ‘B,’ reference is made to a large scheme under which this railway or steam tramway (90 miles long) should not only be reconditioned but should be extended for about 50 miles further at a cost of about 158,000l. Such an extension may be desirable in the future, but the Governor brought strong arguments against the necessity for its being undertaken at present in preference to other schemes of development. The Secretary of State concurred in this view, so that the larger scheme is only mentioned here in order to account for the allusions to it in Annex 1. As indicated at the beginning of this memorandum, this is a scheme which was recommended by the Committee on Unemployment last year and announced in Parliament as ‘authorised.’ It seems, therefore, unnecessary to repeat the arguments, which have already been accepted in favour of the scheme, but it may be emphasized that it had the strongest support from the Empire Cotton-Growing Corporation, the district to be served being a very promising one from a cotton point of view. /

Scheme F. – Feeder Line from Itigi (or Manyoni) on Central Railway to Singida.

The reasons for this undertaking are similar to those for the feeder from Tabora (Scheme B). The waste of man-power in bringing produce to the existing railway is mentioned in Annex 1, Enclosure E, and the General Manager believes that the line will pay its way at once. It is important to remember that the Germans constructed the Central Railway, in as nearly as possible a straight line from the sea to the Lake, largely for strategic reasons, and that this line runs through large areas of unproductive country. It is obvious that the needs of so vast a territory are not adequately served by this one line, and that the sound policy for development is that of constructing feeder lines to the most promising districts. This (as mentioned under Scheme B above) the Germans had recognized by beginning the construction of the branch from Tabora.

‘G’ Rolling Stock, &c., &c. – This item requires no further comment except to call attention to the remarks of the General Manager in Enclosure C of Annex 1, to the effect that the 68,000l. suggested for these miscellaneous incidental services is only a proportion of what could be expended with advantage.
It may be desirable to mention that none of the three railway schemes included in the general programme are recommended in the interests of European settlers or plantations, which in fact do not exist in the districts which will be opened up. The feeder lines will encourage the development by the natives of the country of the produce grown on their own lands, which is an essential part of the policy of the Administration. The only European concerns immediately affected will be the cotton ginneries, the establishment of which will be assisted in every possible way by the Government. As regards the provision of funds and the annual amount which the Imperial Exchequer will be called upon to provide, there is no occasion to modify the statement of Sir Montague Barlow quoted at the beginning of this Memorandum, that the financial assistance should take the form of a loan free of interest for a time. The works in the Schedule may be expected to be completed in about three years, and, therefore, if the money could be spent in regular proportions there would be three annual installments of 500,000/- each. It is not possible, however, at this stage to make any reliable estimate of the actual amounts which will be required each year, and it is suggested that these should be determined annually in correspondence with the Governor and the Treasury in the same manner as the annual decision as to the loan-in-aid is arrived at. The development loan instalments would, in fact, be treated as a special and extraordinary addition to the ordinary loans-in-aid of Tanganyika revenues.

[...]

Colonial Office,

20th May 1924.

Postscript. – The following is an extract from *The Times* report of the debate in the House of Commons on May 22:–

Mr. SHAW, continuing, said that the Labour Government found that the late Government proposed to finance a railway in Kenya and Uganda. They had reaffirmed that proposition, and 3 1/2 millions would be spent. The Government were considering what they could do with regard to other railway works in Crown Colonies, particularly such railways as would tap cotton-growing areas and allow us to grow more cotton. Those were things vital to the future growth of Lancashire, and believing that a good thing was a good thing wherever it came from, the Government were going to try to do the work. (Ministerial laughter and cheers.)

Note. – After consultation with the Treasury it was decided that the funds required for the execution of such portions of the development programme as the Treasury were prepared to sanction should be provided from time to time, as required, in the ordinary estimates of the Territory, and that it was not neces-
sary to have recourse to the Unemployment Sub-Committee. The position was explained to Mr. Clynes, the Chairman, and the necessary instructions sent to the Governor. /

ANNEX 1.

The Acting Governor of Tanganyika Territory to the Secretary of State for the Colonies.

[Received 16th May 1924.]

No. 261.

Government House, Dar-es-Salaam, 

Sir, 25th April 1924.

With reference to the Governor's telegram No. 43 of the 27th March,* I have the honour to transmit herewith a copy of a report by the General Manager of the Railways which gives a résumé of the position with regard to the various railway and other schemes suggested in connected with the proposed Development Loan […].

2. The schemes are as follows:—

£590,000 £910,000 £1,500,000

3. Dar-es-Salaam Harbour Works. – The Governor in his despatch No. 797 of the 3rd December† dealt fully with this matter. The necessity for extending the present wharfage accommodation and improving the facilities for the handling of cargo becomes daily more obvious. There is every indication that during the present year there will be a considerable increase in the amount of sisal, cotton and groundnuts exported from Dar-es-Salaam, while it is expected that 10,000 tons of copper from the Belgian Congo, as compared to 1,700 tons last year, will be handled at the port. The lack of proper appliances for dealing with this large

*  15095; not printed.
†  Annex 2.
volume of exports will undoubtedly cause serious congestion and may result in the loss to the Territory of some of the valuable transit trade from the Congo. The present appliances are not only inadequate, but are in such unsatisfactory a condition that they are liable to break down at any moment.

4. *Tabora – Kahama – Shinyanga feeder line.* – The reasons which led to the original proposal to construct this feeder line are the richness of the soil and the density of the population of the country through which it will pass, and the fact that, unless the Railway is brought nearer to their fields, the natives will be unable to increase their production for export, which is already greater than native porterage can handle. During 1922, 7,390 tons of native produce were exported by rail from Tabora and up to the end of October 1923, 7,123 tons had been railed. The bulk of this produce comes from the rich and populous areas north of Tabora. The average distance over which it has to be carried by porters is 50 miles; therefore, including the return journeys, 245,000 porters are required for 6 days in the year to carry this export produce only. This year production in the Tabora sub-district is expected to outstrip porter transport capacity, and in the Eastern Kahama and Shinyanga sub-districts it has already done so.

5. Production is still in its infancy, and there is no doubt that a large and rapid increase can be counted on. Ploughs have recently been introduced into the Shinyanga sub-district and the Director of Agriculture considers that within a few years the sub-district will be capable of an annual output of 8,000 bales of cotton. The natives of the country which will be tapped by the new line are intelligent and industrious. On the project being mentioned to them, they welcomed it with enthusiasm, and will readily supply labour for construction work. So greatly do they realise the ultimate benefit which the line will be to them that there is no doubt that they would, if asked to do so, supply much labour free.

6. The original proposal was to construct only 80 miles of line from Tabora. In view, however, of the fact that if the line is not extended further the natives of many parts of the fertile Shinyanga sub-district would reap little or no benefit from it, it is strongly recommended that the line should be carried forward a further distance of 40 miles. The General Manager of the Railways, who recently visited this area, considers that this extension would pay its way as soon as laid – see enclosure D of his report in which he fully explains the necessity for the extension.

7. *Completion of slipway, extension of seawall, and new cranes at Kigoma.* – The German Government had completed the underwater part of a patent slipway at Kingoma and had begun the construction of appliances on land. Only five out of 13 cradles for carrying vessels were *in situ* at the commencement of the war, and it is necessary to obtain the remaining eight cradles and to provide mechanical hauling gear for all 13. This slipway is essential for the overhauling and reconditioning of the Government ships on the Lake and will also serve the Belgian
Government who, having nothing of the sort at their own ports, would willingly pay for its occasional use.

8. It is also very necessary that the quay wall should be completed since the greater part of the existing wall lies within the Belgian concession, leaving us without adequate wharf accommodation for our own vessels. The existing cranage will also be insufficient when the Government steamers commence regular sailings.

9. **Engine and Dynamo for the Dar-es-Salaam Electric Power Station.** – It will be necessary to provide current for the electrical appliances required in connection with the new harbour works. The new plant will serve this end and leave a margin for revenue-earning purposes.

10. **Lindi Railway.** – In his despatch No. 811 of the 8th December,* the Governor fully explained the reasons for his attitude towards the proposal to extend the Lindi line into the interior. The experience of the last three seasons has shown that the up-country native producer of the Lindi District is unwilling to sell his produce to traders at up-country markets, but prefers to carry it to the coast rather than diminish its selling price by the cost of railway freight. There is little doubt that the line has so far not stimulated production, and in addition there is every reason to believe that for some years to come the running of the line will prove unprofitable. The line is distant from and not connected with the Central system, and this entails complexity of control and accounting and a consequent disproportionate increase of staff and supervision.

11. At the present time all produce has to be unloaded at Mingoyo, carried by porters half a mile, and loaded on shows at Mingoyo creek. It has then to be off-loaded at Lindi and stored in the Customs sheds before being finally loaded into ships. The proposal to continue the line from Mingoyo to Lindi will eliminate the delay and expense caused by the necessity of man-handling produce at Mingoyo, and should result in the up-country trader being in a position to offer a better price at up-country markets, which in turn may help to induce the native producer to sell at the rail-head rather than carry his produce to the coast. In any case the Governor is strongly of the opinion that it would be inadvisable to construct a costly extension into the interior until it is seen whether the present line, extended into Lindi and reconditioned as far as Masasi, will in fact result in increased cotton production. For this work it is estimated that 50,000l. will be sufficient, and a saving of 108,000l. which will be available for expenditure on other schemes of a more pressing and promising character, would thus be effected.

12. **Manyoni or Itigi – Singida Feeder Line.** – The reasons which render desirable the construction of the Tabora – Shinyanga line apply with almost equal force to this line. The land through which it will pass is fertile and well populated and the natives have already shown that they are able and anxious to
grow products for export. The distance of the thickly populated sub-district of Mkalam from the Central Line entails the use of a large number of porters to take produce to the Railway, and already, as in the Tabora District, the volume of export produce is greater than the available porterage can handle. In addition to groundnuts and grain, the trade of Singida in cattle and hides will benefit by this feeder line, which will also bring into closer touch with the Central Line the fertile country round about Ufhome.

13. The last item mentioned in paragraph 2 of this despatch is 68,000l. for rolling stock, workshops, surveys, &c., with the necessity for which the General Manager deals in Appendix C of his letter. The Rolling Stock referred to is required to deal with expansion of traffic on the main lines, and is in addition to rolling stock required for the proposed extensions, for which provision is made in the separate estimates for those extensions. Repairs and extensions to workshops, stores, carriage sheds, &c., are long overdue and have now become a pressing necessity; additional housing accommodation is also required before full effect can be given to the scheme for training African artizans and engine-drivers. The General Manager of the Railways estimates his requirements under these heads at 200,000l., about one-third of which could be met from the balance of the 1,500,000l. loan remaining after providing for the various construction schemes already referred to. I earnestly hope that you will be able to approve the allotment of the available balance in the manner suggested.

I have, &c.,

JOHN SCOTT.

TANGANYIKA RAILWAYS.

No. L.16/-. General Manager’s Office,
Dar-es-Salaam,
31st March 1924.
The Honble. The Chief Secretary to the Government, Dar-es-Salaam.

I now forward a complete résumé of the Railway situation up to date in regard to Loan development, as indicated by the cables from the Secretary of State.

A. Details of projects already dealt with.
B. Details of projects to make up the balance of 790,000l., as indicated in the latest cable from Secretary of State.
C. Remarks on general improvement.
D. Report on the Shinyanga area.
E. Report on the Singida area.
G. MAXWELL.

General Manager.

</tbody>
</table>

* 10433: not printed.
† 15095: not printed.
(1) The further extension of the Tabora Line for 40 miles to near shinyanga.

**COST:**–

When the Central Railway is relaid, about 100 miles of track (42 lb. German) will be available so that provision need only be made, as regards track for 20 miles, main line, stations, sidings, spares, &c., say 30 miles all told.

30 miles of 45 lb. British Standard Track (with extra sleepers) at 12l. per ton and 120 tons to the mile:–

<table>
<thead>
<tr>
<th>Description</th>
<th>Cost (£)</th>

</thead>
<tbody>
<tr>
<td>Vale in England</td>
<td>43,200</td>
</tr>
<tr>
<td>Freight at 2l. 10s.</td>
<td>9,000</td>
</tr>
<tr>
<td>Total</td>
<td>52,200</td>
</tr>
</tbody>
</table>

It is difficult to say exactly, but 3,500l. a mile should suffice. At this rate 140,000. Station buildings, telegraph and telephone lines, instruments, goods sheds, water-running sheds, &c. Additional locomotive and 10 bogie wagons of 25 tons 12,500. Total 229,700.

Say 230,000l., of which 65,000l. approximate order on England.

(2) Singida (Mkalama) Line.

Looking at the map and the population in the matter of actual construction, I am inclined to think that 100 miles of the line will be sufficient. This does, not, of course, go to Mkalama Boma, but it would be much cheaper to move the Boma than to construct an extra 20 miles of railway:–

<table>
<thead>
<tr>
<th>Description</th>
<th>Cost (£)</th>
</tr>
</thead>
<tbody>
<tr>
<td>110 miles of 45 lb. British Standard track in England (12l. per ton, 120 tons to the mile)</td>
<td>158,400</td>
</tr>
<tr>
<td>Freight at 2l. 10s. a ton</td>
<td>33,000</td>
</tr>
<tr>
<td>Construction, probably 3,500l. a mile</td>
<td>350,000</td>
</tr>
<tr>
<td>Station buildings, water-running sheds, telegraph, telephone, &amp;c.</td>
<td>20,000</td>
</tr>
<tr>

<td>25,000</td>
</tr>
<tr>
<td>Total</td>
<td>586,400</td>
</tr>
</tbody>
</table>

Say 600,000l. complete.

‘C.’

Apart from railway construction and extension there are a great many vital improvements still necessary to put the existing railway and its premises on a sound footing.

As is well known, the Germans had most extensive plans for the improvement of their main stations, workshops, ports, &c., but the war prevented these

† See addition in following enclosure ‘B’ (1).
‡ See reduction of total to 50,000l., explained in enclosure ‘B.’ /
plans being carried out and left the British Administration a half new and half dilapidated property.

From the time I arrived in 1920, I have asked for money to make good the property as it existed, and my memorandum of October 1921 in reply to your 3516/6 of 12th October 1921, resulted in a loan of 250,000l., which just saved the situation, but which did not nearly cover what I asked for.

To show that I can easily spend the balance of 68,000l. on the Railway and can also spend any saving which might possibly accrue on the construction of the lines, I quote a few of the most important outstanding improvements:–

(1) The stores building at Dar-es-Salaam is hopelessly inadequate. Stores are kept all mixed up in sizes as there is no space. Stores are kept at Tabora for which there is no room in Dar-es-Salaam. For economy and efficiency there must be one good central store at Dar-es-Salaam. Plans are ready and this scheme is submitted as urgent.

The removal of the present stores will enable the workshops to expand and the station-yard to be improved.

(2) The state of the Dar-es-Salaam shops in places is beyond words. The corrugated iron roof is like lace in places and the rain has free access. The moulder’s shop is in such a position as to receive all the rain and to give out all its dust over the rest of the shop – a bad business for the bearings of machines and for the throats of the workers. An improvement scheme is submitted as urgent.

(3) Carriage stock has, in many cases, to stand in the open. This is, of course, highly uneconomical, owing to the deterioration and work entailed in repairs. Sheds are a necessity.

(4) Traffic promises to increase very largely, both locally and to and from the Congo, so that extra stock will shortly be wanted over and above the stock specifically asked for under Extension Heads.

(5) Our Asiatic artizan and engine-driver labour is of a most inferior class and is also unreliable. For years I have been working for the white artizan and trained African scheme, but have only been able to put a small part of the scheme into practice for lack of housing accommodation.

All the above are economies in reality which have been waiting for capital. They speak for themselves and will justify the expenditure easily in future economy and efficiency.

As a rough total, these demands, excluding staff, amount to about 200,000l., of which about 100,000l. would be spent in England.
Report on Reconnaissance of the District of Tabora – Northern Portion of Tabora Sub-district and Shinyanga Sub-district.

1. The original German formation was followed from Tabora.

   This formation is in very good order and will only require minor attention to make it perfectly good. The saving in expense by following this old line points to the advantage of following it as far as possible. I followed the formation as far as kilometre 120 and found the alignment good, many abutments and culverts built already, and stone collected in most places where no building had taken place. / …

2. […]

3. It would perhaps have been better had the line been constructed some 20 miles east of its present alignment, but the country is far more difficult when Karundi is passed, and certain quite large engineering works would be necessary, for river crossings, &c.

   The present line is the best alignment and must in any case be followed as far as Karundi, as the expense of making a new line would certainly not be justified.

4. Having arrived at Karundi, it remained to be seen whether the line could economically be developed to the east. I followed the formation to kilometre 120 to see where it arrived, and found an easy access to the northern portion of Karundi and to the highlands connecting Northern Karundi, Luhumbo, Tinde, Usule.

   These places would all be well served by an extension from kilometre 120 along the German survey towards Mwanza. The formation goes on towards Kahama, but no work, beyond survey, has been done after kilometre 120 towards Shinyanga.

5. It is, however, quite obvious that a terminus at kilometre 120 is not far enough and that new and further construction must be undertaken to the north and east, to get in touch with the really fertile and productive district of Shinyanga.

6. Having seen that the approach by the German survey was easy, I returned to Central Karundi with a view to seeing whether a deviation could not be made across Karundi to the north and east, to get into closer touch with Maungoye and Nzega (Ussongo).

   I took off at about kilometre 100 and examined the country to the east, via Kalembera, Senge, Sumbu (all in Karundi) through Kasiga’s in Maungoye, crossing the valley of the Muina east of Kasiga’s.

   (Note. – On existing 1,300,000 map Kasiga’s is called Masugu’s and the Muina is called Sagenda).
This river, Muina, is a serious obstacle as it would entail a large and expensive bridge to cross.

Proceeding further east I arrived at the ford of the Manyonga, the crossing of which would entail a large and expensive bridge again, the cost of which bridge alone would pay for many, many miles of construction.

The crossing of the Muina might be avoided by turning north and crossing only the Manyonga, but there would be a stiff climb on the north side to get up through Tinde to the Ussanda Hills, and the line would be incriminated to a passage to Shinyanga round the east of the Ussanda Hills, which would mean construction against the lie of the land and expensive work.

Still bearing in mind the service of Shinyanga, I proceeded round the east of the Ussanda Hills and followed the road to Shinyanga, nothing on the way that the valley of the Kitalu seemed to afford an excellent approach to Shinyanga from the highlands of Usule where the German survey passed.

8. After visiting Shinyanga I returned through Tindo to Luhumbo, and struck again the German Survey.

9. Realising that the German survey, as it exists west of the Mwantine Hills, is too far from the fertile parts of Shinyanga to be of use, I proceeded to Igalamia in Usule and found, as I thought, that an excellent diversion could be made here down the valley of the Kitalu to serve Shinyanga and pass northward through the edge of the Ushi to rejoin the German survey in Seke.

10. It must always be borne in mind that a railway should have a final objective, and in this case the objective of the future is undoubtedly Mwanza.

11. The German survey is the shorter and easier, but is buried in thick bush and in fly country, and therefore the longer route, giving easy access to ox transport from all Eastern Shinyanga, is much to be preferred.

12. This report is based on a hasty reconnaissance and no actual survey exists of the route I suggest, but I feel fairly confident that no great difficulty will be experienced in following this route.

13. Summing up, therefore, I recommend (1) that the German formation be followed to kilometre 120, as already asked for; (2) that the line be extended from kilometre 120 (new construction) along the line of the German survey for about 36 kilometres; (3) that the line be carried east from this point for about 30 kilometres to a railhead in a fly-free spot near Kisumbi. Roughly, 40 miles of new construction.

14. If this route the followed, the eventual main line to Mwanza will be some 10 to 15 miles longer than the direct German route, but will serve the country far better.

Also, if any difficulty should be found north of Shinyanga in joining back to the original survey, the last 30 kilometres might be looked on as a necessary feeder line for Shinyanga, and the original survey still followed for the main line.
15. I am greatly indebted to Major Stiebel for all the facilities afforded me in the district and cannot speak sufficiently highly of the information afforded me by Mr. C. McMahon, M.C., of Shinyanga, whose knowledge of the country and the natives and their requirements and aspirations enabled me to see very clearly what the desiderata of a railway were.

Mr. McMahon explained very fully the present position as regards marketing the crops and the loss of man-power, due to long head carriage. He convinced me absolutely that a railway only as far as kilometre 120 would be of little or no benefit to Eastern Shinyanga.

16. Mr. McMahon very kindly took me out some 12 miles into Usiha, from which point I was able to see still more of this wonderful country, adding thereby to my impressions of richness gained in travelling through Karundi, Maungoye, Luhunbo, Tinde, Usule, Samuye and Kisumbi.

The country is magnificent, the crops healthy and plentiful, all the cotton I saw looked well (from a non-expert view), the people are industrious, and the many chiefs of I talked to seemed keen and / progressive, and the personal views of Sultans Humba, Kasiga, Kaswende, Kapella, and Wamba led one to suppose (as is true) that transport is the one thing required to make the country a very useful asset to the British Empire.

17. The route I have recommended must now be analysed in regard to its distance from the chief centres of population and production.

It is, of course, impossible to follow every collection of people and, if a reasonable through line can bring the bulk of population within 20 miles, and the outlying population within 40–50 miles, I think the desiderata are fulfilled.

A rough centre of each sultanate has been taken and the approximate distances are as follows to the proposed railhead or nearer point on line:–

District

11,000  50

159,000  20 and under.

151,000  50 and under.

So that this line may be said to serve fairly the region of North Tabora District.

18. That portions of the railway as suggested pass through bush and fly is admitted, but the steady spread of cultivation into the bush and the attraction of the railway certainly lead me to suppose that in a very few years people will cut in towards the railway and an additional belt to bush and fly will be cleared. This will, I think, be especially noticeable in North Karundi and near Shinyanga, where the natives will keep their land open up to and round the railway instead of being inclined, as at present, to let the fly and bush push them further eastwards.

19. I can, therefore, recommend this further construction with every chance of the line paying its way as soon as laid, and the only remark further is that the sooner it is begun the better, as very large crops are being grown and even a few months may make the difference of a bumper market to the people, or their being left discouraged with a lot of produce on hand and no chance of transport to clear it away.

‘E.’

Feeder Line from Manyoni or Itigi to Singida and Mkalama.

This line is asked for purely as a feeder line. It is not likely ever to be a through line. Its construction seems warranted, however, on the following facts:—

(a) the country is rich and fertile. (b) The population is large:

- Wa Nyaturu  150,000
- Wa Iramba  120,000

(c) The work is not expected to be heavy.

The production of this district has increased very largely in the last year or two, and a stage is being reached where further production is impossible owning to the distance from the railway and the consequent number of porters required to bring in the produce.

Such a railway will probably pay at once, and allow all the man-power to be employed on producing instead of carrying, and thus assist a large area to become rich and prosperous.

261. ANNEX 2.

The Governor of Tanganyika Territory to the Secretary of State for the Colonies.

[Received 2nd January, 1914.]

No. 797. Government House, Dar-es-Salaam,
My Lord Duke, 3rd December, 1923

With reference to my telegram No. 226 of the 8th November, I have the honour to submit for Your Grace's consideration the report of a committee which I appointed to investigate the question of extension of the harbour works at Dar-es-Salaam and increased facilities for handling cargo at that port. The necessity of improving facilities is one which I regard as immediate. Production in this Territory is increasing rapidly and exports show a steady growth in volume, which must in turn lead to a greater bulk of imported commodities. Already there is periodical difficulty in handling goods which accumulate before the arrival of a ship, and this is due to the small number of lighters which can be discharged at one time. Complaints on this score are not infrequent, and I foresee that the time is not distant when serious congestion will occur unless the matter of increasing berthing accommodation and port appliances is taken in hand at an early date. I am quite confident in predicting that the volume of exports, which already in some items has passed the German records of 1913, will show very considerable expansion during the next three or four years, and it is important that this growth should not be impeded or checked by the lack of means to deal with it.

2. Mr. Hollis, in his despatch No. 365 of the 22nd May 1922, submitted to Your Grace's predecessor preliminary recommendations for the development of the principal ports in the Territory, and subsequently the Resident of Zanzibar kindly put at my disposal, for a short period, the services of Mr. Furlong, Resident Engineer of the Zanzibar Harbour Works, who examined the conditions in Dar-es-Salaam and drew up plans and estimates, providing for a quay alongside which two ships could be berthed at a time.

3. This scheme, which was estimated to cost approximately 500,000£, was discussed by my technical officers with Mr. Mitchell, of the firm Coode, Fitzmaurices, Wilson, and Mitchell, who was invited here for the purpose as suggested in Your Grace's telegram of the 10th [18th] May, Mr. Mitchell agreed generally with the proposed plans, but recommended a further survey of the harbour bottom, and observation of tides and currents, for a further period of 12 months before undertaking the main works. He, however, advised the immediate execution of certain improvements in the existing arrangements for handling cargo, including the construction of a crane jetty and modifications in the railway system on the wharves.

4. As plans were being drawn up to give effect to Mr. Mitchell's recommendations, certain difficulties and, disadvantages which would result from the

* 30908; not printed.
† 25167; not printed.
proposed scheme became apparent, and it was necessary to review the whole question again.

5. The results of the further deliberations of the committee are given in the enclosed report. I have examined the report and plans and have discussed them with the Director of Public Works, and I am fully in agreement with the proposals now put forward. I desire particularly to support the recommendations in paragraph 10 of the report. The further borings referred to in paragraph 9 are being proceeded with and have so far proved satisfactory.

6. Estimates for the proposed works [...] is also enclosed.

7. I suggest that advantage be taken of the presence on leave in England of Mr. Selander, the Director of Public Works, to obtain any further details or explanations which may be required regarding these proposals.

8. A memorandum by the Acting Comptroller of Customs, which accompanies the report of the committee, makes clear the necessity for an immediate improvement in the arrangements for handling the ever-increasing volume of imports and exports, and I can only urge that approval be given to the scheme now put forward, the necessary funds being made available by way of loan to aid the development of the Territory.

9. As stated in my telegram referred to above, immediate use can be made of two of the 3-ton electric cranes asked for, and if Your Grace is able to convey approval by telegraph, the details necessary for placing the order for these cranes will be forwarded at once. §

§ In view of the urgent demand for cranes, reported in subsequent telegrams, Treasury approval has been obtained for the placing of the necessary orders.

I have, &c.,
H. A. Byatt.
No. 1499 Public Works Department,
Dar-es-Salaam.
The Honourable the Chief Secretary, 2nd November 1923.

DAR-ES-SALAAM.

Dar-es-Salaam Harbour Improvements.

With reference to the Report of the Harbour Improvements Committee forwarded under cover of my letter dated 8th May last, and subsequent report by Mr. Mitchell of the Firm of Coode, Fitzmaurice, Wilson & Mitchell, Consulting Engineers, of 9 Victoria Street, Westminster, dated 26th May, the Committee now beg to submit an alternative scheme and estimate, which, in the light of their further investigation, they strongly recommend for adoption in preference to the deep-water pier scheme, which would involve an expenditure approximating to half a million pounds.
2. The scheme submitted herewith deals with the problem by means of a lighterage wharf as opposed to a two-berth deep-water pier.

3. The Committee were fortunate in obtaining the services in an advisory capacity of Colonel Nicholson, the eminent Harbour Engineer in South Africa, while he was passing through on his way to inspect the Zanzibar Harbour Works about a month ago. The plans and estimates now submitted are based on his recommendations and views.

4. Colonel Nicholson expressed a strong preference for a lighterage wharf, as opposed to a pier, this being in his opinion the most suitable and economical solution of the problem. This view was endorsed by Captain Rainnie, Managing Director, East African Lighterage Company, their wharfage adviser, who was visiting Dar-es-Salaam at the time, as also by other shipping authorities acquainted with local conditions.

5. The members of the Harbour Improvements Committee are in entire agreement with these opinions and they consider that an improved lighterage system will suffice for the needs of Dar-es-Salaam for many years yet.

6. The Scheme now put forward is estimated to cost 92,300l. and will involve therefore an expenditure approximating to one-fifth of the deep-water pier scheme. [...] It will provide a wharf 370 ft. in length, which will enable six lighters to be dealt with simultaneously. The scheme also includes a splay return of 290 ft. in length, which will be used in connection with existing dhow traffic, passenger landing pontoon, and dhow pontoons.

7. The estimate attached is inclusive of cranes and necessary equipment required for the expeditions handling of cargo. A transporter from the high level export shed to the wharf is provided for, and a sum of 5,000l. has been included for improvements to the lower export shed, which it is proposed to convert into an import shed. This arrangement will, in the opinion of the Acting Comptroller of Customs, provide sufficient shed accommodation for years to come. (Comptroller of Customs letter No. H.W./1424, dated 30.10.23, copy attached.) The estimate also makes provision for such services as Supervising Staff, Electric Lighting, Water Supply, Drainage and Railway facilities.

8. Colonel Nicholson expressed his opinion that there would probably be no necessity for the employment of a dredger in connection with the scheme submitted, as cranes and grabs, working from the wharf itself should be able to keep the lighter berths clear. For this purpose the estimate provides for 3 grabs, each with a lifting capacity of 27 cubic feet.

9. Borings on the proposed line of the wharf are now in progress and the results of these will be forwarded in due course. In this connection, no serious difficulties necessitating modifications of the scheme are anticipated, as previous borings for the deep-water pier scheme have revealed a uniform distribution of sand and clay in the vicinity of the proposed works.
10. It is recommended that the whole of the work, if the scheme is approved, be carried out by the Public Works Department.

11. Should the scheme as outlined be approved, specifications and detailed drawings will be prepared and submitted.

12. The Committee consider that the proposed scheme can be carried out without dislocation of the work of the port, and recommend that two of the four three-ton cranes provided for in the scheme should be obtained in advance to facilitate the work of the port during the period of construction of the new wharf.

Say £02,800

From The Comptroller of Customs, Dar-es-Salaam.

To the Chairman, Harbour Board, Dar-es-Salaam.

30th October 1923.

With reference to our meeting this morning I desire to make the following comments:

2. The scheme put forward by Colonel Nicholson appears to offer the best solution of our present difficulties in handling the trade of this port. The scheme is economical, quick working, and need not unduly interfere with the discharge of vessels whilst it is under construction. Although I am firmly of opinion that the trade of this port will increase yearly and considerably, the new lighter wharf
as planned will, with proper organisation, be adequate for dealing with it for many years to come. Included in the scheme is provision for rebuilding the present lower export shed and for a transporter from the large top export shed. When this shed is completed I propose using it for imports only, and so relieve the quite appalling congestion that frequently occurs in the only import shed at present available. By increasing the width of the wharf a useful marshalling yard will become available for cargo that is marked for immediate loading or delivery, and the top export shed will then be ample for all export cargo that needs temporary storage accommodation.

3. On my way through Mombasa I met the chief of the African Wharfage Company and was shown letters and figures proving conclusively that Dar-es-Salaam was anything but a favourite place of call for steamers on account of the hopeless delay at present occasioned by the complete lack of facilities for working cargo. This is a most undesirable state of affairs, and if we are to develop normally and without hindrance, it is essential that improvements be made as rapidly as possible. If I appear to over-emphasize the necessity for immediate action it is because for the last two years I have been made so painfully aware, through constant complaints, of the inadequacy of the present arrangements.

E.C.F. BIRD,

*Acting Comptroller of Customs.*

CONFIDENTIAL.

NATAL GOVERNMENT RAILWAYS.

No. 2.

DRAFT LAW

(Enacted by the Lieutenant-Governor of Natal, with the advice and consent of the Legislative Council thereof),

To raise a Loan for the construction and equipment of certain Railways in the Colony of Natal.

WHEREAS by ‘The Natal Government Railways Law, 1875,’ the Lieutenant-Governor is empowered to make, maintain, equip, and work the following railways, namely:

(A.) The Main Line. – A railway commencing by a junction with the existing line of railway at Pine Terrace, Durban, and terminating at the city of Pietermaritzburg, at a point near to Government House.

(B.) The North Coast Line. – A railway commencing by a junction with the existing line of railway at a point near the Umgeni River, and terminating at the town of Verulam.

(C.) The South Coast Line. – A railway commencing by a junction with the intended line of railway (B) from Durban to Pietermaritzburg, at a point about four and a half miles from Durban, and terminating at the village of Isipingo, and provision is made for alterations of the gauge of the existing railway from
Communications in Africa, 1880–1939: Volume 2

Durban Harbour to Umgeni, and for the purchase or lease of the railway and undertaking of the Natal Railway Company. / And it is expedient to make provision for raising, by way of loan, funds for the purposes of the said Law.

Be it therefore enacted by the Lieutenant-Governor of the Colony of Natal, with the advice and consent of the Legislative Council thereof, as follows:–

1. This Law may be cited for all purposes as ‘The Natal Government Railways (Funds) Law 1875.’

2. In this Law –

   The expression ‘the Lieutenant-Governor’ means and includes the Lieutenant-Governor or Officer administering the Government for the time being.

   The expression ‘debenture’ means a debenture or other security issued under the authority of this Law.

   The expression ‘the railways’ means the railways and works authorized to be constructed and executed, and purchased or leased as aforesaid, or any of them. And,

   The expression ‘the Crown Agents’ means the Crown Agents for the Colonies in London for the time being.

3. The Lieutenant-Governor may from time to time borrow upon debentures, or upon such other form of security as he shall think preferable, such sum or sums of money, not exceeding in the whole the sum of one million and two hundred thousand pounds sterling, as may be required to pay for the construction of the railways and works, and for all necessary services and labour in connection therewith, and for the purchase of such lands, easements, and other property as may have to be purchased for the same, and for the purchase of all requisite materials, plant, engines, rolling stock, and other things in connection with the railways and the equipment and working thereof, and other purposes of the said recited Law, and may employ and empower the Crown Agents to negotiate and to effect the loan hereby authorized. /  

4. The principal money secured by every debenture issued under the authority of this law, shall bear interest at a rate not exceeding 6l. per cent. per annum, and such principal money and interest shall be and are hereby charged upon and made payable out of the general revenue and assets of the Colony, but subject to all now subsisting debts and sums of money charged on such revenue and assets by virtue of any law heretofore passed.

5. The interest on the principal money secured by any debenture shall commence from a-day to be named in the debenture, and shall be paid half-yearly at the office of the Crown Agents in London, and the principal sum secured shall be paid at the same place, on a day to be also named in the debenture, and being not more distant than forty-five years from the 15th day of November, 1875.
6. The debentures issued under this Law may be issued at the par value thereof, or at a premium upon or discount from the par value, as the Crown Agents shall deem to be expedient at the time of issue.  

7. Every debenture shall be signed by the Colonial Secretary and the Colonial Treasurer of Natal, and be countersigned by the Crown Agents or one of them as agents or agent for the negotiation of the loan hereby authorized, and be registered before issue in Register Books to be kept for that purpose in the office of the Crown Agents.  

8. To every debenture shall be attached, at the time of the issue thereof, coupons for the payment of the interest upon the principal sum secured by the debenture, to become due in each half year, either during the whole period during which the debenture shall have to run or a part of such period, as the Lieutenant-Governor may determine.  

9. Every debenture and coupon shall be transferable, and the right to receive the principal money and interest respectively secured or represented thereby shall pass by delivery.  

10. The Lieutenant-Governor shall appropriate and set apart in each half year, out of the general revenue of the Colony, a sum sufficient for the payment of the interest accruing in such half year on the entire amount of the principal monies borrowed under this Law, and for the time being owing, and shall remit the sum so appropriated to the Crown Agents in London, in time for the payment of such half year’s interest when the same shall fall due.  

11. The Lieutenant-Governor shall half yearly, commencing from the 15th day of November, 1880, also appropriate and set apart out of the general revenue of the Colony, and in like manner remit to the Crown Agents, a sum of money equal to the half of 1/ per cent. of the entire amount of the principal moneys so borrowed, and for the time being owing, in order to form a sinking fund as hereinafter provided. Trustees of sinking-fund to be appointed.  

12. The Lieutenant-Governor shall, with the approval of the Secretary of State for the Colonies for the time being, nominate and appoint two or more persons to be trustees for the purpose of the sinking fund, and may from time to time, with the like approval, nominate and appoint other fit persons to fill casual vacancies in the number of trustees occasioned by death or otherwise, so that the number of trustees may never be less than two.  

13. The Crown Agents shall pay over to the trustees for the time being all sums remitted to them as last aforesaid, and the trustees shall accumulate the same to form a sinking fund for the redemption of the loan hereby authorised by investing the same sums, and all the resulting income thereof in some one or more of the securities of the Imperial Government of Great Britain, or of the Government of any Colony or Dependency of Great Britain.
14. The trustees may from time to time apply any part of the sinking fund in the purchase of debentures issued under the authority of this Law. All debentures so purchased, and the interest coupons attached thereto, shall be immediately cancelled or destroyed. Subject to this power of applying the same the sinking fund shall be applied in payment, as and when the same shall become due, of the principal moneys for the time being owing on debentures issued under the authority of this Law pari passu, and without any priority.

15. In case the sinking fund shall be insufficient for the payment of all the principal monies borrowed under the authority of this law at the respective times when the same shall have become due, the Lieutenant-Governor shall make good the deficiency out of the general revenue and assets of the Colony.

16. All expenses of or incidental to the management of the sinking fund or the purchase of debentures, or the repayment of the principal monies to be borrowed under this law, shall be paid out of the sinking fund.

17. Every debenture, the principal money secured by which shall be repaid, shall be delivered up to the Crown Agents, and be by them immediately cancelled or destroyed.

18. No money shall be reborrowed, nor shall any reissue of debentures be made in respect of any debentures purchased or paid off and cancelled or destroyed as aforesaid.

19. All moneys borrowed under the authority of this law shall be applied to and for the purposes for which the same are hereby authorized to be borrowed, and in payment of all costs and expenses of and incidental to the borrowing of the same, and for no other purpose whatever.

20. This law shall commence and take effect from and after the Proclamation by the Lieutenant-Governor in the 'Government Gazette' of Her Majesty’s assent to the same.

Given at Government House this day of

By command of his Excellency the Lieutenant-Governor.

CAPE OF GOOD HOPE.

REPORT

OF THE

SELECT COMMITTEE

ON

RAILWAY LABOURERS.

Ordered by the House of Assembly to be printed.

JULY, 1863.

[...]
REPORT

OF THE

SELECT COMMITTEE appointed by the HONOURABLE the HOUSE OF ASSEMBLY on the 2nd July, 1863, to take into consideration the Message of His Excellency the Governor dated the 25th June, 1863, respecting the provision to be made with regard to certain Railway Labourers.

Your Committee are of opinion that it would not be desirable for the Government to provide passages back to England for any of the labourers referred to in the Governor’s message, for although there may be a temporary want of employment for men of this class, owing to the approaching completion of the Cape Town and Wellington Railway\(^1\) before any new line has been commenced in the colony, and owing to the present slackness of work for this description of labourers in the country districts, arising from the season and other causes, the Committee cannot but look forward to an early revival of such employment; and it would be a subject of regret that any of these men, who may soon again be required and whose labour may be so useful to the colony, should be sent out of it.

The Committee cannot admit that, because the Government made a grant to Mr. Pickering in aid of the introduction of these men into the colony, it is either legally or morally bound to send them back to England or to provide them with employment in the colony, in consequence of any failure on Mr. Pickering’s part to fulfil his engagement. But the Committee have reason to believe that, if the question were raised of Mr. Pickering’s liability under his contract with these men, or a majority of them, it will be found that he was virtually released from it.

The Committee consider that the best course for the House to adopt is, to authorize the Government to provide suitable employment for any of these men who cannot otherwise obtain it, after satisfying that they are really unable to do so, and under such arrangements as will not offer inducements to enter and depend upon such employment when they can procure it elsewhere.
PROCEEDINGS OF COMMITTEE.

[...]

Friday, 10th July, 1863.

PRESENT:

Colonial Secretary (Chairman),

Mr. Solomon,                     Mr. Franklin.

Mr. Harries,

Mr. A.T. Andrews examined.

1. Chairman.] You are the resident engineer of the Table Bay harbour works? – Yes.

2. The Government have reason to apprehend that a certain number of railway labourers, who were introduced from England to the colony by Mr. Pickering for the railway works, are being discharged, and will be discharged in still larger numbers upon the completion of the work, before they can find other employment of the same kind in the colony. We are anxious, if possible, to prevent the necessity of their returning to England, or being sent back to England, or of becoming idlers or something worse about the town, and therefore would be glad if we could find fitting employment for them in Cape Town or the neighbourhood. We are anxious to know whether such employment could not be found for them on the Table Bay harbour works, where, it appears, they could be well employed in the kind of labour they are accustomed to?

– A short time ago the Governor sent for me and questioned me very much to the same effect. I then told him that we had as many men as we could well employ; that we had nearly 150 men over the number estimated for; and that to take on more would unfairly increase the cost of the works. I did not see where I could employ them, but as it seemed very necessary that they should be employed, and / that something should be done, I offered to take about a score of the men. I did so; but their services are not well laid out, and I could very well spare them.

3. How long ago was that? – About three or four weeks ago. The Municipality took a number, I believe, at 2s. 6d. a day. I found it would not do to pay these twenty men I took on at 2s. 6d., for they had to work with men who were getting their 4s. or 5s. a day, so we have put them on at 4s. 6d. This puts them on a par with the other men, and comes cheaper in the end, for you cannot expect men getting 2s. 6d. a day to execute the same amount of work as those getting 4s. 6d. or 5s., and unless they do the same work they could not work well together. It comes cheaper to pay them better wages; and 4s. 6d. a day I consider very good wages, and that the great bulk of our men get. One of the great difficulties we have to contend with in the employment of large bodies of men in the construc-
tion of the works with free labour is to give them as much space as possible, that they may not be in the convicts’ way. I have considered the subject very well over, and I really do not see how we can take on more. It would be very difficult to work them with the convicts; and then there is another reason: the great expense of employing men to do the work estimated to be done by convict labour for nothing; that is to pay men 4s. 6d. for doing the work of others who are paid nothing. It would cost us a large amount extra every week.

4. How many free labourers did you estimate for? – About two hundred, and we have three hundred and thirty now.

5. Mr. Franklin] What number of navvies are now engaged on the Works? – I can hardly say how many navvies.

6. Chairman] If the Government had the opportunity when such men presented themselves, complaining that they cannot find labour, of saying – ‘Very good, go to the harbour works; you will be taken on at such a rate of wages,’ – that would at once relieve us of the difficulty? – Of course, it would relieve the Government of the difficulty; but then the difficulty comes in my department – that of finding a place for them to work. But I object also on the score of expense, and that really must be looked at.

7. The objection of the expense would be got over if the Government bore a proportion of the wages? – Yes; that was very much the case when the railway works were stopped. We paid the men 5s. and the Government repaid us 2s. 6d. But even then we did not get our value for the 2s. 6d., for the men knew that they had been taken on as an act charity, and when I complained of the way in which they worked they said, ‘Don’t find fault with us, we shall be away again in a few days;’ and it was of no use threatening to discharge them.

8. But the present circumstances are quite different; there it was a temporary suspension until the company and Mr. Pickering had come to a settlement, and awaiting the decision of the Supreme Court. Here the men are discharged from work with no immediate anticipation of any similar works being undertaken, and therefore the circumstances are very different. Do you find that those now employed work differently from any of the others? – Yes, in those now employed; there is a great feeling on their part that they are taken on because the Government must find them something to do. I have told them, in order to stimulate them in their work, that I would give those steady at their work a permanent job; for they know they are only sent there to be kept out of idleness. A great many of them are at times away; on Mondays, especially, the half of them are away.

9. Is that the case with the other men? – No, not so much as with them. These men feel that the Government have found them something to do, only to keep them out of mischief.

10. Mr. Harries.] You stated you found a difficulty in finding room for the men to work; but, in such a large area as the works cover, cannot you find a new

Mr. A.T. Andrews. 10th July, 1863
spot to break ground? – Our works extend really over a small space; we only
cover eleven acres, and with eight hundred men, they lie very close in that area.
We are now working almost entirely at the docks, and concentrating the men
more and more. This very morning, the overseer of the convicts pointed out to
me that some of the convicts were mixed with the free labourers. I really should
object to receiving any more men, unless they were sent entirely as an act of char-
ity.

11. Chairman.] How could you employ them under such an arrangement?
– There are some pieces of work that might be done, but if I had to pay for
it, I would not do it – such as leveling ground, &c., but that can be done, at
future day, by convict labour. I have promised the military authorities to slope
the ground about the Amsterdam battery;3 there / would be a few months’ work,
but as there is no time fixed for doing it, I do not like to employ paid labour for it.

12. But if the Government paid all the wages? – Yes, of the greater part, but I
would not like to pay more than a shilling a day, – the same amount that convict
labour costs us, – for horses and men.

13. Would not the difficulty with regard to these men loitering, and not giv-
ing a fair amount of work for their wages, be removed if they were employed
on piece-work and paid for work done? – There are a great many objections
to piece-work. I do very little of that, owing to the men standing out for such
enormous wages for piece work, and requiring such a great deal of inspection.
Sometimes a man will take piece-work at so much a cubic yard, on hard, stony
looking stuff, and perhaps, after a day’s work, come upon soft stuff, and make,
perhaps, 10s. a-day. I have been letting out some work as piece-work to mechan-
ics, this week, and it turned out very much better than was expected, and they
made nearly £3 a week at it. If we had no convicts, and the work was very much
of the same character, I would let nearly all the work; but I always take advantage
of convict labour where it can be used, because it is so cheap. With piece-work
this cannot be done.

14. Is it not worth while to let them earn a good rate of wages at piece-work:
do not they do such a quantity of work as to repay you? – It may be that it comes
to us to the same thing at the end; but, at all events, it would be very much
against the system now pursued. Instead of paying two men wages at the rate of
4s. 6d. a day, one man would earn 9s. and one man stand idle. Where I have now
seventy men at work at day-work, I would only have forty men if they worked at
piece-work; the forty men would do the same work as the seventy at day-work,
and the consequence would be that thirty men would stand idle. I would still
pay the same amount of wages, but it would tell against the employment of many
men.

15. The upshot, however, is this: if the Government found itself in a diffi-
culty with those men, how could you put them to such work as would enable us
to dispose of them for a while? – I could find employment for them for a short
time but it must be really looked upon as quite an act of charity in taking them
on; I could only lose by it, and the work would cost more than it was estimated
at. / 

16. But still this is public work, and the employment of those men is a public
object? – Still, I have to look to my estimate; and when the work is three parts
finished, and the money spent, I know who will get the blame.

17. You have only to report that in the year 1863, between the months of July
and December, you had in your employment one hundred railway labourers, and
that the cost of the work was increased by so many hundred pounds; that would
account for the excess over the estimate? – Still, I see so much blame attached to
works exceeding the estimates, that I think it may, perhaps, be attached to me.
I should not like to see the docks three parts finished, and left standing in that
state for want of funds.

18. Mr. Solomon.] But then if that objection were removed; if the men
employed were paid by Government? – We have now at least twenty-five men
at the works who are not profitably employed, and I should be very glad if the
board were to give me instructions to discharge them.

19. Are these, then, men sent down by the Governor? – Th
they have come
down to me since I saw His Excellency.

20. And you have given them employment only in consequence of their
being in want of employment? – Entirely on account of His Excellency impress-
ing upon me the necessity for doing so.

21. Mr. Franklin.] You can hold out no prospect to take on, profitably, any
further supply of men, excepting they do not cost you more than convict labour?
– Yes. Every day the work is drawing into a smaller compass; but if the board
were to sanction any new work, I could take them on. There has been some talk
of making a boat-harbour which has been taken up by a committee in the other
House, which I attended. On such a work I could employ fifty or sixty extra men;
it would be another work, carried out quite distinct from the harbour works.

22. Chairman.] Have you any idea what a boat-harbour would cost, accord-
ing to the idea of those gentlemen who proposed it? – I was looking over the
matter last night, and I think that for £4,000 or £5,000 a good boat-harbour
could be made.

23. What area would it hold? – About 400 feet square, about 600 feet long,
and would hold all the fishing-boats and other small boats in the bay.

24. Where would you construct it? – Off the Sailors’ /

Home, between that and the Central Causeway. The committee that I
attended yesterday said that the fishermen complained very much of the bad
place they had for their boats and I was asked if it was possible to make a boat-
harbour I said that I would look into it, and I did last night. I have thought over the matter before, and I have no doubt that it would be a very profitable work.

25. Mr. Harries. I think, in more than one of your reports, you have complained of the want of more convicts: has that want ceased to exist? – Yes. At that time I had 130 convicts; now, I have 425. I was then employing free labourers to do convicts’ work. I have the full complement now, viz., 400. That is the number I calculated I would require for the dock. If I had many more men I should require additional plant, and have to get more horses and wagons, and go to other expenses.

26. Chairman. How long would a boat-harbour occupy in construction? – I could hardly say; but I should think between twelve and eighteen months.

27. What number of men would you employ? – I think about fifty, not more.

28. They will take material from your excavations? – Yes, and the rest of the material from the excavation that they would have to make. I should think it would only take twelve months after they were fairly started.

29. Mr. Solomon. That would be a profitable work? – Yes, and a great benefit. The fishermen complain that they are being ruined; that they are driven from place to place that they have no place for their boats; and they have to pay so much money every year on account of breaking their boats in beaching them.

30. Chairman. Have you any further suggestion to offer with regard to the employment of these labourers? – None at all, unless the Government undertake some work in the colony that they may be employed upon.

31. None has struck you in the immediate neighbourhood of Cape Town? – No; excepting the reservoir for the water supply of Cape Town; and considering how short we run of water, and how little water we have in the summer, it seems to me the most important thing that can be carried out; and they are the very men for that work. It could be commenced without any delay. You would only require a few wheelbarrows, pickaxes, and shovels, and begin upon it to-morrow. You require no rails, trucks, or anything else; it is all dirt. It is a great pity it is not commenced now; it is the very time for it, for the ground is soft, and labour is abundant. As they go on now, the winter rains would consolidate the work; and if it is done in summer it would have to be continually watered. I may as well mention to the committee that out of the men we engaged in England twenty men left us, almost as soon as they came here, to go to the railway for higher wages. They were engaged in England at 4s. 6d. per day, but they were offered 6s. at the railway. Some of these men have been back to me lately and asked for work.

32. Mr. Solomon. I suppose you did not care to keep them? – We could not keep them, though they were under contract for three years.

33. But you did not enforce the contract? – We tried that, but we could not find them to levy summonses. I think we only punished one man. He had gone
up the country and taken a contract under Mr. Pickering, and boasted that he had only contracted with us in England at 4s. 6d. per day to get a free passage. He only worked with us one day, and then went to Mr. Pickering. We could not get hold of him; but some time afterwards we heard he was going to New Zealand, we stopped him; took all his money form him, some £10 or £15, and then let him go.

34. Mr. Harries.] What is your average rate of wages? – The lowest is 4s. 6d., and the highest 6s.; the average is 4s. 11d. All the quarrymen for boring and blasting get 5s., for filling wagons, 4s. 6d., drivers, 5s. 6d., and a few head quarrymen, 6s. I have a good many men who came out here for Mr. Pickering, and who have stayed with me ever since. Mr. Pickering was there one day and recognized some of them and spoke to them. They told him they would not go back.

35. Mr. Franklin.] What was the reason of that? – Either that they had more wages or had had quarrels with the foremen. He spoke to me about it. I told him that he had twenty of my men. The whole of Mr. Pickering’s men were engaged in England for 4s. I found this out by applying for a copy of the contract of Mr. Pickering’s firm in London. I made my contract in the same way, with a slight exception. Mr. Pickering’s men were engaged for specific trades; for instance, a man was engaged as a carpenter, / another as a blacksmith, and so on. I put in my contract ‘to work,’ and did not specify what particular work they had to do. As soon as the men came out they struck for higher wages, and got it. Men who had come on for Mr. Pickering at 4s. per day earned as much as 15s. One of the men went to England and commenced an action against Pickering for breach of contract; that man had let and worked for me, and I gave an affidavit to that effect, and he lost the case. I had given him 7s. a day and his agreement with Pickering was for 5s. All my men who were engaged at 4s. a day in England now receive 5s.; with the exception of mechanics, all the men receive higher wages.

36. Mr. Solomon.] What wages do that class of men receive in England? – The highest wages I paid was from 3s. 4d. to 4s. per day, and that in London, which is a very dear place. In the country less is paid. On the Norfolk railway works they receive from 2s. 3d. to 3s. per day and very good workmen they get for that.

37. Of course, living is much cheaper there? – I do not think so very much. These men live chiefly upon meat, and the cost of their living here is not very different from what it is at home. They pay 17s. per week here for everything including board, lodging, and washing. They live very well and have the best of everything for that. The difference the cost of clothing is not great, for in England they principally wear cloth, and here they generally wear canvas.

38. Mr. Franklin.] Do you know of your own knowledge that all Mr. Pickering’s men struck for higher wages? – I know that Mr. Pickering’s men were paid very much higher wages than they had agreed for; for he not only told me so
himself but his men told me so, and I have now several men with me who were engaged by Mr. Pickering at 4s. in England, and who told me that they had got as much as 10s. a day as soon as they had demanded piece-work.

39. That may be the reason why Mr. Pickering did not fulfil his contract, because they broke theirs? – Mr. Pickering told me, at the time he stopped the works, that some his men had tried to compel him to pay them 4s. a day when they were doing nothing; but they could not enforce this.

40. Mr. Solomon.] You do not see anything so easy or so desirable, connected with the works under your charge, as a boat-harbour, for the purpose of giving employment to those men? – Yes; or some other extra work not forming part of the present design. I consider the present works quite full, and I do not know of a more suitable work to employ them upon than a boat-harbour.

41. And you consider that it is a work both needed and desirable? – I think it is very much needed; the evidence upon that point is very strong indeed.

42. Chairman.] When the docks are completed will this boat-harbour be necessary; could they not land in the outer basin? – It will not suit fishing-boats; they will have to come into Cape Town with their fish, and if they had to land it in the docks they would have to bring it into town in carts; and this is what they are afraid of. Another thing is, the fishermen are anxious to beach their boats, and we cannot give them that accommodation in the docks. In the boat-harbour that I would propose, we would give them a good beach to haul the boats up, and it being enclosed they will be out the surf in landing. At the present time they are nearly drowned in beaching the boats through the heavy surf.

43. What would be the monthly expenditure on fifty men, at a rough calculation? – About £300 per month. Much plant would not be wanted; you would only require a few horses, and a ganger or two. I may add that the Governor asked me if I could recommend any work for these men. Of course, looking generally all over the colony, I would fix upon what I consider the best place. I think that the most important work that can be executed is to make a railway and a wharf at Knysna. I would carry a railway from the wharf up to the forest. When you consider the enormous quantity of sleepers and timber that is used for railway purposes, it is a work of very great importance. It could be done at very little cost. I have been down there and examined the place, and found one of the greatest impediments to the wood trade to be the carriage over eight or ten miles of not very good road; and then, when brought down to the water’s edge, floated off to the vessels. These men could be started down, and they would be the very men for the work. A great many of them are rough carpenters in their way, and could do all that would be required. You could erect a steam-mill in the forest and bring down any amount of timber by rail, and I am certain that the expense of the sleepers will be less than we pay for those we get from England, and the
money would be spent in the colony. In a short time you could get something like 100,000 tons of materials for the railways and other purposes.

Mr. Robinson examined.

44. Chairman.] You are the Acting Colonial Engineer and Chief Commissioner of Roads? – I am.

45. Are there any works now being carried on in the neighbourhood of Cape Town, or within a reasonable distance upon which railway labourers seeking employment could be employed if necessity should arise? – I know of none; we are only repairing roads, upon which we have the men usually employed. I do not think there is any opening for the description of labour; if there is, it can only be in a very limited form.

46. There are no quarries to be opened, for materials? – No. All expenditure is at present drawn into the narrowest limit.

47. It has been suggested that Sir Lowry’s Pass and the Houwhoek Pass should be widened? – I do not think Houwhoek requires widening. Sir Lowry’s Pass is narrow in one part; it has been widened in the course of the last three years. It would require but a very small number of men but there is no money on the estimates for it.

48. But if it became necessary to find employment these men, and the Government provided the funds in excess of estimates, what employment could you find for them. There is a very small amount of work in Sir Lowry’s Pass it is quarrying work, or blasting work.

49. Not removable by picking and wedging? – No is heavy, hard sandstone, which would require skill in blasting.

50. Mr. Franklin.] Are there any works in the Easter Province on which these men might be employed? – I not know of any. At the Katberg, of course, they have convict labour. On the Fish River Rand there might be an opening for fifty men, but that would be done by people in the country, who are usually employed on those works; and is too long a distance to send these people down, as it will be finished in a short time.

51. If the Van Staden’s River heights were commenced, would there be an opening then? – The Van Staden’s River / heights is estimated at £4,700, and we have only £1,000 on the estimates for improving that piece of work.

52. Is it a work suitable for this class of men? – Clearly; and it is a work which could be done by piece-work.

53. Chairman.] You have heard the objection Mr. Andrews stated with regard to the employment of men on piecework? – No.

54. He stated that the nature of the soil varied so much that it was difficult to fix the rate of piece-work, so as to pay equally? – That difficulty frequently arises; but by a careful attention, and only giving it out in small quantities, it can be satisfactorily regulated. It is a very important road to open, and a work that
must be done. If I might make a suggestion with reference to the employment of these men, I hardly think a more beneficial employment than making reservoirs along the main roads could be found. I particularly noticed the necessity for these works in my annual report to the Government; it is the greatest difficulty the country labours under. It would be a very great assistance, not only to travellers but also to the carriers and stock, who have now to go miles before they can water their oxen. It is just the work for these men to do, and precisely the work they are accustomed to. Unless you have travelled over the country and know the roads well, you cannot realize the fearful difficulty and distress the want of water occasions.

55. Mr. Harries.] In the event of there being a party told off for the work at the Van Staden's River, has the line been laid out, or is there any person there to do it? – Mr. Pilkington is in the neighbourhood, and he would lay it out certainly in three months. He would lay out sufficient work for fifty men to begin in a month, as soon as they got there.

56. Chairman] With reference to your last observation, in what localities do you consider these dams most wanted? – I think they are especially required on the Port Elizabeth and Graaff-Reinet line of road, – the new line comparatively recently formed. I travelled that road with horses, and though there was sufficient grass, I had to ride ten or twelve hours before I came to water.

57. Is there the same want between Graham's Town and Port Elizabeth? – Yes; you want one reservoir at least in the lower country, about thirty-five miles from Port Elizabeth, when you get into the Zandveldt.

58. What would be the cost of dams of such a nature? – I cannot give any positive opinion upon it; it would depend upon the soil and a variety of circumstances; but I should think from £1,000 to £1,200 each.

59. Mr. Franklin.] Would any of the material have to be brought to it? – Nothing but the timber.

60. Mr. Harries.] Would you contemplate making dam at the Coega? – Yes; but the Coega is at no very great distance from Port Elizabeth; it is about fourteen miles distant.

61. That is a good distance for ox wagons? – Yes; and water is now scarce for twenty-four miles from Port Elizabeth.

63. How many men would you put upon one of those dams? – Not more than twelve or fifteen.

64. Could the officer in charge of the Van Staden's River work superintend at the same time the construction of the dam between Van Staden's River and Port Elizabeth – Certainly.
65. Have you any suggestion to offer the committee with regard to the employment of railway labourers during the remainder of the present year until railway works are under taken in the colony, supposing they could not find employment? – Nothing further than the matter suggested, – Van Staden’s River height and reservoirs along the main road. I know of no new work where they could be economically employed.

Mr. J. A. Ross examined.

66. Chairman. ] You are the secretary to the Municipal of Cape Town? – I am.

67. The Government has been in correspondence with you upon the subject of the employment of certain railway labourers who have been thrown out of their recent employment on the railway, and who have not been able to obtain employment elsewhere. What have you been able to do in that respect? – About a month ago, I received a letter from the Governor, stating that a number of men were out of employ, – not only railway labourers, but others as well. The Governor asked the Municipality whether they could find work for these men. The letter was referred to a committee / and they recommended that a number of these men, about fifty, should be taken on at a reduced rate of wages, in order to see whether they really wanted work. It was proposed to give them 2s. 6d. a day; this was agreed to by the commissioners. The next day, I particularly noticed the kind of men that came for work, and to my surprise I found that out of the fifty there were only two navvies; all the others were sailors discharged from vessels, discharged soldiers, and tradesmen, and very respectable men indeed there were among them; there were also one or two engineers, blacksmiths, carpenters, all out of employ. One stated that he had been an engineer on board of some steamer. Shortly after these men were taken on I sent a note to Mr. Rivers, communicating what had been done, and gave him the result of my inquiry. Subsequently to this, Mr. Rivers sent me a note, stating that a number of navvies were up at Government House asking for work, and inquiring whether we could not make arrangements to take them on. The Governor stated that, if we would take them on at 2s. 6d. a day, there was a person who would find them in board and lodging for 17s. 6d. a week, and that whatever was short he would make good at the end of the week. Eleven men came to us, and they were certainly men that I should be sorry to see leaving the colony at any time, for they were very fine and useful men. These men worked very well, and gave great satisfaction; but it seems the rate of wages was too small, for they gradually disappeared, and we have not a single one of them left. Out of the fifty first taken on we have only forty-four left now.

68. How are they employed? – Quarrying stone, repairing streets, loading carts, and so forth.
69. Mr. Solomon.] What do you think has become of these eleven men you speak of? – I believe they have gone to look for work elsewhere.

70. But are you sure they have not got employment elsewhere? – I am not sure; but one of the men I saw in the street talking to another, and evidently not in work, so that I am under the impression that it is the same with the others; perhaps they are going about looking for work.

71. Chairman.] Do you employ them by the day or by piece-work? – By the day; it was a mere labour test – suggested by the Governor and the Rev. Mr. Lightfood, because a number of men went to the Dean and applied for assistance / pleading that they could not find any work. It was done to ascertain whether they really wanted work or whether it was mere pretence.

72. Mr. Solomon.] Are you aware whether any number of coloured labourers are out of employ? – I think not many.

73. Chairman.] Would you be able now to find employment for any considerable number of men? – If our engineer had been in the colony we could have found employment for about sixty or seventy men by piece-work, because we are contemplating the erection of a large reservoir at the Platte Klip, and these navvies are just the men for it.

74. Could you not make arrangements for commencing the excavation of the work in the absence of Mr. Penketh – I do not think it would be advisable in the absence of the engineer, who has drawn up the plan and prepared the estimate, to commence such an important work.

75. When do you expect him back? – In about four months. But we have just given out a large work in building drains in Darling-street, and the contractors might require navvies to assist them. They will have to excavate a trench across the Parade about ten feet square, at which these men could be very well employed. I am not aware whether the contractors have already engaged men or not.

76. Who are the contractors? – Messrs Levi, Holmes, and Sons. That work will be commenced immediately.

77. What is the amount of the contract? – £3,000 masonry work included.

78. What proportion of that is excavation? – The tender for the excavation was £750.

79. Mr. Harries.] If your engineer were in the colony you would be prepared to pay full wages to the men required to make this reservoir? – Yes; we would employ them on their own terms. We would pay so much for so many cubic yards; if a man worked hard he would earn more, and vice versa.

80. Mr. Solomon.] You have the means for carrying out that work? – Yes, we have borrowed the money; it was intended to commence it long ago.

81. Do you think that the municipal commissioners would be prepared to undertake any works at once, upon condition that a portion of the expense of
the work was paid out of the public revenue: would it be worth their while? – I think so. It strikes me they might be profitably employed in the preparation of macadam until the reservoir was commenced. /

82. Would you purchase macadam from Government in any quantity, supposing Government were to employ these people, and lay it by in store? – Yes, we could purchase a great quantity, at a fair price; but we could not agree to take it at once, there being a contract for it for the present year. If the Government decided to employ these men, I think the Municipality would pledge itself to buy the macadam, and pay for it in the course of next year.

83. Chairman.] Is there any convenient locality in which the Government could employ these men for breaking stone, and where we could keep the stone in any quantity until you wanted it? – Yes; just above Martin's Church. The present contractor brings the stone there, and makes it up into square heaps; it is then measured, and left there until wanted. I may mention that the first day these fifty men I have referred to came to us for work, they were furnished with a new pick and spade each, of the value of about six shillings. Two of the men who went with the others to the quarry never reached it, and we never saw them or the tools again. It was reported that these men were navies, but that was a mistake; one of them was a sailor, and I forget what the other was.

84. Mr. Harries.] Have you any fixed rate for this material? – We pay 4s. a cubic yard; that is, for hard stone. There is another kind of stone – flint-stone, which only costs us 3s. 6d., because it is more easily broken.

85. Chairman.] Have you any further suggestion to offer the committee with regard to the employment of these men by the Municipality, the Government providing a larger or smaller proportion of the funds? – The question is, what number of these men are likely to be out of employ shortly. I have not seen many of them about, with the exception of the few I mentioned, who, as I said before, would not come at the price offered them.

86. I think there are seventeen men now employed in the Botanic Garden: when their labour is completed there, what employment could you find them? – They could be advantageously employed in supplying macadam.

87. Do you think it would be impracticable to commence the reservoir? – The commissioners have decided not to commence it until Mr. Penketh returns.

88. Mr. Solomon.] If certain advantages were offered them to induce them to commence it; supposing the Government were to say that for the present it would, to a certain / extent, give a proportion of the wages, would not that induce them to make some progress with the work? – It might induce them, but I do not think it likely.

89. Mr. Franklin.] When did you take on the fifty men you spoke of? – About a month ago.

Mr. J. A. Roos,
10th July 1863.

Mr. J. A. Roos.
10th July 1863.
90. Since that day you have not heard of many men being out of employ-
ment? – No; excepting a few whom we could not take on because they were
 unfit for work.
91. They were not navvies? – No; all the navvies the same we took on.
92. Chairman.] How many men of that class do you not employ? – Not one.
93. Mr. Solomon.] The commissioners have borrow money for certain pub-
lic works; what work is it borrowed for? – For drainage, the reservoir, and a new
market. The drainage is to be done in several places. The Darling-street drain has
to be covered over, and one in New-street; a drain is to be made in Shortmarket-
street, and there is also one now constructing in Buitengracht.
94. Do you contemplate commencing any of these immediately? – The
New-street and Buitengracht drains have already been commenced, and the
Darling-street drain will be commenced in a few days.
95. Will that give employment to some of these men? – Yes; principally the
Darling-street canal will give a great deal of work.
96. Have you any further suggestions to make to the committee? – No.
97. Mr. Bourne examined.
98. Mr. Bourne.] You are the Colonial Railway Engineer – I am.
99. You heard the opinion expressed by Mr. Andrews with regard to the
employment of railway labourers. Do you consider that it would be desirable for
the Government to enter upon any works such as that proposed? – It would, no
doubt, be a great advantage eventually to be able to bring timber and sleepers at
a cheaper rate from the Knysna forest and the plan suggested by Mr. Andrews
would have the effect; but I doubt whether it will answer the purpose of giving
employment to these people immediately. In the first place, you would have to
make surveys of the country in order to take the line to the best timber dis-
tricts, and, as much as possible, over Crown lands, and this, of course, will take
time; and you would have to expend a considerable sum of money. Supposing
it only costs from £2,000 to £3,000 a mile, then the railway would cost about
£30,000, according to Mr. Robinson's estimate of the distance – ten miles. The
importance of it will depend, also, entirely upon the proposed railways being car-
ried out and constructed, which will not be decided upon until the next session
of Parliament.
100. You have heard the evidence that has been given today. What has pre-
sented itself to your mind as the best mode of employing these labourers? – I
think the first thing to be done is to endeavour to make arrangements with the
Municipality. The reservoir seems to be the most important work; they have the
money for it, and would probably be induced to commence it at once if they had
assistance from Government. I think I understood the secretary of the Munici-
pality to say that the plans and specifications are all ready, but that they object to
commence the work until the return of their engineer. If a sufficient inducement
were held out they might begin at once, and give employment to these people immediately. Some of the men might find employment under the contractor for the drains. I have no doubt that fifty men, or more, might find employment in the Eastern Province, – if not on the Port Elizabeth breakwater, at all events on the Van Staden's River height, or the reservoirs that Mr. Robinson suggested. Of course, these are works that would not give any return. I think that a reservoir might advantageously be made between Mossel Bay and Riversdale, in one of the tributary kloofs of the Gouritz River.
It took several long strides before I reached Nigeria. Had it not been for my bosom pal Charlie I suppose I never would have set foot there. Charlie was forever romancing about foreign parts and of how fortunes could be made in any other country but the one of our birth. The field of Art looked uninspiring, so that when volunteers were called for [to deal with] a war in South Africa I could not resist the arguments and urgings of my friend to break away from the rut that, seemingly, was leading me nowhere. Five shillings a day for twelve months, passage paid to South Africa, fed and clothed for that period, at the end of which I could stay in that delightful country and start on the process of acquiring a fortune. Charlie would of course accompany me.

To a youth of nineteen the prospect was singularly thrilling and alluring. Without much ado Charlie and I presented ourselves to the recruiting sergeant, whom we rewarded with a silver crown on his assurance that we would be among the fifty men selected out of the five hundred that had volunteered. But [as] Charlie, the prime incitér to foreign adventure, changed his mind, without his
company [I sailed] into the blue to find myself ultimately in the Orange Free State just before the war ended.

My discharge came in April 1903, bringing with it a medal with three clasps, and a gratuity of five pounds, which /

This is a record of how a West African railway came into being. It tells of the construction in Northern Nigeria of the Baro-Kano railway. First of all it may be of interest to narrate the events that led up to its inception and construction.

Before the year 1900 the territories which ultimately became designated as Northern Nigeria were administered under Royal Charter by the Royal Niger Company. It was a vast land of some 275,000 square miles with a population estimated to number nine millions souls, composed of Hausa, Filani, and Nupe races and numerous pagan tribes. The country was divided into twelve Emirates or States, each ruled by an Emir. From a fairly high degree of civilisation extending back some centuries they had lapsed into an era of barbarism and constantly made war, one with another. Lnds were overrun, devastated and desolated. Rape and ruin were the order of the day. Captives were forced to slavery, human sacrifices and other horrors prevailed. It was no fit place for any peace-loving to be found wandering in, with the exception, perhaps, of a few areas contiguous to the Niger river, where Europeans could conduct trade in comparative safety. The Niger Company, under the aegis of the British Government, controlled and employed a constabulary under Colonel (afterwards Lord) Lugard for the development and protection of its interests in the hinterland. /

It was sometimes about 1897 that certain European Powers in Africa were casting envious eyes on native countries that remained free from foreign domination. The northern territories of Nigeria seemed a good marks. Already the French from the north and west nosing about the country, as were, also, the Germans from the east. There loomed the possibility of spheres of influence being established, to be followed, as a natural sequence, by complete annexation. A clash with the French at one time seemed imminent, but, fortunately, was averted.

The British Government realising that the power and authority of the Niger Company are inadequate, and spurred to action by the far-seeing and visionary Lugard in a situation complex and dangerous, abrogated the Charter. It was enabled, thereby, by diplomacy, to settle all contentious problems with its two neighbouring Powers.

The military occupation of the country – new the Protectorate of Northern Nigeria – followed and by 1905 the newly acquired territory effectively settled down to the peaceful pursuits of trade and industry. To consolidate this vast acquisition and to promote its economic development became and urgent and pressing problem, for no roads existed and transport of commodities was only possible by head-load along native bush
paths, except in the far north where animals could live and be used as beasts of burden. French policy, now that its power had been denied from the Protectorate, sought to attract the trade of the western provinces by planning a railway in the neighbouring country of Dahomey from the Coast to run close to the Nigerian boundary, while in the north caravans of hides, skins, and other kinds of merchandise crossed into the French Soudan to wend their way to Morocco, returning with the wares and produce of other countries.

Lugard, who had been appointed High Commissioner of the Protectorate, alive to what might prove a dangerous strategical situation urged the immediate construction of a light railway of 2 feet 6 inches gauge, built on pioneer lines, not alone on the grounds of military expediency but, as well, for the effective political administration and development of the country’s potential trade resources. The Southern Nigeria Government then became interested, for it looked forward to an amalgamation of the two territories in the no distant future. It strenuously opposed a narrow gauge railway as it had itself constructed and was extending a line of the wider 3 feet 6 inches gauge to connect with a future northern system.

After protracted discussions the matter resolved itself when in 1907 Sir Percy Girouard succeeded Lugard. Favouring the 3 feet 6 inches gauge he obtained the sanction of the Imperial Government for the construction of a great central railway. Girouard was a soldier of the Royal Engineers who had achieved considerable distinction in India, Egypt and South Africa in railway work, perhaps the most notable being the rapid construction of the line in the Dongola expedition under Kitchener during the advance on Khartoum.

The railway would have its terminus at Kano, which was, by far, the most important and most populated trade centre in the Protectorate. But to get to Kano a suitable starting point had to be found on the River Niger. The necessary material for construction would have to be transported from England to the coast port of Forcados, and then transshipped to shallow-draught river steamers. On the bend of the great river stood the little village of Baro, some 407 miles from Forcados, a place hitherto of little importance, except as a ferry crossing for caravans from the north to Lokoja and other southern towns. At this point the river stretched fully one mile across. Here were found all the conditions adaptable to the enterprise: ground spacious enough for a big railway depot and a depth of water between the months of July and September which would enable steamers of 6 to 12-feet draught to bring material from Forcados. Thus, railway and river would provide the main outlet artery for northern traffic until such time as a junction with the southern line from Lagos could be effected.

Girouard intended to construct the line according to his own method and ideas. The track would be of the pioneer type, pure and simple, to be built quickly and cheaply without any fancy trimmings or expensive buildings or other works, and to be of sufficient use to meet the needs of the moment and the immediate
future. Posteroty could strengthen the whole structure if and when conditions required it. Three years was the time limit set for reaching Kano, some 360 miles from the starting point Baro. One and a quarter million pounds had been sanctioned for the work. / 

Girouard wasted no time. Surveyors were soon in the field plotting the route to be taken. The various Government departments were scoured for men who could turn their hands to engineering work and the supervision of construction gangs. Men, who could be spared, rolled in from the ranks of the military, the Public Works, the Political, and other department all keen to participate in this important undertaking. Although it was in its general make up a scratch team it got things going until the more highly skilled and technical railway personnel arrived. Being a Royal Engineer officer Girouard prevailed upon the War Office to allow a contingent of Sappers to come out for laying the track, an innovation in Colonial railway building and commendable for the opportunity it provided the Sappers for gaining practical experience.

It may be said that the Baro-Kano railway construction formally started on the seventh of January 1908 with the cutting of the first sod by the Emir of Bida at an inaugural ceremony. Political officers organised the recruitment of labour and exercised control in the native interest through village chiefs. For the most part the native worker was raw and unskilled. In supreme control of all the works Girouard had appointed an experienced engineer-administrator, the late Sir John Eaglesome.

Baro, now grown to a goodly-sized railway camp, bustled into activity – a race against time – preparing for the reception of material coming out from England. Stacking ground had to be prepared, sidings laid, jetties constructed, engine sheds, stores and quarters erected. Only three months (July to September) when the river was high, would be available for discharging the / boats – those of up to 1000 tons – coming from Foroados. After that, up to January, only very light craft could be navigated.

In July the boats began to arrive, but one suffered a disaster when it struck a rock below Lokoja and much of the sorely needed tools, rails and sleepers were lost. Discharging at Baro continued feverishly day and night. Each boat when emptied hastened back the 400 odd miles to Forcados for more cargo and was back again in an average of seventeen days.

It was a triumph of organisation. Thirty thousand tons of material were landed in Baro by the end of November, double the quantity it was estimated could be transported in the time.

Tow years continuous hard-driving in, at times, sweltering heat and torrential downpour brought railhead to the banks of the Kaduna, river, 215 miles from the base, Baro.
Tracklaying did not wait on the completion of bridges. If the bridge, or culvert, was not ready to take the material train a temporary expedient was resorted to: the line of rails would be diverted to run on a light formation and stiff gradient across an earth embankment through which galvanised pipes had been laid, for in the dry season most of the stream and river beds carried little, if any, water. But when the floodgates of heaven opened it became a continual struggle to keep these deviations intact. The water steadily rising would finally overtop the embankment and carry away the whole earthen structure, leaving only the rails suspended in mid-air.

By supreme exertion and constant vigilance the trains got through to Kaduna, which was now the receiving depot for all the material required. Kaduna, then a wilderness of bush, was ultimately to become established as the administrative centre and capital of the north.

So far the platelaying programme had kept fairly well to the set timetable. It was now the closing weeks of 1910 and there were still 138 miles of track to lay, and if the objective Kano was to be reached early in 1911 the operation would have to be hard and sustained. Thousands of native workmen were well ahead building up the formation for the track. Could the operation be accomplished in the time? There was no mistaking the air of confidence that prevailed in the camp at Kaduna that it would.

Everyone was keyed up and eager to get going on this last lap and to complete the work before the coming of the rains. Prominent in this enthusiastic, and now highly trained, contingent of platelayers was a body of Sappers fresh from leave in England under the direction of Captains Mance and Hammond.

At last the bridge over the Kaduna river was finished to allow tracklaying to begin. It shot rapidly ahead and, laying over one mile a day, the rails were at the important town of Zaria on the 24th January 1911. Fifty miles of track had been laid. Pushing forward with undiminished vigour the great task became accomplished when early in March the objective Kano was reached.

It was a noteworthy performance and notable for the fact that in this last phase world's record had been set up by the laying of six and one-third miles of continuous track without the aid of special track-laying machinery in a single day. / 

As so, in a little over three years from the cutting of the first sod a railway of 353 miles had been built in the heart of Northern Nigeria, over 400 miles away from the Coast. The Baro-Kano railway had by its achievement fully justified its adoption of unorthodox methods in West African railway construction. /
INTRODUCTION.

All those diaries recording my comings and goings over a quarter century of my lifetime, all those accumulations of letters, newspaper cuttings, reports, statistics and notes, must join them, to be converted into pulp by the ravenous waste paper merchant. I have finished with them; they are so much junk, and as such, deserve the fate in store for them. Out of the miscellanea has emerged a chronicle of events which sheds a light on the work of the railway engineer in West Africa, and shows how a tropical railway came into being.

Much has been written about Nigeria. Its bibliography steadily grows. But its railway has received scant notice. That a railway can have a story or history would seem ludicrous to many people, for the popular conception about any railway is that, like Topsy, it has simply 'grewed', and that is all there is to it – no glamour, glory, or romance. Yet that great steel highway, with the offshoots, has been a vitalising force in the development of Nigeria. It stands to-day a worthy and lasting memorial to those far-seeing Empire statesmen, and Colonial Administrators like Sir William MacGregor, Sir Walter Egerton and Lord Lugard, who planned its foundations.

If I have succeeded through the irrelevancy of a background of personal, and, perhaps, trivial, matter in throwing into the limelight of documentary record a picture of the railwayman's share in the process of building up a great and interesting tropical dependency I shall then be happy to think that the task I have essayed has not been without reward.

STEPPING STONES

It took me a long time to reach Nigeria. Had it not been for George I suppose I never would have got there. George was for ever romancing about foreign parts and of how fortunes could be made in any other country but the one of our birth. The field of Art looked uninspiring, so that when volunteers were worked for a war in South Africa I could not resist the arguments and urgings of my friend to break away from the rut that, seemingly, was leading me nowhere. Five shillings a day for twelve months, passage paid to South Africa, fed and clothed for that period, at the end of which I could stay in that delightful country and start on the process of making a fortune.

To a youth of nineteen the prospect was singularly thrilling and alluring, without much ado George and I presented ourselves to the recruiting sergeant, whom we rewarded with a silver crown on his assurance that we would be among the fifty selected men out of the five hundred that had volunteered. But the prime inciter to foreign adventure, changed his mind, without his company I sailed into the blue to find myself ultimately in the Orange Free State just before the war ended.
My discharge came in April 1903, bringing with it a medal with three clasps, and a gratuity of five pounds, which I thought a very generous recognition of my war service. The five shillings I received in lieu of a suit of civilian clothes was not so generous; I could never understand by what process of reasoning or method of calculation a set-up of civilian attire had been so valued, unless it was intended I should clothe myself native fashion.

I had by now become disillusioned about fortune making; all I wanted was suitable employment, which was hard enough to secure. Therefore, when the Cape Government Railway, instead of offering me an appointment, agreed to give me a trial in the clerical branch of its engineering department, I accepted, and was content for the time being. But having been duly installed in office I found my fingers always itching to give expression to the artistic proclivities that filled my soul. I could not resist the temptation to caricature my fellow workers, from the head down to the office boy. The drawings, displayed around the walls of my office, having caught the eye of the head, instead of incurring his displeasure had the opposite effect. I was ordered to apply art with pen and pencil in another direction. To an understaffed drawing office I was transferred, there to become immersed in plans and sections, and all the works and schemes usually associated with the railway engineer. Like the duck that takes to water I at once took to draughtsmanship, and thenceforward set myself to acquiring as much knowledge as possible of everything pertaining to the practice of railway engineering.

But the post-war boom failed to hold, and the inevitable slump descended upon the country with considerable force. Fortunes were lost instead of won. Retrenchment became the order of the day, and when my colleague Symons received his congé I felt regret, for I would miss his company, when with pencil and paint we would roam the picturesque countryside endeavouring to portray its beauty.

However, Symons was not to remain long out of the picture. From Lobito Bay in Angola (Portuguese South-West Africa) came a telegram saying a job was waiting for me there if I cared to accept it. The urge within me to gain greater experience was strong. After four years with the Cape Government Railway I came to my third stepping stone.

On March 23, 1907 the sun-baked coast of Angola hove in view after 1,600 miles of ocean travel. The Primitive little timber wharf in Lobito Bay shuddered as the ‘Gaika’ bumphet, built upon a finger of land that had been nothing but sandy waste some eighteen months previously. It was littered with the paraphernalia of the kind of railway construction material that ultimately resolves itself into an organized railway system. And here and there through it all darted tiny engines, puffing and shrieking, as though they were the most important elements that made up the general scheme of things.
I was now a human cog in the machinery of a grandiose railway project having for its objective the tapping of Central Africa, where lay immense fields of copper deposits in the Katanga province of the Belgian Congo. But engineers were in insufficient numbers for the huge task in hand. Although nominally a draughtsman I became an engineer in embryo for I had drifted into the use of the engineer’s level and theodolite and was setting out works, completing plans and preparing estimates. I advanced to such a degree as to become fairly knowledgeable in the theoretical and practical field of railway construction.

It so happened that the termination of my twelve-month agreement with the contracting company coincided with a cessation of its activities in Angola. Funds for the further construction of the line had come to the point of exhaustion. But the Benguella Railway company, which had its office in London, had enough money left to extend the railway survey farther into the interior. I learnt that after I had spent a few months at home. I was invited to join a survey party being formed, and as the inducements were attractive, I accepted. And thus my fourth stepping stone had been reached.

My return of Lobito Bay found the place looking woebegone, and almost deserted. The fussy little shunting engines were nowhere to be seen, but the railway functioned with one-train-a-day service. I pushed up 128 miles of its length to railhead, and there, instead of surveying, I assisted in the completion of a bridge, culverting and the ballasting of track whilst waiting for the members of the survey party to materialise. At the end of six weeks I was working with them over rolling country of forest and bush, through fierce thunderstorms and torrential downpours, and in broiling heat. It was a grueling training ground for acquiring practical knowledge of railway location survey, livened in spare moments by game hunting, in which the bush abounded. Although my status was that of a draughtsman I was not satisfied until I had been allowed to work in the field with the party. My assistance was welcomed for it helped to speed up our daily progress.

Then after some months misfortune overtook me. The mosquitoes laid me low with a raging attack of malarial fever. I had become delirious and my condition so serious that a hammock had to be improvised to carry me to railhead, where a train was waiting to convey me to Lobito. I lay in the hospital there shrunken to nothing but skin and bone. The it was discovered I had one disease on top of another for enteric was diagnosed, but with appropriate treatment I was placed on the road to recovery and was able to rejoin my colleagues of the survey.

Soaking rain or blazing sun we plodded on grimly day by day mapping out the course in the direction of Bihe. And through it all intermittent doses of malaria occurred, weakening and impairing my energies, until, at length, I was obliged to relinquish my post and sail for home. The work, however, was nearing its end,
for funds to extend the location were becoming exhausted. Apparently the great undertaking could progress only in fits and starts. It seemed to me at the time destined to be a white elephant and likely to end up in a line of rusted metal somewhere in a wilderness of bush. But it did reach its objective, Elizabethville, 1,300 miles from the coast, in 1828. A traveler in 1933 had this to say about it:

To travel into Africa by the Benguella railway is to wonder at the work of the pioneers. Every sleeper of it cost a life, they said, for the fever was so bad. Perhaps, a highly colourful way of saying that it wasn’t all beer and skittles for the pioneers.

It was in the latter stages of my sojourn in the Angolan bush that I became aware of Nigeria, when an offer of employment as assistant engineer on the Lagos Railway reached me, but now at home and restored in health after shaking off more malarial attacks, I was to be informed by the Crown Agents for the Colonies that the Lagos Railway had now no use for my services. I had wondered how they knew of my existence, but it transpired later that it was through John Norten Griffiths, who had not forgotten his disbanded Lobito Bay staff.

I looked to the world where other railways were being, or likely to be, built. I sounded consulting engineers and contracting firms. I wrote to one John Eaglesome, the big noise of a railway which had recently been started with the object of opening up the vast territory of Northern Nigeria, a region which my map showed me to be about as barren as the Sahara desert, and of which it seemed to be a part. But except for acknowledgments and forms to be filled in no one was eager to accept my services.

Impatient and restless, my exchequer – like the Benguella’ Railway’s – running dry, I turned my thoughts to emigration. The Canadian Office, with its windows decked out with brightly coloured posters depicting immense rich wheat lands, and with displays of the wonderful products of that country, attracted me. I had friends in Canada and to that seemingly happy and prosperous land I decided to go. It was to be my fifth stepping stone.

Without delay I booked a passage and crossed the Atlantic to St. Johns, a voyage that took thirteen days instead of eight owing to a terrific storm, and fog.

It was good to hear the jerky, jovial laugh of my friend Teddy when I stepped out of the train at Montreal. We had much to exchange in the way of experiences over the years which had passed since we parted at Cape Town. But, it was disappointing to learn that the prospects of employment were poor. It was the wrong time of the year for most things particularly railways, which close down all construction when the country became snow-bound, as it now was. Job-hunting became / my daily occupation, but I filled in many hours sketching, for I had never allowed my taste for the art to decline. I remember taking a pen-and-ink cartoon to a newspaper editor. It depicted death and famine stalking the land, and had something to do with the city’s devastating typhoid epidemic. I was
invited to submit sketches on any other subject. From Winnipeg came a letter which raised my hopes of immediate employment there.

Then occurred one of those things which shapes one’s destiny – ‘a tide in the affairs of man’ as the Bard has it. A cable from home had found its way to me. The Crown Agents wanted me for the Nigerian Railway, and it would pay me £100 a year more than had been offered the previous year when I was in Angola. Clearly my stock had gone up, and Africa was determined to lure me back. My heart thumped with excitement.

‘There you are, Teddie’ I said to my friend, handing him the cablegram ‘that settles it – Africa wants me – Canada declines to recognize the budding engineer. This is the second time Nigeria has called me.’

‘My dear Screamer’ he always called me that ‘it sounds swell, but West Africa, – gee! – isn’t that the White Man’s grave, and didn’t you almost peg out in Angola!’

‘True, pard’ I responded ‘but what has this benighted country to offer? Look at the ghastly tragedies of the snow reported in your newsrags; look at your own darned city / here, reeking with typhoid on account of your filthy water – hospitals overcrowded, maladministration, bribery and corruption. No! to be with the devil I know I’m off, if they’ll hold the job, and I’ll cable right now.’

No sooner said than done. I informed the Crown Agents I could be in London on a certain date, and in two days time confirmation of the appointment was in my hands. But being in Canada I was filled with an irrepressible desire to see more of the country. I set out west by train to Winnipeg, there to renew acquaintance with friends I had not seen for eight yours. They had a job of some sort waiting for me-I forget what it was – but when I informed them I was now en route for West Africa and that this was but a brief visit to say ‘how d’ye do’, and to spin a few yarns about old times, they thought I was crazy.

On New Year’s day 1910 I was skating on the ice-bound Assiniboinie river in a temperature 40 degrees below zero. As though I were not already far enough West I traveled 150 miles to Minnedosa to stay with some friends on a farm. My time schedule was now cut to its limit. I hastened back to catch the ‘Adriatic’ sailing from New York hoping to fetch up in London seven days later. It allowed me three days to spend exploring the great city of sky-scrapers, and an opportunity of seeing Enrico Caruso perform in ‘La Boheme’ at the Manhattan Opera House. /

The ‘Adriatic’ failed to make the necessary pace. I was much overdue when I showed up at the Crown Agents, who informed me they were about to make other arrangements as they had given up all hope of seeing me. A boat was leaving Liverpool for West Africa in four days time. They demurred when I suggested that the time was somewhat short – with a Saturday and Sunday intervening – to allow me to procure stores and suitable tropical equipment. But the mat-
ter having been represented as one of extreme urgency I waived my plea for an extension of time, signed a document which showed that I agreed to serve as assistant engineer in Northern Nigeria on the Baro-Kano railway construction, for a period of twelve months. These periods, I was to learn, were called 'tours'. Then I passed a medical test, after which I set about trying to collect a tropical outfit. I had a day and a half to do it in.

I had had a hectic round of travelling on land and water for eight weeks, and had covered something like 10,000 miles in that time – a hustle, which, I thought, many an ubiquitous Yankee globe-trotter might have been proud of. It was an experience full of incident, and one which I had thoroughly enjoyed. It proved to be my sixth and final step to what was destined to be the country of my labours for almost nineteen years.

TO NIGERIA

The 'Landana', Elder Dempster's boat, which I found waiting for its human cargo of west African Coasters at the O Prince's Landing Stage, Liverpool, was a vessel of about 4,000 tons, a drab and dreamy-looking thing compared with some of the craft I had travelled on. It steamed off in frosty weather, the decks slippery with ice. My fellow-passengers, numbering about 80, were all men, for the West Coast at this time was a place where few white women cared to venture. We passed the gigantic 'Lusitania' riding the waves in glorious splendour, a ship destined to meet a tragic ending some years later. Heavy seas tossed and battered us the whole way to Las Palmas it was a relief to land and stretch our legs at this sunny spot, and to do a round of the sights – my second visit.

About half the passengers were Government officials, the other half being composed, for the most part, of the trading element, the whole a fairly tough lot. There were some gay and restless sparks who could never be happy unless devising and carrying out pranks of one kind or another. A Frenchman was the victim of one of these. He was middle-aged, pompous, and self-assertive, was a much travelled man of commerce who talked pretty big about his travels. He possessed an enormous trunk, which being too large to fit in his cabin had found a prominent resting place in the alley serving the sleeping cabins. Almost every inch of it was plastered with / Labels from every quarter of the globe. They were neatly arranged, no one label overlapping the other, and the resulting pattern with its varied colour producing an effect impressive though somewhat bizarre. Monsieur could be seen at betimes proudly expatiating upon the history attached to each label to anyone he could waylay, in something of the manner in which an ardent philatelist would lovingly dilate upon a set of rare stamp specimens. This was too much for two my two cabin mates who succeeded in drawing me in as an accomplice in what was to follow. From illustrated periodicals and magazines we
cut out many weird and grotesque advertisements upon which we smeared paste. Then by stealthy manoeuvering – two of us keeping ‘nix’ as school boys do – we made that trunk glory in nothing in nothing but the wares and manufactures of the day. Frencie stormed when he discovered what had happened, called the Captain and held him to account for the ‘outrage’. But inquiries failed to bring to book the culprits, so well and skilfully had the operation been carried out. The trunk was removed to a safer place where its irate owner, we heard, spent many weary hours in trying to restore it to its former glory.

The ‘Kandana’ duly arrived off Lagos and stood there the whole day in muggy heat. It could not enter the harbour owing to the shallowness at the entrance, the draught limit being only 13 feet, our ship drawing about 19 feet. In consequence Lagos passengers and light cargo had to be transferred to small shallow-draught steamers in the open roadstead. All heavy / cargo from ocean – going ships had at this time to be taken to Forcados – some 150 miles to the east – and there transhipped into branch boats for return to Lagos. The limitations of the Lagos Bar imposed a severe handicap upon the great scheme of development for making Lagos a harbour capable of accommodating large ships, and for opening up the hinterland. Two long parallel mole’s were now being constructed at the harbour entrance to from a navigable channel in which dredgers could work to increase the depth of water. This work was dependent upon the railway being able to deliver stone, which could not be obtained at any point nearer than 60 miles on the railway from Lagos.

A brief reference to the history of the Lagos Railway may now be made. The idea of projecting a railway into the interior emanated, from private interests when, between 1879 and 1891 concessions were sought from the Colonial Office. The essential features of all schemes for railway building, however, was a guarantee of interest by the Government on the construction cost. Lagos Colony, not feeling justified in guaranteeing interest on the exhorbitant sums involved, rejected such schemes, and finally, itself, decided to undertake the development of the hinterland by means of a railway. Construction began in March 1896, concurrently with the commencement of the Sierra Leone railway, these being the first railways laid in the British Colonies on the West Coast of Africa. The rate of progress was slow owing to the numerous difficulties encountered, and construction was interrupted in 1897 and 1898 by native disturbances in the interior. The lethal nature of / the country militated against any rapid advancement. It is recorded that between November 1895 and February 1900 of seven officers holding the position of chief Resident Engineer, three died and two were invalided, while one resigned on account of ill-health. The casualty rate was high, and in consequence the number of Europeans engaged on the work was necessarily large. In 1903 the average number of appointments existing was 57 while the number of persons required to fill these was 219 or an average of 3.84
per appointment. Construction was still in progress and at this stage the line had advanced 272 miles in a northwardly direction towards Jebba on the Niger river.

This digression serves the purpose of connecting up the events that follow, and which lie within the purview of my personal experiences and observations. It enables me to complete a picture of pioneering days on railway construction in Nigeria, and of the growth from birth of two separate organisations which ultimately became welded into one great transport machine – the Nigerian Railway.

Lagos had taken the majority of our passengers, and those now crossing the Bight of Benin were few in number. We were bound for Forcados. This port, on the Forcados river, lay hidden away in the delta of the Niger amongst a labyrinth of creeks and waterways. The land is low-lying and covered thickly with mangrove trees, the evergrowing mangrove that shoots out its tentacles, dropping them to grip and take root in the water bed, which gradually builds up with silt and mud to form new land, and land that is slimy and treacherous. Along the 150 miles stretch of delta coastline are five or six main water channels connecting with the Niger river, but the Forcados entrance was the best and most accessible, and its depth allowed ships of the ‘Landana’ class to negotiate – but, only just – the passage to Forcados. This channel extend some way out to sea and its confines are marked with buoys. Numerous sand bars lie along its course so that steamers have to steer their way slowly and cautiously. Sometimes at low tide steamers get firmly emedded on these bars and have to wait for a rising tide to force themselves off. When we struck two of these sand bars the whole ship shuddered, but it managed to ride clear. These ships, I was told, were specially bottomed to withstand such shocks.

At length we anchored after a voyage that had taken us eighteen days from England. I can well remember the atmospheric conditions of that early morning as we hove off the port, the sweltering, heavy, overpowering heat, and could now understand what Kipling meant when he wrote about the dawn coming up like thunder.

Besides being a trade and Government Marine depot Forcados was then a tranship port, where cargo and passengers were transferred to smaller steamers which connect with important trade centres lying in the deltaic region, such as Warri and Sapele. It is a natural harbour and one of the best landlocked / harbours on the West Coast, covering an area of about four square miles, and providing a minimum depth of thirty feet.

Our baggage was transshipped to a flat-bottomed stern-wheeler, the ‘Empire’, a craft of about 130 feet in length. My destination was Baro, 407 miles up the river, and the headquarters of the railway. Barring accidents or other unforeseen circumstances I expected to get there in eight days.

I found I was inadequately equipped for the journey as the good ship ‘Empire’ did not cater for its passengers, everyone having to fend for himself. One of my
sorely needed half dozen cases was missing. My companions – six Government officials and a German traveler – appeared to be amply provided for such a contingency. Some had brought out with them from England as many as sixty cases of stores and provisions, each weighing fifty to sixty pounds, because, as they informed me, it was difficult to procure supplies up north, especially when living in a bush station. They had mortgaged a few months of their future salaries to them to do this. It was said of the Europeans in Nigeria that they went home all money and no clothes and returned ‘all clothes and no money’. My position at this stage was a very scanty wardrobe and little cash.

I sought out the Niger Company, and having explained my quandary had little trouble in obtaining sufficient cutlery, crockery, and foodstuffs to see me through to Baro. The goods were supplied on ‘tick’, but a Government official, I was to learn, was considered a good mark to sue in the event of trouble over an account, and as the Niger Company had its branches and ramifications all over the country an account could be passed from one branch to another; thus, a defaulter could not easily get away with it.

My next problem lay in finding suitable servants. They were there in abundance – a motley crowd; boys who had been paid off by their masters returning to England, and who had been dumped at Forcados, where they eked out a somewhat precarious existence, living in the hope of employment when the next home mail-boat arrived. I was besieged on all sides, when ‘chits’ testifying to character and ability were thrust into my face. Some of these were anything but flattering, but they were just as eagerly and cheerfully presented. I selected one who alleged to be a cook and who agreed to come with me for twenty-five shillings per month plus two shillings ‘chop’ money. When interrogated as to what he could do in the culinary line he responded that he could cook ‘any dam t’ling’. I then engaged a steward boy who would attend to my other bodily wants for the sum of fifteen shillings per month plus two shillings ‘chop’ money. When interrogated as to what he could do in the culinary line he responded that he could cook ‘any dam t’ling’. I then engaged a steward boy who would attend to my other bodily wants for the sum of fifteen shillings per month plus two shillings ‘chop’ money. When interrogated as to what he could do in the culinary line he responded that he could cook ‘any dam t’ling’.

Forcados had the reputation of being one of the wettest spots on the Coast. I was informed that seldom a day passed without a downpour, that the average annual rainfall was 150 inches, and that as much as 42 inches had been recorded in the month of August. On this Sunday the maximum temperature was 93 degrees and minimum 83 degrees in the shade. I could not help contrasting the damp, sweltering, sticky heat with what I had experienced only a few weeks back, when at Winnipeg I was frostbitten in a forty – degree below zero temperature.

At noon we were ready to go. The boat was loaded to its utmost capacity; and from my position on the upper deck to one that the lower deck stood only a foot or so above the water. This deck contained a heterogeneous rabble of
natives, men, women, and children, with all their their usual accompaniments of travel, but mostly foodstuffs and cooking utensils. On the upper deck we Europeans spread ourselves out with all the equipment required for the journey. In command of the whole outfit was a black skipper. The whole community of Forcados, which consisted of a handful of European traders, a few Government men and hundreds of natives, turned out to witness our departure. As the moorings were cast off the air became filled with a perfect pandemonium of yelling, shouting and excited babbling, but it was all in glee and the utmost merriment. / The upper deck started immediately to sort out its goods and chattels; Masters conferred with their cooks, and steward boys rummaged about the baggage for such indispensable articles as conduced to provide comfort and well-being. Amongst my belongings was a large green Willesden waterproof kit bag, a free issue, with which the Crown Agents had provided me. Everything it contained was designed either to fold or close up – a bed with cork mattress and mosquito net complete, blankets, table, chair, and bath. There was also a box containing a pump filter and an oblong rectangular sort of hurricane lamp, styled a ‘Lord’s lantern’ guaranteed to keep alight against ‘all the winds that blow’. 

Our progress was Leisurely and we covered only 37 miles that day, dropping anchor at sundown off the shore of a tiny village called Frukama. It was not the practice to travel at night owing to the task of getting landed on a sandbank or striking a ‘snag’, which term usually denoted a floating tree. Our meals, to start off with, were of a somewhat scratch character. We issued tins of this and that to our cooks, who took them below and in some extraordinary manner a satisfying three – course dinner was served up. We ‘chopped’ in a kind of community style, and whatever was short in one larder would be supplied from another. In the evenings we lounged in our deck – chairs to indulge in reminiscences. It was, indeed, very interesting to listen to the varied experiences and anecdotes of my fellow – travellers, and to learn something about the great and mysterious country into which I was headed. I, being the only railwayman aboard, was able to throw to the general pool a spotlight of experiences from another angle. Someone produced a gramophone which helped to enliven moments which otherwise might have proved monotonous. I recollect one still, fine night when a particular record was played. We lay out some distance from the river bank opposite a village. The item played was a laughing song in which the singer ended up the refrain in rollicking, hilarious bursts of laughter. It was amusing enough for us, but when the performance was carried over the water through the still night air to the native village it became highly infectious for the inhabitants sent us back yells and roars of hearty laughter in imitation.

We chugged along until we entered the Niger river proper near the village of Asseh, having covered 110 miles. At this point the river is about half a mile in width, and as we progressed it broadened in places where it must have been 11/2
to 2 miles across. I thought of the ‘lordly Niger’ as Longfellow expressed it when about the year 1842 he wrote ‘The Slave’s Dream’. ‘Till he saw the roofs of Caffre huts … and the ocean rose to view’. Incidentally, the outlet of the river was discovered only in 1830 by Richard Lander. Till then it had remained a mystery. / The same Niger river and the same poem got my daughter into trouble when she was about six or seven years of age. Her school teacher taught her to pronounce the word ‘Niger’ to rhyme with ‘Tiger’. When I heard this I was surprised. In school the next day my daughter in reciting the poem boldly put in the correct pronunciation and was reproved. She persisted that that was the way her daddy pronounced it, and as he had actually been on the river he should know. Notwithstanding her persistence, which created a scene ending in tears, Niger as in Tiger it had to remain.

Pushing ahead in easy stages we traveled about fifty miles each day, stopping at villages en route to take on or discharge passengers and freight, and to refuel – a lengthy operation. The ‘Empire’ was run on wood, of which stacks lay at convenient in-travels along the route. Soundings were taken every now and again, and although our skipper must have known the intricacies of the river pretty well he could not always be certain of a clear passage, because new sandbanks had the habit of forming almost overnight at unexpected places. The river was fairly low, but not at its lowest. I was told that when in full spate during the rains from the north it was navigable to Baro for steamers of 1500 to 2000 tons for a few months, and that this period was availed of by the railway for bringing up as much construction material as could be carried in the time.

We had got well out of the low – lying swampy palm – oil / country when we touched at Onitsha, said to have had the largest trading station on the Niger. Apart from its trading activities Onitsha was noted for its Catholic mission in charge of, Father Shannon, who was said to have achieved as much, or more, fame for the teaching of useful trades to his native flock as for inculcating knowledge of a spiritual nature.

The sixth day got us to Idah, important only in that it was the boundary point between Southern and Northern Nigeria, and here some harmless customs formalities were gone through. We now emerged from the thick somber lining of mangrove and forest jungle to enter more open country. Vegetation became less evident and gave place to undulating plains on which hillocks of rock and red-stone reared themselves, where the distance mountain ranges added a picturesque note to the landscape. We could see farms of yams and guinea corn’ and cattle, goats and sheep, while all the time alongside the river banks plied canoes laden with produce and livestock. The river course became more intricate for navigation; dangerous-looking outcrops of granite rock protruded and gave indication that underwater rock lay at no great depth.
The following day we moored alongside the beach at the important trading town of Lokoja, 350 miles from our starting point. Lokoja, until about ten years previously, had been the administrative centre of the Northern Government; before that, Royal Niger Company, under Royal charter, was responsible for law and order and the general administration or affairs in the territories which ultimately became designated as Northern Nigeria. In 1900 the British Government revoked the charter and acquired this immense and valuable property for the paltry sum of £865,000, reserving to the Niger Company certain trading rights and royalties in minerals. Lokoja is situated at the junction of the Benue river with the Niger, which at this point is very wide. The Benue itself is a river of some magnitude and has its source in the Cameroons, some 700 miles away; it is wide and deep enough, according to the season of the year, for the navigation of boats of light draught for some considerable length. The usual method of transporting Europeans was by barges constructed of steel, in length forty to fifty feet, They were propelled by long light poles wielded by natives, in the shallows near the shore, and by paddles in midstream.

Some of our party left us here, bound for eastern stations, To while away waiting moments we called upon some of the local officials and were entertained to drinks and ‘smallchop’ as well as the latest local gossip. This diversion enabled me to add to my knowledge of who was who in the country. I heard of men who had gone home, – some of them invalided –, of some who had died, of scrapping with the natives across the river in pagan country, of mismanagement in the affair of Government and / private concerns, of the lack of Public funds, of the miserable conditions under which Europeans were condemned to live, of Government policy concerning the two rival Nigerias, Northern and Southern, and so on. It was all very interesting and entertaining.

The cantonment was nicely and uniformly laid out the one road well-made and lined with trees, mostly lime. The bungalows were set in spacious compounds, each resting on piles raised about six to eight feet off the ground. The gardens contained many variegated shrubs and trees, amongst which went acacias, oleanders and frangipani. How more fortunately placed were these officials, I thought, than the hemmed-in, washed-out, wear-looking traders of the Niger Delta stations. The 94 degrees temperature at night cooled down to 68, the lowest mark I had experienced on the river.

We left Lokoja next morning, on the last stage, and during the afternoon of the following day, Baro hill hove in sight. /
BARO-KANO RAILWAY CONSTRUCTION

From the deck of the good stern – wheeler 'Empire' there was no mistaking the kind of place on which I was about to set foot. It was Lobito Bay all over again. There were the puny shunting engines puffing and snorting and shrieking, pulling and pushing wagons, empty and laden. There were the tracks and sidings, the stacks of rails, heaps of steel sleepers sand piles of other material, most of it lying higgledy – piggedly and mixed up with great timber baulks and steel bridge girders. There were the same types of sheds and stores buildings and all the machinery and equipment that give evidence of some big railway construction project.

We drew in at four o clock and tied up to a timber wharf. Baro hill lay to my right and ran down at a sharp angle to the water edge. It was about 400 feet in height, and being composed of laterite it looked terra cotta in colour. The hill extended inland and curved around to my left, he whole constituting a semi – circle, within which, on the flat, lay the native village. Before the railway came Baro was a place of little importance except as a ferry crossing for caravans from the north to Lokoja and other southern towns. The river crossing here stretched fully one mile across. Pathways zig-zagged up the near – by hill and here and there a bungalow fitted of places where to large chunks of hillside had been hewn or blasted out to provide sufficient level ground.

It was in one of these bungalows I was accommodated / for a short period before moving to quarters on the hill-top, where the ground was spacious and flat and admirably suited for the quarters and offices of administration staff. Moreover, it was comparatively free from the attentions of mosquitoes and sand-flies which pervaded the lower level. Most of the buildings were constructed of laterite stone.

And now I was to meet the Director of the railway, John Eaglesome, to whom I had written, before I left for Canada, on the prospects of employment in Nigeria. I was appointed, temporarily, as his Personal Assistant, in which capacity I was to become acquainted with much of the administrative workings of the railway.

It was evident that the Baro-Kano Railway was in charge of a most capable and highly-skilled administrator – engineer in the person of John Eaglesome. He was referred to far and wide as John E., a brevity denoting popularity and distinction. To say more about this remarkable man makes it necessary for me to hark back to earlier days, to fill in, however sketchy it may be, a background for the presentation of characters and events associated with the inception of the Northern Nigeria railway project.

Here was as vast territory of about 275,000 square / miles with a population estimated to number nine million souls. They were composed of Hausa,
Filani and Nupe races, and numerous pagan tribes. The country was divided into twelve Emirates or States, each one ruled by an Emir. From a fairly high degree of civilization extending back some centuries they had lapsed into an era of barbarism and constantly made war, one with another. Lands were devastated and desolated. Rapine and ruin were the order of the day. Captives were forced to slavery, human sacrifices and other horrors prevailed. It was no fit place for any peace-loving person, to be found wandering in, with the exception, perhaps, of a few areas close to the Niger river where Europeans could conduct trade in comparative safety. The Niger Company in order to extend its trade obtained its Royal Charter in 1886, and in this way, under the aegis of the British Government was enabled to control and employ a constabulary under Colonel Lugard, for the development and protection of its interests in the hinterland.

It was about this time (1897) that European powers in Africa were casting envious eyes on native countries that remained free from foreign domination. The northern territories of Nigeria seemed a good mark. Already the French from the north and west were nosing about the country as were also the Germans from the east with the obvious intention of establishing spheres of influence at first, to be followed, as a natural sequence, by complete annexation. A clash with the French seemed imminent but was averted. The British Government, realising that the powers and authority of the Niger Company were inadequate and spurred to action by the far-seeing and visionary Lugard in a situation complex and dangerous, abrogated the charter. It was enabled thereby diplomacy, to settle all contentious problems with its two neighbouring Powers.

The military occupation of the country and the establishment of an administrative machine followed in 1900. It was not achieved without fighting, as a number of the Emirs, fearing their power would vanish, and with it the life of rapine and plunder which they so dearly loved, put up a show of resistance. It was, however, a half-hearted effort and the process of establishing law and order gradually assumed shape. By 1905 the newly acquired territory had effectively settled down to the peaceful pursuits of trade and industry. The Emirs, on the whole, were content, and provided they showed good – will to the new order of things and abolished all evil and undesirable practices, as we understand them, were allowed to retain control of their provinces under the guidance of political officers. When the natural suspicions of the native mind were overcome the people realised and appreciated the significance of the word 'Protectorate', that under the ruling monarch of Great Britain they would be protected, guided and advised, that their welfare be promoted, and that in the fulness of time the resources of their lands would bring them prosperity and contentment. The laws – unless they were deleterious – customs, religion and language of the country were not interfered with; rather, were they upheld. It appeared to be government for the people through the people, and it was called ‘indirect administration’. It
was a policy laid down by Sir Frederick Lugard, who had been appointed the first High Commissioner for Northern Nigeria in 1900.

To consolidate this vast acquisition of territory and to promote its economic development became an urgent and pressing problem, for distances from north to south and east to west ran into hundreds of miles. No roads were available and transport of commodities was only possible by head-load along native bushpaths, except in the far north where donkeys, bullocks, and camels could live and operate. French policy, now that its power was ousted from the Protectorate, sought to attract the trade of the western provinces by planning a railway in Dahomey from the coast, to run close to the Nigeria boundary, while in the north caravans of hides, skins, and other commodities crossed into French Soudan to wend their way to Morocco, returning with the wares and produce of other countries.

Lugard urged the immediate construction of a light railway of 2’ 6’ gauge, built on pioneer lines, not alone on the grounds of military expediency but as well for the effective political administration and development of the country’s potential trade / resources. The Southern Nigeria Government then became interested for it looked forward to an amalgamation of the two territories in the no distant future. It strenuously opposed the proposal for a 400 – mile narrow – gauge railway in the north, as it had, itself, constructed, and was extending a line of the wider 3’ 6’ gauge to connect with a future northern system. There followed the battle of the gauges, each side advancing arguments in support of its own particular type of railway. Lugard had (in 1902) established his administrative centre at Zungeru and had caused to be constructed a 2’ 6’ gauge line of 21 1/2 miles from the Kaduna river (a branch of the Niger) to his new capital. He seems to have been imbued with the idea that a railway (it was actually termed a tramway) of 400 miles of this type was equally well adapted to the development of the immense tract of territory under his administration.

Fortunately the matter resolved itself when in 1907 Sir Percy Girouard succeeded Lugard as High Commissioner, Girouard favoured ther wider gauge and it was then only a matter of obtaining the sanction of the Imperial Government to put the work in hand. Plans for a great central railway highway were at once formulated. Girouard was a soldier of the Royal Engineers who had achieved considerable distinction in India, Egypt, and South Africa in Railway work, perhaps the most notable being the rapid construction of the line in the Dongola expedition under Kitchener during the advance on Khartoum. /

The railway would have its terminus at Kano which was by far the most important and most populated trade centre in the Protectorate. Baro was to be the starting point. Its depth of water between July and September would enable steamers of six to twelve feet draught to bring material from Forcados, Thus, railway and river would provide the main outlet artery for northern traffic until such time as a junction with the southern line could be effected.
Girouard intended to construct the line according to his own method and ideas and in this he must have had in mind his achievement in the Soudan. The track would be of the pioneer type, pure and simple, to be built quickly and cheaply without any fancy trimmings or expensive buildings or other works, and to be or sufficient use to meet the needs of the moment and the immediate future. Posterity could strengthen the whole structure if and when conditions required it. The cost of constructing and equipping the line was estimated at £1,230,000 and the wealthy Southern Nigeria neighbour was putting up the money.

A location survey was started in 1907, and hard on its heels came the construction brigade. Girouard wasted no time. He scoured the various Government departments for men who could turn their hands to survey work and the supervision of construction / gangs. Men who could be spared from the ranks of the military, the Public Works, the Political, and other departments, all keen to participate in this great undertaking. The Public Works department had as its head John Eaglesome, whose reputation as an engineer on railway construction in India stood very high. He was appointed as Director of Railways and Public Works, an appointment which was at once popular, and fully justified as future events proved. Other local appointments followed and although it was, in its general make up, a scratch team it got things going until the more highly skilled and technical railway officers arrived. Girouard being an R.E. Officer prevailed upon the War Office to allow a contingent of Sappers to come out for laying the track. It was, I think, an innovation in Colonial railway building and the War Office was only to pleased at the opportunity it provided the Sappers for gaining practical experience.

It may be said that the Baro-Kano railway construction formally started on January 7 1908 with the cutting of the first sod by the Emir of Bida at an inaugural ceremony, at which His Excellency the High Commissioner of Northern Nigeria attended. Labour, for the most part was raw and unskilled, and consisted of about 1,200 Hausa, Yorubas, and upes. Political officers exercised control in the native interest through village chiefs and organised the recruitment of labour. The initial work was hampered by a deficiency in tools, so that the / use of native hoes and native – made baskets for carrying earth was resorted to, as well as all the tinned basins that could be purchased through the trading firms. I had never heard of or seen an African native using a wheelbarrow. A story was told that they were tried once, but the natives filled them and placed them upon their heads.

Baro bustled into activity – a race against time – preparing for the reception of material coming out from England. Stacking ground had to be prepared, sidings laid, jetties constructed, quarters and stores erected. Only three months (July to September) – when the river was high – would be available for dis-
charging the boats (they were up to 1000 tons capacity) coming from Forcados, though lighter craft could be navigated from October to January.

In July the boats began to arrive, but one suffered disaster when it struck a rock below Lokoja and much of the sorely needed earthwork tools, rails and sleepers were lost. Discharging at Baro continued feverishly day and night, from 6 a.m. to 12 midnight in two shifts, with half – days on Saturdays and Sundays, with scarcely a hitch. Each boat when discharged hastened back to Forcados for more cargo and was back again in an average of 17 days.

It was a triumph of organisation. Thirty thousand tons of material were landed in Baro by the end of November – double the quantity it was estimated could be transported and handled in the time. Earthworks for the new line were completed for ninety miles. Two months later fifty miles of track had been laid.

It was apparent that John Eaglesome with his magnetic personality had gathered about him a most enthusiastic body of workers, from the lowest to the highest in rank, all animated with the same resolve – to reach the objective up to schedule and incidentally to show the Southerners a tip or two. The latter were projecting a line northwards in what seemed to be a leisurely, though apparently solid, manner. They were said to deride the methods employed by the Northerners whose avowed determination to reach Kano by rail in three years they regarded as bordering on the fantastic.

John Eaglesome, made a point of knowing everyone of his staff, and seeing that everyone in the railway knew everyone else, whether in the railway or out of it, and so, at the pleasant social functions in his house, at which his distinguished – looking wife presided charmingly as hostess, one would meet people from every aspect of Nigerian life. It was good policy, for in many ways men outside the railway became bound up in its working and the personal contact went a long way in bringing about mutual cooperation. In his selection of men for particular jobs John E’s judgment was sound and unfailing. There were no square pegs in round holes. /

On the 1st April 1910 the section of line, Baro to Minna, 111 miles, was thrown open to traffic for the conveyance of passengers and goods, with rates and fares fixed in the approved manner as pertaining to railways generally. A permanent staff had been appointed and amongst the list of engineers selected I found my name. I concluded, therefore, that in the short space of time I had put in at headquarters I had created a sufficient impression of efficiency as to warrant my selection. I was not, however, to be employed on open lines work but was seconded for construction. /
BARO-KANO RAILWAY CONSTRUCTION

Having equipped myself at the local canteen with boxes of provisions and other necessities for life in the bush I travelled to Minna by the railway. The first part of the journey was through low-lying land with occasional forest belts, after which we ran into undulating and well-wooded country, a range of barren hills. Patches of cultivation, but little native life, was to be seen, except for gangs of labour putting finishing touches to the track and station buildings. The latter in accord with policy, were of the simplest kind – a corrugated iron hut about twelve by eight feet, for the station office, and a few small round bush huts for the staff, which was composed of Southern natives and West Indians, specially imported for the work.

Minna is 800-feet above sea level and was nothing until the railway came. It was to become the junction of the line creeping up from Southern Nigeria and from it a line was shooting out to the west, its immediate object being to connect with Zungeru, the capital, which lay 38 miles away.

The railway station stood in a semi-amphitheatre of hills lying to the east.

On the northern spur, below which the railway skirted were the quarters of the European staff, a distance of about two miles from the station. This area was served by a newly constructed laterite road where midway stood a fine double-storied block of offices. No European walked any great distance for, as at Baro, hammocks carried by four natives were provided so as to conserve one’s bodily energy. I reported to the Engineer in charge, Mr Bland, a tall sparsely-built Canadian and received my final instructions. Bland was only 31 and was John Eaglesome’s right-hand man; he had served on the Canadian and South African railways and had seen service in Strathcona’s Scouts during the South African war.

It took me four days to travel the 67 miles to my camp at the Kugo river, for with the commencement of the rains the floods had played havoc with parts of the line; swollen streams and rivers carried away embankments, and repair gangs were busily engaged repairing the damage. About half-way through the journey I met Bostock, a district engineer, whom I had known at Lobito Bay where he had engaged on location survey the John Norton Griffiths’ regime. He had discarded the flowing moustache and pointed beard of black which had graced his features and made him look like one of the cavaliers of Queen Elizabeth’s day during his Angolan sojourn. It was pleasant recalling the events of those days.

At Kano I relieved Lloyd, a public works man who had been seconded for railway work and was now returning to his former occupation. Apparently there was a dearth Political officers and Lloyd, in addition to his railway responsibility, was acting as Assistant Resident. The duties of that office for which I would receive an emolument of £4 per month were handed over to me.
The political work was bound up principally with the recruitment of railway labour, which was obtained through the medium of the chiefs, or Serikis, of the province, though the dispensing of justice formed a not inconsiderable portion of the duties. It was primitive for there existed no building of dignity in which ‘court’ proceedings could be conducted. The shaded porch of the verandah of my bush house provided as imposing a place as any other, and here, seated at a wooden folding-pattern table, I would preside, while outside would be assembled all the characters usually associated with a judicial contest, including dogarai (native police) in their voluminous red gowns and turbans. The proceedings were conducted in an atmosphere of solemnity, for the native takes matters of law very seriously. The rulings and decisions of the white man were accepted without a murmur, no sign of disapproval being evident. Cases were for the most part, those relating to petty crime and domestic differences as between husband and wife and known as ‘mammy palaver’. Those of a more serious nature and outside my powers of jurisdiction were transferred by me to the ‘big judgie’ (Resident) at Zaria. I was regarded as the ‘little judgie’. / [...]
The object of this paper is to describe the type of railway which in my opinion is best adapted for opening up territory to trade in the shortest time and at the least possible cost, but which shall at the same time possess a large carrying capacity. It is most important in the interests of any undeveloped Colony that the cost per mile of railway communication should be reduced to the lowest figure compatible with efficiency and sufficient carrying capacity. I want to show you why a pioneer railway should be cheap, and some of the results that follow cheapness.

Let us take the theoretical case of the construction of a railway in a new country where all the traffic is brought down to a port and is an even quantity per mile, and therefore proportional to the length built of the railway. Take a fixed sum of capital, say £600,000; what lengths of railway can be built for this? At £3,000 per mile you will get 200 miles; at £6,000, 100 miles; at £9,000, only 66.6 miles. As you increase your length you increase your traffic area. Take it that each mile produces the rather high figure of 600 tons per annum. The line costing £9,000 per mile brings to the port a traffic of 39,960 tons per annum; that costing £6,000 per mile obtains 60,000 tons; and the line costing £3,000 per mile obtains 120,000 tons per annum. The ton-mileage carried under these theoretical conditions illustrates still more clearly the value of increasing the length of a railway and of adding to its traffic catchment area. The ton-miles – that is, the number of tons carried one mile – are respectively, for each length of railway, 1,350,000, 3,030,000, and 12,060,000 ton-miles.

It is necessary to remember that the traffic to be carried in any district through which a railway is about to be constructed is the same per mile of line, whether you put down an expensive broad gauge line or a cheap narrow gauge. You must clearly understand, therefore, that if you select an expensive type of railway to
open up undeveloped country you must be prepared to accept, permanently, rail charges very considerably higher, and as a consequence the slower development of the country and its resources. / Let us assume that Her Majesty’s principal Secretary of State for the Colonies is prepared, with the object of raising capital on the cheapest terms, to offer an Imperial guarantee of say 3 per cent. on a fixed capital sum of £600,000. If the railway is to be self-supporting, it is obvious that while the £9,000 per mile line has to pay working expenses, be maintained, and pay the guaranteed interest amounting to £19,500 yearly out of a traffic of 39,960 tons brought to the port, the £3,000 per mile line trebles the security on account of its 120,000 tons of traffic. It is not the capital expended on a railway which constitutes security, but the amount of its traffic in relation to capital cost. The quota contributed per ton to the guaranteed interest of £19,500 in the case of the £9,000 per mile line is 9s. 9d., equal to 3.47d. per ton-mile; in the second case to 6s. 6d., equal to 1.54d. per ton-mile; and in the case of the £3,000 line to only 3s. 3d., equal to 0.39d. per ton-mile.

Finally, the longer the length of line you get for your money, the poorer the character of country you can enter upon and still obtain profitable results. If it be possible to halve the estimated cost per mile of any projected line, you will get either twice the traffic area for the same money, or, if the line be restricted to the same length, the profits which it may earn will be, per cent. of capital cost, twice that of a line of double the cost, and consequently the prospects of a financial success are made much more certain. What is wanted for Colonial development is cheap railway communication and plenty of it; and if with a proper traffic capacity you can get two lines for the cost of one making a good return on their capital, I think you will agree that railway construction and extension will be much more rapid in the future than it has been in the past.

The substantiality of permanent way does not consist in the adoption of any particular number of lbs. per yard of rail, but solely on the weight per yard of rail having a proper relation to the maximum weight per axle of the rolling stock to be placed upon it. A rail of 25 lbs. per yard may be as permanent and ‘substantial’ as one of 75 lbs., provided that the maximum axle-load bears a proper relation to it.

The decision to be arrived at is, what weight of axle-load is the most desirable, having regard, first, to the character and amount of the traffic to be carried, and, secondly, having regard to the cost per mile of permanent way which the general circumstances of the country, and the capital available together indicate as a necessary limit?

For the Barsi light railway in India, I have adopted a maximum / uniform axle-load of 5 tons on locomotives, wagons, and carriages alike, and the line has been laid with 35-lb. rails to ensure a long life under an extremely heavy traffic.
Both as regards the bulk and weight-carrying capacity of its vehicles, a maximum axle-load of 5 tons will meet all the requirements of a light railway for the Colonies.

On the selection of gauge even more depends than on that of axle-load. The narrower the gauge the smaller the radius of curve around which a train can run without undue resistance and friction. The small radius of the curves of the narrowest gauges confers upon them immense advantages in locating their alignment in rough country. Flexibility of alignment permits a railway of narrow gauge to wind in and out so as to avoid deep cuttings, tunnels, heavy embankments, bridging, and the severance of valuable property. In flat, level country, the difference in favour of a narrow gauge is at its minimum, but the more difficult the country the greater becomes the difference in cost per mile.

It is possible to build broader gauges with curves of very small radius, and that trains will run safely round them, but if this is done train loads must be greatly reduced.

The principle which underlies the question of gauge, and should determine its selection, is, that a railway, like any other machine, is economical only when working within a reasonable measure of its full power. If you adopt a gauge which at the outset is much above the traffic and means of the country to be opened up, you invite financial disaster, and your railways, instead of being a source of profit, may become a burden upon the revenues of the Colony.

The ultimate traffic capacity of a narrow gauge railway, starting with light rails and a small axle-load, can be largely augmented to meet a great increase in traffic by increasing the number of crossing stations, and, when renewal of rails becomes necessary, by laying a much heavier section to double the axle-load, thereby greatly increasing the power of engines. The capacity can be again more than doubled by doubling the line. It is axle-load and not gauge which is the greatest factor in determining ultimate traffic capacity.

The Barsi steel sleepers weigh 40 lbs. each. In laying these sleepers they are spaced at distances so arranged that there is equal resilience, both as regards rail joints and throughout the intermediate length of rail. The unusual smoothness of the Barsi track, laid on this principle, has been generally remarked by those who have travelled over the line, and will no doubt have a perceptible effect in prolonging the life of the rails, and also in reducing wear and tear on the springs of rolling stock.

In opening up new country, timber, however, can often be had for the cutting, and wherever good hardwood sleepers are available and can be prepared in a reasonable time, they should be employed, as they are much cheaper in first cost than steel.

The principal novelty in the Barsi rolling stock has been the adoption of a uniform working axle-load throughout for engines, wagons, and carriages, the
working axle-load being also the maximum adopted, namely, 5 tons per axle. Maximum carrying capacity on the minimum weight of rail can be secured only by uniformity of axle-load.

The Barsi engines are capable of hauling a train load of 1,036 tons at 15 miles an hour on a level, straight line, and 291 tons at 8 miles an hour on a gradient of 1 in 100 combined with a 600 ft. curve. In mountainous districts the engines can haul a train load of 147 tons on a gradient of 1 in 50 combined with a 250 ft. curve, and 69 tons on a gradient of 1 in 25 on the same curve, both at 8 miles an hour.

The Barsi wagon stock has been designed to obtain the greatest bulk and weight carrying capacity on the lightest possible tare weight compatible with a proper reserve of strength. The wagons are of three types, low-side, high-side, and covered. They are all of one standard length, namely, 25 feet over headstocks, and are 7 feet wide. The low-side wagon, weighing 4 tons 2 cwt., carries a maximum load of 15 tons 18 cwt., or nearly four times its own weight. The high-side wagon has a capacity of 500 cubic feet, weighs 5 tons 7 cwt., and carries 14 tons 13 cwt. The covered wagon has a capacity of 1,000 cubic feet, weighs 5 tons 18 cwt., and carries 14 tons 2 cwt. Besides goods, this is capable of carrying 6 cavalry horses, their attendants, and a week's supply of compressed forage.

Light tare weight effects a permanent economy in working expenses by making it possible to carry a greater quantity of goods in each train at the same cost as regards coal, oil, and wages. As the deadweight of the train is thereby reduced in proportion to the weight of goods carried, there is of course less wear and tear on the permanent way. These gains, please note, constitute an actual saving of revenue day by day and year by year in respect of every train that is run. In regard to capital cost the results are of no less importance, as lighter engines and permanent way can be used.

The Barsi carriage stock is also of one standard length, namely, 40 feet over headstocks. Both carriages and wagons are fitted with bogies as shown, and are capable of running round a curve of only 100 feet radius. Two classes only are in use, upper and lower class.

Mr. Calthrop showed a series of photographs with the object of giving a practical idea of what had been accomplished at Barsi in building a railway at a cost of about £3,000 per mile, including rolling stock. The work shown was all of a substantial and permanent character, the buildings being numerous, spacious, and built of solid stone.

The Barsi Light Railway was only opened for traffic in March last; but during its first half-year's working, the working expenses in India were just below 50 per cent. of the gross receipts, and the net profits earned were in excess of 4 per cent. on the capital of the Company, notwithstanding an almost unexampled
combination of troubles, including plague, cholera, and famine, and their ruinous effects upon traffic.

**Discussion.**

Lieut. Leggett, R.E. (Traffic Manager of Woolwich Arsenal), wrote in support of Mr. Calthrop's views as to the importance of economy in the prime cost of light railways, and said it was difficult to think that the special conditions in each case made a gauge of 3 feet 6 inches necessary for the Soudan and Rhodesian lines, 3 feet for the Uganda line and 2 feet 6 inches for the Sierra Leone line. In the event of two of these lines, say the Soudan and Uganda railways, being at some future time joined, the difference in gauge and plant would create very serious difficulties. The inconvenience resulting from the diversity of gauges in the Australian Colonies was also referred to. It was worth while considering whether a standard colonial type and gauge should not be adopted for pioneer lines. Such a type should be suitable to the needs of military expeditions in respect of lightness and rapidity of construction.

Sir Walter J. Sendall, K.C.M.G. (Governor of British Guiana), said he came to learn some useful facts respecting light railways, with a view to formulating a scheme for their introduction into Cyprus, where the question had been for some time under consideration, and where the feeling was in favour of as narrow a gauge as was consistent with a proper carrying capacity. Many of the points raised in the paper were quite novel to him, especially the adaptation of such rolling stock as had been seen on the screen to a narrow gauge line. / Sir Alec Wilson said that in his capacity as chairman he had opened the Barsi railway on March 20 last, and seen for himself its capabilities. No type of railway was more suitable for opening up undeveloped country, and connecting branch lines with the great trunk lines.

Mr. R. W. Perks, M.P., expressed the opinion that the soundest method of constructing light railways was usually by means of private enterprise and not under Government control. He feared that the cost of the Uganda railway would very largely exceed the Government estimate, and he was persuaded that if the undertaking had been entrusted to experienced, able, and responsible contractors it would not only have cost very much less money, but would have been completed in very much less time.

Sir Frederick Young, K.C.M.G., said that in all scientific work men qualified to invent something superior to what had been done before were needed. It was of the utmost importance that we should know the very best methods of constructing railways throughout the length and breadth of our Colonies. He quoted South Africa in illustration of the benefits that new countries derive from such necessary adjuncts of civilisation.

The Chairman said they were indebted to Mr. Calthrop for his paper, which would be of service both to the civilised and uncivilised world. He had
shown it to an expert, who had pronounced the arguments employed to be perfectly sound throughout. The two cardinal points of the paper were the necessity of a uniform axleload and light tare loads. On the Irish railways the heavy locomotives in going over light rails sometimes tore them to pieces. With regard to the light railway proposed to be built from Suakin to Berber in 1885 which would have answered all practical purposes if made of the 2 ft. 6 in. gauge, the War Office decided to make a 4 ft. 6 in. gauge line, which is unnecessarily heavy and expensive for such a line.

[...]
EDITORIAL NOTES

Crown Agents to Colonial Office

1. M. F. OMMANNEY: Sir Montague Frederick Ommanney, War Office and Admiralty architect (1866–70); instructor at the Royal Military Academy (1871); private secretary to Lord Canarvon, Colonial Secretary of State (1874); Crown Agent (1877–1900); Under-Secretary of State for the Colonies (1900–7).

3. The foreshore: The African Steamship Company was founded in the middle of the nineteenth century by Macgregor Laird. It was purchased by Elder Dempster & Co. Ltd in 1891.

4. garden egg: a hairy upright herb native to southeastern Asia and widely cultivated for its edible fruit.

5. plantain: a large, tropical, tree-like herb (Musa paradisiaca).

6. Colonial Rubber Estates Company: founded in 1897 with a capital of £100,000 and acquired the rights to collect and gather rubber over an area of 640,000 acres of West Africa.

7. the African Gold Coast Company: founded in 1878 by the French trader J. Bonnat who had acquired a concession in Tarkwa. Operations began first at Awudua and later at Tarkwa.

Sierra Leone (Kwalu) Railway Survey

1. Sir Frederic Cardew: Governor of Sierra Leone (1894–1900).

2. Mr Gaffney: The hut tax was charged on a per hut or household basis and payable in money, labour, grain or stock. The Hut Tax War of 1898 was a war of resistance. It was initiated by Temne Chief Bai Bureh and later involved other native peoples, including the Mende, and was an attempt by the local African kingdoms to maintain their independence in the face of Britain's 1896 declaration of a protectorate over Sierra Leone. The war was sparked by an attempt by British officials to collect hut tax.

3. piassava: a palm, the stiff coarse fibres of which were used in cordage or brushes.

4. abutments: an abutment is a structure that supports the end of a bridge.

5. chs: chains. A chain is a unit of length equal to 100 feet.

6. grade: the degree of inclination of a slope.

7. piles: A pile is a heavy beam of timber, concrete, or steel driven into the earth as a foundation or support for a structure.
High Commissioner Sir F. Lugard to Mr. Chamberlain

2. Sir Ralph Moor: Sir Denham Rayment Moor (1860–1909), Vice-Consul (1892) and later Commissioner (1892–3) for the Oil Rivers district of Nigeria, Commissioner and Consul-General for the Niger Coast Protectorate and Consul for the Cameroons and Fernando Po (1896–1900), High Commissioner of the British Southern Nigeria Protectorate (1900–3).
3. Haussa: The Hausa are the largest ethnic group in West Africa. The Hausa Kingdoms were a collection of independent city-states situated between the Niger River and Lake Chad.

Construction of Foreign Railways in West Africa

1. Captain C. F. Cromie to the Marquess of Lansdowne: Henry Charles Keith Petty-Fitzmaurice, fifth Marquess of Lansdowne (1845–1927), Liberal and Conservative politician who served successively as the fifth Governor General of Canada, Viceroy of India, Secretary of State for War, and Secretary of State for Foreign Affairs.
2. artesian wells: An artesian well is a well drilled through rock to reach water capable of rising to the surface by internal hydrostatic pressure.
3. diabase: a dark-grey to black, fine-textured igneous rock containing feldspar and pyroxene.
4. angle iron: a piece of steel or iron bent at a right angle and used as a support or structural framework.

Mr. Lyttelton to Governor Egerton

1. Mr. Lyttelton to Governor Egerton: Walter Egerton (1858–1947), Governor of Lagos Colony (1904–6) and of Southern Nigeria (1906–12).

Memorandum by Mr. Churchill

Shelford, Some Features of West African Railways

1. Aneroids: An aneroid barometer is a barometer in which variations of atmospheric pressure are indicated by the relative bulges of a thin elastic metal disk covering a partially evacuated chamber.
2. Tacheometers: A tacheometer is a type of theodolite designed for the rapid measurement of distances, elevations and directions.
3. chronometer: an exceptionally precise timepiece.
4. borrow-pits: A borrow pit was dug to obtain embankment earth. If not drained, the pits became breeding grounds for disease carrying mosquitoes (*West Africa*, 15 August 1903, pp. 171–3).
5. derricking gear: A derrick is a machine for hoisting and moving heavy objects. It consists of a moveable boom equipped with cables and pulleys and connected to the base of an upright stationary beam.
6. capstan: an object used for hoisting weights. It consists of a vertical spool-shaped cylinder that is rotated manually or by machine and around which a cable is wound.
7. quoins: A quoin is an exterior angle of a wall or other piece of masonry.
8. eternit: Eternit is a fibre cement.
9. pony truck: a leading truck with only two wheels.

*The Nigerian Railway*

1. *Admiralty steam coal*: a high-quality, smokeless coal ideal for the production of steam.

**De Frece, The Failure of Officialdom**

3. Mr. Lloyd George: David Lloyd George, first Earl Lloyd-George of Dwyfor (1863–1945), Liberal politician and statesman. Prime Minister of the UK from 1916 to 1922 and the Leader of the Liberal Party from 1926 to 1931.
4. Lord Midleton: William St John Fremantle Brodrick, first Earl of Midleton (1856–1942), Conservative Party MP. Secretary of State for War (1900–3) and Secretary of State for India (1903–5).
5. Mr. Herbert Samuel: Herbert Louis Samuel, first Viscount Samuel (1870–1963), diplomat and Liberal Party MP. High Commissioner of Palestine (1920–5) and Home Secretary in 1916 and from 1931 to 1932. A noted Zionist.
6. the last Ashanti War: The Fourth Anglo-Ashanti War lasted from 1894 to 1896. The war started on the pretext of the failure to pay the fines levied on the Ashanti monarch by the Treaty of Fomena after the third (1874) war.
O’ Callaghan, ‘Uganda Railway’

1. Sir Alexander Rendel: Sir Alexander Meadows Rendel (1828–1918), consulting engineer to the India Office, the East India Railway and other Indian railroads.
2. Tsetse fly: two-winged blood sucking African fly of the genus Glossina, which often carries and spreads pathogenic trypanosomes to humans and livestock.
3. aloes: Aloe bushes have rosettes of succulent, often spiny-margined leaves and long stalks that bear yellow, orange, or red tubular flowers.
5. scantlings: small timbers used in construction.
6. teredo navalis: wormlike marine mollusks of the genera Teredo and Bankia. They bore into wood, especially submerged timbers, and can do extensive damage.
7. angle iron: a length of steel or iron bent at a right angle and used as a support or structural framework.
8. jib: the arm of a mechanical crane.
9. ‘Vignoles’ pattern steel rails: named after their inventor, Charles Vignoles, an early railway engineer.
10. Abney’s levels: An abney level is a surveying instrument comprising a spirit level and a sighting tube and is used to measure the angle of an inclination.

Emett, ‘Some Curiosities of the Uganda Railway’

Memorandum for the Private Enterprise Committee

1. GIDEON MURRAY, MASTER OF ELIBANK: Gideon Oliphant-Murray, second Viscount Elibank (1877–1951), Scottish politician. Private Secretary to Commissioner for Native Affairs, Transvaal (1901); Assistant Native Commissioner, Zoutpansberg (1902–6); and Assistant Private Secretary to the Permanent Under-Secretary of State for the Colonies (1907–9).
3. the Anglo-Persian Oil Co: founded in 1908 on the discovery of large oil deposits at Masjed Soleiman, Persia. In 1935, it was renamed the Anglo-Iranian Oil Company, and, in 1954, became the British Petroleum Company (BP).

Smith Wright, Railways in Rhodesia

1. Sir Arthur Lawley: Arthur Lawley, sixth Baron Wenlock (1860–1932), politician, soldier and administrator. He served as the administrator of Matabeleland (1898–1901), Governor of Western Australia, Lieutenant-Governor of Transvaal and Governor of Madras.
2. **Blackwood’s Magazine**: published between 1817 and 1980. It was founded by William Blackwood (1776–1834) and was originally called the *Edinburgh Monthly Magazine*.

3. **mopani trees**: Colophospermum (or Copaifera) mopane, is native to southern Africa, highly resistant to drought and produces very hard wood. It is also known as ironwood.

‘Contract for the Construction of a Railway’

1. **ERNEST EDWARD BLAKE Esq.**: Sir Ernest Edward Blake served as a Crown Agent from 1881 to 1909.

2. **MAURICE ALEXANDER CAMERON**: Sir Maurice Alexander Cameron served as a Crown Agent from 1895 to 1920.

3. **ex parte**: from or on one side only, with the other side absent or unrepresented.

**Central Africa Railway Company Limited and Shire Highlands Railway Nyasaland Limited and the Crown Agents for the Colonies on behalf of the Nyasaland Government: Conditional Agreement**

1. **Flat trucks**: A flat truck is a truck whose body is in the form of a platform.

2. **Culverts**: A culvert is a drain channel.

**Owen, Report and Estimate in Connection with Caledon Surveys**

1. **triangulation**: a surveying technique in which a region is divided into a series of triangular elements based on a line of known length so that accurate measurements of distances and directions may be made via the use of trigonometry.

**Railway Construction: Zoutpansberg District**

1. **Selati Line**: The Selati Railway Company was established in Brussels by Baron Openheim and his brother to build a railway line from Komatipoort to the new Transvaal gold field near the Selati River. Unfortunately, after building 80 kilometre of track, the company went bankrupt. The line then lay idle until 1912 when the South African Railways took over and extended it first to Tzaneen and later to Soekmekaar.

2. **Messina Copper Mine**: The company was established in 1905 by Lt Colonel J. P. Grenfell. By 1914, Messina was exporting high-grade matte to Welsh refineries, and, by 1940, was producing 10,000 tonnes of copper pa (N. J. Van Warmelo, *The Copper Mines of Musina and the Early History of the Zoutpansberg* (Pretoria: Department of Native Affairs, 1940)).
3. **Guaranteed Loan or other source:** The loan was for £5m, £2.5m was given to the Land and Agricultural Bank and the remainder was to be used for railways, public works, irrigation, agricultural settlement and development.

4. **banket and other reefs:** A banket reef is one that contains gold.

5. **antimony:** A metallic element used in a wide variety of alloys, especially with lead in battery plates, and in the manufacture of flame-proofing compounds, paint, semiconductor devices and ceramic products.

6. **mica:** Aluminum silicate minerals used in insulation and electrical equipment.

7. **auriferous:** Auriferous deposits are gold-bearing.

8. **Adit:** An adit is an almost horizontal entrance to a mine.

9. **tributors:** Self-employed miners.

10. **steam stamp mill:** A machine comprising a heavy bar that moves vertically for pounding or crushing ores.

11. **stilbrite:** A lead-gray mineral that is the chief source of antimony.

12. **dwt.:** DWT – deadweight tonnage.

13. **stamp battery:** A mill in which ore is crushed with stamps.

14. **schist:** Medium to coarse grained metamorphic rock composed of laminated and parallel layers of micaceous minerals.

15. **pyritic:** Pyrite is a brass-coloured mineral used in the production of sulfur dioxide and sulfuric acid. Also called ‘fool’s gold’.

**Tanganyika Territory**

1. **T. Shaw:** Thomas Shaw (1872–1938), trade unionist, Labour Party politician and Minister of Labour (1924).

2. **Sir Montague Barlow:** Sir (Clement) Anderson Montague-Barlow, first Baronet (1868–1951), barrister, Conservative Party politician, Minister of Labour (1922–4).

3. **the League of Nations:** The League of Nations was an intergovernmental organization founded as a result of the Paris Peace Conference of 1919.

4. **the Union-Castle Line:** The Union-Castle Line was a shipping line that operated a fleet of passenger liners and cargo ships between Europe and Africa from 1900. It was formed from the merger of the Union Line and Castle Shipping Line.

5. **British India Steam Navigation Company:** The British India Steam Navigation Company was formed in 1856 as the Calcutta and Burmah Steam Navigation Company. Its main shipping routes were Britain to India, Australia, Kenya and Tanganyika.

6. **East African Lighterage Company:** worked the ships of the Clan and Ellerman lines, the Harrison combine and Japanese and German lines.

7. **pontoons:** A pontoon is a floating structure, such as a flat bottomed boat, that is used to support a bridge.

8. **the African Wharfage Company:** owned by T. B. Davis Ltd of Durban. It held the stevedoring contracts for the British India line, the Union Castle line and French and Italian lines and some of the Coaling ships at Mbaraki.

**Natal Government Railways. Draft Law**

1. **debenture:** Debentures were bearer securities, the ownership of which was not recorded. They could therefore be sold without reference to the issuing house or payment of stamp duty. Although popular with the City, they were disliked by the public, as they were
liable to theft or misappropriation, and, to obtain dividends, coupons attached to the certificate had to be sent to the issuing house.

2. **time of issue**: On issue, each debenture was offered for a set price that was above or below the ‘par’ price (£100) at which it would eventually be repaid. The Crown Agents generally set below-par prices, as trustees were averse to purchasing stock at a considerable premium and they were prohibited by law from buying above par securities if they managed trusts with less than fifteen years to run.

### Report of the Select Committee on Railway Labourers

1. **Cape Town and Wellington Railway**: The Cape Town and Wellington railway was completed in 1863.
2. **navvies**: A navvy is a labourer.
3. **battery**: an emplacement for one or more pieces of artillery.
4. **Sir Lowry’s Pass**: a mountain pass that crosses the Hottentots-Holland mountain range between Somerset West and Grabouw. Houwhoek Pass crosses between Grabouw and Botrivier.

### Calthrop, ‘Light Railways in the Colonies’

1. **tare weight**: the weight of a vehicle or container when it is empty.
2. **Mr. Calthrop**: Everard Richard Calthrop (1857–1927), railway engineer and inventor. He promoted and built narrow gauge railways. Later in life, he took an interest in aviation, patenting some early parachute designs.
3. **Sir Walter J. Sendall**: Sir Walter Joseph Sendall (1832–1904). Governor-in-Chief of the Windward Islands from 1885 to 1889, Governor of Barbados from 1889 to 1891, High Commissioner of Cyprus from 1892 to 1898, and Governor of British Guiana from 1898 to 1901.
5. **Sir Frederick Young**: Sir Frederick Young (1817–1913), traveller and writer on imperial affairs.

**Operation of Lines**

J. H. Smith, *Report upon the Administration, Organisation and Working of the Natal Government Railways* (1903)  
S. Herbert Frankel, *Memorandum on Railway and Harbours Working and Finance* (1933)  

**Editorial Notes**
OPERATION OF LINES

The majority of British African railways were operated by local administrations. As discussed in the General Introduction in Volume 1, Rhodesian and early South African lines were built and operated by private companies, but were gradually acquired by the state (see Hammond, *Report on the Railway System of Southern Rhodesia* (1925), below; Smith, *Special Railway Commissioner, upon the Administration, Organisation and Working of the Natal Government Railways* (1903), below; and Herbert Frankel, *Memorandum on Railway and Harbours Working and Finance* (1933), below). In West Africa (see Hammond, *Report on the Sierra Leone Government Railway* (1922), below), Uganda, Kenya (apart from the Konza–Magadi railway) and Tanganyika (see Hammond, *Report on the Railway Systems of Kenya, Uganda and Tanganyika* (1921), below, and Hammond, *Report on the Railway System of Tanganyika Territory* (1930), below) all the lines were publicly built and managed – in West Africa by individual country authorities, and in Uganda and Kenya after the First World War, by the East African Railways Corporation.¹ Proposals that government constructed lines be operated by the private sector were swiftly dismissed by both the Crown Agents and the Colonial Office. It was pointed out that contractor-run railways in the UK were poorly managed, that the absence of cost and revenue information would discourage contractors bidding for the management of railways and that those that did tender would submit excessively low offers that colonial officials would have difficulty judging. The local government would also be obliged to continue to bear its public responsibility as regards safety and would have to closely and expensively monitor operations to prevent the setting of excessive freight rates.²

Although they contributed greatly to economic development, the majority of lines were commercially unsuccessful.³ Losses were the result of both high costs and low revenues. Costs were raised by the basic nature of construction; in West Africa, by the poor quality of the lines built; various problems with expatriate and African labour; and inadequate organization of railway departments. The higher operating costs that arose from basic construction are summarized in Table 1; while a good example of a railway with high running costs caused
by poor quality construction is the Gold Coast Sekondi–Kumasi line. The steep gradients and tight curves of the railway restricted the haulage capacity of engines, badly laid track demanded almost continuous track maintenance and replacement, poorly built river crossings led to bridge speed limits, the failure to cut a wide right-of-way through forest increased the incident of falling trees that blocked and damaged track, and grades, curves and track problems resulted in numerous derailments and accidents.4

Table 1: The Impact of Lines of a Lower Standard on Operating Costs and Carrying Capacities.5

Costs were further increased by the appointment of advisory consulting engineers and expatriate staff. In order to ensure that completed lines worked efficiently and economically, their operation in the Crown colonies was initially supervised by consulting engineers, who provided advice on rates, staffing and management structures and track and equipment purchase and maintenance.6 For these duties, the West African consulting engineer, Frederic Shelford, received an annual salary plus expenses and recruitment and purchasing fees.7 Not surprisingly, Shelford’s work was subject to a number of criticisms. It was argued that his remuneration was excessive, a claim supported by a comparison of consulting engineer/Crown Agent operation fees (see Table 2); in order to maximize his own income and avoid criticisms of the operation of lines, he recommended the purchase of expensive rolling stock and staff; and he failed to closely monitor the working of lines. He rarely visited Africa and his knowledge of railway operations was based on generally out-of-date reports and correspondence with general managers, who could easily omit information. More importantly, he insisted that completed lines be managed by highly remunerated general managers, selected by himself, and that colonial government involvement should be kept to a minimum, even when it was plain that railway departments were being
inefficiently administered. Aware that Shelford’s supervision of the operation of railways was as inadequate as his construction of them, the Crown Agents in 1904 sought to take over some of his duties, but were repulsed by the Colonial Office. A further attempt in 1911 was more successful, and, by the start of the First World War, they had acquired most of his workload.8

The use of expatriate employees similarly raised costs. It took months to recruit staff, who were often incompetent and/or inexperienced, became so ill that they were unable to work, or died, and stayed in their posts for a relatively short period of time.10 Faced with such criticisms, the Crown Agents, who filled all technical appointments, pointed out that recruitment of high quality technical staff was a formidable task. The construction of railways around the world had resulted in shortages of specialist workers, colonial administrations often demanded highly qualified candidates or combinations of skills impossible to find in one person, and few Englishmen wished to work in Africa. Apart from the health risks, salaries were often relatively low, promotion slow, appointments initially only for two tours of duty and permanent pensionable employment gained only if officers performed their roles well.11 Employment also involved a number of hidden costs – for example, successful candidates had to purchase special equipment and clothing, the cost of passage to Africa was subtracted from future salaries and only reimbursed on their first home leave, some colonies refused to allow wives to accompany appointed officers, forcing the maintenance of two households, and, on their return to Britain, ex-colonial staff often found it difficult to obtain fresh employment, as the colonial experience gained was usually practically useless. A further reason for the inadequacies of recruitment, however, was the Crown Agents’ appointment procedure. Prior to 1911, candidates were chosen by the consulting engineer who worked in the employing colony and specialized in the technical area of appointment. As regards West Africa, recruitment was undertaken by Shelford, who delegated the task to a clerk, and, receiving a fee of five guineas for each man selected, had a monetary incentive to choose candidates who would break their contract before they sailed or would prove unacceptable. Aware of Shelford’s failings, the Agents took over his duties
in 1911, with the result that the quality of recruits noticeably improved, though the recruitment process remained lethargic.\footnote{12}

The obvious solution to the problems of obtaining expatriate skilled staff was to employ Africans or other nationalities (who were also cheaper). Unfortunately, few colonies were willing to replace expatriate workers with trained Africans. It was thought that ‘natives ... did not take kindly to mechanical work or any work requiring sustained effort’ and European staff were loath to train them, often being racist and wishing to protect their jobs.\footnote{13} Some administrations, however, relented. The Gold Coast Sekondi–Kumase line after 1907 began to hire and train a few Fanti men for skilled mechanical roles, and there was further Africanization of posts during the First World War and towards the end of the period.\footnote{14} Administrations looked more kindly on other nationalities. The Kenyan and Ugandan governments, for example, employed large numbers of Indians as drivers, foremen, station masters and so on, though an attempt to follow a similar policy in Lagos in 1903 was opposed by the Crown Agents, who claimed that Indians would be difficult to recruit and would have difficulties adjusting to the West African climate. Other nationalities employed included Afrikaners, found in Rhodesia and South Africa, and West Indians, seven of whom worked at the turn of the century in the Gold Coast and Sierra Leone.\footnote{15}

Africans were largely used for non-skilled work, but, again, were often difficult to recruit. There was competition for labour from agriculture, mines and trading companies, and many Africans were reluctant to work on the railways. Wages were low, owing to the low revenues of lines and the fear that high wages would attract workers away from agriculture/mining and thus weaken colonial economies, and many of the posts were in towns where living costs were relatively high.\footnote{16} Railway work also involved long hours and poor working and living conditions. Many recruits were killed or severely injured by runaway trains etc, the housing provided both in segregated towns and rural camps was often of poor quality and the work of the gangers, who maintained and repaired track, was hard and tedious.\footnote{17} Railway authorities responded to the shortages by employing workers on a temporary or day-to-day basis, which also reduced labour costs; recruiting European staff – Italians and Greeks in Rhodesia and South Africa, respectively – and gradually improving wages and working and housing conditions.\footnote{18} In Natal and the Cape in the 1930s and 1940s, model railway villages were erected, and, from 1938, South African Railways initiated a community development programme.\footnote{19}

Finally, costs were increased by high debt charges and the high cost of coal, African theft of railway materials and the poor structure and financial management of some railway departments.\footnote{20} The Gold Coast railway administration, for example, suffered from unclear lines of authority, interdepartmental rivalries, over-concentration of power in the hands of the resident engineer, admin-
istrative structures that overlapped and personality clashes. The costs of the Kenya–Nairobi–Thika railway, meanwhile, were excessive because the officers of the Uganda Railway simply refused to incorporate it into their own operations. Structural problems were matched by poor accounting and poor decision making. As regards the Gold Coast Sekondo–Kumase line, the expenditure account excluded loan interest payments and Sinking Fund charges, capital improvements were initially financed from the local Treasury and only later applied to the revenue account, locomotives were purchased that lacked automatic breaks, and the line possessed few safety devices and no semaphore signals, making accidents an almost weekly occurrence.

Turning to the other side of the cost–revenue equation, as already discussed in the General Introduction in Volume 1, in West Africa the Crown Agents and consulting engineers deliberately exaggerated anticipated receipts in order to encourage the building of lines. Construction costs also failed to be covered for a host of other reasons. Some lines, such as the Uganda Railway and many of those in South Africa, were constructed for non-economic political or administrative purposes. For others, the anticipated traffic failed to emerge, the construction of rival lines led to intense competition, as occurred in the Transvaal/Cape, and tariffs were sometimes forced down for the good of the economy by local governments. In Rhodesia, administrators put pressure on railway authorities to reduce seed cotton rates, and, in Kenya, to cut maize tariffs.

Administrations and railway authorities responded to operating losses in a number of ways. While some set low freight rates in order to generate traffic, a far larger number used their monopolistic power to introduce excessively high tariffs. The Kenya Nairobi–Thika line, the Nyasaland and Rhodesian railways and the Transvaal NZASM company all pursued this policy. Other administrations and railway authorities sought to maximize returns by extending lines into new territories (see the Construction thematic introduction in Volume 1); through the building of branch lines, which broadened a railway’s hinterland; as discussed in the Road thematic introduction in Volume 5, by encouraging the building of feeder roads and establishing road haulage companies; and, in South Africa, via electrification. There was also some cross-subsidization of tariffs designed to increase traffic. The low agricultural freight rates of the Rhodesian extension to the Congo border, for example, were made possible by the higher tariffs charged for the large amounts of Katanga copper carried by the line.

SOUTHERN RHODESIA.

REPORT

BY

Brigadier-General F. D. Hammond, C.B.E., D.S.O,

ON THE

Railway System of Southern Rhodesia

Under the ‘Railways Enquiry Act, 1924.’

VOL. I.

PARTS I. AND II.

Presented to the Legislative Assembly,

1926.

Salisbury, Rhodesia:

[...]
PART I.

Bulawayo,
Southern Rhodesia,
5th September, 1925.

His Excellency,

Lieut.-Colonel Sir JOHN R. CHANCELLOR,¹
G.C.M.G., G.C.V.O., D.S.O., R.E.,
Governor of Southern Rhodesia,
Salisbury.

Sir,

I have the honour to forward this, the first portion of my report on the Railways of Southern Rhodesia, under the Railways Enquiry Act of 1924.

The terms of my reference are contained in Clause 2 of that Act, which reads as follows:–

‘The Governor-in-Council may, if he deem fit, at any time after the coming into force of this Act, appoint any person or persons to enquire fully into and report upon the conduct, administration, finances and general affairs of any railway or railways.’

These terms of reference were supplemented by the following letter:–

‘31st March, 1925.
Brigadier-General Hammond, C.B.E., D.S.O.

With a view to leaving you as free a hand as possible in the prosecution of your Enquiry, the Government do not propose to issue more detailed Terms of Reference than those contained in Clause 2 of the Railways Enquiry Act, 1924.

There are certain points, however, to which they consider it advisable that your attention should be directed. These points are given in the attached Memorandum. /

In forwarding this Memorandum the Government would point out that they do not intend that it should be considered as in any way comprehensive or as limiting the scope of your Enquiry.

(Signed) H. U. MOFFAT,
Minister of Mines and Public Works.

¹
MEMORANDUM No. 1 FOR GENERAL HAMMOND.

The Railways which serve this Colony and which are operating in Northern Rhodesia, the Union of South Africa, the Bechuanaland Protectorate and Portuguese East Africa as well as Southern Rhodesia are:–

<table>
<thead>
<tr>
<th>Railway Company</th>
<th>Mileage</th>
</tr>
</thead>
<tbody>
<tr>
<td>The Rhodesia Railways, Limited</td>
<td>1,396</td>
</tr>
<tr>
<td>The Mashonaland Railway Co., Ltd.</td>
<td>607</td>
</tr>
<tr>
<td>The Beira Junction Railway Co., Ltd.</td>
<td>35½</td>
</tr>
<tr>
<td>The Beira Railway Company, Ltd.</td>
<td>168½</td>
</tr>
<tr>
<td>The Blinkwater Railway Co., Ltd.</td>
<td>123</td>
</tr>
</tbody>
</table>

Total mileage: 2,330

The Railway line operating from Broken Hill to the Congo Border, 132 miles, owned by the Rhodesia-Katanga Junction Railway and Mining Company, Limited, is leased to and is under the same management as the above Railways.

Total: 2,462

A full enquiry is required into the affairs of these Companies, particularly in regard to the following matters:–

1. The Capital issues of the Companies, particulars of shares issued for cash and of shares issued for other than cash.
2. The debenture issue of the Companies, the dates of repayment, the guarantees of capital and interest and terms conditions of the issues and of the repayments.
3. How the Capital raised was expended, including the expenditure on works which have subsequently been abandoned.
4. The financial position and connection between the various Companies, the working arrangements and Agreements between them.
5. The position of the Railway Companies (the Beira Junction Railway Company, Limited, and the Beira Railway Company, Limited) in Portuguese East Africa and at Beira, the rights they hold under Treaties between the British and the Portuguese Government under the Van Laun Agreement, and any other contracts or agreements between the Railway Companies and the Mozambique Company.
6. The connection between the Railway Companies and –
   1. The British South Africa Company;
   2. The Rhodesia Railways Trust, Limited;
   3. The Beit Trust;
   and how their working, finance and policy is controlled by these concerns, whether by agreements or otherwise.
7. The revenues of the various Railways and the amounts drawn from the various traffics and other sources.
8. The working expenses, viz., the costs of running and working the Railways, whether these are reasonable or whether reductions could be made with out loss of efficiency.
9. The reserves set aside by the Companies for renewals and depreciation, whether the amount already set aside and the annual provision being made are fair and fair and reasonable or excessive, in view of the annual amounts spent on renewals and in maintenance of the permanent way and rolling stock.
10. Whether any portion of the provision for depreciation and renewals (see last combined balance sheet) has been expended on renewals of rolling stock and permanent way and works, or whether such necessary renewals have been provided solely out of revenue. / 

11. Whether any fresh expenditure on capital account, viz., erection of buildings or purchase of new machinery and plant is in the accounts of the Railways being charged direct to working expenditure. 

12. Whether the profits, namely, the balance of revenue over expenditure, which includes the provision for a reserve in Clause 9, are excessive. 

13. And therefore whether the rates and fares charged are fair and reasonable or excessive; the effect of the present rates on the industries of the country, particularly mining and farming. 

14. Do the fares and rates as now charged act to the prejudice of this Colony in comparison with those charged in the other countries served by the Railways? 

15. Whether the charge of £7 per ton per annum for the carriage of Government mails in Southern Rhodesia is excessive. 

16. The Port of Beira. Whether provision at Beira has been sufficient and whether the developments and extensions proposed are sufficient to meet the reasonable needs of this Colony, having regard to increase in the traffic of this Colony and from the other countries using the port. 

17. Is the equipment of the Railways, the rolling stock, etc., sufficient for the traffic requirements, particularly in view of a certain expansion of traffic in the near future? 

18. Whether, having regard to the requirements of mining, farming, commerce and of the general public, the equipment and administrative organization of the Railways produce the best commercial results. 

19. Is the traffic of the Railways actually operating in this Colony sufficient to support the Railway system of the Colony on the present basis? 

In order to explain the reason for the division of my enquiry into two parts, it is necessary to point out that the subjects to which my attention was directed in the Memorandum of Instructions fell into two categories. In respect to the first, I was requested to record an opinion on various aspects of the Railways’ present activities, charges and finance, and their effects on the industries of the country. As these included, inter alia, such questions as whether or not the profits are excessive and whether or not the rates are fair and reasonable, it was essential that I should adopt a strictly impartial attitude towards them, more particularly in view of the special powers granted to me. 

In the second category, I was asked to advise as the future policy of the country, not only in regard to the general problem of railways, but also in respect of certain specified subjects. In this second part, therefore, I was acting merely as the adviser of the Government, and it was no longer incumbent on me to treat the subject from a purely impartial standpoint. 

These considerations rendered the division of the enquiry into two parts a necessity. 

[...]
The railways enumerated in the Letter of Instructions as the subject of this inquiry are located in five different countries; they are all of the usual South African 3 feet 6 inch gauge. The following table shows the distribution:

<table>

</tbody>
</table>
It will be seen that, of the total mileage of 2,462 miles, 1,252 are situated in Southern Rhodesia, and that of the six companies the Blinkwater Railway Company is the only one which is confined to that Colony.

The whole of the mileage of these six distinct companies is managed by one central organization, situated at Bulawayo, with the exception that the Vryburg-Bulawayo section of the Rhodesia Railways, 588 miles long, is worked under a long-standing agreement by the South African Railways, who render accounts of the results.

Owing to the fact that the Southern Rhodesian portion forms an integral part of the whole, and to the fact that the other portions have in return an important bearing on Southern Rhodesia, it has been necessary for me to view the system as a whole in its relation to this Colony, only differentiation between the various companies when it becomes necessary for financial or other reasons.

These railways were built about twenty-five to thirty years ago as pioneer lines, and they still retain, despite certain improvements which have been effected of late years, the chief characteristics of such lines. It was obviously the intention to avoid any heavy work, and a watershed line was obtained wherever possible. The earthworks are extremely light and the formation width for cuttings and embankments is very narrow, so narrow that in many places there is no proper room for a cess. Only a few stretches of the system are ballasted with stone, and station buildings are limited to the strict minimum. Stations are spaced at long intervals, and great use is made of intermediate crossing places with no resident staff.

Another feature of the system is that in its location it bears unmistakable signs of having been built to suit the needs of the moment, and with little regard to traffic prospects en route. The first section from Vryburg to Bulawayo was built for political reasons through the Bechuanaland Protectorate to the west of the Transvaal Republic, and passes through poor traffic country. The northern extension of the original main line, instead of starting from Salisbury, as originally intended, was finally built from Bulawayo to Wankie and the Victoria Falls, in order to reach the coalfields at former place. This section also traverses poor traffic country. The extension from the Victoria Falls north turns off again practically at right angles to its previous course, and runs roughly parallel to the main Bulawayo-Salisbury line at a distance of 280 to 300 miles.

All the branches, with the exception of the short line from Bulawayo to the Matopos, were built originally to connect various mines to the main line.
CONTROL.

The control of the whole system, with the exception of the Blinkwater Railway and the Rhodesia-Katanga Junction Railway and Mining Company, is in the hands of the British South Africa Company. That Company holds approximately 85 per cent. of the shares in the Rhodesia Railways Trust, which in turn holds 7,989 out of a total of 8,000 shares in the Rhodesia Railways, Limited, and 449,612 out of a total of 450,000 in the Mashonaland Railway Company.

In the Beira Railway Company the voting power in respect of 305,000 ordinary shares out of a total of 600,000 is vested in the British South Africa Company in trust until the 1st July, 1942.

The Beira Junction Railway Company has an issued share capital of 250,000 ordinary shares of five shillings each and 423,583 six per cent. cumulative preference shares, also of five shillings each; the whole of the latter shares, which carry equal voting rights with the ordinary shares, are held by the British South Africa Company, which in this way has full control.

The Blinkwater Railway Company has an issued share capital of 200,000 £1 shares, the whole of which is held by the Beit Railway Trustees. Although in this case the control does not actually rest with the British South Africa Company, as most of the trustees are on the board of that company, it may be said for all practical purposes to be in the same hands, subject, of course, to the provisions of the trust deed.

The Rhodesia-Katanga Junction Company is not controlled by the British South Africa Company, which is, however, represented on the board. The bulk of the ordinary shares were originally issued to the Tanganyika Concessions, Limited; there is no information obtainable locally as to the present owners, beyond the fact that the British South Africa Company has not, either itself or through the various railway companies, a sufficiently large holding to give it control.

As to the control of the British South Africa Company over the other companies, as detailed above, there is no secrecy and no dispute.

MANAGEMENT.

The control of virtually the whole system by the British South Africa Company has simplified the question of management. The Mashonaland Railway Company is the managing company for the whole system, except the Vryburg-Bulawayo section. Agreements for this purpose are in force with the Rhodesia Railways, Limited, the Blinkwater Railway Company, the Beira and the Beira Junction Railway Companies; copies are attached in the appendices. The last agreement of the Mashonaland Railway Company and the Rhodesia Railways, Limited, dated 18th June, 1907, was to the effect that, pending the completion of a fresh working agreement, the Mashonaland Railway Company would work...
the Rhodesia Railways at cost as previously; no new working agreement has been made. Perusal of these agreements shows that the principal features therein affecting this enquiry are the clauses relating to the application of rates and the division of receipts.

In the agreements with the Beira and Beira Junction Railway Companies there is a clause providing that the rates to be charged shall be fixed by a committee, which shall consist of three directors of the Mashonaland Railway Company and two directors of the Beira Railway Company, one of whom shall be a director of the Beira Junction Railway Company, if, in fact, my director of the Beira Junction Railway Company, if, in fact, any director of the Beira Railway Company shall be a director of the Beira Junction Railway Company. The position as to rates in these two companies is thus controlled by the Mashonaland Railway Company, or, in other words, by the British South Africa Company, subject, of course, to such conditions as have been imposed by the Portuguese Government or the Mozambique Company for rates in Portuguese territory.

The agreement with the Blinkwater Railway Company lays down in a schedule the rates to be charged, but provides for alteration with the consent of the companies, parties to the agreement.

The Rhodesia-Katanga Junction Railway is leased to the Rhodesia Railways, Limited, and the Mashonaland Railway Company, under date of the 30th January, 1915, and with effect until the 1st October, 1938. Under this lease these two companies pay a fixed rent of £44,000 a year, a capital expenditure rent of 5½ percent. on additional capital outlay, and a royalty rent of half the net profits from the working of the line. The fixed and capital expenditure rents are included as a trade charge against revenue for the purpose of computing the net profits. Under this lease the Mashonaland Railway Company manages the line.

The only references to rates in this lease are to those granted under special agreements with the Union Minière, the Wankie Colliery, the Belgian Congo Railway Companies and the Rhodesian Broken Hill Mine, and to those to be charged to the Rhodesia-Katanga Company’s mines at Kansanshi and Luana. The Rhodesia and Mashonaland Railway Companies are thus left free to fix rates over these sections, subject to the above special cases.

The Vryburg-Bulawayo section of the Rhodesia Railways is worked by the South African Railways under the original agreement made on the 28th May, 1897, with subsequent modifications. Under this agreement the Rhodesia Railways fix the rates.

Thus the final rate-making authority throughout the system, except for a few special cases, is, in fact, the British South Africa Company, through its ownership of the Mashonaland Railways and the Rhodesia Railways, Limited.

The division of receipts does not affect the question of control, and only affects indirectly that of management. [...] It is only necessary here to mention
that the Rhodesia Railways, Limited, pay £10,000 a year to the Beira Companies to compensate them for the loss of transit dues. By the terms of the Van Laun Concession, under which the Beira Railways were built, these companies were entitled to charge transit dues, not exceeding three per cent. *ad valorem*, on certain goods conveyed between the coast and British territory. These dues handicapped Beira as a port of entry, but the financial situation of the Beira Companies was not strong enough to allow them to abandon the revenue, unless they received assistance. The Rhodesia Railways, Limited, therefore agreed to pay the two companies £10,000 a year as compensation for the suspension of the dues, as from the 1st April, 1920.

The Rhodesia Railways also give to the Beira-Salisbury section twenty per cent. more than its mileage proportion of the receipts from traffic between Beira and points west of Salisbury, in order to compensate the other companies for their heavier operating expenses and the lower rated traffics which they carry. The Kalomo-Broken Hill section of the Mashonaland Railway also gets a special terminal, at the expense of the Rhodesia Railways, on certain traffic. These are merely internal adjustments, by means of which the financially stronger company assists those less fortunately situated. So far as the general standard of rate charges is concerned, their effect is therefore beneficial to the country.

The connection between the British South Africa Company, the Rhodesia Railways Trust and the Beit Railway Trustees has already been explained. It only remains to add that the trustees have also advanced sums of money for the purchase of rolling stock, under hire purchase agreements with the Rhodesia Railways and the Mashonaland Railway Company. The agreement with the Rhodesia Railways has now been terminated by the purchase of the stock by the Rhodesia Railways Trust, who lease it to the Rhodesia Railways as a portion of the stock purchased with the proceeds of six per cent. ten-year joint secured notes. The agreements with the Mashonaland company are still in force.

**POSITION IN PORTUGUESE EAST AFRICA.**

Under the Treaty between the Portuguese and the British Governments, dated the 11th June, 1891, the Portuguese Government agreed to construct a railway line between Pungwe and the British sphere, with docks, quays, etc., at Beira. In terms of the Royal Decrees of the 11th February, 1891, and the 30th July, 1891, the Mozambique Company acquired the right to undertake the work, and under a contract dated the 11th September, 1891, they granted a concession to H. T. van Laun. The British South Africa Company, on the 7th December, 1891, entered into an agreement with Mr. van Laun to acquire his rights under this concession, and in September, 1892, the Beira Railway Company was promoted, to which Mr. van Laun assigned his concessionary rights in January, 1894.
In April, 1895, the Beira Railway Company sub-let part of its rights under the concession to the London and Paris Exploitation Company, Limited, who formed the Beira Junction Railway Company. The latter company constructed, at 2 feet gauge, the first 35½ miles of the line from Beira to Fontesvilla, and the Beira Railway Company the remaining 168½ miles from Fontesvilla to the Rhodesian border.

Under a working agreement dated 15th December, 1896, the Beira Company has the option at the end of thirty years either to renew the working agreement for a further thirty years or to purchase the undertaking of the Beira Junction Company.

The original Van Laun contract has been modified by subsequent agreements and decrees. The principal rights and obligations of the Railway Companies as they stand at the present day, as the result of the original contract and these subsequent modifications, may be stated as follows:–

The Mozambique Company has the right to appoint one-third of the members of the board.

In addition to the original grant of land required for the railway line, stations, docks and quays, the Mozambique Company granted to the companies certain blocks of land along the railway and on alternate sides of it, each five kilometres square. The Beira Company thus acquired 130,673 hectares, and the Beira Junction Company 28,290 hectares, of which they still hold at present 125,592 and 26,856 hectares respectively.

The Mozambique Company will not allow any competing line to be constructed within 100 kilometres of either side of the railway, and the Railways have the preferential right to construct any branch lines from the main railway which may become necessary within the same area.

The Railways have the right to construct and work a telegraph along the line of the railway. / 

The Mozambique Company transferred to the Railway Companies its right to charge a transit due not exceeding three per cent. *ad valorem* on certain goods in transit between the East Coast and the British sphere. Reference has already been made to the suspension of these dues since the 1st April, 1920.

All plant, rolling stock and material required for the construction of the railway and telegraph are to be admitted free of duty.

Under the original contract the tariff of charges for the conveyance of passengers and goods was not allowed to exceed those in force on the Government Railways of the Colony of the Cape of Good Hope; this clause has not been altered, but the Mozambique Company has refrained from exacting its fulfilment on condition that the rates within its territories are subjected for its approval and are not more than those charged to and from points beyond Macqueque, the frontier town.
The dock and quay dues, landing and warehouse charges, have to be approved by the Mozambique Company.

The Railway Companies must convey all officials and employees in the direct service of the Mozambique Company, together with their personal baggage and effects, free of charge, and mail service must be performed gratuitously. Special concessions are also fixed for the carriage of natives for the Mozambique Company, for the carriage of stone for public works at Beira, for the transport of troops, and for telegraph messages for the Portuguese Government and the Mozambique Company.

The Portuguese Government, under the decree of the 11th February, 1891, has the right at the end of twenty-five years, and thereafter at the end of each period of ten years, to modify the concession to the Mozambique Company with regard to, *inter alia*, provisions and clauses relative to the concession of exclusive rights, and can at the same periods acquire works of public interest, such as railways, docks, etc., on payment of an indemnity. The redemption price shall be the capital sum which at five per cent. per annum produces an annual sum equivalent to the average of the net receipts during the previous three years, and that sum may be paid down by the Government, at its choice, or in annual instalments bearing interest at five per cent. There is no condition as to the number or amount of the annual instalments. If the indemnity appears prejudicial to the Government or to the Mozambique Company, the redemption price may be fixed by agreement or by arbitration. If the arbitrators are unable to agree, an umpire shall be appointed by the Portuguese Supreme Tribunal of Justice. The dates for expropriation are 1916, 1926 and so on. This obligation is passed on by the Mozambique Company under the Van Laun contract to the Railway Companies.

Under a decree of the 4th June, 1902, the Portuguese Government laid down that the line, with all its fixed and rolling material, should revert to the State at the end of ninety-nine years. The Railway Company disputes this claim on the grounds that the decree is dated eleven years after the decree granting the concession under which the Van Laun contract was made, and that the legislation is therefore *ex post facto*.2

The above summarises the principal rights and obligations of the two Railway Companies as they stand at present.

In 1923 the Mozambique Company made a contract with the Port of Beira Development Company, under which the latter was to form a Portuguese company called the Port of Beira Company, to construct harbours and port works at Beira and to manage the same. The Mozambique Company agreed not to allow the execution of any work whatever by third parties, unless with the consent of the Port of Beira Company, and to authorise the embarkation and disembarkation of goods only at the wharves or piers of the Port of Beira Company,
apart from installations already legally existing. The right of the Port of Beira Company to pass on its rights and obligations to a contractor was recognised. The British South Africa Company opposed this concession strongly, on the grounds that the Beira Junction Railway Company had the right, under the Van Laun contract, to construct such wharves and piers as were necessary to deal with the traffic passing over its line, which had been constructed in accordance with the terms of the Anglo-Portuguese Convention of 1891, and that therefore the new contract involved a breach of the previous contractual obligations of the Mozambique Company. / 

It is understood that the British South Africa Company is now making arrangements to share in the finance and undertakings of the new companies, the existing assets of the Beira Junction Company connected with port working being merged therein. I have seen the correspondence which has passed between the London Office and the General Manager on this subject, but do not propose to append it to this report, as, at the time of writing, no definite conclusion has been reached. The effect of this new development is discussed later.

**CAPITAL.**

**Rhodesia Railways, Limited.**

Taking first the Rhodesia Railways, Limited, the authorised capital and the capital raised as at the 30th September, 1924, are shown in the following table:–

Rhodesia Railways and Rhodesia Railways Trust 10-Year Joint Secured Notes carrying interest at six per cent. per annum, free of income tax, of which the amount allocated to the Rhodesia Railways, Limited, is 1,000,000

Total capital raised 6,139,003

The first point which calls for comment is it that practically the whole of the capital for construction was raised by debentures. The interest on the five per cent issue was guaranteed by the British South Africa Company for twenty years from the 1st November, 1895; that guarantee has now lapsed. The other two debenture issues are guaranteed by the same company as to principal, premium and interest for fifty years from the 1st May, 1899. These onerous conditions explain why the debenture capital forms such a large proportion if it had been possible to raise capital on more favourable terms from the public it may be taken for granted that the owners the British South Africa Company, would have done so, without saddling themselves with these severe obligations. It gains no benefit it has a heavy liability. / The first series of debentures, those issued at five per cent., was secured on the Vryburg-Bulawayo section. For the four per cent. and three per cent. debentures the security given was a first mortgage on the whole line from Bulawayo onwards, and on land grants given in aid of the extension; a second mortgage on the line from Vryburg to Bulawayo and its attached land grants, and a general charge on the whole undertaking and assets of the company, in addition to the British South Africa Company’s guarantees. This illustrates the onerous character of the securities which had to be given in order to raise funds. The first mortgage then given on any future line has seriously hampered the finance of this company; it accounts for the decision to finance the extension of the line from Kalomo to Broken Hill through the agency of the Mashonaland Company, whose future assets were not already pledged.
The total amount of discounts and expenses of issue of the debentures was £264,195 or 4.23 per cent of the nominal value of £6,250,000. The rate of interest on each actually received, 4.47 per cent., is low.

The 10-year six per cent. joint secured notes of the Rhodesia Railways and Rhodesia Railways Trust were issued in 1921; of the total sum of £2,000,000 half was allocated to the Rhodesia Railways. In addition to the mortgage of the debenture holders the Rhodesia Railways had a further liability to the Beit Trust for rolling stock, purchased under hire purchase agreements. With these liabilities it was not possible for that company to raise fresh capital unaided. The Rhodesia Railways Trust therefore joined with the Rhodesia Railways in creating these new notes, for which they are jointly and severally responsible. They are secured generally upon the whole of the undertakings of the two companies, subject to existing prior charges, and specifically upon the rolling stock purchased by the Rhodesia Railways Trust out of its share of the proceeds of the issue. In addition the notes, which are free of income tax, are guaranteed as to principal, premium and interest by the British South Africa Company. The percentage of discounts, stamps and expenses of issue to nominal capital was 7.3; as the notes are free of incomes tax, but it is not possible to state the actual percentage paid on cash received, but it is high, as might be expected, from the date at which the notes were issued.

The discounts on the debentures have already been written off. The discounts and expenses on the note issue are being written off at the rate of £6,567 a year.

To write off the discounts on debentures out of revenue during the life of the debentures is recognised as sound finance. The price at which a debenture is offered to the public and the interest are intimately connected. Assuming a given marketability for the issue, if the price is high the interest must be higher in proportion and vice versa. Consequently, it is only right and sound that the discounts should be gradually written off out of revenue, so that when the time comes to redeem, there is a tangible asset represented on the balance sheet. It is not always possible to do this on account of the financial position of the company, and instances occur in this system where the discounts have been capitalised for this reason. No question can arise as to which is the more correct and sounder course, and no this purpose, provided of course they are not out of proportion and are spaced over a reasonable period. I would mention that the writing off of discounts out revenue is enforced by the Inter-State Commerce Commission of the United States. This body was formed by the United States Government to protect the interests of the public. It regulates, amongst other things, practically every phase of railway finance and rates. It issues detailed instructions as to the precise form of account to be kept, and these have to be obeyed by every railway in the United States. Its decisions, therefore, carry very high authority.
I propose to discuss the subject the subject of the ordinary shares later, when the capital of the Rhodesia Railways Trust, Limited, is under review.

The total capital expenditure on 30th September, 1924, amounted to £8,499,304. For a mileage of 1,396 this is £6,100 a mile, a very low figure.

II
MASHONALAND RAILWAY COMPANY

The situation regarding the capital of the Mashonaland Railway Company is as follows:

Same as authorized capital: £5,510,000

**Application Of Capital**

The British Africa Company, under a contract dated the 4th August, 1897, agreed with the Mashonaland Railway Company, Limited:

1. to grant a concession to make and maintain a railway from Umtali to Salisbury, with the first right to construct branches;
2. to provide land grants for the railway;
3. to construct and complete the railway and works;
4. to provide funds for remunerating engineers (£25,000), working capital (£20,000), and payment during construction of interest on debentures issued under the contract;
5. to guarantee interest on an issue of debentures amounting in all to £2,500,000 for twenty-two years from the 1st October, 1897;
6. to hand over £150,000 ‘C’ Beira Railway debentures.

In return the Railway Company issued to the British South Africa Company £449,993 in fully paid shares, and agreed to issue £1,150,000 in debentures (part of the first series of £2,500,000) at eighty per cent of the face value, or higher if the British South African Company required. In the schedules attached to this contract the debentures are treated as being of the value of £80. At the same time
the British South Africa Company assigned to the actual contractors the right to construct and their liabilities under heading (4), handing over as payment their rights in the debentures and 224,000 £1 shares.

A public issue of these debentures was made by the British South Africa Company at ninety, the contractor bearing the expenses of the issue and paying the interest on the debentures during construction. These payments covered the interest for approximately twenty-one months. The contractors may therefore be regarded as obtaining the debentures at a discount of ten per cent., less the expenses mentioned above.

In the Mashonaland Railway Company’s accounts the issue price of these debentures is shown as par. Thus in its case there are no discounts to be written off out of revenue. The discount of £230,000, the difference between the £80 at which they were valued in the contract and par, is included in the capital expenditure.

When this series of transactions was completed the British South Africa Company remained with 225,993 £1 shares in exchange for the concession, the land rights for the railway, £150,000 ‘C’ Beira Railway debentures were estimated three years later in the Mashonaland Railway accounts as being worth £82,500.

The cost to the railway company of getting the line built was £1,374,000 (the debentures plus 224,000 shares); it was approximately 170 miles long so that the cost per mile worked out at £8,082. Considering the easy nature of the country between Umatali and Salisbury and the light character of the construction, this was a high figure at that time. The reason for is not apparent from the evidence obtainable locally.

In 1889 a public issue was made of a further £900,000 debentures of the same series at 95 per cent., £100,000 of which were to provide steel bridges and extra station buildings between Umtali and Salisbury, the balance, viz., £800,000, being for the purpose of enabling the Beira Railway Companies to widen their lines from their original two feet gauge to three feet six inch gauge, and to provide them with £50,000 cash required for other purposes. At the same time, and in connection with these arrangements, £50,000 debentures were also issued to the British South Africa Company at par. In return, the Beira Companies gave the Mashonaland Railway Company a perpetual prior lien rent-charge of £42,500 per annum, non-cumulative and payable out of the net earnings of the railways, and agreed to bear the ten per cent. discount and expenses on the £800,000 debentures issued for their purposes.

£400,000 issued in 1900 at 93 per cent. completed the issue of the first series of debentures of £2,500,000. This last issue was made for improvements to the line, purchase of rolling stock and general purposes.
